

## Enterprise Architect User Guide

*Enterprise Architect is an intuitive, flexible and powerful UML analysis and design tool for building robust and maintainable software. From requirements gathering, through analysis, modeling, implementation and testing to deployment and maintenance, Enterprise Architect is a fast, feature-rich, multi-user UML modeling tool, driving the long-term success of your software project.*

# Enterprise Architect User Guide

## Introduction

---

*by Geoffrey Sparks*

*Enterprise Architect is a complete UML-based solution for analysing, designing, managing, sharing and building software systems.*

## Part VII Extending UML Models

1471

<b>Using UML Profiles .....</b>	<b>1472</b>
Add Profile Objects to a Diagram .....	1472
Tagged Values in Profiles .....	1473
Synchronize Tagged Values and Constraints .....	1473
<b>Using MDG Technologies .....</b>	<b>1475</b>
Work with MDG Technologies .....	1476
Manage MDG Technologies .....	1477
Access Remote MDG Technologies .....	1479
Import MDG Technologies to Model .....	1480
Extensions - MDG Technologies .....	1481
<b>MDG Technology SDK .....</b>	<b>1483</b>
Defining a Modeling Language .....	1483
Developing Profiles .....	1485
Create Stereotype Profiles .....	1485
Create a Profile Package .....	1487
Add Stereotypes and Metaclasses .....	1488
Create Stereotypes Extending non-UML Objects .....	1491
Define Stereotype Tagged Values .....	1492
Add an Enumeration to a Stereotype .....	1493
Define a Structured Tagged Value .....	1495
Use the Tagged Value Connector .....	1498
With Predefined Tag Types .....	1499
Define Stereotype Constraints .....	1500
Add Shape Scripts .....	1501
Set Default Appearance .....	1502
Special Attributes .....	1503
Define a Stereotype as a Metatype .....	1508
Define Multiple-Stereotype Level .....	1509
Define Creation of Instance .....	1510
Define Composite Elements .....	1511

Define Child Diagram Type.....	1512
Define Tag Groupings.....	1514
Quick Linker.....	1515
Quick Linker Definition Format.....	1516
Quick Linker Example.....	1519
Hide Default Quick Linker Settings.....	1521
Quick Linker Object Names.....	1521
Add Quick Linker Definition To Profile.....	1523
Export a Profile.....	1523
Save Profile Options.....	1525
UML Profiles in the Resources Window.....	1526
Import UML Profiles Into the Resources Window.....	1526
<b>MDG Technologies - Creating .....</b>	<b>1527</b>
Using the Profile Helpers.....	1528
Create Stereotype Profiles using Profile Helpers.....	1529
Add Stereotypes and Metaclasses using Profile Helpers.....	1531
Edit a Stereotype Element.....	1535
Create Diagram Profiles using the Profile Helpers.....	1536
Create Toolbox Profiles using the Profile Helpers.....	1538
Create Hidden Sub-Menus using the Profile Helpers.....	1543
Create MDG Technology File.....	1545
Add a Profile.....	1548
Add a Pattern.....	1549
Add a Diagram Profile.....	1550
Add a Toolbox Profile.....	1551
Add Tagged Value Types.....	1551
Add Code Modules.....	1552
Define Code Options.....	1553
Add MDA Transforms.....	1554
Add Document Report Templates.....	1555
Add Linked Document Templates.....	1555
Add Images.....	1556
Add Scripts.....	1556
Add Workspace Layouts.....	1557
Add Model View s.....	1558
Add Model Searches.....	1559
Working w ith MTS Files.....	1559
Create Toolbox Profiles.....	1560
Create Toolbox Profiles.....	1561
Toolbox Page Attributes.....	1563
Create Hidden Sub-Menus.....	1564
Assign Icons To Toolbox Items.....	1565
Override Default Toolboxes.....	1567
Elements Used in Toolboxes.....	1567
Connectors Used In Toolboxes.....	1569
Create Custom Diagram Profiles.....	1570
Built-In Diagram Types.....	1572
Attribute Values - styleex & pdata.....	1573
Set Up Technology Element Images.....	1574
Define Validation Configuration.....	1576
Incorporate Model Templates.....	1576
Add Import/Export Scripts.....	1578
Deploy An MDG Technology.....	1580
<b>Developing Programming Languages .....</b>	<b>1581</b>
<b>Shape Scripts .....</b>	<b>1582</b>

## **Part XII Systems Engineering 2288**

<b>Systems Modeling Language (SysML) .....</b>	<b>2294</b>
<b>SysML Activity Toolbox .....</b>	<b>2295</b>
<b>SysML Block Definition Toolbox .....</b>	<b>2300</b>
Generate Properties From Block Associations .....	2304
Block Element Compartments .....	2305
Show Direction on SysML 1.3 Ports .....	2306
<b>SysML Interaction Toolbox .....</b>	<b>2306</b>
<b>SysML Internal Block Toolbox .....</b>	<b>2308</b>
<b>SysML Model Elements Toolbox .....</b>	<b>2310</b>
<b>SysML Parametrics Toolbox .....</b>	<b>2312</b>
<b>SysML Requirements Toolbox .....</b>	<b>2314</b>
<b>SysML State Machine Toolbox .....</b>	<b>2316</b>
<b>SysML Use Case Toolbox .....</b>	<b>2318</b>
<b>SysML Parametric Models .....</b>	<b>2320</b>
Simulate a SysML Model .....	2322
<b>A SysML Requirements Model .....</b>	<b>2325</b>
<b>A SysML Operational Domain Model .....</b>	<b>2326</b>
<b>Compose System Design .....</b>	<b>2328</b>
<b>Create Reusable Subsystems .....</b>	<b>2330</b>
<b>Migrate SysML Model to Later SysML Version .....</b>	<b>2331</b>

## **Part XIII Database Engineering 2334**

<b>Physical Data Model .....</b>	<b>2335</b>
<b>Create a Data Model Diagram .....</b>	<b>2336</b>
Example Data Model Diagram.....	2337
<b>Tables and Columns .....</b>	<b>2338</b>
Create a Table.....	2339
Working with Table Properties.....	2340
Set the Database Type.....	2341
Set Table Owner/Schema.....	2342
Set MySQL Options.....	2342
Set Oracle Table Properties.....	2343
Create Columns.....	2345
Reorder Columns .....	2347
<b>Manage DBMS Settings .....</b>	<b>2347</b>
<b>Data Types .....</b>	<b>2348</b>
DBMS Product Conversion for a Package.....	2349
Data Type Conversion For a Table.....	2350
Add New Datatypes.....	2350
MySQL Data Types.....	2352
Oracle Data Types.....	2352
Map Data Types Between DBMS Products.....	2353
<b>Database Keys .....</b>	<b>2354</b>

Primary Key.....	2355
Create a Primary Key.....	2356
Define a Primary Key Name Template.....	2357
SQL Server Non Clustered Keys.....	2358
Foreign Key.....	2358
Create a Foreign Key.....	2359
Composite Foreign Key.....	2361
Define a Foreign Key Name Template.....	2362
Define a Foreign Key Index Template.....	2363
<b>Stored Procedures</b> .....	<b>2364</b>
Create a Stored Procedure.....	2364
<b>Indexes</b> .....	<b>2365</b>
<b>Triggers</b> .....	<b>2368</b>
Create a Trigger .....	2369
<b>Create a Check Constraint</b> .....	<b>2370</b>
<b>Default Constraints</b> .....	<b>2371</b>
<b>Views</b> .....	<b>2371</b>
Create a View .....	2372
<b>Oracle Packages</b> .....	<b>2374</b>
<b>Supported Databases</b> .....	<b>2375</b>
<b>Import Database Schema</b> .....	<b>2376</b>
Select a Data Source .....	2378
Select Tables .....	2378
The Imported Class Elements .....	2379
<b>Generate DDL</b> .....	<b>2380</b>
Generate DDL For a Table .....	2380
Generate DDL for a Package .....	2381
<b>Data Modeling Notations</b> .....	<b>2384</b>

## Part XIV SOA and XML

**2386**

<b>XML Schema - XSD</b> .....	<b>2387</b>
<b>Model XSD</b> .....	<b>2387</b>
Example XML Schema Diagram.....	2389
Schema Package.....	2390
Global Element.....	2392
Local Element.....	2394
Global Attribute.....	2396
Local Attribute.....	2398
Attribute Group.....	2399
Complex Type.....	2401
Simple Type.....	2402
Group.....	2404
Any.....	2405
Any Attribute.....	2407
Union.....	2408
Model Group.....	2410
Enumeration.....	2412
<b>XML from Abstract Class Models</b> .....	<b>2413</b>
Default UML to XSD Mappings.....	2415
<b>Generate XSD</b> .....	<b>2417</b>
Generate Global Element.....	2418
<b>Import XSD</b> .....	<b>2420</b>
Global Element and ComplexType.....	2421
<b>Web Services - WSDL</b> .....	<b>2423</b>
<b>WSDL 1.1 Model Structure</b> .....	<b>2423</b>
<b>Model WSDL</b> .....	<b>2426</b>

WSDL Namespace.....	2429
WSDL Message.....	2430
WSDL Message Part.....	2431
WSDL Port Type.....	2433
WSDL Port Type Operation.....	2434
WSDL Binding.....	2437
WSDL Binding Operation.....	2438
WSDL Service.....	2441
WSDL Document.....	2443
Generate WSDL .....	2445
Import WSDL .....	2447
SoaML .....	2449
SoaML Toolbox Pages .....	2451
SOMF 2.1 .....	2454
MOF .....	2456
Create MOF Diagrams .....	2458
Export MOF Model to XMI .....	2460

## **Part XV Model Simulation 2463**

How It Works .....	2466
How it Looks .....	2468
Simulation Windows .....	2469
Set Up Simulation Script .....	2472
Activate Simulation Script .....	2474
Run Model Simulation .....	2475
Simulation Breakpoints .....	2477
Objects and Instances in Simulation .....	2479
Create Objects in a Simulation .....	2480
Destroy Objects in a Simulation .....	2483
Dynamic Simulation with Javascript .....	2486
Call Behaviors .....	2489
Interaction Operand Condition and Message Behavior .....	2490
Guards and Effects .....	2492
Triggers .....	2494
Action Behavior By Type .....	2497
Structured Activity Simulation .....	2499
Activity Return Value Simulation .....	2501
Simulation Events Window .....	2504
Waiting Triggers .....	2508
Re-Signal Triggers .....	2509
Trigger Parameters .....	2510
Trigger Sets and Auto-Firing .....	2512
Using Trigger Sets to Simulate an Event Sequence .....	2515
Multi-threading - Forks and Joins .....	2516
Multi-threading - Concurrent State Regions .....	2517
Using Composite Diagrams .....	2518
Win32 Dialog Simulation .....	2520
BPMN Simulation .....	2521

Create a BPMN Simulation Model .....	2521
Initialize Variables and Conditions .....	2523
Compare UML Activities to BPMN Processes .....	2524

## Part XVI Execution Analyzer 2527

Visual Execution Analyzer Samples .....	2529
Recording Sequence Diagrams .....	2531
How it Works .....	2532
The Recording History .....	2533
Diagram Features .....	2535
Setup for Recording .....	2535
Control Stack Depth .....	2536
Place Recording Markers .....	2536
Set Record Markers .....	2537
Marker Types .....	2538
The Breakpoints & Markers Window .....	2540
Working with Marker Sets .....	2541
Recording Activity for a Class .....	2542
Control the Recording Session .....	2544
Recorder Toolbar .....	2544
Working With Recording History .....	2546
Start Recording .....	2547
Step Through Function Calls .....	2548
Nested Recording Markers .....	2548
Generating Sequence Diagrams .....	2549
Reporting State Transitions .....	2550
Reporting a State Machine .....	2551
Recording and Mapping State Changes .....	2553
Profiling .....	2555
System Requirements .....	2556
Profiler Operation .....	2557
Getting Started .....	2558
Generate, Save and Load Profile Reports .....	2560
Setting Options .....	2563
Start & Stop the Profiler .....	2564
Function Line Reports .....	2564
Save Report in Team Review .....	2566
Object Workbench .....	2567
How it Works .....	2567
Create & Delete Workbench Instances .....	2568
Invoke Methods .....	2570
Unit Testing .....	2573
Set Up Unit Testing .....	2573
Run Unit Tests .....	2575
Record Test Results .....	2575
Testpoint Management .....	2577
The Testpoints Window .....	2578
The Testpoints Window Toolbar .....	2580
Constraint Composition .....	2581
Testpoint Editor .....	2584
Combine Testpoints .....	2586
Test Cut .....	2588
Test Set .....	2588
Test Suite .....	2589
Object Run State Diagrams .....	2591

## Part XVII Testing 2593

<b>Model Validation .....</b>	<b>2594</b>
Configure Model Validation .....	2596
Run Validation .....	2596
Rules Reference .....	2597
Well-Formedness .....	2599
Element Composition.....	2600
Property Validity.....	2600
OCL Conformance.....	2601
<b>Testing .....</b>	<b>2604</b>
Working On Test Records .....	2605
Create Test Records .....	2607
Move or Copy Tests Between Categories .....	2610
Import Scenario as Test .....	2611
Import Test From Other Elements .....	2613
Import Responsibility or Constraint as Test .....	2614
Create Maintenance Item From Test .....	2615
Show Test Script Compartments .....	2616
Test Documentation .....	2617

## Part XVIII Maintenance 2619

Introduction to Maintenance .....	2621
Working on Maintenance Items .....	2623
Create Maintenance Items .....	2625
Move or Copy Maintenance Items .....	2628
Create Elements From Maintenance Item .....	2629
Show Maintenance Items in Diagram .....	2630
Changes and Issues .....	2631
Issues (Defects) .....	2631
Changes .....	2633
Maintenance Diagram .....	2634
Example Maintenance Diagram.....	2635

## Part XIX Reporting 2638

<b>Document Reports .....</b>	<b>2640</b>
Generate Document Reports .....	2642
Generate Documentation.....	2644
Selecting a Template.....	2648
System Document Templates.....	2648
Selecting a Table of Contents.....	2652
Selecting a Stylesheet.....	2653
Selecting a Cover Page.....	2654
Document Options.....	2654
Exclude Package Query and Script.....	2658
Exclude Filters.....	2660
Element Filters .....	2660
Other Filters.....	2663
Project Constants.....	2664
Word Substitution.....	2665
Language Substitution.....	2666
Diagram Options.....	2667
Resource Documents.....	2668
Virtual Documents .....	2669

Create Master Document.....	2672
Create Model Document.....	2673
Add Packages to Model Document.....	2675
Delete Package in Model Document.....	2676
Document Order.....	2677
Generate the Document.....	2679
Generate Report to an Artifact Element.....	2680
<b>Custom Document Templates .....</b>	<b>2681</b>
Design Custom Document Templates.....	2684
Setting Sections for Reporting.....	2688
Child Objects.....	2690
Report on Embedded Elements .....	2691
Reporting Profiled Relationship Matrices.....	2692
Report on Constraints and Scenarios.....	2693
Reporting Linked Documents.....	2694
Report Elements From External Packages .....	2695
Report on Tagged Values.....	2698
Create Sections as Tables.....	2700
Add Section Content.....	2702
Custom Template Design Options.....	2704
Notes on Creating Stylesheets.....	2705
Notes on Creating Tables of Contents.....	2706
Notes on Creating Cover Pages.....	2707
Import a Document Template.....	2707
Template Fragments.....	2708
Creating a Template Fragment.....	2709
Custom Query Fragments.....	2711
Custom SQL Fragments.....	2712
Custom Script Fragments.....	2714
Example Template Fragment Script.....	2716
Example Output of a Template Fragment Script.....	2717
Adding Fragments to a Document Template .....	2718
<b>The Legacy RTF Report Generator .....</b>	<b>2720</b>
Document a Single Element.....	2721
Set the Main RTF Properties.....	2721
Apply a Filter .....	2722
Exclude Elements .....	2722
RTF Diagram Format.....	2723
Model Include.....	2723
RTF Report Options.....	2723
RTF Report Selections.....	2724
Custom Language Settings .....	2725
Generate the Report.....	2726
Legacy Report Style Templates .....	2726
Save as Document.....	2728
Use Microsoft Word.....	2729
Open a Report in Microsoft Word.....	2729
Change Linked Images to Embedded.....	2730
Document Bookmarks .....	2730
Features of Word.....	2732
Add Table of Contents.....	2733
Add Table of Figures .....	2733
Add Headers and Footers .....	2734
Manipulate Tables in Word.....	2734
Refresh Links.....	2735
<b>System Documents .....</b>	<b>2736</b>
Testing Details Report.....	2736
Implementation Details Report.....	2737

Implementation Targets Dialog.....	2739
Dependency Details Report.....	2739
Maintenance Report.....	2740
Diagrams Only Report.....	2741
Testing Report.....	2742
<b>Web Reports .....</b>	<b>2744</b>
Create a Web Page Report .....	2744
Create Web Style Templates .....	2747
HTML Template Fragments.....	2749
Master Documents and Model Documents .....	2759
Exclude Package from Report .....	2761
<b>Charts .....</b>	<b>2762</b>
Chart Elements .....	2763
Define a Model View Chart .....	2765
Define a Time Series Chart .....	2767
Standard Chart Data .....	2770
Source Package.....	2771
Element Filters in Standard Charts.....	2772
Custom Query .....	2773
External Data.....	2773
Chart Appearance .....	2774
2D Bar Chart.....	2775
3D Bar Chart.....	2778
Pie Chart.....	2782
Time Series Chart.....	2785
Including Charts in Reports .....	2788

## Part XX Automation and Scripting 2790

<b>Scripting .....</b>	<b>2791</b>
Scripts Tab .....	2792
Script Group Properties.....	2794
Console Tab .....	2796
Script Editor .....	2798
Session Object .....	2800
Script Debugging .....	2801
Simulation Scripts .....	2802
<b>Enterprise Architect Object Model .....</b>	<b>2804</b>
Using the Automation Interface .....	2805
Connect to the Interface.....	2805
Set References In Visual Basic.....	2808
Examples and Tips .....	2809
Call from Enterprise Architect.....	2810
Available Resources.....	2811
Reference .....	2812
Interface Overview Package.....	2813
App Object.....	2814
Enumerations.....	2815
ConstLayoutStyles.....	2816
CreateBaselineFlag.....	2817
CreateModelType.....	2818

# Foreword

This user guide provides an introduction to the features contained in Enterprise Architect - a UML modeling tool for developing and building software systems with UML.

**Part**

# 1 Introduction

Sparx Systems **Enterprise Architect** is a full life-cycle **UML** based tool for:

- Designing and constructing a wide range of software systems
- Business analysis, business process modeling, managing requirements
- Systems modeling, systems architecture modeling, component design, simulation
- Generalized domain specific modeling
- Building domain specific modeling languages based on UML
- Visualizing a wide range of systems, processes, data, activities and structures
- Simulating behavioral processes, state machines and interactions
- Collaborating and sharing information and models
- Testing, quality control and end-to-end verification/traceability of complex systems
- Managing developmental tasks, work and scheduling

For over a decade, Sparx Systems has actively and continually developed Enterprise Architect based on the current UML standards. Over those years it has proven itself in a wide range of projects from small single user models to extremely large team based enterprise repositories. With over a quarter of a million licensed users in over 100 countries world wide, the power and effectiveness of Enterprise Architect has been convincingly demonstrated in many different areas.

## 1.1 Overview

### Enterprise Architect

- Is a comprehensive **UML** analysis and design tool.
- Covers all aspects of **software**, **business** and **systems** modeling and design
- Is suitable for **requirements gathering** through analysis, design, construction, build, debug, simulation, testing, change management and maintenance to implementation, with full **traceability**.
- Combines the power of the latest UML specification ([www.omg.org](http://www.omg.org)) with a high performance, intuitive interface, to bring an integrated and advanced toolset to the whole development team.
- Is a **scalable**, multi-user, visual tool with a rich feature set
- Helps build and document robust, maintainable systems and processes.
- Is a **proven**, highly popular tool for analysts, developers, consultants and managers in over 130 countries.
- Is used in the development of many kinds of application and system in a wide range of industries
- Covers **multiple domains**, including: aerospace, banking, web development, engineering, finance, medicine, military, research, academia, transport, retail, utilities and electrical engineering. It also has a long history of being used by standards organization worldwide to structure and organize their domain specific knowledge and communication channels.
- Is **supported** by many **partners**, **consultants**, colleges and other organizations who provide training and consulting services based around Enterprise Architect.

### How this Help is Organized

Topic	Description	Link
<b>Getting Started</b>	Some introductory tutorials and important information to get up and running quickly.	<a href="#">Getting Started</a> <sup>[42]</sup>
<b>Setting up and managing Projects</b>	Configuring, managing and maintaining <b>modeling projects</b> . Includes storage mechanisms, team development environments, managing changes and monitoring progress.	<a href="#">Projects and Teams</a> <sup>[197]</sup>
<b>Models and Modeling</b>	Includes how to work with the models and components, their properties, and the reference data with which you populate the model.	<a href="#">Modeling Basics</a> <sup>[750]</sup>
<b>UML Concepts and Language</b>	Basic UML and open standards based extensions. How those concepts are <b>extended</b> in Enterprise Architect's support of other modeling languages, and how you can create your own modeling languages.	<a href="#">Define a Modeling Language</a> <sup>[1483]</sup>
<b>Navigating and Searching</b>	How to find the information you require in the model. Selecting aspects of the model to extract and review.  <b>Tracing</b> developmental relationships in both the structure and the development timeframe.	<a href="#">Navigate, Search &amp; Trace</a> <sup>[644]</sup>

Topic	Description	Link
<b>Transforming</b>	Transforming model elements and fragments from one domain to another, using standard and customized Model Driven Architecture transformations.	<a href="#">Model Transformation</a> <sup>[2013]</sup>
<b>Generating Code</b>	Forward engineering from models and importing code (reverse engineering). Synchronizing code and model.  <b>Database</b> engineering is also supported, including forward engineering and import of legacy database structures.	<a href="#">Software Engineering</a> <sup>[2073]</sup> <a href="#">Database Engineering</a> <sup>[2334]</sup> <a href="#">SOA and XML</a> <sup>[2386]</sup>
<b>Visual Analysis of Executing code</b>	Advanced debugging and run-time inspection in a variety of languages. Tools for recording execution and stack traces and automatically generating Sequence diagrams. Profiling tools for native Windows applications. A powerful object workbench to test and work with individual objects. A rich testing capability featuring custom Testpoints based on Programming by Contract ideas and using a "code free" xUnit like approach.	<a href="#">Visual Execution Analyzer</a> <sup>[2527]</sup> <a href="#">Profiling</a> <sup>[2555]</sup> <a href="#">Object Workbench</a> <sup>[2567]</sup> <a href="#">Testpoint Management</a> <sup>[2577]</sup> <a href="#">Unit Testing</a> <sup>[2573]</sup>
<b>Simulations</b>	Run model <b>Simulations</b> on behavioral diagrams. Extensive support for State machines, Activity graphs, Interactions and BPMN. A powerful and easy to use feature that brings your model to life and helps ensure the validity and behavior of your solution.	<a href="#">Model Simulation</a> <sup>[2463]</sup>
<b>Domain Specific Modeling</b>	Developing models for <b>specific modeling domains</b> .	<a href="#">Analysis and Business Modeling</a> <sup>[1804]</sup> <a href="#">Database Engineering</a> <sup>[2334]</sup> <a href="#">Systems Engineering</a> <sup>[2288]</sup> <a href="#">SOA and XML Engineering</a> <sup>[2386]</sup>
<b>Quality Control</b>	Ensuring <b>quality control</b> of your models and code through <b>model validation</b> and running your own <b>test scripts</b> .	<a href="#">Testing</a> <sup>[2593]</sup>
<b>Maintenance</b>	Managing the <b>maintenance</b> of model elements and <b>changes and issues</b> across the project.	<a href="#">Maintenance</a> <sup>[2619]</sup>
<b>Reporting</b>	<b>Documenting</b> your model in either document report or web output format.	<a href="#">Reporting</a> <sup>[2638]</sup>

Topic	Description	Link
<b>Automation and Scripting</b>	How to use the ActiveX automation interface provided by Enterprise Architect to script and extend the capabilities of the tool. How to write Add-ins and how to use the scripting capabilities.	<a href="#">Automation and Scripting</a> <sup>[2813]</sup> <a href="#">Scripting</a> <sup>[2791]</sup> <a href="#">Enterprise Architect Add-In Model</a> <sup>[3010]</sup>
<b>Licensing</b>	Managing your private or shared <b>Enterprise Architect product license keys</b> .	<a href="#">License Management</a> <sup>[3162]</sup>

### 1.1.1 What You Can Do

Enterprise Architect is a rich and diverse modeling environment. At the highest level it uses a wide range of tools to help manage, understand, visualize, explore, trace and work with complex systems.

- General analysis, design, construction, visualization, testing, simulation and management of many domains
- Software construction, analysis, management, testing, coding, debugging and visualizing
- Business analysis, process definition, requirements management, process simulation, traceability
- Systems analysis, design, simulation, engineering and verification

#### A summary of some of the main activities supported by Enterprise Architect

Topic	Detail	See also
<b>Modeling Analysis and Design Requirements</b>	To <b>create models</b> with Enterprise Architect, you should become familiar with: <ul style="list-style-type: none"> <li>• The UML standards and</li> <li>• How you apply UML in Enterprise Architect to develop your models</li> <li>• UML extensions such as SysML, BPMN, DDS and others</li> <li>• Domain based modeling</li> <li>• Model Transformations and MDA</li> </ul>	<a href="#">Modeling Fundamentals</a> <sup>[750]</sup> <a href="#">Standard UML Models</a> <sup>[1179]</sup> <a href="#">Requirement Models</a> <sup>[1726]</sup> <a href="#">Domain Based Models</a> <sup>[1789]</sup> <a href="#">Model Transformation</a> <sup>[2013]</sup>
<b>Managing Models</b>	To <b>manage</b> the models in your projects you: <ul style="list-style-type: none"> <li>• Create and structure models</li> <li>• Work with elements within packages and views</li> <li>• Create diagrams as visual representation of model elements</li> <li>• Import and export model information</li> <li>• Protect and manage the model data itself</li> </ul>	<a href="#">Projects and Teams</a> <sup>[197]</sup> <a href="#">Team Development</a> <sup>[306]</sup> <a href="#">Reporting</a> <sup>[2636]</sup> <a href="#">Change Management</a> <sup>[382]</sup>

	<ul style="list-style-type: none"> <li>Communicate information on the data in the form of online, printable and web-page documentation and reports, and</li> <li>Manage change with baselines, XML import and export and auditing</li> </ul>	
<b>Code Engineering</b>	<p>In Enterprise Architect, UML modeling both depends on and supports code engineering - you <b>generate</b> and <b>update code</b> from a model, and you <b>create and update models</b> from code</p> <p>In this broad sense, Enterprise Architect enables you to:</p> <ul style="list-style-type: none"> <li>Forward engineer, reverse engineer, round-trip and synchronize code in a range of programming languages</li> <li>Debug and profile code</li> <li>Model and generate code for XML Technologies</li> <li>Perform database modeling and design for a range of database management systems</li> <li>Convert model components from one domain to another using Model Driven Architecture (<b>MDA</b>) <b>Transformations</b></li> </ul>	<a href="#">Overview Of Development</a> <sup>[2076]</sup>
<b>Model Simulation</b>	<p><b>Model Simulation</b> brings your <b>behavioral models to life</b> with instant, real-time <b>behavioral model execution</b>. Coupled with tools to manage triggers, events, guards, effects, breakpoints and simulation variables, plus the ability to <b>visually track execution at run-time</b>, the Simulator is a powerful means verifying the correctness of your behavioral models.</p>	<a href="#">Model Simulation</a> <sup>[2463]</sup>
<b>Managing Projects</b>	<p>Enterprise Architect provides strong support for Project Management, particularly in the following areas:</p> <ul style="list-style-type: none"> <li>Project estimation - working out how much time and effort is required to build and deploy a solution, using the Use Case metrics facility and carefully-calibrated metrics</li> <li>Defining, assigning and managing resources</li> <li>Communicating Project Management discussions and decisions to the project</li> <li>Monitoring and managing problems, changes, issues and tasks that affect both individual elements and the project as a whole</li> <li>Managing the development, execution and results of testing, from Integration through to User Acceptance, and</li> <li>Maintaining a project glossary of terms, procedures and policies applied to the project</li> </ul> <p>The scope of your project management might include upgrades to Enterprise Architect and installation of related technologies</p>	<a href="#">Projects and Teams</a> <sup>[197]</sup> <a href="#">Testing</a> <sup>[2593]</sup> <a href="#">Maintenance</a> <sup>[2619]</sup> <a href="#">License Management</a> <sup>[3162]</sup>

<b>Extending Enterprise Architect Facilities</b>	<p>Experienced technology developers can develop customized additions to the functionality already present within Enterprise Architect. These additions include:</p> <ul style="list-style-type: none"> <li>• UML Profiles and Stereotypes</li> <li>• UML Patterns</li> <li>• Code Templates</li> <li>• Tagged Value Types</li> <li>• MDG Technologies</li> <li>• Enterprise Architect Add-Ins</li> <li>• Scripts</li> </ul> <p>By creating these extensions the Technology Developer can customize the Enterprise Architect modeling process to specific tasks and speed up development.</p>	<p><a href="#">Extending UML Models</a> <sup>[147]</sup></p> <p><a href="#">Automation and Scripting</a> <sup>[2813]</sup></p>
--	---	--

### 1.1.2 Key Benefits

Enterprise Architect is a powerful tool for specifying, documenting and building your software and business process projects. Using Enterprise Architect's **support for UML** and its related standards, you can model new complex software and business systems, or visualize and maintain existing systems.

#### Key Benefits and Usage

Topic	Detail	See also
<b>Design and Build Diverse Systems Using UML</b>	<ul style="list-style-type: none"> <li>• UML is an open standard that provides a rich language for describing, documenting and designing software, business and IT systems in general.</li> <li>• Enterprise Architect enables you to leverage the full expressive power of UML 2.4.1 to model, design and build diverse systems in an open and well understood manner.</li> <li>• You can generate code, database structures, documentation and metrics; transform models; or specify behavior and structure as the basis for contractual agreements.</li> </ul>	<p><a href="#">Standard UML Models</a> <sup>[1179]</sup></p> <p><a href="#">Modeling Basics</a> <sup>[750]</sup></p>
<b>Model and Manage Complexity</b>	<ul style="list-style-type: none"> <li>• Enterprise Architect helps individuals, groups and large organizations model and manage complex information.</li> <li>• Often this relates to software development and IT systems design and deployment, but it can also relate to business analysis and business process modeling.</li> <li>• Enterprise Architect integrates and connects a wide range of structural and behavioral information, helping to build a coherent and verifiable architectural model, either what-is or what-will-be.</li> <li>• Tools to manage version control, track and compare differences, audit changes and enforce security, help control</li> </ul>	<p><a href="#">User Security</a> <sup>[316]</sup></p> <p><a href="#">Change Management</a> <sup>[382]</sup></p>

Topic	Detail	See also
	project development and enforce compliance to standards.	
<b>Structured Use Case Scenarios</b>	<ul style="list-style-type: none"> <li>Enterprise Architect's Structured Scenario editor enables you to develop structured Use Case Scenarios, to capture vital analysis information in the form of natural language descriptions.</li> <li>The editor helps you use this information to drive downstream development and maximize traceability across the development life-cycle.</li> <li>The editor also helps you to dynamically link scenario steps to associated model elements, such as domain elements, business rules and glossary terms.</li> <li>From structured scenarios, you can automatically generate test case descriptions, and Activity and other UML behavioral diagrams.</li> <li>You can even reverse engineer existing process diagrams into structured, textual specifications to produce documentation deliverables.</li> </ul>	<a href="#">Scenarios</a> <sup>[96]</sup>
<b>Share Models</b>	<ul style="list-style-type: none"> <li>Enterprise Architect enables you to share complete models or specific aspects of a model between members of a team, including (through the 'Lite', read-only edition) stakeholders who can study a model but not change or manage it.</li> <li>You can make your project .EAP file available on a shared network drive, or replicate the .EAP file for complex distributed development.</li> <li>Alternatively, you can develop the project in one of several shared DBMS repositories.</li> <li>You can import and export data as XML files to distribute and update frameworks and other package-based model structures; you control changes through the version control repository.</li> <li>Enterprise Architect provides a data transfer wizard that enables you to upsize or downsize the complete model for maximum flexibility, and it enables you to export and import reference data so that you do not have to recreate it for related projects.</li> </ul>	<a href="#">The Read-only 'Lite' Edition</a> <sup>[23]</sup> <a href="#">Project Sharing</a> <sup>[307]</sup> <a href="#">Server Based Repositories</a> <sup>[214]</sup> <a href="#">XML Import and Export</a> <sup>[473]</sup> <a href="#">Version Control</a> <sup>[383]</sup> <a href="#">Perform a Project Data Transfer</a> <sup>[504]</sup> <a href="#">Sharing Reference Data</a> <sup>[374]</sup>
<b>Model, Manage and Trace Requirements</b>	<ul style="list-style-type: none"> <li>Enterprise Architect enables you to capture requirements and use full traceability from base requirements to design, build, deployment and beyond.</li> <li>You can use impact analysis to trace from proposed changes to original requirements, and build the 'right' system.</li> </ul>	<a href="#">Requirements</a> <sup>[1726]</sup> <a href="#">Trace: Tracking Dependencies</a> <sup>[723]</sup>
<b>Develop Personal Views and</b>	<ul style="list-style-type: none"> <li>Enterprise Architect enables you to develop any number of different views of your model, or parts of it, either for your personal use or for the use of your team.</li> </ul>	<a href="#">Model Views</a> <sup>[686]</sup>

Topic	Detail	See also
<b>Extracts of the Model</b>	<ul style="list-style-type: none"> <li>These Model Views are generated by reports, so they can be set up to always show the current status of the selected view.</li> <li>The facility also enables you to create Favorites folders of hyperlinks to frequently-used data structures.</li> </ul>	
<b>Track and Trace Model Structures</b>	<ul style="list-style-type: none"> <li>In even a small model, it can be difficult to locate specific packages, diagrams or elements, even if you apply a rigorous naming and structure policy.</li> <li>Enterprise Architect has a wealth of facilities that enable you to locate structures quickly and easily, through the Model Search, Package Browser, Diagram List, Auditing facility, Traceability window, Relationship Matrix and reports.</li> <li>The Element menu, Diagram menu and Project Browser context menus also enable you to locate elements in diagrams and in the Project Browser, and you can store hyperlinks to important or commonly-used elements and diagrams in the Model Views.</li> <li>Finally, having located one element you can import any related elements into a diagram in a single operation.</li> </ul>	<a href="#">Navigate, Search &amp; Trace</a> <sup>[644]</sup> <a href="#">Auditing</a> <sup>[446]</sup> <a href="#">System Documents</a> <sup>[2736]</sup> <a href="#">Main Menu</a> <sup>[77]</sup> <a href="#">Project Browser Context Menus</a> <sup>[648]</sup> <a href="#">Insert Related Elements</a> <sup>[933]</sup>
<b>Generate Documentation</b>	<ul style="list-style-type: none"> <li>Enterprise Architect provides powerful document generation and reporting tools with a full WYSIWYG template editor for document or web page output.</li> <li>You can generate complex and detailed reports from Enterprise Architect with the information you require in the format your company or client demands.</li> </ul>	<a href="#">Reporting</a> <sup>[2638]</sup>
<b>Generate and Reverse Engineer Source Code</b>	<ul style="list-style-type: none"> <li>Enterprise Architect supports generation and reverse engineering of source code for many popular languages.</li> <li>With a built in 'syntax highlighting' source code editor, Enterprise Architect enables you to quickly navigate and explore your model source code in the same environment.</li> <li>Code generation templates enable you to customize the generated source code to your company specifications.</li> </ul>	<a href="#">Generate Source Code</a> <sup>[2111]</sup> <a href="#">Importing Source Code</a> <sup>[2136]</sup> <a href="#">Editing Source Code</a> <sup>[2146]</sup> <a href="#">Code and Transform Templates</a> <sup>[1632]</sup>
<b>Visualize, Inspect and Understand Complex Software</b>	<ul style="list-style-type: none"> <li>Software is complex and often hard to understand; you can use Enterprise Architect to reverse engineer code in a wide range of software development languages and database repository schema, to understand static structure.</li> <li>To complete the picture, use the unique built-in profiling and debugging tools to capture and visualize executing software at run-time.</li> <li>Create run-time instances of model elements and invoke methods using the built in Object Workbench.</li> <li>You can also bring in complete frameworks from source code or Java .jar files - or even .Net binary assemblies!</li> </ul>	<a href="#">Importing Source Code</a> <sup>[2136]</sup> <a href="#">Execution Analysis</a> <sup>[2527]</sup> <a href="#">Object Workbench</a> <sup>[2567]</sup> <a href="#">Import Source Code</a> <sup>[2136]</sup> <a href="#">Import Binary Module</a> <sup>[2143]</sup>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>By importing frameworks and library code, you can maximize re-use and understanding of your existing investment.</li> </ul>	
<b>Use Model Driven Architecture and Transformations</b>	<ul style="list-style-type: none"> <li>Model Driven Architecture (MDA) is an open standard designed to facilitate rapid application development in a platform independent manner.</li> <li>Models can be built at a high level of abstraction and, using MDA based tools, transformed into models and code targeting a specific platform or domain.</li> <li>Enterprise Architect supports advanced MDA transformations using easily edited and developed transformation templates.</li> <li>With built-in transformations for DDL, C#, Java, EJB and XSD, you can quickly develop complex solutions from simple platform independent models (PIMs) targeted at platform specific models (PSMs); one PIM can be used to generate and synchronize multiple PSMs, providing a significant productivity boost.</li> </ul>	<a href="#">Model Transformation</a> <sup>[2013]</sup> <a href="#">Built-in Transformations</a> <sup>[2020]</sup>
<b>SOA (Service Oriented Architecture) Support</b>	<p>Enterprise Architect enables you to rapidly model and forward- and reverse-engineer two key W3C XML technologies:</p> <ul style="list-style-type: none"> <li>XML Schema (XSD) and</li> <li>Web Service Definition Language (WSDL)</li> </ul> <p>XSD and WSDL support is critical for the development of a complete Service Oriented Architecture (SOA), and the coupling of UML 2.4.1 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization.</p>	<a href="#">XML Schema - XSD</a> <sup>[2387]</sup> <a href="#">Web Services - WSDL</a> <sup>[2423]</sup>
<b>Systems Engineering support</b>	<p>Integrating many high-end features for Systems Engineers, the Ultimate and Systems Engineering editions of Enterprise Architect provide built-in support for:</p> <ul style="list-style-type: none"> <li>SysML</li> <li>Parametric model simulation</li> <li>Executable code generation</li> <li>Model to code transformations for Hardware Description Languages and Ada 2005</li> </ul>	<a href="#">Editions Available</a> <sup>[20]</sup> <a href="#">SysML</a> <sup>[2294]</sup> <a href="#">Behavior</a> <sup>[1014]</sup> <a href="#">State Machine Modeling For HDLs</a> <sup>[2137]</sup> <a href="#">Ada 2005 Conventions</a> <sup>[2082]</sup>
<b>Model Databases</b>	<ul style="list-style-type: none"> <li>Enterprise Architect enables you to reverse engineer from many popular DBMS systems.</li> <li>You can model database tables, columns, keys, foreign keys and complex relationships using UML and an inbuilt data modeling profile, and forward generate DDL scripts to create target database structures.</li> </ul>	<a href="#">Supported Databases</a> <sup>[2375]</sup> <a href="#">Data Models</a> <sup>[1937]</sup>

<b>Customize Enterprise Architect</b>	<ul style="list-style-type: none"> <li>Enterprise Architect also includes facilities that enable experienced tool developers to customize and extend Enterprise Architect to suit the specific requirements of their organization with, for example, in-house UML Profiles, Add-Ins and Code Templates.</li> <li>The very detailed Automation Interface gives you access to most element features, major functions such as XML import/export, and attached information; most properties are fully writable from the automation client.</li> <li>The Automation Interface provides great support for plug-ins, with the ability to embed automation client windows in the main diagram view.</li> <li>The Interface is accessible from any automation-aware client language, such as VB, C#, C++ and Delphi.</li> </ul>	<a href="#">Extending UML Models</a> <sup>[147]</sup> <a href="#">Enterprise Architect Add-In Model</a> <sup>[8010]</sup> <a href="#">Code Template Framework</a> <sup>[163]</sup> <a href="#">Using the Automation Interface</a> <sup>[2805]</sup>
<b>Link Enterprise Architect to IDEs</b>	<ul style="list-style-type: none"> <li>Using Sparx Systems Model Driven Generation (MDG) Link plug-ins, you can develop source code in your preferred Integrated Development Environment such as Visual Studio .NET or Eclipse, while you use Enterprise Architect to locate the source code for Classes, attributes and operations, and to model, navigate, track, reverse engineer, build and run your project.</li> <li>The MDG Integration products for Eclipse and Visual Studio provide an even closer, seamless integration of Enterprise Architect and UML 2.4.1 with your IDE, bringing the functionality required of a fully fledged modeling platform right inside the IDE.</li> </ul>	<a href="#">Visual Studio .NET Eclipse (Link)</a> <a href="#">Eclipse (Integration)</a> <a href="#">Visual Studio 2008</a>

### 1.1.3 Key Features

Enterprise Architect has a rich and advanced set of tools for conducting a wide range of modeling, analysis, requirements, design, construction and visualization tasks. The table below lists some of the more important capabilities and how they assist you in your modeling and design tasks.

#### Key Features

Feature	Facilities
<b>Modeling</b>	<ul style="list-style-type: none"> <li>Model information, software, business rules and processes, hardware systems and more using UML compliant notation (for the latest UML specification, see <a href="http://www.omg.org">www.omg.org</a>)</li> <li>Leverage SysML, BPMN, DDS and other domain specific UML extensions</li> <li>Model dependencies between elements, system dynamics and states</li> <li>Model class hierarchies, deployment, components and implementation details</li> <li>Save and load complete diagrams as UML Patterns</li> <li>Create and share dynamic views of model elements and diagram sets using Model Views</li> <li>Analyze and trace relationships between elements using the tabular</li> </ul>

Feature	Facilities
	<p>Relationship Matrix</p> <ul style="list-style-type: none"> <li>Specify, trace and verify requirements directly against the design, right through to the deployed solution using built-in Requirements Management</li> <li>Apply and manage Traceability, Auditing and Impact Analysis</li> </ul>
<b>Projects</b> <b>Sharing</b> <b>Import/Export</b>	<ul style="list-style-type: none"> <li>Simple file based repositories for small teams</li> <li>Scalable large team support using shared repositories ( MS SQL Server, MySQL, Oracle and others supported )</li> <li>Record project issues, tasks and system glossary</li> <li>Assign resources to model elements and track effort expended against required effort</li> <li>Manage personal tasks, work flow and collaborative model based mail</li> <li>Schedule tasks and track important events using built in calendars and Gantt charts</li> <li>Distributed development through shareable files, use of shared repositories in a range of major Database Management Systems, file replication, data transfer, and import and export of reference data</li> <li>Share models using the latest XML 2.1 format</li> <li>Import models in XML format from other tools (where compliant)</li> <li>Audit all changes and report on recent activity</li> <li>Visual and textual differencing based on package level baselines</li> </ul>
<b>Business</b>	<ul style="list-style-type: none"> <li>Model and simulate processes with BPMN</li> <li>Use structured scenarios to rapidly define use case based behavior</li> <li>Import plain text use case descriptions into structured scenarios</li> <li>Generate diagrams from structured scenarios</li> <li>Generate BPEL scripts automatically from Business Process models</li> <li>Business rules editor/designer</li> <li>Generate executable business logic from rule tasks and trace to natural language business rules</li> </ul>
<b>Database Modeling</b>	<ul style="list-style-type: none"> <li>Database modeling profile</li> <li>Reverse engineer from a range of DBMSs via ODBC</li> <li>Forward engineer DDL scripts to create database structures</li> <li>Import database schema, XSD and WSDL source</li> <li>Support for GML and ArcGIS</li> </ul>
<b>Software</b>	<ul style="list-style-type: none"> <li>Support for forward and reverse code engineering for many languages including: <ul style="list-style-type: none"> <li><i>ActionScript 3.0</i></li> <li><i>Java</i></li> </ul> </li> </ul>

Feature	Facilities
	<ul style="list-style-type: none"> <li>• <i>C#</i></li> <li>• <i>C++</i></li> <li>• <i>VB.Net</i></li> <li>• <i>Delphi</i></li> <li>• <i>Visual Basic</i></li> <li>• <i>Python</i></li> <li>• <i>PHP</i></li> <li>• Import .NET and Java binaries</li> </ul>
<b>Systems</b>	<ul style="list-style-type: none"> <li>• Simulate SysML parametric models</li> <li>• Simulate state and activity diagrams</li> <li>• Verilog,</li> <li>• VHDL</li> <li>• SystemC</li> </ul>
<b>Visual Execution Analyzer</b> <b>Debuggers</b> <b>Build</b> <b>Testing</b>	<p>The Visual Execution Analyzer contains many important tools for building, verifying and testing your software. Some of the standout features include:</p> <ul style="list-style-type: none"> <li>• Debug numerous languages, including C++, Java, C#, VB.net, PHP and others</li> <li>• Integrate coding and development with the UML model</li> <li>• Quickly search through source files and through your model during coding</li> <li>• Intelli-sense based on model data</li> <li>• Record and generate sequence diagrams from execution traces</li> <li>• Use profiling tools for native windows applications written in C/C++</li> <li>• Use the Object Workbench to test individual objects</li> <li>• Testpoint facility to quickly apply xUnit like tests to source without writing code</li> <li>• Generate Testpoint diagrams and sets from execution traces</li> </ul>
<b>Simulation</b>	<p>Simulation of behavioral models provides numerous benefits, including:</p> <ul style="list-style-type: none"> <li>• Verify the correct behavior of modeled state machines and activity graphs</li> <li>• Demonstrate modeled solutions to customers with attractive, configurable simulation walk-throughs</li> <li>• Simulate buttons presses and real-world events with triggers</li> <li>• Simulate rules and conditional execution with both model elements and Javascript based code</li> <li>• Record sets of triggers and automate playback based on scenarios</li> <li>• Walk through sequence diagrams</li> </ul>
<b>Domain Specific modeling and</b>	<p>Modeling languages and frameworks for specialized domains are easy to build and use within Enterprise Architect. Several are supplied by Sparx Systems, and some additional ones by 3rd parties. The tools available in Enterprise Architect also let you build your</p>

Feature	Facilities
<b>Frameworks</b>	<p>own frameworks for your special domain.</p> <ul style="list-style-type: none"> <li>• Leverage industry-standard Enterprise Architecture frameworks such as Zachman, TOGAF, UPDM and others</li> <li>• Extended modeling for Requirements, User Interface Design, Mind Mapping, Data Modeling</li> <li>• SysML, DDS</li> <li>• BPMN</li> <li>• Built-in Model Driven Architecture (MDA) Transformations</li> <li>• Create custom transforms</li> <li>• Use UML Profiles to for domain-specific modeling</li> <li>• A range of add-Ins to integrate and extend the facilities of Enterprise Architect</li> <li>• Write your own add-Ins</li> <li>• Transform behavioral models into executable source code for software and hardware description languages (HDLs) such as Verilog, VHDL, and SystemC</li> </ul>
<b>Reporting</b>	<ul style="list-style-type: none"> <li>• Comprehensive and flexible MS Word-compatible web and document report options</li> <li>• Read-only Viewer enables stakeholders to view but not change milestone deliverables</li> </ul>
<b>Manage Change</b>	<ul style="list-style-type: none"> <li>• Manage, track and control change using baseline model merge and auditing capabilities</li> <li>• Migrate changes across a distributed environment using Controlled XML Packages</li> <li>• Manage Version control though XML using SCC CVS and Subversion configurations</li> <li>• Inbuilt user and group security and access control management</li> <li>• Auditing</li> </ul>
<b>Testing</b>	<ul style="list-style-type: none"> <li>• Testing support for test cases, JUnit and NUnit</li> <li>• Integrated Debug Workbench for visualizing executable Java and .Net applications, instantiating run-time model objects and generating Sequence diagrams from a stack traces</li> <li>• Extensive Testpoint facility.</li> </ul>
<b>Automation and Scripting</b>	<ul style="list-style-type: none"> <li>• Script and automate common tasks using a detailed Automation Interface and Model Scripts</li> </ul>
<b>User Experience</b>	<ul style="list-style-type: none"> <li>• Speed: Enterprise Architect is quick to load and a spectacularly fast performer, even with large models</li> <li>• Scalability: Enterprise Architect supports single users and the development of small models, or many concurrent users developing extremely large models,</li> </ul>

Feature	Facilities
	<p>with equal ease</p> <ul style="list-style-type: none"><li>• Usability: many of our users agree, Enterprise Architect gets you started and productive quickly, with a rich user interface and the ability to create templates, model views and 'favorites' collections of commonly-used elements and diagrams.</li></ul>

### Notes

- For a complete list of the new features of the latest version of Enterprise Architect, click on the **Help | Read Me** menu option
- Enterprise Architect is available in six editions: **Ultimate, Business and Software Engineering, Systems Engineering, Corporate, Professional**, and **Desktop**, each of which offers a different range of features

<b>Try before Purchase</b>	Test the product in a number of configurations in the Trial Version	<a href="#">The Trial Version</a> <sup>[18]</sup>
<b>Different Editions</b>	Explore the specific features of the six work environment editions available	<a href="#">Editions Available</a> <sup>[20]</sup>
<b>The Lite Edition</b>	Use the free, read-only or 'Lite' edition	<a href="#">The Read-only 'Lite' Edition</a> <sup>[23]</sup>

### 1.2.1 The Trial Version

The fully functional 30 day trial version of Enterprise Architect is available free of charge on the Sparx Systems website [www.sparxsystems.com/bin/easetup.exe](http://www.sparxsystems.com/bin/easetup.exe). The trial version is identical to the registered edition with the exception that all diagrams are output to files with an embedded watermark.

### Trial Details

Option	Detail	See also
<b>Try Out Editions</b>	<p>You can use the trial version to explore and evaluate Enterprise Architect, checking the edition you are interested in and trying out other editions for comparison.</p> <p>When you start up the Enterprise Architect trial version, the Select Trial Version prompt displays; select the mode to trial.</p> <p>If necessary, you can close down Enterprise Architect and restart it in another mode for comparison.</p> <p>The prompt also directs you to useful information such as a walkthrough of the Enterprise Architect facilities, and options to select one of several workspace layouts.</p>	<a href="#">Manage Workspace Layout</a> <sup>[163]</sup>
<b>Trial Period</b>	As you are evaluating the Enterprise Architect trial version, note	

Option	Detail	See also
	<p>that the software operates for a limited period, and denies access after the trial period has elapsed.</p> <p>To continue using Enterprise Architect when the trial period expires, you can either:</p> <ul style="list-style-type: none"> <li>• Apply to extend the trial period, or</li> <li>• Purchase and register a full license; on purchase of a suitable license or licenses, the registered version is made available for download</li> </ul> <p>The latest information on pricing and purchasing is available on the Sparx Systems website; for more information, contact Sparx Systems by email.</p> <p>When you order and pay for an edition of Enterprise Architect, you receive installation instructions and the location of the executable files for download.</p>	<p><a href="#">Order Enterprise Architect</a><sup>[33]</sup></p> <p><a href="#">Installation</a><sup>[34]</sup></p> <p><a href="#">Register a Full License</a><sup>[36]</sup></p> <p><a href="mailto:sales@sparxsystems.com">sales@sparxsystems.com</a></p>
<b>Extend Trial Period</b>	<p>If you are testing the trial version and require more than 30 days to evaluate it, you can apply to Sparx Systems Sales for an extension of the trial period.</p> <p>The trial period must expire before you can enter the extension key.</p>	<p><a href="mailto:sales@sparxsystems.com">sales@sparxsystems.com</a></p>

#### Extend the trial period after receipt of extension key

Step	Action	See also
<b>1</b>	<p>Open the Enterprise Architect trial version.</p> <p>The Evaluation Version of Enterprise Architect dialog displays; once the trial period has expired, you cannot proceed beyond this dialog without extending the trial period.</p>	
<b>2</b>	<p>Press ( <b>Ctrl</b> ) whilst you click on the <b>Continue Trial</b> button.</p> <p>The Upgrade Key dialog displays.</p>	
<b>3</b>	<p>In the <b>Upgrade Key</b> field, type or copy-and-paste the extension key you received from Sparx Systems Sales.</p>	
<b>4</b>	<p>Click on the <b>OK</b> button.</p> <p>Enterprise Architect confirms that your trial period has been extended.</p> <p>Your trial period is extended by the period of days stated in the email from Sparx Systems Sales; you can now restart and continue to use the Trial version of Enterprise Architect.</p>	

Step	Action	See also

### 1.2.2 Editions Available

Enterprise Architect is available in six editions: the **Ultimate**, **Business and Software Engineering**, and **Systems Engineering** 'suite' editions, and the **Corporate**, **Professional** and **Desktop** editions.

#### Edition Comparison

Topic	Detail	See also
<b>Comparison</b>	<p>The functionality for each edition is described below; the features of and differences between the editions are listed in the table provided on the Sparx Systems website.</p> <p>To help you understand the differences between these editions and the advantages and limitations of each, you can open and use the Trial version of Enterprise Architect to mimic any of the editions.</p>	<a href="#">Sparx Systems website</a> <a href="#">The Trial Version</a> <sup>[18]</sup>
<b>Ultimate Edition</b> 	<p>The Ultimate edition is designed for power users and those working across multiple domains, providing deep support for Business, for Software Engineering and for Systems Development seamlessly integrated into a single development environment.</p> <p>It enables you to drill down to the lowest levels of systems design and construction, with SysML and executable code generation for standard and hardware description languages.</p> <p>Business users can leverage BPEL, the Rules Composer and executable UML, in addition to all the advanced features of the other editions of Enterprise Architect.</p> <p>Software developers can integrate their Eclipse and Visual Studio projects with their UML models and leverage the advanced executable code generators to target different domains.</p> <p>The Ultimate edition enables end to end traceability throughout a global vision of your enterprise - unifying strategy, business process, interfaces, software, rules, data and fine grained systems; powerful tools, domain-specific technologies, frameworks, integration platforms and a consistent, scalable, and robust interface work in unison to help you deliver on the promise of Model Driven Development.</p> <p>The Ultimate edition incorporates a number of MDG Technologies and Add-Ins; the Ultimate edition and MDG Technologies are all available in either Fixed License or Floating License form.</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently.</p>	<a href="#">MDG Technologies</a> <sup>[148]</sup>

Topic	Detail	See also
	<p>The Ultimate edition provides:</p> <ul style="list-style-type: none"> <li>• Executable Code Generation - support for generating functional source code for State Machines, Interactions and Activities in C, C++, C#, Java and VB.NET</li> <li>• Full round trip support for Hardware Description Languages (Verilog, VHDL and SystemC) including support for generating State Machine code</li> <li>• SysML Simulation Support - including support for simulating SysML 1.3 constraint models with results graphing capabilities</li> <li>• BPEL Generation – transform BPMN 1.1 and BPMN 2.0 Business process models down to BPEL 1.1 and BPEL 2.0 code respectively</li> <li>• Business Rules – trace from abstract business rules down to automatically generated behavioral code</li> </ul>	
<p><b>Business and Software Engineering Edition</b></p> 	<p>The Business and Software Engineering edition is aimed at software development professionals, business modelers, architects, requirements experts, project managers and others involved in the design and construction of quality software and business services.</p> <p>It combines powerful new features such as executable code generation from UML models, BPEL, advanced scripting and a multi-purpose Rules Composer targeting executable code from Business Domain models; it also bundles licenses for integration products and frameworks such as UPDM (DoDAF-MODAF), TOGAF and Zachman, to provide advanced model-driven construction tools to tightly bind your code development in Eclipse or Visual Studio.</p> <p>The Business and Software Engineering edition incorporates a number of MDG Technologies and Add-Ins; the Business and Software Engineering edition and MDG Technologies are all available in either Fixed License or Floating License form.</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently.</p> <p>The Business and Software Engineering edition provides:</p> <ul style="list-style-type: none"> <li>• Generation of Behavioral Code from State, Sequence and Activity models, supporting standard programming languages such as Java and .NET</li> <li>• Advanced math functions within the scripting engine</li> <li>• BPEL Generation from BPMN 1.1 and BPMN 2.0 models - including validation and WSDL support</li> <li>• A Business Rules Composer that enables you to build Business Domain models and generate code to implement complex business rules in standard programming languages</li> </ul>	<p><a href="#">MDG Technologies</a></p>

Topic	Detail	See also
<b>Systems Engineering Edition</b> 	<p>The Systems Engineering edition is designed for systems and software development professionals working on real-time, embedded and systems solutions.</p> <p>It combines new features such as executable code generation from UML models (including support for hardware languages such as Verilog and VHDL), Ada, SysML 1.3, executable SysML Parametric diagrams and advanced scripting.</p> <p>It also bundles licenses for UPDM (DoDAF-MODAF), SysML, DDS and integration products to provide powerful model-driven construction tools for the Systems Engineering domain to tightly bind your code development in Eclipse or Visual Studio with the UML/SysML models developed in Enterprise Architect.</p> <p>The Systems Engineering edition incorporates a number of MDG Technologies and Add-Ins; the Systems Engineering edition and MDG Technologies are all available in either Fixed License or Floating License form.</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently.</p> <p>This edition provides:</p> <ul style="list-style-type: none"> <li>• Executable Code Generation - support for generating functional source code for State Machines, Interactions and Activities in C, C++, C#, Java and VB.NET</li> <li>• Full round trip support for Hardware Description Languages, including Verilog, VHDL and SystemC, with support for generating State Machine code</li> <li>• SysML Simulation Support - Includes support for simulating SysML 1.3 constraint models with results graphing capabilities</li> </ul>	<a href="#">MDG Technologies</a> <small>1481</small>
<b>Corporate Edition</b> 	<p>Aimed at larger development teams, the Corporate edition enables you to connect to the following DBMS back ends as the shared repository:</p> <ul style="list-style-type: none"> <li>• MySQL</li> <li>• SQL Server</li> <li>• PostgreSQL,</li> <li>• Sybase Adaptive Server Anywhere</li> <li>• Access 2007 and</li> <li>• Oracle 9i, 10g or 11g</li> </ul> <p>This provides additional scalability and improved concurrency over the shared .EAP file approach to model sharing.</p> <p>User security, user logins, user groups and user level locking of elements, user/group based security (with locking at diagram and element levels) are also supported.</p> <p>Security comes in two modes: in the first mode, all elements are</p>	

Topic	Detail	See also
	<p>considered 'writeable' until explicitly locked by a user or group; in the second mode, all elements are considered locked until checked out with a user lock.</p> <p>The Corporate edition forms the base for the three extended editions described above; like those editions, it is available in either Fixed License or Floating License form.</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently.</p>	
<b>Professional Edition</b> 	<p>Aimed at work groups and developers, the Professional edition supports shared projects through replication and shared network files.</p> <p>This edition has an ActiveX interface for interrogating Enterprise Architect projects and extracting information in XML format.</p> <p>The Professional edition fully supports code import/export and synchronization of model elements with source code; it enables reverse engineering of SQL Server; MS Access 97, 2000 and 2003; and Oracle 9i, 10g or 11g databases.</p> <p>Support for MDG Technologies and MDG Link (sold separately) is included with the Professional version.</p> <p>The shared repository available in the Professional edition is restricted to the .EAP file format (JET database).</p>	
<b>Desktop Edition</b> 	<p>The Desktop edition is targeted at single analysts and developers producing UML analysis and design models.</p> <p>It provides facilities for:</p> <ul style="list-style-type: none"> <li>• UML modeling</li> <li>• XML import/export</li> <li>• Document generation</li> <li>• Version control integration and</li> <li>• Profile/metamodel extensibility</li> </ul>	

### 1.2.3 The Read-only 'Lite' Edition

*Enterprise Architect Lite* is a **free**, read-only edition of Enterprise Architect that enables people such as project sponsors to review the project without making any changes.

#### The read-only Lite Version

Topic	Detail	See also
<b>Further Access</b>	Users of Enterprise Architect Lite also have wider access to	<a href="#">Team Review Tools</a> 

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>The Team Review, where readers can create and respond to posts, and link their comments to elements</li> <li>The Source Code Editor, where readers can open and edit external source code files, debug code, and configure and run Analyzer scripts</li> <li>The <b>File</b> menu, where readers can copy the project or create a shortcut to access it</li> <li>The Relationship Matrix, where readers can export the matrix contents to a CSV file to be opened in a spreadsheet application</li> <li>The Default Hours tab to review project metrics.</li> </ul> <p>You can download the Enterprise Architect Lite edition (as the Enterprise Architect Viewer) from the Sparx Systems website.</p>	<a href="#">Editing Source Code</a> <sup>[2146]</sup> <a href="#">File Menu</a> <sup>[79]</sup> <a href="#">Relationship Matrix Options</a> <sup>[738]</sup> <a href="#">Default Hours</a> <sup>[588]</sup> <a href="http://www.sparxsystems.com/products/ea/downloads.html">http://www.sparxsystems.com/products/ea/downloads.html</a> .
<b>Other Read-Only Options</b>	<p>You can also make your model available to others in a read-only format by:</p> <ul style="list-style-type: none"> <li>Generating an HTML report on the model, which can be published on the web with read-only access</li> </ul>	<a href="#">HTML Reports</a> <sup>[2744]</sup>

## Scintilla and SciTE

Copyright 1998-2003 by Neil Hodgson <[neilh@scintilla.org](mailto:neilh@scintilla.org)> All Rights Reserved.

Permission to use and distribute this (Scintilla) software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appears in all copies and that both that copyright notice and this permission notice appear in supporting documentation.

### 1.3.2 End User License Agreement

**Enterprise Architect Modeling Tool Version 11.0**

**Desktop, Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate Editions**

Copyright © 1998-2014 Sparx Systems Pty Ltd. All Rights Reserved.

**IMPORTANT - READ CAREFULLY:** This End User License Agreement ("EULA") is a legal agreement between YOU as Licensee and SPARX SYSTEMS ("SPARX") for the SOFTWARE PRODUCT identified above. By installing, copying, or otherwise using the SOFTWARE PRODUCT, YOU agree to be bound by the terms of this EULA. If YOU do not agree to the terms of this EULA, promptly return the unused SOFTWARE PRODUCT to the place of purchase for a full refund.

The copyright in the SOFTWARE PRODUCT and its documentation is owned by Sparx Systems Pty Ltd A.C.N 085 034 546. Subject to the terms of this EULA, YOU are granted a non-exclusive right for the duration of the EULA to use the SOFTWARE PRODUCT. YOU do not acquire ownership of copyright or other intellectual property rights in any part of the SOFTWARE PRODUCT by virtue of this EULA.

Your use of this software indicates your acceptance of this EULA and warranty.

## DEFINITIONS

In this End User License Agreement, unless the contrary intention appears,

- "ACADEMIC EDITION" means an edition of the Software Product purchased for educational purposes at an academic discount price.
- "EULA" means this End User License Agreement
- "SPARX" means Sparx Systems Pty Ltd A.C.N 085 034 546
- "Licensee" means YOU, or the organization (if any) on whose behalf YOU are taking the EULA.
- "Registered Edition of Enterprise Architect" means the edition of the SOFTWARE PRODUCT which is available for purchase from the web site: <<http://www.sparxsystems.com/products/ea/purchase.html>>, following the thirty-day free evaluation period.

- "SOFTWARE PRODUCT" or "SOFTWARE" means Enterprise Architect, UML Case Tool, Desktop, Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, which includes computer software and associated media and printed materials, and may include online or electronic documentation.
- "Support Services" means email-based support provided by SPARX, including advice on usage of Enterprise Architect, investigation of bugs, fixes, repairs of models, if and when appropriate, and general product support.
- "SPARX support engineers" means employees of SPARX who provide on-line support services.
- "Trial Edition of Enterprise Architect" means the edition of the SOFTWARE PRODUCT which is available free of charge for evaluation purposes for a period of thirty (30) days.
- "EA LITE" means the LITE edition of Enterprise Architect that is distributed free of charge as a read-only viewer of .EAP files.

## GRANT OF LICENSE

In accordance with the terms of this EULA, YOU are granted the following rights:

- To install and use one copy of the SOFTWARE PRODUCT, or in its place, any prior version for the same operating system, on a single computer. As the primary user of the computer on which the SOFTWARE PRODUCT is installed, YOU may make a second copy for your exclusive use on either a home or portable computer.
- To store or install a copy of the SOFTWARE PRODUCT on a storage device, such as a network server, used only to install or run the SOFTWARE PRODUCT over an internal network. If YOU want to increase the number of users entitled to concurrently access the SOFTWARE PRODUCT, YOU must notify SPARX and agree to pay an additional fee.
- To make copies of the SOFTWARE PRODUCT for backup and archival purposes only.

## EVALUATION LICENSE

The Trial Edition of Enterprise Architect is not free software. Subject to the terms of this agreement, YOU are hereby licensed to use this software for evaluation purposes without charge for a period of thirty (30) days.

Upon expiration of the thirty (30) days, the Software Product must be removed from the computer. Unregistered use of Enterprise Architect after the 30-day evaluation period is in violation of Australian, U.S. and international copyright laws.

SPARX may extend the evaluation period on request and at their discretion.

If YOU choose to use this software after the 30-day evaluation period, a license must be purchased (as described at <<http://www.sparxsystems.com/products/ea/purchase.html>>). Upon payment of the license fee, YOU will be sent details on where to download the Registered Edition of Enterprise Architect and will be provided with a suitable software 'key' by email.

## EA LITE

Subject to the terms of this Agreement, EA LITE may be installed on any machine indefinitely and free of charge. There are no fees or Sparx support services in relation to EA LITE.

## ADDITIONAL RIGHTS AND LIMITATIONS

YOU hereby undertake not to sell, rent, lease, translate, adapt, vary, modify, decompile, disassemble, reverse engineer, create derivative works of, modify, sub-license, loan or distribute the SOFTWARE PRODUCT other than as expressly authorized by this EULA.

YOU further undertake not to reproduce or distribute license key-codes except under the express and written permission of SPARX.

If the Software Product purchased is an Academic Edition, YOU ACKNOWLEDGE THAT the license is limited to use in an educational context, either for self-education or use in a registered teaching institution. The Academic Edition may not be used to produce commercial software products or be used in a commercial environment, without the express written permission of SPARX.

## **ASSIGNMENT**

YOU may only assign all your rights and obligations under this EULA to another party if YOU supply to the transferee a copy of this EULA and all other documentation including proof of ownership. Your license is then terminated.

## **TERMINATION**

Without prejudice to any other rights, SPARX may terminate this EULA if YOU fail to comply with the terms and conditions. Upon termination YOU or YOUR representative shall destroy all copies of the SOFTWARE PRODUCT and all of its component parts or otherwise return or dispose of such material in the manner directed by SPARX.

## **WARRANTIES AND LIABILITY**

### **WARRANTIES**

SPARX warrants that the SOFTWARE PRODUCT will perform substantially in accordance with the accompanying written materials for a period of ninety (90) days from the date of receipt, and

Any Support Services provided by SPARX shall be substantially as described in applicable written materials provided to YOU by SPARX, and SPARX support engineers will make commercially reasonable efforts to solve any problems associated with the SOFTWARE PRODUCT.

### **EXCLUSIONS**

To the maximum extent permitted by law, SPARX excludes, for itself and for any supplier of software incorporated in the SOFTWARE PRODUCT, all liability for all claims, expenses, losses, damages and costs made against or incurred or suffered by YOU directly or indirectly (including without limitation lost costs, profits and data) arising out of:

- YOUR use or misuse of the SOFTWARE PRODUCT;
- YOUR inability to use or obtain access to the SOFTWARE PRODUCT;
- Negligence of SPARX or its employees, contractors or agents, or of any supplier of software incorporated in the SOFTWARE PRODUCT, in connection with the performance of SPARX's obligations under this EULA; or
- Termination of this EULA by either party for any reason.

### **LIMITATION**

The SOFTWARE PRODUCT and any documentation are provided "AS IS" and all warranties, whether express, implied, statutory or otherwise, relating in any way to the subject matter of this EULA or to this EULA generally, including without limitation, warranties as to: quality; fitness; merchantability; correctness; accuracy; reliability; correspondence with any description or sample, meeting your or any other requirements; uninterrupted use; compliance with any relevant legislation; and being error or virus free are excluded. Where any legislation implies in this EULA any term, and that legislation avoids or prohibits provisions in a contract excluding or modifying such a term, such term shall be deemed to be included in

this EULA. However, the liability of SPARX for any breach of such term shall, if permitted by legislation, be limited, at SPARX's option to any one or more of the following upon return of the SOFTWARE PRODUCT and a copy of the receipt:

If the breach relates to the SOFTWARE PRODUCT:

- The replacement of the SOFTWARE PRODUCT, or the supply of an equivalent SOFTWARE PRODUCT;
- The repair of such SOFTWARE PRODUCT, or the payment of the cost of replacing the SOFTWARE PRODUCT, or of acquiring an equivalent SOFTWARE PRODUCT; or
- The payment of the cost of having the SOFTWARE PRODUCT repaired.

If the breach relates to services in relation to the SOFTWARE PRODUCT:

- The supplying of the services again; or
- The payment of the cost of having the services supplied again.

## TRADEMARKS

All names of products and companies used in this EULA, the SOFTWARE PRODUCT, or the enclosed documentation may be trademarks of their corresponding owners. Their use in this EULA is intended to be in compliance with the respective guidelines and licenses. Windows, Windows XP, Windows 2003 Server, Windows 2008 Server, Windows Vista, Windows 7 and Windows 8 are trademarks of Microsoft.

## GOVERNING LAW

This agreement shall be construed in accordance with the laws of the Commonwealth of AUSTRALIA, in the state of Victoria.

### 1.3.3 Trademarks

Sparx Systems acknowledge the following trademarks and registered trademarks, which are used throughout the Enterprise Architect documentation.

## 1.4 Order Enterprise Architect

Enterprise Architect is designed, built and published by Sparx Systems, and available through the Sparx Systems website

- Free, 30-day trial version (although you can extend the evaluation period)
- Registered purchase version that provides the facilities of the edition you require, as unlocked by the license keys that you purchase from Sparx Systems
- The trial version of Enterprise Architect is identical to the registered version with the exception that all diagrams are output to files with an embedded watermark. The trial software stops working after the trial period has elapsed.
- On purchase of a suitable license or licenses, the registered version is made available for download.
- The latest information on pricing and purchasing is available on the Purchase and Pricing page of the Sparx Systems website, and from Sparx Sales.

### Purchase Options

- On-line using a secure credit-card transaction
- Fax
- Check or equivalent
- Bank transfer

### Learn more

- [The Trial Version](#)<sup>[18]</sup>
- [Editions Available](#)<sup>[20]</sup>
- [sales@sparxsystems.com](mailto:sales@sparxsystems.com)
- [Pricing and Purchase Options](#)

## 1.5 Installation

Enterprise Architect is distributed as a single executable setup file (.exe). It is a standard Windows installer based file that will check and update previous installations of Enterprise Architect.

- After you install Enterprise Architect, you can immediately begin to create projects as .EAP files.
- The latest evaluation and registered versions of Enterprise Architect are always available from the Sparx Systems website.
- The registered version is available through the registered user area of the web site, which requires a username and password to access.
- These are provided upon purchase of a license.

### Installation

Topic	Detail	See also
<b>System Requirements</b>	The system requirements for installing Enterprise Architect are defined on the Enterprise Architect System Requirements page of the Sparx Systems website.	<a href="#">Enterprise Architect System Requirements</a>
<b>Windows Vista / Windows 7</b>	<p>Under Windows Vista and Windows 7 (with User Account Control turned on) an application starts with only Standard permissions, regardless of what level of authority the current user has.</p> <p>As a result, an installer run normally with an Admin account under Vista only has Standard privileges and either is not able to write to certain critical areas of the registry/file system, or redirects the write requests to a per-user virtualized registry/file system.</p> <p>Sparx Systems recommend that if you are installing on Windows Vista or Windows 7, always run the Enterprise Architect installer with Administrator privileges (right-click on the downloaded installer icon and select the <b>Run as administrator</b> menu option).</p>	
<b>Install Enterprise Architect</b>	<p>Run the Enterprise Architect setup program. Generally you can accept all the default options without change.</p> <p>To place Enterprise Architect in a directory other than the default, enter the name of the destination when prompted.</p> <p>You might be prompted to restart your computer when the installation completes; although this is not always necessary (if you already have the components Enterprise Architect requires installed on your computer), you should restart just to be certain.</p>	
<b>Installation on Linux and MacOS</b>	<p>If you intend to run Enterprise Architect on Linux, refer to the page <i>Installing Enterprise Architect inside Wine</i>, on the Sparx Systems website.</p> <p>To support the Scripting facility in the Corporate and extended</p>	<a href="#">Installation inside Wine</a>

Topic	Detail	See also
	editions of Enterprise Architect, you must also install Internet Explorer 6.0 or later revisions.	
<b>Using a Third Party DBMS as Model Repository</b>	<p>If you plan to use SQL Server, MySQL, PostgreSQL, Access 2007, Sybase Adaptive Server Anywhere or Oracle 9i, 10g or 11g as a model repository, then you must use the Corporate, Business and Software Engineering, Systems Engineering or Ultimate editions of Enterprise Architect.</p> <p>You also require additional files and supplementary installation processes; please note that installation and maintenance of these database management systems is not covered under the support agreement.</p> <p>Users planning to use SQL Server, MySQL, PostgreSQL, Sybase Adaptive Server Anywhere, Access 2007 or Oracle 9i, 10g or 11g as their model repository can access scripts that create the required data structures for the choice of DBMS, from the Sparx Systems website; to access these scripts, please follow the links at right.</p>	<p><a href="#">Corporate Edition Resources Page</a></p> <p><a href="#">Trial Corporate Edition Resources Page</a></p>

## 1.6 Register a Full License

The **Trial** version of Enterprise Architect available for download is an evaluation version only. For the **full** version you must first purchase one or more *licenses*.

The license key supplied determines which edition (Enterprise Architect Desktop, Professional, Corporate, Business and Software Engineering, System Engineering or Ultimate) is activated after installation.

The Corporate, Business and Software Engineering, System Engineering and Ultimate editions can be activated by either a private license key or a shared (floating) license key. Shared license keys, for a user population that includes temporary users, are checked out of and in to a Sparx Systems key store.

### Use to

- Obtain and activate the registered version of Enterprise Architect

### How to

Step	Action	See also
1	<p>Purchase one or more licenses.</p> <p>Once you have paid for a licensed version of Enterprise Architect, you receive (via email or other suitable means):</p> <ul style="list-style-type: none"> <li>• a license key or keys</li> <li>• a web site address from which to download the full version</li> <li>• if you have purchased a Sparx Systems key store, a web site address from which to download the key store</li> </ul>	<a href="#">Editions Available</a> 
2	Save the license key(s) and download the latest full install package from the address supplied.	
3	Run the setup program to install the full version.	
4	<p>Open Enterprise Architect from the Start Menu or desktop icon.</p> <p>The License Management dialog displays.</p>	
5	<p>Click on the <b>Add Key</b> button.</p> <p>The Add Registration Key dialog displays; register your key.</p>	<a href="#">Add License Key</a> 
6	<p>Click on the <b>OK</b> button.</p> <p>The full version is now activated on your PC, and Enterprise Architect displays the message:</p> <p><i>Registration succeeded! Thank you for purchasing Enterprise Architect &lt;type&gt; Edition</i></p>	

**Notes**

- Private license keys and shared license keys have different formats, so you cannot use one in place of the other

## 1.7 Help and Support

Enterprise Architect has three main help and information systems to assist you in using the product:

- Learning Center
- Help
- The Sparx Systems website

In addition we recommend that you fully explore the sample project supplied with the Enterprise Architect installer. It assists you in learning to use Enterprise Architect and offers tips on getting the most out of the product features. Click on the **EAExample** option on the Start Page.

### Getting Help and Support

Topic	Detail	See also
<b>Learning Center</b>	<p>The Enterprise Architect Learning Center provides guidance and demonstrations to help you understand any area of Enterprise Architect that you are interested in.</p> <p>The Learning Center automatically displays on the right of the screen when you first open Enterprise Architect, showing the <i>Introduction To The Learning Center</i> topic. You can select other topics or task areas by clicking on the appropriate part of the topic path ('breadcrumb trail') at the top of the window, and selecting from the drop-down list.</p>	<a href="#">Learning Center</a> [74]
<b>Enterprise Architect Help</b>	<p>Enterprise Architect Help provides comprehensive documentation of Enterprise Architect and covers every aspect and facility of the product. To access Help within Enterprise Architect:</p> <ul style="list-style-type: none"> <li>• Click on the Help icon ( ? ) in the various toolbars</li> <li>• Select the <b>Help   Help Contents</b> menu option</li> <li>• Click on the <b>Help</b> button on a dialog (for Help specific to that dialog)</li> </ul> <p>Enterprise Architect Help is extensive; if you cannot quickly locate the topic you require in the online contents list, you can use one of two search facilities:</p> <ul style="list-style-type: none"> <li>• Click on the Index tab, type in a keyword or key phrase appropriate to the subject you require help for, and press ( <b>Enter</b> ); double-click on the appropriate index item</li> <li>• Click on the Search tab, type in a word or phrase to search for, and click on the <b>List Topics</b> button; double-click on the required topic.</li> </ul>	<a href="#">Available Help</a> <a href="#">File Formats</a> [39]

Topic	Detail	See also
	The Enterprise Architect Help is also available separately from the product, in different formats.	
<b>Sparx Systems Web Site</b>	<p>The Sparx Systems web site is also extensive, and provides information and announcements concerning the company and its full range of products, as well as tutorials, white papers, templates and solutions.</p> <p>It also provides a user forum, community site (see below) and support network; Sparx Systems are highly responsive to user feedback and requirements, and the web site enables rapid communication concerning problems, solutions and enhancements.</p> <p>You can access the web page and user forum within Enterprise Architect from the <b>View   Web Browser</b> menu option.</p>	<a href="#">Sparx Systems Web Site</a> <a href="#">Enterprise Architect User Forum</a>
<b>Community Site</b>	<p>The Sparx Systems website also hosts the Sparx Systems Enterprise Architect Community Site. This is a central location for the Enterprise Architect community to publish resources and share experiences.</p> <p>From this site you can download the latest news, tutorials, resources, best practices, tips, techniques and user-generated content for Enterprise Architect. You can also, as a registered author, contribute content and share your expertise with the wider community.</p>	<a href="#">Sparx Systems Enterprise Architect Community Site</a>

### **1.7.2 Support**

Technical support for Enterprise Architect is available to registered users. Responses to support queries are sent by email.

Sparx Systems endeavors to provide a rapid response to all product-related questions or concerns.

- Registered users can lodge a support request, by visiting: [http://www.sparxsystems.com/registered/reg\\_support.html](http://www.sparxsystems.com/registered/reg_support.html)
- Trial users can contact Sparx Systems with questions regarding their evaluation at: [support@sparxsystems.com](mailto:support@sparxsystems.com)
- An online user forum is also available for your questions and perusal, at <http://www.sparxsystems.com/cgi-bin/yabb/YaBB.cgi>

## 2 Getting Started

This guide helps you to understand the options available when you start Enterprise Architect, and to quickly gain an understanding of how to use these options to create models.

### Getting Started

Learning Activities	Link
After starting Enterprise Architect, use the Quick Start tutorial to immediately create a project	<a href="#">A Quickstart Tutorial</a> <sup>[47]</sup>
Read about work areas applicable to certain Project Roles	<a href="#">Project Roles</a> <sup>[183]</sup>
Review the Enterprise Architect User Interface, or workspace	<a href="#">Enterprise Architect User Interface</a> <sup>[67]</sup>

At various points throughout the *Enterprise Architect User Guide*, there are further Quick Start topics and sections to help you use the system immediately to experiment with a feature of the system. Use the Help **Index** tab and search for *Quick Start* to locate these topics.

### Learn more

- [Common Tasks](#) <sup>[45]</sup>
- [Basics](#) <sup>[43]</sup>

## 2.1 Basics

When you install Enterprise Architect on your system, two items are created:

- An Enterprise Architect icon on your Windows desktop
- A new program folder called *Enterprise Architect<version number>* in your Windows **Start > All Programs** menu; this folder contains the execution option **Enterprise Architect**

You can **start** Enterprise Architect by **clicking on** either of these objects. After a short pause, the **Start Page** displays, from which you can:

- Open a project file (.EAP file or .FEAP file)
- Create a new project (.EAP file or .FEAP file)
- Connect to a DBMS repository (Corporate and extended editions)
- Connect to a project via the Cloud
- Open the Learning Center, to read quick introductions to performing a range of basic tasks

### Notes

- If you changed the default system folder name during installation, the *Enterprise Architect<version number>* folder in the **All Programs** menu will have the name you provided
- By default, when you install Enterprise Architect, an empty 'starter' project called **EABase.EAP** is installed, as well as an example project named **EAExample.EAP**; we recommend that new users select the EAExample file and explore it in some detail while you become familiar with UML and software engineering using Enterprise Architect
- Enterprise Architect .EAP files default to use **JET 3.5** as the database engine, which does **not** support **unicode character sets**

If you want to use unicode character sets (for example, to provide user interface texts in languages other than your Windows-defined native language), you must either upsize to a **DBMS repository** or set **JET 4.0** as the database engine; resetting the database engine ensures compatibility with .EAP files that support unicode character sets and that are in turn compatible with versions of MS Access later than Access 97

If your .EAP project is not in a Jet 4.0 database, you should also download a copy of the **Jet 4.0 EABase** model from the Sparx Systems website, and do an **EAP to EAP transfer** of your model into the Jet 4.0 file

## 2.2 Common Tasks

Enterprise Architect is a powerful modeling tool that can be used by project managers, business analysts, developers and testers alike to build business, real-time and software systems. Across this work there are several key areas in which the system can play a vital role.

### Common tasks

Tasks	Detail
<b>Manage Projects Effectively</b>	<p>Enterprise Architect provides a wide range of tools for planning, executing and successfully completing your projects. You can:</p> <ul style="list-style-type: none"> <li>• Create a shared vision of your project, improve communication and help team members agree upon the design of a proposed system</li> <li>• Evaluate project risk factors, report any changes or defects and develop strategies to tackle potential problems</li> <li>• Estimate the amount of time and effort required to complete a project and maximize the efficiency of use of staff</li> <li>• Use Auditing, Project Baselines and User Access Controls to better manage change in a collaborative environment</li> </ul>
<b>Analyze Strategic Business Needs</b>	<p>A Business Analyst is responsible for gathering requirements, modeling potential solutions and evaluating the business needs of an organization. You can:</p> <ul style="list-style-type: none"> <li>• Build a coherent picture of how a business operates through requirements gathering, Use Case analysis and modeling business rules</li> <li>• Help achieve business process improvement and implement change using tools such as Strategic Models, Use Case Scenarios, Business Rule Models, Flow Charts, Auditing and the Team Review window</li> </ul>
<b>Build and Develop Systems</b>	<p>The developer is responsible for implementing a solution using a range of tools. You can:</p> <ul style="list-style-type: none"> <li>• Bring the power and benefits of Enterprise Architect into your favorite Integrated Development Environment (IDE)</li> <li>• Use Enterprise Architect's in-built support for writing code, including syntax highlighting, line numbering, auto completion, bookmarking and automatic indentation</li> <li>• Create breakpoints to step through code execution, examine variables and view error messages via the Debug window</li> <li>• Apply Visual Execution Analysis to identify costly function calls, explain system behavior and establish the sequence of events that occur immediately prior to system failure</li> <li>• Use Enterprise Architect's support for round trip engineering and synchronizing source code with a corresponding model</li> <li>• In addition to generating code in many popular programming languages, create powerful database solutions that automatically generate DDL scripts for more than 10 different Database Management Systems</li> </ul>

Tasks	Detail
<b>Test and Investigate</b>	<p>Quality Assurance teams test software to identify defects, verify that it satisfies all requirements and ensure that it produces expected results. You can:</p> <ul style="list-style-type: none"><li>• In addition to applying the integrated JUnit and NUnit testing capabilities, create and manage test scripts for model elements, covering Unit, Integration, Scenario, System and Acceptance tests</li><li>• Visualize the execution of code to better understand how applications work and the sequence of events that leads to program failure</li></ul>

## 2.3 A Quick Start Tutorial

### Welcome to Enterprise Architect!

This quick-start tutorial helps you get up to speed with Enterprise Architect.

As you read through this tutorial, it is recommended that you have Enterprise Architect open so that you can try out the tasks described. By the end you should be able to begin modeling your own business/software projects with Enterprise Architect.

### Basic Tasks

Task	Link
Creating a new project	<a href="#">Creating a New Project</a> <sup>[47]</sup>
Adding Views to your model	<a href="#">Views</a> <sup>[49]</sup>
Adding Packages to your model	<a href="#">Packages</a> <sup>[50]</sup>
Adding diagrams	<a href="#">Adding Diagrams</a> <sup>[50]</sup>

### 2.3.1 Create a Project

A project is a single file or repository-based store for one or more Models.

- The first step in getting started with Enterprise Architect is to either open an existing project, or create a new one
- In this example we create a new file-based project and add some template-based models to kick-start our modeling

- Once your new project has been created it will have a simple Use Case View added for you to explore and tailor to your requirements
- You can re-open your project at any time by double-clicking on it in a file browser
- It should also appear in your **Recent Projects** list on the Start page

### Create a New Project

Step	Action	Result
1	Start Enterprise Architect.	The Open Project dialog displays.  (If the dialog does not appear, press <b>Ctrl+O</b> to invoke it.)
2	Click the <b>New Project</b> button to select a suitable location and name for your new project.  	The standard Windows file browser dialog displays.  File-based Enterprise Architect projects are named with a .EAP extension.  You can also create projects on Firebird by clicking on the drop-down arrow in the <b>Save as type</b> field and selecting the .FEAP file extension.
3	Locate a suitable folder for your project and enter a distinctive name.  Click on the <b>Save</b> button to continue.	Enterprise Architect creates a new project file and places it in the specified location.  The project is then opened automatically and the New Model Wizard displays.
4	In the left hand column ensure that <b>Basic UML 2 Technology</b> is selected - and in the right hand side tick the <b>Use Case View</b> check box.    Click on the <b>OK</b> button.	The Model Wizard automatically creates a new Use Case model for you, with an initial diagram, some notes and default elements to help get you started.  At this stage all your changes have been saved to file and do not require further action.

### 2.3.2 Add a View to your Model

A View is a top level Package within a model. It can be categorized by purpose using different icon types, such as Use Case View, Component View or Deployment View. Views are used to contain Packages, diagrams and elements - the building blocks of your model.

#### Add a View

Step	Action	See also
1	<p>Select a model root node in the Project Browser, then either:</p> <ul style="list-style-type: none"> <li>Click the <b>New Package</b> button () on the Project Browser toolbar</li> <li>Select <b>Project   New Package</b></li> <li>Right-click the model root node and, from the context menu, select <b>New View</b>, or</li> <li>Press <b>Ctrl+W</b></li> </ul> <p>The Create New View dialog displays.</p>	<a href="#">Views</a> <sup>[769]</sup>
2	Enter an appropriate name for the new View.	
3	Click the appropriate radio button to select an icon for the View.	
4	<p>Click on the <b>OK</b> button.</p> <p>The Create New View dialog closes.</p> <p>The new View is created as a child of the selected model root node.</p>	

#### Notes

- There are six types of View, which represent conventional ways of categorizing the purpose of a Model View; these Views represent different structural or behavioral aspects of the same model

#### Learn more

- [Add a Package to your model](#) <sup>[50]</sup>
- [Create a new diagram](#) <sup>[50]</sup>
- [Add an element](#) <sup>[52]</sup>
- [Read more about views](#) <sup>[769]</sup>

### 2.3.3 Add New Packages

A **Package** is a container of model elements, which is represented in the Project Browser as a 'folder' icon.

- A Package holds the model building blocks, such as diagrams, elements and other Packages
- To begin developing your model, you create an initial Package to hold your first diagrams and model structures

**Access** [Project Browser Package context menu](#) | **Add a Package ( Ctrl+W )**

#### Add a Package to your model

Step	Action	See also
1	Select a Package or View in the Project Browser, and select the <b>Add a Package</b> option.  The New Model Package dialog displays.	
2	In the <b>Name</b> field, type a suitable name for the Package.	
3	Optionally, select the <b>Automatically add new diagram</b> checkbox, to automatically create a default diagram within your new Package, to speed your development.  If you select this checkbox, you can also select the <b>Open new diagram</b> checkbox to immediately open the new diagram when it is created.	
4	Click on the <b>OK</b> button.  The new Package is inserted into the tree at the current location and, if you selected to create a new diagram, the New Diagram dialog displays.  In the <b>Name</b> field, type an appropriate name for the diagram, and then select the diagram category and diagram type. Click on the <b>OK</b> button.  The diagram displays in the Diagram View, for you to work on.	<a href="#">New Diagrams</a> [822]

#### Learn more

- [Packages](#) [772]
- [Add a Package](#) [772]

### 2.3.4 Create a New Diagram

A diagram is a visual representation of

- The elements of your model
- Their attributes and characteristics
- How they are connected and/or interact with each other
- Different diagram types show different aspects of the model and the relationships between elements.

**Add new diagrams to your model**

Step	Action	See also
1	<p>Select a Package or View in the Project Browser, then either:</p> <ul style="list-style-type: none"> <li>Click on the <b>New Diagram</b> button  on the Project Browser toolbar</li> <li>Press <b>Ctrl+Insert</b></li> <li>Select <b>Project   New Diagram</b>, or</li> <li>Right-click the Package or View and, from the context menu, select <b>Add Diagram</b></li> </ul> <p>The New Diagram dialog displays.</p>	<a href="#">Add Elements</a>  <sup>52</sup> <a href="#">Move Elements</a>  <sup>57</sup> <a href="#">Learn more about UML diagrams</a>  <sup>118</sup>
2	<p>Enterprise Architect provides a default diagram name, that is the same name as the parent Package.</p> <p>Update the diagram name as required.</p>	
3	<p>Select a category of diagrams in the left hand pane.</p> <p>The list of available diagram types in the right hand pane is updated according to your selection.</p>	
4	Select the type of diagram to add from the right hand pane.	
5	<p>Click on the <b>OK</b> button.</p> <p>The New Diagram dialog closes.</p> <p>A new diagram is created as a child of the currently selected Package.</p> <p>The new diagram is opened in the Diagram View, ready for editing.</p>	

**Notes**

- When you create a Package, if you leave the **Automatically add new Diagram** option selected, the New Diagram dialog displays automatically

**2.3.5 Save Changes**

Throughout much of your work in Enterprise Architect, any changes you make are automatically saved when you close the *dialog* (data entry window) on which you made the changes. In some cases the dialog contains a **Save** or **Apply** button, which enables you to save your changes and then keep working on the dialog.

**If there is no specific dialog, such as when you create a diagram, you can save your work by**

- Clicking on the **Save** icon in the Diagram toolbar ()
- Pressing the **Ctrl+S** keyboard keys, or
- Selecting the **Diagram | Save** menu option

Often, Enterprise Architect does not let you close a screen without confirming that you want to save or discard your changes. You can also save your diagram changes automatically, by selecting the **Auto Save Changes** checkbox on the Diagram Behavior page of the Options dialog.

#### Learn more

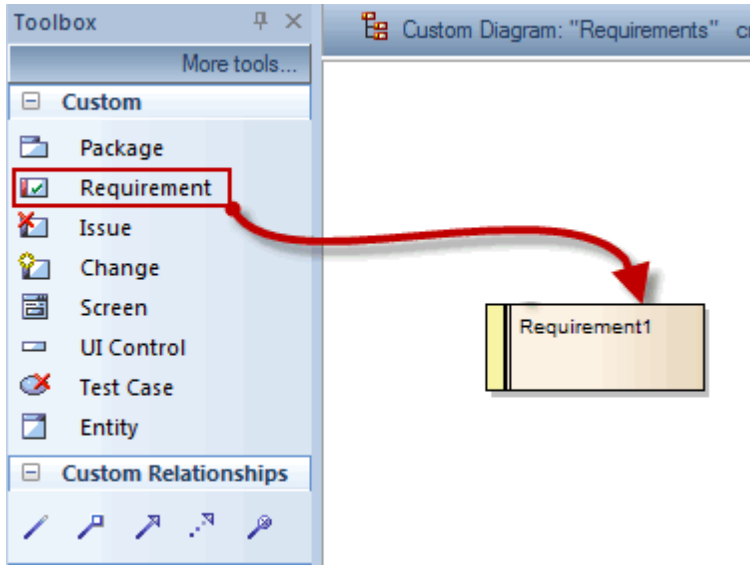

- So far you have been using the Project Browser and Diagram View to develop your project; at this point you should find out a bit more about the other facilities of the Enterprise Architect [User Interface](#)<sup>[67]</sup> or Application Workspace
- When you have finished exploring the User Interface topics, go to the [Summary of Typical Tasks](#)<sup>[183]</sup> to identify areas of Enterprise Architect that provide particular support for your job role
- Explore other options for managing the way your diagrams display and function, on the [Diagram Behavior](#)<sup>[625]</sup> page

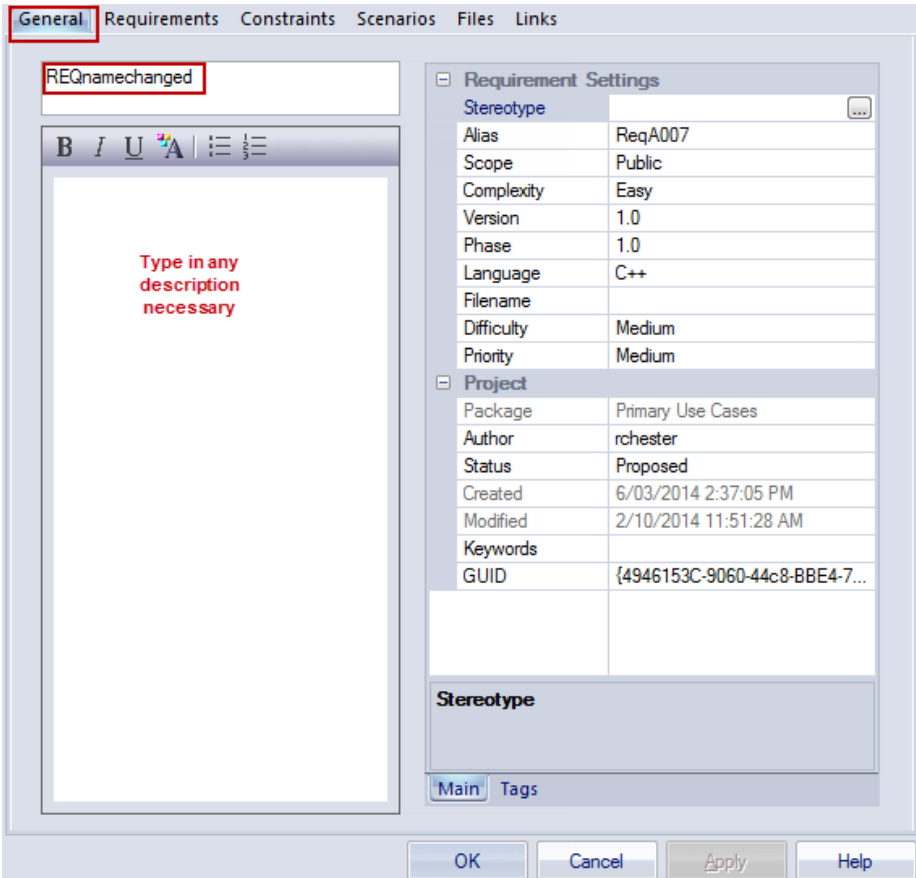

### 2.3.6 Create New Elements on a Diagram

Models are constructed from elements, each of which has its own meaning, rules and notation. Generally, when you create a new element in your model, you want to use that element on a diagram. The simplest way to do this is to create the element directly on the diagram. In the following procedure, we will use a Requirement element as the example.

#### Create a new element on a diagram in your model

Step	Action	See also
1	Display the Diagram Toolbox; either: <ul style="list-style-type: none"> <li>• Select <b>Diagram   Diagram Toolbox</b>, or</li> <li>• Press <b>Alt+5</b></li> </ul>	
2	Display the diagram on which the elements are to be created in the Diagram View. To open the diagram, double-click on the diagram name in the Project Browser.  The diagram opens and the Toolbox is updated to display the categories of elements and relationships that are applicable to that type of diagram. (In this example, the <b>Custom</b> toolbox.)	<a href="#">Diagram View</a> <sup>[784]</sup>
3	Click on the appropriate icon in the Toolbox to select the type of element to create (in this example, the <b>Requirement</b> element).  The element type is highlighted in the Toolbox.	
4	Click on the diagram at the location where you want to place the element.	

Step	Action	See also
	 <p>The new element is created as a child of the Package that contains the diagram, and is placed onto the diagram at the cursor position.</p> <p>The element Properties dialog displays.</p>	
5	<p>Use the Properties dialog to define the element properties that you want.</p>	<p><a href="#">Properties Dialog</a><sup>[956]</sup></p>

Step	Action	See also
		
6	<p>Click on the <b>OK</b> button.</p> <p>The Properties dialog closes.</p>	

### Notes

- You can also drag or paste existing elements onto a diagram from the Project Browser
- If you are creating several elements of one type, after creating the first just press **Shift+F3** or **Ctrl +Click** to create the next element of that type

### Learn more

- [Paste From the Project Browser](#)<sup>[833]</sup>
- [Add connectors](#)<sup>[55]</sup>
- [The Quick Linker](#)<sup>[896]</sup>
- [Move elements](#)<sup>[57]</sup>
- [UML elements](#)<sup>[1265]</sup>

### 2.3.7 Add Connectors

Connectors define specific relationships between specific elements, so you usually create them directly on the diagram by dragging the required relationship type from the Diagram Toolbox. As for elements, the Toolbox automatically presents the connector or relationship types appropriate to the type of diagram.

#### Define a relationship between two model elements on a diagram

Step	Action	See also
1	<p>Ensure that the Diagram Toolbox is visible.</p> <p>To display the Diagram Toolbox, either:</p> <ul style="list-style-type: none"> <li>• Select <b>Diagram   Diagram Toolbox</b> or</li> <li>• Press <b>Alt+5</b></li> </ul>	
2	<p>Ensure that the diagram containing the elements to be connected, is open in the Diagram View.</p> <p>To open the diagram, double-click on the diagram name in the Project Browser.</p> <p>The selected diagram opens and the Toolbox is updated to display the categories of elements and relationships that are applicable to that diagram type.</p>	<a href="#">Diagram View</a> <sup>[784]</sup> <a href="#">Creating Elements on Diagrams</a> <sup>[527]</sup>
3	<p>Click on the required connector in the Toolbox to select the type of connector to draw.</p> <p>The connector type is highlighted in the Toolbox.</p>	
4	<p>Click on the source element in the relationship, then drag across to the target element.</p> <p>The selected connector is drawn between the two elements.</p> <p>The connector Properties dialog displays.</p>	
5	<p>Use the Properties dialog to define the characteristics of the connector as required.</p>	<a href="#">Properties Dialog</a> <sup>[956]</sup>
6	<p>Click on the <b>OK</b> button.</p> <p>The Properties dialog closes.</p>	

#### Notes

- If you are creating several connectors of one type, after creating the first just click on the appropriate source element and press **F3** to create the next connector of that type
- As you drag a connector, you can press **Shift** to create a bend in the connector; if necessary, you can

put several bends in the connector line, pressing **Shift** every time you want to change direction

- To roll back the bends, keep holding the left mouse button down and press **Backspace** as many times as is necessary
- To find out more about the type of connector you have dragged on to a diagram, right-click on the connector and select the **UML Help** menu option, which displays a Help page on the connector type

#### Learn more

- [Quick Linker - Create Connectors](#) <sup>[898]</sup>
- [Create Connector in Project Browser](#) <sup>[1118]</sup>
- [UML Connections](#) <sup>[1389]</sup>

### 2.3.8 Modify Properties

When you create an element and connect it to another element, you usually have to define various characteristics of both the element and the connector to identify the purpose and function they represent. You do this using a Properties dialog.

When you create elements, Enterprise Architect automatically names and numbers them by type - for example, Class1, Class2 - so you should at least change the **Name** field to more easily identify each element. Enterprise Architect does not automatically name connectors, but for many connector types you should provide a name that describes the purpose of the connection.

#### Modify the characteristics of a model element or connector

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on an element or connector in the diagram</li> <li>• Right-click an element in the Project Browser and, from the context menu, select <b>Properties</b>, or</li> <li>• Right-click a connector in a diagram and, from the context menu, select <b>Properties</b></li> </ul> <p>The appropriate Properties dialog displays.</p>	<a href="#">Element Properties Dialog</a> <sup>[956]</sup> <a href="#">Connector Properties Dialog</a> <sup>[1126]</sup>
2	Modify the element or connector characteristics as required.	<a href="#">Element Properties Dialog</a> <sup>[956]</sup> <a href="#">Connector Properties Dialog</a> <sup>[1126]</sup>
3	<p>Click on the <b>OK</b> button.</p> <p>The Properties dialog closes.</p> <p>The modifications are saved; the Project Browser and diagrams that contain the element are updated as necessary.</p>	

**Notes**

- Enterprise Architect is initially configured to display the Properties dialog automatically when you create an element or connector, but it is easy (and often convenient) to turn the dialog display off
- If the default display has been turned off, you can display the Properties dialog by either double-clicking on the element or connector in the diagram or by right-clicking on it in the Project Browser and selecting the **Properties** menu option

**2.3.9 Move Objects Around**

You have created a project containing Packages, diagrams and elements, and you have connected the elements.

How do you change where things are?

**Move diagrams, elements and connectors**

Task	Link
Change the Project Browser list order - re-arrange the order of items in the Project Browser	<a href="#">Move Elements Within a Package</a> <sup>[57]</sup>
Move elements between Packages - move diagrams, elements and child Packages from one parent Package to another	<a href="#">Move Objects Between Packages</a> <sup>[58]</sup>
Move elements on a diagram - re-arrange the position of diagram elements	<a href="#">Move Elements in a Diagram</a> <sup>[59]</sup>
Move elements between diagrams - cut an element from one diagram and paste it onto another	<a href="#">Move Elements Between Diagrams</a> <sup>[59]</sup>
Move connectors on a diagram - re-link a source element to a different target element	<a href="#">Move Connectors on a Diagram</a> <sup>[61]</sup>

**Learn more**

- [Delete Components](#) <sup>[64]</sup>
- [Arrange Connectors](#) <sup>[1112]</sup>
- [Order Package Contents](#) <sup>[672]</sup>

**2.3.9.1 Move Objects Within a Package**

In the Project Browser, the contents of a Package are listed in the order: diagrams, child Packages, elements.

- Elements are further arranged in order of type (but see *Notes*)
- Within a type, components are initially listed in alphabetical or numerical order

- You can change the order in which items are listed within their groups

#### Adjust the order in which items are listed in the Project Browser

Step	Action	See also
1	Click on an item in the Project Browser, then click on  or  in the toolbar at the top of the window.  The selected item is moved up or down in the Project Browser accordingly, but remains within its particular group of items.	
2	To revert to listing components in alphabetical order, in the Project Browser right-click on the Package and from the context menu select <b>Contents   Reset Sort Order</b> .	

#### Notes

- You can re-arrange elements in your preferred sequence **regardless** of type, by selecting the **Allow Free Sorting** checkbox on the General page of the Options dialog

#### Learn more

- [General Options](#) 

### 2.3.9.2 Move Objects Between Packages

When creating the various diagrams, elements and Packages that make up your model, at some point you might create one of these objects under the wrong parent Package. It is quite simple to relocate a model object from one Package to another, either to a higher level Package, a lower level Package or a different Package at the same level.

#### Move objects between Packages

Step	Action	See also
1	In the Project Browser, click and drag the model item to be relocated from its existing position, and drop it onto the new parent Package.  The dragged item and all of its child items are relocated to the target Package.	

#### Notes

- Moving elements in the Project Browser does not affect the use of elements in diagrams
- Moving an element or Package has no effect on any relationships that the element, Package, or elements within the Package have
- Moving a diagram generally does not affect the location of elements in Packages
- However, elements of certain types, such as Initial Node, Decision and Final Node, are used only

within one diagram and have no meaning outside that diagram; if you move a diagram containing these elements, they are moved to the new parent Package with the diagram

#### Learn more

- [Initial Node](#) <sup>[1313]</sup>
- [Decision](#) <sup>[1294]</sup>
- [Final Node](#) <sup>[1305]</sup>

### 2.3.9.3 Move Elements in a Diagram

To improve the understanding of a diagram or to simply improve the presentation, you might want to adjust the position of the elements on your diagram.

#### Adjust the position of the elements on your diagram

For coarse adjustments

Step	Action	See also
1	Click on a diagram element and drag it to its new position.	

For fine adjustments

Step	Action	See also
1	Click on a diagram element to select it.	
2	While holding down the <b>Shift</b> key, press the arrow keys to move the selected element one pixel at a time in the direction of the arrow ( <b>Shift+↑,↓,→,←</b> ).	

### 2.3.9.4 Move Elements Between Diagrams

If an element is present in one diagram but not in another, you can simply move or copy the element from one diagram into the other.

#### Move elements from one diagram to another

Step	Action	See also
1	In the Project Browser, double-click the name of the diagram that contains the element to be moved.  The diagram opens in the Diagram View.	

Step	Action	See also
2	Click on the element in the diagram to select it.	
3	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Cut</b> button () in the Default Tools toolbar, or</li> <li>Press <b>Ctrl+X</b></li> </ul> <p>The selected element is copied to the clipboard.</p> <p>However, the element remains visible on the current diagram until the clipboard content is pasted onto a different diagram.</p> <p>The model element itself is not affected in any way.</p>	
4	<p>In the Project Browser, double-click on the name of the diagram into which the element is to be moved.</p> <p>The diagram opens in the Diagram View.</p>	
5	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Paste</b> button () in the Default Tools toolbar, or</li> <li>Press <b>Ctrl+V</b> or <b>Shift+Insert</b></li> </ul> <p>The element is pasted from the clipboard onto the current diagram and removed from the original (source) diagram.</p> <p>Again, the model element itself is not affected in any way.</p>	

#### Copy elements from one diagram to another

Step	Action	See also
1	<p>In the Project Browser, double-click the name of the diagram that contains the element to be moved.</p> <p>The diagram opens in the Diagram View.</p>	
2	Click on the element in the diagram to select it.	

Step	Action	See also
3	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Copy</b> button (  ) in the Default Tools toolbar, or</li> <li>Press <b>Ctrl+C</b></li> </ul> <p>The selected element is copied to the clipboard.</p> <p>Neither the current diagram, nor the model element itself are affected in any way.</p>	
4	<p>In the Project Browser, double-click on the name of the diagram into which the element is to be copied.</p> <p>The diagram opens in the Diagram View.</p>	
5	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Paste</b> button (  ) in the Default Tools toolbar, or</li> <li>Press <b>Ctrl+V</b> or <b>Shift+Insert</b></li> </ul> <p>The element is pasted from the clipboard onto the current diagram.</p> <p>Again, neither the source diagram nor the model element itself are affected in any way.</p>	

### Notes

- By selecting more than one element at a time, you can move or copy multiple elements in the same operation
- You can remove an element from a diagram by selecting it, then pressing the **Delete** key
- You can also place an element onto an open diagram by locating the element in the Project Browser, then dragging it onto the diagram

### **2.3.9.5 Connect to a Different Element on a Diagram**

When creating connectors in your diagrams, at some point you might connect the wrong pair of elements. Enterprise Architect provides a simple method to enable you to move the end of a connector from one element to another; that is:

- Change the source element of a connector from the current element to another
- Change the target element of a connector from the current element to another

### Change a connected element

Step	Action	See also
1	In the diagram, click on the connector to select it. The connector is highlighted with 'handles' at each connector end.	
2	Move the cursor over the 'handle' at the end of the connector to reconnect. The cursor changes to a small arrow (  ) pointing upwards to the right.	
3	Click and drag the connector end to the other element to connect to. When you release the mouse button, the connector breaks from the original element and reconnects to the new element.	

#### Notes

- You can also tidy up a connection by dragging the end of the connector to a better position on the edge of the element, or move both ends at once by dragging the middle of the connector

### 2.3.10 Delete a Connector

It is possible to hide a connector on a diagram, or to delete it entirely from the model, removing the relationship between the previously connected elements.

Displaying all of the connectors on a complex diagram can make the diagram somewhat confused, so it can be useful to hide some of the connectors, to clarify a specific aspect of a more complex picture.

#### Hide or remove a connector between two elements

Step	Action	See also
1	Open the diagram containing the connector of interest. Either: <ul style="list-style-type: none"> <li>Double-click the diagram name in the Project Browser, or</li> <li>Make an already open diagram the 'active' diagram, by clicking on its tab in the Diagram View</li> </ul>	
2	Click on the connector in the diagram to select it. The selected connector is highlighted in the diagram.	
3	Either: <ul style="list-style-type: none"> <li>Press <b>Ctrl+Delete</b></li> <li>Right-click on the connector and, from the context menu, select <b>Delete Connector</b></li> <li>Press <b>Delete</b></li> </ul>	

Step	Action	See also
	<p>If you press <b>Ctrl+Delete</b>, a dialog displays prompting you to confirm that you want to delete the connector (and the relationship it describes) from the model.</p> <p>Otherwise, the Remove Connector dialog displays.</p>	
4	<p>On the Remove Connector dialog, choose one of the options:</p> <ul style="list-style-type: none"> <li>• <b>Hide the connector</b></li> <li>• <b>Delete the connector from the model</b></li> </ul> <p><b>Hide the connector</b> obscures the connector on the current diagram; you cannot see it but the relationship between the two elements still exists and is shown on other diagrams containing the two elements together, and on all reports of connectors between the elements.</p> <p><b>Delete the Connector from Model</b> removes the relationship that exists between the two elements; the connector is removed from the current diagram, from all other diagrams on which it is shown, and from all reports on connectors between the two elements.</p>	<a href="#">Hiding the Connector</a> <sup>[112]</sup> <a href="#">Relationships</a> <sup>[742]</sup>
5	<p>Optionally, tick the checkbox <b>Don't ask again</b>.</p> <p>Selecting this option prevents the Remove Connector dialog from being displayed next time you select the Delete Connector command; the command uses the setting you last used on the dialog.</p> <p>Make sure that you have selected the right option to use as your default.</p>	
6	<p>Click on the <b>OK</b> button.</p> <p>The connector disappears from the diagram.</p> <p>If you selected <b>Delete the connector from the model</b>, the relationship represented by the connector is also deleted from your model.</p>	

### Notes

- You cannot select multiple connectors - it is only possible to select one connector at a time
- If you select the **Don't ask again** checkbox on the Remove Connector dialog, you can reset this option on the Links page of the Options dialog (**Tools | Options | Links**)
- Selecting the **Hide the connector** option in the Remove Connector dialog, has the same effect as hiding the connector on the Links tab of the source element Properties dialog, or using the **Visibility | Hide Connector** context menu option

### Learn more

- To identify and reveal hidden connectors, see the [Links](#) <sup>[964]</sup> topic

### 2.3.11 Delete an Element

You can delete the elements of a model from a diagram or from the Project Browser.

#### Delete an element

Options	Link
Remove elements from a diagram: this is essentially 'hiding' the element in that particular view of the model.	<a href="#">Remove Elements from a Diagram</a> <sup>[64]</sup>
Delete elements from a model - the element, its properties and any child elements or diagrams it has are all deleted; the element is removed from all diagrams on which it appears.	<a href="#">Delete Elements from your Model</a> <sup>[65]</sup>

#### Learn more

- [Delete Connectors](#) <sup>[62]</sup>

#### 2.3.11.1 Remove Elements From a Diagram

Removing an element from a diagram does not delete the element from the model and therefore does not alter the structure of the underlying model. When you remove an element from a diagram, you are essentially 'hiding' the element in that particular view of the model.

#### Remove elements from a diagram

Step	Action	See also
1	Open the diagram that is to be modified. Either: <ul style="list-style-type: none"> <li>• Double-click on the diagram name in the Project Browser, or</li> <li>• Make an already open diagram the 'active' diagram, by clicking on its tab in the Diagram View</li> </ul>	
2	Either: <ul style="list-style-type: none"> <li>• Press <b>Ctrl+A</b> to select all of the elements in the diagram, or</li> <li>• Click on an element in the diagram to select it (and use <b>Ctrl+Click</b> to add further elements to your selection, or to remove elements from the selection)</li> </ul> <p>The selected elements are highlighted in the diagram.</p>	
3	Either: <ul style="list-style-type: none"> <li>• Press <b>Delete</b>, or</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Press <b>Ctrl+D</b>, or</li> <li>Right-click a selected element and from the context menu select <b>Delete &lt;element name&gt;</b> or <b>Delete Selected Elements</b></li> </ul> <p>The selected elements are removed from the diagram.</p>	

### Notes

- You can 'undo' the removal of a diagram element, by pressing **Ctrl+Z**, or by clicking the **Undo** button  in the Default Tools toolbar

### 2.3.11.2 Delete Elements From Your Model

You can delete elements from your model, working either from the Project Browser or from a diagram.

- When you delete an element from your model, the element, its properties and any child elements or diagrams it contains are all deleted.
- The deleted element is removed from all diagrams on which it appears
- All relationships that it was involved in are also deleted from the model

#### Delete one or more items from your model using the Project Browser

Step	Action	See also
1	<p>In the Project Browser, click on an item to select it.</p> <p>To select additional items, or to remove items from the selection, use <b>Ctrl+Click</b> or <b>Shift+Click</b>.</p> <p>The selected items are highlighted in the Project Browser.</p>	
2	<p>Either:</p> <ul style="list-style-type: none"> <li>Press <b>Ctrl+Delete</b> or</li> <li>Right-click on one of the selected elements, then select the <b>Delete selected item(s)</b> context menu option</li> </ul> <p>A confirmation dialog is displayed.</p>	
3	<p>Click on the <b>Yes</b> button.</p> <p>The selected items are deleted from your model.</p>	

**Delete one or more items from your model using a diagram**

Step	Action	See also
1	<p>To open the diagram containing the items to be deleted from your model, either:</p> <ul style="list-style-type: none"> <li>• Double-click on the diagram name in the Project Browser, or</li> <li>• Make an already open diagram the 'active' diagram, by clicking on its tab in the Diagram View</li> </ul>	
2	<p>Either:</p> <ul style="list-style-type: none"> <li>• Press <b>Ctrl+A</b> to select all of the elements in the diagram, or</li> <li>• Click on an element in the diagram to select it, then use <b>Ctrl+Click</b> to add or remove specific elements to and from the selection</li> </ul> <p>The selected elements are highlighted in the diagram.</p>	
3	<p>Press <b>Ctrl+Delete</b>.</p> <p>A confirmation dialog is displayed.</p>	
4	<p>Click on the <b>Yes</b> button.</p> <p>The selected elements are removed from the model.</p>	

**Notes**

- Deleting a Package completely removes the Package and all its contents - diagrams, child Packages and elements - from the model
- Deleting an element completely removes the element and its properties, connectors, child elements and child diagrams from the model, and from every diagram that contains it
- Deleting a diagram completely removes the diagram from the model, but not the diagram's component elements; they remain in the parent Package

## 2.4 User Interface Guide

The **Enterprise Architect Application Workspace** provides a powerful and flexible analysis, modeling, design and construction environment. The workspace is built from familiar components, such as toolbars, docking windows, dialogs and menus. Together these elements provide a **rich set of tools** for working with diagrams, models, **UML**, source code, executing applications (debugging and visualization), rich text documents, collaborative tools, extension technologies and much more.

### User Interface Tools

Tool	See
The Enterprise Architect <b>workspace</b> is the interface through which you create, open and display your models; the main workspace component is the central <b>Diagram View</b> , which is where you create model diagrams, view reports, scroll through lists of model elements, access the internet and even edit and debug source code.	<a href="#">The Start Page</a> <sup>[68]</sup> <a href="#">Diagram View</a> <sup>[784]</sup> <a href="#">The Web Browser</a> <sup>[170]</sup>
The <b>Main Menu</b> provides access both to high-level functions related to the project life cycle, and to project and system administration functions; at all levels of the system you can also access functions and operations using <b>context menus</b> .	<a href="#">The Main Menu</a> <sup>[77]</sup> <a href="#">Project Browser Context Menus</a> <sup>[648]</sup> <a href="#">Diagram Context Menu</a> <sup>[778]</sup>
The <b>windows</b> are used to enter and display information on your project and models; you can rearrange windows to adapt the screen space to your work habits.	<a href="#">Standard Windows</a> <sup>[125]</sup>
<b>Toolbars</b> are small sets of buttons that provide quick access to common operations, both on your project as a whole and on the individual modeling units.	<a href="#">Standard Toolbars</a> <sup>[134]</sup>
The <b>Diagram Toolbox</b> provides all the components and connectors that you use to create models using the medium of diagrams; the Toolbox automatically matches the kind of diagram you have open, from any technology that is currently active in your model.	<a href="#">The Diagram Toolbox</a> <sup>[792]</sup>
You can use keyboard <b>key combinations</b> to quickly initiate a wide range of actions throughout the system.	<a href="#">Keyboard Shortcuts</a> <sup>[171]</sup>
Enterprise Architect provides various <b>customization tools</b> that you can use to:	<a href="#">Customization</a> <sup>[151]</sup>

Tool	See
<ul style="list-style-type: none"> <li>Tailor the menus, toolbars and function keys you use in your work</li> <li>Set the visual style of the application, and</li> <li>Customize the <b>workspace layout</b></li> </ul>	<a href="#">Customize Command Sets</a> <sup>[165]</sup> <a href="#">Visual Styles</a> <sup>[168]</sup> <a href="#">Manage Workspace Layout</a> <sup>[163]</sup>
You can use several <b>navigation and search tools</b> to search for, track and locate information in your project, and filter the information so that you can explore particular views of your project rather than the entire contents.	<a href="#">Navigate, Search and Trace</a> <sup>[644]</sup> <a href="#">The Project Browser</a> <sup>[646]</sup>

### 2.4.1 Start Page

The **Start Page** is the default jump-off point that displays when you first open Enterprise Architect. It provides a range of useful tools and resources such as commands to select from a list of **recently-opened projects**, **open** some other existing project, **create** a completely new project or copy a **template** project, connect to a **server repository**, or access a project via the **Cloud**. You can also access **online resources** and the **Enterprise Architect Community website** to further explore the possibilities of Enterprise Architect and broader aspects of modeling and the UML.

The options and commands on the Start Page are available through the **Side Buttons**, **Projects** options, **Recent** files list and web site **Resources**.

**Access** Opened by default on startup of Enterprise Architect; if not displayed, select **Window | Show Start Page**

#### Side Buttons

Option	Action	See also

## 2.4.1.1 Remove Recent Projects

On both the **File** menu and the Start Page **Recent** section, the projects that you have opened most recently are listed in the order of opening date/time up to a maximum of ten projects, with the most recently opened project at the top of the list. If the list identifies projects that you do not want to be so immediately accessible, you can remove them specifically from the list.

Removing a project from the list only removes the **hyperlink** to the project and does not remove the project from the file system or repository.

**Access**    **File | Open Project ( Ctrl+O )**  
              **Start Page | Projects | Manage Projects**

### Remove a project hyperlink from the Recent list

Step	Action	See also
1	On the Open Project dialog, in the Recent Projects panel, click on the project to be removed.	
2	Click on the <b>Remove Selection from List</b> button. The project link is immediately removed from the list.	

### Notes

- You can only remove one project link from the list at a time
- To remove a link there must be at least two projects in the list

### Learn more

- [Open a Project](#)<sup>[202]</sup>
- [Start Page](#)<sup>[68]</sup>
- [File Menu](#)<sup>[79]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Getting Started | User Interface | Remove Project From Recent**

## 2.4.2 Learning Center

The **Learning Center** window provides quick access to a range of context-specific task guides in a number of specific work areas, such as Getting Started, Modeling or Testing. Through the 'breadcrumb' path at the top of the Learning Center window you display the short task guides, which describe how to achieve specific objectives in a work area. The guides contain links to Help topics and other useful sources of information.

To open a guide in the Learning Center, click on the task name in the drop-down lists in the 'breadcrumb' path. The document immediately displays in the window.

The Learning Center facilities can be extended to present separate hierarchies of topics on working with any MDG Technologies loaded with Enterprise Architect. Your Technology Developers would create and incorporate these additional sets of topics.

**Access** **View | Learning Center** or  
**Alt+F1** or

Click on the **Learning Center** icon on the Start Page

(Also, when you open Enterprise Architect for the first time, the Learning Center automatically displays on the right of the screen)

### Switch between work areas

Click on the black arrow to the **right** of **Enterprise Architect** in the document path and select the required Enterprise Architect work area from the drop-down list. Click on the work area and select either a further division of the subject area or the title of a guide on that topic.

If you have additional sets of topics for in-house extensions of Enterprise Architect (Add-Ins and MDG Technologies), you can access them by clicking on the black arrow to the **left** of **Enterprise Architect** in the document path, and selecting the required product area from the drop-down list.

### Notes

- If an Add-In or MDG Technology loads its own Learning Center topics, when Enterprise Architect is shut down the Technology Learning Center topics are not retained and, in subsequent work sessions, must be reloaded; if the Technology is deactivated **during** a work session, its Learning Center topics are still available until Enterprise Architect is shut down

### Learn more

- [Create Learning Center Pages](#) 

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Getting Started | Basic Tasks | Use the Learning Center**

### 2.4.2.1 Create Learning Center Pages

As a Technology Developer, it is possible for you to create a set of Learning Center pages to support any MDG Technology that you have developed and loaded into Enterprise Architect. You create each Learning Center page as the **Linked Document** of a **Document Artifact** element. These elements are organized into a hierarchy of **Packages**, where the Package name becomes the name of a **folder** of topics in the Learning Center. You then run two **scripts**; the first to generate the Learning Center folders and topics, and the second (as part of your Add-in or Technology activation) to import your Learning Center structure into the file location from which Enterprise Architect can load it.

The original process of developing a Learning Center Profile as part of an MDG Technology definition is no longer recommended.

### Set Up a Linked Document Template for Learning Center topics

Whilst not mandatory, it is recommended that you create one or more Linked Document templates for your Learning Center documents, to provide consistent standards for the layout, structure and content of your Learning Center pages.

Step	Action	See also
1	Plan the content of your Learning Center topics, and consider: <ul style="list-style-type: none"> <li>How you should present explanatory or descriptive text</li> <li>How you should lay out steps in direct-action tasks</li> <li>How you should refer and/or link to information in other documentation, web sites and file directories</li> <li>What corporate styles, standards and logos you might need to incorporate</li> </ul>	
2	Open the Resources window ( <b>Project   Resources</b> ) and create the appropriate Linked Document templates for your topics.	<a href="#">Create Linked Document Templates</a> <sup>[1098]</sup>

### Set up Package hierarchy to organize the Learning Center topics

Step	Action	See also
1	Create the root Package for your Learning Center documentation. The Package <b>name</b> will be the starting point for the documentation folder structure, as <b>Enterprise Architect</b> is for its product Learning Center topics.	
2	Display the Properties <b>window</b> for this Package element ( <b>Element   Properties Window</b> ) and, in the <b>Filename</b> field, type the file location into which to generate the Learning Center documentation.	<a href="#">Properties Window</a> <sup>[992]</sup>
3	In the Project Browser, create a child Package for each category of Learning Center documentation you intend to create, and within each of those create child Packages for any further subcategories of documentation. You can create child Packages to as many levels as necessary, but it is recommended that you try to limit the structure to fewer than five levels.  Consider also that you can have topics (Document Artifact elements) and folders (Packages) at the same level in your Learning Center document structure.	<a href="#">Add a Package</a> <sup>[772]</sup>

### Create the Learning Center Topics

You have a number of options for creating **Document Artifact** elements in a Package, but creating a **Document** diagram and adding the elements to it is a simple method that gives you an immediate visual impression of the content of a subject area.

Step	Action	See also
1	Working from the Project Browser, within each Package that is to contain Learning Center topics, create a Document diagram; that is: <ol style="list-style-type: none"> <li>1. Right-click on the Package name and select the <b>Add Diagram</b> option.</li> <li>2. On the New Diagram dialog, click on <b>Extended</b> in the <b>Select From</b> panel, and <b>Documentation</b> in the <b>Diagram Types</b> panel.</li> <li>3. Click on the <b>OK</b> button.</li> </ol>	
2	From the Diagram Toolbox, drag a Document Artifact icon onto the diagram and give it the name of the topic it will contain.  This name will display at the top of the document and in the Learning Center topic access path, where it will act as a link to open the topic.	
3	Double-click on the element and select your Learning Center document template (or any other appropriate template) from the New Linked Document from Template dialog.	
4	Add the description and/or procedure text to the document. When you have finished, save the document and repeat this procedure for the next Document Artifact element/ Learning Center topic.	<a href="#">Edit Linked Documents</a>  <sup>[1048]</sup>
5	In the Project Browser, check the order in which the Document Artifact elements are listed. This order determines the sequence of the Learning Center topics.  If you want to present the Learning Center topics in a different order, adjust the sequence of the corresponding Document Artifact elements in the Project Browser accordingly.	<a href="#">Move Objects Within a Package</a>  <sup>[57]</sup>

### Compile the Learning Center documentation

Step	Action	See also
1	In the Project Browser, click on the root-level Package for your Learning Center documentation.	
2	Select the <b>Tools   Scripting</b> menu option.  The Scripting window displays.	<a href="#">Scripting</a>  <sup>[279]</sup>

Step	Action	See also
3	Expand the <b>Local Scripts</b> folder and click on the <b>VBScript - Create Learning Center Books</b> script name.	
4	<p>Click on the <b>Run script</b> icon () in the Scripting window toolbar.</p> <p>The script generates the Learning Center documentation to the file path specified in the <b>Filename</b> field in the root Package properties.</p> <p>The script also generates:</p> <ul style="list-style-type: none"> <li>• An <b>order.txt</b> file from every Package in the document hierarchy, to define the order of display of child folders or topic names in the folder generated from that Package; you can directly edit this file to change the topic order in the Learning Center, if necessary</li> <li>• An <b>index.txt</b> file in the root folder that provides an index for every topic, derived from the GUID of the Document Artifact element from which the topic was generated; this index is used to identify the topic in references and hyperlinks to the topic, regardless of where the topic might be moved to</li> </ul>	

### Load the Learning Center documentation

The Learning Center documentation you have created for an Add-In or Technology is loaded into the Learning Center using the Repository method **AddDocumentationPath**. You would normally write this into the activation script you created to load the Technology itself, but you could also test the documentation using a simpler script that just loaded the documentation. The call resembles this:

```
{
  Repository.AddDocumentationPath('Tool Guide', 'C:\\Temp\\Tool LC', 0)
}
```

### Notes

- If the same Learning Center documentation is loaded more than once during a work session, each load is presented as a separate set of pages; the original documentation is not overwritten

## 2.4.3 Main Menu

Enterprise Architect provides a wide range of high-level and administrative functions for setting up and managing your projects throughout the project life cycle. You can access these functions by mouse, through a set of **Main Menu** options at the top of the Enterprise Architect workspace.

### Main Menu Options

Option	See also
<b>File</b> - Lists options to create, open, close and save <b>projects</b> , and also to perform <b>print</b> tasks.	<a href="#">File Menu</a> <sup>[79]</sup>
<b>Edit</b> - Lists options to invoke a range of functions to apply to <b>diagram elements</b> in the currently open diagram or view.	<a href="#">Edit Menu</a> <sup>[80]</sup>
<b>View</b> - Lists options to <b>display</b> various project windows, <b>show or hide toolbars</b> , and set the <b>visual style</b> of your system workspace.	<a href="#">View Menu</a> <sup>[83]</sup>
<b>Project</b> - Provides access to tools to <b>manage</b> your project and to add to the <b>project structure</b> , such as importing and exporting data, generating documentation, version control and security.	<a href="#">Project Menu</a> <sup>[87]</sup>
<b>Diagram</b> - Lists options to configure <b>diagram properties</b> and options and to save diagram images to file.	<a href="#">Diagram Menu</a> <sup>[93]</sup>
<b>Element</b> - Lists options to configure and access <b>element features</b> and details, control element layout, generate documentation and work on source code for the element.	<a href="#">Element Menu</a> <sup>[97]</sup>
<b>Tools</b> - Provides access to a range of <b>tools</b> related to code engineering, performing transformations, creating technologies, spell checking, customization of features and setting operational options.	<a href="#">Tools Menu</a> <sup>[104]</sup>
<b>Analyzer</b> - Provides access to a range of functions to perform <b>build, debug, simulation</b> and <b>profiling</b> operations on your model code.	<a href="#">Analyzer Menu</a> <sup>[112]</sup>
<b>Extensions</b> - Lists options to connect to, display information on, work with, export and manage your <b>Add-Ins</b> .	<a href="#">Extensions Menu</a> <sup>[117]</sup>
<b>Settings</b> - Provides options to <b>configure</b> various properties for your overall project, such as stereotypes, Tagged Values, cardinality values, datatypes, language macros, local directories and image management.	<a href="#">Settings Menu</a> <sup>[119]</sup>
<b>Window</b> - Provides options for organizing and managing open <b>system windows</b> .	<a href="#">Window Menu</a> <sup>[121]</sup>
<b>Help</b> - Provides options for displaying the Enterprise Architect <b>Help</b> files, the Read Me file, the Enterprise Architect <b>End User License Agreement</b> , the <b>Example model</b> , and a number of <b>resources</b> on the Sparx Systems website; it also enables you to manage your <b>license keys</b> .	<a href="#">Help Menu</a> <sup>[123]</sup>

**Notes**

- If you right-click on the empty areas of the Main Menu ribbon or Toolbar ribbon, a composite context menu displays providing options to display the toolbars and all significant windows and views
- If you click and hold the vertical dotted line at the left of the Main Menu ribbon, you can drag the Main Menu to display above or below the Toolbar ribbon, on the bottom of the screen, vertically on either side of the screen, or as a floating Toolbar in any other screen position that is convenient to you, even on a separate screen from the Enterprise Architect work area

**2.4.3.1 File Menu**

When managing the project as a unit, you can create, open, close or save projects, provide desktop shortcuts to a project, or perform print tasks.

**Access** **File**

**File Management Options**

Option	Action	Shortcut	See also

<b>Find in Files</b>	<b>Search for text</b> in code files and scripts, in the Find in Files window.	<b>Ctrl+Shift+Alt+F</b>	<a href="#">Search In Files</a> <sup>[2164]</sup>

Option	Action	Shortcut	See also
<b>Copy</b>	<ol style="list-style-type: none"> <li>1. Copy selected <b>elements</b> to the MS Windows clipboard. (To <b>paste</b> the selected elements use the <b>Paste as Link</b> or <b>Paste as New</b> options, below.)</li> <li>2. Copy <b>an image</b> of selected elements to the clipboard. If no elements are selected, the entire diagram is copied.</li> </ol> <p>The image can be saved as a bitmap or a metafile; you set the format on the Options dialog.</p>	<b>Ctrl+C</b>	<a href="#">General Options</a> <sup>[60]</sup> (page of the Options dialog)
<b>Paste as Link</b>	<b>Paste</b> copied element(s) into the diagram as an <b>element-hyperlink</b> to the original element(s).	<b>Shift+Insert</b>	<a href="#">Paste Elements</a> <sup>[82]</sup>
<b>Paste as New</b>	<b>Paste</b> copied element(s) into the diagram as a new <b>instance</b> of the original element(s).  The Paste Element(s) as New dialog displays.	<b>Ctrl+Shift+V</b>	
<b>Project Clipboard</b>	<b>Add</b> copied elements to, or <b>clear</b> copied elements from, the Enterprise Architect clipboard; select the appropriate sub-option: <ul style="list-style-type: none"> <li>• <b>Add to Project Clipboard</b> - Add the currently-selected element to the clipboard</li> <li>• <b>Clear Project Clipboard</b> - Clear the clipboard</li> </ul>	<b>Ctrl+Space</b>	
<b>Paste Image From Clipboard</b>	<b>Paste</b> the element in the Enterprise Architect clipboard into the same diagram, or a different diagram, as a <b>metafile</b> (that is, a definition of the element) as many times as is necessary.  If you paste the element into a different diagram, its classifier identifies the source diagram for the element.	<b>Ctrl+Shift+Insert</b>	
<b>Select All</b>	Select <b>all</b> elements concurrently on the current diagram.		
<b>Select By Type</b>	Specify a particular <b>type</b> of element to select on the diagram.		
<b>Clear Selection</b>	<b>Deselect</b> all elements.		
<b>Bookmark Selected</b>	<b>Bookmark</b> the selected element(s).  If the selected element is already bookmarked, this option <b>removes</b> the bookmark.	<b>Shift+Space</b>	

Option	Action	Shortcut	See also
<b>Clear All Bookmarks</b>	<b>Clear</b> bookmarks from any bookmarked elements in the current diagram.		<a href="#">Manage Bookmarks</a> 
<b>Delete Selected Element(s)</b>	<b>Delete</b> the selected elements from the diagram (but not from the model).	<b>Ctrl+D</b>	

#### 2.4.3.2.1 Paste Elements

It is possible to paste an element into a diagram from the Enterprise Architect clipboard **or** the MS Windows <sup>TM</sup> clipboard, either as a hyperlink to the original element or as a new element. The Enterprise Architect clipboard takes precedence, so you must clear that clipboard before you can paste from the MS Windows clipboard.

**Access**    **Edit | Paste As Link**  
                  **Edit | Paste As New**

#### Paste Elements

Option	Action	Shortcut	See also
<b>as Link</b>	<p>Paste the element in the buffer as a link (that is, a reference) to the element.</p> <p>If there are images in the MS Windows clipboard and none in the Enterprise Architect clipboard, you can:</p> <ul style="list-style-type: none"> <li>• Paste an image from the MS Windows clipboard into a new element as the appearance of the new element, or</li> <li>• Paste an image from the MS Windows clipboard into the diagram as a new boundary's appearance</li> </ul>	<b>Shift+Insert</b>	<a href="#">Paste from Project Browser</a> 
<b>as New</b>	<p>Paste each element in the buffer as a completely new  element.</p> <p>The Paste Element(s) as New dialog displays, listing the copied elements and providing a default name for the new instance of each element.</p> <p>If you want to apply your own element name to the new element, overwrite the <b>New Element Name</b> field.</p> <p>Each listed element defaults to selected, to be pasted into the diagram. If you do not want to paste a new instance of an element held in the clipboard, <b>deselect</b> the checkbox against it.</p> <p>If you want to include the connectors between the copied elements, select the <b>Include Connectors</b> checkbox.</p>	<b>Ctrl+Shift+V</b>	

### 2.4.3.3 View Menu

During your work on your models, you might use any of a number of Enterprise Architect windows and toolbars. You can display these windows and toolbars individually or in defined configurations, as well as set the visual style of your workspace.

#### Access **View**

#### View Options

Option	Action	Shortcut	See also
<b>Project Browser</b>	Browse and explore your models in the <b>Project Browser</b> ; this shows the hierarchical arrangement of packages, elements and features within the project.	<b>Alt+0</b>	<a href="#">The Project Browser</a> <sup>[646]</sup>
<b>Package Browser</b>	Display the elements of the current package as a context-sensitive, editable table, in the <b>Package Browser</b> .	<b>Ctrl+A</b>	<a href="#">Package Browser</a> <sup>[673]</sup>
<b>Specification Manager</b>	Display the <b>Specification Manager</b> , a <b>document-based</b> interface to a selected Package in the model, providing the means of creating and reviewing elements as <b>text</b> representations of objects in the Project Browser.		<a href="#">Specification Manager</a> <sup>[1728]</sup>
<b>Model Views</b>	Create filtered views of selected areas or aspects of your project, using the <b>Model Views</b> window.	<b>Ctrl+Shift+5</b>	<a href="#">Model Views</a> <sup>[686]</sup>
<b>Traceability</b>	Trace the relationships of an element through the project, using the <b>Traceability</b> window.	<b>Ctrl+Shift+4</b>	<a href="#">The Traceability Window</a> <sup>[725]</sup>
<b>Team Review</b>	Engage in discussion and review of the project within your development team community, through the portal of the <b>Team Review</b> window, a company-internal discussion forum.	<b>Ctrl+Alt+U</b>	<a href="#">Team Review Tools</a> <sup>[343]</sup>
<b>Model Mail</b>	Exchange internal <b>mail messages</b> with project team members.		<a href="#">Model Mail</a> <sup>[565]</sup>
<b>Personal Tasks</b>	Record and manage the <b>work tasks</b> assigned to your identity as a defined Author on the project.		<a href="#">Personal Tasks</a> <sup>[554]</sup>
<b>Relationship Matrix</b>	Create and manage the relationships between elements, by connector type, through the		<a href="#">Relationship Matrix</a> <sup>[727]</sup>

Option	Action	Shortcut	See also
	<b>Relationship Matrix.</b>		
<b>Gap Analysis Matrix</b>	Analyze model artifacts for potential gaps in the solution, using the <b>Gap Analysis Matrix</b> .		<a href="#">Gap Analysis Matrix</a> <sup>[745]</sup>
<b>Web Browser</b>	Open the web browser page at the site you have specified on the Options dialog, in the <b>Web Home</b> field.	<b>Ctrl+Alt+W</b>	<a href="#">Internal Web Browser</a> <sup>[170]</sup> <a href="#">General Options</a> <sup>[605]</sup>
<b>Notes</b>	Create and review the explanatory text on a diagram, element, feature or connector, on the <b>Notes</b> window.	<b>Ctrl+Shift+1</b>	<a href="#">Notes</a> <sup>[1142]</sup>
<b>Tagged Values</b>	Add further properties to a modeling object beyond those supported by UML, by creating <b>Tagged Values</b> on the Tagged Values window.	<b>Ctrl+Shift+6</b>	<a href="#">Tagged Values</a> <sup>[1134]</sup>
<b>System Output</b>	Check the results of internal processing such as Execution Analysis, Validation, searching the model and scripting, on the <b>System Output</b> window. Add-Ins can also output information to this window.	<b>Ctrl+Shift+8</b>	<a href="#">The System Output Window</a> <sup>[169]</sup>
<b>Learning Center</b>	Display context-specific guides that explain common tasks you might perform in a number of work areas.	<b>Alt+F1</b>	<a href="#">Learning Center</a> <sup>[74]</sup>
<b>Toolbars</b>	Show or hide individual <b>toolbars</b> .		
<b>Visual Style</b>	Set the <b>Visual Style</b> and a number of other <b>User Interface</b> display options.		<a href="#">View Submenus</a> <sup>[86]</sup>
<b>Workspaces and Commands</b>	Set up specific configurations of the content and layout of the Enterprise Architect <b>workspace</b> , and customize the User Interface menus, using the Workspaces and Commands dialog.		<a href="#">Manage Workspace Layout</a> <sup>[163]</sup> <a href="#">Customize Command Sets</a> <sup>[165]</sup>

#### 2.4.3.3.1 View Submenus

In your work on your models, you might use various functions either individually or in combination. These functions are conveniently grouped by task type, on Toolbars that you can display if you wish to use them, or hide if you don't. You can also change certain other aspects of your work environment, such as the visual style of your Enterprise Architect user interface.

**Access** **View | Toolbars** and  
**View | Visual Style**

### Show and Hide toolbars

Option	Action	See also
<b>Default Tools</b>	Show or hide the <b>Default Tools</b> toolbar, which provides instant access to the most commonly used tools including creating and opening projects, editing and saving diagrams, printing and technology selection.	<a href="#">Default Tools Toolbar</a> <sup>[135]</sup>
<b>Project</b>	Show or hide the <b>Project</b> toolbar, which provides access to tools for creating packages, diagrams and elements, searching the Project Browser and model, managing issues and the Project Glossary, and generating model documentation.	<a href="#">Project Toolbar</a> <sup>[136]</sup>
<b>Diagram</b>	Show or hide the <b>Diagram</b> toolbar, which provides access to tools to improve the lay-out of elements and connectors on diagrams, including zooming in and out of the display.	<a href="#">Diagram Toolbar</a> <sup>[138]</sup>
<b>New Element</b>	Show or hide the <b>UML Elements</b> toolbar, through which you can add new elements to a diagram, including Notes, Text and Hyperlink elements	<a href="#">UML Elements Toolbar</a> <sup>[140]</sup>
<b>Element</b>	Show or hide the <b>Current Element</b> toolbar, through which you can view and edit the properties, operations, attributes and Tagged Values of existing elements. You can also select an element in a diagram and locate it in the Project Browser, and lock elements against editing.	<a href="#">Current Element Toolbar</a> <sup>[141]</sup>
<b>Connector</b>	Show or hide the <b>Current Connector</b> toolbar, through which you can modify the properties and style of a connector, show and hide labels and connectors, attach notes, reverse the direction of connectors, and pin each end of a connector.	<a href="#">Current Connector Toolbar</a> <sup>[143]</sup>
<b>Code Engineering</b>	Show or hide the <b>Code Generation</b> toolbar, which provides access to tools to import, generate, synchronize and open source code, and to set the default language and default database type.	<a href="#">Code Generation Toolbar</a> <sup>[144]</sup>
<b>Debug</b>	Show or hide the <b>Debug</b> toolbar, through which you can access the main windows for monitoring debug operations, and the simple commands for starting, pausing, continuing and stopping a debug run.	<a href="#">Debug Toolbar</a> <sup>[146]</sup>
<b>Build</b>	Show or hide the <b>Build</b> toolbar, through which you can configure,	<a href="#">Build Toolbar</a> <sup>[147]</sup>

Option	Action	See also
	compile and debug the last-selected build script, execute it, cancel the execution, and run the executable, test and deployment scripts.	
<b>Record</b>	Show or hide the <b>Record &amp; Analyze</b> toolbar, which provides access to the facilities for managing the recording of the execution of an application, including starting the recording, initiating both manual and automatic recording, stepping through a recording session and stopping the recording.	<a href="#">Record &amp; Analyze Toolbar</a> <sup>[148]</sup>
<b>Workspace Layouts</b>	Show or hide the <b>Workspace Layouts</b> toolbar, through which you can create, manage and apply workspace layouts.	<a href="#">Workspace Layouts Toolbar</a> <sup>[149]</sup>
<b>Status Bar</b>	Show or hide the <b>Status Bar</b> at the bottom of the screen, which provides feedback on current operations, the position of a selected element on a diagram and what keyboard controls are selected, and a zoom control for manipulating the scale of a diagram.	<a href="#">Status Bar</a> <sup>[150]</sup>

### Set the Visual Style

Option	Action	Shortcut	See also
<b>Select Visual Style</b>	Select different visual styles or <b>themes</b> for your <b>user interface</b> .		<a href="#">Visual Styles</a> <sup>[168]</sup>
<b>Animate Autohide Windows</b>	If you are using windows that have been automatically hidden, they simply appear in the workspace when you move the cursor over the window tab.  Select this option to <b>slide</b> the windows out into the workspace when you place the cursor on the window tab.		<a href="#">Auto Hide Windows</a> <sup>[132]</sup>
<b>Show Toolbar Customize Button</b>	Hide or show the down-arrow on the end of each toolbar that enables you to customize the toolbar buttons.  		<a href="#">Standard Toolbars</a> <sup>[134]</sup> <a href="#">The Customize Dialog</a> <sup>[152]</sup>
<b>Hide Diagram Caption Bar</b>	Hide or redisplay the diagram caption bar at the top or bottom of a diagram.		<a href="#">The Diagram View</a> <sup>[784]</sup>

### 2.4.3.4 Project Menu

As your project is developed, you need to **manage** that development by, for example, adding to the project structure, importing and exporting data, generating documentation, implementing version control and applying security. The **Project** menu provides access to a range of facilities for performing these management tasks and others.

Access **Project**

#### Project Management Options

Option	Action	Shortcut	See also
<b>Calendar</b>	Monitor work across the project in terms of the resources involved, the tasks being performed and the events scheduled, using the <b>Project Calendar</b> .		<a href="#">Project Calendar</a> <sup>[57]</sup>
<b>Resources</b>	Select a shortcut or re-use function to add stock elements to the current model, or patterns and elements for additional information, from the <b>Resources</b> window.	<b>Alt+6</b>	<a href="#">Resources</a> <sup>[1173]</sup>
<b>Glossary</b>	Display the glossary terms already defined in your model, in the <b>Glossary</b> view.	<b>Alt+2</b>	<a href="#">Project Glossary</a> <sup>[533]</sup>
<b>Project Status</b>	Review the tasks and issues that relate directly to the current project, and the statistics of the project, in the <b>Project Status</b> view.		<a href="#">The Project Status View</a> <sup>[525]</sup>
<b>Project Gantt View</b>	Review the allocation of work to elements in the project, focussing on either the elements that require work or the resources required to perform the work, using the <b>Project Gantt</b> view.		<a href="#">Project Task Allocation</a> <sup>[538]</sup> <a href="#">The Gantt View</a> <sup>[594]</sup>
<b>Package Baselines</b>	Store a model branch as a <b>snapshot</b> or <b>baseline</b> of the branch content at a given time.  Available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions.	<b>Ctrl+Alt+B</b>	<a href="#">Manage Baselines</a> <sup>[46]</sup>
<b>New Model</b>	Add further <b>models</b> to your project, using the <b>Model Wizard</b> .	<b>Ctrl+Shift+M</b>	<a href="#">Model Wizard</a> <sup>[753]</sup>
<b>New Package</b>	Create a new <b>Package</b> at any level of your model.	<b>Ctrl+W</b>	<a href="#">Add a Package</a> <sup>[772]</sup>
<b>New Diagram</b>	Create a new <b>diagram</b> in the current package.	<b>Ctrl+Inse</b>	<a href="#">Add new diagrams</a>

#### 2.4.3.4.1 Documentation Submenu

When you need to generate **reports** on your project, you can do so in either printable document or web format, generating reports on Package content from standard or custom report templates, or you can generate reports on specific aspects of the project, such as Issues or defined Tests.

**Access** **Project | Documentation**

##### Documentation Options

Option	Action	Shortcut	See also
<b>Generate Documentation</b>	Generate a report on the contents of the currently selected package, in a number of document formats - PDF, RTF, and DocX.	<b>F8</b>	<a href="#">Document Reports</a> <sup>[2640]</sup>
<b>Publish as HTML</b>	Generate a report for the currently selected package in web format.	<b>Shift+F8</b>	<a href="#">Web Reports</a> <sup>[2744]</sup>
<b>Diagrams Only Report</b>	Generate a report on just the <b>diagrams</b> in a package.	<b>Ctrl+Shift+F8</b>	<a href="#">Diagrams Only Report</a> <sup>[2741]</sup>
<b>Testing Report</b>	Generate a report on the project's existing <b>tests</b> .		<a href="#">Test Documentation</a> <sup>[2617]</sup>
<b>Issues</b>	Generate a report on the project's <b>issues</b> .		<a href="#">Project Issues</a> <sup>[528]</sup>
<b>Glossary</b>	Generate a report on the project's <b>Glossary</b> .		<a href="#">Generate a (Glossary) Report</a> <sup>[536]</sup>

#### 2.4.3.4.2 Model Validation Submenu

As you develop your model, you can **validate** its component elements, diagrams and packages against sets of **validation rules** that you can configure to suit your requirements.

**Access** **Project | Model Validation**

##### Model Validation Options

Option	Action	Shortcut	See also
<b>Validate Selected</b>	Validate a selected element, diagram or package from the Project Browser.	<b>Ctrl+Alt+V</b>	<a href="#">Model Validation</a> <sup>[2594]</sup>
<b>Cancel Validation</b>	Cancel a currently-executing validation process.		
<b>Configure</b>	Configure the rules against which a validation checks the model data, selecting from the list of available rules.		<a href="#">Configure Model Validation</a> <sup>[2596]</sup>

#### Learn more

- [Rules Reference](#) <sup>[2597]</sup>

#### 2.4.3.4.3 Model Import/Export Submenu

In developing your model, it is possible to **export** and store modeling data from it in either **XMI** or **CSV** format, to work on in another tool, transfer to another project or hold as a snapshot of the data at a particular time. You can also make a copy of the standard or **reference** data **used** by the model to transfer to another model, and **import** both model and reference data from an XMI or CSV file into your own model.

**Access**    **Project | Model Import/Export**

#### Model Import/Export Options

Option	Action	Shortcut	See also
<b>Import Package from XMI</b>	<b>Import</b> a Package from an <b>XMI</b> (XML based) file.	<b>Ctrl+Alt+I</b>	<a href="#">Import From XMI</a> <sup>[478]</sup>
<b>Export Package to XMI</b>	<b>Export</b> the currently selected Package to an <b>XMI</b> (XML based) file.	<b>Ctrl+Alt+E</b>	<a href="#">Export To XMI</a> <sup>[475]</sup>
<b>Batch XMI Export</b>	<b>Export</b> a <b>group</b> of controlled Packages in one action.		<a href="#">Batch XMI Export</a> <sup>[492]</sup>
<b>Batch XMI Import</b>	<b>Run</b> a <b>batch import</b> of multiple Packages.		<a href="#">Batch XMI Import</a> <sup>[493]</sup>
<b>CSV Import/Export</b>	<b>Import</b> or <b>export</b> information on model elements in <b>CSV</b> format.	<b>Ctrl+Alt+C</b>	<a href="#">CSV Import</a> <sup>[503]</sup> <a href="#">CSV Export</a> <sup>[501]</sup>
<b>CSV Import/Export Specifications</b>	Set up <b>CSV</b> import and export <b>Specifications</b> .		<a href="#">CSV Specifications</a> <sup>[498]</sup>

Option	Action	Shortcut	See also
<b>Export Reference Data</b>	<b>Export reference data</b> to XML files for convenient model updating.		<a href="#">Export Reference Data</a> <sup>[376]</sup>
<b>Import Reference Data</b>	<b>Import reference data</b> from XML files for convenient model updating.		<a href="#">Import Reference Data</a> <sup>[380]</sup>

#### 2.4.3.4.4 Version Control Submenu

If you want to apply a **version control system** to your project, you can set it up and add Packages to it , and:

- Apply version control to a Package
- Modify or check version control settings
- Validate settings for all version controlled Packages
- Resynchronize the status of all version controlled Packages, with their associated version control system.
- Allow working when not connected to version control

Once the system is configured, you can apply further version control options using the **Package** context menu in the **Project Browser**.

**Access**   **Project | Version Control**

#### Version Control Options

Option	Action	Shortcut	See also
<b>Configure Current Package</b>	Specify whether this Package (and its children) is version controlled and, if so, which version control <b>configuration file</b> applies, using the <b>Package Control Options</b> dialog.	<b>Ctrl+Alt+P</b>	<a href="#">Configure Controlled Package</a> <sup>[424]</sup>
<b>Version Control Settings</b>	Specify the options required to connect to a <b>Source Code Control (SCC)</b> provider, using the Version Control Settings dialog.		<a href="#">Version Control Settings</a> <sup>[415]</sup>
<b>Validate Package Configurations</b>	Test the <b>validity</b> of the version control settings associated with each version controlled Package within the current model.		<a href="#">Validate Package Configurations</a> <sup>[443]</sup>
<b>Re-synch Statuses of All Packages</b>	<b>Resynchronize</b> the version control <b>status</b> of Packages as recorded in your project when they are out of synchronization with the version control status reported by your version control		<a href="#">Resynchronize the Status of Version Controlled Packages</a> <sup>[444]</sup>

Option	Action	Shortcut	See also
	<p>provider.</p> <p>The function acts on all version controlled Packages within the project, updating the values recorded in the project to match the values reported by the version control provider, without performing any XML import or export.</p>		
<b>Work Offline</b>	<p>Work <b>independently</b> of the version control server.</p> <p>By selecting Work Offline before loading your project, you can prevent the system from attempting to connect to a version control server that is unavailable, thereby avoiding the delays of waiting for the server to respond and any associated error messages.</p>		<a href="#">Offline Version Control</a> [392]

### 2.4.3.5 Diagram Menu

In creating your **diagrams**, you can make use of a wide range of facilities to add elements and connectors to each diagram, control the diagram size and layout or presentation format, configure diagram properties and save diagram images to file.

#### Access **Diagram**

#### Diagram Options

Option	Action	Shortcut	See also
<b>Diagram Toolbox</b>	Display the <b>Diagram Toolbox</b> , a panel of icons for creating elements and connectors on a diagram; you can select pages of icons for each UML, Extended and MDG Technology diagram type available in your project.	<b>Alt+5</b>	<a href="#">Diagram Toolbox</a> <sup>[792]</sup>
<b>Diagram Filters</b>	<b>Filter the display</b> of elements on a diagram, selecting the elements to show or hide, using the Diagram		<a href="#">Diagram Filters</a> <sup>[718]</sup>

Option	Action	Shortcut	See also
	Filters window.		
<b>Diagram Layout</b>	<b>Reformat</b> your diagram in one of a range of layouts, using the Layout Tools window.		<a href="#">Layout Diagrams</a> [874]
<b>Pan and Zoom</b>	<b>Pan</b> across the current diagram to display sections at greater magnification, using the Pan & Zoom window.	<b>Ctrl+Shift+N</b>	<a href="#">The Pan &amp; Zoom Window</a> [698]
<b>Find in Project Browser</b>	Locate the current diagram in the <b>Project Browser</b> window.	<b>Shift+Alt+G</b>	
<b>Show Diagram As</b>	Change the presentation of the diagram to the <b>Diagram List</b> format or the <b>Gantt Chart</b> format.		<a href="#">Diagram List</a> [684] <a href="#">The Gantt View</a> [594]
<b>Advanced</b>	Lock the current diagram, make it the user or model default, hide or reveal connectors, or save the diagram as a UML Pattern, from the <b>Diagram   Advanced</b> menu.		<a href="#">Diagram Advanced Menu</a> [95]
<b>Save</b>	Save the current <b>position</b> of all diagram <b>elements</b> .	<b>Ctrl+S</b>	
<b>Save as Image</b>	Save the diagram as an image in a <b>graphics file</b> in one of several formats, such as bitmap (.BMP), Graphics Interchange Format (.GIF) or Windows Metafile (.WMF).	<b>Ctrl+T</b>	
<b>Copy Image to Clipboard</b>	Copy an <b>image</b> of the current diagram to the <b>clipboard</b> . The image can be in metafile or bitmap format; you set the format on the Options dialog.	<b>Ctrl+B</b>	<a href="#">General Options</a> [605] (page of Options dialog)
<b>Swimlanes, Matrix and Kanban</b>	Add, modify and delete <b>swimlanes</b> or the <b>swimlanes matrix</b> for the current diagram, or apply the Kanban facilities.		<a href="#">Swimlanes</a> [852] <a href="#">Swimlanes Matrix</a> [854] <a href="#">Kanban Facilities</a> [857]
<b>Repeat Last Element</b>	Create an <b>element</b> of the same type as the last element created.	<b>Shift+F3</b>	
<b>Repeat Last Connector</b>	Create a <b>connector</b> of the same type as the last connector created.	<b>F3</b>	

Option	Action	Shortcut	See also
<b>Add Diagram Property Note</b>	Display the <b>properties note</b> for the current diagram on screen.		<a href="#">Insert Diagram Properties Note</a> <sup>[848]</sup>
<b>Snap To Grid</b>	<p>Show or hide the <b>grid</b> on the diagram, and select one of two options to position elements on the grid:</p> <ul style="list-style-type: none"> <li>• <b>Standard Grid</b> - constrains elements to the grid when they are added to diagrams</li> <li>• <b>Smart Placement</b> - places elements even distances away from other elements and spaces elements evenly; for Sequence diagrams, this helps position Notes on Messages</li> </ul> <p>If neither of these options are enabled, the elements can be placed freely on the diagram.</p>		
<b>Layout Diagram</b>	<b>Automatically lay out</b> the current diagram.		<a href="#">Layout a Diagram Automatically</a> <sup>[891]</sup>
<b>Zoom</b>	Change the <b>zoom</b> factor on the current diagram.		<a href="#">Pan and Zoom a Diagram</a> <sup>[868]</sup>
<b>Properties</b>	View and edit the <type> Diagram: <name> <b>properties</b> dialog for the current diagram.	<b>F5</b>	<a href="#">Set Diagram Properties</a> <sup>[823]</sup>

#### 2.4.3.5.1 Diagram Advanced Menu

As you develop some of your diagrams you might need to perform special operations on them, such as making them the default diagram for the model or for just your own work, or locking them to prevent change by yourself or by other users. You can also generate a Pattern from a diagram, or hide all connectors on the diagram.

**Access** **Diagram | Advanced**

#### Advanced Diagram Options

Option	Action	Shortcut	See also
<b>Lock Diagram</b>	<p>Prevent the diagram from being edited, or <b>release</b> the locked diagram for editing.</p> <p>This does <b>not</b> apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, <b>if security</b> is enabled.</p>		<a href="#">Lock Model Elements</a> <sup>[336]</sup>

Option	Action	Shortcut	See also
<b>Make Model Default</b>	<p>Make the current diagram the default diagram displayed when the model is re-opened (unless you set a <b>User Default diagram</b>, which overrides the model default; see below).</p> <p>This option is also overridden by a <b>project shortcut</b>, which defines displays to present on opening the project.</p> <p>To cancel a Model Default diagram, either:</p> <ul style="list-style-type: none"> <li>• Create a dummy diagram, set it as the Model Default and delete it, or</li> <li>• Delete the original diagram (if it is no longer relevant)</li> </ul> <p>In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, <b>if security</b> is enabled you must have <b>Manage Project Settings</b> permission to set the current diagram as the model default.</p>		<a href="#">Set the Default Diagram</a> <sup>[844]</sup>  <a href="#">Project Shortcuts</a> <sup>[204]</sup>
<b>Make User Default</b>	<p>(Use in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, <b>if security</b> is enabled).</p> <p>Make the current diagram the default diagram displayed when you re-open this model.</p> <p>The User Default diagram overrides the <b>Model Default</b> diagram (see <b>Make Model Default</b>, above); this option is itself overridden by a project shortcut, which defines displays to present on opening the project.</p> <p>To cancel a User Default diagram, either:</p> <ul style="list-style-type: none"> <li>• Create a dummy diagram, set it as the User Default and delete it, or</li> <li>• Delete the original diagram (if it is no longer relevant)</li> </ul> <p>This still blocks the Model Default diagram, whilst security is enabled; to re-establish the Model Default diagram, set it as the User Default.</p>		<a href="#">Project Shortcuts</a> <sup>[204]</sup>
<b>Visible Relations</b>	Hide or show individual <b>connectors</b> for the current diagram.	<b>Ctrl+Shift t+l</b>	<a href="#">Relationship Visibility</a> <sup>[1119]</sup>
<b>Sequence Messages</b>	Change <sup>[1430]</sup> the order of the <b>communication messages</b> in the current diagram.		<a href="#">Message (Communication Diagrams)</a> <sup>[1428]</sup>

Option	Action	Shortcut	See also
<b>Change Type</b>	Change the <b>type</b> of the current diagram.		<a href="#">Change Diagram Type</a> [840]
<b>Save UML Pattern</b> (Not available for Sequence diagrams)	Save the current diagram as a <b>UML Pattern</b> .		<a href="#">Create a Pattern</a> [1464]

### 2.4.3.6 Element Menu

In creating your **elements**, you can make use of a wide range of facilities to add features and properties to each element, control each element's appearance and generate code from the element (if a Class or Interface).

#### Access **Element**

#### Element Management Options

Option	Action	Shortcut	See also
<b>Properties Window</b>	Edit the common properties of the selected element in a table, in the <b>Properties window</b> .	<b>Alt+1</b>	<a href="#">Properties Window</a> [992]
<b>Element Browser</b>	Explore the components of the selected element, in the <b>Element Browser window</b> .	<b>Alt+9</b>	<a href="#">The Element Browser</a> [989]
<b>Relationships</b>	List the selected element's connectors in the <b>Relationships window</b> .	<b>Ctrl+Shift+2</b>	<a href="#">The Relationships Window</a> [742]
<b>Scenarios &amp; Rules</b>	List and edit the Scenarios, internal Constraints and Requirements for the selected element, on tabs of the <b>main work space</b> .	<b>Ctrl+Shift+3</b>	<a href="#">Element Scenarios &amp; Requirements</a> [992]
<b>Testing</b>	Create and manage Unit, Integration, System, Acceptance and Scenario test records for the selected element, using the <b>Testing window</b> .	<b>Alt+3</b>	<a href="#">Working on Test Records</a> [2605]

Option	Action	Shortcut	See also
<b>Maintenance</b>	Create and manage defect, change, issue and task records for the selected element, using the <b>Maintenance window</b> .	<b>Alt+4</b>	<a href="#">Working on Maintenance Items</a> [2623]
<b>Project Management</b>	Create and manage resource allocation, effort, risk and metric records for the selected element, using the <b>Project Management window</b> .	<b>Ctrl+Shift+7</b>	<a href="#">The Project Management Window</a> [510]
<b>Discussions</b>	Create, review and contribute to discussion threads on a selected element, using the <b>Element Discussions window</b> .		<a href="#">Element Discussions</a> [365]
<b>Linked Document</b>	Create or open a <b>rich text document</b> attached to the selected element.	<b>Ctrl+Alt+D</b>	<a href="#">Create Linked Document on an Element</a> [1047]
<b>Appearance</b>	Set up an alternative appearance for the element, or change the text font size or element size, using the <b>Appearance</b> submenu.		<a href="#">Appearance Submenu</a> [99]
<b>Advanced</b>	Add Tagged Values to the selected element, and manage how the element interacts with related elements, using the <b>Advanced</b> submenu.		<a href="#">Advanced Submenu</a> [100]
<b>Find in Project Browser</b>	Find the currently selected element in the <b>Project Browser</b> .  If no <b>element</b> is selected, find the current <b>diagram</b> in the Project Browser.	<b>Alt+G</b>	
<b>Find in Diagrams</b>	List all <b>occurrences</b> of the currently selected element in any <b>diagram</b> .	<b>Ctrl+U</b>	<a href="#">Show Element Use</a> [910]
<b>Attributes</b>	View and edit the <b>attributes</b> for the selected element.	<b>F9</b>	<a href="#">General Properties of Attributes</a> [1001]
<b>Operations</b>	View and edit the <b>operations</b> (methods) for the selected element.	<b>F10</b>	<a href="#">General Properties of Operations</a> [1015]
<b>Feature Visibility</b>	Select which features and characteristics of the selected element are visible on a diagram, using the <b>Feature and Compartment Visibility</b> window.	<b>Ctrl+Shift+Y</b>	<a href="#">Feature Visibility</a> [845]

Option	Action	Shortcut	See also
<b>Inline Features</b>	Make changes to the <b>properties</b> and <b>features</b> of the element <b>within the element shape</b> on the diagram, through the element <b>Inline Features</b> submenu.		<a href="#">Inline Features Submenu</a> <sup>[103]</sup>
<b>Source Code Engineering</b>	<b>Generate source code</b> and, subsequently, synchronize the element against the code, through the element <b>Source Code Engineering</b> submenu.		<a href="#">Source Code Engineering Submenu</a> <sup>[103]</sup>
<b>Show Source Viewer</b>	View and edit the <b>source code</b> that has already been generated for the element, or write new code, in the <b>Source Code window</b> .	<b>Alt+7</b>	<a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>Open Source in External Editor</b>	Open the source code of the selected Class in an editor <b>external</b> to Enterprise Architect (defined in the <b>Editor</b> field on the Language Options page for the programming language of the Class).  Source code must have been generated, and the selected element must be a Class.	<b>F12</b>	<a href="#">Editing Source Code</a> <sup>[2146]</sup> <a href="#">Language Options</a> <sup>[2262]</sup>
<b>Properties</b>	View and edit the <b>properties</b> of the selected element, using the element <b>Properties dialog</b> .	<b>Alt+Enter</b>	<a href="#">Properties Dialog</a> <sup>[956]</sup>

#### 2.4.3.6.1 Appearance Submenu

You can **customize** the appearance of an individual element in a number of ways, such as changing the color of its background, borders and/or text. These changes are applied to the selected element only, on each diagram on which it is used. For example, if the Class element *Customer* is used on three diagrams, and you set its background color to yellow on one diagram, **all three** diagrams will show the *Customer* Class in yellow.

Access **Element | Appearance**

#### Element Appearance Options

Option	Action	Shortcut	See also
<b>Default Appearance</b>	Set the border, font and background colors and the border thickness for the selected element, as its default appearance.	<b>Ctrl+Shift+E</b>	<a href="#">Set an Element's Default Appearance</a> <sup>[927]</sup>

Option	Action	Shortcut	See also
<b>Autosize</b>	Automatically size one element or a group of elements in a diagram to the best fit.	<b>Alt+Z</b>	<a href="#">Autosize Elements</a> <sup>[85]</sup>
<b>Set Font</b>	Change the font of the text displayed on the element in a diagram.		<a href="#">Set Element Font</a> <sup>[94]</sup>
<b>Alternate Image</b>	Select an alternative image for the selected element.	<b>Ctrl+Shift+W</b>	<a href="#">Using the Image Manager</a> <sup>[86]</sup>
<b>Apply Image From Clipboard</b>	Insert the image currently held on the clipboard. (If the image is to be applied from elsewhere in Enterprise Architect, turn off the <b>Diagram Frames On Clipboard Images</b> option in the Options dialog before you capture the image, to avoid having the image applied as a labeled frame.)		<a href="#">Diagram Options</a> <sup>[60]</sup> (page of the Options dialog)

### Notes

- You can also define the default appearance of:
  - The element on the **current diagram only**, using the **Format Toolbar**
  - All** new elements, using the **Diagram | Appearance** page of the Options dialog
  - All** new elements **of a type**, using an **Element Template**
  - Various** new elements **of a type**, by defining the appearance in a **stereotype** that you apply to the element as you create it
  - A **group** of selected elements on a diagram, applying the same change to all elements in the group

### Learn more

- [Operations on Multiple Elements](#) <sup>[95]</sup>

#### 2.4.3.6.2 Advanced Submenu

As you develop the elements in a diagram or package, you can:

- Model more complex interactions between elements, such as adding structured (embedded) elements or cross-references to other elements

- Add more specific properties, in the form of Tagged Values
- Make fundamental changes such as changing the element type
- Generate document reports on individual elements rather than on the entire contents of a package

**Access**   **Element | Advanced**

#### **Advanced Element Management Options**

Option	Action	Shortcut	See also
<b>Add Tagged Value</b>	Add a Tagged Value to the currently selected element.	<b>Ctrl+Shift+T</b>	<a href="#">Quick Start - Add Tagged Value To Elements</a> <sup>[1136]</sup>
<b>Custom References</b>	List the model elements or diagrams that refer to the element you have selected and, if you wish, access one of these elements or diagrams.	<b>Ctrl+J</b>	<a href="#">Set Up Cross References</a> <sup>[916]</sup>
<b>Rich Text Format (RTF) Report</b>	Generate a rich text format report on the currently selected <b>element</b> .	<b>F8</b>	<a href="#">RTF Documents</a> <sup>[2640]</sup>
<b>Set Parents and Interfaces</b>	Set the parent elements for the selected element, or set an interface that the selected element realizes.	<b>Ctrl+I</b>	<a href="#">Set Element Parent</a> <sup>[908]</sup>
<b>Embedded Elements</b>	Attach structural elements such as Ports and Parts to the currently selected element.	<b>Ctrl+Shift+B</b>	<a href="#">Manage Structural Elements</a> <sup>[935]</sup>
<b>Overrides &amp; Implementations</b>	Automatically override methods from parent Classes and from realized interfaces.	<b>Ctrl+Shift+O</b>	<a href="#">Override Parent Operations</a> <sup>[1023]</sup>
<b>Change Type</b>	Change the element type of the selected element.		<a href="#">Change Element Type</a> <sup>[918]</sup>

#### **2.4.3.6.3 Inline Features Submenu**

When you are editing elements and their features, and if you know what to enter without being prompted by field names, you can quickly complete your work by using **inline editing**; that is, typing in and editing the information **within the element image** on a diagram. To support this, you can also use menu options to add and delete selected features, display their properties and add linked notes to the element.

**Access**   **Element | Inline Features**  
**(Or, to display the options on a context menu, right-click on the selected feature)**

### Inline Editing Options

Click on the element and then click on the attribute, operation, element name, Maintenance item or Test item on the element before displaying the menu.

Option	Action	Shortcut	See also
<b>Edit Selected</b>	Type over or delete the text of the highlighted feature.	<b>F2</b>	
<b>View Properties</b>	Open the Properties dialog containing details of the selected feature, or of the element itself if no feature is selected.		
<b>Insert New After Selected</b>	Insert a new item in the element, of the same type as the selected feature, and immediately following the selected feature.  Type in the feature name and parameters, and press <b>Enter</b> .		
<b>Create Linked Note</b>	Add a Note element linked to the selected feature, reflecting the content of that feature.		<a href="#">Link Note to Internal Documentation</a> <sup>[924]</sup>
<b>Add Attribute</b>	Add an attribute to the current element.	<b>Ctrl+Shift+F9</b>	<a href="#">Attributes</a> <sup>[999]</sup>
<b>Add Operation</b>	Add an operation to the element.	<b>Ctrl+Shift+F10</b>	<a href="#">Operations</a> <sup>[1014]</sup>
<b>Add Other</b>	Insert other features such as Maintenance and Testing items.  To display these features on the element, select to show the appropriate compartment on the element.	<b>Ctrl+F11</b>	<a href="#">Compartment s</a> <sup>[955]</sup>  <a href="#">Define Element Characteristics</a> <sup>[828]</sup>
<b>Delete Selected from Model</b>	Delete the selected feature from the model.	<b>Ctrl+Shift+Delete</b>	

### Active keys after selecting the above options

Key	Action
<b>Enter</b>	Save current changes.

Key	Action
<b>Ctrl+Enter</b>	Save current changes and open a new slot to add a new item.
<b>Esc</b>	Cancel editing.
<b>Shift+F10</b>	Display a context menu with possible parameter values.

#### Learn more

- [In-place Editing Options](#) 

#### 2.4.3.6.4 Source Code Engineering Submenu

If you are modeling a software application developed in a particular language, you can generate the code in that language from the elements of your model and, in turn, update the model from changes to the generated code. That is, perform forward and reverse engineering at element level.

**Access**    **Element | Source Code Engineering**

#### Element Source Code Engineering Options

Option	Action	Shortcut	See also
<b>Generate Current Element</b>	Generate source code  for the currently selected element.	<b>F11</b>	<a href="#">Generate a Single Class</a> 
<b>Synchronize Current Element</b>	Synchronize the selected Class with the source code. If a problem arises, an error message displays. Otherwise the synchronization just proceeds in the background until complete.	<b>F7</b>	
<b>Batch Generate Selected Element(s)</b>	Batch generate source code for the currently selected element(s). The operation proceeds in the background until complete. If any problems arise, an error message displays.	<b>Shift+F11</b>	
<b>Batch Synchronize Selected Element(s)</b>	Batch synchronize the currently selected element(s) with source code. The operation proceeds in the background until complete. If any problems arise, an error message displays.	<b>Ctrl+R</b>	
<b>Open Source Directory</b>	Open the directory containing the source for this element. A browser displays, through which you locate the source	<b>Ctrl+Alt+Y</b>	

Option	Action	Shortcut	See also
	code file for the element. Double-click on the file to open the code in the default external viewer for the code language.		

#### Learn more

- [Software Engineering](#)<sup>[2073]</sup>

### 2.4.3.7 Tools Menu

In developing and managing your models, you can make use of a wide range of **tools** for code engineering, performing transformations, creating technologies, spell checking the model, customizing features and setting operational options.

#### Access **Tools**

#### Modeling Tool Options

Option	Action	Shortcut	See also
<b>Open Source File</b>	Open any type of external source file (code, XML, DDL) for editing.  A file browser displays, through which you locate and open the file in the default viewer/editor for the language. This could be an external source code editor or the internal Source Code viewer.	<b>Ctrl+Alt+O</b>	<a href="#">Compare Editors</a> <sup>[2148]</sup>
<b>Source Code Engineering</b>	Generate or import source code files, using options on the <b>Source Code Engineering</b> submenu.		<a href="#">Source Code Engineering Submenu</a> <sup>[106]</sup>
<b>Source Code Generation Templates</b>	Modify code generation templates using the Code Templates Editor.	<b>Ctrl+Shift+P</b>	<a href="#">The Code Template Editor</a> <sup>[1641]</sup>
<b>Document Template Designer</b>	Display the <b>Document Template Designer</b> for creating and reviewing <b>document templates</b> .		<a href="#">Design Custom Document Templates</a> <sup>[2684]</sup>
<b>Database Engineering</b>	Import database schema or generate DDL for a package, using options on the <b>Database Engineering</b> submenu.		<a href="#">Database Engineering Submenu</a> <sup>[107]</sup>
<b>Scripting</b>	Develop scripts for querying and updating the model, using the Scripting window.		<a href="#">Scripting</a> <sup>[2791]</sup>
<b>Web Services</b>	Import or generate Web Service Definition		<a href="#">Web Services</a>

Option	Action	Shortcut	See also
	Language (WSDL) files, using the <b>Web Services</b> submenu.		<a href="#">Submenu</a> <sup>[108]</sup>
<b>XML Schema</b>	Import or generate W3C XML Schema (XSD) files, using the <b>XML Schema</b> submenu.		<a href="#">XML Schema Submenu</a> <sup>[108]</sup>
<b>Model Transformation (MDA)</b>	Perform Model Driven Architecture (MDA) Transformations on elements in a diagram or in a package, using options on the <b>Model Transformation (MDA)</b> submenu.		<a href="#">Model Transformation (MDA) Submenu</a> <sup>[109]</sup>
<b>MDA Transformation Templates</b>	Modify the templates used in Model Transformations, using the Transformation Template Editor.	<b>Ctrl+Alt+H</b>	<a href="#">Edit Transformation Templates</a> <sup>[2048]</sup>
<b>Spelling Tools</b>	Configure and run the spelling checker, to check the spelling of text in a single package or across the whole model.		<a href="#">Spelling Tools</a> <sup>[109]</sup>
<b>Data Management</b>	Move, compare, manage and verify the integrity of the data in your models, using the <b>Data Management</b> submenu.		<a href="#">Data Management Submenu</a> <sup>[110]</sup>
<b>MDG Technology Import</b>	Make an MDG Technology available to: <ul style="list-style-type: none"> <li>• Yourself only, by importing the technology files into the %APPDATA% folder, or</li> <li>• Your project team members by importing the files into the model</li> </ul> (Not available in the Desktop edition.)		<a href="#">Import MDG Technologies to Model</a> <sup>[1480]</sup>
<b>Generate MDG Technology File</b>	Create an MDG Technology file using the MDG Technology Wizard.  (Not available in the Desktop edition.)		<a href="#">Create MDG Technology File</a> <sup>[1545]</sup>
<b>&lt;Customized Options&gt;</b>	Provide access to external tools that you might use during your modeling work, using options that you have defined through the Tools tab of the Customize dialog (below). For example: <ul style="list-style-type: none"> <li>• <b>ODBC Data Sources</b> - Open the Windows system ODBC Data sources administration tool to define connections to Enterprise Architect repositories, or when setting up</li> </ul>		

Option	Action	Shortcut	See also
	<p>connections to data sources for reverse engineering</p> <ul style="list-style-type: none"> <li>• <b>System Information</b> - Open the Windows System Information tool, to explore the various configurations and settings active on your current system</li> </ul>		<a href="#">The Customize Dialog</a> <sup>[152]</sup>
<b>Customize</b>	Customize your operation of the system, such as modifying the main menu, toolbars, tools and other user interface behavior, to your particular preferences using the Customize dialog.		
<b>Options</b>	Customize your general settings through the Options dialog. These options govern how a number of processes within Enterprise Architect are executed, and how various elements are displayed.	<b>Ctrl+F9</b>	<a href="#">Local Options</a> <sup>[604]</sup>

#### 2.4.3.7.1 Source Code Engineering Submenu

As you develop your model, you can **generate code** from the elements in a package (forward engineering) and create and update model elements from source code that you **import into the project** (reverse engineering) using any of a range of programming languages. That is, you perform forward and reverse engineering at **package** level.

**Access**    **Tools | Source Code Engineering**

#### Source Code Engineering Options

Option	Action	Shortcut	See also
<b>Generate Package Source Code</b>	Generate source code for the currently selected package.	<b>Ctrl+Alt+K</b>	<a href="#">Generate a Package</a> <sup>[2115]</sup>
<b>Synchronize Package Contents</b>	Synchronize the selected package with the source code.	<b>Ctrl+Alt+M</b>	<a href="#">Update Package Contents</a> <sup>[2117]</sup>
<b>Import Source Directory</b>	Import and reverse engineer an entire directory structure.	<b>Ctrl+Shift+U</b>	<a href="#">Import a Directory Structure</a> <sup>[2142]</sup>
<b>Import Binary Module</b>	Import a binary module from Java Archive, .NET PE or Intermediary Language files.		<a href="#">Import Binary Module</a> <sup>[2143]</sup>

Option	Action	Shortcut	See also
<b>Import ActionScript Files</b>	Import code written in ActionScript from a <b>.as</b> code file.		<a href="#">Import ActionScript</a>  <sup>[2139]</sup>
<b>Import C Files</b>	Import code written in ANSI C from a <b>.c</b> or <b>.h</b> code file.		<a href="#">Import ANSI C</a>  <sup>[2139]</sup>
<b>Import C# Files</b>	Import code written in C# from a <b>.cs</b> code file.		<a href="#">Import C#</a>  <sup>[2139]</sup>
<b>Import C++ Files</b>	Import code written in C++ from a <b>.h</b> , <b>.hpp</b> or <b>.hh</b> code file.		<a href="#">Import C++</a>  <sup>[2139]</sup>
<b>Import Delphi Files</b>	Import code written in Delphi from a <b>.pas</b> code file.		<a href="#">Import Delphi</a>  <sup>[2139]</sup>
<b>Import Java Files</b>	Import code written in Java from a <b>.java</b> code file.		<a href="#">Import Java</a>  <sup>[2140]</sup>
<b>Import PHP Files</b>	Import code written in PHP from a <b>.inc</b> , <b>.php</b> or <b>.php4</b> code file.		<a href="#">Import PHP</a>  <sup>[2140]</sup>
<b>Import Python Files</b>	Import code written in Python from a <b>.py</b> code file.		<a href="#">Import Python</a>  <sup>[2140]</sup>
<b>Import Visual Basic Files</b>	Import code written in Visual Basic from a <b>.frm</b> , <b>.cls</b> , <b>.bas</b> or <b>.ctl</b> code file.		<a href="#">Import Visual Basic</a>  <sup>[2140]</sup>
<b>Import VB.NET Files</b>	Import code written in VB.NET from a <b>.VB</b> code file.		<a href="#">Import VB.NET</a>  <sup>[2140]</sup>

#### Notes

- Source Code Engineering is available in the Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

#### 2.4.3.7.2 Database Engineering Submenu

If you are modeling databases, you can import existing **database schemas** into your model (reverse engineering the schemas) or **generate data definition language (DDL) scripts** for a package (forward engineering).

**Access** **Tools | Database Engineering**

**Database Engineering Options**

Option	Action	Shortcut	See also
<b>Import DB Schema from ODBC</b>	Import a database schema from an ODBC data source.		<a href="#">Import Database Schema</a> <sup>[2376]</sup>
<b>Generate Package DDL</b>	Generate a Package DDL script to create the tables in the currently selected package.		<a href="#">Generate DDL for a Package</a> <sup>[2381]</sup>

**2.4.3.7.3 Web Services Submenu**

If you are modeling a web service with a **WSDL-stereotyped UML model**, you can import **Web Service Definition Language (WSDL) files** into the model (reverse engineering), or forward-engineer the model into **WSDL 1.1** files.

**Access** **Tools | Web Services**

**Web Services Options**

Option	Action	Shortcut	See also
<b>Import WSDL</b>	Reverse engineer a Web Service Definition Language (WSDL) file into a UML Class model.		<a href="#">Import WSDL</a> <sup>[2447]</sup>
<b>Generate WSDL</b>	Forward engineer a UML Class model into a WSDL 1.1 file.		<a href="#">Generate WSDL</a> <sup>[2445]</sup>

**2.4.3.7.4 XML Schema Submenu**

If you have developed a **UML Class model**, you can forward-engineer a package from it into a W3C **XML Schema (XSD) file**, or reverse engineer a W3C XML Schema (XSD) file into a package of your UML Class model.

**Access** **Tools | XML Schema**

**XML Schema Options**

Option	Action	Shortcut	See also
<b>Import XML Schema</b>	Reverse engineer a W3C XML Schema (XSD) file as a package of a UML Class model.		<a href="#">Import XSD</a> <sup>[2420]</sup>
<b>Generate XML</b>	Forward engineer a package in a UML Class model to a		<a href="#">Generate</a>

Option	Action	Shortcut	See also
<b>Schema</b>	W3C XML Schema (XSD) file.		<a href="#">XSD</a> 

#### 2.4.3.7.5 Model Transformation (MDA) Submenu

Whilst you might develop your model to reflect a particular domain, you can **transform** the model elements and model fragments to reflect a different domain or, typically, convert generic Platform-**Independent** Model (PIM) elements to Platform-**Specific** Model (PSM) elements, using **Model Driven Architecture (MDA) Transformations**. You can perform a transformation on elements either in a diagram or in a Package.

**Access** [Tools | Model Transformation \(MDA\)](#)

##### Model Transformation Options

Option	Action	Shortcut	See also
<b>Transform Selected Elements</b>	Perform an MDA-style transformation on the currently selected elements in a <b>diagram</b> .	<b>Ctrl+H</b>	<a href="#">Transform Elements</a> 
<b>Transform Current Package</b>	Perform an MDA-style transformation on the currently selected <b>Package</b> .	<b>Ctrl+Shift+H</b>	

#### 2.4.3.7.6 Spelling Tools

As you develop your model, you can use the system **Spell Checker** to check the spelling of text in a single package or across the whole model. You can also select from a number of options to determine what types of text are checked or ignored by the Spell Checker.

**Access** [Tools | Spelling Tools](#)

##### Spell-Checking Options

Option	Action	Shortcut	See also
<b>Spell Check Project</b>	Check the spelling across the whole project.	<b>Ctrl+F7</b>	<a href="#">Using the Spell Checker</a> 
<b>Spell Check Current Package</b>	Check the spelling in the current package, selected in the Project Browser.	<b>Ctrl+Shift+F7</b>	
<b>Spelling Options</b>	Specify a range of options to configure how the Spell Checker operates.		<a href="#">Select Spell Checker Options</a> 

Learn more

- [Spell Checking](#)<sup>[549]</sup>
- [Use Languages Other Than English](#)<sup>[552]</sup>

**2.4.3.7.7 Data Management Submenu**

As you develop your project, you might need to perform management tasks on the project data, such as transferring a complete project, sharing data between projects, comparing the data of two instances of a project or two separate projects, checking the integrity of the data in a project, updating the index statistics on your Firebird project file, or performing various tasks specific to .eap files. Such tasks are not necessarily routine, and would be performed only as the need arises.

Access    **Tools | Data Management**

Data Management Options

Option	Action	Shortcut	See also
<b>Project Transfer</b>	<b>Move a complete project</b> from one repository to another.  You cannot move a project from a source .EAP file from a version of Enterprise Architect earlier than <b>3.5.0</b> .		<a href="#">Perform a Project Data Transfer</a> <sup>[504]</sup>
<b>Shared Repository</b>	Generate an SQL script to link the current repository to selected data tables belonging to a <b>shared repository</b> , rather than using data specific to this project only.		<a href="#">Link Reference Data to a Shared Repository</a> <sup>[375]</sup>
<b>Reset IDs</b>	Reset the <b>table auto increment</b> column values.		<a href="#">Reset Table Auto Increment or Identity Columns</a> <sup>[598]</sup>
<b>Project Compare</b>	<b>Compare</b> the total <b>project sizes</b> of two projects after a major operation such as a project transfer or backup recovery.		<a href="#">Compare Projects</a> <sup>[507]</sup>
<b>Project Integrity Check</b>	Check the <b>integrity of the data</b> in your project.	<b>Shift+F9</b>	<a href="#">Check Project Data Integrity</a> <sup>[597]</sup>
<b>Run Patch</b>	Execute an <b>SQL Patch</b> .		<a href="#">Run SQL Patches</a> <sup>[607]</sup>
<b>Manage .EAP File</b>	<b>Repair, compact</b> or <b>replicate</b> your .eap files.		<a href="#">Manage .EAP File Submenu</a> <sup>[117]</sup>
<b>Manage Firebird</b>	Update Index statistics on your Firebird project		

Option	Action	Shortcut	See also
<b>File</b>	<p>file, so that the indices perform better. This is particularly useful after major changes have been made to the project.</p> <p>Select this option, identify the project file on the Browser dialog, and click on the <b>Open</b> button to process the file. Click on the <b>OK</b> button to clear the 'Completed' prompt.</p>

<b>Resolve Replication Conflicts</b>	Resolve any conflicts caused when users have separately changed the same object in two replicas that have been synchronized.	<a href="#">Resolve Conflicts</a> <a href="#">315</a>

### 2.4.3.8 Analyzer Menu

Whilst you are modeling an application, you can generate code from the model and then **analyse** the way in which it **executes**, both monitoring and recording the execution behavior using the **Execution Analyzer**. This facility builds on and processes the structures and operations of the **Model Driven Development Environment (MDDE)**, which provides tools to design, build and debug an application.

Access   **Analyzer**

#### Analyzer Options

Option	Action	Shortcut	See also
<b>Execution Analyzer</b>	Manage the <b>Analyzer scripts</b> for your model, using the <b>Execution Analyzer</b> window.	<b>Shift+F12</b>	<a href="#">Managing Analyzer Scripts</a> <a href="#">[2175]</a>
<b>Debugger</b>	Control a <b>debugging</b> session and review the <b>output</b> , using the <b>Debug</b> window.	<b>Alt+8</b>	<a href="#">Debugging</a> <a href="#">[2222]</a>
<b>Recorder</b>	Review the information <b>recorded</b> during a debug session, using the <b>Record &amp; Analyze</b> window.		<a href="#">The Recording History</a> <a href="#">[2533]</a>
<b>Simulator</b>	<b>Simulate</b> the debugging of an application during the design of that application, using the <b>Simulation</b> window.		<a href="#">Model Simulation</a> <a href="#">[2463]</a>
<b>Simulation Events</b>	Manage the <b>triggers</b> and <b>sets of events</b> in a simulation, using the <b>Simulation Events</b> window.		<a href="#">Simulation Events Window</a> <a href="#">[2504]</a>
<b>Profiler</b>	Create <b>execution profiles</b> to report on runtime aspects such as: <ul style="list-style-type: none"> <li>• What functions are most-frequently called in an application</li> <li>• Which tasks are taking longer than expected, and</li> </ul>		<a href="#">Profiling</a> <a href="#">[2555]</a>

Option	Action	Shortcut	See also
	<ul style="list-style-type: none"> <li>Which tasks are taking the longest time to execute</li> </ul> <p>This information is displayed on the <b>Profiler</b> window.</p>		
<b>Testpoint Manager</b>	Execute <b>test scripts</b> and monitor or control the output, using the <b>Testpoints</b> window.		<a href="#">Testpoint Management</a> <sup>[2577]</sup>
<b>Analyzer Workbench</b>	Create your own Class <b>workbench instances</b> and invoke methods on them, using the <b>Analyzer</b> - or <b>Object - Workbench</b> .		<a href="#">Object Workbench</a> <sup>[2567]</sup>
<b>Grammar Editor</b>	Create, edit and debug <b>context-free grammars</b> to define the <b>syntax</b> of programming languages (in Backus-Normal Form / Backus Naur Form), using the <b>Grammar Editor</b> view.		<a href="#">Grammar Framework</a> <sup>[1705]</sup>
<b>Breakpoints &amp; Events</b>	Manage <b>breakpoints</b> and <b>markers</b> for <b>debugging</b> and <b>Simulation</b> , using the <b>Breakpoints &amp; Markers</b> window.		<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup> <a href="#">Simulation Breakpoints</a> <sup>[2477]</sup>
<b>Call Stack</b>	Review the currently-running <b>threads</b> in a <b>debugging session</b> , using the <b>Call Stack</b> .		<a href="#">Capture Current Work Environment</a> <sup>[207]</sup>
<b>Locals</b>	Review the <b>local variables</b> and their values for the current local thread, using the <b>Locals</b> window.		<a href="#">View the Local Variables</a> <sup>[2234]</sup>
<b>Watches</b>	Evaluate data items that are <b>not</b> available as <b>local variables</b> - such as data items with static Class member items - using the <b>Watches</b> window.		<a href="#">View Variables in Other Scopes</a> <sup>[2237]</sup>
<b>Memory Viewer</b>	Review a <b>process memory</b> debugging session, using the <b>Memory Viewer</b> window.		<a href="#">Inspect Process Memory</a> <sup>[2242]</sup>
<b>Modules</b>	Review details of the loaded <b>modules</b> , using the <b>Modules</b> window.		<a href="#">Show Loaded Modules</a> <sup>[2243]</sup>
<b>Debug</b>	Execute a sequence of <b>debugging commands</b> ,		<a href="#">Debug Menu</a> <sup>[114]</sup>

Option	Action	Shortcut	See also
	initiated through the <b>Debug</b> menu.		
<b>Record</b>	Execute a sequence of commands for <b>recording a debug session</b> ; these commands are initiated through the <b>Record</b> menu.		<a href="#">Record Menu</a> <sup>[115]</sup>
<b>Build</b>	Execute the <b>Build script</b> for the selected package; the script would have been previously created in the <b>Execution Analyzer</b> dialog.  The output from the script is displayed in the Build tab of the System Output window.	<b>Ctrl+Shift+F1 2</b>	<a href="#">Add Build Commands</a> <sup>[2180]</sup>
<b>Run</b>	Execute the <b>Run script</b> for the selected package; the script would have been previously created in the <b>Execution Analyzer</b> dialog.  The output from the script is displayed in the Build tab of the System Output window.	<b>Ctrl+Alt+N</b>	<a href="#">Add Run Command</a> <sup>[2217]</sup>
<b>Test</b>	Execute the <b>Test script</b> for the selected package; the script would have been previously created in the <b>Execution Analyzer</b> dialog.  The output from the script is displayed in the Build tab of the System Output window.	<b>Ctrl+Alt+T</b>	<a href="#">Add Testing Command</a> <sup>[2182]</sup>
<b>Deploy</b>	Execute the <b>Deploy script</b> for the selected package; the script would have been previously created in the <b>Execution Analyzer</b> dialog.  The output from the script is displayed in the Build tab of the System Output window.	<b>Ctrl+Shift+Alt +F12</b>	<a href="#">Add Deploy Command</a> <sup>[2218]</sup>

- [Execution Analyzer](#) <sup>[2527]</sup>

#### 2.4.3.8.1 Debug Menu

As you model and test software applications, you can execute complete **debugging sessions** on the code and observe the outcome as **Sequence diagrams** generated from the Call Stack.

**Access**    **Analyzer | Debug**

#### Debugging Options

Option	Action	Shortcut	See also
<b>Debug Run</b>	Start or resume the <b>debugger</b> .  If no debug session is in progress, the active Analyzer Script is used to determine which application to run or whether the debugger should attach to an already running process.	<b>F6</b>	<a href="#">Run the Debugger</a> <small>[223]</small>
<b>Debug Pause</b>	<b>Suspend</b> execution of process being debugged.		
<b>Step Into</b>	<b>Step into</b> the current function.	<b>Shift+F6</b>	
<b>Step Over</b>	<b>Step over</b> the current function.	<b>Alt+F6</b>	
<b>Step Out</b>	<b>Step out</b> of the current function.	<b>Ctrl+F6</b>	
<b>Debug Stop</b>	<b>Stop</b> the current debug session.	<b>Ctrl+Alt+F6</b>	<a href="#">Create Sequence Diagram Of Call Stack</a> <small>[224]</small>
<b>Generate Sequence Diagram From Stack</b>	Create a <b>Sequence diagram</b> from the <b>Stack Trace History</b> .		
<b>Register as Just-In-Time Debugger</b>	Register Enterprise Architect as the <b>operating system debugger</b> , saving the currently registered debugger.  When an exception or crash occurs in an application running <b>outside</b> Enterprise Architect, the Enterprise Architect debugger is opened so that you can debug the application.  When this option is de-selected again, the previously-registered debugger is restored.		

#### 2.4.3.8.2 Record Menu

As you model, test and debug software applications, you can **record** the execution of the debugging sessions on the code, and generate **Sequence**, **Test Point** and **Collaboration Class** diagrams from the recording.

**Access**    **Analyzer | Record**

#### Debug Recording Options

Option	Action	Shortcut	See also
<b>Start Debug Recording</b>	Enter <b>manual</b> record mode; each time you step into a function, the call is captured.  When you step out, the return is captured.  This option is available when the target program is at a breakpoint.		<a href="#">The Recording History</a>  <sup>[2533]</sup> <a href="#">Recorder Toolbar</a>  <sup>[2544]</sup>
<b>Stop Debug Recording</b>	Stop the recording.  This option is available when recording is in progress.		
<b>Auto Record Thread</b>	Record the thread that is halted, and resume execution of the program; whenever the thread makes a function call or a function call exits, this information is captured to the <b>History window</b> .  The Stack Trace History, Stack tab and Source Code Editor dynamically update to reflect the current execution sequence for the thread. Stack Trace Recording ends when the thread ends or when you click on the <b>Stop</b> button.  This option is available when the target program is at a breakpoint.		
<b>Show/Hide Execution</b>	Display the executing code while the recording is in progress. The <b>Call Stack</b> is updated in real time, even while recording is in progress.  Watching this window while recording can give a quick picture of what is going on, even without producing a Sequence diagram.  This option slows recording down considerably, and is not necessary when recording is being controlled by recording markers.		<a href="#">View the Call Stack</a>  <sup>[2239]</sup>
<b>Generate Sequence Diagram</b>	Create a Sequence diagram from the <b>Record &amp; Analyze</b> window.		<a href="#">Generating Sequence Diagrams</a>  <sup>[2549]</sup>
<b>Generate Testpoint Diagram</b> <b>Generate Class Diagram</b>	Create a Testpoint or Collaboration Class diagram from the stack trace in the <b>Record &amp; Analyze</b> window.		<a href="#">Testpoint Management</a>  <sup>[2577]</sup> <a href="#">Combine Testpoints</a>  <sup>[2586]</sup> <a href="#">Recorder Toolbar</a>  <sup>[2544]</sup>

### 2.4.3.9 Extensions Menu

Whilst modeling in Enterprise Architect, you can extend and specialize the product's capabilities by using Add-Ins (extensions written in COM that interact with the Enterprise Architect user interface), and by importing XML files from specific technologies, working with them and publishing model information in XML format back to the technologies.

Menu options are provided for:

- An Add-In when the product has been loaded into the system on start-up using the Manage Add-Ins dialog (below)
- ODM, ArcGIS, BPMN 2.0 and GML when they have been enabled through the MDG Technologies dialog (**Settings | MDG Technologies**)

#### Access   **Extensions**

#### Technology Options

Option	Action	Shortcut	See also
<b>ArcGIS</b>	Display a menu of options for the built-in MDG Technology for ArcGIS, a technology supporting geospatial data modeling. Using this menu you can: <ul style="list-style-type: none"> <li>• Create new model packages using patterns</li> <li>• Import ArcGIS data models</li> <li>• Export models to schema and</li> <li>• Configure the ArcGIS technology</li> <li>• Validate your ArcGIS model</li> </ul>	<b>Ctrl+Shift +M</b>	<a href="#">Geodatabase Design for ArcGIS</a> <sup>[1944]</sup>
<b>ODM</b>	Display a menu of options for the built-in MDG Technology for Ontology Definition Metamodel (ODM), a technology for developing large-scale ontologies for project domains. Using this menu you can: <ul style="list-style-type: none"> <li>• Import OWL/RDF XML files</li> <li>• Export packages as OWL/RDF XML files</li> <li>• Define new namespaces for ODM packages and</li> <li>• Define new labels for OWL and RDF elements</li> </ul>		<a href="#">MDG Technology for ODM</a> <sup>[1971]</sup>
<b>GML</b>	Display a menu of options for the built-in MDG Technology for GML, a technology supporting geographical feature modeling. Using this menu you can: <ul style="list-style-type: none"> <li>• Generate GML Application Schema from models</li> </ul>		<a href="#">MDG Technology For GML</a> <sup>[1983]</sup>
<b>Import</b>	Display a menu of options for importing XML/XML from a variety of formats. ArcGIS, OWL/RDF and EMX are specifically supported, but a wide range of other tools' XML output can be imported into Enterprise Architect		<a href="#">ODM Commands</a> <sup>[1980]</sup> <a href="#">Import ArcGIS XML Workspace</a> <sup>[1968]</sup>

Option	Action	Shortcut	See also
	using the <b>Other Tools/Formats</b> menu option.		
<b>Publish</b>	<p>Display a menu of options for Publishing (exporting) Enterprise Architect model information in a specific format for consumption by other tools or processes.</p> <p>A wide range of output formats is supported, and you can further tailor the output by including or excluding diagram information, Enterprise Architect specific extensions and so on. You would tailor your published file for the capabilities of the tool or process expected to consume it.</p> <p>The <b>Normative XMI 2.4.1</b> option provides a quick means of exporting model information in the latest UML/XMI combination with no Enterprise Architect extension information or diagram information. This format is most useful for standards development and for base interoperability with other UML based tools.</p> <p>Note that you should not use this menu to Publish model information for consumption by other users of Enterprise Architect. For that purpose, use the <b>Project   Model Import/Export</b> options.</p>		<a href="#">Publish Model Package</a> <sup>[478]</sup> <a href="#">Model Import/Export Submenu</a> <sup>[90]</sup> <a href="#">ODM Commands</a> <sup>[1980]</sup> <a href="#">Export ArcGIS XML Workspace</a> <sup>[1961]</sup>

#### Dynamic/Configuration options for Add-Ins such as TOGAF or UPDM

Option	Action	Shortcut	See also
<b>&lt;Add-In Name(s)&gt;</b>	<p>Access the facilities of the selected Add-In, through a submenu (below).</p> <p>For example, if you have TOGAF enabled on your system, you could click on the <b>TOGAF</b> menu option and display the options available to you as a TOGAF user.</p>		
<b>Add-In Windows</b>	<p>Display a window, or list of windows, provided by any Add-Ins you have installed and enabled.</p> <p>If no windows are provided, an empty, docked Add-Ins window displays.</p>		
<b>Manage Add-Ins</b>	<p>Display the Manage Add-Ins dialog, which you use to enable or disable Add-Ins for use.</p> <p>Any technology loaded by an Add-In is automatically enabled; if you do not want to use it, you can disable it on the dialog.</p>		<a href="#">The Add-In Manager</a> <sup>[8018]</sup>

**Add-In Submenu**

Option	Action	Shortcut	See also
<b>&lt;Add-In specific options&gt;</b>	List options to perform various functions specific to the Add-In.  For example, the MDG Technology For Zachman Framework, as an Add-In, has the options <b>Open Example Model</b> and <b>Insert New Framework Model</b> .		
<b>Help</b>	Display the Help subsystem for the Add-In (if one has been provided).		
<b>About</b>	Display information on the Add-In installation, such as version, registration details and copyright statement.		

**2.4.3.10 Settings Menu**

When you set up a project, you need to configure several types of reference data, default settings and directory paths for the project, such as stereotypes, Tagged Values, cardinality values, data types, language macros, local directories and image library content. You access the facilities for configuring this data from the **Settings** menu.

**Access **Settings******Configure Project Settings**

Option	Action	Shortcut	See also
<b>UML Types</b>	Set up the stereotypes, Tagged Value Types and the cardinality list for your project, on the corresponding tabs of the UML Types dialog.		<a href="#">Stereotype Settings</a> [1147] <a href="#">Tagged Value Types</a> [1150] <a href="#">Cardinality</a> [1151]
<b>Project Types</b>	Display the options to register the people involved in the project, and the categories or status types for a number of object properties.		<a href="#">Project Types Submenu</a> [120]
<b>Namespace Roots</b>	Locate and delete model namespaces.		<a href="#">Namespaces</a> [2120]
<b>Project Template Package</b>	Configure or change the default element template directory.		<a href="#">Set Element Templates Package</a> [929]

Option	Action	Shortcut	See also
<b>Auto Names and Counters</b>	Set up automatic naming and counters for elements. The conventions you define can be applied to names or aliases, or both.		<a href="#">Set Auto Naming and Auto Counters</a> 
<b>MDG Technologies</b>	Activate and connect to MDG Technology files.		<a href="#">Manage MDG Technologies</a> 
<b>Local Directories and Paths</b>	Configure local directories and paths for each of your programming languages.		<a href="#">Local Paths</a> 
<b>Code Engineering Datatypes</b>	Add, modify and delete programming language datatypes.		<a href="#">Data Types</a> 
<b>Preprocessor Macros</b>	Add and delete preprocessor macros that are skipped during reverse engineering.		<a href="#">Language Macros</a> 
<b>Database Datatypes</b>	Add, modify and delete database datatypes.		<a href="#">Add New Datatypes</a> 
<b>Images</b>	Import and configure custom images to be applied to elements in the model.		<a href="#">Using the Image Manager</a> 
<b>Colors</b>	<p>Configure the custom colors for the project.</p> <p>There are two options:</p> <ul style="list-style-type: none"> <li>• <b>Get Project Custom Colors</b> (import from the Project file)</li> <li>• <b>Set Project Custom Colors</b> (export to the Project file)</li> </ul> <p>Custom colors are used in setting the default appearance of an element in a diagram.</p>		<a href="#">Set an Element's Default Appearance</a> 

#### 2.4.3.10.1 Project Types Submenu

The **Project Types** submenu enables you to create and manage project variables and definitions for use across the project.

Access    **Settings | Project Types**

##### Set Project Types

Option	Action	Shortcut	See also
<b>People</b>	Configure the authors, clients, resources and roles for		<a href="#">People</a> 

Option	Action	Shortcut	See also
	your project.		
<b>General Types</b>	Configure requirement types, status types, constraints and scenarios for your project.		<a href="#">General Types</a> <sup>[1158]</sup>
<b>Project Indicators</b>	Define the project indicators (risks, efforts and metrics) used in Resource Management.		<a href="#">Risk Types</a> <sup>[524]</sup> <a href="#">Effort Types</a> <sup>[522]</sup> <a href="#">Metric Types</a> <sup>[523]</sup>
<b>Maintenance</b>	Define problem types and test types.		<a href="#">Maintenance</a> <sup>[1169]</sup>
<b>Estimation Factors</b>	Configure estimation factor types (Technical Complexity Factors, Environmental Complexity Factors, and Default Hour Rate) for your project.		<a href="#">Use Case Estimation</a> <sup>[584]</sup> <a href="#">Technical Complexity Factors</a> <sup>[585]</sup> <a href="#">Environment Complexity Factors</a> <sup>[586]</sup> <a href="#">Default Hours</a> <sup>[588]</sup>

### 2.4.3.11 Window Menu

The **Window** menu provides a range of options for controlling how currently-open system windows and views are displayed and used.

Access **Window**

#### Window Control options

Option	Action	Shortcut	See also
<b>Full Screen</b>	<p>Reset the display to full screen so that only the work area and main menu are shown - no toolbars or windows.</p> <p>To return to your normal working display, either click on the <b>Full Screen</b> option again or click on the <b>Close Full Screen</b> pop-up menu option.</p> <p>You can also restore individual menus and toolbars using the <b>View</b> menu options.</p>	<b>Shift+Alt+Enter</b>	<a href="#">View Submenus</a> <sup>[84]</sup> <a href="#">Manage Workspace Layout</a> <sup>[163]</sup>

Option	Action	Shortcut	See also
<b>Save All Modified</b>	Save all changes that you have made.		
<b>Reload Current View</b>	Refresh the current view.		<a href="#">Refresh View of Shared Project</a> [308]
<b>Set Focus to Current View</b>	Make the current view the active one, so that key strokes immediately act on that view.	<b>Ctrl+Shift+0</b>	
<b>Float Current View</b>	<p>Switch the current view into a floating window that you can move around your screen(s) and dock in any convenient location.</p> <p>This option is very useful for displaying two or more diagrams or views at the same time, which makes it easier to copy or drag and drop elements between them. Other points to consider are:</p> <ul style="list-style-type: none"> <li>• The view windows are not affected by the <b>Full Screen</b> option (above); other window management options do apply to them</li> <li>• A working set that includes floating or docked views will, when activated, re-open the views at their most recent location</li> <li>• Floating or docked diagrams display the Caption Bar, but not the Format toolbar that is attached to the tabbed diagrams in the Diagram View</li> </ul> <p>You can also make a tabbed view into a floating view by simply clicking on the tab and dragging it off the row of Diagram Tabs.</p> <p>To restore a floating view to a tab in the Diagram View, right-click on its Caption Bar and select the <b>Tabbed Document</b> option.</p>		<a href="#">Working Sets</a> [56↑]  <a href="#">Diagram View</a> [78↓]
<b>Close Current View</b>	Close the current view.		
<b>Close All Except Current</b>	Close all views except the currently selected view.		
<b>Close All</b>	Close all opened windows in the main tab view.		
<b>Auto Hide Active Window</b>	Autohide [132] the window that currently has focus.	<b>Ctrl+Shift+F4</b>	<a href="#">Autohide</a>

Option	Action	Shortcut	See also
<b>Auto Hide All Docked Windows</b>	Autohide <sup>[132]</sup> all windows that are docked.		<a href="#">Windows</a> <sup>[132]</sup>
<b>Close Active Window</b>	Close the window that currently has focus.	<b>Ctrl+F4</b>	
<b>Show Start Page</b>	Show or hide the Start Page.  The setting of this option persists through shut down and restart, until you specifically change the option again.		<a href="#">The Start Page</a> <sup>[68]</sup>
<b>Always on Top</b>	Force the main Enterprise Architect window to be on top of all other windows.		

### 2.4.3.12 Help Menu

The **Help** menu provides access to the Enterprise Architect Help files, the Read Me file, the Enterprise Architect End User License Agreement and a range of features on the Sparx Systems website.

Access   **Help**

#### Help Options

Option	Action	Shortcut	See also
<b>About EA</b>	Display information about Enterprise Architect, including your registration details.		
<b>Help Contents</b>	Display the Enterprise Architect Help, starting at the <i>Introduction to Enterprise Architect</i> page.		
<b>On-Line Resources</b>	Display a submenu of options for accessing Online Resources; see below.		
<b>Open Example Model</b>	Open the <i>EAExample</i> model provided with Enterprise Architect.  New users can explore the example model to immediately see a range of existing model structures and diagrams, several of which are constructed to help demonstrate many of Enterprise Architect's modeling features.		

Option	Action	Shortcut	See also
<b>Register and Manage License Key(s)</b>	Configure and manage the license keys used to register Enterprise Architect and its Add-Ins.		<a href="#">License Management</a> <sup>[3162]</sup>

<b>Pricing and Purchase Options</b>	Display details on purchasing or upgrading Enterprise Architect over the internet.		<a href="#">Purchase or upgrade Enterprise Architect</a>

## 2.4.4 Standard Windows

As you work on your project, creating and reviewing model structures, you can make use of a wide range of system windows that help you locate and focus on particular types of object or object properties. To make your modeling tasks even easier, you can fix these windows in a convenient place on your screen, move them around, set them as callable tabs or autohide them.

You can access these windows through:

- **Main Menu** options, such as those on the **View**, **Project**, **Diagram** or **Element** menus, or
- Options on the context menu that displays when you right-click anywhere on the **Main Menu** bar

### The Standard windows

Window	See also
<b>Project Browser</b> - The Project Browser is the primary mechanism for navigating through and exploring your model and is the starting point for many of the most important features in Enterprise Architect. It lists the model packages, diagrams, elements and element features in a hierarchical structure, reflecting the arrangement of packages and elements within your model.	<a href="#">The Project Browser</a> 
<b>Properties window</b> - The Properties window provides a convenient, concise way to view (and in some cases edit) the common properties of a selected element.	<a href="#">Properties Window</a> 
<b>Testing window</b> - The Testing window, or workspace, lists the <b>test records</b> for a selected element, ready for modification or addition. The window provides several facilities for managing the test records.	<a href="#">Working on Test Records</a> 
<b>Maintenance window</b> - The Maintenance window, or workspace, lists the <b>maintenance records</b> (defects, changes, issues and tasks) for a selected element, ready for modification or addition. The window provides several facilities for managing the maintenance records.	<a href="#">Working on Maintenance Items</a> 
<b>Diagram Toolbox</b> - The Diagram Toolbox is a panel of icons that you drag onto a diagram to create elements and connectors. Related elements and connectors are organized into Toolbox <b>pages</b> , each page containing the elements or connectors used for a particular type of diagram.	<a href="#">Diagram Toolbox</a> 
<b>Resources window</b> - The Resources window provides useful shortcuts and re-use functions for creating and applying stock components in the current model. The	<a href="#">Resources</a> 

Window	See also
<p>window contains a tree structure of Document templates, Relationship Matrix profiles, Stylesheets, UML Patterns and commonly-used model elements. The window can also provide access to UML Profiles and MDG Technologies, although this is not the recommended route to these facilities.</p>	
<p><b>Source Code Viewer</b> - The viewer displays the generated source code for a selected Class element, and provides a number of facilities for <b>editing</b> that source code.</p>	<a href="#">Editing Source Code</a> 
<p><b>Scripting window</b> - The Scripting window hosts a flexible and easy to use scripting capability to create scripts in Javascript, Microsoft JScript or VBScript. Using a built in 'Repository' object, you can programmatically inspect and/or modify elements within the currently open model. The window provides tools to edit, run, debug and manage your scripts.</p>	<a href="#">Scripting</a> 
<p><b>Debug window</b> - The Debug window provides a set of facilities for starting, managing and halting a debug session on the code generated from elements of your model.</p>	<a href="#">Run the Debugger</a> 
<p><b>Learning Center</b> - The Learning Center provides quick access to a range of context-specific task guides in a number of work areas of the system, such as Getting Started, Modeling or Testing.</p>	<a href="#">Learning Center</a> 
<p><b>Notes window</b> - Notes are the main documentation feature you use to describe an element, diagram, feature or connector; in the documentation that Enterprise Architect generates, notes feature prominently. You can record and view notes on a modeling object using the Notes window.</p>	<a href="#">Notes</a> 
<p><b>Traceability window</b> - Using the Traceability window you can quickly see what elements are immediately linked to the selected element and in what relationships, and what elements are indirectly linked via a <b>chain</b> of relationships. You can also select a diagram and explore the relationships of all elements in that diagram.</p>	<a href="#">The Traceability Window</a> 
<p><b>Tagged Values window</b> - Tagged Values are a convenient method of adding additional information to an element or connector, beyond what is directly supported by UML. A Tagged Value is the <b>value</b> of a property of a modeling item, the property being called a <b>tag</b>.</p> <p>You can create, view and edit Tagged Values for the currently-selected modeling object using the Tagged Values window.</p>	<a href="#">Tagged Values</a> 
<p><b>Project Management window</b> - You use the Project Management window to record and manage the resources, effort, risk and metrics associated with the work in developing the area of the model represented by the selected element.</p>	<a href="#">The Project Management Window</a> 

Window	See also
<b>Model Views</b> - The Model Views window provides a mechanism for representing areas of your model in any of a number of different ways, to capture a particular aspect of the structure or purpose of the model.	<a href="#">Model Views</a> <sup>[686]</sup>
<b>Element Browser</b> - You can use the Element Browser to summarize, review and manage a wide range of added-on properties of the selected element. These added-on properties include methods, attributes, Tagged Values, relationships and responsibilities.	<a href="#">The Element Browser</a> <sup>[989]</sup>
<b>Relationships window</b> - The Relationships window lists all the relationships of the currently-selected element, and shows the properties of each relationship.	<a href="#">The Relationships Window</a> <sup>[742]</sup>
<b>Scenarios &amp; Requirements window</b> - The Scenarios & Requirements window is a three-tabbed window through which you can quickly add, view, edit and delete rules applied to the selected element. The entities that impose such rules are scenarios, constraints and requirements applied to the element.	<a href="#">Element Scenarios &amp; Requirements</a> <sup>[992]</sup>
<b>Pan &amp; Zoom window</b> - The Pan and Zoom window enlarges the current diagram by a percentage you define, and displays a thumbnail view of it with a shaded rectangle. As you move the shaded rectangle with the mouse, the diagram shows the magnified items of the structure underneath the rectangle.	<a href="#">The Pan &amp; Zoom Window</a> <sup>[698]</sup>
<b>Layout Diagrams</b> - The Layout Diagrams window provides a set of <b>diagram layout formats</b> that you can apply to a diagram you have created, to automatically reorganize the layout to make it more readable.	<a href="#">Layout Diagrams</a> <sup>[874]</sup>
<b>Team Review</b> - The Team Review window provides a structured internal <b>forum</b> that your team can use to discuss aspects of the model content and development.	<a href="#">Team Review Tools</a> <sup>[343]</sup>
<b>Diagram Filters</b> - You use the Diagram Filters window to modify the display of diagram components so that relevant items are immediately identified for the reader's attention, without damaging the structure and integrity of the model.	<a href="#">Diagram Filters</a> <sup>[718]</sup>

### Notes

- On the **Testing**, **Maintenance** and **Project Management** windows, any descriptive text, history, input or results for a selected item are also displayed in the **Notes** window; you cannot edit this text in the Notes window

### 2.4.4.1 Dock Windows

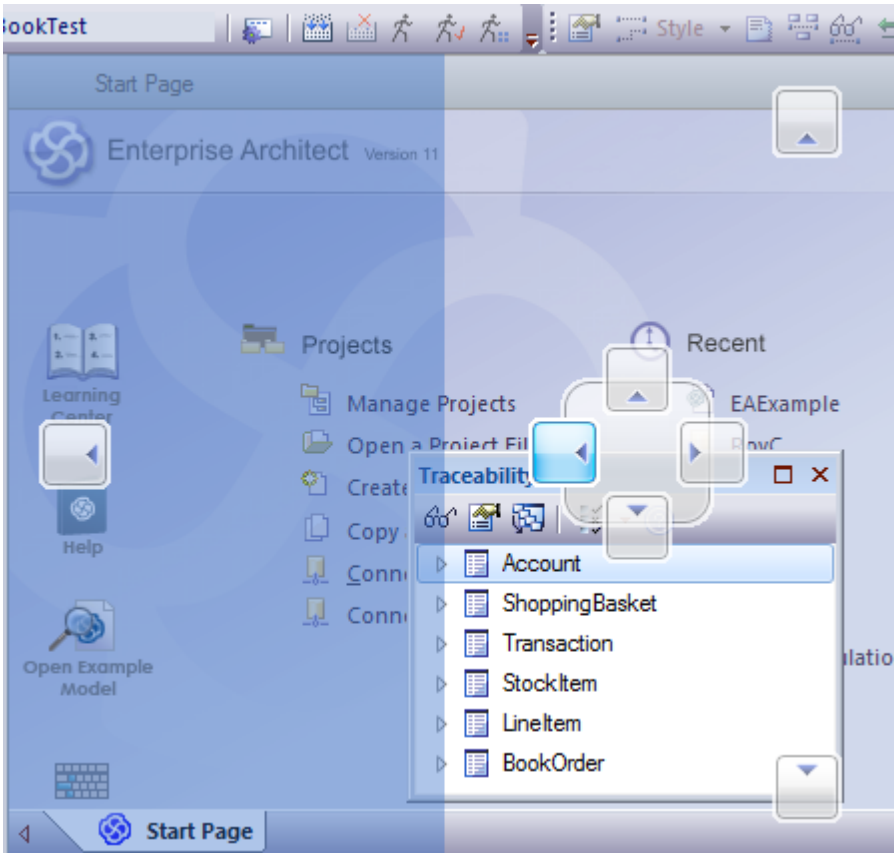

When you are doing work using one or more of the Enterprise Architect **windows**, you can re-position and/or group the windows to make them easier to use. You can easily move any window around the **application workspace** and either **dock** (anchor) it against the top, bottom, left or right edge of the workspace for long-term use, or just drop it where it is most convenient for the moment (that is, leave it **floating**).

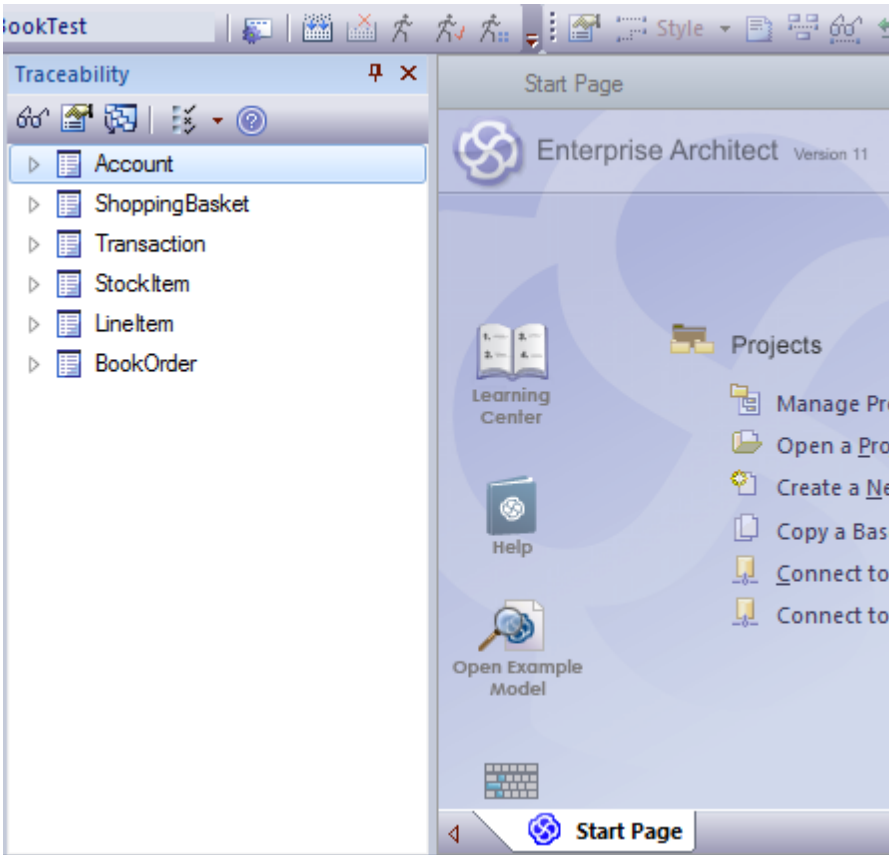

All the windows are **resizable**, so you can also drag the window margins to make the window a convenient size and shape to display either just a column or row, or a large section of the information it contains.

#### Dock a Window Against an Edge

Step	Action	See also
1	<p>Click on the title bar of the window and start to drag it towards the appropriate edge of the workspace. A set of positioning icons display, consisting of a <b>navigation compass</b> in the body of the application workspace and a <b>compass pointer</b> in the middle of each edge.</p> 	
2	<p>Drag the window onto a compass point.</p> <p>The screen display shades the area that the window will fill, once you release the mouse button.</p>	

Step	Action	See also
	 <p>The screenshot shows the Enterprise Architect Version 11 Start Page. On the left, there are icons for Learning Center, Help, and Open Example Model. In the center, there is a 'Projects' section with a list of actions: Manage Projects, Open a Project File, Create, Copy, Connect, and another Connect. On the right, a 'Recent' window is open, displaying a list of recent projects: Account, ShoppingBasket, Transaction, StockItem, LineItem, and BookOrder. The 'Account' project is currently selected. The background of the Start Page is a light blue gradient with a large, faint 'E' logo.</p>	
3	Release the mouse button to dock the window.	

Step	Action	See also
	 <p>The docked window initially fills the previously-highlighted space, but you can drag the margins to resize the window, if you wish.</p>	

Notice that the window docking is an **insert**, not an **overlay**; in the illustration, the left border of the Start Page now sits just under the 'ticked man' icon in the toolbar.

The docking behavior varies depending on whether you have already docked other windows on the screen, whether you use the navigation compass or the compass point icons, and where you drag the docked window before you release the mouse button. If you drag and release the window over:

- A point of the **navigation compass** in the **center** of the screen, the window sits **inside** existing docked windows (for example, in the illustration a window released on the bottom, top or left icons of the navigation compass would be docked to the **right** of the Traceability window)
- A **separate compass point** icon on the edge of the screen, the window is docked on the **outside** edge of the screen and existing docked windows are pushed inwards
- A point of the **navigation compass** at the **edge** of the screen (only when there is **already** a docked window there) the window is docked **within** the area occupied by the previously docked window (for example, in the illustration you could dock your new window as the left, right, top or bottom segment of the Traceability window space; the Traceability window itself is reduced in size to accommodate the new docked window, but you can then adjust the margins of the two docked windows to improve

readability)

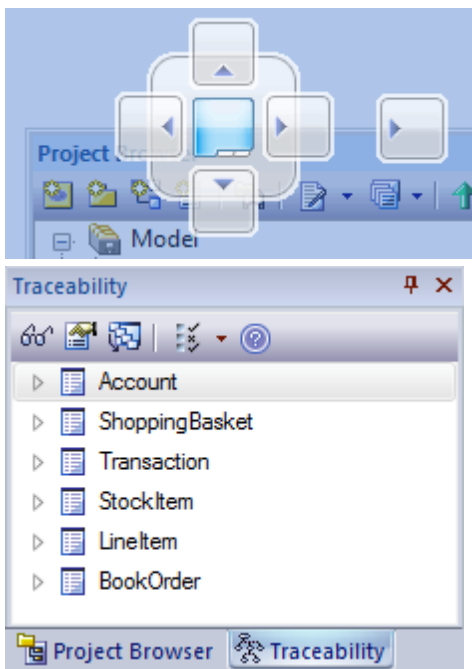

- The **center** of the **navigation compass** at the **edge** of the screen (only when there is **already** a docked window there) the window is docked as a **tab** of a window **frame**; see below

The highlighted area always indicates exactly where the moved window will be docked, so you have an indication of the effect before you release the window.

### Dock Windows into a Frame

A docked window does not overlap any other window, so if you are docking several windows you progressively fill up the workspace; however, you can avoid this by **combining** the docked windows in a single **tabbed frame** by either:

- Dragging the title bar of each window up to the title bar of the first docked window, or
- Dragging each window over the 'tabbed frame' icon in the middle of the navigation compass, when the compass is over the previously-docked window that you want to combine the dragged window with; when you release the mouse button, the window becomes a tab of the frame

The Project Browser becomes a tab -

You can move and re-dock a frame of windows as if they were a single window.

To **separate** a window from a tabbed frame, click on the window's tab at the bottom of the frame and drag it away.

### Floating Windows

To float a window anywhere on the screen, click on its **title bar** and drag it to where you want it to sit. The navigation compass displays, but you ignore it in this situation. Floating windows **can overlay** each other, which is convenient if you want to compare information displayed in two windows. You can drag one window under or over another so that the relevant pieces of information are adjacent, do your check, then move the windows apart again.

Learn more

- [Standard Windows](#) <sup>[125]</sup>
- [Autohide Windows](#) <sup>[132]</sup>

**2.4.4.2 Autohide Windows**

If you are using docked windows, you can have them available for use but kept minimized or **hidden** until you actually need to use them. The windows are represented by tabs in the top, bottom, left or right margins of the work area.

When you move the cursor over the tab, the window displays and you can work within it. As soon as you move the cursor out of the window, it **automatically** contracts into the margin tab again. This means that you have the maximum work area for performing your main task, with the convenience of still being able to immediately use any of a wide range of other windows.

If you have 'hidden' a **tabbed frame** of docked windows, the 'open' hidden window is represented by the tab, whilst the others are indicated by an icon. In the illustration, the Project Browser is the open hidden window in the frame containing (continuing downwards) the Tagged Values window, Package Browser and Model Views window. You move the cursor over an icon to expand both the tab and the associated window.

**Autohide a Window or Set of Windows**

- To set the displayed window to 'autohide', click on the  button in the top right corner of the window; any other windows in the same frame as the open window are set to 'autohide' as well
- To turn off 'autohide' for a particular window, or set of windows within a frame, click on the  button

**Notes**

- You can only autohide docked windows; if you want to autohide a floating window, dock it against a margin first
- When you select an autohidden window, it immediately displays against the nearest work area margin; you can make the autohidden window **slide** out of and into the margin by selecting the **View | Visual Style | Animate Autohide Windows** menu option

**2.4.4.3 Code Editors**

Enterprise Architect provides a number of **editors** that you can use across the development environment to maintain scripts, code and templates. Each editor has its own features, but they are all based on a common **Code Editor control**.

You can have several code editors (or files within a code editor) open at the same time, as separate tabs in the Enterprise Architect central work area (the 'Diagram View'). You can also close the editors individually or all together, leaving views of other types (such as diagrams or Document reports) still open.

Code Editors

Editor	Detail	See also
<b>Shape Script Editor</b>	When you create a <b>Shape Script</b> to alter the appearance of an element or connector through the use of a stereotype, you create and edit the script using the Shape Script Editor, which provides a number of facilities including <b>Intelli-sense</b> for Shape Script attributes and functions.	<a href="#">Shape Script Editor</a> <sup>[1584]</sup>
<b>Code Generation Template Editor</b>	You use the Code Generation Template Editor to create and edit templates that control the generation of code from your model elements. The facilities include Intelli-sense for a wide range of macros.	<a href="#">Code Generation Template Editor</a> <sup>[1641]</sup>
<b>Transformation Template Editor</b>	You use the Transformation Template Editor to create and edit templates that control the transformation of model structures from one domain to another (typically a generic domain to a code language specific domain).	<a href="#">Edit Transformation Templates</a> <sup>[2048]</sup>
<b>Custom SQL Search Filter Editor</b>	The Custom SQL Search Filter Editor is available through the <b>Model Search</b> facility, to define your own SQL searches for locating information in your model.	<a href="#">Custom SQL Search Filter Editor</a> <sup>[711]</sup>
<b>Database View Editor</b>	The Database View editor is available within the <b>View definition</b> field of a database View element Properties dialog. You create the View definition in SQL, using Intelli-sense for basic SQL keywords and functions.	<a href="#">Database View Editor</a> <sup>[2372]</sup>
<b>HTML and CSS Style Editor</b>	You use the HTML and CSS Style Editor to create web style templates from which to generate HTML reports. These templates incorporate a large number of HTML Template Fragments, which you edit to customize the reports for your specific purposes.	<a href="#">Create Web Style Templates</a> <sup>[2747]</sup>

Editor	Detail	See also
<b>Source Code Viewer</b>	You use the Source Code Viewer to both display and edit the source code files that you have generated or imported for an element. The Viewer/Editor is quite adaptable, and you can access it and use it in different ways for different types of source code file.	<a href="#">Editing Source Code</a> <sup>[2148]</sup>
<b>Script Editor</b>	Enterprise Architect provides a flexible and easy to use <b>scripting capability</b> to create scripts in Javascript, Microsoft JScript or VBScript for programmatically inspecting and/or modifying elements within the currently open model. You use the <b>Script Editor</b> to create and edit scripts, and to run, debug and stop an open script.	<a href="#">Script Editor</a> <sup>[2798]</sup>

## 2.4.5 Standard Toolbars

Enterprise Architect provides a set of **toolbars** containing convenient **shortcuts** to a wide range of common functions that you can perform on your project as a whole through to the individual modeling units. You can also **customize** the toolbars by deleting and reordering the default button set.

The toolbars are initially displayed in the toolbar banner at the top of the workspace, but you can display them at the foot of the workspace, drag and dock them within the workspace, or float them over the application; this is useful when you are using a certain set of functions a lot in a particular area.

You can also dock toolbars to the edge of the Enterprise Architect workspace by dragging them by the title bar and placing them against the appropriate edge.

#### Available toolbars

- [Default Tools Toolbar](#)<sup>[135]</sup>
- [Project Toolbar](#)<sup>[136]</sup>
- [Code Generation Toolbar](#)<sup>[144]</sup>
- [UML Elements Toolbar](#)<sup>[140]</sup>
- [Diagram Toolbar](#)<sup>[138]</sup>
- [Current Element Toolbar](#)<sup>[141]</sup>
- [Current Connector Toolbar](#)<sup>[143]</sup>
- [Build Toolbar](#)<sup>[147]</sup>
- [Record & Analyze Toolbar](#)<sup>[148]</sup>
- [Debug Toolbar](#)<sup>[146]</sup>
- [Workspace Layouts Toolbar](#)<sup>[149]</sup>
- [Status Bar](#)<sup>[150]</sup>
- [Format Toolbar](#)<sup>[783]</sup>
- [Notes Toolbar](#)<sup>[1143]</sup>

Each toolbar has a drop-down arrow at the right-hand end, , which can be enabled or hidden using the **Visual Style** sub-menu. If you click on this drop-down arrow, the **Add or Remove Buttons** option displays. Select this option to show a context menu listing the toolbars that are displayed on the same line as the current toolbar, and an option to customize toolbars - both your own and the system-provided toolbars.

You can select one of the toolbars identified on the context menu to list the icons available through that toolbar. Click on the icons as necessary to hide or show them in the toolbar.

- You can hide or show the toolbar by clicking on the **View | Toolbars | Current Element** menu option

### 2.4.5.6 Current Connector Toolbar

The **Current Connector** toolbar provides a number of options for quickly modifying the properties, style and direction of a connector, showing and hiding a connector and/or its labels, and pinning each end of the connector.

**Access** **View | Toolbars | Connector**

#### Current Connector Toolbar Options

Icon/Option	Action	Shortcut	See also
<b>Connector Properties</b>	Click on this option to display the <connector type> Properties dialog, on which you can view and edit the properties of the selected connector.	<b>Enter</b>	<a href="#">Connector Properties</a> <small>[1126]</small>
<b>Connector Style</b>	Click on the drop-down arrow and select the appropriate connector line style from the list. The options are: <ul style="list-style-type: none"> <li>Direct Route</li> <li>Auto Routing</li> <li>Custom Routing</li> </ul>	<b>Ctrl+Shift+D</b> <b>Ctrl+Shift+A</b> <b>Ctrl+Shift+C</b>	<a href="#">Connector Styles</a> <small>[1114]</small>
<b>Attach Note or Constraint</b>	Click on this option to display the Link Relations dialog, which you use to attach a note or constraint to the selected connector and to any other existing connectors in the current diagram.  Double-click on the Note element to display the Notes dialog on which to type in the Notes text.		<a href="#">Add a Note to a Connector</a> <small>[1111]</small>
<b>Show or Hide Connector Labels</b>	Click on this option to display the Label Visibility dialog, which you use to specify which of the eight possible label		<a href="#">Hide/Show Labels</a> <small>[1122]</small>

	positions around the selected connector are to be displayed.		
<b>Show and Hide Relationships</b>	Click on this option to display the Set Visible Relations dialog, through which you can show or hide each of the relationships between elements within the current diagram.	<b>Ctrl+Shift+I</b>	<a href="#">Relationship Visibility</a> <sup>[1115]</sup>
<b>Reverse Direction</b>	Click on this option to simply reverse the direction of the selected connector.		<a href="#">Reverse Connector</a> <sup>[1123]</sup>
<b>Pin Connector Ends</b>	Click on the down-arrow to select the end of the selected connector to pin to the source and/or target elements. The pinned end cannot be dragged off the point on the element border to which it has been fixed.		

#### Notes

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Current Connector** menu option

### 2.4.5.7 Code Generation Toolbar

The **Code Generation** toolbar provides options to import, generate, synchronize and open source code. Some of these options display convenient menus to quickly set, for example, the default language and default database type for the project.

Access **View | Toolbars | Code Engineering**

#### Code Generation Toolbar Options

Icon/Option	Action	Shortcut	See also
<b>Default Code Language</b>	Click on the drop-down arrow and click on a coding language in the list, to set that language as the default applied to all newly created Class elements.		<a href="#">Language Options</a> <sup>[2262]</sup>
<b>Default Database Type</b>	Click on the drop-down arrow and click on a database type in the list, to set that database type as the default applied to all newly created database elements.		<a href="#">Physical Data Model</a> <sup>[2335]</sup>

<b>Import</b>	<p>Click on the drop-down arrow to locate and select source files to import for reverse engineering code into new Class and Interface elements in the current diagram.</p> <p>Firstly, click on a coding language in the drop-down list to identify the file types to locate; this selection overrides the project's default language for this particular import.</p> <p>When you have selected a language, a browser dialog displays through which you browse for the file location and select from files with the extensions appropriate to the coding language you selected.</p> <p>When you click on a file, the system immediately imports it and generates elements from the file, in the current diagram. The progress of the reverse engineering is shown on a Progress dialog; click on the <b>Close</b> button when the process is complete.</p>		<a href="#">Notes on Source Code Import</a> <sup>[2139]</sup>
<b>Generate Source Code</b>	Click on this option to generate source code for the currently selected single Class element, through the Generate Code dialog.	<b>F11</b>	<a href="#">Generate a Single Class</a> <sup>[2113]</sup>
<b>(Batch) Generate Source Code</b>	<p>Click on this option to batch-generate source code for multiple selected Class elements.</p> <p>A Progress dialog displays and, if no target file is specified in the element, a prompt for the location of a file to generate the code into.</p>	<b>Shift+F11</b>	<a href="#">Generate a Group of Classes</a> <sup>[2114]</sup>
<b>Synchronize Element with Source</b>	<p>Click on this option to synchronize the selected Class element with its associated source code.</p> <p>The synchronization completes as a background task.</p>	<b>F7</b>	
<b>Open Source Code</b>	<p>Click on this option to open the source code of the selected Class, in the default code editor.</p> <p>The source code must have been generated, and the selected element must be a Class. Otherwise no action is taken.</p>	<b>F12</b>	<a href="#">Editing Source Code</a> <sup>[2146]</sup>

**Notes**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Code Generation** menu option

### 2.4.5.8 Debug Toolbar

The **Debug** toolbar provides access to tools for debugging program source code. From this toolbar you can:

- Attach to running processes
- Open a number of debugger windows
- Run, pause or terminate program execution
- Step over, step into or step out of program statements

**Access** [View | Toolbars | Debug](#)

#### Debug Toolbar Options

Icon/Option	Action	Shortcut	See also
<b>Drop-down Command List</b>	Click on the drop-down arrow and select options from the menu for attaching to a running process and accessing a range of debugging windows.		<a href="#">Debug Another Process</a> <a href="#">Breakpoint and Marker Management</a> <a href="#">View the Call Stack</a> <a href="#">View the Local Variables</a> <a href="#">View Variables in Other Scopes</a> <a href="#">Inspect Process Memory</a> <a href="#">Show Loaded Modules</a>
<b>Debug</b>	Click on this option to begin or continue execution of the current program.	<b>F6</b>	
<b>Pause-Resume</b>	Click on this option to pause or resume execution of the current program.		
<b>Step Over</b>	Click on this option to step over the next statement in the program.	<b>Alt+F6</b>	
<b>Step In</b>	Click on this option to step into the next function call in the program.	<b>Shift+F6</b>	

<b>Step Out</b>	Click on this option to step out of the current function call.	<b>Ctrl+F6</b>	
<b>Debug Stop</b>	Click on this option to stop debugging the current program.	<b>Ctrl+Alt+F6</b>	

### Notes

- The toolbar can be docked to any main window edge or floated freely in a convenient location for quick access
- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Debug** menu option

### Learn more

- [Run the Debugger](#) <sup>[223]</sup>

## 2.4.5.9 Build Toolbar

The **Build** toolbar provides access to tools for building program source code. From this toolbar you can:

- Build the currently active application
- Run the compiled application
- Run your Test and Deployment scripts

**Access** **View | Toolbars | Build**

### Build Toolbar Options

Icon/Option	Action	Shortcut	See also
<b>Active Analyzer Script</b>	Display the name of the currently active analyzer script.		
<b>Execution Analyzer</b>	Click on this icon to display the Execution Analyzer window, which you use to manage the Analyzer scripts for your model.	<b>Shift+F12</b>	<a href="#">Managing Analyzer Scripts</a> <sup>[217]</sup>
<b>Build Current Package</b>	Click on this icon to execute the <b>Build</b> script for the selected package.	<b>Ctrl+Shift+F12</b>	<a href="#">Add Build Commands</a> <sup>[218]</sup>

<b>Cancel Build</b>	Click on this icon to cancel execution of the Build script currently in progress.		
<b>Run Executable</b>	Click on this icon to execute the <b>Run</b> script for the selected package.	<b>Ctrl+Alt+N</b>	<a href="#">Add Run Command</a> <small>[2217]</small>
<b>Run Test Script</b>	Click on this icon to execute the <b>Test</b> script for the selected package.	<b>Ctrl+Alt+T</b>	<a href="#">Add Testing Command</a> <small>[2182]</small>
<b>Run Deployment Script</b>	Click on this icon to execute the <b>Deploy</b> script for the selected package.	<b>Ctrl+Shift+Alt+F12</b>	<a href="#">Add Deploy Command</a> <small>[2218]</small>

### Notes

- The toolbar can be docked to any main window edge or floated freely in a convenient location for quick access
- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Build** menu option

### Learn more

- [Build Application](#) [2221]

## 2.4.5.10 Record & Analyze Toolbar

The **Record & Analyze** toolbar provides access to tools for recording the execution of program source code. From this toolbar you can:

- Begin manual or automation recording of the currently active application
- Step through manual execution
- Generate sequence diagrams from a recording session

**Access** **View | Toolbars | Record**

### Record & Analyze Toolbar Options

Icon/Option	Action	Shortcut	See also
<b>Recorder Command List</b>	Click on the drop-down arrow to show a menu of commands for recording the execution of Analyzer scripts.		<a href="#">Recorder Toolbar</a> <small>[2544]</small>

<b>Recording</b>	Click on this icon to begin or resume recording of the current program.		<a href="#">Start Recording</a> 
<b>Manual Record</b>	Click on this icon to manually step-record the current thread.		
<b>Auto Record Selected Thread</b>	Click on this icon to auto-record an execution trace for the current thread.		
<b>Step Through</b>	Click on this icon to step into a function, record the function call in the History window, and step back out.  The option is enabled for manual recording only.	<b>Alt+;</b>	<a href="#">Step Through Function Calls</a> 
<b>Stop Recording</b>	Click on this icon to end the recording of program execution.		

**Notes**

- The toolbar can be docked to any main window edge or floated freely in a convenient location for quick access
- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Record** menu option

**Learn more**

- [Recording Sequence Diagrams](#) 
- [Recorder Toolbar](#) 

**2.4.5.11 Workspace Layouts Toolbar**

As you perform work on your model you use various toolbars and windows; you will quite likely use the same toolbars and windows regularly, in an arrangement that suits the way in which you use the system. Rather than having to re-open and arrange these tools at the start of each work session, you can use either a predefined or a customized work environment - or **workspace**. Workspaces:

- Automatically open and organize all the tools appropriate to an area of work such as Requirements Management, Code Engineering or Debugging
- Help a new user by:
  - Opening the tools that are appropriate to a task so that they can immediately get started, and
  - Showing the user what tools they should become familiar with for that area of work
- Help you switch rapidly to work environments for either successive or completely different areas of work
- Re-establish a work environment that you have accidentally or deliberately changed

To select, create and maintain workspaces you can use the **Workspace Layouts toolbar**, which you can leave in the Toolbar ribbon, dock to any main window edge or float freely in a convenient location for quick access.

**Access** [View | Toolbars | Workspace Layouts](#)

#### Workspace Toolbar Options

Icon/Option	Action	Short Cut	See also
<b>Save Workspace Layout As</b>	Click on this icon to save the current workspace layout under an existing name or a new name, using the Save Custom Workspace Layout dialog.		<a href="#">Manage Workspace Layout</a> [163]
<b>Manage Workspaces</b>	Click on this icon to open the Workspaces tab on the Workspaces and Commands dialog, to change to a different workspace layout, create or edit a layout, or delete a layout.		
<b>Select Layout</b>	Click on the drop-down arrow and select an existing workspace layout to immediately apply.  User-defined layout names have a preceding asterisk; system-provided layouts are not marked with an asterisk.		

#### 2.4.5.12 Status Bar

The **Status bar** displays at the bottom of the Enterprise Architect workspace. It shows information on the current operation and certain key settings, and provides a 'zoom bar' for adjusting the scale of the diagrams you view.

You can hide the Status bar itself by toggling the **View** menu option (below), and hide sections of the information that the Status bar shows by right-clicking on it and de-selecting either or both of the options:

- Zoom Slider
- Status Indicators

**Access** [View | Toolbars | Status Bar](#)

#### Status Bar Sections

Section	Information	See also
<b>Object Type/ Name</b>	Shows the type and name of the currently-selected diagram, or of the currently selected element in the diagram, or the status of the currently-displayed Model Search.	
<b>Creation data</b>	Shows the date and time at which the current diagram was created and last modified, the percentage zoom of the current display, and the normal page size of the diagram.	
<b>Element/ Feature Name</b>	Shows the name of the currently-selected element, attribute or operation.	
<b>Position and Size</b>	Shows the coordinates of the top left corner of the selected element, and the width and height of the element.	
<b>Zoom Control</b>	Allows a zoom to be applied to all diagrams, regardless of existing zoom levels and without impacting other users. Values range from 100% to 150%.	
<b>Status Indicators</b>	Indicates the status of the <b>Caps Lock</b> , <b>Num Lock</b> and <b>Scrl Lock</b> keyboard keys, and the <b>Connect to Cloud</b> facility (bold indicates 'in use', pale indicates 'off').	<a href="#">Start Page</a> [68]
<b>Display Maximized</b>	A triangle in the bottom right corner indicates that the screen is <b>not</b> maximized; you can drag the screen corner to increase the size of the window.	

### Notes

- The zoom facility has the same function as the **Scale view by** field on the Diagram Appearance page of the Options dialog; changes in the 'zoomed' display scale of a diagram update this field and **are applied to any other diagrams** that you open

### Learn more

- [Diagram Appearance Options](#) [62]

## 2.4.6 Customization

Enterprise Architect has a standard style and appearance, which you can customize to suit your work environment. Several facilities are available for customizing:

- The means of issuing commands to the system - such as menus, toolbars and keyboard keys - and the commands themselves
- The visual style and color of the user interface
- The windows you want to display together on the screen, and their position on the screen (the Workspace Layout)

If you want to quickly select the **sets** of definitions for the user interface to apply, you can select the **Interface Customization** option on the Start Page to customize the interface using the Interface Customization Wizard.

On occasion, you might want to use Enterprise Architect for two distinct types of operation at the same time. You can do this by storing **registry settings** - such as window layouts - to a different path in the registry, by adding the following command line argument when you run Enterprise Architect:

```
/regkey: <regkeyname>
```

You can also configure a wide range of **local** options and specific settings for using Enterprise Architect on your workstation, through the **Options dialog**.

#### Learn more

- [User Interface Customization](#)<sup>[167]</sup>
- [The Customize Dialog](#)<sup>[152]</sup>
- [Workspace Layouts Toolbar](#)<sup>[149]</sup>
- [Manage Workspace Layout](#)<sup>[163]</sup>
- [Customize Command Sets](#)<sup>[165]</sup>
- [Visual Styles](#)<sup>[168]</sup>
- [Local Options](#)<sup>[604]</sup>

### 2.4.6.1 The Customize Dialog

It is possible to customize the Enterprise Architect toolbar and keyboard commands and how they are displayed and made available to you, tailoring the user interface to suit your work methods and environment. You can also define a number of external applications that you can activate from the **Tools** menu. You perform these tasks using the Customize dialog.

#### Access

- Select the **Tools | Customize** option, or
- At the far right of any toolbar, click on the drop-down arrow and on the **Add or Remove buttons | Customize** option

#### Notes

- If a documented toolbar icon, keyboard combination or menu facility does not appear to be available, select the appropriate tab and click on the **Reset** or **Reset All** button to restore the toolbar, menu or key settings to the defaults; however, this also removes any customized icons, options or combinations you might have set, because it is possible that the customization itself has displaced or affected the default setting

#### Learn more

- [Customize Commands](#)<sup>[153]</sup>
- [Customize Toolbars](#)<sup>[156]</sup>
- [Add Custom Tools](#)<sup>[157]</sup>
- [Customize Keyboard Shortcuts](#)<sup>[161]</sup>
- [Customize Menu](#)<sup>[162]</sup>
- [Customize Command Sets](#)<sup>[165]</sup>

- [Customize Options](#)<sup>[163]</sup>

#### 2.4.6.1.1 Customize Commands

The Enterprise Architect toolbars provide a wide range of functions, some of which are useful in several different contexts. You might find it more convenient to have a function command available either from a different toolbar to the one it is currently set in, or from more than one toolbar. You can customize which toolbar a command is available from by generating a button or icon for the command on either another existing toolbar or a new toolbar that you create for this purpose. Conversely, you might remove a command from its current toolbar, to simplify the selection of tools from that toolbar.

**Access** **Tools | Customize > Commands**

#### Manage Toolbar Commands

Task	Action	See also
<b>Add Command To Toolbar</b>	<p><b>Also</b> display the appropriate toolbar, using either:</p> <ul style="list-style-type: none"> <li>• <b>View   Toolbars</b> (for standard toolbars) or</li> <li>• <b>Tools   Customize &gt; Toolbars</b> (for custom toolbars)</li> </ul> <p>The toolbar icons are then highlighted with a dark border as you select them.</p> <p>On the Commands tab:</p> <ol style="list-style-type: none"> <li>1. Click on the appropriate command category in the Categories: panel.</li> <li>2. Click on the command you need from the list in the Commands: panel.</li> <li>3. Drag the command onto the toolbar; it is immediately placed in the toolbar at the cursor position.</li> <li>4. Add any further commands you want.</li> <li>5. Put the icons in the order you prefer, by dragging each icon into position.</li> <li>6. Click on the <b>Close</b> button to close the Customize dialog.</li> <li>7. If necessary, resize the toolbar or drag it back into the top of the screen.</li> </ol> <p>If the command has an associated icon, the icon displays in the toolbar; otherwise, the command name displays.</p>	<p><a href="#">Standard Toolbars</a><sup>[134]</sup></p> <p><a href="#">Customize Toolbars</a><sup>[156]</sup></p>
<b>Delete Command from Toolbar</b>	<p><b>While the Customize dialog is displayed</b>, right-click on the command icon or text in the toolbar, and select the <b>Delete</b> context menu option. The command icon is immediately removed from the toolbar.</p> <p>The context menu does not display if the Customize dialog is closed.</p>	
<b>Change or assign icon for command</b>	<p>All commands listed in the Customize dialog have a text label, and many have associated icons, either system-defined (default) or user-defined. If the command has an icon, you can select to represent the command in the toolbar by:</p> <ul style="list-style-type: none"> <li>• The icon</li> </ul>	

Task	Action	See also
	<ul style="list-style-type: none"> <li>• The text</li> <li>• Both together</li> </ul> <p>You have a range of other options for changing how the command is represented in the toolbar, such as:</p> <ul style="list-style-type: none"> <li>• If the command does not have an associated icon, assign one from an image library</li> <li>• Change the icon currently assigned to the command to a different icon</li> <li>• If the command has a system default icon and you have changed it, restore that default icon to the command</li> <li>• Edit the icons in the library, and create new ones; you can also <b>copy</b> an existing icon and edit the copy</li> </ul> <p>These options are available through a context menu that you display by right-clicking on the icon in the toolbar <i>while the Customize dialog is displayed</i>. The context menu does not display if the Customize dialog is closed.</p> <p>The changes apply only to the selected toolbar. Any instances of the command in other toolbars or menus are not affected.</p>	
<b>Toggle command button between icon, text and both</b>	<ol style="list-style-type: none"> <li>1. Right-click on the command icon or text in the toolbar.</li> <li>2. Select the context menu option you need - <b>Image</b>, <b>Text</b> or <b>Image and Text</b>.</li> </ol> <p>If the option has an icon, the selected change is made. If the command has no icon, the Button Appearance dialog displays (see below). You can also toggle between the image/text options on this dialog.</p>	
<b>Assign icon to command</b>	<ol style="list-style-type: none"> <li>1. Right-click on the command icon or text in the toolbar.</li> <li>2. Select the <b>Button Appearance</b> context menu option; the Button Appearance dialog displays.</li> <li>3. Select either the <b>Image only</b> radio button or the <b>Image and text</b> radio button.</li> <li>4. For a command with a default icon, the <b>Use Default Image</b> radio button is followed by the default icon; if you have assigned a different image, you can restore the default by selecting this radio button.</li> </ol> <p>Otherwise, select the <b>Select User-defined Image</b> radio button, and click on an appropriate image from the selection provided. You can add or edit images in this selection (see below).</p> <ol style="list-style-type: none"> <li>5. Click on the <b>OK</b> button to apply the changes to the toolbar.</li> </ol> <p>(You can also restore the default icon by right-clicking on the current icon in the toolbar and selecting the <b>Reset to default</b> context menu</p>	

Task	Action	See also
	option.)	
<b>Copy a toolbar icon</b>	<ol style="list-style-type: none"> <li>1. Right-click on the icon in the toolbar.</li> <li>2. Select the <b>Copy Button Image</b> context menu option; the image is copied to the clipboard.</li> </ol>	
<b>Create and edit icons</b>	<ol style="list-style-type: none"> <li>1. Right-click on the command graphic or text in the toolbar.</li> <li>2. Select the <b>Button Appearance</b> context menu option; the Button Appearance dialog displays.</li> <li>3. Select either the <b>Image only</b> radio button or the <b>Image and text</b> radio button.</li> <li>4. Select the <b>Select User-defined Image</b> radio button.</li> <li>5. To create a new image, click on the <b>New</b> button; to edit an existing user-defined image, click on the image and then on the <b>Edit</b> button.</li> </ol> <p>The Edit Button Image dialog displays.</p> <ol style="list-style-type: none"> <li>6. If you have copied another icon to edit as a new icon, click on the <b>Paste</b> button in the <b>Tools</b> block.</li> <li>7. Select a color and the appropriate painting tool - the 'pencil' fills individual squares, the 'filler' fills the whole <b>Picture</b> block, and the 'line' creates lines of two or more squares thick.</li> <li>8. Create or edit the icon, working right up to the border of the <b>Picture</b> block if you wish.</li> <li>9. Click on the <b>OK</b> button to apply the changes to the toolbar.</li> </ol>	
<b>Change icon text label</b>	<ol style="list-style-type: none"> <li>1. Right-click on the command graphic or text in the toolbar.</li> <li>2. Select the <b>Button Appearance</b> context menu option; the Button Appearance dialog displays.</li> <li>3. Select either the <b>Text only</b> radio button or the <b>Image and text</b> radio button.</li> <li>4. In the <b>Button text</b> field, highlight and delete the existing text and type in the new text.</li> <li>5. Click on the <b>OK</b> button to apply the changes to the toolbar.</li> </ol>	
<b>Group Icons</b>	<p>If you wish, you can indicate that the command icons are arranged in groups. To do this:</p> <ol style="list-style-type: none"> <li>1. <i>While the Customize dialog is displayed</i>, right-click on the first command icon or text in the group in the toolbar, and select the <b>Start Group</b> context menu option.</li> </ol> <p>A vertical line displays to the left of the icon. All icons to the right of the line form a group, up to any subsequent line.</p> <p>To remove the line and cancel the grouping, repeat the step.</p>	

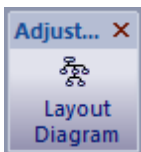

### 2.4.6.1.2 Customize Toolbars

As well as tailoring the commands that are available through the toolbars, you can modify the toolbars themselves; for example, you can:

- Hide or show toolbars by selecting the appropriate checkbox
- Rename toolbars
- Create new toolbars
- Delete toolbars
- Modify toolbar contents by dragging commands onto a visible toolbar from the Commands tab or from another toolbar
- Reset a toolbar (or all toolbars) to the default contents and position, and
- Display text labels under the toolbar icons, to indicate what the icons do

**Access** **Tools | Customize > Toolbars: New**

#### Create a New Toolbar and Populate it with Commands

Step	Action	See also
1	In the <b>Toolbar Name</b> field, type a name for your new toolbar and click on the <b>OK</b> button.  Your new toolbar is created. The toolbar and Customize dialog are independently positioned, so you might have to drag the Customize dialog to one side to expose your new toolbar.	
2	If you want to display the name of each command you put into your toolbar, select the <b>Show text labels</b> checkbox.  Otherwise leave the checkbox unselected.	
3	To add commands to your new toolbar from <b>another toolbar</b> , see step 6.  To add <b>menu</b> commands to your toolbar, click on the Commands tab.  The <b>Categories</b> list on the left of the tab represents the Enterprise Architect menu structure. The <b>Commands</b> list contains the commands in the selected category; the list updates when you click on a different category.	
4	Find and click on the command to add to your toolbar in the <b>Commands</b> list.	
5	Drag the selected command from the list into the new toolbar.  If you selected the <b>Show text labels</b> checkbox, your toolbar should now resemble this:  	

Step	Action	See also
	<p>If you did not select the <b>Show text labels</b> checkbox, your toolbar should resemble this:</p> 	
6	<p>If the command you require is on another toolbar, display that toolbar and drag it to a position near your new toolbar.</p> <p>Press <b>(Ctrl)</b> and drag the required icon for the command from the existing toolbar onto your new toolbar.</p>	
7	<p>Repeat steps 3 to 6 for each command that you want to make available in your new toolbar.</p> <p>When you have finished, click on the <b>Close</b> button on the Customize dialog and drag your toolbar into the toolbar ribbon or to any other convenient position for you to use.</p>	

### Notes

- You can add as many commands to your toolbar as you need; your new toolbar behaves the same way as other toolbars - you can position it next to the other toolbars at the top of the application workspace, dock it to the side of the workspace or close it
- On the Customize dialog, you can customize all the listed toolbars except for the **Format Tool** toolbar (which is actually tied to displayed diagrams)
- You can also modify the display of toolbar options using the **Options** page of the Customize dialog

### Learn more

- [Customize Commands](#) <sup>[153]</sup>
- [Add Custom Tools](#) <sup>[157]</sup>
- [Customize Options](#) <sup>[163]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Getting Started | User Interface | Toolbars**

#### 2.4.6.1.3 Add Custom Tools

You can extend the power of the Enterprise Architect desktop by making external tools accessible from the **Main Menu**. You can create menu options that hyperlink to different applications, compilers, batch scripts, automation scripts, URLs or documentation. The tools can be either commercially available or those you have configured yourself.

**Access** **Tools | Customize > Tools:** 

**Add and configure custom tools**

Field/Option/ Button	Action	See also
<b>Menu contents</b>	In the boxed, blank field in the list, type in the name of the tool as it should appear in the menu.	
<b>Command</b>	Either: <ul style="list-style-type: none"> <li>Type the name of the tool .exe file to use, or</li> <li>Click on the ( ... ) Browse button and browse to the file location</li> </ul> The .exe file must have a valid filename.	
<b>Arguments</b>	Type in any arguments required by the tool	<a href="#">Opening External Tools</a>  <sup>158</sup>  <a href="#">Passing Parameters to External Applications</a>  <sup>160</sup>
<b>Initial directory</b>	(Optional) Type in the location of an initial directory.	
<b>Close</b>	Click on this button to close the Customize dialog.  Your tool is added to the <b>Tools</b> menu.	

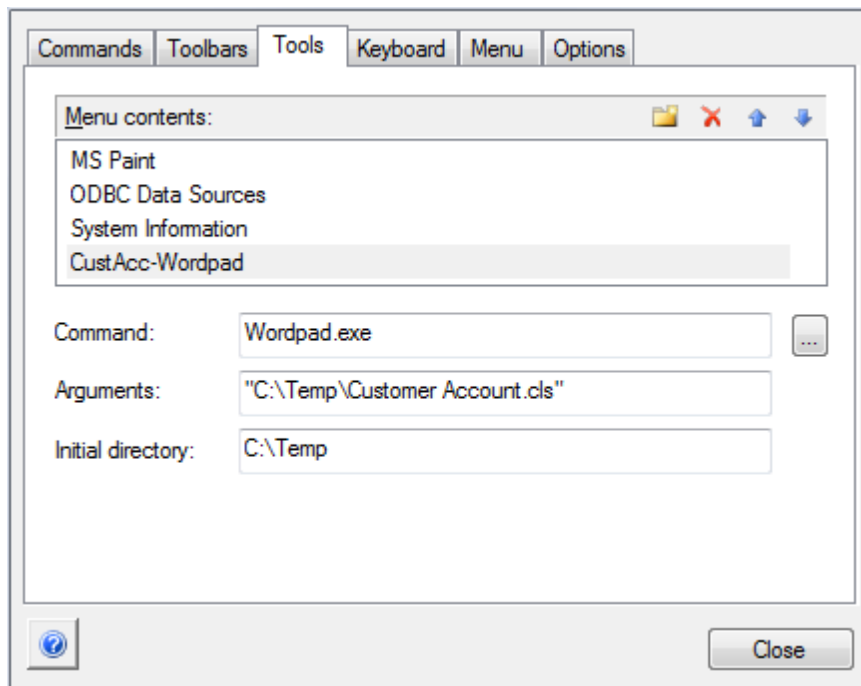

**2.4.6.1.3.1 Open External Tools**

When configuring custom tools in Enterprise Architect, by selecting **Tools | Customize > Tools**, you can:

- Specify the custom tool (application) using the **Command** field
- Define a file to open using the **Arguments** field

**Example 1**

This configuration opens the file `c:\Temp\Customer Account .cls` using Wordpad. If you save from within Wordpad the initial directory is `c:\Temp`.

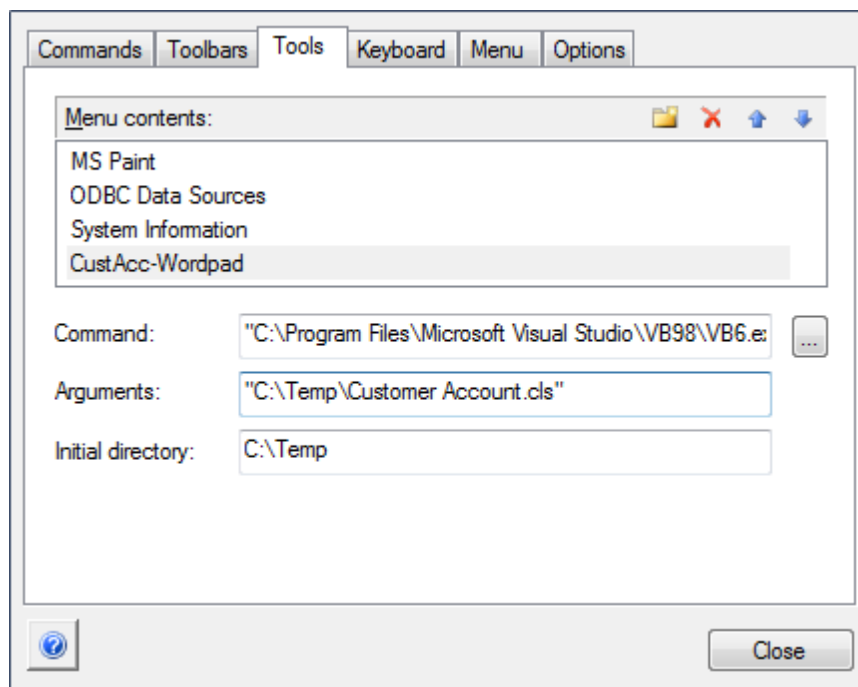

If there are any spaces in the paths in the **Command**, **Arguments** or **Initial directory** fields, you must enclose the whole path in double quotes. For example:

"c:\Temp\Customer Account.cls" must have quotes, but c:\Temp\Customer Account.cls does not have to have quotes.

### Example 2

This example opens the file c:\Temp\Customer Account.cls using **Visual Basic** (VB). As VB is not installed with the operating system, the **whole file path** for VB must be included in the **Command** field; you can locate and select this path using the ( ... ) (Browse) button. Again, if you save from within VB the initial directory is c:\Temp.

#### Learn more

- [Add Custom Tools](#) <sup>[157]</sup>
- [Pass Parameters to Applications](#) <sup>[160]</sup>

#### 2.4.6.1.3.2 Pass Parameters to Applications

When configuring custom tools in Enterprise Architect, by selecting **Tools | Customize > Tools**, you can define parameters to pass to an external application using the **Arguments** field.

#### Available parameters

Parameter	Passes	Notes
<b>\$f</b>	A project name.	For example, <b>C:\projects\EAExample.eap</b> .
<b>\$F</b>	The calling application.	That is, <b>Enterprise Architect</b> .
<b>\$p</b>	The current package ID.	For example, <b>144</b> .
<b>\$P</b>	The package GUID.	A GUID for accessing this package.
<b>\$d</b>	The diagram ID.	An ID for accessing the associated diagram.
<b>\$D</b>	The diagram GUID.	A GUID for accessing the associated diagram.

Parameter	Passes	Notes
<b>\$e</b>	A comma separated list of element IDs.	All elements selected in the current diagram.
<b>\$E</b>	A comma separated list of element GUIDs.	All elements selected in the current diagram.

#### 2.4.6.1.4 Customize Keyboard Shortcuts

Various **Main Menu** options can also be invoked using a single keyboard key, or a combination of keys, referred to as **shortcuts**. You can assign your own shortcut keys to either the standard options or your customized options, to suit your work practices or other applications.

**Access** **Tools | Customize > Keyboard**

#### Create or modify a keyboard shortcut

Field/Button/Option	Action	See also
<b>Category</b>	Click on the drop-down arrow and select the name of the <b>Main Menu</b> containing the command to assign a shortcut to.	
<b>Commands</b>	Scroll through the list of commands and click on the one to assign the shortcut key(s) to.  If the command already has a shortcut key it is shown in the <b>Current Keys</b> field.	
<b>Press New Shortcut Key</b>	Click on this field and <b>press</b> the shortcut key(s) to assign to the command.  Press the <b>actual keys</b> to use; for example, to assign <b>F5</b> press the <b>F5 key</b> , do not press <b>F</b> and then <b>5</b> .	
<b>Assign</b>	Click on this button to assign the key to the command.  The button is disabled if the selected keyboard shortcut is already used for another command; if this occurs the command it is assigned to is shown in the <b>Assigned to</b> field, and you must select a different shortcut key.	

Field/Button/Option	Action	See also
<b>Remove</b>	To remove a shortcut, select it in the <b>Current Keys</b> field and click on this button. The shortcut is immediately removed.	
<b>Reset All</b>	Click on this button to reset all commands to the default set of shortcut keys. All keys that <b>you</b> have assigned are removed.	
<b>Close</b>	Click on this button to close the dialog, saving all keys that you have assigned.	

#### Notes

- You can assign more than one shortcut to a command if you wish, although it is simpler to have one shortcut per command
- Modified shortcut keys are stored in the registry, so they are available only to you and not to other users

#### 2.4.6.1.5 *Customize Menu*

It is possible to customize your **Main Menu** submenus to add or remove shadow around the outline of each menu and to apply animation to the way in which the submenus are opened.

Access **Tools | Customize > Menu**

#### Animate Menu Display

Field/Option/ Button	Description	See also
<b>Menu animations</b>	Click on the drop-down arrow and select one of the options: <ul style="list-style-type: none"> <li>• <b>None</b> - the menus are instantaneously displayed on selection</li> <li>• <b>Unfold</b> - the menus unfold from the top left corner diagonally downwards</li> <li>• <b>Slide</b> - the menus slide out from the top downwards</li> <li>• <b>Fade</b> - the menus fade in</li> <li>• <b>[Default]</b> - similar to Fade</li> </ul>	
<b>Menu Shadows</b>	Select the checkbox to display a shadow along the right and lower edges of the menu.  Clear the checkbox to display menus with no shadow on the borders.	
<b>Close</b>	Click on this button to close the Customize dialog.  Your animation options take effect on the menus.	

**Notes**

- When you perform a major upgrade of the system (such as from release 10 to 11) the menus are reset and deleted options are replaced.

**2.4.6.1.6 Customize Options**

It is possible to customize the entire set of Toolbars to display with large icons, and/or show a Screen Tip as you mouse over each toolbar icon. The options take instant effect, so you can see what impact they have before closing the dialog.

**Access** **Tools | Customize > Options**

**Customize Toolbar Display**

Field/Option/ Button	Description	See also
<b>Show Screen Tips on Toolbars</b>	Select this checkbox to display a Screen Tip as you mouse over each toolbar icon, if a Screen Tip is defined for the icon.  The screen tip is predefined in Enterprise Architect and cannot be edited.	
<b>Show shortcut keys in Screen Tips</b>	If you have selected to show Screen Tips, select this checkbox to include any shortcut key combinations in the Screen Tip text.  The shortcut keys are editable, and you can add, change or remove the keys assigned to any of the commands represented by an icon. The current shortcut key combination is added to the Screen Tip text.	<a href="#">Customize Keyboard Shortcuts</a> 
<b>Large Icons</b>	Select this checkbox to enlarge all the Toolbox icons. This takes immediate effect, so that you can see how the display changes.	
<b>Close</b>	Click on this button to save and commit the settings.	

**2.4.6.2 Manage Workspace Layout**

As you perform work on your model you use various toolbars and windows; you will quite likely use the same toolbars and windows regularly, in an arrangement that suits the way in which you use the system. Rather than having to re-open and arrange these tools at the start of each work session, you can use either a predefined or a customized work environment - or **workspace**. Workspaces:

- Automatically open and organize all the tools appropriate to an area of work such as Requirements Management, Code Engineering and Debugging
- Help a new user by:
  - Opening the tools that are appropriate to a task so that they can immediately get started, and
  - Showing the user what tools they should become familiar with for that area of work
- Help you switch rapidly to work environments for either successive or completely different areas of

work

- Re-establish a work environment that you have accidentally or deliberately changed

To select, create and maintain workspaces you use the Workspaces tab on the Workspace and Commands dialog, which lists the currently-available system and user-defined layouts.

**Access** **View | Workspaces and Commands > Workspaces** or  
**View | Toolbars | Workspace Layouts:**  **(Manage Workspaces) > Workspaces**

### Manage Layouts

Task	Description	See also
<b>Change workspace layout</b>	<p>The <b>Current Workspace Layout</b> field at the bottom of the Workspaces and Commands dialog identifies the layout last selected. You might have moved or closed windows after applying that layout. The <b>(Copy of existing Workspace Layout)</b> at the top of the Available Workspaces list is a capture of the workspace layout immediately before you opened the dialog.</p> <p>You can change the layout to:</p> <ul style="list-style-type: none"> <li>• The original layout (as identified by the <b>Current Workspace Layout</b> field), discarding any changes you might have made</li> <li>• The <b>Copy of existing Workspace Layout</b>, preparatory to saving the changes in a new named layout, or</li> <li>• One of the other named layouts</li> </ul> <p>To change the layout in use, either:</p> <ul style="list-style-type: none"> <li>• Double-click on the required layout name</li> <li>• Click on the layout name and click on the <b>Apply</b> button or <b>OK</b> button, or</li> <li>• Right-click on the layout name and select the <b>Apply</b> context menu option</li> </ul> <p>When you change the workspace layout in use, the layout name in the toolbar layout field also changes.</p>	
<b>Copy workspace layout</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Change the layout in use to the required layout and click on the <b>Save As New</b> button, or</li> <li>• Right-click on the layout name and select the <b>Save As</b> context menu option</li> </ul> <p>The Save Custom Workspace Layout dialog displays.</p> <p>In the <b>Custom Workspace Layout Name</b> field, type a name for the layout. By selecting an existing name you can change an existing layout to something different. Click on the <b>Save</b> button.</p> <p>If you already have tailored windows or views open that you want to include in your selected layout, select the <b>Include active custom views</b> checkbox.</p>	

Task	Description	See also
<b>Delete workspace layout</b>	Right-click on the layout name and select the <b>Delete</b> context menu option. A prompt displays for you to confirm or cancel the deletion.	

### Notes

- If you apply a working set that invokes floating diagrams or views, it will override the current workspace layout with the layout that was in use when the working set was defined
- If you develop a workspace layout that would be useful for your colleagues, you can share it with them by incorporating it in an MDG Technology that they can download

## 2.4.6.3 Customize Command Sets

The Enterprise Architect User Interface has an extensive range of main menu and context menu options to support the work of many different user roles. Some of these menu options might not be necessary for the work you do; therefore, it is possible to show, hide and customize the menus in a **Command Set**, to tailor them to your specific work practices and responsibilities.

**Access** **View | Workspaces and Commands > Commands** or  
**View | Toolbars | Workspace Layouts:**  **(Manage Workspaces) > Commands**

### Manage Command Sets

Field/Option/ Button	Action	See also
<b>Command Sets</b>	<p>List the available Command Sets (or roles).</p> <p>The following predefined Command Sets are shown:</p> <ul style="list-style-type: none"> <li>• <b>Complete</b> - every menu option is visible</li> <li>• <b>Essential UML</b> - options for modeling with UML; more advanced options, such as for security and version control, are <b>not</b> visible</li> <li>• <b>Business Modeling</b> - menu options appropriate to modeling business structures and processes</li> <li>• <b>Software Engineering</b> - menu options for UML modeling, code generation and reverse engineering</li> <li>• <b>Software Development</b> - menu options for software engineering,</li> </ul>	

Field/Option/ Button	Action	See also
	<p>plus commands for building and debugging code</p> <ul style="list-style-type: none"> <li>• <b>System Engineering</b> - menu options for real-time development, embedded development and behavioral model execution</li> <li>• <b>Testing</b> - menu options for writing and running tests, including integration with external unit testing frameworks</li> <li>• <b>Project Management</b> - menu options for managing a project, including resource and task tracking</li> </ul> <p>These predefined Command Sets can be used as a template for creating new Command Sets.</p> <p>To create or work on a command set, right-click on it in the <b>Command Sets</b> field and select from these context menu options:</p> <ul style="list-style-type: none"> <li>• <b>Save</b> - Save the modifications to the currently selected user-defined Command Set</li> <li>• <b>Save As</b> - Duplicate the selected Command Set</li> <li>• <b>Delete</b> - Delete the selected user-defined Command Set</li> <li>• <b>Export</b> - Export the selected user-defined Command Set to file</li> <li>• <b>Import</b> - Import a Command Set from an external file</li> </ul> <p>The <b>predefined</b> Command Sets are <b>protected</b> from change, deletion and export.</p>	
<b>Clear check boxes to hide menu commands</b>	<p>A full list of Enterprise Architect menus is shown. You can expand these menus to show the menu options, and the options of any submenus.</p> <p>For each command set, the checkboxes against those menus, submenus and menu options that are to be <b>hidden</b> in the User Interface are <b>not selected</b>.</p> <ul style="list-style-type: none"> <li>• If you want to hide further options in your customized command sets, deselect the corresponding check box</li> <li>• To make menus and options available again, select the checkbox</li> </ul> <p>Click on the <b>Save As</b> button to create a new user-defined Command Set based on your changes; provide a name for the Command Set.</p> <p>Click on the <b>Save</b> button to save changes to an existing user-defined Command Set.</p>	
<b>Apply</b>	Click on this button to <b>apply</b> the currently-selected command set to the menus of the user interface, <b>without</b> closing the dialog.	
<b>OK</b>	Click on this button to <b>apply</b> the currently-selected command set to the menus of the user interface, <b>and</b> close the dialog.	

Field/Option/ Button	Action	See also
<b>Cancel</b>	Click on this button to <b>discard</b> changes to the command sets and close the dialog.	

#### 2.4.6.4 User Interface Customization

If you want to set up your work environment to make specific commands, windows and technologies more easily available, you can customize the various ways in which those tools and commands are selected so that your preferred options are presented together. You might set up a number of groupings, in which case you can quickly select which groups of options to apply, using the **Interface Customization Wizard**.

**Access**   **Start Page:** Interface Customization

##### Select custom options and tools

Step	Action	See also
<b>1</b>	Read the introduction to the Interface Customization Wizard, then click on the <b>Next</b> button.  The Select a Command Set screen displays.	
<b>2</b>	In the list, click on the Command Set that defines the group of menus and options you want to have available (or accept the default of <b>Complete</b> - all menus and options).  Click on the <b>Next</b> button.  The Select a Workspace Layout window displays.	<a href="#">Customize Command Sets</a> [165]
<b>3</b>	Click on the Workspace Layout you want to apply. This displays the windows and toolbars appropriate to the tasks you intend to perform.  Click on the <b>Next</b> button.  The Select Active Technologies window displays.	<a href="#">Manage Workspace Layout</a> [163]
<b>4</b>	Select the checkbox against each technology you want to have available for use. You can also: <ul style="list-style-type: none"> <li>• Enable all technologies, by clicking on the <b>Select All</b> button</li> <li>• Clear all current technology selections, by clicking on the <b>Select None</b> button</li> </ul> To apply your selections, click on the <b>Finish</b> button.	<a href="#">Using MDG Technologies</a> [147]

##### Notes

- On any of the windows, if you decide not to process your selections click on the **Cancel** button

#### Learn more

### 2.4.6.5 Visual Styles

It is possible to change the overall style and color of the Enterprise Architect **user interface** to match the standard **styles** (or **themes**) of a number of Microsoft Office and Visual Studio product releases.

**Access** [View | Visual Style | Select Visual Style](#)

#### Reset the style of the user interface

Step	Action	See also
1	On the Application Look dialog, select the radio button for the style you want to set. Note that if you select the: <ul style="list-style-type: none"> <li><b>Microsoft Office 2007</b>, <b>Microsoft Office 2010</b> or <b>Microsoft Office 2013</b> radio buttons, you can also select from a drop-down list of base-color options</li> <li><b>Microsoft Visual Studio 2012</b> radio button, you can also select either a dark or a light base color</li> <li><b>Microsoft Office 2013</b> and <b>Microsoft Visual Studio 2012</b> radio buttons, the <b>Accent Color</b> field, is enabled, and you can select from a drop-down list of colors for the active window borders and highlighting</li> </ul>	
2	To just try out a style, select it and click on the <b>Apply</b> button. The current user interface setup is redisplayed in the selected style.	
3	When you have selected the style you want to use, click on the <b>OK</b> button.	

#### Notes

- You can also apply a specific color and format **theme** to all **diagrams** that you display

#### Learn more

- [Diagram Theme Options](#)<sup>[61]</sup>

### 2.4.7 Other Windows

Most of the **standard** windows you use in Enterprise Architect have a specific, task-oriented purpose. However, two windows have **broader** functions.

#### Broad-function windows

Window	Detail	See also
<b>System Output Window</b>	This window displays the data that Enterprise Architect generates during each of a range of processes. The data from each type of operation generally has its own window tab.	<a href="#">The System Output Window</a> <sup>[169]</sup>
<b>Web Browser</b>	This view, or window, provides access to internet facilities within your Enterprise Architect work area.	<a href="#">The Web Browser</a> <sup>[170]</sup>

#### Learn more

- [Standard Windows](#)<sup>[125]</sup>

### 2.4.7.1 The System Output Window

The **System Output** window is used to display information generated by internal Enterprise Architect processes, or by Add-Ins and other third-party tools. The output from each type of operation is generally displayed on its own tab within the window. The System Output window can provide useful information during long-running processes and batch operations; through this window you can, for example:

- **Validate** information - many validation processes within Enterprise Architect write out their results to this window
- Review **progress** information during the launch of external processes
- Review command line output from **Build** and **Test** scripts
- Check **parse errors** generated during import of various types of files
- Check **Audit** information
- Re-dock the **Model Search** results into an Output window tab for more convenient reference during various operations

#### Access

- Select **View | System Output**
- Press **Ctrl+Shift+8**
- **Edit | Find in Project: Options | Dock in Output Bar**

#### Options available on output data

Right-click on an item and select the appropriate context menu option to:

- Copy the selected item to the clipboard
- Copy all items to the clipboard
- Save the output to an external file
- Clear the output from the window
- Rollback selected **Get All Latest** updates to a version controlled package

You can also:

- **Drag** the selected items or text out of the System Output window and **onto a diagram** to quickly create a named element
- Double-click on model validation errors or parsing errors to display the **source** of the error
- **Switch** between tabs to view different categories of information from different tools

### Notes

- (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, with **Auditing turned on**) The **Audit History** tab of the System Output window shows a history of changes to any element or connector selected from the:
  - Audit View
  - Package Browser
  - Diagram List
  - Project Browser, or
  - Current diagram

### Learn more

- [Model Search](#)<sup>[700]</sup>
- [Get All Latest](#)<sup>[427]</sup>
- [Add-Ins](#)<sup>[3010]</sup>
- [Audit History](#)<sup>[455]</sup>
- [Auditing](#)<sup>[446]</sup>

## 2.4.7.2 The Web Browser

The Web Browser provides access within Enterprise Architect to internet facilities such as email, websites and search engines; you define the default home website, search engine and email exchange address on the General page of the Options dialog. The Web Browser displays as a tabbed view in the application work area, where the Start Page and Diagram View display.

**Access**    **View | Web Browser ( Ctrl+Alt+W )**

### Options

To access the:

- Email exchange server, click on the  icon in the toolbar; the appropriate email login window displays
- Web search engine (such as *Google*), click on the  icon in the toolbar; the search engine screen displays
- Home web site, after displaying other web pages, click on the  icon in the toolbar

To go directly to another website or email server (your internet security permitting), in the **Address** field type or select the website http address and click on the **Go** button.

Learn more

- [General Options](#)<sup>[60]</sup>

## 2.4.8 Keyboard Shortcuts

You can display the Enterprise Architect dialogs, windows and views, or initiate processes, using menu options and Toolbar icons. In many cases, you can also access these facilities by pressing individual **keyboard keys** or **combinations of keys**, as **shortcuts**. This table lists the default keyboard shortcut for each of the functions. You can also display the key combinations on the **Help Keyboard** dialog.

Access    **Start Page: Keyboard Accelerators** or  
**Help | Keyboard Accelerator Map**

Notes

- There are additional shortcuts using the keyboard and **mouse** in combination
- If necessary, you can change the keyboard shortcuts using the Keyboard tab of the **Customize** dialog

Learn more

- [Keyboard-Mouse Shortcuts](#)<sup>[180]</sup>
- [Customize Keyboard Shortcuts](#)<sup>[16]</sup>

### 2.4.8.1 Keyboard-Mouse Shortcuts

When you work on an aspect of your model **within a diagram**, there are a number of operations you can perform quickly using a combination of **keyboard keys** and the **computer mouse**.

Action	Shortcut
Create an element of the same type as was last created on the diagram.	<b>Ctrl</b> + click
Display the element Properties dialog for the element shown in the scenario Context References tab.	<b>Ctrl</b> + click
Select a number of individual objects for an operation.	<b>Ctrl</b> + click each object
Select a range of objects for an operation.	<b>Shift</b> + click the first and last object in the range
Move the selected elements along the horizontal axis or vertical axis.	<b>Shift</b> + hold left mouse button and drag
Create a bend in and change the direction of the connector line.	<b>Shift</b> + hold left mouse button and drag

Action	Shortcut
Move the selected elements in any direction, including diagonally.	<b>Alt</b> + hold left mouse button and drag
Zoom in to or zoom out of the diagram.	<b>Ctrl</b> + mouse scroll wheel
Pan the diagram horizontally or vertically.	<b>Ctrl +Shift</b> + hold left mouse button and drag

## 2.5 Typical Project Roles

Enterprise Architect supports common **working practices** and **tasks** that are performed by specific **roles** and **professions**. A number of the roles and their responsibilities that the system supports are outlined here.

Role & Responsibilities	See also
<b>Business Analyst</b> , to create high-level models of business processes	<a href="#">Business Analyst</a> <sup>[185]</sup>
<b>Software Architect</b> , to map functional requirements, perform real time modeling of objects, design the Deployment model and detail the deliverable components	<a href="#">Software Architect</a> <sup>[186]</sup>
<b>Software Engineer</b> , to map Use Cases onto Class diagrams, detail the interactions between Classes, define the system deployment and define software packages	<a href="#">Software Engineer</a> <sup>[187]</sup>
<b>Developer</b> , to perform round trip code engineering, including reverse engineering of existing code and generation of code from Class elements	<a href="#">Developer</a> <sup>[188]</sup>
<b>Project Manager</b> , to assign resources to elements, measure risk and effort, estimate project sizes, and manage element status, change control and maintenance	<a href="#">Project Manager</a> <sup>[190]</sup>
<b>Tester</b> , to create test scripts against elements in the modeling environment	<a href="#">Tester</a> <sup>[191]</sup>
<b>Implementation Manager</b> , to: <ul style="list-style-type: none"> <li>Track and assign maintenance-related items to elements within Enterprise Architect</li> <li>Rapidly capture and keep records of maintenance tasks such as issues, changes, defects and tasks</li> <li>Trace the maintenance of the items and processes involved in system deployment</li> </ul>	<a href="#">Implementation Manager</a> <sup>[192]</sup>
<b>Technology Developer</b> , to create customized additions to the functionality already present within Enterprise Architect	<a href="#">Technology Developer</a> <sup>[193]</sup>

Role & Responsibilities	See also
<b>Database Developer</b> , to develop databases, including modeling database structures, importing database structures from an existing database and generating DDL for rapidly creating databases from a model	<a href="#">Database Developer</a> [194]

You can review a summary of the **typical tasks** supported for each role, or click on the appropriate role title to explore how Enterprise Architect can assist you in carrying out that role within a model-driven project.

#### Learn more

- [Summary of Typical Tasks](#) [183]

### 2.5.1 Summary of Typical Tasks

Throughout a design and development project there are many different tasks to be performed, which could be carried out either by one person or - more probably - by members of a team with different responsibilities. In either case, Enterprise Architect supports most - if not all - of the **responsibilities** you might have on your project. The descriptions below cover a number of job roles that the system supports. For those that most resemble your role on a project, follow the job title hyperlink to display a description of how that role might make use of Enterprise Architect, then follow links within those topics to explore some of the features of importance to the role.

#### Summary of Typical Job Roles

Role	Responsibilities	See also
<b>Business Analyst</b>	For modeling: <ul style="list-style-type: none"> <li>• Requirements</li> <li>• High-level business processes</li> <li>• Business activities</li> <li>• Work flows</li> <li>• System behavior</li> </ul>	<a href="#">Business Analyst</a> [185]
<b>Database Developer</b>	<ul style="list-style-type: none"> <li>• Developing databases</li> <li>• Modeling database structures</li> <li>• Creating logical data models</li> <li>• Generating schema</li> <li>• Reverse engineering databases</li> </ul>	<a href="#">Database Developer</a> [194]
<b>Software Architect</b>	<ul style="list-style-type: none"> <li>• Mapping functional requirements of the system</li> <li>• Mapping objects in real time</li> <li>• Mapping the deployment of objects</li> <li>• Defining deliverable components</li> </ul>	<a href="#">Software Architect</a> [186]
<b>Tester</b>	<ul style="list-style-type: none"> <li>• Developing test cases</li> <li>• Importing requirements, constraints and</li> </ul>	<a href="#">Tester</a> [197]

Role	Responsibilities	See also
	<ul style="list-style-type: none"> <li>scenarios</li> <li>Creating Quality Test documentation</li> <li>Tracking element defects and changes</li> </ul>	
<b>Software Engineer</b>	<ul style="list-style-type: none"> <li>Mapping Use Cases into detailed Classes</li> <li>Defining the interaction between Classes</li> <li>Defining system deployment</li> <li>Defining software packages and the software architecture</li> </ul>	<a href="#">Software Engineer</a> <sup>[187]</sup>
<b>Project Manager</b>	<ul style="list-style-type: none"> <li>Providing project estimates</li> <li>Resource Management</li> <li>Risk Management</li> <li>Maintenance Management</li> </ul>	<a href="#">Project Manager</a> <sup>[190]</sup>
<b>Developer</b>	<ul style="list-style-type: none"> <li>Forward, reverse and round-trip engineering</li> <li>Visualizing the system states</li> <li>Visualizing package arrangements</li> <li>Mapping the flow of code</li> </ul>	<a href="#">Developer</a> <sup>[188]</sup>
<b>Implementation Manager</b>	<ul style="list-style-type: none"> <li>Modeling the tasks in rolling-out a project, including network and hardware deployment</li> <li>Assigning and tracking maintenance items on elements (issues, changes, defects and tasks)</li> </ul>	<a href="#">Implementation Manager</a> <sup>[192]</sup>
<b>Technology Developer</b>	For creating or customizing: <ul style="list-style-type: none"> <li>UML Profiles</li> <li>UML Patterns</li> <li>Code Templates</li> <li>Tagged Value Types</li> <li>MDG Technologies</li> <li>Add-Ins</li> </ul>	<a href="#">Technology Developer</a> <sup>[193]</sup>

Most of these roles work with specific types of diagram, so you might want to learn more about diagram types in general and specific types of diagram in particular.

Several types of project team member might want to **generate documentation** on their work and report on how the project is developing and changing. Using Enterprise Architect you can generate project reports in either document or web format.

#### Notes

- The Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect have a user security feature that can be applied or turned off; if security is turned

on, you need to have the appropriate access permissions to use many of the facilities listed above

## 2.5.2 Business Analysts

A **Business Analyst** can use Enterprise Architect to create high-level models of business processes, including business requirements, activities, work flow, and the display of system behavior.

Using Enterprise Architect, a Business Analyst can describe the procedures that govern what a particular business does. Such a model is intended to deliver a high-level overview of a proposed system.

#### Business Analyst Tasks

Task	Detail	See also
<b>Model High Level Business Processes</b>	<p>Using <b>Analysis</b> diagrams, you can model the high-level processes of the business.</p> <p>Analysis diagrams are a subset of UML 2.4.1 Activity diagrams and are less formal than other diagram types, but they provide a useful means for expressing essential business characteristics and requirements.</p>	<a href="#">Analysis Diagram</a> <sup>[1801]</sup> <a href="#">Example Analysis Diagram</a> <sup>[1802]</sup>
<b>Model Requirements</b>	<p>Gathering <b>requirements</b> is typically the first step in developing a solution, be it for developing a software application or for detailing a business process; it is an important step in the implementation of a project.</p> <p>Using Enterprise Architect, you can define the Requirement elements, connect Requirements to the model elements for implementation, connect Requirements together into a hierarchy, report on Requirements, and move Requirements out of model element responsibilities.</p>	<a href="#">Requirements Management</a> <sup>[1726]</sup> <a href="#">Specification Manager</a> <sup>[1728]</sup>
<b>Model Business Activities</b>	<p>You can use <b>Activity</b> diagrams to model the behavior of a system and the way in which these behaviors are related to the overall flow of the system.</p> <p>Activity diagrams do not model the exact internal behavior of the system but show instead the general processes and pathways at a high level.</p>	<a href="#">Activity Diagram</a> <sup>[1199]</sup>
<b>Model Work Flow</b>	<p>To visualize the cooperation between elements involved in the work flow, you can use an <b>Interaction Overview</b> diagram, which provides an overview of sub activities that are involved in a system.</p>	<a href="#">Interaction Overview Diagram</a> <sup>[1262]</sup>

Task	Detail	See also
<b>Display System Behavior</b>	In displaying the behavior of a system as a <b>Use Case</b> diagram, Enterprise Architect provides an easily understood tool for mapping the functional requirements and behavior of a system.	<a href="#">Use Case Diagram</a> 

#### Learn more

- [Business Modeling](#) 

## 2.5.3 Software Architects

**Software Architects** can use Enterprise Architect to map functional requirements with Use Cases, perform real time modeling of objects using **Interaction diagrams** (Sequence, Timing, Communication or Interaction Overview), design the **Deployment** model and detail the deliverable components using **Component** diagrams.

#### Software Architect Tasks

Task	Detail	See also
<b>Map Functional Requirements of the System</b>	With Enterprise Architect you can take the high level business processes that have been modeled by the Business Analyst and create detailed <b>Use Cases</b> .  Use Cases describe the proposed functionality of a system and are only used to detail a single unit of discrete work.	<a href="#">Use Cases</a> 
<b>Map Objects in Real Time</b>	You can use <b>Interaction</b> diagrams (Sequence and Communication diagrams) to model the dynamic design of the system.  <b>Sequence</b> diagrams detail the messages that are passed between objects, and the lifetimes of the objects.  <b>Communication</b> diagrams are similar to Sequence diagrams, but instead display the way in which the object interacts with other objects.	<a href="#">Sequence Diagram</a>  <a href="#">Example Sequence Diagram</a>  <a href="#">Communication Diagram</a> 
<b>Map Deployment of Objects</b>	You can use <b>Deployment</b> diagrams to provide a static view of the run-time configuration of processing nodes and the components that run on the nodes.  Deployment diagrams show the connections between hardware, software and any middleware that is used on a system.	<a href="#">Deployment Diagram</a> 
<b>Detail Deliverable</b>	Using <b>Component</b> diagrams, you can model the	<a href="#">Component Diagram</a> 

Task	Detail	See also
<b>Components</b>	<p>physical aspects of a system.</p> <p>Components can be executables, libraries, data files or another physical resource that is part of a system.</p> <p>The component model can be developed from scratch from the Class model or can be brought in from existing projects and from third-party vendors.</p>

## 2.5.4 Software Engineers

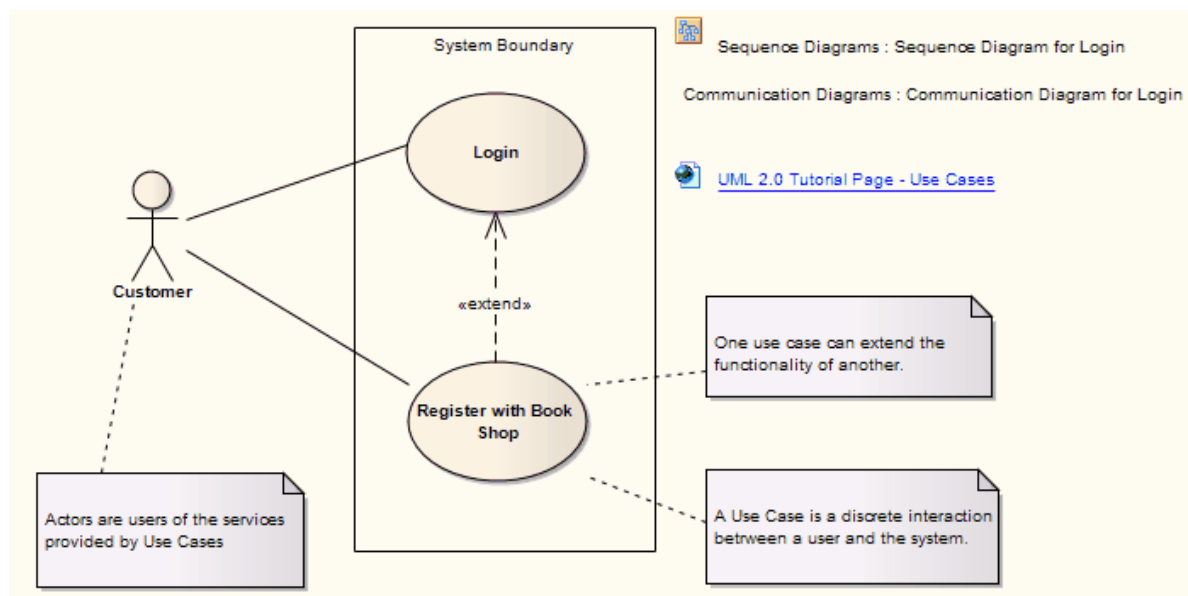

**Software Engineers** using Enterprise Architect can manually map Use Cases onto Class diagrams, detail the interactions between Classes, define the system deployment with Deployment diagrams and define software packages with Package diagrams.

#### Software Engineering Tasks

Task	Detail	See also
<b>Map Use Cases into Detailed Classes</b>	<p>Within Enterprise Architect you can study the <b>Use Cases</b> developed by the Software Architect, and with that information create <b>Classes</b> that fulfill the objectives defined in the Use Cases.</p> <p>A Class is one of the standard UML constructs that is used to detail the pattern from which objects are produced at run time; to record the relationships between Use Cases and Classes, you can create diagrams linking the elements with <b>Realization</b> connectors, and/or map the Realization connectors in the <b>Relationship Matrix</b>.</p>	<a href="#">Use Cases</a> <sup>[1201]</sup> <a href="#">Example Use Case Diagram</a> <sup>[1203]</sup> <a href="#">Class Diagram</a> <sup>[1184]</sup> <a href="#">Realization</a> <sup>[1440]</sup> <a href="#">Relationship Matrix</a> <sup>[727]</sup>
<b>Detail Interaction Between Classes</b>	<p>You can use <b>Interaction</b> diagrams (<b>Sequence</b> and <b>Communication</b> diagrams) to model the dynamic design of the system.</p> <p>Sequence diagrams are used to detail the messages passed between objects, and the lifetimes of the objects.</p> <p>Communication diagrams are similar to Sequence diagrams, but instead display the way in which objects interact with other</p>	<a href="#">Sequence</a> <sup>[1249]</sup> <a href="#">Communication</a> <sup>[1259]</sup>

Task	Detail	See also
	objects.	
<b>Define System Deployment</b>	<p>Deployment diagrams provide a static view of the run-time configuration of processing nodes and the components that run on the nodes.</p> <p>Deployment diagrams can be used to show the connections between hardware, software and any middleware that is used on a system, to explain the connections and relationships of the components.</p>	<a href="#">Deployment</a> <sup>[119]</sup>
<b>Define Software Packages</b>	<p>You can use Package diagrams to detail the software architecture.</p> <p>Package diagrams are used to organize diagrams and elements into manageable groups, declaring the dependencies.</p>	<a href="#">Package</a> <sup>[118]</sup>

### Simple Use Case diagram

### Learn more

- [Modeling Fundamentals](#)<sup>[750]</sup>

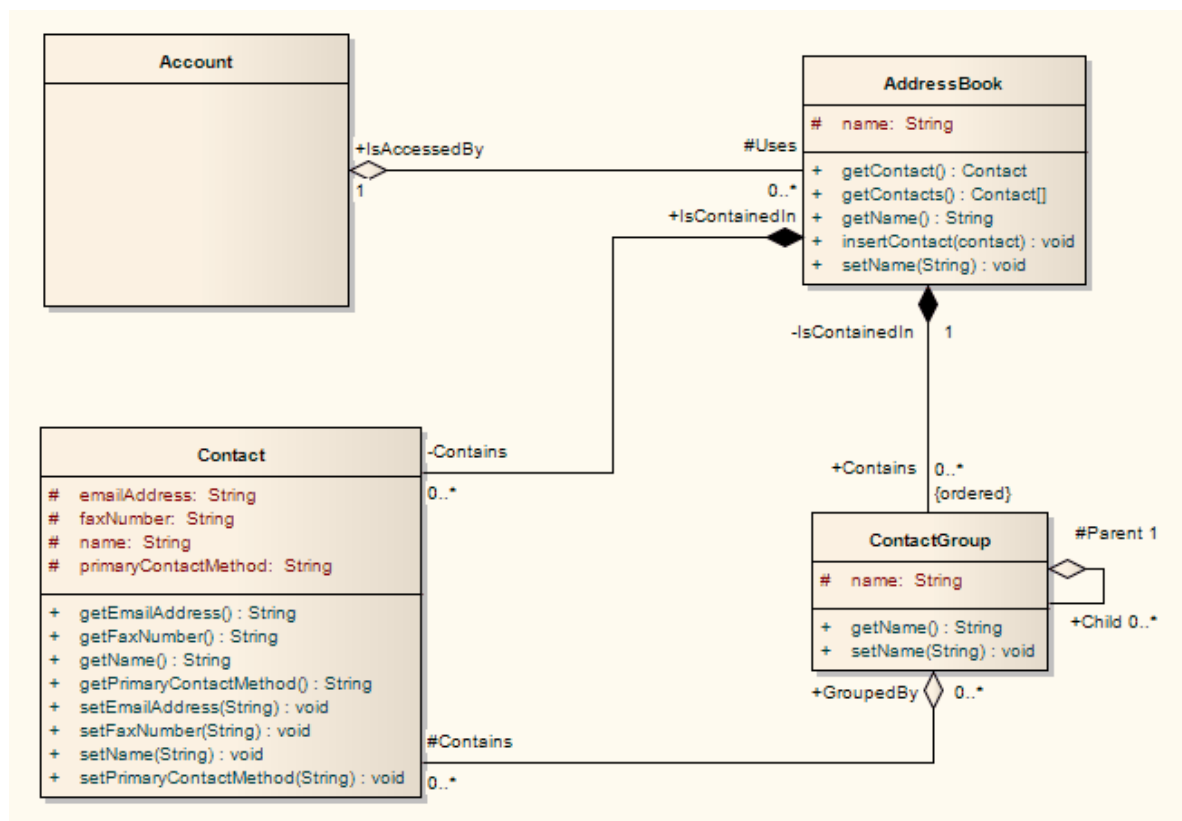

## 2.5.5 Developers

**Developers** can use Enterprise Architect to perform round trip code engineering, which includes reverse engineering of existing code and generation of code from Class elements.

### Developer Tasks

Task	Detail	See also
<b>Round Trip Engineering</b>	Enterprise Architect gives you unparalleled flexibility in <b>'round tripping'</b> software from existing source code to UML 2.4.1 models and back again.  Round trip engineering involves both <b>forward</b> and <b>reverse engineering</b> of code, keeping the model and code synchronized.	<a href="#">Code Engineering</a>  <a href="#">Update Package Contents</a>  <a href="#">Estimation</a> 
<b>Reverse Engineering</b>	In Enterprise Architect, you can reverse engineer code from a number of supported languages and view the existing code as <b>Class</b> diagrams, which illustrate the static design view of the system.  Class diagrams show Classes and interfaces, and the relationships between them; the Classes defined in UML Class diagrams can have direct counterparts in the implementation of a programming language.	<a href="#">Reverse Engineering</a>  <a href="#">Class Diagram</a>  <a href="#">Class Element</a> 
<b>Forward Engineering</b>	As well reverse engineering your code into your model, you can forward engineer elements of your model into code ( <b>code generation</b> ).  This way you can make changes to your model with Enterprise Architect and quickly implement the changes in the source code.	<a href="#">Code Engineering</a> 
<b>Determine the System State</b>	To visualize the state of the system you can use <b>State Machine</b> diagrams to describe how elements move between states, classifying their behavior according to transition triggers and constraining guards.  State Machine diagrams capture system changes over time, typically being associated with particular Classes; often a Class can have one or more State Machine diagrams to fully describe its potential states.	<a href="#">State Machine</a> 
<b>Visualize Package Arrangement</b>	<b>Package</b> diagrams help you design the architecture of the system; they are used to organize diagrams and elements into manageable groups, and to declare their dependencies.	<a href="#">Package</a> 
<b>Follow the Flow of Code</b>	<b>Activity</b> diagrams help you develop a better understanding of the flow of code.  Activity diagrams illustrate the dynamic nature of the system; you can model the flow of control between Activities and represent the changes in state of the system.	<a href="#">Activity</a> 

### Simple Class Diagram

### Notes

- You can use State Machine, Package and Activity diagrams to better understand the interaction between code elements and the arrangement of the code

- [Visual Execution Analysis](#)<sup>[2527]</sup>

## 2.5.6 Project Managers

Enterprise Architect provides support for the management of projects. **Project Managers** can use the system to assign resources to elements, measure risk and effort, estimate project sizes, and manage element status, change control and maintenance.

### Project Manager Tasks

Task	Detail	See also
<b>Provide Project Estimates</b>	In Enterprise Architect you have access to a comprehensive <b>project estimation</b> tool that calculates effort from Use Case and Actor objects, coupled with project configurations defining the technical and environmental complexity of the work environment.	<a href="#">Estimation</a> <sup>[584]</sup>

Task	Detail	See also
<b>Resource Management</b>	Managing the <b>allocation of resources</b> in the design and development of system components is an important and sometimes difficult task; Enterprise Architect provides you with an effective tool for assigning resources directly to model elements and tracking progress over time.	<a href="#">Resources</a> <sup>[512]</sup>
<b>Risk Management</b>	You can use the <b>Project Management window</b> to assign <b>risk</b> to an element within a project; using risk <b>types</b> you can name the risk, define the type of risk and give it a weighting.	<a href="#">Risk</a> <sup>[519]</sup> <a href="#">Risk Types</a> <sup>[524]</sup>
<b>Maintenance</b>	Within Enterprise Architect you can assign maintenance-related items to elements and track them, providing rapid capture and record keeping for items such as issues, changes, defects, and tasks.  You can also create and maintain a project glossary of processes, procedures, terms and descriptions.	<a href="#">Issues</a> <sup>[528]</sup> <a href="#">Changes and Issues</a> <sup>[2631]</sup> <a href="#">Tasks</a> <sup>[526]</sup> <a href="#">Project Glossary</a> <sup>[533]</sup>

#### Learn more

- [Project Management](#) <sup>[509]</sup>
- [Element Status](#) <sup>[590]</sup>
- [Maintenance](#) <sup>[2619]</sup>

## 2.5.7 Testers

Enterprise Architect provides a design testing facility for **Testers** and **Quality Assurance** personnel to create a range of test scripts against elements in the modeling environment.

#### Testing Tasks

Task	Detail	See also
<b>Test Cases</b>	With Enterprise Architect, you can set up a series of tests for each model element.  The test types include <b>Unit</b> , <b>Acceptance</b> , <b>System</b> , <b>Integration</b> and <b>Scenario</b> tests.	<a href="#">Testing</a> <sup>[2604]</sup>
<b>Import requirements, constraints and scenarios</b>	To use testing to maintain the integrity of the entire business process, you can import <b>requirements</b> , <b>constraints</b> and <b>scenarios</b> defined in earlier iterations of the development life cycle.  Requirements indicate contractual obligations that elements must perform within the model.	<a href="#">Requirements</a> <sup>[1726]</sup>

Task	Detail	See also
	<p>Constraints are conditions that must be met in order to pass the testing process; constraints can be:</p> <ul style="list-style-type: none"> <li>• Pre-conditions (states which must be true before an event is processed)</li> <li>• Post-conditions (events that must occur after the event is processed) or</li> <li>• Invariant constraints (which must remain true through the duration of the event)</li> </ul> <p>Scenarios are textual descriptions of an object's action over time and can be used to describe the way a test works.</p>	<p><a href="#">Constraints</a> <sup>[963]</sup></p> <p><a href="#">Scenarios</a> <sup>[965]</sup></p>
<b>Create quality test documentation</b>	Enterprise Architect provides the facility to generate high quality test <b>documentation</b> in the industry-standard .RTF file format.	<a href="#">Test Documentation</a> <sup>[2617]</sup>
<b>Element defect changes</b>	In defect tracking you can allocate defect reports to any element within the model, so that all who are involved in the project can quickly view the status of defects and see which defects have to be addressed and which have been dealt with.	<a href="#">Create Maintenance Items</a> <sup>[2625]</sup>

### 2.5.8 Implementation Managers

Enterprise Architect provides support for the management of **project implementation**. You can track and assign maintenance-related items to elements within Enterprise Architect, and rapidly capture and update records of maintenance tasks such as issues, changes, defects and tasks. By providing a centralized facility for each element involved in the deployment process Enterprise Architect offers a powerful solution for tracing the maintenance of the items and processes involved in system deployment.

#### Implementation Tasks and Tools

Task	Detail	See also
<b>Develop Deployment Diagrams</b>	<p>Using Deployment diagrams you can model the roll out of a project, including network deployment and workstation deployment.</p> <p>Users involved in project deployment can add maintenance tasks to the diagram elements.</p> <p>Deployment diagrams provide a static view of the run-time configuration of nodes on the network or of workstations, and the components that run on the nodes or are used in the workstations.</p>	<p><a href="#">Deployment Diagram</a> <sup>[1191]</sup></p> <p><a href="#">Example Deployment Diagram</a> <sup>[1193]</sup></p>

[Learn more](#)

- [Working on Maintenance Items](#) 

## 2.5.9 Technology Developers

**Technology Developers** are Enterprise Architect users who create customized additions to the functionality already present within Enterprise Architect.

Additions include UML Profiles, UML Patterns, Code Templates, Tagged Value Types, Scripts, Custom Queries, Transformations, MDG Technologies and Enterprise Architect Add-Ins. By creating these extensions the Technology Developer can customize the Enterprise Architect modeling process to specific tasks and speed up development.

### Developing Technologies

Extension	Detail	See also
<b>UML Profiles</b>	By creating <b>UML Profiles</b> you can create a customized extension for building UML models that are specific to a particular domain.  Profiles are stored as XML files and can be imported into any model as required.	<a href="#">Using UML Profiles</a> 
<b>UML Patterns</b>	<b>Patterns</b> are sets of collaborating Objects and Classes that provide a generic template for repeatable solutions to modeling problems.  As patterns are discovered in any new project, you can create the basic pattern template.  Patterns can be re-used with the appropriate variable names modified for any future project.	<a href="#">Design Patterns</a> 
<b>Code Templates</b>	<b>Code templates</b> are used to customize the output of source code generated by Enterprise Architect; in this way you can generate code languages not specifically supported by Enterprise Architect and define how the system generates source code to comply with your own company style guidelines.	<a href="#">Code Template Framework</a> 
<b>Tagged Value Types</b>	<b>Tagged Values</b> are used in Enterprise Architect to extend the information relating to an element in addition to the information directly supported by the UML language.  A Tagged Value, strictly, is the value of a property of a modeling item, the property being called a tag; for example: a Class element called Person might have a tag called Age with the Tagged Value of <b>42</b> .  More loosely, the combination of tag and value can be referred to as a Tagged Value.  A <b>Tagged Value Type</b> is a group of parameters that define and/or limit the possible values of a tag and, in many instances, how a specific value is assigned to the tag; for example, the tag <b>Age</b> might have a Tagged Value Type of Integer, so the user simply types in a numeric value.	<a href="#">Tagged Values</a>   <a href="#">Tagged Value Type</a> 

	<p>Alternatively, the type could be <b>Spin</b>, with lower and upper limits of, say, <b>20</b> and <b>120</b>, so the user sets a value by clicking on arrows in the field to increment or decrement the value within the limits of <b>20</b> and <b>120</b>.</p> <p>Typically, Tagged Values are used during the code generation process, or by other tools to pass on information that is used to operate on elements in particular ways.</p>	
<b>MDG Technologies</b>	<b>MDG Technologies</b> can be used to create a logical collection of resources that can contain UML Profiles, Patterns, Code Templates, Image files and Tagged Value types that are accessed through a technology file.	<a href="#">MDG Technologies</a> <sup>[1475]</sup>
<b>Enterprise Architect Add-Ins</b>	Using <b>Add-Ins</b> you can build your own functionality into Enterprise Architect, creating your own mini programs that can extend the capabilities of the system, defining your own menus, and creating your own Custom Views.	<a href="#">Enterprise Architect Add-Ins</a> <sup>[9010]</sup>

## 2.5.10 Database Developers

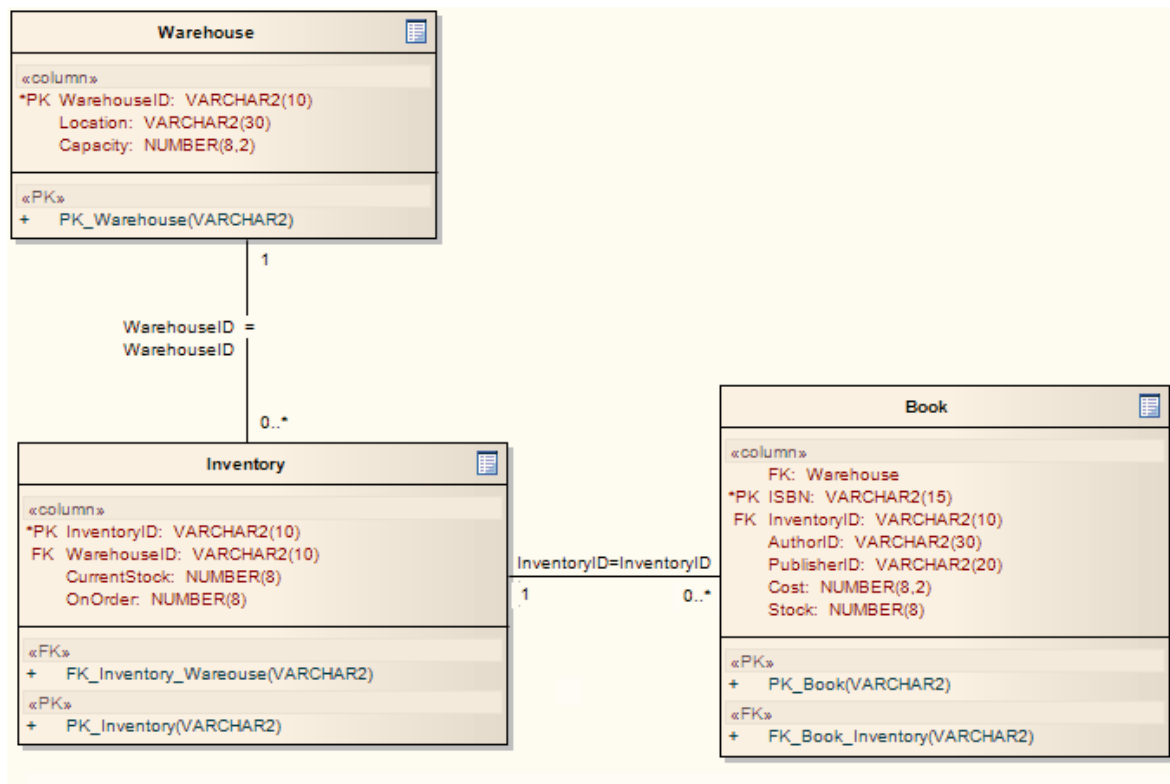

Enterprise Architect supports a range of features for the **development of databases**, including modeling database structures, importing database structures from an existing database and generating DDL for rapidly creating databases from a model.

#### Database Development Tasks

Task	Detail	See also
<b>Create Logical Data Models</b>	<p>With Enterprise Architect you can build database diagrams using the built-in UML Data Modeling Profile.</p> <p>This supports the definition of Primary and Foreign keys, cardinality, validation, triggers, constraints and indexes.</p>	<a href="#">Logical Data Model</a> <sup>[1939]</sup>
<b>Generate Schema</b>	<p>By using Enterprise Architect's DDL generation function you can create a DDL script to create the database table structure from the model.</p> <p>Enterprise Architect currently supports:</p> <ul style="list-style-type: none"> <li>• JET-based databases</li> <li>• DB2</li> <li>• InterBase</li> <li>• Informix</li> </ul>	<a href="#">Database Schema</a> <sup>[1943]</sup>

	<ul style="list-style-type: none"> <li>• Ingres</li> <li>• MySQL</li> <li>• SQL Server</li> <li>• PostgreSQL</li> <li>• Sybase Adaptive Server Anywhere and Adaptive Server Enterprise, and</li> <li>• Oracle 9i, 10g and 11g</li> </ul>	
<b>Reverse Engineer Database</b>	<p>Using an ODBC data connection you can import a database structure from an existing database to create a model of the database.</p> <p>By generating the model directly from the database you can quickly document your work and create a diagrammatic account of a complex database through the graphical benefits of UML.</p>	<a href="#">Reverse Engineering</a> [2136]

### 3 Projects and Teams

Enterprise Architect helps you to create projects for development under a [range of work conditions](#)<sup>[199]</sup>, from single user/local access through to multiple-role teams working in a distributed environment. You both protect and manage the model data itself, and communicate information on the data in the form of documentation and reports, using facilities such as those listed below.

<b>Opening Existing Projects</b>	There are various ways to open a project in Enterprise Architect; new users are advised to explore the <i>EAExample</i> file supplied with Enterprise Architect.	<a href="#">Open a project</a> <sup>[202]</sup>
<b>Connect to a Data Repository</b>	<p>You can connect to any of the following data repositories:</p> <ul style="list-style-type: none"> <li>• MS Access 97, 2000 and 2003 (in all editions - .EAP files are stored in Microsoft JET databases)</li> <li>• Access 2007</li> <li>• SQL Server 2000, 2005, 2008 and 2012</li> <li>• SQL Server Express 2005 and 2008</li> <li>• MySQL</li> <li>• Oracle 9i, 10g and 11g</li> <li>• PostgreSQL</li> <li>• Adaptive Server Anywhere</li> <li>• Progress OpenEdge</li> </ul> <p>To create a new data repository, you first create a new database with the DBMS management software, then run supplied scripts to create the logical structure.</p> <p>You then use Enterprise Architect data transfer functions to move a project from a .EAP, .FEAP or DBMS model into the new project.</p>	<a href="#">Server Based Repositories</a> <sup>[214]</sup>

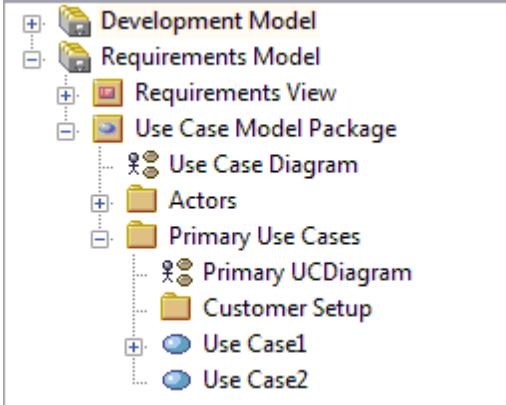

### 3.1.1 Projects Defined

An Enterprise Architect Project is a repository for storing, manipulating and managing one or more Models. A single repository can contain many models, and a repository can be either file based or hosted in a larger DBMS system.

#### Concepts

Concept	Detail	See also
<b>Project</b>	<p>A project can contain a single model, or a number of models, each of which defines a particular system or process. A model contains the diagrams, elements, relationships and associated metadata that define the structure and function of the system or process.</p> <p>These components are organized into a hierarchy of Packages, which help to group and manage related components.</p>	<a href="#">Open a Project</a> <sup>[202]</sup> <a href="#">Model Shortcuts</a> <sup>[204]</sup> <a href="#">Project Management</a> <sup>[509]</sup> <a href="#">Team Development</a> <sup>[306]</sup>
<b>Model Package</b>	Different aspects of the process or system - or their development - are defined by Model Packages, which you generate from templates	<a href="#">Model Wizard</a> <sup>[753]</sup>

Concept	Detail	See also
	<p>specifically structured to support the aspects that the Model Packages represent, such as requirements or deployment.</p> <p>You can generate these templated Packages at any level of the hierarchy, but as they are created with their own content they are more useful at the top levels.</p>	<a href="#">Model Templates</a> <sup>759</sup>
<b>View</b>	<p>The top-level Packages in a model can also be Views, which represent partitions of the model that you define yourself.</p> <p>You can start with standard Views such as Class or Component, or create whatever partitions are appropriate to your model.</p>	<a href="#">Views</a> <sup>769</sup>
<b>Example Project Structure</b>	 <p>Each View or Model Package contains Packages; <i>Use Case Model Package</i> contains:</p> <ul style="list-style-type: none"> <li>• Actors and</li> <li>• Primary Use Cases</li> </ul> <p>It also contains the diagram Use Case Diagram, which could be an overview of the Package structure or function.</p> <p>Each Package itself can contain one or more diagrams, one or more Packages, and several elements; the <i>Primary Use Cases</i> Package contains the:</p> <ul style="list-style-type: none"> <li>• Primary UCDiagram</li> <li>• Customer Setup Package</li> <li>• Use Case1 element</li> <li>• Use Case2 element</li> </ul> <p>Each subordinate Package also contains diagrams, elements and (if necessary) further Packages; the elements are related by connectors created in the diagrams, and each element and connector has properties, attributes, operations and extensions defined in the respective Properties dialogs.</p>	
<b>Storage</b>	A project can be a .EAP file in an MS Access database. a .FEAP file or	<a href="#">File Based</a>

Concept	Detail	See also
	(in the Enterprise Architect Corporate, Business and Software Engineering, System Engineering and Ultimate editions) a structure of files in a database management system such as MySQL or Oracle.	<a href="#">Repositories</a> <sup>[210]</sup> <a href="#">Server Based Repositories</a> <sup>[214]</sup>

### 3.1.2 Open a Project

An Enterprise Architect project is used for storing and managing the components of one or more UML models. The Desktop and Professional versions of Enterprise Architect work on file-based projects (.eap files). If you are using the Corporate edition (or above), you can also use one of a number of DBMSs such as Oracle or MySQL to host the project repository.

When you select to open a project, you can:

- Select a shortcut to a recent project, to open it
- Browse for another existing project to open
- Remove a shortcut from the list of recently-opened projects
- Specify connection details for opening a project hosted on a DBMS
- Create a new Enterprise Architect project file

**Access** **File | Open Project (Ctrl+O)**

#### Options

Field/Button/Option	Action	See also
<b>New Project...</b>	Click on this button to specify the location and name of a new .EAP or .FEAP project file.  Alternatively, click on the drop-down arrow and select the <b>Copy Base Project</b> option to create the new project from an existing project file. The system provides a standard base file as a template, but you can select any other .eap project file as a base.	<a href="#">File Based Repositories</a> <sup>[210]</sup>  <a href="#">Copy a Base Project</a> <sup>[211]</sup>
<b>Browse for Project</b>	Click on this button to open a file browser dialog, to select an existing .EAP file; the .EAP file can be a project file or a shortcut to a project hosted on a DBMS.	<a href="#">Model Shortcuts</a> <sup>[204]</sup>
<b>Connect to Server</b>	Click on this button to specify connection details for opening an Enterprise Architect project that is hosted on a DBMS. The <b>Windows</b> Data Link Properties dialog displays; start to define the connection to the project's server-based repository.  You can also click on the drop-down arrow and select the: <ul style="list-style-type: none"> <li>• <b>Connection Wizard</b> option - the Data Link Properties dialog again displays</li> </ul>	<a href="#">Server-Based</a>

	<ul style="list-style-type: none"> <li>• <b>Connection String</b> option - the Connection String dialog displays; type in or paste the connection string and click on the <b>OK</b> button to connect directly to the project</li> <li>• <b>Connect to Cloud</b> option - the Cloud Connection dialog displays, on which you specify the server, URL and model name to access via the Cloud</li> </ul>	<a href="#">Repositories</a> <sup>[214]</sup>  <a href="#">Connect to a Project Via the Cloud</a> <sup>[266]</sup>
<b>Recent Projects</b>	<p>This panel lists the ten most recently opened projects. To open one of these projects either double-click on the name, or click on it and then click on the <b>Open</b> button.</p> <p>Each project name is shown with its access path. You can edit the access path by right-clicking on it and selecting the <b>Edit Connection String</b> context menu option; make the changes on the Connection String dialog, and click on the <b>OK</b> button.</p> <p>This list is also displayed:</p> <ul style="list-style-type: none"> <li>• On the Start Page, under the <b>Recent</b> heading</li> <li>• As a drop-down menu under the <b>Open Project</b> button on the Default Tools toolbar</li> <li>• As part of the <b>File</b> menu</li> </ul>	
<b>Remove Selection from List</b>	Click on a project name and click on this button to remove that project name from the <b>Recent Projects</b> list.	
<b>Show this Dialog at Startup</b>	<p>Select the checkbox to show this Open Enterprise Architect Project dialog automatically upon starting Enterprise Architect.</p> <p>Deselect the checkbox to hide the dialog.</p>	
<b>Open</b>	Click on this button to open the currently selected project in the Recent Project list.	
<b>Cancel</b>	Click on this button to close this dialog without any further action.	
<b>Help</b>	Click on this button to display this Help topic.	

### Notes

- Use of a DBMS for hosting the model repository is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- Enterprise Architect supports the following DBMS products for hosting model repositories; [SQL Server and SQL Server Express](#),<sup>[217]</sup> [MySQL](#),<sup>[222]</sup> [Oracle 9i, 10g or 11g](#),<sup>[253]</sup> [Postgre SQL](#),<sup>[233]</sup> [ASA](#),<sup>[239]</sup> and [Progress OpenEdge](#).<sup>[248]</sup>

### 3.1.3 Project Shortcuts

Enterprise Architect enables you to create a desktop shortcut (or *proxy* file) to an Enterprise Architect project (DBMS or file-based). Each shortcut is a file containing the connection string for the model.

However, the shortcut also defines *views* that Enterprise Architect should open when it opens the model, as outlined below.

Topics

View	Detail	See also
<b>Diagrams</b>	Define one or more specific diagram(s) to be loaded on opening the project.	
<b>Model Search</b>	<p>Open the Model Search with a specific text string and search type.</p> <p>For searches operating on the current tree selection, a diagram in the target package must be opened first.</p> <p>If you use a custom SQL search, the SQL must include <i>ea_guid</i> AS <i>CLASSGUID</i> and the object type.</p> <p>You specify a single Model Search to open.</p>	<a href="#">Model Search</a> <sup>[700]</sup>
<b>The Relationship Matrix with a saved profile</b>	<p>Open the Relationship Matrix with a saved profile.</p> <p>You specify a single Relationship Matrix profile to open.</p>	<a href="#">Relationship Matrix</a> <sup>[727]</sup>
<b>The default Team Review</b>	<p>Open the default Team Review document.</p> <p>You specify the Team Review once.</p>	<a href="#">Team Review Tools</a> <sup>[343]</sup>
<b>Working Set</b>	<p>Open a working set.</p> <p>You specify a single Working Set to open.</p> <p>This is very similar to the shortcut itself, opening a defined set of diagrams and views. However, the working set can <b>also</b> open source code editors, therefore widening the capabilities of the shortcut alone.</p> <p>Working sets make it easy to customize the main views you want to open without having to resave your project short cuts. The working set is easy to tailor to your changing requirements, adding greater flexibility to any short cut that calls the working</p>	<a href="#">Working Sets</a> <sup>[567]</sup>

View	Detail	See also
	<p>set</p> <p>Also, working sets provide the capability of storing the currently-engaged files when closing a model, and reopening them in the context in which you were last using them. The basic project shortcut can also do this, but once the work environment is captured the shortcut returns to the <b>same</b> set up each time you use it. The working set always captures the <b>current</b> work environment each time the model closes.</p> <p>This option can be very useful in, for example, a coding environment when you want to return to the last files you were editing.</p>	
<b>Workspace Layout</b>	<p>Apply a selected Workspace Layout, which opens and sets out the appropriate screens and windows for a specific area of work, such as model simulation.</p> <p>You specify a single Workspace Layout to open. However, by creating and using <b>separate shortcuts</b> you can open Enterprise Architect in exactly the configuration you need for the work you want to do - modeling, coding, or debugging, for example.</p>	<a href="#">Manage Workspace Layout</a> <small>163</small>
<b>An example shortcut</b>	<p>You might create a shortcut to open, in sequence:</p> <ul style="list-style-type: none"> <li>• A Development module</li> <li>• The Model Search for a simple search on the term <i>Issue</i></li> <li>• The module <i>Issues</i> diagram</li> <li>• The module <i>Changes</i> diagram</li> </ul> <p>Enterprise Architect opens the appropriate windows in the sequence in which you list the options, displaying the last view in the list as the active view.</p> <p>In this example, the project opens with the Enterprise Architect work area showing the two diagram tabs and the Model Search tab, and with the <i>Changes</i> diagram displayed in the Diagram View.</p>	

### Notes

- If specified, the shortcut views override any default diagram defined for the model or current user
- A shortcut does not affect the original Enterprise Architect .exe file or icon, or any other shortcut you might have defined; you can use all of these independently
- If you are using a database repository other than MS Access 97, 2000 or 2003, you can configure the shortcut to **encrypt the password** used to set up the connection between Enterprise Architect and the repository; the Enterprise Architect user does not have the real password, thereby preventing them from accessing the repository using other tools such as Query Analyzer or SQLPlus

**3.1.3.1 Create Project Shortcut**

You can create a shortcut to an Enterprise Architect project (either a DBMS project or file based project). The shortcut can specify additional windows and diagrams to open up automatically every time the shortcut is run, to create a working environment in advance for other users.

Shortcuts are stored with a .EAP extension, but are actually small text files that tell Enterprise Architect what project to open and what initial views and windows to display.

**Access**   **File | Save Shortcut**

Create a project shortcut

Step	Action	See also
1	Open Enterprise Architect.	
2	Open the required project.	
3	Select the <b>File   Save Shortcut</b> menu option. The Save Project Shortcut dialog displays.	
4	Click on the ( ... ) (Browse) button at the end of the <b>Target File</b> field. The Save Project As dialog displays.	
5	Browse for the appropriate file location and, in the <b>File name</b> field, type an appropriate filename.  All shortcuts are .EAP files, regardless of whether the model itself is a .EAP file or a DBMS model.	
6	Click on the <b>Save</b> button to return to the Save Project Shortcut dialog.	
7	Click on the <b>Add Other</b> button and select the required option to define: <ul style="list-style-type: none"> <li>• A diagram to open</li> <li>• A Relationship Matrix profile to open</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• The Team Review</li> <li>• A Model Search to perform</li> <li>• A working set to apply</li> <li>• A workspace layout to apply</li> </ul>	
8	<p>The appropriate browser or dialog displays to define the view to display; enter the details and click on the <b>OK</b> button.</p> <p>The view is added to the <b>Actions when model is opened</b> field; the entry is automatically selected, with a tick in the checkbox.</p>	
9	Repeat steps 7 and 8 for as many additional views as you require.	
10	<p>Review the items in the <b>Actions when model is opened</b> field.</p> <ul style="list-style-type: none"> <li>• If you decide not to have an item in the shortcut, deselect its checkbox</li> <li>• If you want to clear all selected items, click on the <b>Include None</b> button</li> </ul> <p>Unselected entries are deleted when you save the shortcut.</p>	
11	<p>If you decide to change the sequence and/or make a different view display first in the Diagram View:</p> <ul style="list-style-type: none"> <li>• Click on the appropriate entry</li> <li>• Click on the <b>'Up Hand'</b> or <b>'Down Hand'</b> buttons</li> </ul>	
12	Click on the <b>OK</b> button to save the shortcut.	

### Notes

- When you subsequently open the Save Project Shortcut dialog, it lists the currently-opened views in the order in which they were opened; you can add further views or remove them from the shortcut

### Learn more

- [Capture Current Work Environment](#)<sup>[207]</sup>
- [Encrypt Repository Password](#)<sup>[209]</sup>

### 3.1.3.2 Capture Current Work Environment

You can capture the current Enterprise Architect work environment in your shortcut. This maintains the work environment from that point, and is useful if you intend to close and re-open the model and return to **the same** configuration many times.

If you simply want to return to **whatever** work environment you happen to be in each time you close the

model, you should use a **work set** that captures the current environment, either by itself or as part of a broader project shortcut.

**Access** **File | Save Shortcut**

#### Capture your current work environment

Step	Action	See also
1	Open Enterprise Architect.	
2	Open the required project and work in it.	
3	At the point at which you decide to capture your work environment in a shortcut, ensure that: <ul style="list-style-type: none"> <li>You have opened all diagrams you require</li> <li>If necessary, you have opened the Team Review, Model Search (with appropriate search term and type) and/or Relationship Matrix (at the appropriate profile)</li> <li>The view you want to resume work on is the last one opened</li> </ul>	
4	Select the <b>Save Project Shortcut</b> menu option.  The Save Project Shortcut dialog displays, showing a list of actions derived from the views you currently have open.	
5	If you accessed Enterprise Architect via a shortcut, the <b>Target File</b> field displays the file location of that shortcut.  Otherwise, click on the ( ... ) (Browse) button at the end of the <b>Target File</b> field.  The Save Project As dialog displays.	
6	Browse for the appropriate file location and, in the <b>File name</b> field, type an appropriate filename.  All shortcuts are .EAP files, regardless of whether the model itself is a .EAP file, .FEAP file or DBMS model.	
7	Click on the <b>Save</b> button to return to the Save Project Shortcut dialog.	
8	In the <b>Actions when model is opened</b> field, click on the <b>Include All</b> button.	
9	If you also want to save current window positions click <b>Add Other</b> followed by <b>Add Workspace Layout...</b> The dialog shown allows you to select an existing layout or save the current layout.	<a href="#">Manage Workspace Layout</a> <sup>[163]</sup>

Step	Action	See also
10	Click on the <b>OK</b> button to save the shortcut.	

#### Learn more

- [Working Sets](#) <sup>[564]</sup>
- [Encrypt Repository Password](#) <sup>[209]</sup>

### 3.1.3.3 *Encrypt Repository Password*

If your model is developed on a DBMS repository, the Save Project Shortcut dialog has an **Encrypt Connection String** check box.

You can create the shortcut actions and, if necessary, select the checkbox to encrypt the database connection string.

You distribute the shortcut file to the database users who are to access the model. The users then have an encrypted string that prevents them from directly accessing the database using other tools.

- [Create Project Shortcut](#) <sup>[206]</sup>

## 3.2 File Based Repositories

Having a light weight, portable, file-based repository for Enterprise Architect is ideal for those who want to quickly develop modeling suggestions and solutions and share the model information easily with others. All editions of Enterprise Architect support this type of repository in the form of .eap files in an Access database, or .feap files on a Firebird repository.

A default project file (*EABase.eap*) is supplied in the Enterprise Architect installer and is automatically stored in your Enterprise Architect installation directory. You can:

- Copy the EABase.eap file as the base for your own projects
- Create your own base projects as .eap files or .feap files, and
- Copy existing operational projects

Task	Detail	See also
<b>Create .EAP Project Files</b>	<p>Select one of:</p> <ul style="list-style-type: none"> <li>• <b>File   New Project</b> menu option</li> <li>• <b>New Project   New Project</b> option on the Open Enterprise Architect Project dialog, or</li> <li>• <b>Create a New Project</b> option on the Start Page</li> </ul> <p>All of these options display the New Project dialog; select a directory and enter a file name for your project.</p> <p>Once the project has been saved, the Model Wizard displays, which makes a selection of Model Patterns available; select the Model Patterns to use.</p> <p>Enterprise Architect adds a model containing the selected Model Packages to the Project Browser.</p>	<a href="#">Model Wizard</a> <sup>[753]</sup>
<b>Create .FEAP Project Files</b>	<p>As for a .EAP file (above), except that in the New Project dialog, in the <b>Save as Type</b> field, click on the drop-down arrow and select the <b>.feap</b> file extension.</p> <p>Enterprise Architect will check your input and display an error message if:</p> <ul style="list-style-type: none"> <li>• Your Firebird repository is not located on the local drive; a Firebird repository is not appropriate for a network shared project</li> <li>• The file path contains characters that are not in the system codepage</li> </ul>	

Task	Detail	See also
<b>Default EABase. EAP Installation directories</b>	<p>The default installation directories, depending on which version you have installed, are:</p> <ul style="list-style-type: none"> <li>Registered version: C:\Program Files\Sparx Systems\EA</li> <li>Trial version: C:\Program Files\Sparx Systems\EA Trial</li> <li>Lite version: C:\Program Files\Sparx Systems\EA Lite</li> </ul> <p>Having copied the base project as a template for your own project, you can rename it.</p>	<a href="#">Copy a Base Project</a> <sup>[211]</sup> <a href="#">Rename a Project</a> <sup>[601]</sup>
<b>Configure Project</b>	Having created your project, you can set a range of project parameters to define defaults, tailor the project to particular coding languages, and ensure consistent development and use of the project.	<a href="#">Settings Menu</a> <sup>[119]</sup> <a href="#">Defaults and User Settings</a> <sup>[151]</sup>
<b>Create Custom Templates</b>	You can customize any Enterprise Architect project as a template project with company standards, tutorials, frameworks and any other common piece of modeling already in-built; with careful planning you can save yourself many hours of work at project start-up.	<a href="#">Incorporate Model Templates</a> <sup>[1576]</sup>
<b>Copy Existing Project</b>	<p>A Base project contains templates and reference data to enable you to develop your own project quickly.</p> <p>You can also copy an operational .EAP project file to enable separate development by team members, or to create an evaluation or distribution version of the project.</p>	<a href="#">Copy Existing Projects</a> <sup>[212]</sup>

**Notes**

- You can also add Model Packages to a project using the **New Model From Pattern** icon in the Project Browser toolbar

**3.2.1 Copy a Base Project**

When you create a new project, you can use the Model Wizard to define the structure and contents. Alternatively, you can copy an existing **template** or **base project** which is already largely set up, containing company standards, tutorials, frameworks and any other common modeling structures.

If you intend to use an existing project file as the template for a new project, it is **important** to use this method rather than simply copying the .EAP file using Windows Explorer. This process **resets all the unique identifiers** for packages and elements, so that your new project is truly **unique** - otherwise it is simply an exact copy of the original project.

**Access** **File | Open Project (Ctrl+O) : New Project (arrow) | Copy Base project**

Create a new project from a base project

Step	Action	See also
1	On the Create New Enterprise Architect Project dialog, in the <b>New Project</b> field, click on the <b>Browse</b> button and select the file path for saving your project.  If this is to be a shared project, store the file on a shared network resource such as a Network Server or Workgroup Server.	
2	In the <b>Model Project</b> field, select the project that is the base template.  The field defaults to <b>EABase.eap</b> , the default base project provided in the Enterprise Architect installer.  If you want to use a different base, such your own custom project, click on the <b>Browse</b> button and locate the file to use.	<a href="#">Incorporate Model Templates</a> <sup>[1576]</sup>
3	The <b>Reset New Project GUIDs</b> checkbox defaults to selected, to replace all GUIDs from the base model with fresh GUIDs in the new model.  However, if the new project is based on one that is under version control, we recommend that you <b>deselect</b> this checkbox to prevent duplication of Packages when the <i>Get Latest</i> facility is used.	<a href="#">Package Version Control Menu</a> <sup>[427]</sup>
4	Click on the <b>Create Project</b> button to create your project.	

### 3.2.2 Copy Existing Project

You can copy an operational .EAP or .FEAP project file to a new file location under a new name to, for example:

- Provide separate copies for individual team members
- Create an evaluation or distribution version of the project

**Access**   **File | Save Project As**

#### Create a copy of a project

Step	Action	See also
1	Select the <b>Save Project As</b> menu option.  The Save Enterprise Architect Project Copy dialog displays.	
2	In the <b>Target Project</b> field, type the new project filename.  You can either type in the file path as well, or click on the <b>Browse</b> button and browse for the required file path.	

Step	Action	See also
3	<p>If this copy is to be used for a different project, select the <b>Reset New Project GUIDs</b> checkbox.</p> <p>This ensures that all components of the new project have different IDs to their counterparts in the source project.</p>	
4	<p>Click on the <b>Save As</b> button to save the new project.</p>	

### 3.3 Server Based Repositories

You can create a model in any edition of Enterprise Architect as a .eap or .feap file. However, if you need to develop **large** models with **many concurrently-connected users**, you might prefer to use the greater capacity and flexibility of a Data Base Management System (DBMS) and create your project on a DBMS (server-based) repository. This facility is available through the Corporate, Business and Software Engineering, Systems Engineering or Ultimate editions.

#### Set up a project on a DBMS repository

To set up your project on a DBMS repository, you work through these stages:

1. Set up your DBMS software and create a repository.
2. Create the required tables in your repository, by running a script supplied on the Sparx Systems website.
3. (For certain DBMS products) Set up an ODBC driver to enable connection to the repository.
4. Transfer the project from the source file to the DBMS repository; the source file can be:
  - a .eap or .feap template file, to begin a new project from scratch, or
  - a previously-developed project file, to move an existing project into the DBMS repository
5. Connect to your repository.

#### DBMS Products you can use

You can set up your project on a repository in:

- SQL Server 2000, 2005, 2008 or 2012
- SQL Server Express 2005 or 2008
- MySQL 4 or 5
- PostgreSQL 7, 8 or 9
- Adaptive Server Anywhere 8 or 9, or SQL Anywhere 10, 11 or 12
- Access 2007
- Progress OpenEdge, or
- Oracle 9i, 10g or 11g

For information on creating a project on a specific DBMS from this list, see *Learn more*, below.

#### Notes

- You cannot move a model from a source .eap file of an Enterprise Architect version earlier than 3.5.0 without updating it first
- Before proceeding, you must have MDAC 2.6 or higher installed on your system

- (Optional, but recommended) before actually transferring the project structure from the file to the repository, perform a Project Data Integrity Check on the file

### **3.3.1 Create a Project in a SQL Server Database**

To create a project on a repository in SQL Server 2000, 2005, 2008 or 2012, or SQL Server Express 2005 or 2008, work through the following stages:

- Stage 1: Create an empty database repository and set up the data tables
- Stage 2: Perform a project integrity check on the project file you are using as a base (optional, but recommended)
- Stage 3: Transfer the data
- Stage 4: Connect to the repository to open the project

#### Prerequisites

- Install SQL Server and MDAC 2.6 or higher, and obtain access permissions to create a new database

#### Create a SQL Server Repository

Step	Action	See also
1	Create an empty SQL Server database.	<a href="#">Create a SQL Server Repository</a> <sup>[217]</sup> <a href="#">Registered User's Scripts page</a> <a href="#">Trial User's Scripts Page</a>
2	Using a tool such as the SQL Enterprise Manager, load the <b>SQLServer_EASchema.sql</b> file from the Sparx Systems website.	
3	Run the script to create all required data tables in the repository.	

#### Perform a Project Integrity Check

Step	Action	See also
1	In Enterprise Architect, open the file-based project or template from which you are creating the project on the repository.	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> . This ensures your project data is 'clean' before being copied to the repository.	<a href="#">Project Integrity Check</a> 

#### Transfer the project data to the repository

Step	Action	See also
1	Open Enterprise Architect. (If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option. The Project Transfer dialog displays.	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the project file to copy to the repository. If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> 
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button. The Datalink Properties dialog displays.	
6	Select <b>Microsoft OLE DB Provider for SQL Server</b> from the list. Click on the <b>Next</b> button.	
7	On the Data Source Details page of the Datalink Properties dialog, type in the server name, database name and any security details required. Click on the <b>OK</b> button. The Project Transfer dialog redisplay.	
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	

Step	Action	See also
9	Click on the <b>Transfer</b> button to begin the data transfer process.	
10	When the process is complete, you have created a project on a SQL Server database and can now connect to it and open it from Enterprise Architect.	<a href="#">Connect to a SQL Server Data Repository</a> <sup>[218]</sup>

#### Learn more

- [Perform a Project Data Transfer](#)<sup>[504]</sup>

### 3.3.1.1 Create a SQL Server Repository

Creating a SQL Server database is fully documented in the product information provided with your SQL Server installer.

Having created your SQL Server database, use the SQL script (**SQLServer\_EASchema.sql**) provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the script from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

If you are unfamiliar with SQL Server and DBMS systems in general, you might want to consider a suitable front end tool, such as SQL Enterprise Manager.

#### SQL Enterprise Manager example

Step	Action
1	In SQL Enterprise Manager, locate the server on which to create your new project; for example: DBSERVER02\SQLEXPRESS.
2	Right-click and choose the <b>New Database</b> context menu option.
3	Enter a suitable name for the database. Set any file options as required. Ensure that the database collation is set to the alphabet you use, such as Latin or Cyrillic, and case-insensitive.
4	Click on the database to select it, then select the <b>New Query</b> menu option.
5	In the Query window, use the Open File dialog to locate the <i>SQLServer_EASchema.sql</i> script file.

Step	Action
6	Click on the <b>Open</b> button. In the drop-down menu, check that you have selected the correct database to run the script in.
7	Click on the <b>Execute</b> button; SQL Server executes the script, which creates the base tables for an Enterprise Architect project.

#### Notes

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- When creating a project in a SQL Server database you must have **db\_ddladmin** permission in order to execute the **SET IDENTITY\_INSERT ( table ) {ON | OFF}** command

#### Learn more

- [Create a project in a SQL Server database](#)<sup>[215]</sup>
- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)

### 3.3.1.2 Connect to a SQL Server Data Repository

To access a project in your SQL Server data repository, you need to connect to the data repository from Enterprise Architect.

#### Prerequisites

- The SQL Server repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions

Access   **File | Open Project ( Ctrl+O )**

#### Connect to the repository

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
2	Click on the ( ... ) (Browse) button. The Data Link Properties dialog displays.

Step	Action
3	Select <b>Microsoft OLE DB Provider for SQL Server</b> from the list.
4	Click on the <b>Next&gt;&gt;</b> button. The Connection tab displays.
5	Type in the server details, including Server Name, User Name and Password.
6	Click on the <b>Select the database on the server</b> option and on the drop-down arrow. From the list, select the project to connect to.
7	Click on the <b>Test Connection</b> button to confirm that the details are correct.
8	If the test does not succeed, revise your settings. If the test succeeds, click on the <b>OK</b> button; the Connection Name & Type dialog displays.
9	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.
10	If required, select the <b>Encrypt Connection String</b> checkbox. This encrypts and hides the connection details of the database from the users that the connection string is given to.
11	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded. With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.
12	If required, select the <b>Use WAN Optimization</b> checkbox. To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time. If you select this checkbox, complete the next two fields (see your administrator for the correct values); otherwise go to step 15.
13	In the <b>Server</b> field, type the network name or address of the optimizer server.
14	In the <b>Port</b> field, type the port on which the server is running on the remote machine.

Step	Action
15	Click on the <b>OK</b> button to complete the configuration and open the project.  This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.

#### Notes

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

#### Learn more

### 3.3.2 Create a Project in a MySQL Database

To create a project in a repository on MySQL 4 or 5, you work through the following stages:

- Stage 1: Create an empty database repository and set up the data tables
- Stage 2: Set up the ODBC Driver
- Stage 3: Perform a project integrity check on the .project file you are using as a base (optional, but recommended)
- Stage 4: Transfer the data
- Stage 5: Connect to the repository and open the project

#### Prerequisites

- Install MySQL version 4.0.3 or higher, and MySQL ODBC 5.1 or higher

#### Create a MySQL Repository

If MySQL is set up to use **MyISAM** table types (the default), transactional support is disabled. To enable transactions you must set up MySQL to use **InnoDB** tables and create the database tables as InnoDB type.

Sparx Systems provide scripts to create both InnoDB- and MyISAM-based repository tables.

Step	Action	See also
1	Create an empty MySQL database.	<a href="#">Create a MySQL Repository</a>
2	Set up the <i>MySQL .ini</i> file.	

Step	Action	See also
3	<p>To use <i>MyISAM</i> tables, run the <b>MySQL_MyISAM_EASchema.sql</b> script.</p> <p>To use <i>InnoDB</i> tables, run the <b>MySQL_InnoDB_EASchema.sql</b> script.</p>	<p><a href="#">Registered User's Scripts page</a></p> <p><a href="#">Trial User's Scripts Page</a></p>

### Set Up the ODBC Driver

Step	Action	See also
1	<p>Create a suitable ODBC Data Source to point to your new database.</p> <p>Select the following checkboxes:</p> <ul style="list-style-type: none"> <li>• <b>Return matched rows instead of affected rows</b></li> <li>• <b>Allow big result sets</b></li> </ul>	<p><a href="#">Set up a MySQL ODBC Driver</a></p>

### Perform a Project Integrity Check

Step	Action	See also
1	In Enterprise Architect, open the file-based project or template from which you are creating the project on the repository.	
2	<p>Select and run <b>Tools   Data Management   Project Integrity Check</b>.</p> <p>This ensures your project data is 'clean' before being copied to the repository.</p>	<p><a href="#">Project Integrity Check</a></p>

### Transfer the Project Data

Step	Action	See also
1	<p>Open Enterprise Architect.</p> <p>(If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)</p>	
2	<p>Select the <b>Tools   Data Management   Project Transfer</b> menu option.</p> <p>The Project Transfer dialog displays.</p>	

Step	Action	See also
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the project file to copy to the repository.  If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> <sup>[313]</sup>
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button.  The Datalink Properties dialog displays.	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.  Click on the <b>Next</b> button.	
7	In the <b>Use Data source name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database.  Click on the <b>OK</b> button. The Project Transfer dialog redisplay.	<a href="#">Set up a MySQL ODBC Driver</a> <sup>[223]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	
9	Click on the <b>Transfer</b> button to begin the data transfer process.	
10	When the process is complete, you have created a project on a MySQL database and can now connect to it and open it from Enterprise Architect.	<a href="#">Connect to a MySQL Data Repository</a> <sup>[225]</sup>

#### Learn more

- [Perform a Project Data Transfer](#)<sup>[504]</sup>

### 3.3.2.1 Create a MySQL Repository

Creating a MySQL database is fully documented in the product information provided with your MySQL installer.

Having created your MySQL database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect.

You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

### **Third Party Tools**

If you are unfamiliar with MySQL and DBMS systems in general, you might want to consider a suitable front end tool. MySQL Administrator is one such tool, providing a convenient graphical user interface to enable the creation of databases, execution of scripts, backups and restores.

You might, therefore:

1. Run MySQL Administrator and create a new database, then
2. Run MySQL Query Browser, and open and execute the MySQL repository script

After creating a MySQL data repository in Enterprise Architect, you must set up the MySQL ODBC driver.

### **Notes**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

### **Learn more**

- [Create a project in a MySQL database](#) <sup>220</sup>

- [Set up a MySQL ODBC Driver](#) <sup>223</sup>

### **3.3.2.2 Set up a MySQL ODBC Driver**

After you have created a repository on your MySQL database, you set up the MySQL ODBC driver so that you can connect to a project on that repository from Enterprise Architect.

### **Prerequisites**

Install:

- MySQL DBMS and repository
- MySQL ODBC driver software version 5.1.5

### **Set up the ODBC Driver**

Step	Action
1	<p>If you are using a 32-bit operating system:</p> <ul style="list-style-type: none"> <li>• Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option</li> </ul> <p>If you are using a 64-bit operating system:</p>

Step	Action
	<ul style="list-style-type: none"> <li>Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on <b>64-bit clients</b>, run the 32-bit ODBC Data Source Administrator from <i>C:\Windows\SysWOW64\odbcad32.exe</i></li> <li>You can quickly load the correct 32-bit ODBC Data Source Administrator by selecting <b>Tools   ODBC Data Sources</b> in the Enterprise Architect menu bar</li> </ul> <p>The ODBC Data Source Administrator window displays.</p>
2	<p>Click on the <b>Add</b> button.</p> <p>The Create New Data Source dialog displays, enabling you to add a new DSN.</p>
3	<p>Select <b>MySQL ODBC 5.1 Driver</b> from the list.</p>
4	<p>Click on the <b>Finish</b> button.</p> <p>The MySQL Connector/ODBC dialog displays.</p>
5	<p>Enter the following configuration details:</p> <ul style="list-style-type: none"> <li>A data source name for the connection</li> <li>A description (optional)</li> <li>The host address of the DBMS server</li> <li>User name and password</li> <li>The database name on the selected server</li> </ul>
6	<p>To set the advanced options, click on the <b>Details&gt;&gt;</b> button.</p>
7	<p>Select the following checkboxes (where provided):</p> <ul style="list-style-type: none"> <li><b>Return matched rows instead of affected rows</b> (Connection or Cursors/Results tab)</li> <li><b>Allow big result sets</b> (Connection tab)</li> </ul>
8	<p>Click on the <b>Test Connection</b> button to confirm that the details are correct.</p>
9	<p>If the test succeeds, click on the <b>OK</b> button to complete the configuration.</p> <p>If the test does not succeed, review your settings.</p>

Your MySQL driver is now available to connect to the repository from Enterprise Architect.

**3.3.2.3 Connect to a MySQL Data Repository**

To access a project in your MySQL data repository, you need to connect to the data repository from Enterprise Architect.

Prerequisites

- The MySQL repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions
- The MySQL ODBC driver has been set up

Access   **File | Open Project (Ctrl+O)**

Connect to the repository

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
2	Click on the ( ... ) (Browse) button. The Data Link Properties dialog displays.
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.
4	Click on the <b>Next&gt;&gt;</b> button. The Connection tab displays.
5	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field. From the list, select the ODBC driver you have set up to connect to your MySQL repository.
6	If required, type in a <b>User</b> name and <b>Password</b> .
7	If required, type in an initial catalog.
8	Click on the <b>Test Connection</b> button to confirm that the details are correct.

Step	Action
9	<p>If the test does not succeed, revise your settings.</p> <p>If the test succeeds, click on the <b>OK</b> button; the Connection Name &amp; Type dialog displays.</p>
10	<p>Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.</p>
11	<p>If required, select the <b>Encrypt Connection String</b> checkbox.</p> <p>This encrypts and hides the connection details of the database from the users that the connection string is given to.</p>
12	<p>If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded.</p> <p>With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.</p>
13	<p>If required, select the <b>Use WAN Optimization</b> checkbox.</p> <p>To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time.</p> <p>If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 17.</p>
14	<p>In the <b>Server</b> field, type the network name or address of the optimizer server.</p>
15	<p>In the <b>Port</b> field, type the port on which the server is running on the remote machine.</p>
16	<p>In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.</p>
17	<p>Click on the <b>OK</b> button to complete the configuration and open the project.</p> <p>This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.</p>

### 3.3.3 Create a Project in a PostgreSQL Database

To create a project in a repository on PostgreSQL 7, 8 or 9, you work through the following stages:

- Stage 1: Create an empty database repository and set up the data tables
- Stage 2: Set up the PostgreSQL ODBC Driver
- Stage 3: Perform a project integrity check on the project file you are using as a base (optional, but recommended)
- Stage 4: Transfer the data
- Stage 5: Connect to the repository to open the project

#### Prerequisites

- PostgreSQL 7.3.2 or higher has been installed
- psqLODBC, version 7.03.01.00 or higher has been installed (do not use version 8.3.4 or 8.4.1)

#### Create Database Repository

Step	Action	See also
1	Create the empty database.	<a href="#">Create a PostgreSQL Repository</a> <sup>[229]</sup> <a href="#">Registered User's Scripts page</a> <a href="#">Trial User's Scripts Page</a>
2	Load the <b>PostgreSQL_EASchema.sql</b> file from the Sparx Systems website. For this you can work from the PostgreSQL (PSQL) command line, or with a tool such as <b>pgAdminIII</b> or EMS PostgreSQL Manager.	
3	Run the script to create all required data tables.	

#### Set Up the ODBC Driver

Step	Action	See also
1	Create a suitable ODBC Data Source to point to your new database.	<a href="#">Set up a PostgreSQL ODBC Driver</a> <sup>[230]</sup>

**Perform a Project Integrity Check**

Step	Action	See also
1	In Enterprise Architect, open the file-based project or template from which you are creating the project on the repository.	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> . This ensures your project data is 'clean' before being copied to the repository.	<a href="#">Project Integrity Check</a> [59]

**Transfer the project data to the repository**

Step	Action	See also
1	Open Enterprise Architect. (If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option. The Project Transfer dialog displays.	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the project file to copy to the repository. If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> [313]
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button. The Datalink Properties dialog displays.	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list. Click on the <b>Next</b> button.	
7	On the <b>Use Data Source Name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database. Click on the <b>OK</b> button. The Project Transfer dialog redisplay.	<a href="#">Set up a PostgreSQL ODBC Driver</a> [230]

Step	Action	See also
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	
9	Click on the <b>Transfer</b> button to begin the data transfer process.	
10	When the process is complete, you have created a project on a PostgreSQL database and can now connect to it and open it from Enterprise Architect.	<a href="#">Connect to a PostgreSQL Data Repository</a> <sup>[233]</sup>

**Notes**

- During the transfer, if an error message displays reporting '*...nonstandard use of \ in a string literal...*', set the server variable in the *postgresql.conf* file to: *escape\_string\_warning = off*

**Learn more**

- [Perform a Project Data Transfer](#)<sup>[504]</sup>

**3.3.3.1 Create a PostgreSQL Repository**

Creating a PostgreSQL database is fully documented in the product information provided with your PostgreSQL installer.

Having created your PostgreSQL database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

### 3.3.3.2 Set up a PostgreSQL ODBC Driver

After you have created a repository on your PostgreSQL database, you set up the PostgreSQL ODBC driver so that you can connect to a project on that repository from Enterprise Architect.

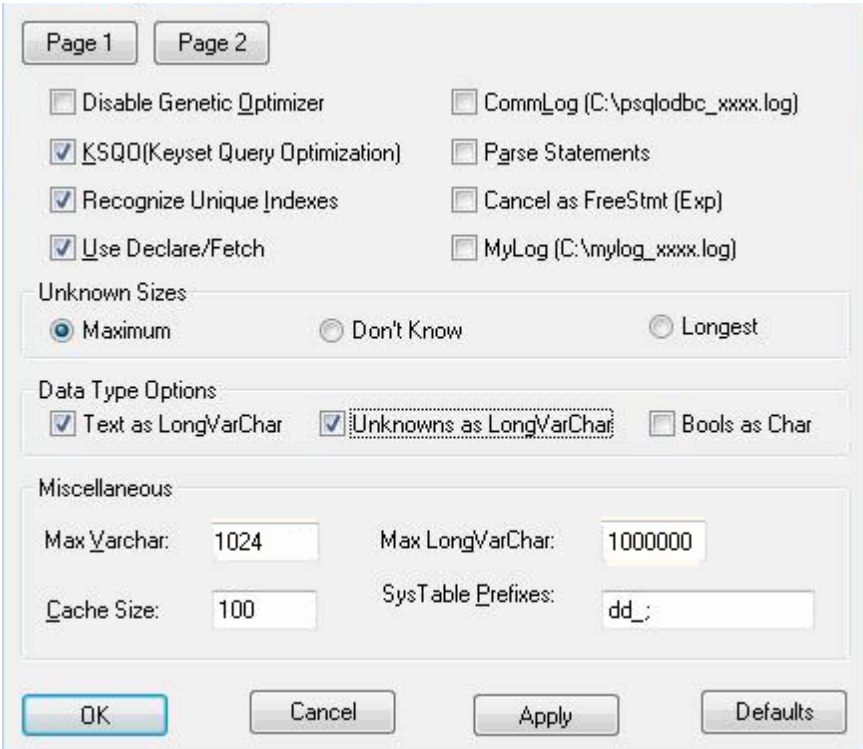

#### Prerequisites

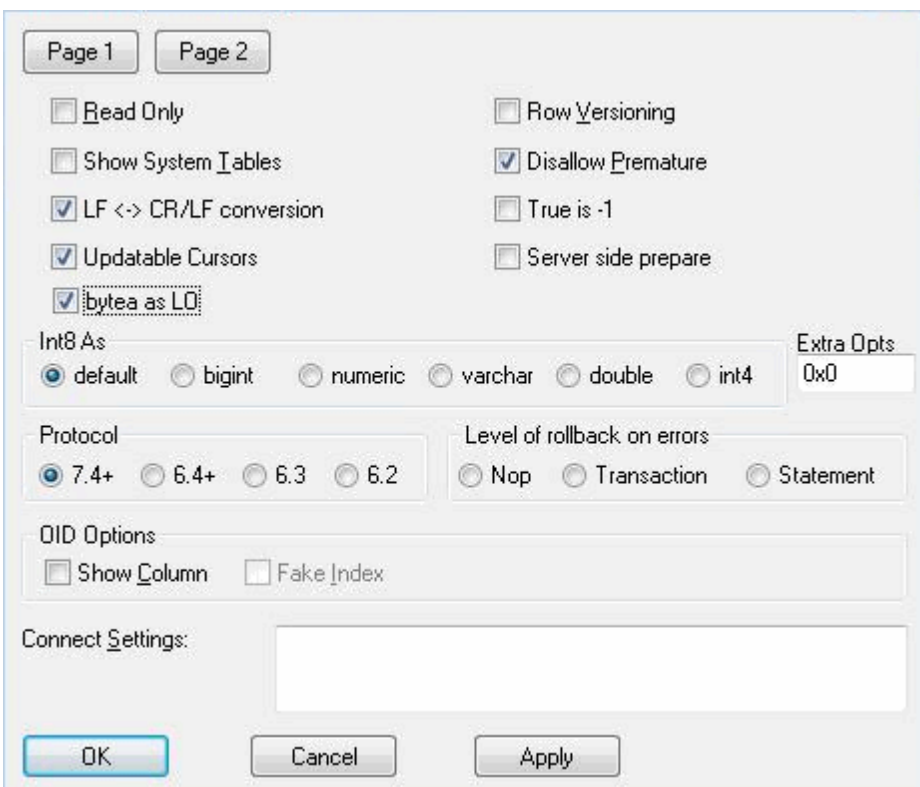

Install:

- PostgreSQL DBMS and repository
- PostgreSQL ODBC driver software version 7.03.01.00 or above (note that versions 8.3.4 and 8.4.1 of the PostgreSQL ODBC Driver are not supported)

#### Set up the ODBC driver

Step	Action
1	<p>If you are using a 32-bit operating system:</p> <ul style="list-style-type: none"> <li>• Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option</li> </ul> <p>If you are using a 64-bit operating system:</p> <ul style="list-style-type: none"> <li>• Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on <b>64-bit clients</b>, run the 32-bit ODBC Data Source Administrator from <code>C:\Windows\SysWOW64\odbcad32.exe</code></li> <li>• You can quickly load the correct 32-bit ODBC Data Source Administrator by selecting <b>Tools   ODBC Data Sources</b> in the Enterprise Architect menu bar</li> </ul> <p>The ODBC Data Source Administrator window displays.</p>
2	<p>Click on the <b>Add</b> button.</p> <p>The Create New Data Source dialog displays, enabling you to add a new DSN.</p>
3	<p>Select <b>PostgreSQL UNICODE</b> from the list.</p>
4	<p>Click on the <b>Finish</b> button.</p> <p>The Postgre SQL Connector/ODBC dialog displays.</p>
5	<p>Enter the following configuration details:</p> <ul style="list-style-type: none"> <li>• A data source name for the connection</li> <li>• The actual name of the database</li> </ul>

Step	Action
	<ul style="list-style-type: none"> <li>• The host address of the DBMS server</li> <li>• User name</li> <li>• A description (optional)</li> <li>• The password</li> </ul>
6	<p>To set the advanced options, click on the <b>Datasource</b> button and set the options on Page 1 and Page 2 as shown below:</p> 

Step	Action
	
7	<p>If you are using PostgreSQL version 8+, on Page 2 select:</p> <ul style="list-style-type: none"> <li>• The <b>Disallow Premature</b> checkbox</li> <li>• In the Protocol panel, the <b>7.4+</b> radio button</li> </ul>
8	<p>Click on the <b>OK</b> button to complete the configuration.</p>

Your PostgreSQL driver is now available to connect to the repository from Enterprise Architect.

### 3.3.3.3 Connect to a PostgreSQL Data Repository

To access a project in your MySQL data repository, you need to connect to the data repository from Enterprise Architect.

#### Prerequisites

- The PostgreSQL repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions
- The PostgreSQL ODBC driver has been set up

Access   **File | Open Project ( Ctrl+O )**

#### Connect to the repository

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
2	Click on the ( ... ) (Browse) button. The Data Link Properties dialog displays.
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.
4	Click on the <b>Next&gt;&gt;</b> button. The Connection tab displays.
5	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field. From the list, select the ODBC driver you have set up to connect to your PostgreSQL repository.
6	Click on the <b>Test Connection</b> button to confirm that the details are correct.
7	If the test does not succeed, revise your settings. If the test succeeds, click on the <b>OK</b> button; the Connection Name & Type dialog displays.
8	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.
9	If required, select the <b>Encrypt Connection String</b> checkbox. This encrypts and hides the connection details of the database from the users that the connection

Step	Action
	string is given to.
10	<p>If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded.</p> <p>With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.</p>
11	<p>If required, select the <b>Use WAN Optimization</b> checkbox.</p> <p>To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time.</p> <p>If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 15.</p>
12	In the <b>Server</b> field, type the network name or address of the optimizer server.
13	In the <b>Port</b> field, type the port on which the server is running on the remote machine.
14	In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.
15	<p>Click on the <b>OK</b> button to complete the configuration and open the project.</p> <p>This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.</p>

### Notes

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

### 3.3.4 Create a Project in a Sybase ASA Database

To create a project in a repository on Sybase Adaptive Server Anywhere 8 or 9, or SQL Anywhere 10, 11 or 12, you work through the following stages:

- Stage 1: Create an empty database repository

- Stage 2: Set up the ASA ODBC Driver
- Stage 3: Perform a project integrity check on the .project file you are using as a base (optional, but recommended)
- Stage 4: Transfer the data
- Stage 5: Connect to the repository and open the project

### Prerequisites

- Install Adaptive Server Anywhere - SQL Anywhere Studio 8 or higher; this also installs the ASA ODBC driver

### Create Database Repository

Step	Action	See also
1	Create an empty ASA database.	<a href="#">Create an Adaptive Server Anywhere Repository</a> <sup>[237]</sup> <a href="#">Registered User's Scripts page</a> <a href="#">Trial User's Scripts Page</a>
2	Using (for example) Sybase Central, load the <b>ASA_EASchema.sql</b> file from the Sparx Systems website.	
3	Run the script to create all required data tables.	

### Set up the ASA ODBC Driver

Step	Action	See also
1	Create a suitable ODBC Data Source to point to your new database.	<a href="#">Set up an ASA ODBC Driver</a> <sup>[237]</sup>

### Perform Project Integrity Check

Step	Action	See also
1	In Enterprise Architect, open the file-based project or template from which you are creating the project on the repository.	<a href="#">Project Integrity Check</a> <sup>[597]</sup>
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> . This ensures your project data is 'clean' before being copied to the repository.	

Step	Action	See also

### Transfer the Project Data

Step	Action	See also
1	Open Enterprise Architect. (If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option. The Project Transfer dialog displays.	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the project file to copy to the repository.  If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> 
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button.  The Datalink Properties dialog displays.	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.  Click on the <b>Next</b> button.	
7	In the <b>Use Data source name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database.  Click on the <b>OK</b> button. The Project Transfer dialog redisplay.	<a href="#">Set up an ASA ODBC Driver</a> 
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	
9	Click on the <b>Transfer</b> button to begin the data transfer process.	
10	When the process is complete, you have created a project on an ASA	<a href="#">Connect to an ASA Data</a>

Step	Action	See also
	database and can now connect to it and open it from Enterprise Architect.	<a href="#">Repository</a> <sup>[239]</sup>

**Learn more**

- [Perform a Project Data Transfer](#)<sup>[504]</sup>

**3.3.4.1 Create an Adaptive Server Anywhere Repository**

Creating an ASA database is fully documented in the product information provided with your ASA installer.

Having created your ASA database, use the SQL script (**ASA\_EASchema.sql**) provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**Third Party Tools**

If you are unfamiliar with ASA and DBMS systems in general, you might want to consider a suitable front end tool. Sybase Central is one such tool, that can be installed along with the DBMS. It provides a convenient graphical user interface to enable creation of databases, execution of scripts and restores.

After creating an ASA data repository in Enterprise Architect, you must set up the ASA ODBC driver.

**Notes**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn more**

- [Create a project in a Sybase ASA database](#)<sup>[234]</sup>
- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)
- [Setup an Adaptive Server Anywhere ODBC Driver](#)<sup>[237]</sup>

**3.3.4.2 Set up an ASA ODBC Driver**

After you have created a repository on your ASA database, you set up the ASA ODBC driver so that you can connect to a project on that repository from Enterprise Architect.

**Prerequisites**

Install:

- Adaptive Server Anywhere - SQL Anywhere Studio 8 or higher, and create a repository

- ASA ODBC driver software (installed with the ASA DBMS)

### Set up the ODBC Driver

Step	Action
1	<p>If you are using a 32-bit operating system:</p> <ul style="list-style-type: none"> <li>• Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option</li> </ul> <p>If you are using a 64-bit operating system:</p> <ul style="list-style-type: none"> <li>• Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on <b>64-bit clients</b>, run the 32-bit ODBC Data Source Administrator from <code>C:\Windows\SysWOW64\odbcad32.exe</code></li> <li>• You can quickly load the correct 32-bit ODBC Data Source Administrator by selecting <b>Tools   ODBC Data Sources</b> in the Enterprise Architect menu bar</li> </ul> <p>The ODBC Data Source Administrator window displays.</p>
2	<p>Click on the <b>Add</b> button.</p> <p>The Create New Data Source dialog displays, enabling you to add a new DSN.</p>
3	<p>Select <b>Adaptive Server Anywhere</b> or <b>SQL Anywhere</b> from the list.</p>
4	<p>Click on the <b>Finish</b> button.</p> <p>The ASA Connector/ODBC dialog displays.</p>
5	<p>Enter the following configuration details:</p> <ul style="list-style-type: none"> <li>• A data source name for the connection, on the ODBC tab</li> <li>• User name and password on the Login tab (dba, sql are the defaults when ASA is installed)</li> <li>• The server name and the path to the database, on the Database tab</li> <li>• The network protocol on the Network tab (if the database is on a network location)</li> </ul>
6	<p>Return to the ODBC tab and click on the <b>Test Connection</b> button to confirm that the details are correct.</p>
7	<p>If the test succeeds, click on the <b>OK</b> button to complete the configuration.</p> <p>If the test does not succeed, review your settings.</p>

Your ASA driver is now available to connect to the repository from Enterprise Architect.

**3.3.4.3 Connect to an ASA Data Repository**

To access a project in your Adaptive Server Anywhere (ASA) data repository, you need to connect to the data repository from Enterprise Architect.

Prerequisites

- The ASA repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions
- The ASA ODBC driver has been set up

Access   **File | Open Project (Ctrl+O)**

Connect to the repository

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
2	Click on the ( ... ) (Browse) button. The Data Link Properties dialog displays.
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.
4	Click on the <b>Next&gt;&gt;</b> button. The Connection tab displays.
5	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field. From the list, select the ODBC driver you have set up to connect to your ASA repository.
6	Click on the <b>Test Connection</b> button to confirm that the details are correct.
7	If the test does not succeed, revise your settings. If the test succeeds, click on the <b>OK</b> button; the Connection Name & Type dialog displays.

Step	Action
8	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.
9	If required, select the <b>Encrypt Connection String</b> checkbox.  This encrypts and hides the connection details of the database from the users that the connection string is given to.
10	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded.  With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.
11	If required, select the <b>Use WAN Optimization</b> checkbox.  To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time.  If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 15.
12	In the <b>Server</b> field, type the network name or address of the optimizer server.
13	In the <b>Port</b> field, type the port on which the server is running on the remote machine.
14	In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.
15	Click on the <b>OK</b> button to complete the configuration and open the project.  This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.

### Notes

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

### 3.3.5 Create a Project in an Access 2007 Database

In setting up a project in an Access 2007 repository, you could be working in one of two situations:

- You are able to work in Access 2007 itself, in which case you can **convert** your .eap project directly to an Access 2007 .accdb database file, which you can connect to and open in Enterprise Architect
- You have access to an empty Access 2007 .accdb file, and need to **transfer** a .eap project into that .accdb file

In either case, before you convert or transfer the project data, you could perform a project integrity check on the .eap file you are using as a base (optional, but recommended).

#### Perform a Project Integrity Check

Step	Action	See also
1	Open the base project or template .eap file.	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> . This ensures your project data is 'clean' before uploading.	<a href="#">Project Integrity Check</a> <sup>[59]</sup>

#### Convert a .eap file in Access 2007

Step	Action	See also
1	Open Access 2007 and open the source .EAP file within this product. Allow Access to convert the .eap file to a .accdb file. This forms the Access 2007 repository.	
2	Open Enterprise Architect and open the .accdb file containing the project, browsing for it using the Open project dialog.	<a href="#">Open a Project</a> <sup>[20]</sup>

#### Transfer the project data into an empty .accdb file

Step	Action	See also
1	Open Enterprise Architect. (If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)	

Step	Action	See also
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option. The Project Transfer dialog displays.	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the .EAP file to copy to the repository. If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> <sup>[313]</sup>
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button. The Datalink Properties dialog displays.	
6	Select <b>Microsoft Office 12.0 Access Database Engine OLE DB Provider</b> from the list. Click on the <b>Next</b> button.	
7	On the Data Source Details page of the Datalink Properties dialog, type in the full path to the Access 2007 .accdb file. Click on the <b>OK</b> button to return to the Project Transfer dialog.	
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	
9	Click on the <b>Transfer</b> button to begin the data transfer process.  When the process is complete, you have created your project in an Access 2007 database and can now open it directly from Enterprise Architect, browsing for the .accdb file location in the Open Project dialog.	<a href="#">Open a Project</a> <sup>[202]</sup>

### Notes

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- If you do not have Access 2007, you can download the Access Database Engine from the [Microsoft downloads site](#)

### 3.3.6 Create a Project in a Progress OpenEdge Database

To create a project in a repository on Progress OpenEdge, you work through the following stages:

- Stage 1: Create an empty database repository and set up the data tables
- Stage 2: Set up the Progress OpenEdge ODBC Driver
- Stage 3: Perform a project integrity check on the project file you are using as a base (optional, but recommended)
- Stage 4: Transfer the data
- Stage 5: Connect to the repository to open the project

#### Prerequisites

- Install OpenEdge, version 10.1C
- Install DataDirect ODBC driver for OpenEdge (version 4.20 or later)
- Obtain access permissions to create a new database

#### Create Database Repository

Step	Action	See also
1	Create an empty OpenEdge database for the new repository.	<a href="#">Create a Progress OpenEdge Repository</a> <sup>[245]</sup> <a href="#">Registered User's Scripts page</a> <a href="#">Trial User's Scripts Page</a>
2	Download the <b>OpenEdge_EASchema.sql</b> file from the Sparx Systems website.	
3	Run the script to create all required data tables.	

#### Set up the ODBC Driver

Step	Action	See also
1	Create a suitable ODBC Data Source to point to your new database.	<a href="#">Set Up a Progress OpenEdge ODBC Driver</a> <sup>[247]</sup>

Step	Action	See also
1	In Enterprise Architect, open the file-based project or template from	

Step	Action	See also
	which you are creating the project on the repository.	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> . This ensures your project data is 'clean' before uploading.	<a href="#">Project Integrity Check</a> <sup>[597]</sup>

### Transfer the Project Data

Step	Action	See also
1	Open Enterprise Architect. (If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option. The Project Transfer dialog displays.	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the project file to copy to Progress OpenEdge. If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> <sup>[313]</sup>
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button. The Datalink Properties dialog displays.	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list. Click on the <b>Next</b> button.	
7	In the <b>Use Data source name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database. Click on the <b>OK</b> button. The Project Transfer dialog redisplay.	<a href="#">Set up a Progress OpenEdge ODBC Driver</a> <sup>[247]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	

Step	Action	See also
9	Click on the <b>Transfer</b> button to begin the data transfer process.	
10	When the process is complete, you have created a project on a Progress OpenEdge database and can now connect to it and open it from Enterprise Architect.	<a href="#">Connect to a Progress OpenEdge Repository</a> <sup>[248]</sup>

#### Learn more

- [Perform a Project Data Transfer](#)<sup>[504]</sup>

### 3.3.6.1 Create a Progress OpenEdge Repository

Creating a Progress OpenEdge database is fully documented in the product information provided with your OpenEdge installer.

Having created your OpenEdge database, use the SQL script (**OpenEdge\_EASchema.sql**) provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the script from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

#### Create the repository

Step	Action
1	From the Windows Start menu, run proenv in OpenEdge; that is: <b>Start   Programs   OpenEdge   proenv</b> .
2	Create the database: <code>prodb &lt;database_name&gt; empty</code>
3	Start the database server: <code>proserve &lt;database_name&gt; -S &lt;port_number&gt;</code>
4	Open Data Administration to add users:  <code>prowin32 -db &lt;database_name&gt; -S &lt;port_number&gt; -p _admin -rx</code>  The Database Administration dialog displays.
5	Select <b>Admin   Security   Edit User List</b> and set up one or more user IDs from the Edit User List dialog, as follows:

Step	Action
	<ol style="list-style-type: none"> <li>1. Click on the <b>Add</b> button; the Add User dialog displays.</li> <li>2. Complete the <b>User ID</b>, <b>User Name</b> and <b>Password</b> fields, and click on the <b>OK</b> button; the Password Verification dialog displays.</li> <li>3. Verify the password and click on the <b>OK</b> button; the Edit User List dialog redisplay.</li> <li>4. Repeat the process for the next user or, if finished, click on the <b>OK</b> button; the Database Administration dialog redisplay.</li> </ol>
6	Close Database Administration ( <b>Database   Exit</b> ).
7	<p>On the proenv command prompt, type:</p> <pre>sql exp -user &lt;user id&gt; -password &lt;password&gt; -db &lt;database_name&gt; -S &lt;port_number&gt;</pre> <p>The SQL Explorer &gt; prompt displays.</p>
8	<p>Grant privileges to the administrator user:</p> <pre>SQL Explorer&gt;grant dba, resource to oe_user; SQL Explorer&gt;commit; SQL Explorer&gt;exit</pre>
9	<p>Execute the <b>OpenEdge_EASchema.sql</b> script, with the following command:</p> <pre>sql exp -user oe_user -password sparx -db &lt;path\to\database&gt; -S &lt;port_number&gt; -infile &lt;path\to\OpenEdge_EASchema.sql&gt;</pre>

After creating a Progress OpenEdge data repository in Enterprise Architect, you must set up the Progress OpenEdge ODBC driver.

### Notes

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

### Learn more

- [Create a project in a Progress OpenEdge database](#)<sup>[243]</sup>

### 3.3.6.2 Set up a Progress OpenEdge ODBC Driver

After you have created a repository on your Progress OpenEdge database, you set up the Progress OpenEdge ODBC driver so that you can connect to a project on that repository from Enterprise Architect.

#### Prerequisites

Install:

- OpenEdge DBMS (10.1C) and repository
- DataDirect ODBC driver for OpenEdge software (version 4.20 or later)

#### Set up the ODBC driver

Step	Action
1	<p>If you are using a 32-bit operating system:</p> <ul style="list-style-type: none"> <li>• Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option</li> </ul> <p>If you are using a 64-bit operating system:</p> <ul style="list-style-type: none"> <li>• Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on <b>64-bit clients</b>, run the 32-bit ODBC Data Source Administrator from <code>C:\Windows\SysWOW64\odbcad32.exe</code></li> <li>• You can quickly load the correct 32-bit ODBC Data Source Administrator by selecting <b>Tools   ODBC Data Sources</b> in the Enterprise Architect menu bar</li> </ul> <p>The ODBC Data Source Administrator window displays.</p>
2	<p>Click on the <b>Add</b> button.</p> <p>The Create New Data Source dialog displays, enabling you to add a new DSN.</p>
3	<p>Select <b>DataDirect/OpenEdge SQL Driver</b> from the list.</p>
4	<p>Click on the <b>Finish</b> button.</p> <p>The DSN Configuration dialog displays.</p>
5	<p>Enter the following configuration details:</p> <ul style="list-style-type: none"> <li>• A data source name for the connection</li> <li>• A description (optional)</li> <li>• The host name and port number of the DBMS server</li> <li>• The database name on the selected server</li> <li>• The User ID</li> </ul>

Step	Action
6	Click on the <b>Test Connect</b> button to confirm that the details are correct.
7	If the test succeeds, click on the <b>OK</b> button to complete the configuration. If the test does not succeed, review your settings.

Your OpenEdge connection is now available to connect to the repository from Enterprise Architect.

#### Learn more

### 3.3.6.3 Connect to a Progress OpenEdge Data Repository

To access a project in your Progress OpenEdge data repository, you need to connect to the data repository from Enterprise Architect.

#### Prerequisites

- The Progress OpenEdge repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions
- The Progress OpenEdge ODBC driver has been set up

Access   **File | Open Project (Ctrl+O)**

#### Connect to the repository

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
2	Click on the ( ... ) (Browse) button. The Data Link Properties dialog displays.
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.

Step	Action
4	Click on the <b>Next&gt;&gt;</b> button. The Connection tab displays.
5	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field. From the list, select the ODBC driver you have set up to connect to your Progress OpenEdge repository.
6	Enter the <b>User Name</b> and <b>Password</b> .
7	Enter the <b>Initial catalog</b> .
8	Click on the All tab and double-click on <b>Extended Properties</b> .
9	Click on the Connection tab again.
10	In the <b>Property Value</b> field, edit the value to: <b>DefaultSchema=PUB</b> . Click on the <b>Test Connection</b> button to confirm that the details are correct.
11	If the test does not succeed, revise your settings. If the test succeeds, click on the <b>OK</b> button; the Logon to Progress dialog displays.
12	Check the details to ensure that they are correct. Click on the <b>OK</b> button; the Connection Name & Type dialog displays.
13	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.
14	If required, select the <b>Encrypt Connection String</b> checkbox. This encrypts and hides the connection details of the database from the users that the connection string is given to.
15	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded. With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.

Step	Action
16	<p>If required, select the <b>Use WAN Optimization</b> checkbox.</p> <p>To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time.</p> <p>If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 20.</p>
17	In the <b>Server</b> field, type the network name or address of the optimizer server.
18	In the <b>Port</b> field, type the port on which the server is running on the remote machine.
19	In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.
20	<p>Click on the <b>OK</b> button to complete the configuration and open the project.</p> <p>This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.</p>

#### Notes

### 3.3.7 Create a Project in an Oracle Database

To create a project in a repository on Oracle 9i, 10g or 11g, you work through the following stages:

- Stage 1: Create an empty database repository and set up the data tables
- Stage 2: Set up the ODBC Driver (if required; you can connect to an Oracle repository using either OLE DB or an ODBC driver; if you intend to connect through the ODBC driver, you must first set it up)
- Stage 3: Perform a project integrity check on the project file you are using as a base (optional, but recommended)
- Stage 4: Transfer the data
- Stage 5: Connect to the repository to open the project

**Prerequisites**

- Oracle 9i, 10g or 11 g has been installed

**Create Database Repository**

Step	Action	See also
1	Create the empty database.	<a href="#">Create an Oracle Data Repository</a> <sup>[253]</sup>
2	Using a tool such as Oracle SQL *Plus, load the <b>Oracle_EASchema.sql</b> file.	<a href="#">Registered User's Scripts page</a> <a href="#">Trial User's Scripts Page</a>
3	Run the script to create all required data structures.	

**Set Up the ODBC Driver**

Step	Action	See also
1	Create a suitable ODBC Data Source to point to your new database.	<a href="#">Set up an Oracle ODBC Driver</a> <sup>[254]</sup>

**Perform Project Integrity Check**

Step	Action	See also
1	Open the file-based project or template.	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> . This ensures your project data is 'clean' before uploading.	<a href="#">Project Integrity Check</a> <sup>[597]</sup>

**Transfer the project data to the repository**

Step	Action	See also
1	Open Enterprise Architect. (If the Open Project screen displays, click on the <b>Cancel</b> button to open with no project loaded.)	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option. The Project Transfer dialog displays.	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b> .	
4	In the <b>Source Project</b> field, type the name of the project file to copy to Oracle. If the .EAP file has Replication enabled, this must be removed before performing the transfer.	<a href="#">Remove Replication</a> 
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button. The Datalink Properties dialog displays.	
6	Select <b>Oracle Provider for OLE DB</b> from the list. Click on the <b>Next</b> button.	
7	On the Connection page of the Datalink Properties dialog, enter the Oracle service name in the <b>Data Source</b> field, and the user name and password as required. Click on the <b>OK</b> button. The Project Transfer dialog redisplay.	
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file.	
9	Click on the <b>Transfer</b> button to begin the data transfer process.	
10	When the process is complete, you have created a project on a Oracle database and can now connect to it and open it from Enterprise Architect.	<a href="#">Connect to an Oracle Data Repository (ODBC)</a>  <a href="#">Connect to an Oracle Data Repository (OLE DB)</a> 

### **Notes**

- When transferring a project to Oracle you must have access rights to execute the **CREATE SEQUENCE** command

### **Learn more**

- [Perform a Project Data Transfer](#)<sup>[504]</sup>

#### **3.3.7.1 Create an Oracle Data Repository**

Creating an Oracle database is fully documented in the product information provided with your Oracle installer.

Before creating an Oracle data repository, install the appropriate version of Oracle (9i, 10g or 11g) and MDAC 2.6 or higher, and obtain access permission to create a new database.

Having created your Oracle database, use the SQL script (**Oracle\_EASchema.sql**) provided by Sparx Systems to create the required table definitions and indexes for Enterprise Architect. You can obtain the script from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users), or
- Corporate edition Resources page (Trial users)

When you eventually connect to the Oracle database from Enterprise Architect, you can do so using either OLE DB or ODBC; if you intent to use ODBC, after creating the Oracle data repository you set up the Oracle ODBC driver.

### **Third Party Tools**

If you are unfamiliar with Oracle and DBMS systems in general, you might want to consider a suitable front end tool. You could connect to the database and execute the scripts with a program such as Oracle SQL\*Plus or SQL Plus Worksheet.

### **Notes**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- With Windows 7 the OLE/ODBC connection is set using the 32 bit ODBC driver, installed using C: \Windows\SysWOW64\odbcad32.exe; the connection can be set using either ODBC or OLE
- If you intend to connect via the OLE connection, download the 32-bit ODBC driver from <http://www.oracle.com/technetwork/topics/dotnet/utilsoft-086879.html>
- Set the collation to the alphabet you use, such as Latin or Cyrillic

### **Learn more**

- [Trial User's Scripts Page](#)
- [Set up an Oracle ODBC Driver](#)<sup>[254]</sup>
- [Connect to an Oracle Data Repository \(ODBC\)](#)<sup>[255]</sup>

- [Connect to an Oracle Data Repository \(OLE DB\)](#) <sup>[257]</sup>

### 3.3.7.2 Set up an Oracle ODBC Driver

After you have created a repository on your Oracle database, you set up the Oracle ODBC driver so that you can connect to a project on that repository from Enterprise Architect (in preference to using an OLE DB connection).

#### Prerequisites

Install:

- Oracle DBMS and repository

#### Set up the Oracle ODBC driver

Step	Action
1	<p>If you are using a 32-bit operating system:</p> <ul style="list-style-type: none"> <li>• Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option</li> </ul> <p>If you are using a 64-bit operating system:</p> <ul style="list-style-type: none"> <li>• Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on <b>64-bit clients</b>, run the 32-bit ODBC Data Source Administrator from <code>C:\Windows\SysWOW64\odbcad32.exe</code></li> <li>• You can quickly load the correct 32-bit ODBC Data Source Administrator by selecting <b>Tools   ODBC Data Sources</b> in the Enterprise Architect menu bar</li> </ul> <p>The ODBC Data Source Administrator window displays.</p>
2	<p>Click on the <b>Add</b> button.</p> <p>The Create New Data Source dialog displays, enabling you to add a new DSN.</p>
3	<p>Select <b>Oracle in OraDB11g_home1</b> from the list (or similar, depending on the ODBC installation).</p>
4	<p>Click on the <b>Finish</b> button.</p> <p>The Oracle ODBC Driver Configuration dialog displays.</p>
5	<p>Enter the following configuration details:</p> <ul style="list-style-type: none"> <li>• A data source name for the connection</li> <li>• A description (optional)</li> <li>• The TNS Service Name (click on the drop down arrow and select from the list)</li> <li>• User ID</li> </ul>
6	<p>Click on the <b>Test Connection</b> button and enter the Oracle user password to confirm that the details</p>

Step	Action
	are correct.
<b>7</b>	If the test succeeds, click on the <b>OK</b> button to complete the configuration. If the test does not succeed, review your settings.

Your Oracle driver is now available to connect to the repository from Enterprise Architect.

#### Learn more

- [Create a Project in an Oracle Database](#)<sup>[250]</sup>
- [Create an Oracle Data Repository](#)<sup>[253]</sup>
- [Connect to an Oracle Data Repository \(ODBC\)](#)<sup>[255]</sup>

### **3.3.7.3 Connect to an Oracle Data Repository (ODBC)**

To access a project in your Oracle 9i, 10g or 11g data repository, you need to connect to the data repository from Enterprise Architect.

#### Prerequisites

- The Oracle repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions
- The Oracle ODBC driver has been set up

Alternatively, you can connect to your Oracle project using OLE DB - see *Connect to an Oracle Data Repository (OLE DB)*.

**Access**   **File | Open Project (Ctrl+O)**

#### Connect to an Oracle Data Repository using an ODBC Driver

Step	Action
<b>1</b>	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
<b>2</b>	Click on the ( ... ) (Browse) button. The Data Link Properties dialog displays.
<b>3</b>	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list.

Step	Action
4	Click on the <b>Next&gt;&gt;</b> button. The Connection tab displays.
5	In the <b>Data source</b> field, click on the drop-down arrow and select the data source name.
6	Type in the <b>User</b> name and <b>Password</b> .
7	Click on the <b>Test Connection</b> button to confirm that the details are correct.
8	If the test does not succeed, revise your settings. If the test succeeds, click on the <b>OK</b> button; Oracle prompts you for the password.
9	Type in the password. The Connection Name and Type dialog displays.
10	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.
11	If you want to encrypt and hide the connection details of the database from the users that the connection string is given to, select the <b>Encrypt Connection String</b> checkbox.
12	The Lazy Load facility does not load the full project view when the model is loaded; instead, it loads only the parts that are necessary to display the visible portion of the tree. With this set, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.  If you want to use the Lazy load facility, select the <b>Lazy Load</b> checkbox.
13	To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time. If you are using a WAN, and want to apply this facility, select the <b>Use WAN Optimization</b> checkbox; otherwise go to step 16.  If you select this checkbox, complete the next two fields (see your administrator for the correct values).
14	In the <b>Server</b> field, type the network name or address of the optimizer server.
15	In the <b>Port</b> field, type the port on which the server is running on the remote machine.

Step	Action
16	<p>Click on the <b>OK</b> button to complete the configuration and open the project.</p> <p>This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.</p>

### 3.3.7.4 Connect to an Oracle Data Repository (OLE DB)

To access a project in your Oracle 9i, 10g or 11g data repository, you need to connect to the data repository from Enterprise Architect.

### Prerequisites

- The Oracle repository and the project already exist
- You have **SELECT**, **UPDATE**, **INSERT** and **DELETE** access permissions

Alternatively, you can connect to the repository using an Oracle ODBC driver - see *Connect to an Oracle Data Repository (ODBC)*.

**Access** **File | Open Project (Ctrl+O)**

### Connect to an Oracle Repository using OLE DB

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox.
2	<p>Click on the ( ... ) (Browse) button.</p> <p>The Data Link Properties dialog displays.</p>

Step	Action
3	<p>Select <b>Oracle Provider for OLE DB</b> from the list.</p> <p>Do not select <b>Microsoft OLE DB Provider for Oracle</b>; Enterprise Architect might not work as expected.</p>
4	<p>Click on the <b>Next&gt;&gt;</b> button.</p> <p>The Connection tab displays.</p>
5	In the <b>Data source</b> field, click on the drop-down arrow and select the data source name (the service name of the Oracle database).
6	Type in the <b>User</b> name and <b>Password</b> .
7	Click on the <b>Test Connection</b> button to confirm that the details are correct.
8	<p>If the test does not succeed, revise your settings.</p> <p>If the test succeeds, click on the <b>OK</b> button; the Connection Name and Type dialog displays.</p>
9	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog.
10	If you want to encrypt and hide the connection details of the database from the users that the connection string is given to, select the <b>Encrypt Connection String</b> checkbox.
11	<p>If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded.</p> <p>With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model.</p>
12	<p>To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time. If you are using a WAN, and want to apply this facility, select the <b>Use WAN Optimization</b> checkbox; otherwise go to step 15.</p> <p>If you select this checkbox, complete the next two fields (see your administrator for the correct values).</p>
13	In the <b>Server</b> field, type the network name or address of the optimizer server.
14	In the <b>Port</b> field, type the port on which the server is running on the remote machine.

Step	Action
15	<p>Click on the <b>OK</b> button to complete the configuration and open the project.</p> <p>This also adds the project name to the <b>Recent Projects</b> list on the Start Page; from now on, you can open the project again just by clicking on this name.</p>

### 3.3.8 The WAN Optimizer

You can significantly improve Enterprise Architect's performance in a Wide Area Network (WAN) by reducing the amount of data transmitted and, in turn, the number of network calls made. To achieve this, you can use the Sparx Systems *Wide Area Network (WAN) Optimizer*, a lightweight server installed on a Local Area Network (LAN) connection to a Database Management System (DBMS) that hosts an Enterprise Architect repository. You can configure the server to listen for client connections on a particular port; it acts as a local proxy to execute queries and return the results in a compressed format to the client.

In the following diagram, transmission between Enterprise Architect and a DBMS is depicted first without and then with the WAN Optimizer.

You can download the WAN Optimizer installer from the Downloads page of the Registered Users section of the Sparx Systems website. The Wan Optimizer Service installer package provides two installable features for the target machine:

- WAN Optimizer Service - the installer also helps register and start the service on the target machine, and add it to the Windows Startup folder
- WAN Optimizer Admin Client - to enable an administrator to administer and configure the service from a remote client

The Optimizer has its own *Sparx WAN Optimizer User Guide*. See that User Guide for more information on:

- WAN Optimizer Components
- Installing and Starting the WAN Optimizer Service
- Configuring the Service
- Troubleshooting

### 3.4 Connecting to Projects Via the Cloud

With a simple connection to the internet or web - **the 'Cloud'** - you can access and work on projects stored in repositories at **remote locations anywhere in the world**, or access local repositories from such locations, using the Enterprise Architect installation **on your machine**. The advantages of working in this way include:

- You, as a user, do not need to have database drivers installed on your machine or to create a database connection, as you do to work directly on projects held on a DBMS server; your system administrator performs the driver set-up and connection once only, during server configuration
- The http and, especially, https connections apply a firewall and all the security facilities provided by the web server - whether Apache or IIS - to your project work, such as URL authorization, domain authentication and IP security
- The Cloud Server can be configured to encrypt all communications using standard TLS/SSL protocols; you can be certain that your data is not intercepted during transmission across insecure networks

Using the Cloud can help to reduce lag time for common tasks such as opening Packages and editing model data. Requests are cached and sent together, rather than individually, which reduces communication delays to a minimum.

Using the Cloud server is most beneficial when:

- You want to minimize the set-up requirements each user has on their workstation
- You want to expose models held outside your private network
- Your users are accessing their models over slow connections

#### Learn more

- [Server Based Repositories](#) <sup>[214]</sup>
- [Setting up the Cloud Server](#) <sup>[262]</sup>
- [Connect to a Project Via the Cloud](#) <sup>[266]</sup>
- [Additional Functionality Using the Cloud](#) <sup>[267]</sup>

#### 3.4.1 Setting up the Cloud Server

One of the benefits of using the Cloud server is that you only need to perform the set-up once on the server, rather than separately on each user's workstation. This single-set-up process of installation, configuration and connection is described here.

##### Installation

To run the installer for Sparx Systems Cloud Services you must have administration permissions for installation on your system.

- Run the installer as an administrator
- Accept the license agreement
- Specify the location of the target directory
- Apply the options for installing the service itself, the management client and the IIS integration files

##### IIS Integration

IIS integration is not set up by default. Only the files are copied to the install target location.

### Configuration File

In the service installation directory is the **SCloudServices.config** file. Edit this file to set the ports that the server will 'listen' on, and other configuration options (below). When you make changes to this file, you must restart the server for those changes to take effect; you can do this using the Windows Services list.

The first group of settings are for the **TCP connection**, followed by a list of global, or **General**, settings that are applied across the entire service.

### **TCP Connection**

The TCP settings control the port used for administration tasks.

Setting	Description
<b>SERVER_PORT=803</b>	Sets the port to use when you connect to the administration client or opt to use the IIS integration instead of the integrated web server. It is recommended that this port is not exposed to external networks, as encryption cannot be applied to the port.
<b>SERVER_PASSWORD=</b>	The password to protect the administration functions of the server. This can also be changed directly within the Admin client.

### **General Settings**

Setting	Description
<b>DBMAN_DEFAULTMAXSIMQUERIES=10</b>	The default maximum number of queries that can be run at a time for any configured database. This can be changed directly within the Admin client.
<b>AUDIT_TIME_PERIOD=3600</b>	The number of seconds between the recording activities on the system logs on each database.
<b>TEMP_DIRECTORY=%SERVICE_PATH %Temp</b>	The location to which temporary files are written before they are sent to clients. You generally do not need to change this.
<b>LOGGING_LEVEL=SYSTEM</b>	Indicates how much text the server should provide when writing log files. The valid values are: <ul style="list-style-type: none"><li>• <b>OFF</b></li><li>• <b>FATAL</b></li><li>• <b>WARNING</b></li></ul>

Setting	Description
	<ul style="list-style-type: none"> <li>• <b>INFO</b> and</li> <li>• <b>SYSTEM</b></li> </ul> <p>The value can be changed directly within the Admin client.</p>
<b>LOGGING_DIRECTORY=%SERVICE_PATH%\Logs</b>	Collectively, identify where log files are written and how much history will be kept.
<b>LOGGING_FILECOUNT=3</b>	
<b>LOGGING_FILESIZE=1048576</b>	

### HTTP Ports

In the Cloud server you can define a number of different ports to listen to http connections, **each** with a different configuration and each denoted in the config file with an open and close parenthesis on their own line.

```
(
SERVER_PORT=804
REQUIRE_SSL=0
DEFAULT_MODEL=
MODEL_AUTHENTICATION=
GLOBAL_AUTHENTICATION=user model
OSLC_SUPPORT=1
)
```

Setting	Description
<b>SERVER_PORT</b>	The port that the server will listen on for http connections. Each port must be unique and not be used by any other services on the machine.
<b>REQUIRE_SSL</b>	When set to <b>1</b> , enables <b>https</b> on this port. This should be set to <b>1</b> for all connections that are being exposed on public networks, but it requires a private key ( <b>server.pem</b> ) to be included in the same directory before it will run.
<b>DEFAULT_MODEL</b>	Enables a single model to be exposed on a port, making it possible to use a different port for each model.
<b>MODEL_AUTHENTICATION</b>	Can be set to <b>1</b> to request http authorization using the list of security users in the model being connected to.  Note that if you are not using SSL to connect, the usernames and

Setting	Description
	passwords will be sent in plain text. This option is mutually exclusive with <b>GLOBAL_AUTHENTICATION</b> .
<b>GLOBAL_AUTHENTICATION</b>	Can be set to the name of a model with security enabled that will provide the list of users for <b>all</b> models provided by the connection. This is helpful if you want to provide multiple models but only manage one list of users. This option is mutually exclusive with <b>MODEL_AUTHENTICATION</b> .
<b>OSLC_SUPPORT</b>	Enabled by default (set to <b>1</b> ) to enable models to be queried using the Open Services for Lifecycle Collaboration ( <b>OSLC</b> ) standard. (See <i>OSLC Requirements Management</i> )  Set to <b>0</b> to disable the use of OSLC.

### Configure Models

Once your **service** is configured, you can connect to the Admin client to configure any **databases** you want to provide using the Cloud server.

Step	Action	See also
<b>1</b>	Open the Admin client.  An empty list of Database Management Systems displays.	
<b>2</b>	Click on the <b>Add</b> button to configure a new DBMS.  A dialog displays in which you provide the connection string that the server should use when connecting to a model. If you are running the Admin client on the same machine as the server you can click the ellipsis (...) button to open the Data Link Properties dialog to build the connection string.  This dialog also helps you to create a new <b>Firebird</b> database with all tables set up. This is the easiest way to get a connection running; just enter the model name followed by <b>.fdb</b> .	<a href="#">Server Based Repositories</a> [214]
<b>3</b>	Once you have added one or more Database Managers, they are included in the list in the main dialog.  Select any of these and click on the <b>Configure</b> button to allow connections to the model. A number of options are provided for the selected model.  <ul style="list-style-type: none"> <li>• <b>Accept Queries</b> - must be set to enable users to connect to this database</li> <li>• <b>Max Simultaneous Queries</b> - allows you to control the maximum number of simultaneous connections that will be created to this model; when the</li> </ul>	

Step	Action	See also
	<p>database was created the maximum number came from the system setting for this option</p> <p>To tweak constraints of system performance against resource usage, you can look at the audit history for each database to see how many connections have been used in the specified time period</p> <ul style="list-style-type: none"> <li>• <b>Run Scheduled Tasks</b> - allows the server to run periodic updates to this model</li> <li>• <b>Read-only connection</b> - allows a model to be shared but blocks any changes</li> <li>• <b>Require a secure and authenticated connection</b> - flags that security is required for this model; no connections will be accepted unless via https, with either <b>Model Authentication</b> or <b>Global Authentication</b> set</li> </ul>	<a href="#">Additional Functionality Using the Cloud</a> <a href="#">[267]</a>

### Security Considerations

As with any web connected service, you should consider a number of security concerns when setting up a new service.

- If any data is considered private, always use an **https** connection and require user authentication; there is an option on the database itself to set this
- There is an implicit trust in sharing a model with anyone; security is available to prevent users doing things that they shouldn't, but because Enterprise Architect allows user-written SQL to be used in queries in a number of places, any information can be at least retrieved

Be aware, this includes user names and hashes of their passwords, although this can be prevented by using **Global Authentication** instead of **Model Authentication** (see above)

- [OSLC Requirements Management](#) [\[268\]](#)

## **3.4.2 Connect to a Project Via the Cloud**

A connection to the 'Cloud' is set up once; thereafter you can open the model via the link name in the Start Page **Recent** list. To create the link to a project via the Cloud, you need the access URL and model name as stored on the server; if you do not have this information, see your System Administrator.

Your link name can itself be a shortcut file that you provide to other users who need not know it is a Cloud connection. The Cloud connection makes no difference to the actions of any such Project Shortcut that you create; using the shortcut users can not only access a remote project simply, but also see it opened at specific diagrams, views and/or windows.

Access    **Start Page | Connect to Cloud**

Connect to Your Project

Field/Option/ Button	Action	See also
<b>Name</b>	Type in a name by which <b>you</b> can recognize and open the model in the <b>Recent</b> list on <b>your</b> Start Page or <b>File</b> drop-down menu.  This name does not affect the model loaded (see <b>Model Name</b> , below).	
<b>URL</b>	Type in the address or name of the computer hosting the model.  This starts with the protocol ( <i>http://</i> or <i>https://</i> ) followed by the name or IP address of the server and the port number; for example:  <code>http://localhost:804</code>  If you do not enter the port number, the system uses the default ports ( : <b>80</b> for http, : <b>443</b> for https).	
<b>Model Name</b>	Type in the model name by which the model is identified <b>on the server</b> .	
<b>Username</b>	If the host server is configured to request a username and password for authentication, you can type those values in here.  If you need to provide a user name and password and you require greater security (for example, if the password changes frequently or several users are using the connection) you can omit these values here, so that each person using this connection is prompted to provide them each time they access the model.	
<b>Password</b>

**3.4.3 Additional Functionality Using the Cloud**

The Cloud services provide the facility of connecting to and using models over a secure http connection. They also make it possible to use three further facilities on or within your models:

- Open Services for Lifecycle Collaboration (OSLC)
- Reusable Asset Service (RAS)
- Scheduled Tasks

**OSLC**

OSLC is an initiative to allow easier integration between Requirement Management tools. It uses HTTP to

list, add, modify and delete requirements. The service provider definition to direct any OSLC client to is:

```
<protocol>://<server>:<port>/<model_name>/oslc/sp/
```

For example, if you were connecting to a server running on your own machine using the default settings, the connection would be:

```
http://localhost:804/model/oslc/sp/
```

## **RAS**

The RAS portion of the Cloud server enables you to define Packages that can be used in **any** model. When a Package is requested, Enterprise Architect and the Cloud server will track cross-Package dependencies and make available everything required by that Package.

## **Scheduled Tasks**

The Cloud server includes optional support for running time-based updates to data. Currently, this is applied to updating a **Time Series chart** automatically to provide a dynamic view of how a model is changing over time. You can set different time scales for these updates, such as daily, weekly or monthly.

### **3.4.4 OSLC Requirements Management**

The following text is derived from the OSLC Primer:

**Open Services for Lifecycle Collaboration (OSLC)** is an open community creating specifications for integrating tools. These specifications allow conforming independent software and product lifecycle tools to integrate their data and workflows in support of end-to-end lifecycle processes.

OSLC is based on the W3C Linked Data. One of the primary techniques for integrating tools using OSLC is **Linking data via HTTP**, which specifies creating, retrieving, updating and deleting (CRUD) lifecycle artifacts based on internet standards like HTTP and RDF using Linked Data model. Each artifact in the lifecycle, such as a requirement, is an HTTP resource that is manipulated using the standard methods of the HTTP specification (like GET, POST).

Enterprise Architect acts as an OSLC **Provider** and supports the Requirements Management 2.0 specification of OSLC, which allows for creating, retrieving and querying the Requirements in a model accessed via a Cloud connection. With OSLC support, Requirements in an Enterprise Architect model can be identified and accessed using a unique URL that can be linked to resources in other lifecycle products and tools.

Enterprise Architect complies with the following Requirements Management 2.0 base requirements:

- Resource Operations
- Service Provider Resource
- Partial Resource Representations
- Creation Factory

- Query Capability
- Query Syntax
- Error Responses
- RDF/XML Representations

#### \*Beta Implementation\*

This is a **BETA** release of OSLC Requirements Management and associated tools. As such, it is supplied without warranty of any kind and is subject to change without notice during the Beta period. Sparx Systems welcomes any feedback, issues, suggestions and comments on this implementation. As with all Beta software, please take due care when using OSLC Requirements Management in a production environment.

### **3.4.4.1 Service Provider and Service Provider Resource**

Enterprise Architect acts as an OSLC **Provider** that other OSLC-compliant tools (OSLC **Consumer/Clients**) access to link to its **Resources**. All OSLC Resources live in a **Service Provider**, which is a central organising concept of OSLC. In Enterprise Architect, each **model** that can be accessed via the Cloud connection is treated as an OSLC Service Provider. The Requirement elements in the model are the OSLC Resources.

The services offered by the Service Provider can be retrieved using the **Service Provider Resource**. A Service Provider Resource specifies the:

- URL to which you can POST representations to create new resources
- URL you can use to GET a list of existing resources

To retrieve the Service Provider Resource from an Enterprise Architect model connected via the Cloud, use the URL:

`http://<server>/<model_name>/oslc/sp/`

For example, the Service Provider Resource for a model called *firebird\_model*, connected via the Cloud, would be accessed using the URL:

`http://localhost:480/firebird_model/oslc/sp/`

This retrieved resource would resemble this:

```

```

→ Create new Requirements in the Model by sending POST request to this URL

→ Access the Requirements in the Model by sending GET request to this URL

→ Requirements representation is available in this URL

### Elements of the Service Provider Resource

Element	Description
<b>oslc:Publisher</b>	Specifies the OSLC Provider.
<b>oslc:Service</b>	Specifies the services offered by the OSLC Provider. Enterprise Architect supports the following OSLC Requirement Management services: <ul style="list-style-type: none"> <li>• <b>Creation Factory</b> - Used to create new Requirements in the model, by passing</li> </ul>

Element	Description
	<p>the Requirement's representation in RDF format using HTTP POST to the URL:</p> <p><code>http://&lt;server&gt;/&lt;model_name&gt;/oslc/cf/</code></p> <ul style="list-style-type: none"> <li>• <b>Query Capability</b> - Used to list/query the Requirements in the model, by passing the query using HTTP GET to the URL:</li> </ul> <p><code>http://&lt;server&gt;/&lt;model_name&gt;/oslc/qc/</code></p>
<b>oslc:resourceShape</b>	<p>Specifies the Requirement's metadata; that is, its properties and constraints. These are available in the URL:</p> <p><code>http://&lt;server&gt;/&lt;model_name&gt;/oslc/rs/</code></p>
<b>oslc:prefixDefinition</b>	Specifies the namespace prefixes and their namespace definitions.

### 3.4.4.2 Resource Shape

Resource Shape specifies a Requirement's metadata; that is, the set of standard OSLC properties and custom Enterprise Architect properties. Resource Shape can be accessed using the URL:

`http://<server>/<model_name>/oslc/rs/`

The properties of both types specified in the Resource Shape map to specific fields in the Requirement's Properties dialog in Enterprise Architect. For each property, the Resource Shape can also specify constraints.

#### OSLC Properties

(These are as defined in the *Dublin Core Metadata Element Set*.)

Property Name	Requirement element Properties dialog field
<b>title</b>	Short Description
<b>description</b>	Notes
<b>subject</b>	Key Words

Property Name	Requirement element Properties dialog field
<b>creator</b>	Author
<b>created</b>	Created
<b>modified</b>	Last Updated

#### Custom Enterprise Architect properties

Property Name	Requirement element Properties dialog field
<b>alias</b>	Alias
<b>status</b>	Status
<b>difficulty</b>	Difficulty
<b>priority</b>	Priority
<b>type</b>	Type
<b>phase</b>	Phase
<b>version</b>	Version

#### Constraints

Constraint	Meaning
<b>name</b>	The name of the property.
<b>valueType</b>	The type of value the property can have, such as <i>string</i> , <i>dateTime</i> or <i>integer</i> .
<b>occurs</b>	The cardinality of the property; that is, whether the property is optional or

Constraint	Meaning
	required.
<b>maxSize</b>	The maximum number of characters for a <i>string</i> valueType.
<b>allowedValue</b>	The list of values that can be assigned for the property.
<b>readOnly</b>	Determines whether a value for the property can be set by the client.

#### Notes

- The property **identifier** refers to a Requirement's unique Enterprise Architect GUID
- The property **packageID** refers to the ID of the Package under which the Requirement exists in the model

### 3.4.4.3 Query Capability

Clients can query a model and retrieve the Requirements that match a specific criteria. In Enterprise Architect, the base URI for accessing the Query Capability is:

`http://<server>/<model_name>/oslc/qc/`

A query string expressing the specific criteria should be added to the base URI and addressed to the model using an HTTP GET request. The response for this request will be in RDF/XML format. For example, all the Requirements in a model called *firebird\_model* connected by the Cloud can be retrieved using the URL:

`http://localhost:480/firebird_model/oslc/qc/`

The response for the request will resemble this:

```
<?xml version="1.0" encoding="UTF-8"?>
- <rdf:RDF xmlns:ss="http://www.sparxsystems.com.au/" xmlns:foaf="http://xmlns.com/foaf/0.1/" xmlns:dcterms="http://purl.org/dc/terms/"
  xmlns:oslc_rm="http://open-services.net/ns/rm#" xmlns:rdfs="http://www.w3.org/2000/01/rdf-schema#" xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#">
-   <rdf:Description rdf:about="http://localhost:480/firebird_model/oslc/qc/">
-     <rdfs:member>
-       <oslc_rm:Requirement rdf:about="http://localhost:480/firebird_model/oslc/re/{58089E4F-E705-46ae-992E-0D876D7F5DF5}/">
-         <rdf:type>http://open-services.net/ns/rm#Requirement</rdf:type>
-         <dcterms:title>Requirement2</dcterms:title>
-         <dcterms:description>Requirement2 Notes</dcterms:description>
-         <dcterms:identifier>{58089E4F-E705-46ae-992E-0D876D7F5DF5}</dcterms:identifier>

-         <ss:type>Display</ss:type>
-         <ss:phase>1.0</ss:phase>
-         <ss:version>1.0</ss:version>
-         <ss:packageID>355</ss:packageID>
-       </oslc_rm:Requirement>
-     </rdfs:member>
-   </rdfs:member>
- </rdf:Description>
</rdf:RDF>
```

### Elements of the response

Element	Description
<b>oslc_rm:Requirement</b>	A Requirement and its properties (as defined in the Resource Shape).  The attribute <b>rdf:about</b> on this element specifies the URL for accessing the Requirement. The format for the URL is:  <code>http://&lt;server&gt;/&lt;model_name&gt;/oslc/re/&lt;requirement_GUID&gt;/</code>
<b>Elements with namespace prefix <i>dcterms</i></b>	The standard properties from the Dublin Core Metadata Element Set.
<b>Elements with namespace prefix <i>ss</i></b>	The custom Enterprise Architect properties.

In Enterprise Architect, the Query Capability supports these parameters:

- **oslc.where**
- **oslc.select**
- **oslc.properties**
- **oslc.prefix**

**Learn more**

- [Dublin Core 1.1](#) (Online Resource)
- [Resource Shape](#)<sup>[271]</sup>
- [WHERE Parameter](#)<sup>[275]</sup>
- [SELECT Parameter](#)<sup>[276]</sup>
- [Combine WHERE and SELECT Parameters](#)<sup>[277]</sup>
- [PROPERTIES Parameter](#)<sup>[278]</sup>
- [PREFIX Parameter](#)<sup>[279]</sup>

**3.4.4.3.1 WHERE Parameter**

The **oslc.where** Query parameter specifies the conditions that the resources must satisfy; it is similar to the WHERE clause of an SQL statement. This parameter must be appended to the base URI of the Query Capability in Enterprise Architect:

```
http://<server>/<model_name>/oslc/qc/
```

The syntax for the **oslc.where** Query parameter (defined in BNF grammar and as specified in the OSLC Query Syntax Specification) is:

```
oslc_where    ::= "oslc.where=" compound_term
compound_term ::= simple_term (space? boolean_op space? simple_term)*
simple_term    ::= term | scoped_term
space         ::= " " /* a space character */
boolean_op    ::= "and"
term          ::= identifier_wc comparison_op value | identifier_wc space in_op space? in_val
scoped_term   ::= identifier_wc "{" compound_term "}"
identifier_wc ::= identifier | wildcard
identifier    ::= PrefixedName
PrefixedName ::= /* see "SPARQL Query Language for RDF", http://www.w3.org/TR/rdf-sparql-query/#rPrefixedName */
wildcard      ::= "*"
comparison_op ::= "=" | "!=" | "<" | ">" | "<=" | ">="
in_op         ::= "in"
in_val        ::= "[" value ("," value)* "]"
value         ::= uri_ref_esc | literal_value
uri_ref_esc   ::= /* an angle bracket-delimited URI reference in which > and \ are \-escaped. */
literal_value ::= boolean | decimal | string_esc (LANGTAG | ("^^" PrefixedName))?
boolean       ::= "true" | "false"
decimal       ::= /* see "XML Schema Part 2: Datatypes Second Edition", http://www.w3.org/TR/xmlschema-2/ */
string_esc    ::= /* a string enclosed in double quotes, with certain characters escaped. See below. */
LANGTAG       ::= /* see "SPARQL Query Language for RDF", http://www.w3.org/TR/rdf-sparql-query/#rLANGTAG */
```

These example queries act on a model called *firebird\_model* connected by the Cloud:

Query	Response
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where= dcterms: title="Requirement1"</code>	Retrieves all the OSLC properties of all the Requirements having the <b>title Requirement1</b> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where= dcterms:title in ["Requirement1","Requirement2"]</code>	Retrieves all the OSLC properties of all the

Query	Response
	Requirements having the <b>title</b> <i>Requirement1</i> or <i>Requirement2</i> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where=dterms:title="Requirement1" and dterms:creator{foaf:name}="User1"</code>	Retrieves all the OSLC properties of all the Requirements having the <b>title</b> <i>Requirement1</i> , created by <i>User1</i> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where=dterms:creator{foaf:name}="User1" and dterms:created&lt;"2014-01-07"</code>	Retrieves all the OSLC properties of all the Requirements created by <i>User1</i> prior to <i>7th January 2014</i> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where=name="Requirement1"</code>	Returns an error response as <b>name</b> is not a valid property in Enterprise Architect.
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where=dterms:created&lt;"01-07-2014"</code>	Returns an error response as the value of the property <b>created</b> is not in a valid format.

#### Notes

- Dates must be specified in the format **YYYY-MM-DD**

#### Learn more

- [OSLC WHERE](#) (Online Resource)
- [Resource Shape](#)<sup>[27]</sup>
- [Query Capability](#)<sup>[27]</sup>

#### 3.4.4.3.2 SELECT Parameter

The **oslc.select** Query parameter specifies the Requirement properties to be retrieved; it is similar to the SELECT clause of an SQL statement. This parameter must be appended to the base URI of the Query Capability in Enterprise Architect:

`http://<server>/<model_name>/oslc/qc/`

The syntax for the **oslc.select** Query parameter (defined in BNF grammar and as specified in the OSLC Query Syntax Specification) is:

```

oslc_select ::= "oslc.select=" properties
properties ::= property ("," property)*
property    ::= identifier | wildcard | nested_prop
nested_prop ::= (identifier | wildcard) "{" properties "}"

```

These example queries act on a model called *firebird\_model* connected by the Cloud:

Query	Response
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.select= dterms: title</code>	Retrieves the OSLC property <b>title</b> of all the Requirements.
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.select=dterms: title,dterms:created,dterms:creator{foaf:name},ss:version</code>	Retrieves the OSLC properties <b>title</b> , <b>creator</b> and <b>version</b> of all the Requirements.
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.select=*</code>	Retrieves all the OSLC properties of all the Requirements.
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.select=dterms: name</code>	Returns an error response, as <b>name</b> is not a valid property in Enterprise Architect.

#### Learn more

- [OSLC SELECT](#) (Online Resource)
- [Resource Shape](#)<sup>[27]</sup>
- [Query Capability](#)<sup>[27]</sup>

#### 3.4.4.3.3 Combine WHERE and SELECT Parameters

The **oslc.where** and **oslc.select** Query parameters can be combined in the base URI of the Query Capability to retrieve the required properties of all those Requirements that satisfy the specified condition. This is similar to using WHERE and SELECT clauses together in a SQL statement.

These example queries act on a model called *firebird\_model* connected by the Cloud:

Query	Response
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where= dterms: title="Requirement1" &amp; oslc.select=dterms:title</code>	Retrieves the OSLC property <b>title</b> of all the Requirements that have the <b>title Requirement1</b> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where= dterms: title in ["Requirement1","Requirement2"] &amp; oslc.select=dterms: title,dterms:created,dterms:creator{foaf:name}</code>	Retrieves the OSLC properties <b>title</b> , <b>created</b> and <b>creator</b> of all the Requirements that have the title

Query	Response
	<i>Requirement1</i> or <i>Requirement2</i> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where=dcterms:title="Requirement1" and dcterms:creator{foaf:name}="User1" &amp; oslc.select=*</code>	Retrieves all the OSLC properties of all the Requirements that have the <b>title</b> <i>Requirement1</i> , created by <i>User1</i> .
<code>http://localhost:480/firebird_model/oslc/qc/?oslc.where=dcterms:created&lt;"01-07-2014" oslc.select=dcterms:title</code>	Returns an error response, as the value of the property <b>created</b> is not in the valid format.

### Notes

- Dates must be specified in the format **YYYY-MM-DD**

### Learn more

- [Resource Shape](#)<sup>[27]</sup>
- [WHERE Parameter](#)<sup>[27]</sup>
- [SELECT Parameter](#)<sup>[27]</sup>

#### 3.4.4.3.4 PROPERTIES Parameter

Enterprise Architect supports a technique called **Selective Properties**, through which clients can retrieve selected OSLC properties of a Requirement. This technique accepts a partial representation of the OSLC properties - that is, all properties or only some of them. The base URI for accessing Selective Properties of a Requirement in Enterprise Architect is :

`http://<server>/<model_name>/oslc/re/<requirement_GUID>/`

The syntax for the **oslc.properties** Query parameter (defined in BNF grammar and as specified in the OSLC Core Specification) is:

```
oslc_properties ::= "oslc.properties=" properties
properties      ::= property ("," property)*
property        ::= identifier | wildcard | nested_prop
nested_prop     ::= (identifier | wildcard) "{" properties "}"
wildcard        ::= "*"
identifier      ::= PrefixedName
PrefixedName    ::= /* see "SPARQL Query Language for RDF", http://www.w3.org/TR/rdf-sparql-query/#rPrefixedName */
```

These example queries act on a Requirement with the GUID {7104C13D-841C-4068-B7EE-FB998C5BA4B7} in a model called *firebird\_model* connected by the Cloud:

Query	Response
<code>http://localhost:480/firebird_model/oslc/re/{7104C13D-841C-4068-B7EE-FB998C5BA4B7}/?oslc.properties=*</code>	Retrieves all the OSLC properties of the specified Requirement.

Query	Response
<code>http://localhost:480/firebird_model/oslc/re/{7104C13D-841C-4068-B7EE-FB998C5BA4B7}/?oslc.properties=dcterms:title,dcterms:creator{foaf:name}</code>	Retrieves the OSLC properties <b>title</b> and <b>creator</b> of the specified Requirement.
<code>http://localhost:480/firebird_model/oslc/re/{7104C13D-841C-4068-B7EE-FB998C5BA4B7}/?oslc.properties=dcterms:title,dcterms:creator{}</code>	Returns an error response as the property <b>creator</b> is incomplete; it should be:  <code>dcterms:creator{foaf:name}</code>

- [OSLC PROPERTIES](#) (Online Resource)
- [Resource Shape](#)<sup>[27]</sup>
- [Query Capability](#)<sup>[27]</sup>

#### 3.4.4.3.5 PREFIX Parameter

Clients can use the **oslc.prefix** parameter to specify URI prefixes as used in OSLC property names. This parameter is appended to the base URI of the Selective Properties of a requirement:

`http://<server>/<model_name>/oslc/re/<requirement_GUID>/`

The syntax for the **oslc.prefix** parameter (defined in BNF grammar and as specified in the OSLC Core Specification) is:

```
oslc_prefix ::= "oslc.prefix=" prefix_defs
prefix_defs ::= prefix_def ("," prefix_def)*
prefix_def  ::= prefix "=" uri_ref_esc
prefix      ::= PN_PREFIX
PN_PREFIX   ::= /* see "SPARQL Query Language for RDF", http://www.w3.org/TR/rdf-sparql-query/#rPN_PREFIX */
uri_ref_esc ::= /* an angle bracket-delimited URI reference in which > and \ are \-escaped. */
```

These example queries act on a Requirement with the GUID `{7104C13D-841C-4068-B7EE-FB998C5BA4B7}` in a model called `firebird_model` connected by the Cloud:

Query	Response
<code>http://localhost:480/firebird_model/oslc/re/{7104C13D-841C-4068-B7EE-FB998C5BA4B7}/?oslc.prefix=otrm=&lt;http://purl.org/dc/terms/&gt; &amp; oslc.properties=otrm:title</code>	Retrieves the OSLC property <b>title</b> of the specified Requirement.  Note that the prefix for the namespace <code>http://purl.org/dc/terms/</code> has been specified as <b>otrm</b> in the query.
<code>http://localhost:480/firebird_model/oslc/re/{7104C13D-841C-4068-B7EE-FB998C5BA4B7}/?oslc.prefix=otrm=&lt;http://purl.org/dc/terms/&gt; &amp; oslc.properties=otrm:title,otrm:alias</code>	Retrieves the OSLC properties <b>title</b> and <b>alias</b> of the specified Requirement.

Query	Response
org/dc/terms/>>,spx=<http://www.sparxsystems.com.au/>&oslc.properties=otrm:title,spx:alias	Note that the prefix for the namespace <i>http://purl.org/dc/terms/</i> has been specified as <b>otrm</b> and that of <i>http://www.sparxsystems.com.au/</i> has been specified as <b>spx</b> in the query.
http://localhost:480/firebird_model/oslc/re/{7104C13D-841C-4068-B7EE-FB998C5BA4B7}?oslc.prefix=otrm=<http://purl.org/dc/terms/>>,spx=<http://www.sparxsystems.com.au/>&oslc.properties=otrm:title,sx:alias	Returns an error response as the namespace prefix <b>sx</b> on the property <b>alias</b> is undefined.

#### Learn more

- [OSLC PREFIX](#) (Online Resource)
- [Resource Shape](#)<sup>[27]</sup>
- [Query Capability](#)<sup>[27]</sup>
- [PROPERTIES Parameter](#)<sup>[27]</sup>

#### 3.4.4.4 Creation Factory

Enterprise Architect supports the **Creation Factory** OSLC service, through which clients can create new Requirements via HTTP **POST**. To create a new Requirement, the client POSTs a representation of the Requirement in **RDF** format to the Creation Factory URL. If the POST is successful, the HTTP location header of the response will contain the URL of the created Requirement. An unsuccessful POST will generate an error response.

The Creation Factory URL has the format:

`http://<server>/<model_name>/oslc/cf/`

Some example representations of a Requirement in RDF format are:

RDF Representation	Result
<pre>&lt;rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"   xmlns:oslc_rm="http://open-services.net/ns/rm#"   xmlns:dcterms="http://purl.org/dc/terms/"   xmlns:foaf="http://xmlns.com/foaf/0.1/"   xmlns:ss="http://www.sparxsystems.com.au/"&gt;   &lt;oslc_rm:requirement&gt;   &lt;dcterms:title&gt;Requirement3&lt;/dcterms:title&gt;   &lt;dcterms:description&gt;Requirement Notes     &lt;/dcterms:description&gt;   &lt;dcterms:creator&gt;     &lt;foaf:Person&gt;       &lt;foaf:name&gt;User1&lt;/foaf:name&gt;     &lt;/foaf:Person&gt;   &lt;/dcterms:creator&gt;   &lt;ss:type&gt;Functional&lt;/ss:type&gt;   &lt;ss:packageID&gt;355&lt;/ss:packageID&gt;</pre>	Creates a new Requirement with the specified <b>name</b> , <b>notes</b> , <b>author</b> and <b>stereotype</b> .

RDF Representation	Result
<pre> &lt;/oslc_rm:requirement&gt; &lt;/rdf:RDF&gt; </pre>	
<pre> &lt;rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"   xmlns:oslc_rm="http://open-services.net/ns/rm#"   xmlns:dct="http://purl.org/dc/terms/"   xmlns:foaf="http://xmlns.com/foaf/0.1/"   xmlns:ss="http://www.sparxsystems.com.au/"&gt;   &lt;oslc_rm:requirement&gt;     &lt;dct:title&gt;Requirement4&lt;/dct:title&gt;     &lt;ss:packageID&gt;355&lt;/ss:packageID&gt;     &lt;ss:difficulty&gt;High&lt;/ss:difficulty&gt;     &lt;ss:priority&gt;High&lt;/ss:priority&gt;   &lt;/oslc_rm:requirement&gt; &lt;/rdf:RDF&gt; </pre>	Creates a new Requirement with the specified <b>name</b> , <b>difficulty</b> and <b>priority</b> .
<pre> &lt;rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"   xmlns:oslc_rm="http://open-services.net/ns/rm#"   xmlns:dct="http://purl.org/dc/terms/"   xmlns:foaf="http://xmlns.com/foaf/0.1/"   xmlns:ss="http://www.sparxsystems.com.au/"&gt;   &lt;oslc_rm:requirement&gt;     &lt;dct:title&gt;Requirement4&lt;/dct:title&gt;     &lt;ss:packageID&gt;355&lt;/ss:packageID&gt;     &lt;ss:difficulty/&gt;   &lt;/oslc_rm:requirement&gt; &lt;/rdf:RDF&gt; </pre>	Produces an error response, as the property <b>difficult</b> has an invalid (empty) value.

**Note**

- The OSLC properties **title** and **packageID** of the Requirement are mandatory and must be supplied in the RDF representation
- The value of the OSLC property **packageID** should already exist in the model, so before creating a Requirement using Creation Factory, use the Query Capability URL to determine the existing values of **packageID**
- The OSLC properties **identifier**, **created** and **modified** of the Requirement are read-only and cannot be set using the Creation Factory service

### 3.5 Reuseable Asset Service

Within a large organization, groups of users - such as model developers - can be separated by geographical distance and/or being on different networks. This can make it difficult to share common data, standards and modeling structures easily, without the complexity of using external version control tools or manually distributing XML files between projects. However, within Enterprise Architect the **Reusable Asset Service (RAS)** provides a simple and convenient mechanism for modelers to distribute or download **reusable** model structures, information, corporate directives and standards, through a **shared repository**, accessible via a **Cloud Service** connection. The person who sets up the reusable data can retain ownership and management of the resource - or **asset** - whilst their distant colleagues can quickly review the currency of the information and download the latest versions into their models or file folders.

The RAS gives distributed teams convenient access to a single 'source of truth' for shared data, including project milestones, architectural frameworks and industry standards.

#### Reusable Assets

Reusable Assets consist of:

- **Packages** containing elements, diagrams and structures (as drawn from any point within the Project Browser), and
- **Files** in a range of text, code and graphic formats, including .eap files

An asset can be, for example:

- A common Class library or framework
- A set of common Requirements or Use Cases
- A draft specification document
- Marketing collateral

#### Storage Structure and Use

Reusable Assets are held in a remote **registry**, accessed through a Cloud Service connection. The registry contains any number of **Storages**, which any user can create. Each Storage can contain any number of **Asset Packages** holding modeling structures, and **files** containing textual or graphical information and data. When a user creates a Storage, they can protect the contents from being updated in the Registry or downloaded into a model, using **password protection** defined by that user.

For each Package, the RAS automatically identifies the:

- Version of the Package held in the registry
- Diagrams and elements (including child Package elements) contained by the Asset Package
- Dependencies on parent Packages of any external elements that the Asset Package references
- Dependencies on MDG Technologies

Any user, regardless of password protection, can freely browse and identify the contents of a Package held in a Storage - including displaying the diagrams - without importing the material into a model. A user that has imported an Asset Package into their model can compare their model Package against any version of the Asset Package, to check for and assess any differences between them.

#### Notes

- The Reusable Asset Service is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

- [Update an Asset](#) <sup>[304]</sup>

### 3.5.1 Connect to the Asset Service

The Reusable Asset Service provides model structures and documents to you from one or more registries on remote systems. You access these registries through a Cloud connection to the appropriate server. The connection details should be provided to you by your System Administrator or Reusable Asset Service Administrator.

#### Access    **Project | Reusable Asset Service**

#### Connect to Assets

### 3.5.2 Browse Assets

When you select a **Storage** in the Reusable Asset Service, the **Registry Browser** tab immediately displays a list of the **Packages** registered in that Storage. You can review and use these Packages using the context menu and buttons on the tab.

You can review the properties and contents of the selected Package in the Storage, and access any files in the Storage, using the tabs in the **lower** half of the Reusable Asset Service view, underneath the Registry Browser tab.

If you have left the Registry Browser open for a while and there is a possibility that the Registry has been changed, you can click on the  icon in the Reusable Asset Service toolbar to refresh the Browser with the latest contents of the Registry.

Access    **Project | Reusable Asset Service > Registry Browser**

#### Review Assets

Field/Option	Detail	See also
<b>Toggle Filter Bar</b>	Right-click on the column headings and select this option to show or hide the <b>Filter Bar</b> on the display.	
<b>&lt;filter bar fields&gt;</b>	Type in the appropriate characters to list only Packages that have that string of characters in the values in the corresponding column.	<a href="#">List Header</a> <sup>[678]</sup>
<b>Package</b>	This column shows the <b>name</b> of the Packages held in the selected Storage.	
<b>Version</b>	This column defaults to the most recent <b>version</b> of each Package held in the selected Storage.  You can click on the drop-down arrow at the end of a field and select a <b>different version</b> of the corresponding Package, if any have been registered.	
<b>Last Registered</b>	This column shows the <b>date and time</b> at which the currently-listed version of each Package was registered.	
<b>Registered By</b>	This column shows the <b>user name</b> of the person who registered the currently-listed version of each Package.	

Field/Option	Detail	See also
<b>Import</b>	<p>Click on a Package name and click on this button to begin to <b>import</b> either the Package alone or the Package and its dependent structures into your <b>model</b>.</p> <p>You can perform the same action by right-clicking on the Package name and selecting the <b>Import from Registry</b> menu option.</p> <p>If the Package from the Registry <b>already exists</b> in your model, it is deleted and replaced by this import.</p>	<a href="#">Import an Asset into the Model</a> <sup>[291]</sup>
<b>Compare with Package in Model</b>	<p>If you have previously imported a Package from the Registry into your model, you can right-click on the Package name in the Registry Browser and select this option to <b>compare</b> the imported Package with the Registry version, and show any differences.</p> <p>The system automatically selects the model Package from the Project Browser.</p>	<a href="#">Compare an Asset to the Model</a> <sup>[291]</sup>
<b>Find in Project Browser</b>	<p>If you have previously imported a Package from the Registry into your model, you can right-click on the Package name in the <b>Registry Browser</b> and select this option to highlight the corresponding Package in the <b>Project Browser</b>.</p>	

### Notes

- Some of the other options available on the Registry Browser are used to **set up** assets in the Registry
- If the Storage is password-protected, a prompt for you to enter a password displays when you select to perform an operation on the data; in this situation, you need the Read-only password to **process** the information from the Storage, and the All-access password to **change** the information in the Storage

- [Reuseable Asset Service](#)<sup>[282]</sup>
- [Browse Assets](#)<sup>[284]</sup>

### 3.5.2.2 Package Contents

When you select a Storage and a Package in the Registry Browser, the first four tabs in the lower half of the Reusable Asset Service view are updated with information from the Package. The **Contents** tab lists the **diagrams** and **elements** (including child Packages) held in the selected Package, listing the two types of object separately. You can organize the information within a column into alphabetical or reverse-

alphabetical order for ease of reference, and use the Filter bar to filter the display to show only items with values containing specific characters or digits.

Access **Project | Reusable Asset Service > Contents**

#### Review Package Contents

Field/Option	Detail	See also
<b>Content Type</b>	Click on this button to toggle between listing the Package <b>diagrams</b> first and listing the Package <b>elements</b> first.	
<b>Toggle Filter Bar</b>	Right-click on the column headings and select this option to show or hide the <b>Filter Bar</b> on the display.	
<b>&lt;filter bar fields&gt;</b>	Type in the appropriate characters to list only elements and diagrams that have that string of characters in the values in the corresponding column.	<a href="#">List Header</a> <sup>[678]</sup>
<b>Content Type: Diagram</b> <b>Content Type: Element</b>	These are the headers for the two types of object listed in this tab. Click on the appropriate expansion box to hide or show the list of diagrams or elements under the heading.	
<b>Name</b>	Displays the name of the element or diagram available in the Package.	
<b>Type</b>	Displays the type of the element or diagram, such as UseCase or Use Case Diagram.	
<b>GUID</b>	Displays the Global Unique Identifier of the element or diagram.	
<b>Content Type</b>	Displays the object type of the item - <b>Element</b> or <b>Diagram</b> .	
<b>Find in Project Browser</b>	Right-click on an element or diagram line and select this option to see if the element or diagram also exists in your model and, if it does, to highlight it in the Project Browser.	
<b>View Diagram</b>	Right-click on a diagram name and select this option to display the diagram within a labeled frame, as an image. Alternatively, double-click on the diagram name.	

Learn more

- [Reuseable Asset Service](#)<sup>[282]</sup>
- [Browse Assets](#)<sup>[284]</sup>

**3.5.2.3 Package Dependencies**

A Package held as an asset in the Reusable Asset Service registry might contain elements and diagrams that have relationships with objects in other Packages. The Packages containing these 'external' objects will also have been added to the Registry, to support the first Package, and will be listed in the Registry Browser tab along with other, unrelated Packages. You can establish whether the selected Package in the Registry Browser has links to other Packages in the Registry, and which they are, by reviewing the **Dependency** tab.

Package A depends on Package B if any of the following constructs (or their Tagged Values) in Package A references elements in Package B:

- Elements
- Attributes
- Operations
- Operation Parameters
- Diagrams
- Connectors

Access    **Project | Reusable Asset Service > Dependency**

Check Package Dependencies

Field/Option	Detail	See also
<b>Package</b>	Displays the name of the related Package.	
<b>Version</b>	Displays the latest registered version of the related Package that has links to the selected Package.	
<b>GUID</b>	Displays the Global Unique Identifier of the related Package.	
<b>Find in Project Browser</b>	Right-click on the Package line and select this option to see if the Package also exists in your model and, if it does, to highlight it in the Project Browser.	

Notes

- If one Package depends on another, and that second Package itself depends on another Package, both the second **and** third Packages are shown in the Dependency tab

Learn more

- [Reuseable Asset Service](#)<sup>[282]</sup>
- [Browse Assets](#)<sup>[284]</sup>

### 3.5.2.4 Package Technologies

It is possible that the asset Package in the Registry is associated with one or more Technologies, especially if the Package comes from a model developed as an extension or customization of the UML. You can check whether an asset Package has any associated Technologies, and what they are, by viewing the **Technology** tab of the Reusable Asset Service view.

**Access**    **Project | Reusable Asset Service > Technology**

#### Review Technologies

Field/Option	Detail	See also
<b>Name</b>	Displays the name of the Technology as recorded in the Registry.	
<b>Version</b>	Displays the required version of the Technology to support the asset Package, available through the Registry.	
<b>ID</b>	Displays the unique identifier of the Technology.	
<b>Type</b>	Identifies whether the Technology is system-supplied and <b>built in</b> to Enterprise Architect (such as BPMN 2.0 or ArcGIS), or <b>user-defined</b> .  A user-defined technology can be introduced from an external source or developed by a user within the system.	<a href="#">Using MDG Technologies</a> <sup>[1475]</sup>
<b>Registry Status</b>	Indicates whether the Technology file is: <ul style="list-style-type: none"> <li>• <b>Available</b> - the Technology file is registered in the current Storage, or</li> <li>• <b>Unavailable</b> - either: <ul style="list-style-type: none"> <li>• The Technology file is not registered in the Storage, or</li> <li>• The Technology is a <b>built-in</b> Technology and is already integrated with your system, or must be purchased under license</li> </ul> </li> </ul>	
<b>Import From Registry</b>	If your local system does not have one of the <b>Available</b> Technologies, you can quickly import it from the Registry. You cannot import <b>Unavailable</b> Technologies.  Right-click on the Technology name and select this context menu option.  A prompt displays for you to confirm the import to your system. Click on the <b>Yes</b> button.  A message displays to confirm that the Technology has been imported. Click on the <b>OK</b> button.	

Field/Option	Detail	See also
	You might need to restart Enterprise Architect to activate the Technology.	

### Notes

- You can also import **Available** Technologies from the registry as part of the process of importing the asset Package
- If the Storage is **password protected**, a prompt to enter your password displays (this can be a **Read-Only** or a **Complete Access** password) after you confirm that you want to import the Technology; you cannot import the Technology without this password

### Learn more

- [Reuseable Asset Service](#)<sup>[282]</sup>
- [Browse Assets](#)<sup>[284]</sup>
- [Import an Asset into the Model](#)<sup>[291]</sup>
- [Set Up the Asset Service](#)<sup>[293]</sup>

### 3.5.2.5 Storage Files

The **Storage Files** tab of the Reusable Asset Service view simply lists the **files** that have been uploaded to the specified **Storage**. The files can be of any type, uploaded from any directory on any system connected to the registry. Typically they would be document or graphics files that provide standards, guidelines or design information on a model structure. The tab displays the file name and extension, and a comment on the nature or purpose of the file.

Files held in the Registry are compressed, so to view the contents you download them onto your local system.

**Access**    **Project | Reusable Asset Service > Storage Files**

### Review Storage Files

On the Storage Files tab, check the **Comments** field against each file that interests you.

To view the contents of a file, right click on the file name and select the **Import From Registry** context menu option. The Save As browser displays, through which you select the directory into which to copy the file.

Click on the **Open** button. The file is copied into the selected location, from which you can open it.

### Notes

- If the **Storage** is **password-protected**, the system prompts you to enter a password before you begin importing a file from the Storage; in this case you require either a **Read-Only** or **Complete Access** password

#### Learn more

- [Reuseable Asset Service](#)<sup>[282]</sup>
- [Browse Assets](#)<sup>[284]</sup>
- [Set Up the Asset Service](#)<sup>[293]</sup>

### 3.5.2.6 Compare an Asset to the Model

If you are developing a Package in your model against a standard structure, or using common elements from the Reusable Asset Service, you can check that your model conforms to the standard or incorporates any changes to the common elements, by performing a comparison between the asset Package and your model.

**Access** **Project | Reusable Asset Service > Registry Browser | right-click Package | Compare with Package in Model**

#### Compare Asset Package and Model

A prompt displays for you to confirm the comparison. Click on the **Yes** button.

The Baseline Comparison view displays, showing the element hierarchy in which differences have been detected between the Package in the model and the asset Package in the Registry (as the Baseline).

All facilities of the standard Baseline Comparison are available, including the ability to 'roll back' differences so that the element or Package in the model matches the Registry.

#### Notes

- If the **Storage** is **password-protected**, the system prompts you to enter a password before you begin comparing information in the Storage and in the model; in this case you require either a **Read-Only** or a **Complete Access** password

#### Learn more

- [Reuseable Asset Service](#)<sup>[282]</sup>
- [Package Baselines](#)<sup>[457]</sup>
- [Example Comparison](#)<sup>[468]</sup>

### 3.5.3 Import an Asset into the Model

The Reusable Asset Service provides common or standard information and data that you can import into your local model. The unit that you import is a selected version of the Asset Package; you can also, optionally, import:

- Other Packages on which the selected Asset Package depends, and/or
- Available Technologies that support full use of the model structures in the Asset Package

The Asset Package (with, if selected, any needed Packages) is imported into the **currently-selected** model Package in the Project Browser, **unless** the Asset Package already exists anywhere else in the **Project**. In this case, the system locates the existing Package and overwrites it with the imported Asset Package.

**Access** **Project | Reusable Asset Service | Click on Asset Package: Import** or

### Project | Reusable Asset Service > Registry Browser | Right-click on Asset Package | Import from Registry

#### Import Asset Package

Before selecting an Asset Package to import into your model, click on the **Version** drop-down arrow and select the appropriate version of the Package to import.

When you select to import an Asset Package into your model, a short menu displays from which you select to import:

- The Package alone or
- The Package with the Packages on which it is dependent

A prompt then displays for you to confirm the import, and to warn you that if the Package already exists in the model, it will be overwritten by the import. Click on the **Yes** button to continue, or the **No** button to cancel the import.

If the Storage is **password protected**, after you confirm the import a prompt displays for your Read-Only or Complete-Access password; enter this and click on the **OK** button.

The Import from Registry dialog displays, followed by confirmation that the import of the Package or Packages is complete. Click on the **OK** button.

#### If the Package depends on Technologies

If the Technologies associated with an Asset Package are not already on your system and/or enabled in your model, during the display of the Import from Registry dialog the Import Technology From Registry dialog also displays. Process this dialog as described.

Field/Option	Detail	See also
<b>Name</b>	Displays the name of the Technology as recorded in the Registry.  The check box against each name is selected by default. If you want to import one technology but not another, <b>deselect</b> the checkbox of the technology to ignore.	
<b>Version</b>	Displays the required version of the Technology to support the Asset Package, available through the Registry.	
<b>Registry Status</b>	Indicates whether the Technology file is: <ul style="list-style-type: none"> <li>• <b>Available</b> - the Technology file is registered in the current Storage, or</li> <li>• <b>Unavailable</b> - either: <ul style="list-style-type: none"> <li>• The Technology file is not registered in the Storage, or</li> <li>• The Technology is a <b>built-in</b> Technology and is already integrated with your system, or must be purchased under license</li> </ul> </li> </ul>	

Field/Option	Detail	See also
<b>Model Status</b>	Indicates whether the Technology is already in your model and disabled.  (If the Technology is in your model and enabled, there is no need to import it and it is not listed in the dialog.)	
<b>OK</b>	Click on this button to import and/or enable the selected Technology or Technologies in your system.  A status message displays to indicate that the Package and Technologies have been imported and the Technologies enabled. You might have to restart Enterprise Architect for the Technologies to take full effect.  Click on the <b>OK</b> button to clear the message.  In the Project Browser, the Package has been added to the model with (if selected) the Packages on which it is dependent.	

**Notes**

- You can also import Technologies separately from the Package that is dependent on them, using the Technology Tab of the Reusable Asset Service view

**Learn more**

- [Reuseable Asset Service](#) <sup>[282]</sup>
- [Register New Assets](#) <sup>[298]</sup>
- [Package Technologies](#) <sup>[289]</sup>

**3.5.4 Set Up the Asset Service**

The process of setting up assets and files in the Reusable Asset Service has a number of simple stages, typically:

- Identify the Registry
- Create the Storages, including copying an existing Storage as template for a new one
- Set password protection on each Storage
- Register the Asset Packages and Storage Files, and update them as necessary

**Access Project | Reusable Asset Service****Identify Registry**

The **Registry server** holds the **Storages** of the Reusable Asset Service. It will have been previously configured by your system administrator, to be accessed through a **Cloud Connection**. Your system administrator will provide the connection details for you to use.

In the Reusable Asset Service view, click on the [ ... ] Browse button to the right of the **Registry** field. The Cloud Connection dialog displays.

Using the information provided by your administrator, type in the server name, URL and the name of the model hosting the registry data. If advised by your administrator, also type in the user name and password for the server.

Click on the **OK** button; the Registry field now shows the server name.

### Create Storages

A Storage is a container within the Registry, holding related assets and files. There can be several Storages in the Registry, to support the different areas of work or purposes that your organization might define.

Step	Action	See also
1	Click on the  icon in the Reusable Asset Service toolbar. The New Storage dialog displays.	
2	In the <b>Name</b> field, type a name that indicates the purpose or content of the Storage.	
3	In the <b>Type</b> field, select: <ul style="list-style-type: none"> <li>• <b>Draft</b> if you intend to make significant changes to the content of the Storage, such as populating it with assets and/or files; you <b>can</b> overwrite existing Packages or files in a Draft Storage</li> <li>• <b>Complete</b>; if the Storage is ready for use; you <b>cannot</b> overwrite any Packages or files in a Complete Storage, although you can delete Packages and files and add new ones</li> </ul> <p>You can modify a Storage at a later time, and change this setting.</p>	<a href="#">Change Storage Details</a> <sup>[296]</sup>
4	If you want to set <b>Storage Access Passwords</b> on this Storage, click on the check box against one or both password types, and provide and confirm the <b>Complete Access</b> and/or <b>Read-Only Access</b> passwords.	<a href="#">Password Protection</a> <sup>[294]</sup> (below)
5	Click on the <b>OK</b> button. A prompt displays for you to confirm the creation of the Storage, with the type of access you have set on the Storage.	
6	Click on the <b>Yes</b> button. A confirmation message displays; click on the <b>OK</b> button. The name of the new Storage displays in the <b>Storage</b> field.	

### Password Protection

Access to a Storage is unrestricted, but you can apply password protection to restrict users in processing and modifying the contents of the Storage either intentionally or unintentionally. Password protection can be applied at two levels:

- **Complete Access** - users enter their password and can modify or delete the Storage itself, and within the Storage can register, update and delete Packages and files in the Registry, view Packages and import assets into their models
- **Read-Only Access** - users enter their password and can import assets into their models

You set the **Complete Access** password **before** you set the **Read-Only Access** password.

If password protection is set and a user has no password, they can only view the contents of the Storage. If **no** password protection is set, all users can freely access and modify the Storage and its contents.

You set the passwords on each Storage as you create that Storage, using the New Storage dialog. Once the Storage has been created, you can change or remove an existing password using the Modify Storage Access dialog, but you cannot **add** a password.

If a Storage is password protected, the system displays a prompt for the password when the user begins to:

- Change or delete a password on the Storage
- Copy the Storage to create a new Storage
- Delete the Storage
- Register a Package or file in the Storage
- Import a Package, file or Technology from the Storage
- Delete a Package or file from the Storage
- Compare an Asset Package with a Package in the model

The system displays the password prompt when any of those operations is performed for the **first time** after the user:

- Connects to a Registry
- Reloads the Registry Browser
- Selects a Storage in the **Storage** field in the Reusable Asset Services view

If the user enters the correct password and therefore establishes their credentials, the system does not display a password prompt again for any valid operation that user performs until they:

- Select a different Storage in the **Storage** field in the Reusable Asset Services view or
- Reload the Registry Browser from the Registry.

### Register Assets and Files

Whilst a Storage exists and, if the Storage is under password protection, you have the **Complete Access** password, you can register Packages from a model and files from your system as assets in that Storage. If the Asset Package was developed using one or more MDG Technologies, you can optionally register those technologies in the Storage as well.

See the *Register New Assets* Help topic.

### Copy Storages

It is possible to copy a Storage as the basis for creating another Storage, for example if you want to use the same set of assets in the context of larger set for a different department, work area or development phase.

Step	Action	See also
1	In the <b>Storage</b> field, select the Storage to be copied.	
2	Click on the  icon in the Reusable Asset Service toolbar.	
3	If necessary, enter your <b>Complete Access</b> password and click on the <b>OK</b> button. The Save Storage As dialog displays.	
4	In the <b>Name</b> field, type a name that indicates the purpose or content of the new Storage.	
5	In the <b>Type</b> field, select: <ul style="list-style-type: none"> <li>• <b>Draft</b> if you intend to make significant changes to the content of the Storage, such as populating it with assets and/or files; you <b>can</b> overwrite existing Packages or files in a Draft Storage</li> <li>• <b>Complete</b>; if the Storage is ready for use; you <b>cannot</b> overwrite any Packages or files in a Complete Storage, although you can delete Packages and files and add new ones</li> </ul> <p>You can modify a Storage at a later time, and change this setting.</p>	<a href="#">Change Storage Details</a> <sup>[296]</sup>
6	If you want to set <b>Storage Access Passwords</b> on this Storage, click on the check box against one or both password types, and provide and confirm the <b>Complete Access</b> and/or <b>Read-Only Access</b> passwords.	<a href="#">Password Protection</a> <sup>[294]</sup> (above)
7	Click on the <b>OK</b> button. A prompt displays for you to confirm the creation of the Storage, with the type of access you have set on the Storage.	
8	Click on the <b>Yes</b> button. A confirmation message displays; click on the <b>OK</b> button. The name of the new Storage displays in the <b>Storage</b> field.	

### Change Storage Details

After you have set up a Storage, you can update it at a later stage to:

- Change the status, or **Type**,
- Change one or both of the existing **Complete Access** and **Read-Only Access** passwords
- Delete one or both of the passwords

It is not possible to **add** a password where one has not previously been set.

You cannot change or delete passwords unless you have the **Complete Access** password yourself.

Step	Action	See also
1	On the Reusable Asset Service view, in the <b>Storage</b> field click on the drop-down arrow and select the Storage to update.	
2	Click on the  icon in the Reusable Asset Service view toolbar.	
3	If necessary, enter your <b>Complete Access</b> password and click on the <b>OK</b> button. The Modify Storage Access dialog displays.	
4	In the <b>Type</b> field, click on the drop-down arrow and select: <ul style="list-style-type: none"> <li>• <b>Complete</b> if the Storage has now been set up and is ready for use; you cannot overwrite any Packages or files in the Storage, although you can delete them and add new Packages and files</li> <li>• <b>Draft</b> if you intend to make significant changes to the content of the Storage; you can overwrite existing Packages or files</li> </ul>	
5	The <b>Action</b> field defaults to <b>None</b> , to indicate no changes to the passwords. If you are changing or deleting the passwords, click on the drop-down field and select: <ul style="list-style-type: none"> <li>• <b>Change Password</b> to enable both password type fields ready for editing</li> <li>• <b>Remove Storage Access Password</b> to simply delete the Complete Access password altogether</li> <li>• <b>Remove Read-Only Access Password</b> to simply delete the Read-Only Access password altogether</li> </ul>	<a href="#">Password Protection</a> <sup>[294]</sup>
6	If you have selected the <b>Change Password</b> option, select the appropriate password checkbox or both checkboxes, and type in the new password(s). Re-type the password(s) in the <b>Confirm Password</b> field(s).	
7	Click on the <b>OK</b> button to save your changes and close the Modify Storage Access dialog.	

### Delete a Storage

If a Storage has been created by mistake, or is no longer necessary in the Registry, you can delete it and its entire contents of Package and files in one action.

Step	Action	See also
1	On the Reusable Asset Service view, in the <b>Storage</b> field click on the drop-down arrow and select the Storage to delete.	
2	Click on the  icon in the Reusable Asset Service view toolbar. A prompt displays to confirm the deletion.	
3	Click on the <b>Yes</b> button. If necessary, enter your <b>Complete Access</b> password and click on the <b>OK</b> button. A message displays to confirm that the Storage has been deleted.	
4	Click on the <b>OK</b> button to clear the message. The Storage and its contents have been cleared from the Registry.	

#### Learn more

- [Update an Asset](#)<sup>[304]</sup>
- [Browse Assets](#)<sup>[284]</sup>

#### 3.5.4.1 Register New Assets

After you have set up your Storages in the Reusable Asset Service Registry, you can register assets in them. The assets include:

- Packages of modeling structures, held in the Project Browser of your model; these Packages can include diagrams and subordinate Packages
- Any Packages containing model components on which the primary Asset Packages depend
- Any MDG Technologies that you used in developing the Asset Packages, and that you decide to register with the Packages
- Any text or graphics files you want to make available to your corporate community; these files are compressed before being added to the Storage

You register the first three items together. You can register files in the Storage during that same process, or separately.

You can register separate versions of the same Package. If you register a Package that already exists in the Registry under the **same** version reference, and the Storage has **Draft** status, the existing version is **overwritten**. If you register the same package with a **different** version number or reference, it is registered **separately** and users can access **both** versions of the Package from the Registry.

**Access** **Project | Reusable Asset Service** and  
**View | Project Browser** (Alt+0)

### Register Package as Asset

Step	Action	See also
1	In the <b>Reusable Asset Service</b> view, select the appropriate Registry and Storage.	<a href="#">Set Up the Asset Service</a> <sup>[293]</sup>
2	In the <b>Project Browser</b> for your model, click on the Package to register as an Asset.	
3	On the <b>Registry Browser</b> tab, click on the <b>Register</b> button.  If the Storage is password protected, a prompt displays for your <b>Complete Access</b> password. Enter this and click on the <b>OK</b> button.	<a href="#">Set Up the Asset Service</a> <sup>[294]</sup>
4	<p>The Register Package(s) dialog displays, showing the:</p> <ul style="list-style-type: none"> <li>Name and type of the Storage</li> <li>Name and status of the selected Package (the status at this point being <b>Pending</b>)</li> <li>The name, GUID and current version of the selected Package; you can type a different version number or text string if necessary</li> </ul> <p>If there is a version of the Package already in the Registry, and the Storage has <b>Draft</b> status, you can either:</p> <ul style="list-style-type: none"> <li>Overwrite the registered Package with an update of that version, or</li> <li>Add the updated Package as another Asset under a different version number; in this case, the Packages to Register panel shows the version number, registration date and comments on the latest version of the Asset Package</li> </ul> <p>You cannot overwrite an existing Package if the Storage has <b>Complete</b> status. In this case, add the Package under a different version number.</p>	
5	In the <b>Comments</b> field type a short comment and, in the <b>Notes</b> field, a longer explanation of the Package being registered.	
6	Click on the <b>Check Dependency</b> button and resolve the dependencies of the Package.  At the end of this process, the selected Package has the status <b>Ready</b> (for registration).	<a href="#">Check Package Dependencies</a> <sup>[302]</sup>

Step	Action	See also
7	<p>You can, at this point, also register <b>files</b> as assets of the Storage. See Step 4 of the <i>Register File as Asset</i> procedure below.</p> <p>However, if you prefer you can follow the complete procedure separate from registering Packages.</p>	
8	<p>Click on the <b>Register</b> button.</p> <p>A prompt displays to confirm registering the package. Click on the <b>Yes</b> button.</p> <p>If the <b>same</b> version of the selected Package already exists in the Registry (if the Storage is a <b>Draft</b>) a prompt displays to confirm overwriting it. Click on the <b>Yes</b> button.</p> <p>A progress dialog displays. If the Package does <b>not</b> have any associated MDG Technologies, a message displays confirming that Package registration is complete. Go to step <b>10</b>.</p>	
9	<p>If the Package has one or more associated MDG Technologies, the Register MDG Technology dialog displays, listing the Technologies and prompting you to register (<b>OK</b>) or <b>Ignore</b> all of them.</p> <p>If you want to register some Technologies but not others, click on those you do not want to register, and click on the <b>Remove</b> button for each one in turn.</p> <p>Click on the <b>OK</b> or <b>Ignore</b> button.</p> <p>A message displays confirming that Package and Technology registration is complete.</p>	
10	<p>Click on the <b>OK</b> button.</p> <p>The Registry Browser tab is updated with the newly-added details of the Package and any dependent Packages. You can review the details on the tabs on the lower half of the Reusable Asset Server view.</p>	<a href="#">Browse Assets</a> <sup>[284]</sup>

### Register File as Asset

Step	Action	See also
1	In the <b>Reusable Asset Service</b> view, select the appropriate Registry and Storage.	
2	<p>On the <b>Registry Browser</b> tab, click on the <b>Register</b> button.</p> <p>If the Storage is password protected, a prompt displays for your <b>Complete Access</b> password. Enter this and click on the <b>OK</b> button.</p> <p>The Register Package(s) dialog displays.</p>	<a href="#">Set Up the Asset Service</a> <sup>[293]</sup>

Step	Action	See also
3	If any Packages are listed in the Packages to Register panel, and you do not want to re-register them, clear the checkbox against each Package name.	
4	Click on the <b>Additional Files</b> button. The Select Additional Files dialog displays.	
5	Click on the <b>Add</b> button. A Select screen displays, on which you browse for and click on the required file. You can only select one file at a time on this browser.	
6	Click on the <b>Open</b> button. The Add Comment dialog displays.	
7	Type a brief comment on the nature or purpose of the file in the Registry, and click on the <b>OK</b> button. Focus returns to the Select Additional Files dialog, which now lists the selected file.	
8	Repeat steps 5-7 for each Asset file to register. When you have finished, click on the <b>OK</b> button. The Register Package(s) dialog redisplays.	
9	Click on the <b>Register</b> button. A prompt displays to confirm that you want to register the files.	
10	Click on the <b>Yes</b> button. A Progress dialog displays while the files are registered, followed by a message confirming that the (Package and) File registration is complete.	
11	Click on the <b>OK</b> button to clear the message, and to return focus to the Reusable Asset Service view. You can review the files on the Storage Files tab in the lower half of the view.	<a href="#">Browse Assets</a> <sup>[284]</sup> <a href="#">Storage Files</a> <sup>[290]</sup>

### Learn more

- [Browse Assets](#) <sup>[284]</sup>

#### 3.5.4.1.1 Check Package Dependencies

As you register a Package in the Reusable Asset Service, the system provides a check on whether that Package is **dependent on** any external content; that is, whether it links to any modeling component held in Packages **other than** its own child Packages. Package A is dependent on Package B if Package A contains any of these constructs (or their Tagged Values) that reference elements in Package B:

- Elements
- Attributes
- Operations
- Operation parameters
- Diagrams
- Connectors

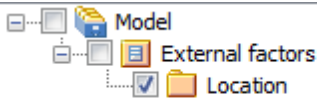

You perform this dependency check as an integral part of the Asset Registration process (specifically, at step 6 of the *Register Package as Asset* process). The check automatically identifies, firstly, the Packages directly needed by the Asset Package, and then any Packages needed by **those** initial Packages, and so on until the needed Packages are not dependent on any other.

In practice, such dependency chains are likely to be quite short. If you know that the original Asset Package is dependent on two other Packages, one of which is subordinate to the other, you can simplify the process further by selecting the Parent or Ancestor package first and thus avoiding the extra steps of selecting the two Packages separately.

**Access**    **Project | Reusable Asset Service > Registry Browser: Register**

#### Check Package Dependencies

Step	Action	See also
1	Select the appropriate Registry, Storage and version of the model Package to register, and provide any appropriate comments or notes.	<a href="#">Register New Assets</a> <sup>[298]</sup> to Step 6.
2	<p>Click on the <b>Check Dependency</b> button.</p> <p>If there are no Packages on which the Asset Package depends, the system sets that Package to <b>Ready</b>. Go to step 6.</p> <p>The Select Needed Package: &lt;dependent package name&gt; dialog displays, showing the model hierarchy containing the Packages needed by the Asset Package. Each needed Package has a selected checkbox against it.</p> <p>If you know that a needed Package is a child or grandchild of another needed Package, click on the checkbox next to the 'higher' Package name so that the child is validated as part of the parent. In this example, if the Asset Package has dependencies on both <b>External factors</b> and <b>Location</b>, click on the <b>External factors</b> check box to register both dependencies as <b>External factors</b>.</p>	

Step	Action	See also
		
3	<p>Click on the <b>OK</b> button.</p> <p>The Register Package(s) dialog updates to show the initial Asset Package status as <b>Ready</b>, and to list the needed Packages each with the status of <b>Pending</b>.</p>	
4	<p>Click on the <b>Check Dependency</b> button again.</p> <p>If there are no Packages on which the needed Package depends, the system sets that Package to <b>Ready</b> and sets the focus on the next <b>Pending</b> Package. If there are no more <b>Pending</b> Packages, go to step 6.</p> <p>If the needed Package is dependent on other Packages, the Select Needed Package: &lt;dependent package name&gt; dialog displays again, showing the model hierarchy containing <b>those</b> Packages, each with a selected checkbox next to it. As in step 2, you can select a 'higher' Package if appropriate.</p>	
5	<p>Click on the <b>OK</b> button.</p> <p>The Register Package(s) dialog updates to show the first needed Package status as <b>Ready</b>, and to list any further needed Packages with the status of <b>Pending</b>.</p>	
6	<p>If there are further needed Packages in the chain, repeat step 4. The system automatically identifies them and lists them for validation as in step 5.</p> <p>Otherwise the system sets the final needed Package status to <b>Ready</b> and you can continue to register files and MDG Technologies.</p>	<a href="#">Register New Assets</a> <sup>[298]</sup> from Step 7.

### Notes

- A Package with status **Pending** cannot be registered; only Packages with status **Ready** can be registered
- If you are certain that there are no parent-child relationships between the needed Packages, you can work through these steps quickly by just clicking on the **Check Dependency** and **OK** buttons alternately until all Packages in the **Package to Register** list have the status **Ready**
- The system does not allow you to register an Asset Package that has dependencies on its own parent or grandparent Package; such dependencies would cause the Asset Package to be registered twice - by itself and as part of the parent Package - creating the risk of differences developing between the two instances

### 3.5.4.2 Update an Asset

Over time, you might need to revise the contents of the Registry. Such updates can include:

- Registering additional Asset Packages and files
- Registering a new version of an Asset Package
- Registering a new edition of a Storage file
- Deleting an Asset Package
- Deleting a Storage file
- Changing the details of a Storage
- Deleting an entire Storage and the assets and files within it

**Access** [Project | Reusable Asset Service > Registry Browser](#)

#### Update Tasks

Task	Detail	See also
<b>Register new Asset Packages and Storage files</b>	You can add further Asset Packages and files to a Storage at any time.	
<b>Register a new version of an Asset Package</b>	<p>You register a <b>new version</b> of an Asset Package as if it were a new Asset. In the <b>Current Version</b> field on the Register Package(s) dialog, you enter a different number or reference to that assigned to the currently-registered asset.</p> <p>You can overwrite an existing Asset Package under the <b>same</b> version number only if the Storage has <b>Draft</b> status. If the Storage has <b>Complete</b> status, you cannot overwrite the existing Asset Package under the same version number. To replace the <b>current</b> version, you must delete the Asset from the Storage (see below) and register the Package again.</p>	<a href="#">Register New Asset</a> <sup>[298]</sup>
<b>Delete Asset Package from Storage</b>	<p>Click on the Package name in the Registry Browser tab and either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>Delete</b> button or</li> <li>• Right-click and select the <b>Delete From Registry</b> menu option</li> </ul> <p>In either case a short submenu displays, prompting you to select to delete:</p> <ul style="list-style-type: none"> <li>• The Asset Package only, or</li> <li>• The Asset Package and the Packages on which it is directly or indirectly dependant</li> </ul> <p>When you select the appropriate option, a prompt displays for you to confirm the deletion.</p> <p>Click on the <b>Yes</b> button. A message displays to confirm that the</p>

## 3.6 Team Development

Using Enterprise Architect, you can develop a project across a team of people so that each person can access the latest data without the risk of damaging or losing that data. The system provides a number of facilities for managing, accessing and discussing the model data within the team.

### Making project data available in a distributed environment

Enterprise Architect offers a diverse set of functionality designed specifically for sharing projects in team-based and distributed development environments; for example: **network deployment** of model repositories, **replication** and **XMI Import/Export**.

### Applying security to the model

**User Security** is a means of improving collaborative design and development by preventing concurrent editing, and limiting the possibility of inadvertent model changes by users not designated as model authors.

### Using an internal discussion forum

The **Project Team Review** facility is a **discussion forum** within your development team community to discuss the development and progress of a project. You can link to the model elements that are the subject of a post thread in the forum.

Similarly, you can develop a discussion about a specific element in the model as a component of the element, using the **Element Discussions** facility.

### Building company policy and project development guidelines into the project

You can create **workflow scripts** that provide a robust approach to applying company policy and strengthening project development guidelines, by validating against the policy and procedures within the model itself.

### Standardizing and re-using project data

You can import and export **Reference data** (including Glossary and Issue information) from .XML files of another iteration of the **same** model, or of a **different** model.

<b>Project</b>	<ul style="list-style-type: none"> <li>• Right-click on the package name in the Project Browser and select the <b>Contents   Reload Current Package</b> context menu option</li> <li>• Select the <b>File   Reload Project</b> menu option</li> <li>• Select the  (<b>Reload Project</b>) icon in the <b>Project</b> toolbar</li> <li>• Press ( <b>Ctrl+Shift+F11</b> )</li> <li>• Close the project and reopen it</li> </ul>	<a href="#">Contents Submenu</a> <sup>[655]</sup> <a href="#">File Menu</a> <sup>[79]</sup> <a href="#">Project Toolbar</a> <sup>[136]</sup>

Refresh	Detail	See also
<b>Diagram</b>	<ul style="list-style-type: none"> <li>Select the <b>Window   Reload Current View</b> menu option</li> <li>Right-click on the opened diagram tab in the diagram view, and select the <b>Reload &lt;diagram name&gt;</b> context menu option</li> </ul>	<a href="#">Window Menu</a> <sup>[127]</sup> <a href="#">Diagram Tabs</a> <sup>[790]</sup>

### 3.6.1.2 Share Projects on Network Drive

The easiest way to share a project amongst a work group of developers and analysts is to place the project file on a shared network drive, to which people connect from their workstations.

Individual developers and analysts can then open and work on the project concurrently.

Network Issues	See also
<p>Enterprise Architect accepts a number of concurrent connections without issue; however:</p> <ul style="list-style-type: none"> <li>There can be occasional 'lock-outs' when one user tries to access or update something another user is in the process of modifying</li> <li>Changes to the Project Browser (and other project views) are not automatically updated; to compensate for this, users must occasionally reload their project to see changes made by other users</li> <li>If two or more people work on the same diagram concurrently, unexpected results can occur; it is best to allow only one analyst to work on a diagram at a time</li> <li>(.EAP files only) If a user's machine crashes, the network suffers an outage or a machine is turned off unexpectedly, the project file might require repair to compensate for the sudden inconsistency; a repair facility is provided (<b>Tools   Data Management   Manage .EAP File   Repair .EAP File</b>) to carry out this task</li> </ul>	<a href="#">Refresh Model View</a> <sup>[308]</sup>  <a href="#">Repair a Project</a> <sup>[602]</sup>

#### Notes

- Firebird-based projects (.feap files) are not suitable for sharing over a network

### 3.6.1.3 Distributed Development

Enterprise Architect supports distributed development using two different techniques.

Topic	Detail	See also
<b>Replication</b>	Enables geographically separated analysts to update and modify parts of the model in replicas, then merge these back together at a central location.	<a href="#">Replication</a> <sup>[310]</sup>
<b>XMI Import/Export</b>	Use XMI-based import/export to export discrete packages to XML to share among the development team; this has several	<a href="#">Import/Export</a> <sup>[473]</sup>

Topic	Detail	See also
	<p>benefits over replication:</p> <ul style="list-style-type: none"> <li>You can assemble a model from only the parts necessary to get your job done</li> <li>You can assemble a full model if required</li> <li>You can assemble a model from different package versions for different purposes (such as customer visible, internal release only)</li> <li>You can roll-back parts of a model as required</li> <li>There is less chance of 'collisions' between developers if each works on a discrete package</li> <li>The process is controllable using a version control system, or through package control</li> </ul> <p>XMI based import/export is UML1.3 / XMI1.1 compliant; you can also write XML based tools to manipulate and extract information from XML files to enhance the development process.</p> <p>XMI-based Import/Export is accessed through <b>Project   Model Import/Export</b>.</p>	<p><a href="#">Version Control</a> <sup>[383]</sup></p> <p><a href="#">Controlled Packages</a> <sup>[484]</sup></p> <p><a href="#">XMI Import Export Options</a> <sup>[90]</sup></p>

### 3.6.1.4 Replication

Apart from sharing Enterprise Architect projects in real time over a network, you can also share projects using replication.

#### Guide

Topic	Detail	See also
<b>Replication</b>	<p>Replication is a powerful means of sharing projects between isolated or mobile users; it enables different users to work independently of one another, and to merge their changes at a later time.</p> <p>In Replication:</p> <ul style="list-style-type: none"> <li>A project is converted to a design master, then replicas are made of the master</li> <li>Users take the replicas away, modify the project, then bring their replicas back to be synchronized with the master file</li> </ul>	
<b>Use Replication</b>	<p>To use replication</p> <ol style="list-style-type: none"> <li>Convert the base project to a design master.</li> <li>Create replicas from the design master.</li> <li>Take the replica away and work on it as required, then bring it back for synchronization with the design master.</li> <li>Synchronize the replicas, during which all changes to both the</li> </ol>	<p><a href="#">Design Master</a> <sup>[311]</sup></p> <p><a href="#">Create Replicas</a> <sup>[312]</sup></p> <p><a href="#">Synchronize Replicas</a> <sup>[313]</sup></p>

Topic	Detail	See also
	master and the replica are propagated in both directions, so they both finally contain the same information.	
<b>Enterprise Architect Merge Rules</b>	<p>Enterprise Architect follows these rules in merging:</p> <ul style="list-style-type: none"> <li>• Additions are cumulative; that is, two replicas each creating three new Classes result in six new Classes after merging</li> <li>• Deletions prevail over modifications; if one replica changes a Class name and other deletes the Class, merging replicas results in both files losing the Class</li> </ul> <p>Conflicting modifications appear in the Resolve Replication Conflicts dialog.</p>	<a href="#">Resolve Conflicts</a> <sup>[315]</sup>
<b>Upgrades and Replicas</b>	When you upgrade your version of Enterprise Architect, you must not open a replica until you have opened the design master and then synchronized the replicas with the master; you cannot directly upgrade a replica.	<a href="#">Upgrade Replicas</a> <sup>[315]</sup>
<b>Avoid Change Collisions</b>	<p>If two or more people make changes to the same element, Enterprise Architect arbitrarily overwrites one person's change with the other's; to avoid this, different users should work on different packages.</p> <p>However, since Enterprise Architect does not enforce this rule, it is possible for users' work to conflict; to minimize difficulties, please note the following guidelines:</p> <ul style="list-style-type: none"> <li>• If users are likely to have worked in the same area of the model, they should both witness the synchronization and confirm that they are happy with the net result</li> <li>• If small pieces of information have been lost, they should be typed into one of the merged models after synchronization</li> <li>• If a large piece of information has been lost (for example, an overwritten large Class note) use the Resolve Replication Conflicts dialog</li> </ul>	<a href="#">Resolve Conflicts</a> <sup>[315]</sup>
<b>Disable or Remove Replication Features</b>	If you have converted a project to a design master but now want to disable the replication features, you can remove Replication; ensure that you back up all your files first.	<a href="#">Remove Replication</a> <sup>[313]</sup>

### 3.6.1.4.1 Design Masters

A design master is the first converted Enterprise Architect project that supports replication. You create the master project from which you create replicas that can be modified independently of the master project and re-merged later.

**Access** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Make Design Master](#)

**Create a design master**

Step	Action
1	Take a back-up of the required Enterprise Architect project.
2	Select the project in the Project Browser.
3	Select the <b>Make Design Master</b> menu option and follow the on-screen instructions.

**Learn more**

- [Create Replicas](#) <sup>[312]</sup>

**3.6.1.4.2 Create Replicas**

A replica is one of several copies of the design master of an Enterprise Architect project. You create the copy of the master project for you or another user to modify independently and re-merge later.

**Access**   **Tools | Data Management | Manage .EAP File | Create New Replica**

**Create a replica**

Step	Action
1	First create a design master, then select the <b>Create New Replica</b> menu option and follow the on-screen instructions.
2	Edit the replica over time and, when required, return the file for merging with the design master.

**Notes**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Replicas** permission to create a replica

**Learn more**

- [Design Masters](#) <sup>[311]</sup>
- [Manage Replicas User Permissions](#) <sup>[329]</sup>

### 3.6.1.4.3 Synchronize Replicas

Synchronizing replicas combines the changes made to each file. You can:

- Merge the changes made to each replica with the design master, so that a new set of replicas with all changes can be generated and distributed
- Combine the changes made to two replicas, should it be necessary for two team members to combine their work

**Access** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Synchronize Replicas](#)

#### Synchronize replicas

Step	Action
1	Open the design master project file (or the first required replica).
2	Select the <b>Synchronize Replicas</b> menu option.
3	Locate and select the (second) required replica to merge the open project and the replica.

#### Notes

- Information is copied both ways, including deletes, updates and inserts; both projects end up containing identical information
- If this process generates 'conflicting changes' errors, you should review and, if necessary, resolve these conflicts
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Replicas** permission to create a replica

#### Learn more

- [Resolve Conflicts](#) <sup>[315]</sup>
- [Manage Replicas User Permissions](#) <sup>[329]</sup>

### 3.6.1.4.4 Remove Replication

Replication makes many changes to the database structure of your model, so the model file becomes considerably larger with additional information; you might, therefore, decide not to use the replication feature any more.

**Access** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Remove Replication](#)

#### Remove replication from your model

Step	Action
1	Ensure that you have open a temporary repository (not the one having replication removed) - the menu option is not available if no repository is open.
2	Select the <b>Remove Replication</b> menu option. The Remove Replication Wizard displays.
3	Enter the full path and file name of the project to have replication removed. Click on the <b>Next</b> button.
4	Enter the full path and file name of the base Enterprise Architect model (with no replication) to act as template. Click on the <b>Next</b> button.
5	Enter the full path and required file name for the output file. Click on the <b>Next</b> button.
6	Select whether to have a log file created and, if so, enter a file name for the log file.
7	Click on the <b>Run</b> button to begin removing replication. Enterprise Architect creates a new project containing all the model information. Your model has now had replication removed, and should be considerably smaller.

### Notes

- You cannot remove replication from a model with Auditing enabled - if you want to remove replication:
  - Disable Auditing
  - If prompted to do so, allow Enterprise Architect to roll back the database version
  - Remove replication

### Learn more

- [Auditing](#)<sup>[446]</sup>
- [Auditing Settings](#)<sup>[448]</sup>

### 3.6.1.4.5 Upgrade Replicas

A new release of Enterprise Architect might contain changes to the underlying project structure, such as more tables or changed queries. If you use Replication, you must take care with your upgrade.

#### Considerations

Consideration	Detail	See also
<b>Open Design Master Project first</b>	After installing the new version of Enterprise Architect, it is very important that you open the <i>design master</i> before opening any of the replicas with the updated version.	<a href="#">Design Masters</a> 
<b>Changes to the database design</b>	Changes to the database design in a replicated project can ONLY be done to the design master; trying to update a replica at best does nothing, and at worst causes the update of the master to fail.	
<b>Propagate Changes</b>	Design changes are propagated through to the replicas the next time the replicas are synchronized with the master.	<a href="#">Synchronize Replicas</a> 
<b>Alternatively</b>	One other strategy is to remove replication from a copy of the replica set, upgrade that project and convert it into a new design master from which new replicas are created.	<a href="#">Remove Replication</a> 

### 3.6.1.4.6 Resolve Conflicts

If two or more people each work on the same model object in their respective replicas between synchronizations, the replication engine has problems in resolving which change is the master. You need to Select which of two conflicting changes you should save to the Design Master and/or replicas, where a substantial piece of information has been overridden by a user and you want to retrieve it.

Consideration	Detail	See also
<b>Avoid the problem</b>	Ensure that each team member always works in a separate area of the model within their replica.	
<b>Check for conflicts</b>	After synchronizing replicas, open the Resolve Conflicts dialog (see below this table) and check if there were any conflicts.	
<b>Response to conflicts</b>	When a project record has been modified in different ways by different users, the replication engine selects one of the conflicting values based on rules within the JET replication manager.  However, the replication engine stores the discarded changes and flags the conflict on the Resolve Conflicts dialog so that you can choose to roll in the discarded change instead.	

Consideration	Detail	See also
	<p>Normally it is not necessary or desirable to examine conflicts, since they represent relatively inconsequential pieces of information that can very easily be modified through the normal Enterprise Architect interface; for example, by moving a diagram element.</p> <p>The only case in which the Resolve Conflicts dialog should be used is where a substantial piece of information has been overridden by a user, and you want to retrieve it.</p>	

**Access** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Resolve Replication Conflicts](#)

#### Resolve conflicts in changes to the same model object in two separate replicas

Step	Action
1	Synchronize a replica with the Design Master, and display the Resolve Conflicts dialog.
2	In the Table with Conflicts list, click on the entry that is likely to contain the lost information.
3	<p>Click on each entry in the Conflicting Records list.</p> <p>When the lost information appears in the Conflict Details list, click on the <b>Overwrite with Conflict</b> button.</p>
4	<p>In the Conflicting Records list, you can also copy each Row ID to the clipboard by right-clicking on the row and selecting the <b>Copy to Clipboard</b> menu option.</p> <p>You can locate the object that is in conflict in the Project Browser or diagrams, by right-clicking on it and selecting the <b>Find in Project Browser</b> or <b>Find in Diagrams</b> context menu option.</p>

### 3.6.2 User Security

**User Security** in Enterprise Architect is a means of blocking the use of model **update functions** across the model by means of **access permissions** for each function, and protecting specific elements and diagrams from change by means of **user locks**. The intent is not to prevent access to information, but to prevent inadvertent changes to data.

Security is an **optional** facility in the system. If required it is **enabled** by the Security Administrator, who at the same time sets the security **policy** to either:

- **Require User Lock to Edit** - the whole project is blocked against editing and the user locks an object to open it and edit it, or
- **User/group locking** - the whole project is open for editing and the user locks an object to protect it from being edited

The Security Administrator also sets up the user and group **IDs and passwords**, which every user requires

to log in to the model when security is enabled. Access permissions are assigned to the user IDs to determine which update functions the user can apply. The users can still **view** any information in the project. If security is **not** enabled in the project, no login is required and users do not have to have access permissions to perform update functions.

## Access   **Project | Security**

### Security Operations

Operations For	Detail	See also
<b>Administrators</b>	<p>A number of security tasks can be performed only by users with Administrative permissions to the security operations. The person who <b>enables</b> security receives online instructions to login as <b>Admin</b>. This login ID automatically:</p> <ul style="list-style-type: none"> <li>• Has access permissions to perform all security operations</li> <li>• Is a member of an Administrators user group, which also has access permissions to perform all security operations</li> </ul>	<p><a href="#">Enable/Disable Security</a> <sup>[318]</sup></p> <p><a href="#">Set Security Policy</a> <sup>[319]</sup></p> <p><a href="#">Maintain Users</a> <sup>[323]</sup></p> <p><a href="#">Import User IDs From Active Directory</a> <sup>[324]</sup></p> <p><a href="#">Assign User To Groups</a> <sup>[326]</sup></p> <p><a href="#">Set Up Single Permissions</a> <sup>[327]</sup></p> <p><a href="#">View All User Permissions</a> <sup>[328]</sup></p> <p><a href="#">Maintain Groups</a> <sup>[329]</sup></p> <p><a href="#">Set Group Permissions</a> <sup>[329]</sup></p> <p><a href="#">View and Manage Locks</a> <sup>[332]</sup></p> <p><a href="#">Password Encryption</a> <sup>[333]</sup></p> <p><a href="#">Change Password</a> <sup>[334]</sup> (of any user)</p>
<b>Users</b>	<p>Other security tasks can be performed by users who do not have Administrative rights, on work performed under their own user ID. These users must still have the appropriate access permissions to perform many of these 'user' tasks.</p>	<p><a href="#">Lock Model Elements</a> <sup>[336]</sup></p> <p><a href="#">Lock Packages</a> <sup>[337]</sup></p> <p><a href="#">Apply a User Lock</a> <sup>[339]</sup></p> <p><a href="#">Identify Who Has Locked An Object</a> <sup>[342]</sup></p> <p><a href="#">Locked Element Indicators</a> <sup>[340]</sup></p> <p><a href="#">Manage Your Own Locks</a> <sup>[342]</sup></p> <p><a href="#">Change Password</a> <sup>[334]</sup> (your own password)</p>

### Notes

- User Security can be enabled in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

### 3.6.2.1 Enable/Disable Security

User security is not automatically enabled on the system. If your organization requires the security facilities, the Security Administrator **enables** them using an **authorization key** obtained from the Sparx Systems website. Similarly, if security facilities are no longer required, the Security Administrator explicitly **disables** security, again using the authorization key.

**Access**    **Project | Security | Enable Security**

### Enable and Disable User Security

Step	Action	See also
1	<p>Obtain the authorization key from the Sparx Systems website on:</p> <ul style="list-style-type: none"> <li>the Team Modeling Resources section (Trial User) or</li> <li>the Registered Users section (Registered User; you must also have your Registered Users login and password)</li> </ul> <p>The two authorization keys are not interchangeable - the Trial User key does not work on a registered user installation.</p>	<a href="#">Team Modeling Resources web pages</a> <a href="#">Registered Users web pages</a>
2	<p>In Enterprise Architect, select the <b>Enable Security</b> menu option.</p> <p>The Enter authorization dialog displays.</p>	
3	<p>In the <b>Enter authorization key</b> field, type the authorization key from the Sparx Systems website.</p>	
4	<p>If required, select the <b>Automatically apply Exclusive Edit Locks to diagrams</b> checkbox.</p> <p>In standard (<i>User/Group Locking</i>) mode, this option blocks multiple users from simultaneously attempting to modify the same diagram (see <i>Notes</i> below).</p> <p>This option is ignored in <i>Require User Lock to Edit</i> security mode.</p>	<a href="#">Set Security Policy</a> <sup>[319]</sup>
5	<p>Click on the <b>OK</b> button.</p> <p>Security is enabled, and an <b>Admin</b> user and <b>Administrators</b> user group are created, both with all access permissions; the Admin user has the password of <b>password</b>.</p>	<a href="#">List of Available Permissions</a> <sup>[329]</sup>
6	<p>Select the <b>Project   Security   Login as Another User</b> menu option, and</p>	

Step	Action	See also
	log in as <b>Admin</b> with the initial password of <b>password</b> . It is recommended that you change the <b>Admin</b> password immediately.	<a href="#">Change Password</a> [334]
7	Set up users and permissions as required.	<a href="#">Maintain Groups</a> [320] <a href="#">Set Group Permissions</a> [321] <a href="#">Maintain Users</a> [323] <a href="#">Set Up Single Permissions</a> [327] <a href="#">Assign User To Groups</a> [326]

### Notes

- Once security has been enabled, you must have **Security - Enable/Disable** permission to turn it off - the initial **Admin** administrator and **Administrators** group automatically have this permission; the system prompts you to log off the project and log on again, but this is not strictly necessary
- If you re-enable security, be aware that any changes you have made to the **Admin** user (password and reduced access permissions) are reset to **password** and full access; similarly, the **Administrators** user group is reinstated with full access permissions
- The **Automatically apply Exclusive Edit Locks to diagrams** option is not displayed when disabling security, therefore to toggle the setting whilst security is enabled you must disable security and re-enable it; security settings (users, groups and permissions) and locks on elements, are **not** affected by this action
- If the **Automatically apply Exclusive Edit Locks to diagrams** option is selected, as a user modifies a diagram the system automatically applies a User Lock to the diagram, preventing any other user from modifying it

It is creating difference between the database and buffer versions of the diagram that triggers the temporary lock, and elimination of difference that releases the lock; therefore, the system releases the lock when:

- The user saves the changes to the diagram, with the **Save** icon or keyboard keys
- The user undoes the last remaining action in the **Undo** list
- The user saves or discards changes via the system prompt when they close the diagram

If the diagram already has a User Lock or Group Lock that does not exclude the current user, this lock is set aside and saved when the temporary User Lock is applied; when the temporary User Lock is released, the pre-existing lock is restored

### 3.6.2.2 Set Security Policy

The security policy determines how security mechanisms are applied and interpreted on the system. There are two possible security policies in Enterprise Architect:

- User/Group Locking** mode - All elements and diagrams are considered unlocked and anyone can edit any part of the model; however, when you edit a diagram, package or element, you lock the element or set of elements at either the user level or group level

This mode is good for cooperative work groups where there is a solid understanding of who is working on which part of the model, and locking is used mainly to prevent further changes or to limit who has write access to a part of the model

- **Require User Lock to Edit** mode - More rigorous: the model is read-only, and everything is locked so that nobody can edit anything unless they explicitly check out the object with a user lock; a single 'check out' function operates on a diagram to check out the diagram and all contained elements in one go.

There are also functions on the context (right-click) menus of packages, diagrams and elements in the Project Browser to apply a user lock when this mode is in use

You would use this mode when there is a strict requirement to ensure only one person can edit a resource at one time; this is suitable for much larger projects where there might be less communication between users

**Access** **Project | Security | Require User Lock to Edit** (select for **Require User Lock to Edit** mode, **deselect for User/Group Locking** mode)

#### Notes

- Only the Admin Security Administrator, with **Admin** permissions, is able to set the security policy applied
- When you add new elements in **User/Group Locking** mode (elements editable by default), no user lock is created automatically for the newly created element
- When you add new elements in **Require User Lock to Edit** mode (elements locked by default), a user lock is created on the new element to enable instant editing

### 3.6.2.3 Maintain Groups

Whilst you can apply access permissions to each user individually, it is easier and more convenient to assign all users with the same access permission(s) to a **security group**, and assign the permissions to all the members of that group in a **single** action.

The security group also acts as a **mailbox** for Model Mail, where the group name can be selected as the addressee; when an internal mail is sent to the group, all members of the group receive that email in their Model Mail window. The group name can act as either:

- A mail **list**, in which case each group member receives their **own** copy of the message, or
- A mail **box**, in which case the email is a **single entity** and the group members do not receive separate instances of it; if one group member responds to or deletes the email, the other group members see that action as if they had performed it themselves

**Access** **Project | Security | Manage Groups**

#### Set up a security group

Field/ Button	Action	See also
<b>New</b>	Click on this button to clear the fields ready to define a new group.	
<b>Group</b>	Type the security group name.	

Field/ Button	Action	See also
<b>Name</b>		
<b>Description</b>	Type a description of the group.	
<b>Save</b>	Click on this button to save the group definition and add it to the <b>Groups</b> list.	
<b>Set Group Permissions</b>	Click on this button to immediately assign group access permissions to the group.	<a href="#">Set Group Permissions</a> [321]
<b>Shared Mail</b>	To make the group name act as a mail <b>box</b> , select this checkbox against the name in the list.  To use the group name as a mail <b>list</b> , leave the checkbox unselected.	<a href="#">Model Mail</a> [565]
<b>Close</b>	Click on this button to close the dialog.	

### Notes

- You must have **Security - Manage Users** permission to manage user groups; the initial **Admin** administrator and **Administrators** group automatically have this permission
- You do not define groups as group logins with passwords; if you intend to use a group login, you can define a single-user login and password that all group members use (that is, Enterprise Architect allows multiple logins under one user ID)
- Emails already sent to a group as a mail list and those sent to a group as a mailbox cannot be interchanged; if you change the status of the **Shared Mail** checkbox, the only way to change the distribution of past emails is to forward them to the group name again
- You can subsequently edit the group name; changes are automatically reflected in the internal Model Mail mail list or mail box

### Learn more

- [Set Group Permissions](#) [321]
- [Maintain Users](#) [323]
- [Assign User To Groups](#) [326]
- [List of Available Permissions](#) [329]

### 3.6.2.4 Set Group Permissions

Once you have set up some user groups, you can assign access permissions to each group to define what update functions in the system the group members have access to.

Access    **Project | Security | Manage Groups**

**Assign access permissions to a security group**

Step	Action	See also
1	Select the user group from the <b>Groups</b> list, so that the name displays in the <b>Group Name</b> field.	
2	Click on the <b>Set Group Permissions</b> button.  The Group Permissions dialog displays, listing all available access permissions.	<a href="#">List of Available Permissions</a> <sup>[329]</sup>
3	Scroll through the list and select the checkbox against any access permissions you want to assign to the members of this group. You can also: <ul style="list-style-type: none"> <li>Click on the <b>Select All</b> button, then <b>deselect</b> the checkbox against any access permissions you do <b>not</b> want to assign to the members of this group or</li> <li>Click on the <b>Deselect All</b> button to clear all selected permissions, then select the checkbox against any you want to keep selected</li> </ul>	
4	Click on the <b>OK</b> button to assign the permissions.  All of the users assigned to this group share in this set of permissions.	
5	Click on the <b>Close</b> button.	

**Notes**

- You must have **Security - Manage Users** permission to assign permissions to user groups; the initial **Admin** administrator and **Administrators** group automatically have this permission
- You can transport the group permissions between models as Reference Data, using the **Project | Model Import/Export | Export Reference Data** and **Import Reference Data** options

**Learn more**

- [Maintain Groups](#)<sup>[320]</sup>
- [Assign User To Groups](#)<sup>[326]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 3.6.2.5 Maintain Users

When you have enabled security, you create the user definition for each user that has access to the model. The user definition initially consists of the user ID and the user's password. You can either set up the user manually, as below, or import the user IDs from a Windows Active Directory.

**Access**   **Project | Security | Manage Users: New**

#### Set up a user for your model

Step	Action	See also
1	<p>In the:</p> <ul style="list-style-type: none"> <li>• <b>Login</b> field, type the user ID</li> <li>• <b>Firstname</b> field, type the user's first name</li> <li>• <b>Surname</b> field, type the user's last name</li> </ul> <p>Optionally, in the <b>Department</b> field, type the name of the user's department.</p>	
2	<p>Click on the <b>Save</b> button, and then click on the <b>Change Password</b> button.</p> <p>The Change Password dialog displays.</p>	
3	<p>In the <b>New password</b> field, type the user's password.</p> <p>This can be any number of characters in length.</p> <p>(As this is a new user, the <b>Enter old password</b> field is disabled.)</p>	
4	<p>In the <b>Retype new</b> field, type the user's password again, for confirmation.</p>	
5	<p>Click on the <b>OK</b> button.</p> <p>A <i>Password Changed</i> message displays.</p> <p>Click on the <b>OK</b> button to return to the Security Users dialog.</p>	
6	<p>The user definition is complete. You can now either:</p> <ul style="list-style-type: none"> <li>• Assign the user to an existing user group</li> <li>• Assign access permissions to update functions for the new user</li> <li>• Click on the <b>New</b> button to add another user, or</li> <li>• Click on the <b>Close</b> button to exit the Security Users dialog</li> </ul>	<p><a href="#">Assign User IDs to Groups</a> <sup>[326]</sup></p> <p><a href="#">Single Permissions</a> <sup>[327]</sup></p>

#### Notes

- You must have **Security - Manage Users** permission to maintain users; the initial **Admin** administrator and **Administrators** group automatically have this permission
- You can transport the user definitions between models as Reference Data, using the **Project | Model Import/Export | Export Reference Data** and **Import Reference Data** options

#### Learn more

- [Import User IDs from a Windows Active Directory](#)<sup>[324]</sup>

- [Import Reference Data](#)<sup>[380]</sup>

### 3.6.2.6 Import User IDs From Active Directory

Whilst you can define each of your model users individually and specifically for Enterprise Architect security, you can also import your **Windows user IDs** from Windows Active Directory and use those as the security user IDs with **Windows Authentication**. If you set up your security user IDs in this way, when a user opens the model the system checks the users database for their Windows ID and, if it matches, automatically logs the user in without prompting for a password.

As a pre-requisite, you create an appropriate user group into which to import the user IDs; you can also use this to assign appropriate permissions to the user IDs as a whole.

**Access**    **Project | Security | Manage Users**

#### Import user IDs from Windows Active Directory

Step	Action	See also
1	On the Security Users dialog do not complete any user details fields. Instead, select the <b>Accept Windows Authentication</b> checkbox and click on the <b>Import</b> button. The Import Users dialog displays.	
2	Click on the down arrow in the <b>Security Group</b> field and select the appropriate security group for the imported user IDs.	
3	Click on the <b>Add</b> button. The Select Users dialog displays.	
4	If the <b>Select this object type</b> field has not defaulted to <b>Users</b> : <ol style="list-style-type: none"> <li>1. Click on the <b>Object Types</b> button; the Object Types dialog displays</li> <li>2. Select the checkbox against <b>Users</b> (the type of object to import from the Active Directory).</li> <li>3. Click on the <b>OK</b> button to return to the Select Users dialog.</li> </ol>	
5	Click on the <b>Locations</b> button.	

Step	Action	See also
	The Locations dialog displays.	
6	Browse for and select the location to import from within the Active Directory. Click on the <b>OK</b> button to return to the Select Users dialog.	
7	In the <b>Enter the object names to select</b> field, either: <ul style="list-style-type: none"> <li>Type in the user IDs individually (click on the <b>examples</b> link to see examples of the correct formats) and go to <b>step 13</b>, or</li> <li>Click on the <b>Advanced</b> button to search for IDs; the Select Users dialog redisplay shows a Common Queries tab</li> </ul>	
8	In the <b>Name</b> and <b>Description</b> fields, type any characters or text that help identify the IDs you are searching for.	
9	In the <b>Starts with</b> field, click on the drop-down arrow and, if necessary, select a different qualifier.	
10	Optionally, to further filter the IDs to search for, select the <b>Disabled accounts</b> or <b>Non-expiring password</b> checkboxes, and/or select a value in the <b>Days since last logon</b> field.	
11	Click on the <b>Find Now</b> button to initiate the search, and to display a list of IDs in the bottom panel of the dialog.  You can vary the types of information shown here by clicking on the <b>Columns</b> button and selecting the column headings to display, then dragging the column titles into the sequence you prefer.	
12	When you have identified the IDs to import, click on a required ID (or press <b>(Ctrl)</b> or <b>(Shift)</b> while you click to select several) and click on the <b>OK</b> button.  The Select Users dialog redisplay, with the selected ID or IDs listed in the <b>Enter the object names to select</b> field.	
13	Click on the <b>OK</b> button to redisplay the Import Users dialog with the selected users' names listed in the Users panel.	
14	Click on the <b>Import</b> button to add the user IDs to the Security Users dialog.	
15	Click on a user ID to populate the dialog fields with the user ID details.  Optionally, you can start to set group membership and/or single permissions.	<a href="#">Group Membership</a> 326

Step	Action	See also
		<a href="#">Set Single Permissions</a> <sup>327</sup>

### Notes

- You must have **Security - Manage Users** permission to maintain users; the initial **Admin** administrator and **Administrators** group automatically have this permission
- As a security measure, the Windows Authentication is automatically deactivated if the project file is moved to a different location; once the file has been relocated, you can toggle the **Accept Windows Authentication** checkbox to reactivate Windows Authentication.
- Enterprise Architect generates random passwords for Windows user IDs; however, if necessary you can assign a new password to an imported user ID

- [Change Password](#) <sup>334</sup>

## 3.6.2.7 Assign User To Groups

Once you have created your user IDs and the security groups for assigning sets of access permissions to users, you can **assign each user ID** to the **security group or groups** that define the access permissions needed by that user. A user can belong to more than one security group and also have individual access permissions, appropriate to the work that they perform.

**Access**   **Project | Security | Manage Users**

### Assign a user to user groups

Step	Action	See also
1	On the Security Users dialog, select the user ID in the <b>Users</b> list so that the details display in the User Details panel.  Click on the <b>Group Membership</b> button. The User Groups dialog displays, listing the security groups that exist in the project.	
2	Select the checkbox against each security group that this user belongs to. If you select a group by accident, deselect the checkbox against it.	
3	Click on the <b>OK</b> button to assign the user to the selected groups.	
4	On the Security Users dialog either select another user to assign to security groups, or	

Step	Action	See also
	click on the <b>Close</b> button.	

#### Notes

- To assign users to groups, you must have **Security - Manage Users** permission; the initial **Admin** administrator and **Administrators** group automatically have this permission

#### Learn more

- [Maintain Groups](#) <sup>[320]</sup>
- [List of Available Permissions](#) <sup>[329]</sup>
- [Set Up Single Permissions](#) <sup>[327]</sup>

### 3.6.2.8 Set Up Single Permissions

A user commonly belongs to one or more work groups that give that user group permissions to use update facilities in various areas of the system. You can also assign additional, individual user permissions to that user ID.

**Access**   **Project | Security | Manage Users**

#### Set up single permissions for a user

Step	Action	See also
1	On the Security Users dialog, select the user ID in the <b>Users</b> list so that the details display in the User Details panel.  Click on the <b>Single Permissions</b> button.  The User Permissions dialog displays.	
2	Scroll through the list and select the checkbox against any access permissions you want to assign to this user ID. You can also: <ul style="list-style-type: none"> <li>Click on the <b>Select All</b> button, then <b>deselect</b> the checkbox against any access permissions you do <b>not</b> want to assign to this user, or</li> <li>Click on the <b>Deselect All</b> button to clear all selected permissions, then select the checkbox against any you want to keep selected</li> </ul>	<a href="#">List of Available Permissions</a> <sup>[329]</sup>
3	Click on the <b>OK</b> button to assign the selected access permissions to the user.	
4	Click on the <b>Close</b> button.	

**Notes**

- You must have **Security - Manage Users** permission to assign permissions to users; the initial **Admin** administrator and **Administrators** group automatically have this permission
- A user's total permissions are those granted by Group Membership plus those granted by specific permission assignment
- You can transport the user permissions between models as Reference Data, using the **Project | Model Import/Export | Export Reference Data** and **Import Reference Data** options

**Learn more**

- [Maintain Groups](#)<sup>[320]</sup>
- [Assign User To Groups](#)<sup>[326]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

**3.6.2.9 View All User Permissions**

When a user has been set up on the system with their appropriate access permissions, you can periodically monitor their list of permissions to verify what they are able to do and check that their profile is up to date. The access permissions shown are derived from their individual profile and from their membership of security groups.

**Access**   **Project | Security | Manage Users**

**Display the permissions assigned to a user ID**

Step	Action	See also
1	On the Security Users dialog, select the user ID in the <b>Users</b> list so that the details display in the User Details panel.	
2	Click on the <b>View All</b> button.  The All user permissions dialog displays, listing all permissions available on the system.	
3	Scroll through the list. The user has all access permissions for which the checkbox is selected, and does not have the permissions for which the checkbox is clear.	

**Notes**

- You must have **Security - Manage Users** permission to maintain users; the initial **Admin** administrator and **Administrators** group automatically have this permission
- You can select and deselect checkboxes on the All user permissions dialog, but you cannot save these changes; if you want to edit the user's access permissions, click on the **Cancel** button and on the **Single Permissions** button

Learn more

- [Set Up Single Permissions](#)<sup>[327]</sup>

**3.6.2.10 List of Available Permissions**

In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions, if security is enabled, users can update information if they have the appropriate access permissions for the data update tasks for that type of data. The tasks that a user can perform with each access permission are listed below.

Some permissions take precedence over others. For example, if a user has **Use Version Control** permission, they can modify model elements on import even if they do not have **Update Element** permission.

Permissions

Permission	Enables the user to	See also
<b>Administer Database</b>	Compact and repair a project database.	<a href="#">Compact a Project</a> <sup>[601]</sup> <a href="#">Repair a Project</a> <sup>[602]</sup>

### 3.6.2.11 View and Manage Locks

When security is enabled, users lock and unlock model elements in order to work on them, which can require monitoring and control. You can periodically **view** and, if necessary, **delete** the active locks placed on elements by users.

**Access** [Project | Security | Manage Locks](#)

#### Manage user locks

Step	Action	See also
1	<p>On the Active Locks dialog, in the View Locks For panel, click on the radio button for the type of lock to view.</p> <ul style="list-style-type: none"> <li>• All</li> <li>• Groups Only</li> <li>• Users Only</li> </ul> <p>Locks of the selected type are listed in the Active Locks panel.</p>	

Step	Action	See also
2	<p>To remove a lock, click on it and click on the <b>Unlock Selected</b> button.</p> <p>You can select (and deselect) multiple locks by pressing <b>Ctrl</b> as you click on each one, or <b>Shift</b> as you click on the last block in a range.</p> <p>You can also select all locks in the list by clicking on the <b>Select All</b> button, and clear that selection by clicking on the <b>Select None</b> button (or by clicking off the list).</p>	
3	When you have finished reviewing the locks, click on the <b>Close</b> button to close the dialog.	

### Notes

- You must have **Security - Manage Locks** permission to view and delete user locks; the initial **Admin** administrator and **Administrators** group automatically have this permission
- The Active Locks dialog does not currently show any **Full** locks set in the model
- If you want to display the resulting information in a more readable layout, you can resize the dialog and its columns

### Learn more

- [List of Available Permissions](#)<sup>[329]</sup>

### 3.6.2.12 Password Encryption

In releases of Enterprise Architect prior to **7.1**, Security Administrators of projects on SQL Server or Oracle repositories can **encrypt** the password used to set up the connection between Enterprise Architect and the repository. The system user does not have the real password, thereby preventing them from accessing the repository using other tools such as Query Analyzer or SQLPlus.

For password encryption for all repositories at and beyond release 7.1, you provide the connection but protect the password using **model shortcuts**.

**Access**    **Project | Security | Encrypt Password**

### Encrypt a repository password

Step	Action	See also
1	<p>In the <b>Password</b> field, enter the password to access the repository.</p> <p>The <b>Encrypted</b> field displays the modified password to be provided to users.</p>	
2	Instruct users to connect Enterprise Architect to the repository using the encrypted password prefixed with <b>\$\$</b> .	<a href="#">Connect to Oracle Data Repository</a> <sup>[255]</sup>

Step	Action	See also
		<a href="#">Connect to SQL Server Data Repository</a> <sup>[218]</sup>

### Notes

- Do not click on the **Test Connection** button as it can cause an error with encrypted passwords
- For SQL Server repositories, you must enter the **Initial Catalog** details from the All tab of the Data Link Properties dialog

### Learn more

- [Model Shortcuts](#)<sup>[204]</sup>

### 3.6.2.13 Change Password

It is recommended that users of any computer system change their passwords - or have them changed - at regular intervals. When security is enabled in Enterprise Architect, users can change their own passwords or, if the user is unable or not authorized to do this, a Security Administrator can set or change the user's password.

**Access**    **Project | Security | Change Password** (User)  
**Project | Security | Manage Users** (Administrator)

#### User - Change your own user password

Step	Action	See also
1	On the Change Password dialog, in the <b>Enter old password</b> field, type your <b>current</b> password.	
2	In the <b>New password</b> field, type your new password. This can be any number of characters in length.	
3	In the <b>Retype new</b> field, type your new password again, for confirmation.	
4	Click on the <b>OK</b> button. The <i>Password Changed</i> message displays.	
5	Click on the <b>OK</b> button to clear the message. Use your new password next time you log in.	

Step	Action	See also

#### **Administrator - Set or change any user's password**

Step	Action	See also
<b>1</b>	On the Security Users dialog, in the <b>Users:</b> panel, click on the user's name. The user's details display in the dialog fields.	
<b>2</b>	Click on the <b>Change Password</b> button. The Change Password dialog displays.	
<b>3</b>	In the <b>New password</b> field, type the user's new password. This can be any number of characters in length. You do not have to enter the user's current password.	
<b>4</b>	In the <b>Retype new</b> field, type the user's password again, for confirmation.	
<b>5</b>	Click on the <b>OK</b> button. The <i>Password Changed</i> message displays.	
<b>6</b>	Click on the <b>OK</b> button.	
<b>7</b>	By secure means, notify the user of their new password.	

#### **Notes**

- A user must have **Change Password** permission to change their own password; the initial **Admin** administrator and **Administrators** group automatically have this permission
- A Security Administrator must have **Security - Manage Users** permission to change other users' passwords; the initial **Admin** administrator and **Administrators** group automatically have this permission

#### **Learn more**

- [List of Available Permissions](#) 

### 3.6.2.14 Lock Model Elements

If you need to set a lock on a **package**, **element** or **diagram**, or clear that lock, you can do so from either the Project Browser or - for an element or diagram - from within a diagram. You follow one of three procedures, depending on whether you are:

- Locking an element or diagram under the User/Group Locking security policy
- Locking a package under the User/Group Locking security policy
- Locking an element or diagram under the Require User Lock to Edit security policy

#### Notes

- You must have **Lock Elements** permission to lock an element or diagram

#### Learn more

- [Set Security Policy](#)<sup>[319]</sup>
- [Lock Objects Under User/Group Locking](#)<sup>[336]</sup>
- [Lock Packages Under User/Group Locking](#)<sup>[337]</sup>
- [Lock Objects Under Require User Lock to Edit](#)<sup>[339]</sup>
- [Locked Element Indicators](#)<sup>[340]</sup>
- [List of Available Permissions](#)<sup>[329]</sup>

#### 3.6.2.14.1 Lock Objects Under User/Group Locking

Under the **User/Group Locking** security policy, if you need to set or release a lock on an **element** or **diagram**, you can do so from either the Project Browser or from within the diagram.

**Access** Select one of:

- **Project Browser | right-click on diagram | Lock**
- **Project Browser | right-click on element | Lock**
- **Diagram | right-click on diagram background | Lock** or
- **Diagram | right-click on element | Lock**

#### Set a lock on an element or diagram

Step	Action	See also
1	<p>On the Lock Element or Lock Diagram dialog, in the Lock Type panel, select the radio button for the required option:</p> <ul style="list-style-type: none"> <li>• <b>No lock</b> - do not set a lock on this object; clear any existing lock that <b>you</b> have set, or clear any <b>Full lock</b> that <b>other users</b> have set</li> <li>• <b>Full lock</b> - lock this object so that no-one can edit it without specifically clearing the lock</li> <li>• <b>User lock</b> - lock this object so that only you can make further edits; other users cannot unlock or edit the object</li> <li>• <b>Group lock</b> - lock this object so that any member of the specified group (below) can edit the object; other users cannot unlock or edit the object</li> </ul>	

Step	Action	See also
2	<p>If you have selected the <b>Group lock</b> option, in the <b>GroupID</b> field click on the drop-down arrow and select the group containing users that can edit the object.</p> <p>The <b>GroupID</b> drop-down list only includes groups which you are a member of.</p>	<a href="#">Assign User To Groups</a> <a href="#">[326]</a>
3	Click on the <b>OK</b> button.	

### Notes

- To check whether the project security is in **User/Group locking** mode, select **Project | Security**; the **Require User Lock to Edit** option should be **deselected**
- You must have **Lock Elements** permission to lock an element or diagram
- If the item already has a lock, only the corresponding lock option and the **No lock** option are highlighted; you have to release the lock in order to set a different type of lock
- If a **diagram** is locked and you select an element on it, the element border displays in **red**, indicating that you cannot move it or resize it
- If an **element** is locked and you click on it on a diagram, the element border displays in **black**; you can display the properties but not change them
- If you select the **Full Lock , no-one may edit** option, a red exclamation mark displays against the object in the Project Browser
- If you select the **User Lock, locking user may still edit** or **Group lock, locking group may still edit** options, a blue exclamation mark displays against the object in the Project Browser; **other** users see a red exclamation mark

#### 3.6.2.14.2 Lock Packages Under User/Group Locking

If, in **User/Group locking** mode, you want to lock or unlock the contents of a **package**, you can do so in a single operation. You can set the lock on the entire contents (including child packages), just on the top-level package content, or just on the elements or diagrams in the package.

**Access** **Project Browser | Package context menu | Lock Package**

### Lock or Unlock a package

Step	Action	See also
1	<p>In the Lock Type panel, select the appropriate radio button for the lock to apply:</p> <ul style="list-style-type: none"> <li>• <b>No lock</b> - do not set a lock on this package; clear any existing lock that <b>you</b> have set, or clear any <b>Full lock</b> that <b>other users</b> have set</li> <li>• <b>Full lock</b> - lock this package so that no-one can edit it without specifically clearing the lock</li> <li>• <b>User lock</b> - lock this package so that only you can make further edits; other users cannot unlock or edit the package</li> <li>• <b>Group lock</b> - lock this package so that any member of the specified group (below) can edit the object; other users cannot unlock or edit the package</li> </ul>	
2	<p>If you have selected the <b>Group lock</b> option, in the <b>GroupID</b> field click on the drop-down arrow and select the group containing users that can edit the object.</p> <p>The <b>GroupID</b> drop-down list only includes groups which you are a member of.</p>	<a href="#">Assign User To Groups</a> <sup>[326]</sup>
3	<p>The <b>What to Process</b> checkboxes default to selected to also lock or unlock:</p> <ul style="list-style-type: none"> <li>• Elements and/or diagrams in the package</li> <li>• The contents of child packages (that is, the whole branch)</li> </ul> <p>If you want to exclude any type of package content from the change in lock status, deselect each appropriate checkbox.</p>	
4	Click on the <b>OK</b> button to apply the lock.	

### Notes

- To check whether the project security is in **User/Group locking** mode, select **Project | Security**; the **Require User Lock to Edit** option should be **deselected**
- You must have **Lock Elements** permission to lock a package
- If the package is already locked, only the corresponding lock option and the **No lock** option are highlighted; you have to release the lock in order to set a different type of lock
- If you select the **Full Lock , no-one may edit** option, a red exclamation mark displays against the package in the Project Browser
- If you select the **User Lock, locking user may still edit** or **Group lock, locking group may still edit** options, a blue exclamation mark displays against the package in the Project Browser; **other** users see a red exclamation mark

- [Locked Element Indicators](#)<sup>[340]</sup>

### 3.6.2.14.3 Lock Objects Under Require User Lock to Edit

In the **Require User Lock to Edit** security mode, if you want to edit one or more of the diagrams or elements in a package, you need to set a User Lock on either the specific objects or the package that contains them. You can set or release the lock from either a diagram or the Project Browser. Once you have set a lock, only you or the Security Administrator can release it again; no other user can release your locks.

**Access** Select one of:

- **Project Browser | right-click on package | Apply/Release User Lock**
- **Project Browser | right-click on diagram | Apply/Release User Lock**
- **Project Browser | right-click on element | Apply/Release User Lock**
- **Diagram | right-click on background | Apply/Release User Lock** or
- **Diagram | right-click on element | Apply/Release User Lock**

#### Set or clear a user lock in Require User Lock to Edit security mode

Step	Action	See also
1	On the Set User Lock dialog, click on either the: <ul style="list-style-type: none"> <li>• <b>Apply User Lock</b> radio button to set the lock or</li> <li>• <b>Release User Lock</b> radio button to clear the lock</li> </ul>	
2	For a package, if you want to also lock all child packages, select the <b>Include Child Packages</b> checkbox.  If any elements in the package tree are locked by other users, a list of elements that couldn't be locked displays.	
3	Click on the <b>OK</b> button.  The system locks or unlocks: <ul style="list-style-type: none"> <li>• The selected element</li> <li>• The selected diagram and any elements in the diagram, or</li> <li>• The package and all elements and diagrams in the top level of the package</li> </ul>	

#### Notes

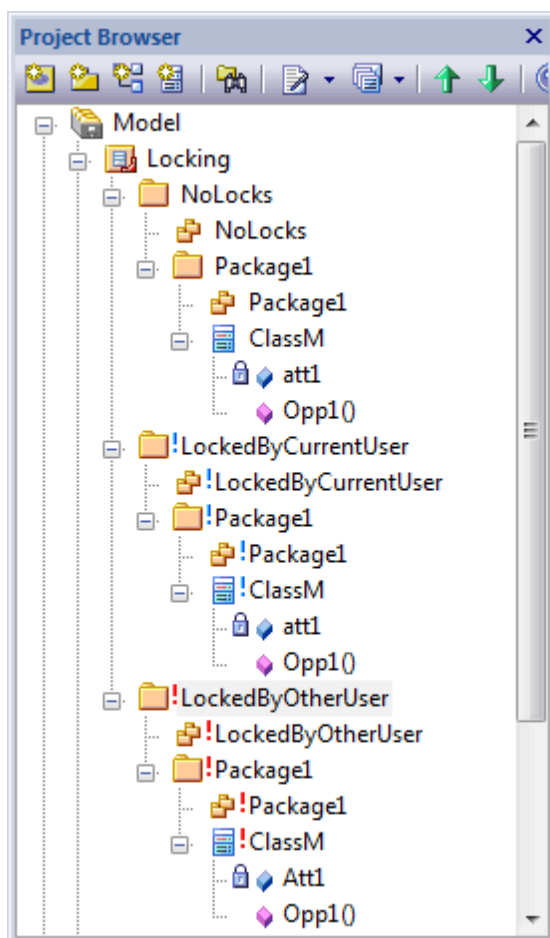

- To check whether the project security is in **Require User Lock to Edit** mode, select **Project | Security**; the **Require User Lock to Edit** option should be **selected**
- You must have **Lock Elements** permission to lock a package
- When you set a user lock, a blue exclamation mark displays against the object or objects that are locked; other users see these as red exclamation marks

- [Locked Element Indicators](#)<sup>[340]</sup>

**3.6.2.15 Locked Element Indicators**

When a user sets a lock on an item through User Security, the lock status of the item is indicated in the Project Browser by a marker against the item - a red or blue exclamation mark - as shown:

The effect of the lock and the meaning of the status marker depend on the security policy applied to your project.

Marker meanings, by security mode

Security Mode	Marker	Meaning	See also
<b>Require User Lock to Edit</b>	No marker	There is no lock, the item <b>is not</b> editable, but any user can now apply	<a href="#">Lock Objects Under Require</a>

Security Mode	Marker	Meaning	See also
		a user lock to edit the item.	<a href="#">User Lock to Edit</a> [339]
	Blue exclamation mark	You have applied a user lock and can edit the item; no other user can release the lock, set their own lock or edit the item.	
	Red exclamation mark	Another user has applied a user lock, and you cannot release the lock, set your own lock or edit the item.  You can find out which user has locked the item.	<a href="#">Identify Who Has Locked An Object</a> [342]
<b>User/Group Lock</b>	No marker	There is no lock, the item is editable, but any user can now apply a user or group lock.	<a href="#">Lock Objects Under User/Group Locking</a> [336]  <a href="#">Lock Packages Under User/Group Locking</a> [337]
	Blue exclamation mark	The item has a lock set by you or a group including your user ID as a member, and you can edit the item.	
	Red exclamation mark	The item has a lock set by another user, or a group of which you are <b>not</b> a member; you cannot edit the item.  You can find out which user has locked the item.  The red exclamation mark also indicates that you or another user has set a <b>full lock</b> on the item. Any user can clear that lock.	<a href="#">Identify Who Has Locked An Object</a> [342]

**Notes**

- If a diagram is locked and you select an object on it, the object border displays in red; this indicates that you cannot change the location or size of the object on the diagram

### 3.6.2.16 Identify Who Has Locked An Object

When you are working in your model, you might find that you are unable to update an element, diagram or package. If you cannot update any object, this might mean that you do not have the access permissions to update diagrams or elements. However, if the object in the Project Browser has a red exclamation mark next to it this indicates that either another person has placed a user or group lock on the object, or you or another user have put a full lock on the object.

You can quickly establish if the lock is a full lock (which you can remove) or which user has set a user or group lock.

#### Access

- **Project Browser | Package context menu | Lock**
- **Project Browser | Diagram context menu | Lock**
- **Project Browser | Element context menu | Lock**

#### Identify the lock holder

Step	Action	See also
1	<p>In the Project Browser, right-click on the diagram, package or element that has a red lock indicator, and select the <b>Lock</b> option.</p> <p>If the lock is:</p> <ul style="list-style-type: none"> <li>• A <b>Full</b> lock, the Lock &lt;object&gt; dialog displays, and you can delete the lock and set your own</li> <li>• A <b>user</b> lock or <b>group</b> lock, a message displays showing the user ID of the person or group who currently holds the lock on that item; click on the <b>OK</b> button to clear the lock</li> </ul>	<p><a href="#">Lock Objects Under User/Group Locking</a><sup>[336]</sup></p> <p><a href="#">Lock Packages Under User/Group Locking</a><sup>[337]</sup></p>

### 3.6.2.17 Manage Your Own Locks

As you are working in your model, you might set user locks on elements, diagrams and packages so that you can work on them and protect that work while it is progress. Having completed your work, you might then want to remove those locks. You can do this on each object individually, using the same procedure as you used to set the lock. You can also display a list of all the locks you have set, and remove selected locks or all locks at once. This is especially useful when working under the **Require user locks to edit** security policy.

**Access** **Project | Security | Manage My Locks (Ctrl+Shift+L)**

#### Manage your own locks

Step	Action	See also
1	<p>All the locks that <b>you</b> have set in the model are listed on the My Locks dialog.</p> <p>This dialog does not show Full locks or Group locks.</p>	<p><a href="#">Lock Objects Under User/Group Locking</a><sup>[336]</sup></p>

Step	Action	See also
		<a href="#">Lock Packages Under User/Group Locking</a> <a href="#">Lock Objects Under Require User Lock to Edit</a>
2	If you intend to clear locks, either: <ul style="list-style-type: none"> <li>• Select a single lock you intend to clear</li> <li>• Press <b>(Ctrl)</b> or <b>(Shift)</b> as you select a number of locks or a range of locks respectively, to clear</li> <li>• Click on <b>Select All</b> to select all of your locks, or</li> <li>• Click on <b>Select None</b> to clear your selection, if you have made an error</li> </ul>	
3	If you have selected locks to clear, click on the <b>Unlock Selected</b> button.  The objects that were locked are now unlocked.	

#### Notes

- You need to have **Lock Elements** access permission to **set** user locks on modeling elements, but you do not require any access permission to **list** or **clear** them using this procedure

### 3.6.3.1 Work on Team Review Items

Within the Team Review, you can perform a wide range of operations on the Documents and the Topics and Categories that contain them. These operations include creating an item, Commenting on a Document, password-protecting an item so that it is not accidentally changed, accessing protected items, adding resources to an item, and deleting an item. All of these operations are accessed through the context menu in the Team Review window.

**Access**    **View | Team Review > right-click on item**

#### Team Review Options

Option	Action	Shortcut	See also
<b>New Category</b> <b>New Topic</b> <b>New Document</b>	Add a new Category, new Topic or new Document to the Team Review.  Alternatively, for a Topic or Document, click on the <b>New</b> icon in the window toolbar.		<a href="#">Add a New Category</a> <sup>[350]</sup> <a href="#">Add a New Topic</a> <sup>[351]</sup> <a href="#">Add a New Document</a> <sup>[353]</sup>
<b>New Category From Template</b> <b>New Topic From Template</b> <b>New Document from Template</b>	Add a new Category, new Topic or new Document, based on a defined template.		<a href="#">Add a New Category</a> <sup>[350]</sup> <a href="#">Add a New Topic</a> <sup>[351]</sup> <a href="#">Add a New Document</a> <sup>[353]</sup>
<b>New Comment</b>	Create a response to the selected Document.  Alternatively, click on the <b>New Comment</b> icon in the window toolbar.		<a href="#">Comment on a Document</a> <sup>[355]</sup>
<b>Rename</b>	Edit the name, in situ, of the currently-selected item.	<b>F2</b>	
<b>Copy Path to Clipboard</b>	Copy the path of the currently-selected item to the clipboard.  You can then paste the path into a document or file to add the discussion to any text concerning the item.	<b>Ctrl+C</b>	
<b>Show Contents</b>	Display the description or text of the item selected from the Team Review window, if the Team Review tab is not yet open.		
<b>Share Resource</b>	(If anything other than a Resources folder is		

Option	Action	Shortcut	See also
	<p>selected.)</p> <p>Add an item into the <i>Resources</i> folder under the selected Category, Topic or Document. If a <i>Resources</i> folder does not exist, one will be automatically created.</p> <p>Available options:</p> <ul style="list-style-type: none"> <li>• Package from Current Model</li> <li>• Image of Active Diagram</li> <li>• Active Profiler Report</li> <li>• Bookmark Active Website</li> <li>• Image from Clipboard</li> </ul>		<a href="#">Team Review Resources</a> <sup>[36]</sup>
<b>Add Package From Current Model</b>	<p>(If a <i>Resources</i> folder is selected.)</p> <p>Export a Package as an XML file from the current model as a resource of the selected Category, Topic or Document.</p> <p>You browse for and select the required Package using the Select &lt;item&gt; dialog.</p>		<a href="#">Team Review Resources</a> <sup>[36]</sup> <a href="#">Select &lt;item&gt; Dialog</a> <sup>[99]</sup>
<b>Import to Current Model</b>	<p>(If a Package XML file resource is selected.)</p> <p>Import the resource Package to the current model.</p> <p>You browse for and select the required target Package using the Select &lt;item&gt; dialog; the resource is imported as a child of that Package.</p> <p>This is a useful option for transferring relevant Packages from the Team Review of one model into another model.</p>		<a href="#">Select &lt;item&gt; Dialog</a> <sup>[99]</sup>
<b>Image of Active Diagram</b>	<p>(If a <i>Resources</i> folder is selected.)</p> <p>Add an image of the currently-displayed diagram as a resource of the selected Category, Topic or Document.</p> <p>You are prompted to provide a reference name for this image.</p>		<a href="#">Team Review Resources</a> <sup>[36]</sup>
<b>Active Profiler Report</b>	<p>(If a <i>Resources</i> folder is selected.)</p> <p>Add an active Profiler Report as a resource of the selected Category, Topic or Document.</p> <p>You are prompted to browse for and select the appropriate active report.</p>		<a href="#">Team Review Resources</a> <sup>[36]</sup> <a href="#">Generate, Save and Load Reports</a> <sup>[256]</sup>
<b>Image From</b>	(If a <i>Resources</i> folder is selected.)		<a href="#">Team Review</a>

Option	Action	Shortcut	See also
<b>Clipboard</b>	Add an image held on the clipboard as a resource of the selected Category, Topic or Document.		<a href="#">Resources</a> 
<b>View Image</b>	(If a diagram image resource is selected.) Open the View Image window, containing an image of the selected diagram. Alternatively, double-click on the image name.		<a href="#">Team Review Resources</a> 
<b>Copy Image To Clipboard</b>	(If an image resource is selected.) Copy the image or diagram image to the clipboard.		<a href="#">Team Review Resources</a> 
<b>Refresh Category 'xyz'</b> <b>Refresh Topic 'xyz'</b> <b>Refresh Document 'xyz'</b> <b>Refresh Comment 'xyz'</b>	Refresh the currently-open Category, Topic, Document or Comment, getting new Comments, Documents and Topics that other users might have created.  However, if you open another Category, Topic or Document the Team Review always displays the latest information from the database.  Alternatively, click on the <b>Refresh</b> icon in the window toolbar.		
<b>Reload Current Connection</b>	Reload the entire <b>Team Review</b> connection, getting new Categories, Topics and Documents.		
<b>Review Status</b>	Assign or clear a status marker against the selected Category, Topic or Document; you can mark the item as: <ul style="list-style-type: none"> <li>• <b>Awaiting Approval</b></li> <li>• <b>Approved</b></li> <li>• <b>Rejected</b></li> </ul> Or clear the marker ( <b>None</b> ).		<a href="#">Team Review Tools (Icons)</a> 
<b>Mark</b>	Mark the selected item (and, if appropriate, its contents) as read or unread.  The names of unread (such as newly-posted) items are in bold. When you open the item, the name reverts to normal type.		<a href="#">The Mark Submenu</a> 
<b>Bind to Project Browser Package</b>	Bind the selected Topic to a Package in the Project Browser, so that <b>Review Documents</b> created in the <b>Specification Manager</b> for that Package are automatically stored in the Topic.		<a href="#">Specification Manager</a>  <a href="#">Create Review</a>

Option	Action	Shortcut	See also
	When you select this option, the Select Package to Bind dialog displays, on which you browse for and select the Package to bind the Topic to.		<a href="#">Document</a> <sup>[1749]</sup>  <a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Security Options</b>	<p>Access one of three options:</p> <ul style="list-style-type: none"> <li>• <b>Apply Password Lock</b> - to display a prompt to enter a security password</li> <li>• <b>Unlock for Editing</b> - to display a prompt to enter the set password so that you can edit the item</li> <li>• <b>Remove Password Lock</b> - to display a prompt for the set password, which is then removed</li> </ul> <p>When you set the password, an exclamation mark icon is added to the Category, Topic or Document name.</p>		<a href="#">Protection Against Editing</a> <sup>[357]</sup>
<b>Connections...</b>	<p>Access other Team Reviews from other Enterprise Architect models or models located on servers.</p> <p>Alternatively, click on the drop-down arrow in the <b>Connection Options</b> field in the window toolbar, and select one of the listed models.</p> <p>Use the <b>&lt;Configure Connections&gt;</b> option to add and connect to additional Team Reviews.</p>		<a href="#">Team Review Connections</a> <sup>[363]</sup>
<b>Options...</b>	Change the loading behavior of the Team Review.		<a href="#">Team Review Options</a> <sup>[362]</sup>
<b>Delete Category 'xyz'</b> <b>Delete Topic 'xyz'</b> <b>Delete Document 'xyz'</b> <b>Delete Resource 'xyz'</b> <b>Delete Comment 'xyz'</b>	<p>Delete this Category, Topic, Document or Comment and all sub-topics and sub-documents, or delete the resource attached to the item.</p> <p>Alternatively, click on the item and press ( <b>Delete</b> ).</p> <p>A confirmation dialog displays; click on the <b>Yes</b> button to remove the item and any dependent items from the Team Review.</p>		

### The Mark Submenu

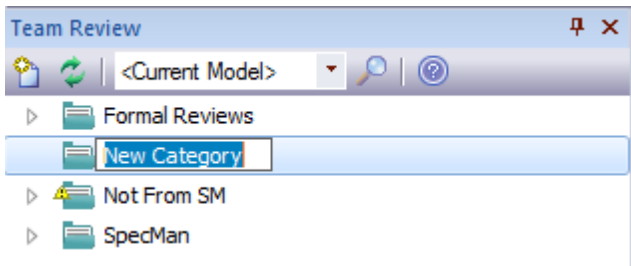

Option	Action	Shortcut	See also
<b>All items as Read</b>	Mark the entire contents of the Team Review as read.		<a href="#">Team Review Tools</a> <sup>[343]</sup>
<b>All items as Unread</b>	Mark the entire contents of the Team Review as unread.		<a href="#">Team Review Tools</a> <sup>[343]</sup>
<b>Branch as Read</b>	Mark this item and all its contents as read.		
<b>Branch as Unread</b>	Mark this item and all its contents as unread.		
<b>'xyz' as Unread</b>	Mark only this item as unread.		

### 3.6.3.2 Add a New Category

You can add new Categories to the Team Review, in which to store related Topics and Documents.

**Access** **View | Team Review** ( Ctrl+Alt+U )

#### Create a Category

Step	Action	See also
1	<p>Right-click on a blank area in the Team Review window and select the <b>New Category</b> context menu option.</p> <p>A new Category icon displays in the hierarchy.</p> 	<a href="#">Work on Team Review Items</a> <sup>[346]</sup>
2	<p>Overtyping the <i>New Category</i> text with the name of the Category, and clicking off the name.</p> <p>The Category description editor displays in the Team Review tab; type the appropriate Category description, if required.</p>	
3	Add new Topics and/or resources to the Category.	<a href="#">Add a New Topic</a> <sup>[351]</sup>

Step	Action	See also
		<a href="#">Team Review Resources</a> <sup>[36]</sup>
<b>Alternatively</b>		
<b>1</b>	Right-click on a blank area in the Team Review window and select the <b>New Category from template</b> context menu option.  A new Category icon displays in the hierarchy.	<a href="#">Work on Team Review Items</a> <sup>[34]</sup>
<b>2</b>	Overtyping the <i>New Category</i> text with the name of the Category, and clicking off the name.  The New Category from Template dialog displays.	
<b>3</b>	Click on the <b>Template</b> drop-down arrow and select a predefined template for the Category description.  Click on the <b>OK</b> button.	
<b>4</b>	The Category description editor displays in the Team Review tab; type the appropriate Category description, if required.	
<b>5</b>	Add new Topics and/or resources to the Category.	<a href="#">Add a New Topic</a> <sup>[35]</sup> <a href="#">Team Review Resources</a> <sup>[36]</sup>

### 3.6.3.3 Add a New Topic

You can add new Topics to a Category in the Team Review, in which to store related Documents and their Comments.

**Access** **View | Team Review** (Ctrl+Alt+U)

#### Create a new Topic

Step	Action	See also
<b>1</b>	Either: <ul style="list-style-type: none"> <li>Right-click on the required Category name in the Team Review window and select the <b>New Topic</b> context menu option</li> <li>Click on the Category name and click on the <b>New</b> icon in the Team</li> </ul>	<a href="#">Work on Team Review Items</a> <sup>[34]</sup>

Step	Action	See also
	<p>Review toolbar, or</p> <ul style="list-style-type: none"> <li>Click on the Category name and press ( <b>Ctrl+N</b> )</li> </ul> <p>A new <b>Topic</b> icon displays under the Category name.</p>	
2	<p>Overtyping the <i>New Topic</i> text with the name of the Topic, and clicking off the name.</p> <p>The Topic description editor displays in the Team Review tab; type the appropriate Topic description, if required.</p>	
3	Add new Documents and/or resources to the Topic.	<a href="#">Add a New Document</a> <small>[353]</small> <a href="#">Team Review Resources</a> <small>[361]</small>
<b>Alternatively</b>		
1	<p>Right-click on the required Category name in the Team Review window and select the <b>New Topic from Template</b> context menu option.</p> <p>A new Topic icon displays under the Category Name.</p>	<a href="#">Work on Team Review Items</a> <small>[346]</small>
2	<p>Overtyping the <i>New Topic</i> text with the name of the Topic, and clicking off the name.</p> <p>The New Topic from Template dialog displays.</p>	
3	<p>Click on the <b>Template</b> drop-down arrow and select a predefined template for the Topic description.</p> <p>Click on the <b>OK</b> button.</p>	
4	The Topic description editor displays in the Team Review tab; type the appropriate Topic description, if required.	
5	Add new Documents and/or resources to the Topic.	<a href="#">Add a New Document</a> <small>[353]</small> <a href="#">Team Review Resources</a> <small>[361]</small>

**Notes**

- If you already have the Team Review tab open, the New Topic from Template dialog displays as soon as you select the **New Topic from Template** menu option; you can click on and overtype the Topic Name after you have created the topic description.

### 3.6.3.4 Add a New Document

Within the Team Review, you can create a new Document on a Topic as a:

- Blank document
- Document based on a predefined template
- Document from a file link

Access **View | Team Review** ( **Ctrl+Alt+U** )

#### Create a blank Document

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>• Right-click on the appropriate Topic name in the Team Review window and select the <b>New Document</b> context menu option</li> <li>• Click on the Topic name and on the <b>New Document</b> icon in the Team Review toolbar, or</li> <li>• Click on the Topic name and press ( <b>Ctrl+N</b> )</li> </ul> <p>A new Document icon displays underneath the Topic name.</p>	<a href="#">Work on Team Review Items</a> [346]
2	<p>Overtyping the <i>New Document</i> text with the name of the Document, and clicking off the name.</p> <p>The text editor displays in the Team Review tab.</p>	
3	Type the text of the Document as required.	<a href="#">Edit an Item</a> [358]

#### Create a Document based on a predefined template

Step	Action	See also
1	<p>Right-click on the appropriate Topic name in the Team Review window and select the <b>New Document from template</b> context menu option.</p> <p>A new Document icon displays in the hierarchy.</p>	<a href="#">Work on Team Review Items</a> [346]

Step	Action	See also
2	Overtyping the <i>New Document</i> text with the name of the Document, and clicking off the name.  The New Document from Template dialog displays.	
3	Click on the drop-down arrow in the <b>Template</b> field, and select a predefined template for the Document contents.	
4	Click on the <b>OK</b> button.  The template structure is displayed in the Team Review tab.	
5	Enter the text of the Document.	<a href="#">Edit an Item</a> <sup>358</sup>

#### Create a Document based on a link to an external file

Step	Action	See also
1	Open a file browser (such as Windows Explorer) and locate the file.	
2	Click on the file name and drag it onto the appropriate Topic name in the Team Review window.  A new Document icon is created underneath the selected Topic, and the body of the Document is shown in the Team Review tab.  A link to the source file is created at the start of the message.	
3	Click twice on the <i>New Document</i> text in the Team Review window, and overtype the text with the name of the Document.	
4	In the Team Review tab, create and edit text around the file link, and add further links if required.	<a href="#">Edit an Item</a> <sup>358</sup>

#### When you have created the Document

You can	Detail	See also
<b>Create links from the Document</b>	To elements and diagrams from the: <ul style="list-style-type: none"> <li>• Project Browser</li> <li>• Model Search</li> <li>• Model Views window</li> <li>• Package Browser</li> </ul>	<a href="#">Add Object Links</a> <sup>[359]</sup> <a href="#">The Project Browser</a> <sup>[646]</sup> <a href="#">Model Search</a> <sup>[700]</sup> <a href="#">Model Views</a> <sup>[686]</sup> <a href="#">Package Browser</a> <sup>[673]</sup>
	To related Team Review: <ul style="list-style-type: none"> <li>• Categories</li> <li>• Topics</li> <li>• Documents</li> </ul>	<a href="#">Add Object Links</a> <sup>[359]</sup>
	To external files, either in the text of the Document or on the Category, Topic or Document in the Team Review window (the link is added to the Model Links folder for the Team Review item).	<a href="#">Add Object Links</a> <sup>[359]</sup>
<b>Add resources to the Document</b>	It is simple and convenient to link to the resources that are the subject of discussion or that illustrate points in the discussion.	<a href="#">Team Review Resources</a> <sup>[361]</sup>
<b>Receive Comments on the Document from other users</b>	The objective of the Team Review is to discuss aspects of development, so you can expect to receive Comments on the Documents that you have posted, and to create Comments on the material posted by your colleagues.	<a href="#">Comment on a Document</a> <sup>[355]</sup>

### 3.6.3.5 Comment on a Document

You use the Team Review as a forum for discussion of items and issues within the project, so when you read a Document on a particular point (or a response to that Document) you might want to respond with your own Comment.

**Access** [View | Team Review](#) ( Ctrl+Alt+U )

#### Create a Comment in the Team Review

Step	Action	See also

### 3.6.3.6 Protection Against Editing

When you have created a Team Review Category, Topic or Document containing text, the item text is exposed to change by any user who has access to the Team Review. You can protect the item against unrestricted changes by setting a password on it. The password only refers to that item; to protect the text of Topics, Documents or Comments subordinate to the item, you set a password on each of them as well.

When the password is set, only those users who have the password can edit that item, and only when they specifically enter the password to unlock that item. Any other user of the Team Review can still **view** the protected item.

The password does not protect the item from operations on the item as a whole, including being deleted.

#### Notes

- The use of a password on an item is indicated by an exclamation mark against the item in the Team Review window; a blue icon indicates that a user with the password has opened the item, and a red icon indicates that the item is locked
- When you click on an item to set a password, the item opens; you can edit the item after you have set the password, while it is still open
- Once a password-protected item is closed, any user who wants to edit the item must first select to unlock the item for editing and then enter the password set on the item
- Unlocking is specific to the user; the item remains locked to other users until they enter the password themselves
- If the password becomes unnecessary, you can remove it from the item

#### Learn more

- [Work on Team Review Items](#) <sup>[346]</sup>

### 3.6.3.7 Edit an Item

When you have created a Category, Topic, Document or Comment, you edit the text within it using the Team Review editor. This is based on the Document editor, which is used to edit report documents and linked documents throughout Enterprise Architect.

You can also change the **name** of the item by selecting it, pressing **F2** and typing the new name.

**Access**    **View | Team Review | <item>**

#### Option Descriptions

The editor menu option descriptions are grouped according to the actions you are performing.

Actions	Link
Creating and importing documents	<a href="#">File Control</a> <sup>[1050]</sup>
Configuring the editor page display and formatting tools shown	<a href="#">Editor Tool Display Options</a> <sup>[1052]</sup>
Incorporating stylesheets, special texts and Tables of Contents Managing the base styles in the Normal.rtf style template file	<a href="#">Styles, Special Texts &amp; Table of Contents</a> <sup>[1054]</sup> <a href="#">The Normal.rtf Style Template</a> <sup>[1058]</sup>

Create and refer to definitions of Glossary terms in the Project Glossary (using the <b>Create   Glossary Definition</b> context menu option)	<a href="#">Project Glossary View</a> <sup>[534]</sup>

### Notes

- Throughout your document editing:
  - To undo one or more immediately previous edits, press **(Ctrl+Z)**, or select the **Edit | Undo** menu option; you can still undo a change even after you have saved the change
  - To redo one or more immediately previous undone edits, press **(Ctrl+Y)**, or select the **Edit | Redo** menu option

### 3.6.3.8 Add Object Links

In the Team Review window you can create hyperlinks from a Document to the elements and diagrams that are associated with it. This helps you to:

- Rapidly navigate to the objects in the Project Browser
- Access the element properties
- Open a diagram directly from the Team Review

You can also create links to:

- Other Categories, Topics and Documents in the Team Review window
- External files from a file browser

**Facilities**

Facility	Action	See also
<b>Associate an element, diagram, external file or Team Review item with a message</b>	<p>Drag the object over the required Category, Topic or Document in the Team Review window, from the:</p> <ul style="list-style-type: none"> <li>• Project Browser</li> <li>• Package Browser</li> <li>• Model Views window</li> <li>• Model Search dialog or</li> <li>• External file browser</li> </ul> <p>To create a link to another Team Review item, press <b>Ctrl</b> as you drag that item over the required Category, Topic or Document.</p> <p>If it does not already exist, a <i>Model Links</i> folder is created under the selected Team Review item, and the link to the dragged object is added to the folder.</p>	<p><a href="#">The Project Browser</a><sup>[646]</sup></p> <p><a href="#">Package Browser</a><sup>[673]</sup></p> <p><a href="#">Model Views</a><sup>[686]</sup></p> <p><a href="#">Model Search</a><sup>[700]</sup></p>
<b>Associate an external file with the message text</b>	<p>From any browser, click on and drag the file name into the text of the message.</p> <p>The filename becomes a link to the file; click on it to display the contents of the file.</p> <p>The external file name also becomes a link to the file within the message when you drag the filename onto a Topic to create a Document.</p>	<p><a href="#">Add a New Document</a><sup>[353]</sup></p>

To review an object in the *Model Links* folder, right-click on the object to display the navigation context menu.

Option	Action	See also
<b>Open</b>	<p>Open the linked diagram or external file.</p> <p>Alternatively, double-click on the diagram link.</p>	
<b>Properties</b>	<p>Display the Properties dialog for the selected element or diagram.</p> <p>Alternatively, double click on the element, attribute or operation link to open the Properties dialog of the object.</p>	
<b>Create (Edit) Linked Document</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Open the New Linked Document from Template dialog, to begin creating a new Linked Document on the element, or</li> <li>• Open the Linked Document Editor to change an existing Linked Document</li> </ul>	

Option	Action	See also
<b>Find in all Diagrams</b>	Open the diagram in which the element or diagram is used, or display a list of several diagrams in which the element or diagram has been used.	
<b>Find in Project Browser</b>	Highlight the element or diagram in the Project Browser.	
<b>Locate Item</b>	Highlight, in the Team Review window, the Team Review item linked to the message.  Alternatively, double-click on the link in the Model Links folder.	
<b>Delete Model Link &lt;name&gt;</b>	Delete the association between the Document and the object.	

### 3.6.3.9 Team Review Resources

Whilst having a discussion through the Team Review, it is convenient to link to the resources that are the subject of discussion or that illustrate points in the discussion. Such resources include:

- XML files of Packages within the current project
- Active Profiler reports
- Images of currently-active diagrams
- Images currently captured on the clipboard
- Bookmarks to currently active websites

You can link to such resources from Category or Topic notes, or from a Document. The resource links are created in a *Resources* folder underneath the selected Category, Topic or Document, as shown:

**Access**    **View | Team Review | Right-click on <object> | Share Resource | <resource type>**

You create the *Resources* folder by creating a link to a resource underneath the selected Category, Topic or Document. Similarly, you delete the *Resources* folder by deleting the last resource within it. Having added a resource, you can right click on it and use a further context menu to:

- Reimport the Package XML files to the model or
- Display the images

**3.6.3.10 Search Team Review**

The Team Review provides the facility to search the *titles* of all Team Review items, to locate items referring to a specific subject.

Search the Team Review

Step	Action	See also
1	In the Team Review window toolbar, click on the  ( <b>Search</b> ) icon. The search panel displays underneath the toolbar.	
2	In the blank field, type the text string to search for.	
3	If required, select the <b>Match Case</b> checkbox to locate text with the same case as the search string.	
4	If required, select the <b>Match Whole Word</b> checkbox to locate only complete words that match the search string.	
5	Click on the <b>Find</b> button. The search locates the first instance of the search string in the title of a Category, Topic, Document or Comment, and displays the contents of that item in the Team Review tab.	
6	To locate further instances of the text string, click on the <b>Find</b> button again.	
7	To close the search panel, click on the <b>Search</b> icon in the toolbar again.	

**3.6.3.11 Team Review Options**

You can change the loading behavior of the Team Review, using the Team Review Server Options dialog. If you change the settings, the new loading behavior is not applied until you restart the Team Review.

Access    **Right-click Team Review window | Options**

Field/Option/ Button	Action	See also
<b>Preload items less than</b>	Type the threshold item size (in KB) below which the items will be preloaded and above which item data is only loaded when selected.	
<b>Load item data when required</b>	The fastest loading option. Team Review data is only loaded on demand; for example, when you read a Document.	
<b>Preload all data</b>	Caches the entire contents of the Team Review on load; this takes longer to load but, once completed, navigating the Team Review is faster.	
<b>Mark All Unread</b>	Resets all Documents you have read to 'unread' (bolds all items in the Team Review).	

### 3.6.3.12 Team Review Connections

If you are modeling in a different model from the rest of your team, you can switch to Team Reviews from **other** Enterprise Architect models, including models located on servers. This connects only to the **Team Review** for the selected model; it does not change the model open in the **Project Browser** or anywhere else in the system.

**Access** Through the **Connection Options** drop-down field in the **Team Review window Toolbar**  
**Right-click on the Team Review Window | Connections**

#### Switch to another Team Review

Step	Action	See also
<b>1</b>	In the Team Review window toolbar, click on the drop-down arrow in the <b>Connection Options</b> field and select the appropriate model name from the list, to connect to the Team Review for that model.  If the required model is not listed, click on the <b>&lt;Configure Connections&gt;</b> option; the Team Review Server Connections dialog displays.  Go to <b>Step 3</b> .	
<b>2</b>	<i>Alternatively:</i>  Right-click anywhere in the Team Review window and select the <b>Connections</b> context menu option; the Team Review Server Connections dialog displays.  In the list in the Connections panel, select the check box against the appropriate model name to connect to the Team Review for that model, and click on the <b>Open</b> button.  The connection now switches to the Team Review in the selected model.  If the required model is not listed, go to <b>Step 3</b> .	

Step	Action	See also
3	<p>Select the appropriate <b>Connection Type</b> radio button and click on the <b>New</b> button.</p> <ul style="list-style-type: none"> <li>For a project <b>file</b>, a browser dialog displays through which you can search for and select the appropriate model</li> <li>For a model in a <b>DBMS</b> data repository, the Microsoft Data Link dialogs display, through which you can locate and connect to the repository</li> </ul>	
4	When you have selected and opened or connected to the required Enterprise Architect model, and returned to the Team Review Server Connections dialog, the model name displays in the <b>Connection Name</b> field and in the Connections panel.	
5	<p>Select the check box against the model name and click on the <b>Open</b> button to connect to the Team Review for that model.</p> <p>The Team Review now shows the discussions in the selected model.</p>	

#### Fields/Options on the Team Review Server Connections dialog

Field/Option	Action	Shortcut	See also
<b>Connection Name</b>	Verify the name of the selected model.		
<b>Connection Type</b>	Select the appropriate radio button for the type of Enterprise Architect model to locate: a local project file or a model on a remote server.		
<b>Target Model</b>	Verify the path to the selected model.		
<b>New</b>	Click on this button to display the file browser or Data Link Properties dialog to select the model for a new Team Review connection.		
<b>Delete</b>	Click on this button to delete the currently selected connection from the Connections list. There is no confirmation prompt; the connection is immediately removed from the list.		
<b>Connections</b>	View all Team Review connections created; click on the checkbox against the required connection.		

Field/Option	Action	Shortcut	See also
<b>Open</b>	Click on this button to switch the <b>Team Review</b> to the selected connection and to close the dialog.		

### 3.6.4 Element Discussions

Using the dockable **Element Discussions window** you can develop a discussion on, or review of, an individual element that is **directly associated** with that element. This makes it easy to locate, view and contribute to a discussion, or more than one discussion, on the selected element.

You can review and participate in discussions on different elements simply by clicking on each element in turn; the Element Discussions window immediately switches to the discussions of the new selected element.

As a discussion develops, the number of responses is shown next to the original Document, in brackets; therefore you can see when a discussion has a new reply without having to expand and work through the thread. You can also set a status of **Awaiting Review** or **Closed** on a discussion, indicated by an icon against the posting. This helps you to resolve and close off points raised in the discussion, so that they do not continue indefinitely. You can also delete the whole posting or specific replies, to balance retaining discussion history with removing irrelevant information.

**Access**    **select element | Element | Discussions**

#### Operations in Element Discussions

Operation	Action	See also
<b>Create a discussion</b>	<p>The window displays the message <i>Create new Discussion</i>. Double-click on this message and type in your posting as continuous text (no carriage returns).</p> <p>When you have finished typing, click off the text or press <b>Enter</b>.</p> <ul style="list-style-type: none"> <li>• An open expansion box, a  icon, your user ID and the date and time of posting display above your text</li> <li>• The messages <i>Post Reply</i> and <i>Create new Discussion</i> display beneath your text</li> </ul> <p>You can also right-click on the window and select the <b>Create new Discussion</b> menu option. All new discussions are added underneath existing discussion threads.</p>	
<b>Add a response</b>	<p>Double-click on the <i>Post Reply</i> message and type your response in as continuous text.</p> <p>When you have finished typing, click off the text or press <b>Enter</b>.</p> <ul style="list-style-type: none"> <li>• A  icon, your user ID and the date and time of posting display above your text</li> <li>• The message <i>Post Reply</i> displays beneath your text</li> <li>• The number of responses posted displays or is incremented to the left of the original posting</li> </ul>	

Operation	Action	See also
	<p>You can also right-click on a post and select the <b>Post Reply</b> menu option. All new discussions are added underneath existing discussion threads.</p>	
<b>Set discussion status</b>	<p>The icon against a new discussion indicates that the discussion has the status of <b>Open</b>. To change the status, right-click on the discussion item and select either:</p> <ul style="list-style-type: none"> <li>• <b>Discussion Status   Awaiting Review</b> (  ) or</li> <li>• <b>Discussion Status   Closed</b> (  )</li> </ul> <p>If the discussion already has one of these statuses, you can also select the <b>Open</b> option to return the discussion to <b>Open</b> status.</p> <p>The status settings are simply labels - they do not have an impact on posting replies, deleting replies or deleting the discussion.</p>	
<b>Edit postings</b>	Once a discussion or reply has been posted, you cannot edit it.	
<b>Delete a discussion or reply</b>	<p>Right click on the original discussion or a reply, and select the <b>Delete Selected</b> menu option. A prompt displays to confirm the deletion. Click on the <b>Yes</b> button.</p> <p>If you delete a discussion, all replies associated with that discussion will be deleted as well.</p> <p>If you delete a reply in a thread, the count of replies against the original posting is decremented.</p>	
<b>Review Discussion History</b>	<p>Click on the History tab to display a table of <b>all</b> existing discussion items on elements. You can:</p> <ul style="list-style-type: none"> <li>• Add to or reduce the number of columns using the <b>Field Chooser</b>, and display the <b>Filter bar</b> to filter the list for discussions having a specific property such as the user who <b>posted the discussion item</b>, or the person who created the <b>element</b> (element author)</li> <li>• List the discussions posted over a number of days - either <b>Today</b> or <b>7</b>, <b>30</b> or <b>90</b> days prior to today, by right-clicking on the display and selecting the <b>Visible Timeframe</b> option</li> <li>• Locate the element in a discussion in the Project Browser or diagrams</li> <li>• Open a discussion to read the full text and replies in a review window; you cannot operate on or delete the discussions in this window</li> </ul>	<a href="#">Customizing the Search View</a> <sup>708</sup>

### 3.6.5 Workflow Scripts

Workflow scripts validate user work and actions against the policy and procedures within your model, providing a robust approach to applying company policy and strengthening project development guidelines.

Project Administrators can write workflow scripts to manage the way users interact with a model, such as managing security, staff compliance and model access, and monitoring changes made by users. Administrators can also use the scripts to control a user's capacity to change a model element, taking into account factors such as access rights, group membership and even the value of a proposed change.

#### **Access Tools | Scripting**

#### **Application of Workflow scripts**

Topic	Detail	See also
<b>Project Governance</b>	<p>Good corporate governance relies on well written and transparent project development guidelines and company policy.</p> <p>A project might be compromised if the appropriate policies and procedures are poorly understood and not followed correctly - effective governance can be hampered by human error and the costs of recovering from the inadequate compliance of developers.</p>	
<b>Policies, Procedures and Development</b>	<p>Company policy and procedures can be integrated with the development process to manage work flows, determine access rights, extend role based security permissions and respond to property change events.</p> <p>This approach reduces compliance costs, enhances collaborative development and gives you confidence that projects are being developed correctly the first time around.</p> <p>Development teams can adhere to best practice guidelines that govern model validation, change management, access controls and general development principles.</p>	
<b>Script Implementation</b>	<p>When a model is launched, the Workflow Engine is initialized with the current user and group memberships; this information determines who can access and modify parts of a given model.</p> <p>When a selected event occurs, the script engine is initialized with values including the author's name and access rights, and the element name and version details.</p> <p>The workflow script implements rules governing change management, access control and model validation; if a user attempts to make changes in violation of company policy, the script denies the update.</p> <p>The user is notified why the validation failed and the activity is logged.</p> <p>These reminders help to reinforce company policy, reduce human error and provide management with valuable project feedback.</p>	

**Notes**

- Workflow Scripting is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- Workflow Scripting requires User Security to be enabled in order to function
- You need **Admin Workflow** permission to develop and manage workflow scripts

### 3.6.5.1.3 Filled Workflow Data Structures

These workflow data structures are objects that Enterprise Architect fills.

Workflow Data Structure	Description	Calls	See also
<b>WorkflowUser</b>	<p>This object provides information about the user currently logged in to the model.</p> <p>It is filled by Enterprise Architect before any function is called by Enterprise Architect; it has the following properties:</p> <ul style="list-style-type: none"> <li>• <b>Username</b> - the username for login to the system (if using Windows Authentication, this matches the Windows username)</li> <li>• <b>Firstname</b> - as found in the Security Users dialog</li> <li>• <b>Surname</b> - as found in the Security Users dialog</li> <li>• <b>Fullname</b> - the combination &lt;<b>Firstname</b>&gt; &lt;<b>Surname</b>&gt; (the form Enterprise Architect uses for <b>Author</b> fields and similar)</li> </ul>	<p>This object calls the <b>IsMemberOf (GroupName)</b> function (see below).</p>	<p><a href="#">Maintain Users</a> [323]</p>
<b>WorkflowContext</b>	<p>This object provides information about the object currently in context.</p> <p>It is filled by Enterprise Architect before any searches except <b>GetWorkflowTasks</b> are run; it has the following properties:</p> <ul style="list-style-type: none"> <li>• <b>MetaType</b> - the type of the current object, either an Enterprise Architect core type or a profile-specified metatype</li> <li>• <b>Name</b> - as found in the object Properties dialog</li> <li>• <b>Status</b> - as found in the object Properties dialog</li> <li>• <b>Phase</b> - as found in the object Properties dialog</li> <li>• <b>Version</b> - as found in the object Properties dialog</li> <li>• <b>Stereotypes</b> - an array of strings for the stereotypes applied to this object</li> <li>• <b>Tags</b> - an array of Tagged Values, providing: <ul style="list-style-type: none"> <li>• <b>Name</b> - the Tagged Value name</li> <li>• <b>Value</b> - the Tagged Value value</li> </ul> </li> <li>• <b>Tests</b> - an array of tests; only filled during an <i>Allow*</i> call after the <i>PreAllow*</i></li> </ul>	<p>This object calls the <b>TagValue (TagName)</b> function (see below).</p>	<p><a href="#">Functions - Create a Search With User Tasks</a> [370]</p> <p><a href="#">Working on Test Records</a> [2605]</p>

Workflow Data Structure	Description	Calls	See also
	<p>call has specified that tests are required; provides the following details, as found in the Testing window:</p> <ul style="list-style-type: none"> <li>• <b>Name</b></li> <li>• <b>Status</b></li> <li>• <b>RunBy</b></li> <li>• <b>CheckedBy</b></li> <li>• <b>TestClass</b></li> <li>• <b>TestType</b></li> </ul>		

Function	Action	Return Value
<b>IsMemberOf (GroupName)</b>	Check the group membership of the current user.	Returns the value <b>True</b> if the current user is a member of the group with the specified name.
<b>TagValue (TagName)</b>	Get the value from a named tag.	Returns the value of the first Tagged Value with that name, or an empty string if no Tagged Value with that name exists.

#### 3.6.5.1.4 Workflow Data Structures You Fill

These two workflow data structures are objects that you can fill.

Workflow Data Structure	Description
<b>WorkflowStatus</b>	<p>Use this data structure to provide information on the status of the object.</p> <ul style="list-style-type: none"> <li>• <b>LogEntry</b> - set to <b>True</b> or <b>False</b> to indicate whether or not a log item should be recorded</li> <li>• <b>Reason</b> - indicate what reason should be recorded in the log</li> <li>• <b>Action</b> - indicate how to display the log message; valid values are: <b>MessageBox</b>, <b>StatusBar</b>, <b>Output</b> (default)</li> </ul>
<b>WorkflowSearches</b>	<p>Use this data structure to provide an array of searches.</p> <p>Use <b>Redim WorkflowSearches(x)</b> to specify the number of searches being provided.</p> <p>Each search has the following attributes:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> - the name of this search</li> <li>• <b>Group</b> - the name of the group that this search should appear under in the <b>Search</b> combo box</li> </ul>

Workflow Data Structure	Description
	<ul style="list-style-type: none"> <li>• <b>ID</b> - the GUID for this search</li> <li>• <b>Tasks</b> - the array of tasks that this search looks for; an entry describes how to find all objects required to meet a particular task: <ul style="list-style-type: none"> <li>• <b>Name</b> - the name of the task, as displayed in the Search view; workflow searches are grouped by this field by default</li> <li>• <b>Conditions</b> - an array of conditions, all of which must be matched for an object to be included in this task; a condition is a comparison of a single field to a value: <ul style="list-style-type: none"> <li>• <b>Column</b> - the name of the field</li> <li>• <b>Operator</b> - operator types, either = (provide matching values only) or &lt;&gt; (provide non-matching values only)</li> <li>• <b>Value</b> - if this contains a comma, the string is treated as a comma separated list of values to compare against; otherwise the string is a single value to compare against</li> </ul> </li> </ul> </li> </ul>

#### 3.6.5.1.5 Functions You Call

These are functions that Enterprise Architect provides for you to call.

Function	Action	Return Value	See also
<b>NewSearch(name, group, guid, taskcount)</b>	Create a new search object to be included in <b>WorkflowSearches</b> . Initialize each member.	The created search	<a href="#">Workflow Data Structures You Fill</a> <sup>[372]</sup>
<b>NewTask(name, conditioncount)</b>	Create a new task object to be included in a search. Initialize each member.	The created task	
<b>NewCondition(column, operator, value)</b>	Create a new condition object to be included in a task. Initialize each member.	The created condition	
<b>SetLastError(message, outputMethod)</b>	Called on user input to the following element properties: <ul style="list-style-type: none"> <li>• Status</li> <li>• Phase</li> <li>• Version, and</li> <li>• Tagged Values</li> </ul> <p>It logs and/or reports the provided message to the user. It can be called within the functions:</p>	The message	

Function	Action	Return Value	See also
	<ul style="list-style-type: none"> <li>• AllowPhaseUpdate</li> <li>• AllowStatusUpdate</li> <li>• AllowTagUpdate</li> <li>• AllowVersionUpdate</li> <li>• preAllowPhaseUpdate</li> <li>• preAllowStatusUpdate</li> <li>• preAllowTagUpdate</li> <li>• preAllowVersionUpdate</li> </ul> <p>For example:</p> <pre> public function AllowPhaseUpdate ( OldValue, NewValue )      AllowPhaseUpdate = false      Set Last Error " No updating to phase allowed", "messagebox"  end function </pre> <p>Parameters:</p> <p>message: Text</p> <p>outputMethod can be "messagebox", "statusbar" or "outputwindow".</p> <p>outputmethod is case sensitive.</p>		

### 3.6.6 Sharing Reference Data

You can conveniently update your models with reference data (including Glossary and Issue information) by exporting the data to and importing the data from .XML files to (for example):

- Copy glossaries from one model to another
- Add additional profiles by merging new stereotypes into the model
- Update reference data from files supplied by Sparx Systems as a maintenance release
- Copy resources, clients and so on from one model to another

You import data into the model automatically or manually from a reference data .XML file, exported from another model or an iteration of the current model.

#### Learn more

- [Reference Data](#) <sup>[1146]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

- [Export Reference Data](#)<sup>[376]</sup>
- [Link Reference Data to a Shared Repository](#)<sup>[375]</sup>

### 3.6.6.1 Link Reference Data to a Shared Repository

If you have a number of projects that use the same sets of reference data, you can use a central project containing that common data as a **shared repository**. The common data includes system resources such as Security Users and Groups, Glossary terms or Data Types. Shared repositories make it possible for teams working on multiple projects to leverage a common and consistent set of system resources. Common standards and definitions can be applied across all projects using this repository. Anytime a new project is started, that project can automatically inherit some or all of these common resources from the repository; there is no need to establish these resources again for each project.

Shared repositories apply to Database Management System (DBMS) based Enterprise Architect projects and can link all projects residing within one DBMS.

A new DBMS based project in Enterprise Architect is initially created with its own stand-alone repository. A single step process then allows that new project to be linked to the shared repository residing on its DBMS. Any older or pre-existing Enterprise Architect projects can also be linked to the shared repository, taking their resource data from the master version. This then allows for centralized management of the contents of the repository, promoting or enforcing common usage and standards.

Any changes to the shared repository are automatically available to every participating project.

**Access**   **Tools | Data Management | Shared Repository**

#### Set up a shared repository

Step	Action	See Also
1	Create the script file to set up the shared repository, as explained in the next table.	
2	Execute the generated SQL script using a third-party tool.	

#### Select the repository tables to share

Field/Button	Action	See also
<b>Script File</b>	Type in or browse ( ... ) to the location into which the script file will be generated by this dialog.	
<b>Main Repository</b>	Type in the name of the current main repository.	
<b>Shared Repository</b>	Type in the name of the database to be used as the shared repository.  This name cannot be the same as the name of the main repository.	

Field/Button	Action	See also
<b>Table Groups</b>	In the list of table groups that can be linked to the shared repository, select the checkbox against each table group to share in the repository.	
<b>Tables in each group</b>	(Read only) Review the list of database tables in the currently-selected table group. All of these tables in the selected group will be available through the shared repository.	
<b>Generate</b>	Click on this button to generate the SQL script to link the selected tables of the current (main) repository to the shared repository. The script is generated into the file location you specified in the <b>Script File</b> field.	
<b>View Script</b>	Click on this button to open the generated script file in the default Code Editor, and to close the dialog.	<a href="#">Editing Source Code</a> 
<b>Close</b>	Click on this button to close the dialog.	

#### Notes

- This feature is not applicable to projects that are based on local project files (.eap or .feap)
- Shared repositories are supported for MySQL, SQL Server and Oracle

### 3.6.6.2 Export Reference Data

When you have a complete project set up, with fully defined project data, it is possible to capture either selected categories or all categories of that data, and export it to a single XML file. You can then review the data, and import it to another project or tool so that you do not have to define it all again. The exported data includes **all instances** of the selected data **type** in the project; for example, all defined cardinality values, or all Document Style Templates.

**Access** [Project](#) | [Model Import/Export](#) | [Export Reference Data](#)

#### Select and Export Reference Data

Step	Action	See also
1	On the Export Reference Data dialog, click on the '+' box against each table group you want to expand.	
2	Select the checkbox against each table or table group to export.	<a href="#">Constraint Status Types</a>  <a href="#">Constraint Types</a> 

Step	Action	See also
	<p>If you select the top-level, group-name checkbox, all tables in that group are selected for export.</p>	<p> <a href="#">Difficulty Types</a> <sup>[1163]</sup>  <a href="#">Priority Types</a> <sup>[1164]</sup>  <a href="#">Requirement Types</a> <sup>[1166]</sup>  <a href="#">Scenario Types</a> <sup>[1167]</sup>  <a href="#">Status Colors</a> <sup>[1159]</sup> (colors defined for status types)  <a href="#">Status Types</a> <sup>[1159]</sup>  <a href="#">Status Types - Application</a> <sup>[1159]</sup> (elements to which status can be applied)  <a href="#">Test Status Types</a> <sup>[1165]</sup>  <a href="#">Type Default</a> <sup>[1163]</sup> (the defined default value for each General Types data type; for example, as set on the Difficulty tab)    <a href="#">Model Authors</a> <sup>[1153]</sup>  <a href="#">Project Clients</a> <sup>[1157]</sup>  <a href="#">Project Resources</a> <sup>[1156]</sup>  <a href="#">Project Roles</a> <sup>[1155]</sup>    <a href="#">General Effort Types</a> <sup>[522]</sup>  <a href="#">Defined Metric Types</a> <sup>[523]</sup>  <a href="#">Risk Types</a> <sup>[524]</sup>    <a href="#">Defined Problem Types</a> <sup>[1169]</sup>  <a href="#">Maintenance Types</a> <sup>[1169]</sup> (Problem Types plus Test Types)  <a href="#">Test Types</a> <sup>[1170]</sup>    <a href="#">Cardinality Types</a> <sup>[1151]</sup>  <a href="#">Tagged Value Types</a> <sup>[1621]</sup>  <a href="#">Stereotypes</a> <sup>[1461]</sup> (as listed on the Stereotypes page of the UML Types dialog)  <a href="#">UML Patterns (Resources)</a> <sup>[1464]</sup>    <a href="#">Estimation - Environment Complexity Factor Values</a> <sup>[586]</sup>  <a href="#">Estimation - Technical Complexity Factor Values</a> <sup>[585]</sup>  Standard Complexity Types <a href="#">a</a> </p>

Step	Action	See also
		<p><a href="#">Predefined Reference Data Tagged Value Type</a> <sup>[1629]</sup></p> <p><a href="#">Security - Groups</a> <sup>[320]</sup></p> <p><a href="#">Security - Group Permission</a> <sup>[321]</sup></p> <p><a href="#">Security - Users</a> <sup>[323]</sup></p> <p><a href="#">Security User Groups</a> <sup>[326]</sup></p> <p><a href="#">Security - User Permissions</a> <sup>[327]</sup></p> <p><a href="#">Calendar of Events</a> <sup>[574]</sup></p> <p><a href="#">Calendar Event Types</a> <sup>[577]</sup></p> <p><a href="#">Model Images</a> <sup>[860]</sup></p> <p><a href="#">Project Issues</a> <sup>[528]</sup></p> <p><a href="#">Project Glossary</a> <sup>[533]</sup></p> <p><a href="#">Project Tasks</a> <sup>[526]</sup></p> <p><a href="#">Diagram Matrix Profiles</a> <sup>[854]</sup> (Model Profiles)</p> <p><a href="#">Gap Matrix Profiles</a> <sup>[745]</sup></p> <p><a href="#">Linked Document Templates</a> <sup>[1098]</sup> (each of the Linked Document templates in the Resources window)</p> <p>RTF Document Templates (each of the <a href="#">Document Report Style templates</a> <sup>[2684]</sup> in the Resources window)</p> <p>Templates - RTF <a href="#">Project Constants</a> <sup>[2664]</sup></p> <p>Templates - RTF Style (the <a href="#">Legacy RTF Style templates</a> <sup>[2726]</sup> in the Resources window)</p> <p>Templates - RTF Style Detail (the content of the Legacy RTF Style templates)</p> <p>Templates - RTF Tag &amp; Language Options (RTF <a href="#">word substitution</a> <sup>[2725]</sup> templates)</p> <p>Templates - HTML Style (the <a href="#">web templates</a> <sup>[2747]</sup> listed in the Resources window)</p>

Step	Action	See also
		<p>Templates - HTML Style Detail (the content of the HTML report templates)</p> <p>Model Data Types - <a href="#">Code</a><sup>[1171]</sup> and <a href="#">DDL</a><sup>[2350]</sup> (for each programming language supported by Enterprise Architect)</p> <p><a href="#">Macro List</a><sup>[2257]</sup> (Preprocessor macros)</p> <p><a href="#">Import Component Types</a><sup>[2249]</sup></p> <p><a href="#">Automation Scripts</a><sup>[2791]</sup> (JavaScript, JScript and VBScript)</p> <p><a href="#">Team Review</a><sup>[343]</sup></p> <p>Code language templates and/or transformation templates, where <a href="#">templates</a><sup>[1632]</sup> for a particular language or transformation exist in the model</p> <p><a href="#">CSV</a><sup>[498]</sup> Specifications</p>
3	Click on the <b>Export</b> button.	
4	When prompted to do so, enter a valid file name with a . XML extension.	
5	Click on the <b>Save</b> and <b>OK</b> buttons.  This exports the data to the file; you can use any text or XML viewer to examine the file.	

### Notes

- You can resize the Export Reference Data dialog; drag the dialog edges to the size you need
- If there are no instances of a selected data type in the project, the export does not generate any output for that data type in the XML file
- Currently, Standard Complexity Types cannot be directly edited and are therefore effectively standard for **all** models; they can be listed using the Predefined Reference Data Tagged Value type *ComplexityTypes*

Learn more

- [Import Reference Data](#)<sup>[380]</sup>

**3.6.6.3 Import Reference Data**

It is possible to import reference data into your model from an .xml file that was exported from another model or from an iteration of the current model, either:

- Manually, whenever you know there is new or changed data to apply, or
- Automatically whenever the model is reloaded into Enterprise Architect (if the file has changed since the previous import)

The automatic import checks if the source file has changed since the last import; if the file has not changed, the import does not proceed. If the file has changed, the changed data is imported; however, you can configure the system to display a prompt for you to allow or cancel the import.

**Access**    **Project | Model Import/Export | Import Reference Data > Import File**  
**Project | Model Import/Export | Import Reference Data > Shared File**

Import reference data manually (Import File)

Step	Action	See also
1	On the Import Reference Data dialog, click on the Import File tab and on the <b>Select File</b> button, then select the filename to import data from.  This would be an XML file produced by the Enterprise Architect Data Exporter.	<a href="#">Export Reference Data</a> <sup>[376]</sup>
2	If you have selected a valid file, a list of available tables to import displays in the Select Datasets to Import panel.	
3	Click on one or more of the tables to import.  Press <b>(Ctrl)</b> or <b>(Shift)</b> to click on multiple tables.	
4	Click on the <b>Import</b> button to start the process.  A message displays when the import is complete; generally the process is quite fast.	

Import reference data automatically (Shared File)

Step	Action	See also
1	On the Import Reference Data dialog, click on the Shared File tab.	

Step	Action	See also
2	If you are changing an existing configuration to import from a different XML file, click on the <b>Clear</b> button to clear the dialog fields.	
3	Click on the <b>Select File</b> button and browse for the filename to import data from. This would be an XML file produced by the Enterprise Architect Data Exporter.	
4	If you have entered the name of a valid file, a list of tables to import displays in the Datasets in File panel.  Click on one or more of the tables to import. Press <b>(Ctrl)</b> or <b>(Shift)</b> to click on multiple tables.	<a href="#">Export Reference Data</a> <sup>[376]</sup>
5	If you prefer to control whether or not the automatic import takes place, select the <b>Always prompt before import</b> checkbox.	
6	Click on the <b>Import</b> button to import the reference data now, and to enable the automatic check and import for subsequent reloads.	

### Notes

- Concerning General Types data:
  - For Statuses, Constraints, Requirements and Scenarios, the imported data is merged with the existing data; if a record already exists it is updated to the new values, and if the record does not exist, a new record is added - records are never deleted
  - For Constraint Status Types, Difficulty, Test Status and Priority, the complete existing list is replaced by the imported list
- Concerning Calendar events and event types, Team Review configurations, Patterns and Gap Matrix Profiles:
  - The imported data is merged with the existing data; if a record already exists it is updated to the new values, and if the record does not exist, a new record is added - records are never deleted

## 3.7 Change Management

As your users develop their models in the project, you need to monitor and control the changes they make to their own data and to data that they might share. Enterprise Architect provides a number of tools and facilities for managing and protecting the data in a project.

### Topics

Topic	Detail	See also
<b>Version Control of Packages</b>	<p>Enterprise Architect Model Version Control enables you to:</p> <ul style="list-style-type: none"> <li>• Coordinate sharing of packages between users, with either read-only access or update access, ensuring that work on different areas of the model is coordinated and synchronous rather than conflicting</li> <li>• Save and retrieve a history of changes to packages</li> </ul> <p>To use version control in Enterprise Architect, you require a third-party source-code control application such as:</p> <ul style="list-style-type: none"> <li>• Subversion</li> <li>• CVS</li> <li>• MS Team Foundation Server (TFS), or</li> <li>• Any other version control product that complies with the Microsoft Common Source Code Control standard</li> </ul>	<a href="#">Version Control</a> [383]
<b>Tracking Changes</b>	<p>Enterprise Architect provides two separate but complementary facilities for tracking changes to data across the project:</p> <ul style="list-style-type: none"> <li>• Auditing of model changes</li> <li>• Baselining and differencing to capture and roll back changes</li> </ul>	<a href="#">Tracking Changes</a> [445]

### 3.7.1 Version Control

Within Enterprise Architect, you can manage changes to and revisions of your projects by placing **individual** model packages, view nodes or root nodes under **version control**. Version control provides numerous key facilities, including:

- Saving a **history of changes** to packages
- The ability to retrieve **previous revisions** of packages
- Propagating model updates **between team members**
- Coordinating the **sharing of packages** between team members

You apply version control through a **third-party source-code control application** that manages access to and stores revisions of the controlled packages. Once the version control software has been installed and configured, you must define a **Version Control Configuration** within your project. You can then use version control to manage changes to the packages of your model.

#### Notes

- Sparx Systems strongly urge you not to manipulate version controlled package files outside of Enterprise Architect; it is possible to leave the package files in a state that Enterprise Architect cannot recognize
- Database replication should not be combined with version controlled packages
- If the packages under version control contain any alternative images and those images are subject to frequent change, you can set the **Export alternate images** option on the Options dialog to export the images to the version control repository when you check in the packages; if the images are not subject to frequent change, do not select this option and instead use **Export / Import Reference Data** to manage alternative images

#### Learn more

- [Introduction](#)<sup>[383]</sup>
- [Version Control Product Set-up](#)<sup>[394]</sup>
- [Version Control Setup](#)<sup>[413]</sup>
- [Use Version Control](#)<sup>[422]</sup>

#### 3.7.1.1 Introduction

Enterprise Architect's version control integration provides several key facilities, including:

- Saving a **history of changes** made to your model's packages
- Retrieving **previous revisions** of packages
- **Propagating model updates** between team members
- Coordinating the **sharing of packages** between team members

There are a number of factors to consider when setting up and using version control in your model development.

#### Factors to consider

Factor	Detail	See also
<b>System Requirements and Configuration</b>	<p>You apply version control through a <b>third-party source-code control application</b> that manages access to and stores revisions of the controlled packages.</p> <p>Typically the configuration consists of:</p> <ul style="list-style-type: none"> <li>• A server component that manages a version control repository, and</li> <li>• Client components on the workstations, that manage local working copies of controlled files</li> </ul> <p>Enterprise Architect uses the client component to communicate with the server. A version control client must be installed on every machine where you run Enterprise Architect and want to access your version control system.</p>	<a href="#">System Requirements</a> <sup>[395]</sup>
<b>Version Control Usage</b>	<p>There are two main ways in which projects can be deployed:</p> <ul style="list-style-type: none"> <li>• <b>Centralized Shared Model</b></li> <li>• <b>Distributed Private Models</b></li> </ul> <p>Version control is employed in the same way for both scenarios; however, when using <b>Private Model</b> deployment you have the additional facility of propagating model updates throughout the team.</p> <p>Version Control can also be used to share standard packages between different projects.</p>	<a href="#">Version Control Usage</a> <sup>[385]</sup>
<b>Team Deployment</b>	<p>Consider the process of setting up a version control environment and applying version control to a project to be accessed by <b>a number of users</b>.</p>	<a href="#">Applying Version Control in a Team Environment</a> <sup>[389]</sup>
<b>Version Control Basics</b>	<p>Enterprise Architect enforces <b>serialized editing</b> of version controlled packages, using the <b>lock-modify-unlock</b> mode of operation.</p>	<a href="#">Version Control Basics</a> <sup>[387]</sup>
<b>Applying Version Control to Models</b>	<p>Using version control consists of placing <b>individual model packages</b> under version control, rather than version controlling the project as a whole.</p>	<a href="#">Version Control Of Model Data</a> <sup>[386]</sup> <a href="#">Version Control Nested Packages</a> <sup>[390]</sup>

Factor	Detail	See also
<b>Version Control and Project Reference Data</b>	To share changes in <b>reference data</b> between users in a version-controlled project deployed as multiple <b>private models</b> , you periodically <b>export</b> the reference data from the model where the changes were made, and <b>import</b> it into the other models maintained by the team.	<a href="#">Version Control and Reference Data</a> <sup>[387]</sup>
<b>Offline Version Control</b>	You can prevent the system from attempting to make any version control connections by choosing to <b>Work Offline</b> before loading a model.  If Enterprise Architect is unable to connect a Version Control Configuration for any reason, it displays warning messages to notify you and provides 'offline' version control functionality for all packages associated with the failed connection.	<a href="#">Offline Version Control</a> <sup>[392]</sup>

#### Notes

- Packages under version control are identified in the Project Browser by **icons** that indicate the current **status** of the package

#### Learn more

- [Project Browser Indicators](#) <sup>[391]</sup>
- [Version Control Branching](#) <sup>[394]</sup>

#### 3.7.1.1.1 Version Control Usage

The version control facility can be used in many different ways, although these roughly fall into one of four types of use as discussed here.

#### Usage

Type	Usage	See also
<b>Single Shared model</b>	Users <b>share</b> a model stored in a <b>central</b> project file or DBMS repository. In this configuration you can view changes to other users' Packages without explicitly having to check them out, by simply refreshing your view of the model.  Version control is used to: <ul style="list-style-type: none"> <li>• Archive successive versions of your work to date</li> <li>• Maintain Package revision history</li> <li>• Recover from unwanted changes or accidental deletions, through an 'undo' facility</li> <li>• Regulate access to Packages</li> </ul>	
<b>Multiple Private models</b>	<b>One</b> model is created by a single user who configures it for version control. The model file is then <b>distributed</b> to other users, with each user	

Type	Usage	See also
	<p>storing <b>their own private copy</b> of the model.</p> <p>Version control is used to:</p> <ul style="list-style-type: none"> <li>• Propagate changes to the model, throughout the team</li> <li>• Archive successive versions of your work to date</li> <li>• Maintain Package revision history</li> <li>• Recover from unwanted changes or accidental deletions, through an 'undo' facility</li> <li>• Regulate access to Packages</li> </ul>	
<b>Shared Packages</b>	<p>Individual users create <b>separate</b> models but <b>share</b> one or more <b>Packages</b>:</p> <ul style="list-style-type: none"> <li>• Users share Packages through version control</li> </ul>	
<b>Standard Packages</b>	<p>A company might have a <b>standard set</b> of read-only Packages that are broadly <b>shared</b>:</p> <ul style="list-style-type: none"> <li>• Individual users retrieve Packages with the <b>Get Package</b> menu option</li> </ul>	

#### Learn more

- [Version Control Best Practices for Enterprise Architect](#) (Online Resource)

#### **3.7.1.1.2 Version Control of Model Data**

When applying version control in Enterprise Architect, you place individual model packages under version control, and not the project as a whole.

All Enterprise Architect models are stored in databases - even the .eap file is an MS Jet database. In simple terms, the project file is a **single entity** of **binary data**. Being binary data, the project file would require the use of the **lock-modify-unlock** model of version control, which would mean that only a **single user** at a time could work on any given (version controlled) model. Therefore, it is not practical to apply version control to the database (.eap file) as a whole; this can also create problems for you:

- Most version control systems mark their controlled files as **read only**, unless they are specifically checked-out to you
- The .eap file is an MS Jet database, and Enterprise Architect must be able to open this file for **read/write** access when you load your model; the system displays an error message and fails to load the model if it is read-only

#### **Version Controlling Packages in your Model**

To overcome the limitations described above, Enterprise Architect exports discrete **units** of the model - the **packages** - as **XMI package files**, and it is **these XMI files**, not the project file, that are placed under version control. The XMI file format used by Enterprise Architect dictates that they too be treated as binary files - therefore it is not possible to merge the XMI files either; however, by splitting the model into much smaller parts, many users can work on separate parts of the model simultaneously.

### Version Controlled Nested Packages

Version controlled **nested** packages result in much smaller XML files being exported, as the **parent packages'** XML files do not contain any content for the version controlled **child** packages.

Version control of nested packages, together with a model structure of small individual packages, provides greater scope for multiple users to work concurrently, as individual users are locking much smaller parts of the model.

#### Learn more

- [Version Control Basics](#)<sup>[387]</sup>

#### **3.7.1.1.3 Version Control and Reference Data**

Reference data is data that is used **across** a model or project; it is **not package-specific**. Version control operates at **package level**, and therefore does not capture changes in reference data. Where version control is used in a multiple private model set up, changes in reference data are not brought into the model when packages are updated from version control.

In a Shared Model environment, all users are accessing **the same** project reference data. Changes in reference data can be shared between users in a version-controlled project deployed as **multiple private models**, by periodically **exporting** the reference data from the model where the changes were made, and **importing** it into the other models maintained by the team.

Reference data is exported and imported as an **XML** file, which contains whatever types of reference data you want to transfer. You **can** place your project reference data under version control by exporting the data as an XML file and apply version control **to that file** using your version control software **external** to Enterprise Architect.

#### Learn more

- [Reference Data](#)<sup>[1146]</sup>
- [Sharing Reference Data](#)<sup>[374]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

#### **3.7.1.1.4 Version Control Basics**

Enterprise Architect implements version control of your model by **exporting package data** from the project database to **XML package files**, which are placed under version control in the **source-code control application**. The XML file format cannot be **merged** in the same way as ordinary text files can be merged, which is why Enterprise Architect must enforce **serialized editing** of version controlled packages, as discussed below.

### The Lock-Modify-Unlock Solution

Many version control systems use a **lock-modify-unlock** model to address the problem of different authors in a shared source overwriting each other's work. In this model, the version control repository allows only one person to change a file at a time, and access is managed using locks.

Harry must lock a file before he can begin making changes to it. If Harry has locked a file, Sally cannot also lock it, and therefore cannot make any changes to that file. All she can do is read the file, and wait for Harry to finish his changes and release the lock. After Harry unlocks the file, Sally can take her turn in locking and editing the file.

### The Copy-Modify-Merge Solution

Subversion, CVS and a number of other version control systems use a **copy-modify-merge** model as an alternative to locking. In this model, each user's client contacts the project repository and creates a **personal working copy** - a local reflection of the repository's files and directories. Users then work **simultaneously and independently**, modifying their private copies. In due course, the private copies are **merged** together into a new, final version. The version control system often assists with the merging, but ultimately a person is responsible for making it happen correctly.

### When Locking is Necessary

While the lock-modify-unlock model is generally considered a hindrance to collaboration, there are still times when locking is necessary.

The copy-modify-merge model is based on the assumption that files are contextually merge-able: that is, that the files in the repository are line-based text files (such as program source code). However, for files with **binary** formats, such as artwork or sound, it is often impossible to merge conflicting changes. In these situations, it really is necessary for users to take strict turns in changing the file. Without serialized access, some users end up wasting time on changes that are ultimately overwritten.

### Learn more

- [Add Connectors To Locked Elements](#) <sup>388</sup>

#### **3.7.1.1.4.1 Add Connectors To Locked Elements**

Generally, when working in a diagram containing locked elements, you **cannot** add a connector to a locked element. However, this depends on the lock status of the source and target elements (or more precisely, the lock status of the parent packages of the source and target elements, when the source and target element are held in different packages). There are scenarios in which a connector **can** be created on a locked element.

### Lock Scenarios

Element Status	Add Connectors	See also
Source unlocked, target unlocked	Yes, any kind of connector can be added	
Source unlocked, target locked	Yes, except for Composition connectors	
Source locked, target unlocked	No, except for Composition connectors	
Source locked, target locked	No, prohibited for all connectors	

### Notes

- A connector can be added if its source is unlocked - you are modifying what the source can see
- The exception is Composition connectors, where the target (the parent) must be unlocked - you are

modifying the parent by adding children

- [Version Control Basics](#)<sup>[387]</sup>

#### **3.7.1.1.5 Applying Version Control in a Team Environment**

The process of **setting up** a version control environment and **applying** version control to a project to be accessed by a **number of users** is summarized below.

#### Version Control - Process Overview

Step	Action	See also
1	Install your version control product.	<a href="#">Version Control Product Setup</a> <sup>[394]</sup>
2	Create a version control repository.	
3	Create a version control project to be used with your Enterprise Architect project.	
4	<p>Check-out a working copy of the version control project (a module, project or folder within the version control system) into a local folder.</p> <p>You must do this for every team member that is accessing the version controlled packages, whether you are using a single shared model or each team member stores his own private copy of the model.</p>	<a href="#">Create a Local Working Copy</a> <sup>[399]</sup> (Subversion)  <a href="#">Prepare a CVS Local Workspace</a> <sup>[405]</sup>
5	<p>Within Enterprise Architect, define a version control configuration to provide access to the working copy files.</p> <p>The name of the version control configuration must be the same across all machines throughout a team. That is, all version control access to a given package must be through version control configurations with the same name, across all models and all users.</p> <p>The easiest way to perform this step, (throughout the team), is to have one user set up version control on the model and then share that model with the rest of the team.</p> <ul style="list-style-type: none"> <li>• In Shared Model deployment, all users connect to a single instance of the model database, so the model is shared automatically</li> <li>• In Private Model deployment, it is easiest to distribute copies of the original model (after version control has been set up) to all other members of the team</li> </ul> <p>Whenever you open a model (Private or Shared) that uses a version control configuration that is not yet defined on your workstation, a prompt displays to complete the definition for that configuration. This typically means specifying the local working copy directory and maybe choosing the version control project associated with this Enterprise Architect project.</p> <p>Once this has been done, the version controlled packages that already exist in</p>	<a href="#">Version Control Setup</a> <sup>[413]</sup>

	the model are ready for use.	
6	Configure packages within the Enterprise Architect model for version control. That is, apply version control to individual packages.	<a href="#">Configure Controlled Package</a> <sup>[424]</sup>
7	Check-out and check-in packages as required.	<a href="#">Check Out a Package</a> <sup>[431]</sup> <a href="#">Check In a Package</a> <sup>[432]</sup>

### Notes

- It is possible to use multiple version control configurations within the same model; different packages can still use different version control configurations within the model, as long as any given package is always accessed via the same version control configuration

### Learn more

Team deployment and the use of version control is discussed in two Sparx Systems white papers, available as on-line resources on the Sparx Systems web site:

- [http://www.sparxsystems.com/WhitePapers/Version\\_Control.pdf](http://www.sparxsystems.com/WhitePapers/Version_Control.pdf)
- [http://www.sparxsystems.com/downloads/whitepapers/EA\\_Deployment.pdf](http://www.sparxsystems.com/downloads/whitepapers/EA_Deployment.pdf)

#### 3.7.1.1.6 Version Control Nested Packages

When you save a package to the version control system, only stub information is exported for any nested packages. This protects information in a nested package from being inadvertently over-written by a top level package.

### Operations on Nested Packages

Operation	Detail	See also
<b>Checking Out</b>	When you check out a package, you do not modify or delete nested packages; only the top level package is modified.  As a consequence of this behavior, if you check out or get a version controlled package with nested packages that are not already in your model, you see stubs in the model for the nested packages only.	
<b>Get All Latest</b>	If you select the <b>Get All Latest</b> option from the version control menu, any new stubs are populated from the version control system.	<a href="#">Get All Latest</a> <sup>[427]</sup>
<b>Importing Models</b>	You can populate a large and complex model, by 'getting' only the root packages, then using <b>Get All Latest</b> to recursively iterate	<a href="#">Get Package</a> <sup>[436]</sup>

Operation	Detail	See also
	<p>through the attached and nested packages.</p> <p>This is a powerful and efficient means of managing your project and simplifies handling very large models, even in a distributed environment.</p> <p>The <b>Import a Model Branch</b> option combines the steps described above into a single operation.</p>	<a href="#">Import Controlled Model Branch</a> <sup>[438]</sup>

### Notes

- It is recommended that, when sharing a version controlled model, you do not mix versions of Enterprise Architect later than version 4.5 with earlier versions; if this is necessary it is best to go to the Version Control Settings dialog and deselect the **Save nested version controlled packages to stubs only** checkbox, setting Enterprise Architect to the pre-version 4.5 behavior (for the current model only)

#### 3.7.1.1.7 Project Browser Indicators

Packages under version control are identified in the Project Browser by icons that indicate the current status of the package.

### Indicators

Icon	Indicates that	See also
	<p>This package is version controlled and not checked out to you.</p> <p>You cannot edit the package (until you check out the package yourself).</p>	<a href="#">Check Out a Package</a> <sup>[437]</sup>
	<p>This package is version controlled and checked out to <b>you</b>.</p> <p>You can edit the package.</p>	
	<p>This package is version controlled, but you checked it out whilst not connected to the version control server.</p> <p>You can edit the package but there could be version conflicts when you check the package in again.</p>	<a href="#">Offline Version Control</a> <sup>[392]</sup>
	<p>This package is controlled and is represented by an XML file on disk, but it is not under version control.</p> <p>You can edit this package.</p>	<a href="#">Controlled Packages</a> <sup>[484]</sup>

### Learn more

- [Using Version Control](#)<sup>[422]</sup>

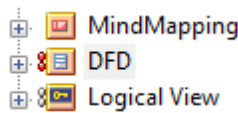

### 3.7.1.1.8 Offline Version Control

When loading a model that uses version control, Enterprise Architect normally initializes a connection to the version control system for each version control configuration defined in the model. If Enterprise Architect is **unable** to connect a version control configuration for any reason, it displays warning messages to notify you and provides **offline** version control functionality for all packages associated with the failed connection.

You can prevent Enterprise Architect from starting to make any version control connections, by selecting to work offline menu **before** loading your model.

Access    **Project | Version Control | Work Offline**

#### Working Offline

Concept	Discussion	See also
<b>Choosing to Work Offline</b>	<p>Selecting to work offline is useful if you know beforehand that Enterprise Architect cannot connect to your version control system. For example: If you are working on a laptop computer that is <b>disconnected</b> from your network, on an Enterprise Architect model that uses a large number of version control configurations, you can select to work offline before you load the model to avoid all the error messages that the system would normally display as each version control connection attempt failed.</p> <p>You can switch between working offline and working online at any time, either before or after a model is loaded, by toggling the <b>Work Offline</b> menu option. Enterprise Architect disconnects or reconnects version control (depending on the connection availability) according to your selection.</p>	
<b>Using Version Control Whilst Disconnected From the Version Control Server</b>	<p>Enterprise Architect 'remembers' the status of a model's version controlled packages. Packages that were checked out to you prior to disconnecting from the server are still shown as checked out to you, even though you are no longer connected to the server. You can still edit these packages as you normally would.</p> <p>Packages that were not checked out to you prior to disconnecting from the server are shown as version controlled and locked. You cannot edit these packages until you check them out.</p>	
<b>Offline Check Out</b>	<p>You can 'check-out' and edit a version controlled package even when your machine is disconnected from the version control server. In the example below, the <b>colored</b> 'figure 8' icon for <i>DFD</i> indicates that you have checked it out whilst <b>offline</b>.</p> <div style="text-align: center;">  <p>MindMapping DFD Logical View</p> </div> <p>(The <b>gray</b> 'figure 8' icon shown against <i>Logical View</i> indicates that you have checked out a version-controlled package <b>online</b>.)</p>	<a href="#">Project Browser Indicators</a> <sup>391</sup>

Concept	Discussion	See also
	<p>You should be aware that the version control system, and therefore other users, have no way of knowing that you have 'checked-out' a package whilst offline. It is not possible to <b>merge</b> changes to an XML file that result from two users editing the same package at the same time. If an offline checkout leads to two people editing the same package at the same time, when the changes are brought back online the <b>first-saved</b> set of changes is lost.</p>	
<b>Checking In a Package That Was Checked Out Offline</b>	<p>Once you reconnect your system to the version control server, if the package you checked out offline is not currently checked out by another user, you can check in that package. However, before Enterprise Architect checks in the package, it compares the local working copy of the package file with the latest revision in the repository. (These package files remain unchanged in your work area until Enterprise Architect exports the package again before checking in.) If the repository version <b>remains unchanged</b> from when you last updated your local copy, Enterprise Architect exports and checks in your package without further prompting.</p> <p>On the other hand, if the repository now contains a file that <b>has changed</b> since you last updated your local copy, checking in your package would <b>overwrite</b> those changes. Enterprise Architect displays a message warning you of the pending data loss and giving you the opportunity to abort the check in. At this point, you must decide whether to discard your own changes, using the <b>Undo Check Out</b> command, or continue with your check in and overwrite the changes that have been committed to the repository since you last updated your local copy from the repository.</p> <p>You can use the <b>File Properties</b> command to determine who checked in the last changes to this package. This might help you to discover what changes have been uploaded and decide whose changes take precedence.</p>	<p><a href="#">Package Version Control Menu</a> </p>
<b>Update Before You Disconnect</b>	<p>Whenever you are connected to the version control server, you are always working with the latest version of a package. This is because you cannot modify a package until you check it out from version control, and checking it out loads the latest revision from the repository into your model.</p> <p>This cannot happen when you are disconnected from the version control server. You are working on whatever versions you have on your machine, dating back to the last time you updated your local copy of each version controlled package. So, if you are planning to work on a model whilst disconnected from version control, it is a very good idea to make sure that you have the latest versions of all packages <b>before you disconnect</b>. The <b>Get All Latest</b> option makes this a simple task.</p>	<p><a href="#">Get All Latest</a> </p>

### 3.7.1.1.9 Version Control Branching

Currently, Enterprise Architect **does not** support Version Control Branching.

Work-arounds to achieve similar results might be possible for certain version-control products; contact **Sparx Support** for advice.

User Type	Contact via

### 3.7.1.2 Version Control Product Setup

To control and maintain the different revisions of your project packages, Enterprise Architect uses third-party version control products. Once your version control product is installed and a suitable environment has been created, Enterprise Architect can use that environment to control your project's packages.

Typically, version control products consist of:

- A server component
- A client component

Enterprise Architect integrates with the version control client components for Subversion, CVS and MS Team Foundation Server command line clients, as well as for products having API clients that comply with the MS SCCI specification.

#### Version Control System Components

Component	Detail	See also
<b>Version Control Server</b>	<p>The server component maintains the controlled files in their many revisions, in a central repository.</p> <p>The server component is usually located on a server machine that is accessible to all team members who are using version control.</p>	
<b>Server Configuration</b>	<p>The steps for configuring a version control server are, broadly:</p> <ul style="list-style-type: none"> <li>• Install the software</li> <li>• Create a repository</li> <li>• Create version control projects (or modules or folders for use with specific projects)</li> <li>• Configure user IDs and passwords</li> </ul> <p>For details on configuring any particular version control server, consult the appropriate documentation provided with the version control product.</p>	

Component	Detail	See also
<b>Version Control Client</b>	<p>The client component manages the working copies of the controlled files, submitting files to or retrieving files from the server as required.</p> <p>A version control client must be installed on every machine on which you run Enterprise Architect and want to access your version control system.</p>	
<b>Client Configuration</b>	<p>The steps for configuring a version control client are, broadly:</p> <ul style="list-style-type: none"> <li>• Install the software</li> <li>• Create a new directory for use as a local working copy folder</li> <li>• Log in to the version control server</li> <li>• Associate the working copy folder with its corresponding server repository folder</li> </ul> <p>For details on setting up a product-specific version control environment for use with Enterprise Architect, click on the appropriate link in the next column.</p>	<p><a href="#">Create a Subversion Environment</a> 397</p> <p><a href="#">Create a CVS Environment</a> 404</p> <p><a href="#">Create a TFS Environment</a> 408</p> <p><a href="#">Create an SCC Environment</a> 411</p>

### 3.7.1.2.1 System Requirements

Enterprise Architect is a Windows-based application and requires a Windows-based version control **client** for integration. It is independent of the version control **server** component and the platform on which that runs.

#### Version Control Product Requirements

Product	Detail	See also
<b>Subversion</b>	<p>Subversion is free, open source software.</p> <p>Subversion server components are available to run on a wide range of different hardware and operating systems.</p> <p>Enterprise Architect is not affected by your choice of <b>server</b> components, but requires Subversion's Windows-based command line <b>client</b> for integration.</p> <p>There are many graphical user interface clients available for use with Subversion, such as TortoiseSVN; this type of client <b>cannot be used directly</b> for integration with Enterprise Architect, but can be very useful in <b>preparing</b> a working Subversion environment for use by Enterprise Architect.</p> <p>Binary packages are available for download from:</p> <ul style="list-style-type: none"> <li>• <a href="http://subversion.apache.org/packages.html">http://subversion.apache.org/packages.html</a></li> </ul> <p>Subversion documentation is available from:</p> <ul style="list-style-type: none"> <li>• <a href="http://svnbook.red-bean.com/nightly/en/index.html">http://svnbook.red-bean.com/nightly/en/index.html</a></li> </ul>	<p><a href="#">Create a Subversion Environment</a> 397</p>

Product	Detail	See also
<b>Concurrent Versions System (CVS)</b>	<p>CVS is free, open source software.</p> <p>CVS server components are available to run on a wide range of different hardware and operating systems.</p> <p>Enterprise Architect is not affected by your choice of <b>server</b> components, but requires CVS's Windows-based command line <b>client</b> for integration.</p> <p>There are many graphical user interface clients available for use with CVS, such as TortoiseCVS; this type of client <b>cannot be used directly</b> for integration with Enterprise Architect, but can be very useful in <b>preparing</b> a working CVS environment for use by Enterprise Architect.</p> <p>The software is available for download from:</p> <ul style="list-style-type: none"> <li>• <a href="http://www.nongnu.org/cvs/">http://www.nongnu.org/cvs/</a></li> </ul> <p>CVS documentation is available from:</p> <ul style="list-style-type: none"> <li>• <a href="http://cvsbook.red-bean.com/cvsbook.html">http://cvsbook.red-bean.com/cvsbook.html</a></li> </ul>	<p><a href="#">Create a CVS Environment</a><sup>[404]</sup></p>
<b>Microsoft Team Foundation Server</b>	<p>Enterprise Architect is able to use either the:</p> <ul style="list-style-type: none"> <li>• Command line client for TFS, or</li> <li>• MS TFS-SCC client</li> </ul> <p>Your choice of client affects how you specify your Version Control Configuration.</p> <p>MS TFS-SCC clients are available for download from Microsoft's web pages:</p> <ul style="list-style-type: none"> <li>• <a href="#">Visual Studio 2005 Team Foundation Server MSSCCI Provider</a></li> <li>• <a href="#">Visual Studio Team System 2008 Team Foundation Server MSSCCI Provider</a></li> </ul>	<p><a href="#">TFS Settings</a><sup>[421]</sup></p> <p><a href="#">SCC Settings</a><sup>[417]</sup></p>
<b>Common Source Code Control (SCC)-compatible products</b>	<p>Any version control product that provides a client that complies with the Microsoft Common Source Code Control standard, version 1.1 or higher, can be integrated with Enterprise Architect.</p> <p>The following products are SCC-compatible and are known to successfully integrate with Enterprise Architect:</p> <ul style="list-style-type: none"> <li>• Accurev</li> <li>• ClearCase</li> <li>• MS Visual Source Safe</li> <li>• MS TFS-SCC</li> <li>• MKS Source Integrity</li> <li>• Perforce</li> <li>• Source Offsite</li> <li>• Snapshot CM</li> </ul>	

Product	Detail	See also
	Products that do not appear in this list should still integrate successfully with Enterprise Architect, if there is a <b>client</b> available for that product that complies with the MS SCC API specification.	

### 3.7.1.2.2 Create a Subversion Environment

You can use **Subversion** as a version control provider for Enterprise Architect. The first step in doing this is for a Subversion administrator to install and configure the appropriate software. A number of basic tasks are performed in creating an **operational Subversion environment**, and useful **tools** are available for performing some of these tasks.

#### Tasks in Creating a Subversion Environment

Task	Detail	See also
<b>Install server components</b>	<p>Executable files for Subversion can be obtained from the Apache Software Foundation.</p> <p>Subversion server components are available to run on a wide range of different hardware and operating systems; Enterprise Architect is not affected by your choice of server components.</p> <p><b>VisualSVN</b> is a package that can greatly simplify the installation, configuration and management of your Subversion server.</p>	<a href="#">Apache Subversion</a>  <a href="#">Official Subversion Documentation</a>
<b>Create a repository</b>	Please consult the official Subversion documentation.	
<b>Create Subversion users</b>	Please consult the official Subversion documentation.	
<b>Create a new repository sub-tree</b>	<p>It is good practice to create a new <b>repository sub-tree</b> in Subversion for <b>each</b> new Enterprise Architect model being added to version control with Subversion. Users should create a new local working copy from the sub-tree to be used with that model</p> <p><b>TortoiseSVN</b> can greatly simplify the process of creating new repository sub-trees.</p>	<a href="#">Create a Repository Sub-tree</a> <sup>[398]</sup> <a href="#">TortoiseSVN</a> <sup>[403]</sup>
<b>Install client components</b>	Executable files for Subversion can be obtained from the Apache Software Foundation.	<a href="#">Apache Subversion</a>
<b>Create a working copy folder</b>	A working copy folder must exist on each users' machine, for Enterprise Architect to use when exporting and importing the version controlled package files. It is this folder that is specified as the Local Project Path, when defining your Version Control Configurations.	<a href="#">Create a Local Working Copy</a> <sup>[399]</sup>

Task	Detail	See also
	<p>The working copy folder is the 'sandbox' where you modify the controlled files. The working copy folder is usually associated with a folder that exists within the version control repository. In Subversion, to create a local working copy you perform an initial check-out of a folder from the Subversion repository; this downloads a copy of the folder and its contents, to create your local working copy.</p> <p>TortoiseSVN can greatly simplify the initial check out of a working copy folder.</p>	<a href="#">TortoiseSVN</a> <sup>[403]</sup>
<b>Setting up Subversion under Wine/CrossOver</b>	The process of setting up and using Subversion with Enterprise Architect under Wine is almost identical to the process when running natively under Windows, apart from minor differences in installing the Subversion client and performing the initial check out of the working copy folder.	<a href="#">Subversion under Wine</a> <sup>[401]</sup>

#### Notes

- Enterprise Architect relies on exclusive file locking when applying version control to its packages; file locking was not introduced into Subversion until version 1.2, therefore Enterprise Architect does not work with Subversion releases earlier than Subversion 1.2
- Enterprise Architect can only communicate with the Subversion server using the Subversion command line client **svn.exe**

#### Learn more

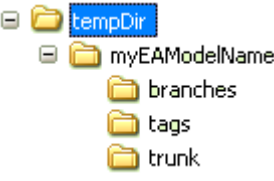

- [TortoiseSVN](#)<sup>[403]</sup>

#### 3.7.1.2.2.1 Create a new Repository Sub-tree

When you set up **Subversion** as your version control tool, it is good practice to create a new **repository sub-tree** in Subversion for **each** new Enterprise Architect model. The sub-tree can be used to control the package files for your model.

#### Create a new sub-tree in the Subversion Repository

Step	Action	See also
1	Use Windows Explorer to create a temporary directory on your PC file system, to be imported into the Subversion repository as a new repository sub-tree. The directory would have this structure:	

		
2	<p>Open a Windows command prompt, navigate to <i>tempDir</i> and issue the Subversion command <b>import</b>.</p> <p>For example;</p> <pre>C:\Documents and Settings\user&gt; cd \tempDir C:\tempDir&gt; svn import . https://host.example.com:8443/repos/ --message "Repository Initialization"</pre>	<a href="#">Subversion repository administration basics</a>
3	On your PC, delete the temporary directory structure ( <i>tempDir</i> ) and all its contents.	

#### Notes

- After the import is finished, the original tree is not converted into a Subversion working copy; you should delete the temporary structure and check out a fresh working copy of the tree
- The process described above can also be performed using TortoiseSVN's Repository Browser, which provides commands for simply creating new folders directly in the repository

#### 3.7.1.2.2.2 Create a Local Working Copy

In order to use Subversion to provide version control of the packages in a model, you need to prepare a functional **SVN working copy folder** that can be accessed through an Enterprise Architect **version control configuration** within that model.

#### Create a Subversion working copy folder

Step	Action	See also
1	Choose or create a suitable directory on your system in which to create your Subversion working copy.	
2	<p>Open a command prompt window and navigate to the directory you have selected. For example:</p> <pre>C:\&gt; mkdir mySVNWorkSpace C:\&gt; mkdir mySVNWorkSpace/myEAModelName C:\&gt; cd mySVNWorkSpace/myEAModelName</pre>	
3	<p>Perform the initial check out from the Subversion repository, specifying the repository folder and local working copy folder, as well as your user name and password. For example:</p> <pre>C:\&gt; svn checkout "https://myserver:8443/svn/repos_folder"</pre>	

	<pre>"C:\mySVNWorkSpace\myEAModelName" --username myUserName --password myPassword</pre> <p>(By specifying your Subversion username and password, you ensure that they are correctly cached by Subversion and available for use by Enterprise Architect.)</p> <p>If you specify the HTTPS protocol when performing the initial Subversion check out, a prompt displays to accept a security certificate; in this instance, press <b>( P )</b> to permanently accept the certificate.</p> <p>The nominated local folder is configured as a Subversion working copy folder.</p> <p>Any files already existing in the repository folder are downloaded to the working copy folder as working copy files.</p>	
4	Verify that your Subversion environment functions correctly.	<a href="#">Verify the SVN Workspace</a> 400

#### Notes

- It is important that Subversion caches your username and password, so that it never has to prompt for user input; a check-out operation might not request authentication, and if it does not you should perform an action that does request authentication, such as adding and committing a dummy test file
- The process described above can also be performed using TortoiseSVN's **Checkout** command (which provides options to browse when specifying both your repository folder and your local folder); when prompted for authentication details by TortoiseSVN, make sure you place a check against the **Save Authentication Data** option

#### 3.7.1.2.2.3 Verify the SVN Workspace

After creating the Subversion local working copy to hold the working copies of your package files, you can verify that it functions correctly before attempting to use it with Enterprise Architect. You need to be able to add files to Subversion, lock the files and commit changes to those files.

#### Verify correct operation of a Subversion working copy folder

Step	Action	See also
1	Use Windows to open a command prompt window.	
2	Select the directory you specified as the working copy, in the Subversion checkout command when preparing the SVN workspace. For example: <pre>C:\&gt; cd mySVNWorkSpace</pre>	<a href="#">Create a Local Working Copy</a> 399
3	Create a test file, such as <i>Test.txt</i> , containing the text <b>Subversion Test</b> . For example:	

	<pre>C:\&gt; echo Subversion Test &gt; Test.txt</pre>	
4	<p>Execute each of the following Subversion commands:</p> <ul style="list-style-type: none"> <li>• <code>svn add Test.txt</code></li> <li>• <code>svn commit -m"Commit comment" Test.txt</code></li> <li>• <code>svn update Test.txt</code></li> <li>• <code>svn lock Test.txt</code></li> <li>• Use your preferred editor to modify the file and save the changes</li> <li>• <code>svn commit -m"Second commit comment" Test.txt</code></li> </ul> <p>The commands should execute without any errors and without prompting the user for any extra input.</p>	

**Notes**

- Your environment must be set up such that you can perform these operations without ever being prompted for user ID or password; for further information, please see the *Caching Client Credentials* topic in the official Subversion documentation

**Learn more**

- [Official Subversion Documentation](#)

**3.7.1.2.2.4 Subversion Under Wine-Crossover**

If you want to set up and use Subversion with Enterprise Architect under **Wine**, the process is almost identical to the process for setting up and using the systems under Windows. When running Enterprise Architect under Wine or CrossOver, you still use a Windows-based Subversion command line client.

There are some minor differences in the way you prepare the Subversion working environment, specifically in the way you install your Subversion client and the way you check out a working copy folder from the Subversion repository.

**System Requirements**

Sparx Systems has tested the use of Enterprise Architect with Subversion under Wine 1.2, on **Mac OS 10.4** and **10.6.2**, and on **Ubuntu 10.04**. All tests were passed.

When using Wine 1.2 on the **Ubuntu 9.10** platform, Sparx Systems was able to use the **svn:** and **file:** protocols to communicate with the SVN server; but not the **https:** protocol.

**Installing a Subversion Client**

Wine is able to install applications from either a Windows **.exe** file, or a **.msi** installer file.

Place the installer for your Windows Subversion client in a convenient location on the native file system, then open a **Wine console window** from within Enterprise Architect and run the installer from within the Wine console. Your Subversion installation can then access the same C: drive and folders that Enterprise Architect is accessing.

Learn more

- [Preparing a Subversion Environment Under Wine.](#)<sup>[402]</sup>

Under Wine, you can install Subversion from either a Windows **.exe** file, or a **.msi** file. By performing your Subversion installation and initial check out from a Wine console window opened from within Enterprise Architect, you have access to the same C: drive and folders that Enterprise Architect is accessing.

Set up Subversion for use with Enterprise Architect, running under Wine

Step	Action	See also
1	Start Enterprise Architect. You do not have to load a project at this point.	
2	Select <b>Tools   Customize &gt; Tools :</b>  (New). A new, blank entry is opened on the Tools tab of the Customize dialog.	<a href="#">Custom Tools</a> <sup>[157]</sup>
3	Define the new menu item entry, as follows: <ul style="list-style-type: none"> <li>• In the newly-opened <b>Menu contents</b> field, type the name <b>Wine Console</b></li> <li>• In the <b>Command</b> field, type <b>wineconsole</b></li> <li>• In the <b>Arguments</b> field, type <b>cmd</b></li> <li>• Leave the <b>Initial directory</b> field blank</li> </ul>	
4	Click on the <b>Close</b> button. The Customize dialog closes.	
5	Select <b>Tools   Wine Console</b> . A Wine console window opens.	
6	Type <b>C:</b> and press ( <b>Enter</b> ). The Wine console switches to the C: drive.	
7	Issue the command to install your Subversion client. For example:  <pre>C:\&gt;/Installers/Subversion-client-1.6.12-1.win32.exe</pre> To install from a .msi file, use Wine's <b>msiexec</b> utility. For example:  <pre>C:\&gt;msiexec "Slik-Subversion-1.6.9-win32.msi" /i</pre>	

	Installation of the Subversion command line client begins.	
8	<p>Create a folder to serve as the working copy folder to be used by Enterprise Architect. For example:</p> <pre>C:\&gt;mkdir C:\VC_workspaces\SVN_workcopy</pre>	
9	<p>Issue the command to perform the initial checkout from the Subversion repository, specifying the repository folder, working copy folder, username and password. For example:</p> <pre>C:\&gt;svn checkout "https://myServer:8443/svn/repos_folder" "C:\VC_workspaces\SVN_workcopy " "--username myUserName" "--password myPassword"</pre> <p>(After specifying your Subversion username and password, they are correctly cached by Subversion and are available for use by Enterprise Architect.)</p> <p>If the HTTPS protocol is specified when performing the initial Subversion check out, you are prompted to accept a security certificate; in this instance, press ( <b>P</b> ) to permanently accept the certificate.</p> <p>The nominated local folder is configured as a Subversion working copy folder. Any files already existing in the repository folder are downloaded to the working copy folder as working copy files.</p>	
10	<p>Type <b>Exit</b> and press ( <b>Enter</b> ).</p> <p>The Wine console window closes.</p> <p>You are now ready to load a project in Enterprise Architect and apply version control to it, following the normal Windows-based procedures.</p>	<a href="#">Version Control Setup</a> 413 <a href="#">Use Version Control</a> 422

**Notes**

- You should copy the installer for your Windows Subversion client to a convenient location on the native file system, so that you can easily refer to it from within the Wine console window in step 7 above

**3.7.1.2.2.5 TortoiseSVN**

**TortoiseSVN** is a Windows shell extension for Subversion; it provides icon overlays in Windows Explorer that are useful as a tool for observing the status of your Subversion controlled files. You can also use it to create your repository sub-trees and check out local working copies from within Windows Explorer, using simple menu commands.

You can download TortoiseSVN from <http://tortoisesvn.net/downloads.html>.

**Notes**

- Enterprise Architect can only communicate with the Subversion server using the Subversion command line client **svn.exe**

### 3.7.1.2.3 Create a CVS Environment

You can use **Concurrent Versions System (CVS)** as a version control provider for Enterprise Architect. The first step in doing this is for a CVS administrator to install and configure the appropriate software. A number of basic tasks are performed in creating an **operational CVS environment**, and useful **tools** are available for performing some of these tasks.

#### Tasks in Creating a CVS Environment

Task	Detail	See also
<b>Install server components</b>	<p>Executable files for CVS can be obtained from the Free Software Foundation, or from March Hare Software.</p> <p>CVS server components are available to run on a wide range of different hardware and operating systems; Enterprise Architect is not affected by your choice of server components.</p>	<a href="#">FSF CVS</a> <a href="#">March Hare CVS</a>  <a href="#">CVS Documentation</a>
<b>Create a repository</b>	Please consult the official CVS documentation.	<a href="#">CVS Repository Administration</a>
<b>Create CVS users</b>	Please consult the official CVS documentation.	
<b>Create a new repository module</b>	<p>It is recommended good practice to create a new <b>repository module</b> in CVS for <b>each</b> new Enterprise Architect model being added to version control with CVS. Users should create a new local working copy folder from the module to be used with that model.</p> <p>A repository module represents a project, or a set of related files in the repository.</p> <p><b>TortoiseCVS</b> can greatly simplify the process of creating new repository sub-trees.</p>	<a href="#">CVS Starting a New Project</a> (Online Resource)  <a href="#">TortoiseCVS</a> <sup>[407]</sup>
<b>Install client components</b>	<p>Executable files for CVS can be obtained from the Free Software Foundation, or from March Hare Software.</p> <p>Enterprise Architect is a Windows based application - it requires a Windows based CVS command line client for integration.</p>	<a href="#">FSF CVS</a> <a href="#">March Hare CVS</a>
<b>Create a working copy folder</b>	<p>A working copy folder must exist on each users' machine, for Enterprise Architect to use when exporting and importing the version controlled package files. It is this folder that is specified as the Local Project Path, when defining your Version Control Configurations.</p> <p>The working copy folder is the 'sandbox' where you modify the controlled files. The working copy folder is usually associated with a folder that exists within the version control repository. In CVS, to create a local working copy you perform an initial check-out of a folder from the CVS repository; this downloads a copy of the</p>	<a href="#">Prepare a CVS Local Workspace</a> <sup>[405]</sup>

Task	Detail	See also
	<p>folder and its contents, to create your local working copy.</p> <p>TortoiseCVS can greatly simplify the initial check out of a working copy folder.</p>	<a href="#">TortoiseCVS</a> <sup>[407]</sup>
<b>Setting up CVS under Wine/ CrossOver</b>	The process of setting up and using CVS with Enterprise Architect under Wine is almost identical to the process when running natively under Windows, apart from minor differences in installing the CVS client and performing the initial checkout of the working copy folder.	

**Notes**

- If you do not already use CVS for version control, you should consider using Subversion instead; Subversion's client-server protocols provide a broader range of possibilities for connecting to remote servers, with easier set up of secure connections
- TortoiseCVS is a Windows shell extension; Enterprise Architect cannot use TortoiseCVS as its client, it must use the CVS command line client

**Learn more**

- [Create a Subversion Environment](#)<sup>[397]</sup>

**3.7.1.2.3.1 Prepare a CVS Local Workspace**

In order to use CVS to provide version control of the packages in a model, you need to prepare a functional **CVS working copy folder** that can be accessed through an Enterprise Architect **version control configuration** within that model.

**Prepare a CVS Working Copy Folder**

Step	Action	See also
<b>1</b>	<p>Ask your System Administrator to install CVS and create a remote repository, with a module that you can use to control your Enterprise Architect package files.</p> <p>Your administrator must create a username and password for you before you can make a connection.</p>	
<b>2</b>	Select or create a suitable directory to use as your CVS working copy directory.	
<b>3</b>	<p>Open a command prompt window and navigate to your CVS working copy directory. For example:</p> <pre>C:\&gt; mkdir myCVSWorkSpace C:\&gt; cd myCVSWorkSpace</pre>	

4	<p>Log in to the remote CVS repository. For example:</p> <pre>C:\myCVSWorkspace&gt; cvs -d:pserver:myUserID@ServerName:/reposPath</pre> <p>Replace <i>myUserID</i> with your CVS username, replace <i>ServerName</i> with the name of your CVS server and replace <i>reposPath</i> with the path to the repository on the server.</p> <p>A prompt for a password displays.</p>	
5	<p>Enter your password.</p> <p>You are logged in to the CVS server.</p>	
6	<p>Perform the initial checkout of the CVS repository module, into the local working copy directory. For example:</p> <pre>C:\myCVSWorkspace&gt; cvs -d:pserver:myUserID@ServerName:/reposPath</pre> <p>(Replace <i>moduleName</i> with the name of the repository module that you want to check out.)</p> <p>A subdirectory is created in your current working directory, with the same name as the module being checked out.</p> <p>Any files already existing in the repository module are downloaded to the working copy folder as working copy files.</p>	
7	<p>Verify that your CVS environment functions correctly.</p>	<a href="#">Verify the CVS Workspace</a> 406

### Notes

- Much of the process described above can also be performed (more simply) using the TortoiseCVS command **Make New Module**

#### 3.7.1.2.3.2 Verify the CVS Workspace

After creating the CVS local working copy to hold the working copies of your package files, you can verify that it functions correctly before attempting to use it with Enterprise Architect. You need to be able to add files to CVS, and commit changes to those files. You also need to be able to register as an editor of the file and retrieve the list of currently registered editors.

#### Verify correct operation of a CVS working copy folder

Step	Action	See also
1	Use Windows to open a command prompt window.	

2	<p>Select the directory you specified as the working copy in the <b>cv</b>s <b>checkout</b> command, when preparing the CVS workspace. For example:</p> <pre>C:\&gt; cd myCVSWorkSpace</pre>	
3	<p>Create a test file, such as <i>Test.txt</i>, containing the text <b>CVS Test</b>. For example:</p> <pre>C:\&gt; echo CVS Test &gt; Test.txt</pre>	
4	<p>Execute the following CVS commands:</p> <ul style="list-style-type: none"> <li>• <code>cv</code>s <code>add</code> <code>Test.txt</code></li> <li>• <code>cv</code>s <code>commit</code> <code>-m</code>"Commit comment" <code>Test.txt</code></li> <li>• <code>cv</code>s <code>update</code> <code>Test.txt</code></li> <li>• <code>cv</code>s <code>edit</code> <code>Test.txt</code></li> <li>• <code>cv</code>s <code>editors</code> <code>Test.txt</code></li> </ul> <p>The commands should execute without any errors and without prompting the user for any extra input.</p> <p>The editors command should produce output that resembles the following:</p> <pre>Test1.txt myUserID Tue Aug 9 10:08:43 2009 GMT myComputer C:\myCVSWorkSpace\moduleName</pre>	
5	<p>Take note of the userID that follows the filename.</p> <p>Enterprise Architect must find and use this user ID when you create your version control configuration.</p>	<a href="#">CVS Settings</a> <sup>419</sup>

#### Notes

- Your environment must be set up such that you can perform these operations without ever being prompted for input, such as user ID or password

#### 3.7.1.2.3.3 TortoiseCVS

**TortoiseCVS** is a Windows shell extension for CVS; it provides icon overlays in Windows Explorer that are useful as a tool for observing the status of your CVS controlled files. You can also use it to create your repository modules and check out local working copies from within Windows Explorer using simple menu commands.

You can download TortoiseCVS from: <http://www.tortoisecvs.org>.

#### Notes

- Enterprise Architect must use the CVS command line client to communicate with the CVS server; it cannot use TortoiseCVS

### 3.7.1.2.4 Create a TFS Environment

You can use **Microsoft Team Foundation Server (TFS)** as a version control provider for Enterprise Architect. The first step in doing this is for a TFS administrator to install and configure the TFS server and client applications. A number of basic tasks are performed in creating an **operational TFS environment**.

#### Tasks in Creating a TFS Environment

Task	Detail	See also
<b>Obtain and install TFS</b>	Enterprise Architect uses the <b>TFS command line client</b> to integrate TFS version control.  The TFS command line client is normally available as part of your Visual Studio installation.	
<b>Choose a TFS project</b>	It is good practice to create a new <b>TFS project</b> , or least a new <b>Source Control Folder</b> within a project, for each Enterprise Architect project being added to version control with TFS.  If you have a single Enterprise Architect project that contains many different models (for example, a DBMS hosted project with multiple model root nodes), you might choose to create a new TFS project for each separate <b>model</b> .  For further information, please consult your TFS product documentation.	
<b>Create a TFS workspace</b>	A working copy folder must exist on each users' machine, for Enterprise Architect to use when exporting and importing the version controlled package files. It is this folder that is specified as the Local Project Path, when defining your Version Control Configurations.  The working copy folder is the 'sandbox' where you modify the controlled files. The working copy folder is usually associated with a folder that exists within the version control repository. In TFS, the TFS workspace is used to map a local working folder on your PC to a Source Control Folder within a TFS project.  A single TFS workspace <b>can</b> map many different local folders, each one to a separate Source Control Folder. In this case, TFS can take a long time to work through and update the files in all of those folders, and the system might appear to 'freeze' whilst it waits for TFS to hand back program control.  You can avoid this if you keep your version controlled <b>package</b> files in a folder that is separate from other artifacts, such as source code files, creating a <b>separate work space</b> to use <b>just</b> for your package files, or creating and mapping a separate folder for package files within an existing workspace.	<a href="#">TFS Workspaces</a> [409]
<b>Configure exclusive check-outs</b>	The XML format files used for the version control of Enterprise Architect's packages can not be merged like ordinary text files. Therefore, Enterprise Architect must enforce serialized editing of its version controlled packages. As a consequence, it is important that TFS is configured to use 'exclusive checkouts' for	<a href="#">TFS Exclusive Check Outs</a> [411]

Task	Detail	See also
	XML files.	

### Notes

- TFS can also be used with an SCC client; the MS TFS-SCC client is available for download from Microsoft's web site
- MDG Integration for Visual Studio 2005 or 2008 enhances TFS support by providing access to, for example, work items and bugs within both Enterprise Architect and the MDG Integration product

### Learn more

- [System Requirements](#)<sup>[395]</sup>

#### 3.7.1.2.4.1 TFS Workspaces

In order to use TFS to provide version control of the packages in a model, you need to prepare a functional **TFS workspace** that can be accessed through an Enterprise Architect **version control configuration** within that model. You use the TFS workspace to map a local working folder on your PC to a Source Control Folder within a TFS project repository.

It is assumed that a Team Project that you can use to control your Enterprise Architect package files already exists. You create the TFS workspace through **MS Visual Studio**.

#### Map a local folder to a TFS Source Control Folder

Step	Action	See also
1	Connect to your TFS server. From the main menu, choose <b>View   Team Explorer</b> .	
2	From the main menu, choose <b>View   Other Windows   Source Control Explorer</b> .	
3	From the main menu, choose <b>Tools   Connect to Team Foundation Server</b> . A prompt displays for you to log in to the Team Foundation server; another prompt then displays to choose an available Team Foundation server.	
4	Choose an appropriate server and click on the <b>OK</b> button. The selected Team Foundation Server is displayed in the Team Explorer pane. The server's project hierarchy is displayed in the Source Control Explorer's Folders pane.	
5	From the main menu, choose <b>File   New   Team Project</b> . The New Team Project wizard opens.	

6	Enter an appropriate name and description for the new Team Project. Choose the option to create an empty source control folder.	
7	Create a new Workspace. In the Source Control Explorer, click on the drop-down arrow in the <b>Workspace</b> field, then choose <b>Workspaces</b> The Manage Workspaces dialog is displayed.	
8	Click on the <b>Add...</b> button. The Add Workspace dialog is displayed.	
9	Type in an appropriate name for the new workspace and, if required, type in a comment.	
10	Click in the <b>Source Control Folder</b> column, then click on the <b>Browse</b> button to select a Source Control Folder. Select the new folder that was created in step 6.	
11	Click on the <b>Browse</b> button in the <b>Local Folder</b> column and create a new local folder. This is the working copy folder into which Enterprise Architect exports the package files.	
12	Click on the <b>OK</b> button. The new workspace is created and saved. The Add Workspace dialog closes.	
13	Click on the <b>OK</b> button. The Manage Workspaces dialog closes.	

### Notes

- The local folder referenced in step 11 is the Working Copy Path that should be specified when defining an Enterprise Architect Version Control Configuration to use this TFS workspace

### Learn more

- [TFS Settings](#) 

### 3.7.1.2.4.2 TFS Exclusive Check Outs

The XML format files used for the version control of Enterprise Architect's packages can not be merged as ordinary text files can. Therefore Enterprise Architect must enforce serialized editing of its version controlled packages, and it is important that Team Foundation Server is configured to use 'exclusive checkouts' for XML files. Otherwise, TFS can return file statuses that make it look as if the package file is not checked-out by another user when indeed it is.

You set exclusive checkouts in the TFS workspace through **MS Visual Studio**.

#### Configure TFS to enforce exclusive check outs for XML files

Step	Action	See also
1	Using Visual Studio, from the main menu select <b>View   Team Explorer</b> .	
2	In the Team Explorer pane, right-click on the TFS Server name that is controlling the Enterprise Architect package files, then from the context menu select <b>Team Foundation Server Settings   Source Control File Types</b> .	
3	Select the entry for XML files (or create an entry if necessary) then click on the <b>Edit</b> button.	
4	Clear the check-mark from the option <b>Enable file merging and multiple check out</b> .	

### 3.7.1.2.5 Create an SCC Environment

You can use a Microsoft Common Source Code Control (SCC) compatible product as a version control provider for Enterprise Architect. The first step in doing this is for an administrator to install and configure the server and client applications. A number of basic tasks are performed in creating an **operational SCC-based environment**.

#### Tasks in Creating an SCC Environment

Task	Detail	See also
<b>Install and configure your chosen version control product</b>	<p>A version control server component is typically installed on a dedicated server machine. All Enterprise Architect users who require access to version control must be able to connect to the server machine.</p> <p>After installing the version control software, the administrator should also create version control user IDs for all users who require access to version control.</p> <p>For further information, consult the product documentation for your particular version control product.</p>	<a href="#">System Requirements</a> (list of SCC compatible version control providers)
<b>Create a new SCC</b>	It is good practice to create a new SCC version control	

Task	Detail	See also
<b>project</b>	<p>project, or least a new folder within a project, for <b>each</b> Enterprise Architect project being added to version control with SCC.</p> <p>If you have a single Enterprise Architect project that contains many different models (for example, a DBMS hosted project with multiple model root nodes), you might choose to create a new SCC version control project for each separate <b>model</b>.</p> <p>For further information, consult the product documentation for your particular version control product.</p>	
<b>Configure your SCC project to support exclusive checkouts for .XML files</b>	<p>The XML-format files used for the version control of Enterprise Architect packages can not be merged like ordinary text files can. Therefore, Enterprise Architect must enforce serialized editing of its version controlled packages. As a consequence, it is important that your version control application is configured to use 'exclusive checkouts' for XML files.</p>	<a href="#">Version Control Basics</a> 387
<b>Create a local working copy folder</b>	<p>A working copy folder must exist on each users' machine, for Enterprise Architect to use when exporting and importing the version controlled package files. It is this folder that is specified as the Local Project Path, when defining your Version Control Configurations.</p> <p>The working copy folder is the 'sandbox' where you modify the controlled files. The working copy folder is usually associated with a folder that exists within the version control repository. Your version control product provides some means by which you associate a working copy folder with a repository folder.</p> <p>For further information, consult the documentation for your particular version control product.</p>	<a href="#">Version Control Setup</a> 413

#### Notes

- When installing the client component software on users' PCs, check that the SCC client is also installed, as it might not be a part of the default installation

#### Learn more

- [Upgrade at Enterprise Architect Version 4.5, Under SCC Version Control](#) 412

#### 3.7.1.2.5.1 Upgrade at Enterprise Architect Version 4.5, Under SCC Version Control

If you are working in Enterprise Architect release **4.5 or later** and you open an SCC version-controlled project that was created under a release **earlier** than 4.5, you must identify the SCC connection with a new unique ID. You can assign a name to the existing SCC configuration or associate the project with another configuration that has previously been assigned a unique ID.

By having a unique ID for each version control configuration, you can assign a configuration quickly and

efficiently using configurations that have been created previously for other version controlled repositories. This enables you to configure the many packages to use an existing version control repository; this can apply to packages created for more than just one model enabling a great deal of flexibility.

**Upgrade an existing SCC version controlled project created before release 4.5, in Enterprise Architect release 4.5 or later**

Step	Action	See also
1	Open the project that has an SCC version control configuration created in Enterprise Architect earlier than version 4.5.  The Select or Create Unique ID for Version Control dialog automatically displays.	
2	On the dialog, either create an ID for an existing configuration or choose a previously created one from the <b>Unique ID</b> drop-down list.	
3	The existing SCC configuration is the initial value, represented by <b>SCC-XXXXX</b> ; this number is not especially meaningful, therefore it is recommended that the configuration be given a meaningful name.	
4	You can associate the version controlled package with a previously-defined configuration by selecting an existing configuration from the <b>Unique ID</b> drop-down list (if one exists).	
5	After you have assigned the unique ID, click on the <b>OK</b> button to load the model.	

### 3.7.1.3 Version Control Setup

Once you or an Administrator have installed and configured the version control **product** software, to start using version control you must first define a **version control configuration** within your project in Enterprise Architect, to be used to control the packages in the project. You can define any number of version control configurations in a single model, but any given package is associated with only **one** configuration.

**Access**    **Project | Version Control | Version Control Settings**

**Define Version Control Configuration**

Step	Action	See also
1	On the Version Control Settings dialog, click on the <b>New</b> button.	
2	In the <b>Unique ID</b> field, type a suitable configuration name.	<a href="#">Re-use an Existing Configuration</a>

Step	Action	See also
		<a href="#">[414]</a>
3	Select the <b>Type</b> of version control product you are connecting to, by clicking on the corresponding radio button.	<a href="#">Version Control Settings</a> <a href="#">[415]</a>
4	At this point, the middle section of the dialog changes to display a collection of fields specific to the type of version control configuration you are defining.  Enter details relating to the version control workspace that this configuration is to use.	
5	Click on the <b>Save</b> button. The new configuration is added to the <b>Defined Configurations</b> list.	
6	If you want to create another version control configuration, return to step 1.  When you have finished defining your version control configurations, click on the <b>Close</b> button.	

### Notes

- Version control configuration details are stored in the user's Windows Registry settings, but each project stores a list of the configurations it uses, so that version control connections can be initialized as the project is being loaded
- If you are using the Corporate or extended editions of Enterprise Architect with **security** enabled, the administrator must also set up access permissions to configure and use version control

### Learn more

- [Version Control Submenu](#) [\[91\]](#)
- [User Security](#) [\[316\]](#)
- [List of Available Permissions](#) [\[329\]](#)

#### 3.7.1.3.1 Re-use an Existing Configuration

Once a version control configuration has been defined for use in one project, it is possible to re-use that configuration in other projects to provide access to:

- An already existing version control environment (a working copy directory and its associated repository that is already in use)
- Version controlled packages that were created (and version controlled) in another project

**Access** **Project | Version Control | Version Control Settings** or  
**Project Browser package context menu | Package Control | Version Control Settings**

**Select existing configuration**

Step	Action	See also
1	On the Version Control Settings dialog, click on the <b>New</b> button. The various fields on the dialog are cleared, ready for data entry.	
2	In the <b>Unique ID</b> field, click on the drop-down arrow and select one of the previously-defined version control configurations. The details of the selected configuration are displayed in the dialog.	<a href="#">Version Control Settings</a> <sup>[415]</sup>
3	Click on the <b>Save</b> button. The configuration details are saved and are ready for use in the current project.	

**3.7.1.3.2 Version Control Settings**

As part of the process of setting up a version control configuration on your model, or updating an existing version control configuration, you define a number of settings that control how the status of your model is communicated to your version control system. You define these settings using the Version Control Settings dialog.

**Access** **Project | Version Control | Version Control Settings** or  
**Right-click on any package node | Package Control | Version Control Settings**

**Configuration Options**

Field/Button	Action	See also
<b>This model is private</b>	Select to specify that this model database is to be accessed by just a single user ( <b>Private Model</b> ).  Leave unselected (the default) or deselect to specify that the database is to be accessed by multiple concurrent users ( <b>Shared Model</b> ).  If in doubt, use the default setting.	<a href="#">Version Control Usage</a> <sup>[385]</sup>
<b>Save nested version controlled packages to stubs only</b>	Select to specify that the exported XML file for a version controlled package will contain package stubs (place holders) for nested version controlled child packages (recommended).  Deselect to specify that the exported XML file will contain the full content of nested version controlled child packages.	
<b>For all packages,</b>	Select to force all XML 1.1 imports across the <b>model</b> to exclude	

Field/Button	Action	See also
<b>create placeholders for external references</b>	incoming relationships and instead create external references. If the <b>Create placeholders for missing External References during XML 1.1/2.1 Import</b> checkbox is not selected in the XML Specifications options for a <b>user</b> , this field overrides that setting.	<a href="#">XML Specifications</a> <sup>[640]</sup>
<b>Unique ID</b>	Specify a name that uniquely identifies the configuration. Either: <ul style="list-style-type: none"> <li>Type a name to identify a new configuration, or</li> <li>Click on the drop-down arrow and select the name of a configuration previously defined in a different project (if any exist)</li> </ul>	
<b>Type</b>	Click on the appropriate radio button for the type of version control system you are associating with this configuration.  The middle section of the dialog changes to display a collection of fields relating to the type of version control configuration you are defining.  Set the type to <b>SCC</b> for: <ul style="list-style-type: none"> <li>MS Visual Source Safe</li> <li>Rational Clear Case</li> <li>Perforce</li> <li>AccuRev</li> <li>Any other SCC-compatible clients</li> </ul> For any other product that you are using, select the type that matches the product - <b>CVS</b> , <b>Subversion</b> or <b>TFS</b> .	<a href="#">SCC Settings</a> <sup>[417]</sup>  <a href="#">CVS Settings</a> <sup>[419]</sup> <a href="#">SVN Settings</a> <sup>[420]</sup> <a href="#">TFS Settings</a> <sup>[421]</sup>
<b>New</b>	Click on this button to clear the fields and create a new version control configuration.	
<b>Save</b>	Click on this button to save the details of a new or updated configuration.	
<b>Delete</b>	Click on an entry in the <b>Defined Configurations</b> list and click this button to remove the definition of the selected configuration from this model.	
<b>Defined Configurations</b>	Review a list of configurations that are in use in the current model.	
<b>In future, do not prompt for incomplete configurations</b>	Select to specify that the user is not prompted to complete the definition of configurations that are not fully specified (the default).	

Field/Button	Action	See also
	Deselect to prompt the user to complete configurations that are not fully defined.	
<b>Close</b>	Close the Version Control Settings dialog.	
<b>Help</b>	Display this Help topic.	

### Notes

- It is important that, for any given version controlled package file, any user accessing that file from any model uses version control configurations having the same **Unique ID**
- When you first open a model that was created by another user and that uses version control, the version control configuration(s) used by that model do not yet exist in your Windows registry settings; you need to complete the definitions of those configurations before you can use version control in that project
- If User Security is enabled, you must have **Configure Version Control** permission to set up version control options for the current model
- It is possible to use multiple version control configurations in the same model

#### 3.7.1.3.2.1 SCC Settings

When you are setting up your version control configurations on the Version Control Settings dialog, and you set the configuration type to **SCC**, the dialog presents a set of fields specific to SCC-based configurations. You can then define details such as:

- The working copy folder to be used with the configuration
- The details necessary to connect to the SCC version control system

You set the version-control configuration type to **SCC** for version control providers such as:

- MS Visual Source Safe
- Rational Clear Case
- Perforce
- AccuRev
- Any other SCC-compatible clients

**Access** **Project Browser package context menu | Package Control | Version Control Settings: Type:**  
**SCC**

**Settings**

Field/Button	Action	See also
<b>Local Project Path</b>	<p>Displays the full path of the folder that contains the local (working) copies of the XML package files.</p> <p>This field is read-only; its value can only be set through use of the <b>Select Path</b> button (below).</p>	
<b>Select Path</b>	<p>Click on this button to choose the Local Project Path, by opening a file browser dialog and navigating through the file system to the appropriate folder.</p> <ul style="list-style-type: none"> <li>After you choose the appropriate folder path, the Select SCC Provider dialog displays, listing all SCC providers that are installed on the current workstation; choose the SCC provider to use and click on the <b>OK</b> button</li> <li>At this point, the SCC client opens its own dialog to prompt you for information; SCC products implement this functionality in varied ways, but typically you are prompted to log in to the version control system, then prompted to choose the SCC project to use and possibly a (server) folder contained within that project</li> <li>At the conclusion of this process, all of the SCC details should be filled in; you can then save the definition by clicking on the <b>Save</b> button on the Version Control Settings dialog</li> </ul>	<p><a href="#">System Requirements</a> <sup>[395]</sup></p> <p><a href="#">Version Control Settings</a> <sup>[415]</sup></p>
<b>Current User</b>	<p>Displays the user name used to log on to the version control system that is accessed through this configuration.</p> <p>This field is read-only; the value it displays is retrieved from the SCC client.</p>	
<b>SCC Provider</b>	<p>Displays the name of the SCC provider.</p> <p>This field is read-only; the value it displays is retrieved from the SCC client.</p>	
<b>SCC Project</b>	<p>Displays the name of the SCC Project that this configuration attaches to.</p> <p>This field is read-only; the value it displays is retrieved from the SCC client.</p>	

**Notes**

- You define the SCC-specific details as part of the broader process of setting up a version control configuration on the Version Control Settings dialog

### 3.7.1.3.2.2 CVS Settings

When you are setting up your version control configurations on the Version Control Settings dialog, and you set the configuration type to **CVS**, the dialog presents a set of fields specific to CVS-based configurations. You can then define details such as:

- The working copy folder to be used with the configuration
- The path to the CVS command line client

**Access** **Project Browser package context menu | Package Control | Version Control Settings: Type:**  
**CVS**

#### Settings

Field/Button	Action	See also
<b>Working Copy Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files.  This field is read-only; its value can only be set through use of the <b>Select Path</b> button (below).	
<b>Select Path</b>	Click on this button to choose the working copy path, by opening a file browser dialog and navigating through the file system to the appropriate folder.	
<b>Current User</b>	This field is read-only; its value is retrieved from a file named <i>CVS\Root</i> , located in the folder selected using the <b>Select Path</b> button, above.	
<b>CVS Exe Path</b>	Displays the full path of the CVS command line client executable file.  This field is read-only; its value can only be set through use of the <b>Select Path</b> button ( <b>below</b> ).	
<b>Select Path</b>	Click on this button to specify the path to the CVS command line client, by opening a file browser dialog and navigating through the file system to locate the appropriate file.	
<b>VC Time-Out Value</b>	Specify the amount of time that Enterprise Architect waits for a CVS command to complete; if the command does not complete within the allowed time, the system displays a <i>Time-out</i> error message, detailing the command that failed to complete.  This single time-out value is applied to all Version Control Configurations (of types SVN, TFS and CVS) that the user accesses from this workstation.	

#### Notes

- When connecting to a remote CVS repository, the **Current User** field should display the user name used to log into that repository; if this does not happen, it indicates that Enterprise Architect cannot extract the user name from the file ...*WorkingCopyPath*\CVS\Root and the configuration does not work correctly
- You define the CVS-specific details as part of the broader process of setting up a version control configuration on the Version Control Settings dialog

### 3.7.1.3.2.3 SVN Settings

When you are setting up your version control configurations on the Version Control Settings dialog, and you set the configuration type to **Subversion**, the dialog presents a set of fields specific to Subversion-based configurations. You can then define details such as:

- The working copy folder to be used with the configuration
- The path to the Subversion command line client

**Access** **Project Browser package context menu | Package Control | Version Control Settings: Type: Subversion**

#### Settings

Field/Button	Action	See also
<b>Working Copy Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files.  This field is read-only; its value can only be set through use of the <b>Select Path</b> button (below).	
<b>Select Path</b>	Click on this button to choose the Working Copy Path, by opening a file browser dialog and navigating through the file system to the appropriate folder.	
<b>Subversion Exe Path</b>	Displays the full path of the Subversion command line client executable file.  This field is read-only; its value can only be set through use of the associated <b>Select Path</b> button ( <b>below</b> ).	
<b>Select Path</b>	Click on this button to specify the path to the Subversion command line client, by opening a file browser dialog and navigating through the file system to locate the appropriate file.	
<b>VC Time-Out Value</b>	Specify the amount of time that Enterprise Architect should wait for a Subversion command to complete; if the command does not complete within the allowed time, the system displays a <i>Time-out</i> error message, detailing the command that failed to complete.  This single time-out value is applied to all Version Control Configurations (of types SVN, TFS and CVS) that the user accesses from this workstation.	

Field/Button	Action	See also

### Notes

- You define the Subversion-specific details as part of the broader process of setting up a version control configuration on the Version Control Settings dialog

### 3.7.1.3.2.4 TFS Settings

When you are setting up your version control configurations on the Version Control Settings dialog, and you set the configuration type to **TFS**, the dialog presents a set of fields specific to TFS-based configurations. You can then define details such as:

- The working copy folder to be used with the configuration
- The user name and password to log in to the TFS server
- The path to the TFS command line client

**Access** **Project Browser package context menu | Package Control | Version Control Settings: Type:**  
**TFS**

### Settings

Field/Button	Action	See also
<b>Working Copy Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files.  This field is read-only; its value can only be set through use of the associated <b>Select Path</b> button (below).	
<b>Select Path</b>	Click on this button to choose the Working Copy Path, by opening a file browser dialog and navigating through the file system to the appropriate folder.	
<b>Server Name</b>	Displays the name of the TFS Server that is associated with the working copy folder specified in the <b>Working Copy Path</b> field, above.  This field is read-only; Enterprise Architect retrieves the value it displays by querying the TFS client.	
<b>Workspace Name</b>	Displays the name of the TFS Workspace that is associated with the working copy folder specified in the <b>Working Copy Path</b> field, above.  This field is read-only; Enterprise Architect retrieves the value it displays by querying the TFS client.	
<b>User Name</b>	Specify the user name with which to log into the TFS Server.	

Field/Button	Action	See also
<b>Password</b>	Specify the password with which to log into the TFS Server.	
<b>TFS Exe Path</b>	Displays the full path of the TFS command line client executable file.  This field is read-only; its value can only be set through use of the associated <b>Select Path</b> button ( <b>below</b> ).	
<b>Select Path</b>	Click on this button to specify the path to the TFS command line client, by opening a file browser dialog and navigating through the file system to locate the appropriate file.	
<b>VC Time-Out Value</b>	Specify the amount of time that Enterprise Architect waits for a TFS command to complete; if the command does not complete within the allowed time, the system displays a <i>Time-out</i> error message, detailing the command that failed to complete.  This single time-out value is applied to all version control configurations (of types SVN, TFS and CVS) that the user accesses from this workstation.	

### Notes

- If you automatically log in to TFS through means external to Enterprise Architect (for example, through MS Integrated Security), you can leave the **User Name** and **Password** fields blank
- If the **Password** field is blank, Enterprise Architect retrieves the your Windows username and uses that value when determining whether a package file is checked out to you or to another user
- TFS version control can also be accessed using the TFS MSSCCI client; to make use of the TFS MSSCCI client, please define an **SCC** based version control configuration
- You define the TFS-specific details as part of the broader process of setting up a version control configuration on the Version Control Settings dialog

### Learn more

### 3.7.1.4 Use Version Control

Once your version control product is installed and you have created a suitable environment, Enterprise Architect can make use of that environment to **control the Packages in your project**. Version control provides a **range of facilities**, as outlined in the following table.

### Facilities

Facility	Detail	See also
<b>Define Version Control Settings</b>	<b>Version control configurations</b> are used by Enterprise Architect to communicate with your version control system.	<a href="#">Version Control Setup</a> <sup>[43]</sup>

Facility	Detail	See also
	You define one or more version control configurations in your project and then use those configurations to control the Packages in your project.	
<b>Configure a Package</b>	To put a Package under version control you mark the Package as a <b>controlled package</b> , specify the version control configuration to control it, and associate an XML file with the Package.	<a href="#">Configure Controlled Package</a> <sup>[424]</sup>
<b>Check In a Model Branch</b>	<b>Checks in</b> all packages involved in a particular unit of work, as a single operation.  Checking-in updates the <b>reference</b> version of a package or group of packages in the model.	<a href="#">Check In a Model Branch</a> <sup>[434]</sup>
<b>Check Out a Model Branch</b>	Checks out all packages within a selected model branch as a single operation, so that you can update modeling objects within them.	<a href="#">Check Out a Model Branch</a> <sup>[433]</sup>
<b>Check In a Package</b>	<b>Checks in</b> the package currently selected in the Project Browser.  Checking-in updates the <b>reference</b> version of a package or group of packages in the model.	<a href="#">Check In a Package</a> <sup>[432]</sup>
<b>Check Out a Package</b>	<b>Checks out</b> the version controlled package currently selected in the Project Browser, so that you can update modeling objects within it.	<a href="#">Check Out a Package</a> <sup>[431]</sup>
<b>Undo Check Out of a Package</b>	<b>Reverses the check-out</b> of a package, discarding any modifications that have been made by restoring the package content to the latest revision held in version control.	<a href="#">Undo Check Out of a Package</a> <sup>[432]</sup>
<b>Import a Package From Version Control</b>	<b>Retrieves</b> packages from version control that have been created by other users, or by you in another model, and <b>imports</b> them into your current model.	<a href="#">Include Other Users Packages</a> <sup>[436]</sup>
<b>Apply Version Control to a Model Branch</b>	Applies version control to all packages within the selected model branch, in a single operation.  In this context, a model branch is a <b>package</b> in the Project Browser, and <b>all of the packages contained within it</b> .	<a href="#">Apply Version Control to Branches</a> <sup>[426]</sup>
<b>Export a Version Controlled Model Branch</b>	<b>Exports</b> version control information about the <b>root package</b> of a model branch, that is used to simplify the process of exporting and importing a hierarchy of packages from one model to another.	<a href="#">Export Controlled Model Branch</a> <sup>[437]</sup>

Facility	Detail	See also
<b>Import a Model Branch From Version Control</b>	Uses Enterprise Architect's <b>Model Branch files</b> , of which there are few, to retrieve information about the root package file and to import the model branch.  Model branch files can simplify the process of exporting and importing a hierarchy of packages from one model to another.	<a href="#">Import Controlled Model Branch</a> <sup>[438]</sup>
<b>View Package Revision History</b>	Displays the <b>change history</b> of version controlled packages.  You can also check out a prior revision of the package for editing, effectively <b>rolling-back</b> to a prior revision of the package.	<a href="#">Review Package History</a> <sup>[440]</sup>
<b>Validate Package Configurations</b>	You can test the <b>validity</b> of the version control settings associated with each version controlled package within your current model.	<a href="#">Validate Package Configurations</a> <sup>[443]</sup>
<b>Resynchronize the Status of Version Controlled Packages</b>	<b>Re-synchronizes</b> the version control status of packages within your project with the status reported by your version control provider.	<a href="#">Resynchronize Package Status</a> <sup>[444]</sup>

### Notes

- **Database replication** should not be combined with version controlled packages
- If the Packages under version control contain any **alternative images**, you can export the images to the version control repository when you check in the Packages, by setting the **Export alternate images** option on the Options dialog

#### 3.7.1.4.1 Configure Controlled Package

Once your version control application is set up and you have version control configurations in place, you can place the **individual packages** in your model under version control. To **put a package under version control**, you:

- Flag the package as a controlled package
- Specify the version control configuration to control it and
- Associate an XML file with the package

You can then export and import the package data to and from the file and issue commands to the version control system.

**Access** **Project Browser | right-click package | Package Control | Configure... (Ctrl+Alt+P)**

**Apply version control to a single package**

Step	Action	See also
1	Click on the <b>Control Package</b> checkbox to select it, indicating that this package is to be controlled.	
2	Click on the <b>Version Control</b> drop-down arrow and select the version control configuration to be used to control this package.	
3	<p>The <b>XMI Filename</b> field displays a default filename for the package export file, based on the package name.</p> <p>Optionally, modify the filename. Either:</p> <ul style="list-style-type: none"> <li>Type a new name, or</li> <li>Click on the browse button ( ... ) to open a file selection dialog</li> </ul> <p>The target file must be located within the working copy folder of the selected version control configuration, or one of its sub-folders.</p>	
4	<p>The <b>Version ID</b> field defaults to <b>1.0</b>.</p> <p>Optionally, change this to a different version number.</p>	
5	<p>The <b>Owner</b> field defaults to your user name.</p> <p>Optionally, type or select the name of the user who actually owns the package.</p>	
6	<p>Click on the <b>OK</b> button.</p> <p>The Add Package to Version Control dialog displays.</p>	
7	<p>Optionally, clear the <b>Keep checked out</b> checkbox.</p> <p>After applying version control, the package either remains checked-out for editing, or is checked-in and locked against editing, depending on this setting.</p>	
8	<p>Click on the <b>OK</b> button.</p> <p>The Add Comment dialog displays.</p>	
9	<p>Optionally, add any further comments to the default comment.</p> <p>Enterprise Architect provides a default comment that includes the current date &amp; time.</p>	

Step	Action	See also
10	<p>Click on the <b>OK</b> button.</p> <p>The current package is exported to the nominated XML file, which is then committed to version control. The package icon in the Project Browser is updated to reflect the package's version control status.</p>	<a href="#">Project Browser Indicators</a> [391]

### Notes

- If you are using the Corporate or extended editions of Enterprise Architect with security enabled, these features are only available to users who have been granted permission to configure and use version control

### Learn more

- [Use Version Control](#) [422]
- [List of Available Permissions](#) [329]

#### 3.7.1.4.2 Apply Version Control To Branches

It is possible to apply version control to all packages within a selected **model branch**, in a single operation. In this context, a model branch is a package that is currently selected in the Project Browser, and all of the packages contained within it.

**Access**    **Project Browser | right-click node package | Add Branch to Version Control**

#### Apply version control to all packages within a selected model branch

Step	Action	See also
1	On the Apply VC to Branch dialog, click on the drop-down arrow in the <b>Version Control Configuration</b> field and select the configuration to use.	
2	<p>Optionally, tick the checkbox <b>Export as Model Branch</b>.</p> <p>Once the version control operation is complete a Model Branch file (.EAB file) is created for this branch.</p>	<a href="#">Export Model Branch</a> [437] <a href="#">Import Model Branch</a> [438]
3	<p>Click on the <b>OK</b> button.</p> <p>The system creates a number of sub-folders within the version control working copy folder, then exports all of the packages within the selected model branch. The system generates filenames for the XML files, based on the package GUIDs.</p>	

**Notes**

- The version control configuration to be used in this operation must be defined within the model before selecting this command
- When invoked on the **model** root node, this command applies version control to every package within the model

**3.7.1.4.3 Package Version Control Options**

When you have set up a Package for version control, you gain access to a **range of version control operations** that can be performed on that Package, such as:

- Open the dialog for working with **baselines** of the Package
- Check-in and check-out **single** Packages or a selected **hierarchy** of Packages
- Update Packages to the **latest revision** from the version control repository
- Inspect the revision history or properties of the **XMI file** associated with a Package
- **Revert** a Package to a **previous** revision
- **Compare** the current model content of a Package, against the latest revision of the Package in version control
- **Import** and **export hierarchies** of Packages (**model branches**) to and from the model, through the version control system
- Synchronize the status of a Package, with the version control system

**Access**    **Project Browser | right-click version-controlled Package | Package Control**

**Options**

Option	Action	Shortcut	See also
<b>Configure</b>	Apply or remove version control for the selected Package (specify version control settings) or specify a file for use in XMI Package Control.	<b>Ctrl+Alt+P</b>	<a href="#">Configure Controlled Package</a> <sup>[424]</sup>
<b>Package Baselines</b>	Create a Baseline of the current Package, or compare the current Package with a previous Baseline.	<b>Ctrl+Alt+B</b>	<a href="#">Manage Baselines</a> <sup>[461]</sup>
<b>Check In Branch</b>	<p>Check-in Packages contained in the currently selected model <b>branch</b> (that is, the selected Package and all of its child Packages).</p> <p>The Select Packages to Check In dialog lists all version controlled Packages within that branch that are checked out to you; you can then select Packages in the displayed list, to be submitted for check-in.</p> <p>You can also choose to keep the Packages checked-out after committing a new revision to version control.</p>		<a href="#">Check In a Model Branch</a> <sup>[434]</sup>

Option	Action	Shortcut	See also
<b>Check Out Branch</b>	Recursively check out all Packages contained within the currently selected model branch (that is, the selected Package and all of its child Packages) that are version controlled and checked-in.		<a href="#">Check Out a Model Branch</a> <sup>[433]</sup>
<b>Check In</b>	Commit a new revision of the currently selected Package to the version control repository and lock the Package against further editing.  Only available for Packages that you have checked-out yourself.		<a href="#">Check In a Package</a> <sup>[432]</sup>
<b>Check Out</b>	Synchronize the currently selected Package with the latest revision from the version control repository and unlock the Package to allow editing.  Only available for Packages that are not already checked-out (and whose associated Package file is not checked-out).		<a href="#">Check Out a Package</a> <sup>[431]</sup>
<b>Undo Check Out</b>	Restore the selected Package to the latest revision in the version control repository and lock the Package against further editing.		<a href="#">Undo Check Out of a Package</a> <sup>[432]</sup>
<b>Put Latest</b>	Commit a new revision of the currently selected Package to the version control system, while keeping the Package checked-out.  This is equivalent to checking a Package in and immediately checking it back out again.  Only available for Packages that you have checked-out yourself.		
<b>Get Latest</b>	Synchronize the currently selected Package with the latest revision from the version control repository.  Available only for Packages that are checked in.		<a href="#">Update to the Latest Revision of Selected Package</a> <sup>[435]</sup>
<b>Get All Latest</b>	Update all of the version controlled Packages in the project, to the latest revision retrieved from version control.  Only updates Packages that are currently checked in.  Once the latest revisions are retrieved, the system scans all the controlled Packages and		<a href="#">Update to the Latest Revision of All Packages</a> <sup>[435]</sup>  <a href="#">The System Output Window</a> <sup>[169]</sup>

Option	Action	Shortcut	See also
	<p>fixes any missing cross-references by comparing the Package with its XML 1.1 file.</p> <p>If the cross-reference information in the XML does not match the model, the system updates the model with the information from the XML and records this update in the System Output window.</p> <p>You can roll back such updates by selecting the entry in the Output window and using the context menu option <b>Rollback Update</b> (or <b>Rollback Selected Updates</b> if multiple entries are selected).</p> <ul style="list-style-type: none"> <li>• Closing the model clears the entries in the System Output window</li> <li>• An entry in the System Output window is also cleared as and when you roll-back the update for it</li> </ul>		
<b>Scan XML and Reconcile Model</b>	<p>Scan the Package XML files associated with each of the project's controlled Packages and restore any diagram objects or cross-references that are detected as missing from the project.</p> <p>This function is useful in team environments where each user maintains their own private copy of the model database (i.e. multiple private project files) and model updates are propagated through the use of controlled Packages. It provides no benefit when the model is hosted in a single shared database that is accessed by all team members.</p> <p>Each controlled Package is compared with its associated XML file and, if the cross-reference information in the model does not match the XML, the system updates the model with the information from the XML and records the update in the Output window.</p> <p>You can roll back such updates by right-clicking on the entry in the Output window and selecting the context menu option <b>Rollback Update</b> (or <b>Rollback Selected Updates</b> if multiple entries are selected).</p> <p>Closing the model clears the entries in the Output window; an entry in the Output window is also cleared as and when you roll-back the update for it.</p> <p>This functionality is invoked automatically as part of the <b>Get All Latest</b> operation.</p> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-Package references, it is recommended that you invoke</p>		<p><i>Version Control Best Practices</i> white paper  <a href="http://sparxsystems.com/WhitePapers/Version_Control.pdf">http://sparxsystems.com/WhitePapers/Version_Control.pdf</a></p>

Option	Action	Shortcut	See also
	<p><b>Scan XMI and Reconcile Model</b> from time to time, following the re-importation of controlled Packages - for example, after using <b>Get Latest</b> to update a number of Packages - or after performing a number of Package check-outs.</p> <ul style="list-style-type: none"> <li>As a general rule, avoid running <b>Scan XMI and Reconcile Model</b> while you have uncommitted changes in your model</li> <li>Generally, you should: <ul style="list-style-type: none"> <li>Check-out a number of Packages</li> <li>Invoke <b>Scan XMI and Reconcile Model</b></li> <li>Make your modifications</li> <li>Commit any outstanding changes before you check-out more Packages and run <b>Scan XMI and Reconcile Model</b> again</li> </ul> </li> </ul>		
<b>File Properties</b>	Display version control properties pertaining to the XMI export file associated with the currently selected Package; this also identifies who has checked out the Package.		
<b>File History</b>	<p>Display change history information for the currently selected Package.</p> <p>Revert to or check-out a prior revision of the Package.</p>		<a href="#">Review Package History</a> <sup>[440]</sup>
<b>Compare with Controlled Version</b>	Compare the currently selected Package with the latest revision of its associated XMI file retrieved from version control.		
<b>Add Branch to Version Control</b>	<p>Apply version control to all Packages within a selected <i>model branch</i>, in a single operation.</p> <p>In this context, a model branch is a Package that is currently selected in the Project Browser, and all of the Packages contained within it.</p>		<a href="#">Apply Version Control to Branches</a> <sup>[426]</sup>
<b>Export as Model Branch</b>	Export a newly created model branch from your own private copy of a model.		<a href="#">Export Controlled Model Branch</a> <sup>[437]</sup>
<b>Import a Model Branch</b>	Retrieve a model branch and import it into either the source model or another model.		<a href="#">Importing Controlled Model Branch</a> <sup>[438]</sup>

Option	Action	Shortcut	See also
<b>Get Package</b>	Access Packages in the version control repository that are not currently available in your model.		<a href="#">Include Other Users' Packages</a> <sup>[436]</sup>
<b>Re-synch Status With VC Provider</b>	Update the version control status value recorded for the selected Package in the project to match the value reported by the version control provider, without performing an XML import or export.  Use this function when the Package's version control status recorded in your project is out of synchrony with the version control status reported by your version control provider.		<a href="#">Resynchronize the Status of Version Controlled Packages</a> <sup>[444]</sup>
<b>Version Control Settings</b>	Display the Version Control Settings dialog.		<a href="#">Version Control Settings</a> <sup>[415]</sup>

**Notes**

- You set up Version Control using options from the **project Version Control** submenu
- If the selected Package is **not** under version control, a different set of options is available
- If a version control configuration has not been defined for the model, no options for **using** version control are available, only the options for **configuring** version control

**Learn more**

- [Version Control Submenu](#) <sup>[91]</sup>
- [Controlled Package Menu](#) <sup>[485]</sup>
- [Version Control Nested Packages](#) <sup>[390]</sup>

**3.7.1.4.4 Check Out a Package**

When you need to work on a version controlled package, you check it out. The local XML file associated with the package is then checked-out from version control. No other user can check out the package to make changes to it until it has been checked **in** again.

**Access** **Project Browser | right-click package | Package Control | Check Out**

**Check out a single package**

The package file is imported into your model, and the package icon is updated to reflect the change in the package's version control status.

When working in a **Private Model**, if the system detects that the package content in the model is **already** up to date with the latest revision of the package file retrieved from version control, then the Import Package dialog displays first. This dialog is not displayed for a **Shared Model**.

The following options are available:

- **Force Reload From XMI** - reload the package from XMI regardless of whether it is up to date or not
- **Accept current package** - select to skip the process of re-importing the package from XMI
- **Refresh model view** - select to refresh the Project Browser and diagrams, by reloading the package content from the project database
- **Always use these settings** - When selected, if you subsequently check out a package that is found to be up to date, the same settings are applied again without displaying the dialog

#### Notes

- If you check out a version controlled package whilst offline, the package icon has a red figure 8 in front of it
- If you have selected the **Always use these settings** checkbox and you want to **reconfigure** the Import Package dialog, press the **Ctrl** key whilst you select the **Package Control | Check Out** menu option; the dialog displays and you can change the settings

#### Learn more

- [Offline Version Control](#)<sup>[392]</sup>
- [Check Out Model Branch](#)<sup>[433]</sup>
- [Check In Package](#)<sup>[432]</sup>

#### 3.7.1.4.5 Undo Check Out of a Package

If you check out a package and then decide not to proceed, you can undo the check-out and discard any modifications that have been made, by restoring the package content to the latest revision held in version control. The package returns to a checked-in state and subsequently can be checked out by any user, including yourself if, for example, you need to reverse incorrect changes before checking the package out and starting again.

**Access** **Project Browser | right-click checked-out package | Package Control | Undo Check Out**

#### Undo check out of a selected package

A confirmation dialog displays; click on the **OK** button.

The latest revision of the package is retrieved from version control and re-imported into your model. The icon against the package in the Project Browser is updated to reflect the change in the package's version control status.

#### 3.7.1.4.6 Check In a Package

When you have finished working on the contents of a package under version control, and you want to return it to the model for other users to see, you check it in.

**Access** **Project Browser | right-click package | Package Control | Check In**

#### Check in a single package

Ste	Action	See also

Step		
1	<p>The selected package is exported and the Add Comment dialog displays. A default comment is provided that contains the current date and time.</p> <p>Optionally, modify the default check-in comment</p>	
2	<p>Click <b>OK</b>.</p> <p>The package file is checked-in to version control and the package icon is updated to reflect the change in version control status.</p>	

#### Learn more

- [Check In Model Branch](#)<sup>[434]</sup>
- [Check Out Package](#)<sup>[431]</sup>

#### 3.7.1.4.7 Check Out a Model Branch

If you need to check out a **number** of related packages involved in a particular unit of work, to update the contents, you can do so in a single operation by checking out the whole **model branch** that contains them.

**Access** **Project Browser | right-click root-node package | Package Control | Check Out Branch**

#### Check out a sub-tree of model packages

Step	Action	See also
1	<p>The selected root-node package and all of its contained sub-packages are recursively checked out.</p> <p>Any packages that cannot be checked-out are listed in a message box, with a brief description of the problem; for example: <i>The package is already checked out by user 'Fred'</i>.</p>	
2	<p>When Project Security is enabled in <i>Lock to Edit</i> mode, Enterprise Architect prompts you to apply a User Lock throughout the selected model branch before proceeding.</p>	

#### Learn more

- [Check Out Package](#)<sup>[431]</sup>
- [Check in Model Branch](#)<sup>[434]</sup>
- [Set Security Policy](#)<sup>[319]</sup>
- [Lock Model Elements](#)<sup>[336]</sup>

### 3.7.1.4.8 Check In a Model Branch

If you need to check in a **number** of related packages involved in a particular unit of work, and that you have updated, you can do so in a single operation by checking in the whole **model branch** that contains them. You can also commit new revisions of the affected packages as you complete milestones, whilst **keeping** the packages checked-out for further editing.

**Access**    **Project Browser | right-click root-node package | Package Control | Check In Branch**

#### Check in packages from within a model branch

Step	Action	See also
1	<p>The Select Packages to Check-in dialog lists all version controlled and checked-out packages within the selected model branch. By default, the entire list is selected.</p> <p>Optionally:</p> <ul style="list-style-type: none"> <li>Click an individual package to select just that package</li> <li><b>Ctrl+click</b> on an individual package to add or remove it from the selection</li> <li><b>Shift+click</b> on a range of packages to select them</li> <li>Click on <b>All</b> to select all listed packages</li> <li>Click on <b>None</b> to clear the selection</li> </ul>	
2	<p>Optionally, you can commit into version control a new revision of all selected packages, while keeping those packages checked out for further editing. To do this, select the <b>Keep packages checked-out after committing new revision</b> checkbox.</p>	
3	<p>Click on the <b>OK</b> button.</p> <p>The Add Comment dialog displays. A default comment is provided that contains the current date and time. This comment is applied to all packages that are checked in.</p>	
4	<p>Optionally, modify the default check-in comment.</p>	
5	<p>Click on the <b>OK</b> button.</p> <p>The selected packages are exported and checked-in. The package icons are updated to reflect any change in version control status. If you opted to keep packages checked out, there is no change in status.</p>	

#### Learn more

- [Check In Package](#)<sup>[432]</sup>
- [Check Out Model Branch](#)<sup>[433]</sup>

#### 3.7.1.4.9 Update to the Latest Revision of Selected Package

When you are part of a team working in a Distributed Model environment, you will want to periodically update your model with the changes that other team members have committed into version control. You can transfer the other users' updates from version control into the selected package in the Project Browser.

**Access**    **Project Browser | right-click package to update | Package Control | Get Latest**

##### Update package to latest revision

The local XML file associated with the package is updated to the latest revision from version control. The XML file is imported into your model database, updating the package in your model.

When working in a **Private Model**, if the system detects that the package content in the model is **already** up to date with the latest revision of the package file retrieved from version control, then the Import Package dialog displays first. This dialog is not displayed for a **Shared Model**.

The following options are available:

- **Force Reload From XML** - reload the package from XML regardless of whether it is up to date or not
- **Accept current package** - select to skip the process of re-importing the package from XML
- **Refresh model view** - select to refresh the Project Browser and diagrams, by reloading the package content from the project database
- **Always use these settings** - When selected, if you subsequently check out a package that is found to be up to date, the same settings are applied again without displaying the dialog

##### Notes

- The **Get Latest** command is disabled for any package that is **checked-out** (to anybody) in the currently loaded project
- When using a Shared Model environment, where all users are connected to a single model database, you should reload the package from the **database**, rather than using the **Get Latest** command
- If you have selected the **Always use these settings** checkbox and you want to **reconfigure** the Import Package dialog, press the **Ctrl** key whilst you select the **Package Control | Get Latest** menu option; the dialog displays and you can change the settings

##### Learn more

- [Update to the Latest Revision of All Packages](#) <sup>435</sup>

#### 3.7.1.4.10 Update to the Latest Revision of All Packages

When you are part of a team working in a Distributed Model environment, you will want to periodically update your model with the changes that other team members have committed into version control. You can transfer the other users' updates to all version controlled packages into the currently loaded project.

**Access**    **Project Browser | right-click package to update | Package Control | Get All Latest**

##### Update all packages in project to latest revision retrieved from version control

All the local XML files for all the version control configurations used in the project are updated to the latest

revision from version control. The system then scans the packages in the model, to determine which ones are up to date and which are not, compared to the latest revisions of the associated package files.

A prompt displays, providing the following import options for packages that are up to date:

- **Import changed files only**
- **Always import**
- **Prompt for each file**

Click on the **OK** button. The version controlled packages in your project are updated according to the option you selected; if you chose the **Prompt for each file** option, a prompt displays to confirm import of each file.

#### Notes

- There is no need to re-import packages that are already up to date - re-importing packages first deletes them from the project and then re-imports them from the XML file, which is time consuming as well as unnecessary; we strongly recommend using the default option **Import changed files only**
- The **Get All Latest** command does not update any package that is checked-out (to anybody) in the currently loaded project; otherwise, any changes not yet committed to version control would be discarded
- When using a **Shared Model** environment, where all users are connected to a single model database, the **Get All Latest** option should not be used - the information in the model database is always ahead of what is committed into version control; you should from time to time refresh your view of the model database, by reloading diagrams or reloading package content in the Project Browser

#### Learn more

- [Update to the Latest Revision of Selected Package](#)<sup>435</sup>

#### **3.7.1.4.11 Include Other Users' Packages**

Other users might be developing Packages in their own models that you could use in your model, or you might have other models containing Packages that you want to use in the current model. Unless you are sharing an SQL database or project file, those packages are not **automatically** available to you. However, if the Packages have been placed into **version control**, you can import them into your model as children of one of your model's Packages.

**Access**    **Project Browser | right-click parent Package | Package Control | Get Package**

#### Import Packages from version control into current model

Step	Action	See also
1	On the Get Shared File dialog, click on the drop-down arrow of the <b>Version Control Configuration</b> field and select the version control configuration associated with the Package to retrieve.  The file list is populated with the names of files available through that configuration, for retrieval and import into your model.	
2	Click on the Package file to import into your model and click on the <b>OK</b> button.	

	The Package file is imported as a new child Package, under the parent Package you selected.	
--	---	--

### Notes

- You must have access to the Package files through the version control system and you must define a version control configuration through which to access those files
- The version control configuration must use the same unique ID that was originally used to add the Package to version control
- XML Package files associated with Packages that are already part of your project, are NOT included in the list of files available for import

#### 3.7.1.4.12 Export Controlled Model Branch

Applying version control to a model can result in many XML files placed under version control. It might then be hard to locate and import the file corresponding to the root of a particular model branch. Using Model Branch Files (.eab files) overcomes this problem by making it easier to export and import package hierarchies from one model to another.

You could export a newly created model branch from your own private copy of a model so that, for example:

- Another user can import that branch into their own private copy of the same model
- It can be imported for inclusion as a common branch in a number of different models

**Access** [Project Browser | right-click package to export | Package Control | Export as Model Branch](#)

#### Create a Model Branch File to represent a package hierarchy stored in version control

Step	Action	See also
1	On the Export as Model Branch dialog, in the <b>EAB Filename</b> field, type a name for your Model Branch File.  Alternatively, click on ( ... ) and browse for the file location.  Note that the package name is supplied as a default.	
2	Click on the <b>OK</b> button.  A branch file is created to represent the selected package. The branch file is committed to version control using the same version control configuration that controls the package you selected.	

### Notes

- You can specify any file name, including sub-folder names, as long as the file is contained in or below the working folder of your version control configuration
- The facility is only enabled for packages that are already under version control

### Learn more

- [Import Model Branch](#)<sup>[438]</sup>

#### 3.7.1.4.13 Import Controlled Model Branch

Applying version control to a model can result in many XML files placed under version control. It could then be hard to locate and import the file corresponding to the root of a particular model branch, if you want to:

- Retrieve a model branch created by another user in a private copy of a model, to import it into your own private copy of the same model
- Retrieve a model branch that is common in many models, for inclusion in a new model

**Model Branch Files** overcome this problem by simplifying the retrieval of package hierarchies for use in other models. You use Enterprise Architect's Model Branch Files, of which there are few, to retrieve information about the **root package file** such as the name and type of the version control configuration for the selected package, and the relative filename of the version controlled XML file associated with the package. The system then uses this information to import the branch into your model.

### Prerequisites

Before you begin, you must have:

- An operational version control environment that can be accessed by Enterprise Architect, and
- All of the version controlled package files and the model branch file associated with the model branch to import, in a valid and accessible working copy folder

**Access** **Project Browser | right-click on target package for import | Package Control | Import a Model Branch**

### Import a Model Branch

Step	Action	See also
1	<p>On the Import VC Model Branch dialog, either:</p> <ul style="list-style-type: none"> <li>• Use the lower portion of the Import VC Model Branch dialog to select a model branch file</li> </ul> <p>(This is the simpler option if the associated version control configuration has already been saved in the current model; continue to step 2)</p> <p>OR</p> <ul style="list-style-type: none"> <li>• Click on the <b>Find a Model Branch (.EAB) file</b> button</li> </ul> <p>(This option is useful when you have not yet defined the version control configuration that is associated with the model branch to be imported; see the <i>Manually Locating Model Branch Files</i> topic)</p>	<p><a href="#">Manually Locating Model Branch Files</a><sup>[439]</sup></p>
2	Click on the drop-down arrow in the <b>Select a Version Control Configuration</b> field and select the configuration you need.	

	A list of .eab files controlled by that configuration is displayed in the <b>Select a Model Branch (.EAB) file</b> list.	
3	<p>Select the Model Branch File you need, then click on the <b>OK</b> button.</p> <p>Enterprise Architect imports the root package specified in the Model Branch File and recursively imports and populates all the sub-packages contained in the root package.</p>	

### Notes

- The **Import a Model Branch** command is only enabled for packages that you (the current user) are able to edit, as the imported model branch is inserted into the model under your selected package

### Learn more

- [Version Control Product Setup](#)<sup>[394]</sup>
- [Export a Model Branch](#)<sup>[437]</sup>
- [Version Control Nested Packages](#)<sup>[390]</sup>

#### 3.7.1.4.13.1 Manually Locating Model Branch Files

When importing a Model Branch File from version control, you might not have the associated version control configuration saved in the model that is receiving the import. In this situation, it is simpler to manually browse the file system to locate the Model Branch File (.eab) and let Enterprise Architect derive the details of the configuration from the branch file you select.

### Prerequisites

Before you begin, you must have:

- An operational version control environment that can be accessed by Enterprise Architect, and
- All of the version controlled package files and the model branch file associated with the model branch to import, in a valid and accessible working copy folder

**Access** **Project Browser** | **right-click on target package** | **Package Control** | **Import a Model Branch: Find a Model Branch (.EAB) file**

### Locate the Model Branch File

Step	Action	See also
1	Access the Import VC Model Branch dialog, then browse for and select the Model Branch File that represents the model branch to import.	<a href="#">Import Controlled Model Branch</a> <sup>[438]</sup>
2	<p>Click on the <b>Open</b> button.</p> <p>If the version control configuration referenced by the file is fully defined within</p>	

	the current model, the import commences at this point.  Otherwise, Enterprise Architect displays a dialog prompting you to complete the required configuration.	
3	Click <b>Yes</b> to proceed with completing the definition of the version control configuration.  The Version Control Settings dialog is displayed.	<a href="#">Version Control Settings</a> <sup>[415]</sup>
4	Complete the definition of the configuration.  (Typically this involves simply specifying the working copy folder.)	
5	Click on the <b>Save</b> button.  The configuration details are saved.  The import of the model branch proceeds.	

**Notes**

- The **Import a Model** Branch command is only enabled for packages that you (the current user) are able to edit, as the imported model branch is inserted into the model under your selected package

**Learn more**

- [Export a Model Branch](#) <sup>[437]</sup>
- [Version Control Product Setup](#) <sup>[394]</sup>

**3.7.1.4.14 Review Package History**

It is possible to review the change history of version controlled packages by examining previous revisions. If necessary, you can check out one of these earlier revisions of a package for editing, effectively **rolling-back** to that prior revision of the package.

**Access**    **Project Browser | right-click package | Package Control | File History**

**Review change history of a version-controlled package**

Step	Action	See also
1	For version control environments using Subversion, CVS or TFS command line clients, the File Version History dialog displays.  Click on a revision number in the <b>Revisions</b> field, to select that revision and view its log entry.  For version control environments using SCC based clients, your particular product opens its own File Version History dialog.	<a href="#">Review Package History - SCC Client</a> <sup>[441]</sup>

2	<p>On the File Version History dialog, you can optionally click on either:</p> <ul style="list-style-type: none"> <li>• <b>Check Out</b> - the selected revision of the package file is retrieved from version control and imported into your model as a package that is checked out for editing; you can subsequently check in this revision as a new HEAD revision, effectively allowing you to revert the package to a prior revision</li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• <b>Retrieve</b> - the selected revision of the package file is retrieved from version control and imported into your model, but the package remains flagged as checked-in and cannot be modified; subsequently checking out the package updates it to the latest revision before it is unlocked for editing</li> </ul>	
---	---	--

### Notes

- If the selected package was already checked out in the current model, the **Retrieve** and **Check Out** buttons are disabled
- If the selected package contains any sub-package that is already checked-out in the current model, a warning will be displayed and the retrieval or check-out will not go ahead
- If you check out a prior revision of a package, but do not want to commit it as a new revision, right-click on the package and select **Package Control | Undo Check Out**

### Learn more

- [Undo Check Out of a Package](#)<sup>[432]</sup>

#### 3.7.1.4.14.1 Review Package History - SCC Client

It is possible to review the change history of version controlled packages by examining previous revisions. If necessary, you can check out one of these earlier revisions of a package for editing, effectively **rolling-back** to that prior revision of the package. The process for reviewing the change history of packages configured for version control with an SCC client (including products such as Visual Source Safe, TFS-SCC, ClearCase, Perforce, AccuRev and MKS Source Integrity) differs from that for Subversion, CVS or TFS command line clients.

**Access** **Project Browser | right-click package | Package Control | File History**

#### Review change history of a version-controlled package (SCC client)

Step	Action	See also
1	<p>The change history mechanism offered by the third party SCC provider displays.</p> <p>To import a prior revision of the package into your model, use the SCC History dialog to retrieve the revision, then close the dialog.</p>	<a href="#">Retrieve Prior Revision - SCC Client</a> <sup>[442]</sup> (Example)
2	The SCC client notifies Enterprise Architect that a different revision has been retrieved. A prompt then displays, asking whether you want to check-out the	

	prior revision.	
3	<p>Optionally, click on either:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>, to check out the prior revision - the selected revision of the package file is retrieved from version control and imported into your model as a package that is checked out for editing; you can subsequently check in this revision as a new HEAD revision, effectively reverting the package to the prior revision</li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• <b>No</b>, to import the prior revision as read-only - the selected revision of the package file is retrieved from version control and imported into your model, but the package remains flagged as checked-in and cannot be modified; subsequently checking out the package updates it to the latest revision before it is unlocked for editing</li> </ul>	

### Notes

- If the selected package was already checked out in the current model, the system does not proceed with retrieving a prior revision
- If you check out a prior revision of the package, but do not want to commit it as a new revision, right-click on the package and select **Package Control | Undo Check Out**

### Learn more

- [Undo Check Out of a Package](#)<sup>[432]</sup>

Depending on your version control product, retrieving a prior revision of a controlled package can involve a number of prompts regarding overwriting the current local copy.

This example details retrieval of a prior revision from a TFS-SCC version control configuration.

**Access**   **Project Browser | right-click package | Package Control | File History**

### Example Procedure - retrieve prior revision, TFS-SCC client

Step	Action	See also
1	Display the TFS File History dialog.	<a href="#">Review Package History - SCC Client</a> <sup>[441]</sup>
2	<p>Click on the <b>Get</b> button.</p> <p>The TFS-SCC client displays the Resolve Conflicts dialog.</p> <p>This dialog offers an option to <b>Automerge All XML</b> package files. <b>DO NOT select this option.</b></p> <p>It is important to prevent any merging of Enterprise Architect's XML package</p>	

	files.	
3	Click on the <b>Resolve</b> button. The TFS-SCC client displays the Resolve writable file conflict dialog.	
4	Select the <b>Overwrite local file/folder</b> option. The existing working copy of the package file is <b>overwritten</b> by the prior revision retrieved from version control.	
5	Click the <b>OK</b> button. The TFS-SCC client redisplay the Resolve writable file conflict dialog; it should now show no conflicts.	
6	Click on the <b>Close</b> button. The TFS-SCC client redisplay the File History dialog.	
7	Click on the <b>Close</b> button. Enterprise Architect displays a prompt, asking whether to check-out the prior revision.	
8	Click on the: <ul style="list-style-type: none"> <li>• <b>Yes</b> button to check-out the prior revision</li> <li>• <b>No</b> button to retrieve a read-only version of the package, that is NOT checked-out and is NOT editable</li> </ul>	

#### 3.7.1.4.15 Validate Package Configurations

Having defined the version control settings for your current model, you can test the validity of those settings associated with each version controlled package within the model.

**Access** **Project | Version Control | Validate Package Configurations**

##### Validate version control settings

Step	Action	See also
1	The validation process scans the model database and verifies that the version control configuration associated with each version controlled package is fully specified in the current model. It also queries the corresponding version control provider to find the status of the package file associated with each version controlled package.  The results of the validation process are sent to the System Output window.	<a href="#">The System Output Window</a>

Step	Action	See also
		<a href="#">[169]</a>
2	Open the Version Control Settings dialog to complete the definition of any invalid or missing version control configurations.	<a href="#">Version Control Setup</a> <a href="#">[413]</a>
3	Click on an error message in the System Output window to highlight the corresponding package in the Project Browser.	
4	Right-click a package node and choose <b>Package Control   Configure Package</b> to open the Package Control Options dialog.  Correct any problems with the version control details for the package.  Correct any problems with the package's associated XML file.	<a href="#">Configure Controlled Package</a> <a href="#">[424]</a>

#### 3.7.1.4.16 Resynchronize the Status of Version Controlled Packages

It is possible to update the version control status of version controlled packages within your project to re-synchronize with the status reported by your version control provider. This can be useful if you are creating copies of your project, where checking in a package from one copy of the model leaves the package in the second copy of the model with an out-of-date version control status.

For a given package, the re-synchronization process queries the corresponding version control provider to find the status of the package file associated with the version-controlled package. If necessary, the process then updates the package flags within the model database, to synchronize the package status recorded in the model with the value reported by the version control provider.

**Access** **Project Browser | right-click package | Package Control | Re-synch Status With VC Provider**  
or  
**Project | Version Control | Re-synch Statuses of All Packages**

#### Resynchronize version control status

Step	Action	See also
1	The results of the re-synchronization process are sent to the System Output window.	<a href="#">The System Output Window</a> <a href="#">[169]</a>
2	Double-click on any result message to select, in the Project Browser, the corresponding package.	

#### Notes

- This process does **not** cause any package data to be either exported from your model to the

associated package file, or imported from a package file into your model's package data

- If a package has been checked-out and modified with Enterprise Architect, but your version control provider reports the package file as checked-in, running this process marks the package within Enterprise Architect as being checked-in, without exporting and committing the pending changes; subsequently checking-out the package imports the latest revision of the package file from version control, effectively discarding the uncommitted modifications from the model
- Similarly, if a package file is checked-out to you in your local working copy folder, but not in the Enterprise Architect model, running this process marks the package within the model as checked-out, but it does not import the associated package file from the version control system; consequently, it is possible to check-in a package from Enterprise Architect that is potentially out of date, compared to the latest revision of the package file within the version control system

### 3.7.2 Tracking Changes

If you want to track changes to data across your project, you can use two separate but complementary facilities - **Auditing** and **Baselines**.

#### Topics

Topic	Detail	See also
<b>Auditing of model changes</b>	<p><i>Auditing</i> is a project-level feature, available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions, that enables you to record model changes in Enterprise Architect.</p> <p>By enabling this feature, model administrators can view a range of information regarding changes, such as:</p> <ul style="list-style-type: none"> <li>• Who changed an element</li> <li>• How many elements they changed</li> <li>• When they changed the data</li> <li>• What the previous values were, and</li> <li>• What type of elements they changed</li> </ul>	<a href="#">Auditing</a> <sup>[446]</sup>
<b>Baselining and differencing to capture and roll back changes</b>	<p>The Enterprise Architect Corporate, Business and Software Engineering, System Engineering and Ultimate editions provide a facility to 'baseline' or snapshot a model branch in XML format at a particular point in time, and store it within the model in compressed format.</p> <p>More than one baseline can be stored against a single Enterprise Architect package; using baselines, you can compare packages at the current and earlier stages of development, using the <i>Compare</i> (Diff) utility.</p> <p>The Compare utility is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect; it enables you to compare the current model with:</p> <ul style="list-style-type: none"> <li>• A Baseline</li> <li>• An exported Enterprise Architect XML file on disk</li> <li>• A version-controlled Enterprise Architect XML file on disk</li> </ul>	<a href="#">Package Baselines</a> <sup>[457]</sup> <a href="#">The Compare Utility (Diff)</a> <sup>[463]</sup>

Topic	Detail	See also

### 3.7.2.1 Auditing

**Auditing** is a project-level feature that model administrators can use to record model changes in Enterprise Architect. After switching Auditing on, you can view information on changes such as:

- Who changed an element
- How many elements they changed
- When they changed the data
- What the previous values were, and
- What type of elements they changed

Auditing does **not** record changes to:

- Document Templates
- Model Documents
- Baselines or
- Profiles

We provide a Quickstart procedure to help you enable Auditing and see it in action, from which point you can explore a number of set-up options and display features.

#### Features

Feature	Detail	See also
<b>The Audit View</b>	To view what has been recorded by the audit, use the <b>Audit View</b> , which provides an interface to everything recorded by Auditing.  If security is enabled, you must have <b>Audit View</b> permission to display data in the Audit View.	<a href="#">Audit View</a> <sup>[451]</sup> <a href="#">List of Available Permissions</a> <sup>[329]</sup>
<b>Model Views</b>	You can also obtain a snapshot of selected items in the model, using the <b>Model View</b> facility.  In the Corporate, Business and Software Engineering, Systems Engineering or Ultimate editions of Enterprise Architect, you can use this facility to automatically generate a snapshot at intervals and, if there are changes in the items collected by the defined search, to trigger a notification to you of such changes.  This helps you to monitor work flow and other events of concern to you.	<a href="#">Model View</a> <sup>[686]</sup>  <a href="#">Monitor Events</a> <sup>[593]</sup>
<b>Document Report</b>	You can generate a document report that includes the audit history information for the selected element or Package, by choosing the <b>basic + audit</b> template.	<a href="#">Generate Documentation</a> <sup>[2644]</sup>

Feature	Detail	See also
<b>Audit History</b>	Using Auditing, you can track changes to an element or connector over time.  However, enabling Auditing also enables an Audit History tab in the System Output window, which summarizes all changes made to the selected element or connector.	<a href="#">Audit History Tab</a> <sup>[455]</sup>
<b>Performance Issues</b>	By enabling Auditing on a project, you increase the time taken for most actions.  For most modeling tasks, this increase is insignificant; however, there are some instances where the difference is more substantial.	<a href="#">Performance Issues</a> <sup>[456]</sup>

### Notes

- The Auditing facility is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Warning** - If your site runs separate editions of Enterprise Architect, when Auditing is turned on in a project any Desktop or Professional edition users are locked out of the project; to restore access, turn Auditing off in the project from the Corporate, Business and Software Engineering, Systems Engineering or Ultimate edition instance of Enterprise Architect

### Learn more

- [Auditing Quickstart](#) <sup>[447]</sup>
- [Auditing Settings](#) <sup>[448]</sup>

#### 3.7.2.1.1 Auditing Quickstart

It is very simple to enable Auditing and see it in action.

**Access** **Project | Auditing: Audit Settings**

### Enable Auditing

Step	Action	See also
<b>1</b>	In the Audit View, click on the <b>Audit Settings</b> button.  The Audit Settings dialog displays.	<a href="#">The Audit View</a> <sup>[451]</sup>  <a href="#">Auditing Settings</a> <sup>[448]</sup>
<b>2</b>	Select the <b>Enable Auditing</b> checkbox.	
<b>3</b>	Click on the <b>OK</b> button to close the Audit Settings dialog.	

Step	Action	See also
4	Close the Audit View dialog.	
5	Change and save your project. <ul style="list-style-type: none"> <li>• Add a new Package</li> <li>• Add a new Class</li> <li>• Add a new connector</li> <li>• Change the name of an element</li> <li>• Delete an element</li> </ul>	
6	Open the Audit View again and click on the <b>Refresh</b> (or <b>Load</b> ) button to display a record of the changes you have made.	

### 3.7.2.1.2 Auditing Settings

Using the Audit Settings dialog, you can change what is recorded by the Auditing facility and:

- Define the areas of processing in Enterprise Architect to audit
- Administer your audit records
- Indicate the kind of model objects for which changes are to be recorded
- Configure Auditing to record changes to only certain types of elements

**Access**    **Project | Auditing: Audit Settings**

#### Configure Settings

Field/Option/ Button	Action	See also
<b>Enable Auditing</b>	Select this checkbox to turn the Auditing facility on.	
<b>Audit XMI Import</b>	Select this checkbox to record changes arising from <b>XMI importing</b> in the audit.  As version control uses XMI, you must select this option to record changes from checking out Packages.	<a href="#">Version Control</a> <sup>383</sup>
<b>Audit XMI Export</b>	Select this checkbox to record changes arising from <b>XMI exporting</b> in the audit.  As version control uses XMI, you must select this option to record changes from checking out Packages.	

Field/Option/ Button	Action	See also
<b>Audit Reverse Engineering</b>	Select this checkbox to record changes arising from <b>reverse engineering</b> in the audit.	
<b>Use Database Timestamp</b>	Select this checkbox to use the <b>database server's</b> timestamp instead of each user's <b>local</b> timestamp; this improves security.  This option is not available for project <b>files</b> .	
<b>Save Logs</b>	Click on this button to save a copy of the logged audit items currently held in the project. These items remain in the project; you can use the <b>Clear Logs</b> button to remove them.  The system prompts you to specify whether to save items covering a specific period of time. <ul style="list-style-type: none"> <li>Click on the <b>No</b> button to save all log items currently held in the database</li> <li>Click on the <b>Yes</b> button to display the Time Filter dialog, on which you select a standard time period or define your own</li> </ul> This function can be accessed through the Automation Interface.	<a href="#">Audit View Controls</a> <sup>[453]</sup>
<b>Clear Logs</b>	Click on this button to permanently delete all log data from the current project; use the <b>Save Logs</b> button first, to save the audit records outside the project.  The system prompts you to specify whether to clear items covering a specific period of time. <ul style="list-style-type: none"> <li>Click on the <b>No</b> button to clear all log items currently held in the database</li> <li>Click on the <b>Yes</b> button to display the Time Filter dialog, on which you select a standard time period or define your own</li> </ul> This function can be accessed through the Automation Interface.	<a href="#">Repository</a> <sup>[2850]</sup>
<b>Load Logs</b>	Click on this button to load a previously saved set of logs back into the project. A browser displays through which you select the log file to reload.  If the same record exists in both project and log file, that record is not reloaded.	
<b>Core</b>	Select this radio button to record changes to elements (including attributes and operations), Packages, connectors and some model-level information.	
<b>Standard</b>	Select this radio button to record the same changes as for the <b>Core</b>	

Field/Option/ Button	Action	See also
	option, plus changes to diagrams.	
<b>Extended</b>	Select this radio button to record the same changes as for the <b>Standard</b> option, plus changes to project security.	
<b>Maintenance</b>	Select this radio button to audit changes to maintenance elements only; that is: <ul style="list-style-type: none"> <li>• Package (element)</li> <li>• Requirement</li> <li>• Feature</li> <li>• Use Case</li> <li>• Actor</li> <li>• Note</li> <li>• Issue and</li> <li>• Change</li> </ul>	
<b>Core Structural</b>	Select this radio button to audit changes to maintenance elements (as above) plus certain structural elements; that is: <ul style="list-style-type: none"> <li>• Package (structure)</li> <li>• Class</li> <li>• Interface</li> <li>• Signal</li> <li>• Node</li> <li>• Component</li> <li>• Artifact</li> <li>• Part</li> <li>• Port and</li> <li>• Device</li> </ul>	
<b>All</b>	Select this radio button to audit changes to all types of element.	
<b>Custom</b>	Select this radio button to audit changes to element types that you specify.  The <b>Customize</b> button is made available; click on this button to display a list of element types, and select the checkbox against each element type to include in the audit (or click on the <b>Select All</b> button to select every element type).  Click on the <b>OK</b> button to save the selection.	

**Notes**

- As the number of records increases, the performance of the Audit View reduces; it is recommended that audit records that are not regularly required are saved to file, then cleared from the project, to help ensure high performance
- Connectors are audited when they are connected to an element that is included in the **Audit Options**
- If security is enabled, you must have **Audit View** permission to turn Auditing on, and **Audit Settings** permission to change the audit settings

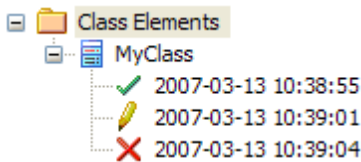

**3.7.2.1.3 The Audit View**

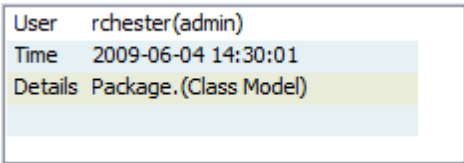

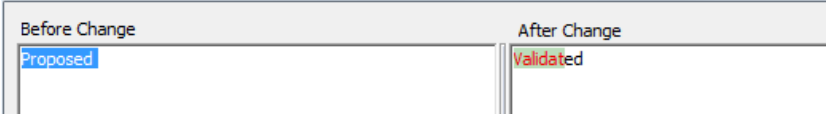

The Audit View provides an interface to the information that has been recorded by auditing.

**Access** **Project | Auditing**

**Sections of the Audit View**

The Audit View is divided into three main areas:

Section	Description	See also
<b>View controls</b>	The view controls provide a variety of settings for controlling auditing and the display of audit records.	<a href="#">Audit View Controls</a> <sup>[453]</sup>
<b>Audit tree</b>	<p>The audit tree displays the log items that have been recorded by auditing. What is displayed in the tree is affected by the view controls, such as:</p> <ul style="list-style-type: none"> <li>• Sorting</li> <li>• Filter (by time)</li> <li>• Mode</li> <li>• Auditing settings (what was actually recorded)</li> </ul> <p>If synchronizing with the Project Browser, it is also affected by the Package, diagram or element you have selected.</p>  <p>In the audit tree:</p> <ul style="list-style-type: none"> <li>• The green tick indicates a creation</li> <li>• The yellow pencil indicates an edit</li> <li>• The red cross indicates a deletion</li> </ul>	<a href="#">Audit View Controls</a> <sup>[453]</sup> <a href="#">Auditing settings</a> <sup>[448]</sup> <a href="#">The Project Browser</a> <sup>[646]</sup>

Section	Description	See also
	<p>Right-clicking an element in the audit tree (such as <i>MyClass</i>) displays a context menu that enables you to locate the selected element in:</p> <ul style="list-style-type: none"> <li>• The Project Browser</li> <li>• Any diagrams in which it exists</li> </ul>	
<b>Record display</b>	<p>The record display is in two parts: the identity of the selected change, and the actual change made.</p> <p>The data in the record display is determined by the view controls and mode and, if synchronizing with the Project Browser, by the package, diagram or element you have selected.</p> <p><b>Identity</b></p>  <p>The identity of a change consists of:</p> <ul style="list-style-type: none"> <li>• The Windows username of the user that made the change; if security is enabled, the name is of the format <i>WindowsUsername (SecurityUser)</i></li> <li>• When the change was made</li> <li>• The path of the change; for example: Class <i>Class1</i> - Attribute <i>Att1</i> - Attribute Constraint <i>Constraint</i></li> </ul> <p><b>Changes</b></p> <p>Changes are displayed in a table format, showing the:</p> <ul style="list-style-type: none"> <li>• Property (or data item) name</li> <li>• Its original value before the change and</li> <li>• Its value after the change</li> </ul> <p>If you double-click on an item in the list of changes (or right-click and select the <b>Show Differences</b> context menu option) the Difference window displays:</p>  <p>This shows the specific changes that have been made, highlighting the edited, created, deleted or formatted characters.</p>	<p><a href="#">Audit View Controls</a> <sup>[453]</sup></p> <p><a href="#">The Project Browser</a> <sup>[646]</sup></p>

Section	Description	See also
	Changes to the <i>format</i> of text in the element, made through the element Properties dialog, are not apparent in the initial table; they are visible in the Difference window, identified by HTML formatting tags.	

### Notes

- If security is enabled, you must have **Audit View** permission to display data in the Audit View

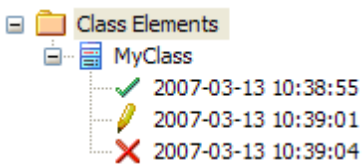

### Learn more

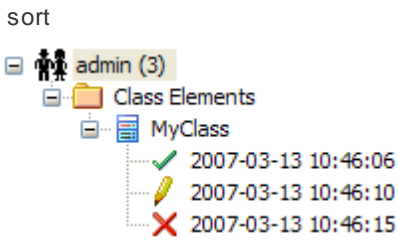

- [List of Permissions](#) <sup>[329]</sup>

#### 3.7.2.1.3.1 Audit View Controls

The **Audit View** controls provide a variety of settings for controlling auditing and the display of audit records.

### Reference

Action	Usage	See also
<b>Load or Refresh</b>	Click to reload the Audit Tree, updated with any new audit results.	
<b>Search</b>	Click to search through log items for a particular area - you can search by Name, Type or GUID.  The items are loaded and filtered with the current Sort By, Time Filter and Mode settings.  If you refresh the Audit View, you must run the search again.	
<b>Audit Settings</b>	Click to open the Audit Settings dialog.	<a href="#">Audit Settings</a> <sup>[448]</sup>
<b>Sort-by</b>	Select the appropriate radio button for the required display setting: <ul style="list-style-type: none"> <li><b>Type</b> - changes are grouped under element type (such as Class or Requirement), and then grouped under the changed element    </li> <li><b>User</b> - changes are grouped under user name, each with the number of changes for that user  Under each user name, changes are grouped as for the Type</li> </ul>	

Action	Usage	See also
		
<b>Filter By Date/Time</b>	<p>Select to enable the <b>Filter Settings</b> button, to filter the audit results by time period.</p> <p>Changes that occur <i>outside</i> the selected filter period are not shown in the Audit View.</p>	
<b>Filter Settings</b>	<p>Click to display the Time Filter dialog, to set the filter time period:</p> <ul style="list-style-type: none"> <li>• <b>Today</b> - to display changes occurring today</li> <li>• <b>Previous Hour</b> - to display changes occurring in the last 60 minutes</li> <li>• <b>Previous 24 Hours</b> - to display changes occurring in the last 24 hours</li> <li>• <b>Previous Week</b> - to display changes occurring in the last 7 days</li> <li>• <b>Previous 30 Days</b> - to display changes occurring in the last 30 days</li> <li>• <b>Previous Year</b> - to display changes occurring in the last 365 days</li> <li>• <b>Custom</b> - to define your own time period, using the <b>From</b> and <b>To</b> fields</li> </ul> <p>The six pre-configured time periods automatically update when you click on the <b>Refresh</b> button; custom periods are static and do not automatically update.</p> <p>If you have set a filter period, and you deselect the <b>Filter By Date/Time</b> checkbox, the period remains set; the custom time period, too, is retained so that you can re-use it or modify it later if required.</p>	
<b>Status Text</b>	<p>Read to see which:</p> <ul style="list-style-type: none"> <li>• Mode has been selected and</li> <li>• Time filter is being applied to the data</li> </ul>	
<b>Mode</b>	<p>Click to display a menu of options to change the mode of the Audit View.</p> <p>Select:</p> <ul style="list-style-type: none"> <li>• <b>Standard</b> - to automatically synchronize with the Project Browser; where changes have been made, the Audit View reflects your selection from the Project Browser - if you click on:</li> </ul>	<a href="#">The Audit View</a> <sup>#45↑</sup>

Action	Usage	See also
	<ul style="list-style-type: none"> <li>• An element, the Audit View displays the history for that element</li> <li>• A package, the Audit View displays the history for that package and its immediate children (but not the contents of nested packages)</li> <li>• A diagram, the Audit View displays the history for that diagram and its contents (which could be drawn from a wide area of the Project Browser)</li> <li>• <b>Advanced</b> - to load large sets of log items independent of the Project Browser; in this mode, a special Audit Settings group can be displayed in the Audit Tree, which records: <ul style="list-style-type: none"> <li>• When Auditing has been enabled and disabled</li> <li>• Who made the change</li> <li>• The date and time of the change</li> <li>• Changes to the Audit Settings</li> <li>• When Audit Operations are executed</li> <li>• Security changes (which can be browsed in the same way as other changes)</li> </ul> </li> <li>• <b>Deleted</b> - to display only deleted records, but otherwise data is shown as in <b>Advanced</b> mode; records can be sorted by element type or by user as required</li> <li>• <b>Raw</b> - to display all audit records in chronological order without sorting, enabling you to see a progression of changes; this can be especially useful in determining date-time inconsistencies</li> </ul> <p>Any search and filtering you define still apply, enabling you to view all of today's changes in order, or all changes for a particular element in order, or both</p> <p>Additional database information is displayed; this additional information might be insignificant or only in machine-readable format</p>	

### 3.7.2.1.4 Audit History Tab

When Auditing is turned on, an Audit History tab is enabled in the System Output window.

**Access** [View | System Output > Audit History](#)

#### Guide

Topic	Detail	See also
<b>Prerequisite</b>	To see this tab, you must have the Audit View open.	<a href="#">The Audit View</a> 

Topic	Detail	See also
	The tab continues to display if you subsequently close the Audit View.	
<b>Information Shown</b>	<p>The tab shows a history of changes to whichever element or connector you have selected in the:</p> <ul style="list-style-type: none"> <li>• Current diagram</li> <li>• Project Browser</li> <li>• Audit View, or</li> <li>• Package Browser</li> </ul> <p>As you select different elements or connectors, the Audit History tab automatically updates to reflect your current selection.</p> <p>For each change made to the element or connector, the tab shows:</p> <ul style="list-style-type: none"> <li>• Who made the change</li> <li>• When the change was made</li> <li>• Where the change was made</li> <li>• The value of the characteristic before the change</li> <li>• The value of the characteristic after the change</li> </ul>	

#### Notes

- If security is enabled, you must have **Audit View** permission to display data on the Audit History tab

- [List of Permissions](#)<sup>[329]</sup>

#### 3.7.2.1.5 Auditing Performance Issues

Enabling auditing on a project increases the time taken for most actions.

For most modeling tasks, this increase is insignificant; however, there are some situations where the difference is more substantial.

Operation	Detail	See also
<b>Large Deletions</b>	<p>Deleting large Packages or Package structures, or large numbers of elements, takes significantly longer with auditing on.</p> <p>You might disable auditing before performing such a deletion.</p>	<a href="#">Auditing Settings</a> <sup>[448]</sup>
<b>XML Imports</b>	Importing XML takes longer with auditing enabled.	<a href="#">Import From XML</a>

Operation	Detail	See also
	A project-level option is provided for disabling auditing of XML Imports.	<a href="#">Auditing Settings</a>
<b>Reverse Engineering</b>	Reverse engineering code takes longer with auditing enabled. A project-level option is provided for disabling auditing of reverse engineering.	<a href="#">Import Source Code</a> <a href="#">Auditing Settings</a>
<b>Replication</b>	You cannot remove replication from a model with Auditing enabled. If you have to remove replication, disable Auditing and - if prompted to do so - allow Enterprise Architect to roll back the database version; you can then remove replication.	<a href="#">Remove Replication</a> <a href="#">Auditing Settings</a>

### 3.7.2.1.6 Audit View Performance Issues

Most operations in the Audit View are affected by the volume of use of the database - both by other facilities and by auditing itself.

Some potential considerations and responses are outlined below:

Consideration	Detail	See also
<b>Navigating the Project Browser Within Auditing is Slow</b>	Try setting the time filter to a period in the immediate past, such as <b>Today</b> , <b>Previous 24 Hours</b> or <b>Previous Week</b> ; this time period updates each time you open or refresh the Audit View.	<a href="#">Audit View Controls</a> <a href="#">Auditing Settings</a>
<b>The Audit View is Slow in Loading and Changing Modes</b>	Save log items outside the project with the <b>Save Logs</b> button; if you then clear the logs you have just saved, the load time of the Audit View is reduced.  You can reload logs into the project at any time, using the <b>Load Logs</b> button.	
<b>Navigating the Audit Tree is Slow</b>	Close the Audit History tab in the Output window	<a href="#">Audit History Tab</a>

### 3.7.2.2 Package Baselines

Enterprise Architect includes tools to help you manage and review changes to your models over time. These tools apply the concepts of *Baselines*, *Differencing* and *Merges*.

You use Baselines, Differencing and Merges essentially to compare two snapshots of a specific part of your project, to capture the differences between them and either roll back or incorporate selected changes or all changes.

Topic	Detail	See also
<b>Baselines</b>	Enterprise Architect provides a facility to create a Baseline or	<a href="#">Baselines</a>

Topic	Detail	See also
	<p>'snapshot' of the contents of a selected package and its child packages at a particular point in time; this enables you to later compare that branch of the model at that time with the current state of the branch.</p> <p>Baselines are stored in the same XML format as is used for version control, but are stored within the project in compressed format.</p> <p>You can also have parallel copies of parts of your model for team development, and create Baselines within each copy to merge changes into the project master.</p>	
<b>Differencing</b>	<p>Differencing (<i>Diff</i>, or <i>Compare</i>) enables you to explore the differences between:</p> <ul style="list-style-type: none"> <li>• The current state of a specific part of your project, and</li> <li>• Previous or parallel versions captured in a Baseline or an XMI 1.1 file on disk</li> </ul> <p>The section includes an example of such a comparison.</p>	<p><a href="#">The Compare Utility (Diff)</a> <sup>[463]</sup></p> <p><a href="#">Example Comparison</a> <sup>[468]</sup></p>
<b>Merges</b>	<p>Once Differencing is complete, you can merge information from the Baseline into the current project; it is not possible to go the other way.</p> <p>You can:</p> <ul style="list-style-type: none"> <li>• Merge information manually, change by change</li> <li>• Merge information automatically by electing to merge in all changes in one batch procedure</li> <li>• Revert completely to the original Baseline by importing the stored XMI directly</li> <li>• Merge information and elements from a Baseline in a different project, making it possible to keep multiple versions of a single model in synch</li> </ul> <p>The merge options are available through the toolbar, context menus and the keyboard on the Compare Utility tab, which shows the results of a comparison.</p>	<p><a href="#">Compare Utility Tab Options</a> <sup>[470]</sup></p>
<b>Visual Differences in Diagrams</b>	<p>Changes to a model might include:</p> <ul style="list-style-type: none"> <li>• Adding or removing elements and connectors on a diagram, or</li> <li>• Changing the position of elements or the overall layout of a diagram</li> </ul> <p>You might believe that a diagram has changed, and select to compare it with a baseline using a context menu option from the Project Browser. Alternatively, you might perform a</p>	<p><a href="#">Check Visual Changes to Diagrams</a> <sup>[466]</sup></p>

Topic	Detail	See also
	baseline comparison on a package or a model and select from the comparison output any diagrams that are flagged as changed.	

### Notes

- Package Baseline facilities are available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- The Enterprise Architect Corporate, Business and Software Engineering, System Engineering and Ultimate editions provide another facility, Auditing, which you can switch on to perform continuous monitoring of changes across the project; you can dovetail your use of each facility to meet the range of your change management requirements
- If a package under version control forms part of a Baseline, and that package is checked in to the model, you cannot merge the original data from the Baseline into that package
- You can also obtain a snapshot of selected items in the model, using the Model Views facility; this facility enables you to automatically generate the snapshot at intervals and, if there are changes in the items collected by the defined search, to trigger a notification to you of such changes, which enables you to monitor work flow and other events of concern to you
- If security is enabled you must have **Baselines - Manage** permission to create, import and delete Baselines, and **Baselines - Restore** permission to merge data from a Baseline; security permissions are not required to select an existing Baseline and perform a comparison with the model

- [Monitor Change Events](#) <sup>[593]</sup>

#### 3.7.2.2.1 Baselines

Enterprise Architect provides a facility to 'Baseline' (snapshot) a model branch at a particular point in time for later comparison with the current package state.

Topic	Detail	See also
<b>Baselines</b>	<p>Baseline comparison is most useful for determining the changes made to the model during development compared to some Baseline saved at a crucial point - for example the completion of a phase or version iteration.</p> <p>More than one Baseline can be stored against a single Enterprise Architect package.</p> <p>Baselines are particularly useful during requirements management to check for changes, additions and deletions that have occurred since the start of the current work phase; knowing how a model has changed is an important part of managing change and the overall development process.</p> <p>Baselines are stored within the model in compressed XML format; you can save a Baseline to an external XML file for</p>	<a href="#">The Compare Utility (Diff)</a> <sup>[463]</sup>

Topic	Detail	See also
	<p>storage or archive, or for distributing to other users working on models derived from a master project.</p> <p>Baselines are generally used in conjunction with the <i>Compare</i> utility.</p>	
<b>Scenario</b>	<p>A typical scenario for using Baselines would be:</p> <ul style="list-style-type: none"> <li>• Create the base model branch to a sufficient point to create a Baseline (checkpoint); create and store the Baseline as Version 0.1a</li> <li>• As work continues on development, managers and developers can check the current model branch against the Baseline for important modifications, additions and deletions; the Compare utility can be invoked from the Baseline dialog to check the current model branch against the stored version</li> <li>• As required, minor Baselines can be created to check recent progress; these 'temporary Baselines' are useful for managing change when a lot of work is being done and it is important to only see what has changed in, for example, the last 24 hours</li> <li>• At sign-off or the move to a new version/phase, a major Baseline can be created to capture the new state of the model</li> </ul> <p>Minor Baselines created earlier can be deleted if required to save space</p>	<p><a href="#">Manage Baselines</a> <sup>461</sup></p> <p><a href="#">Create Baselines</a> <sup>462</sup></p>
<b>Considerations</b>	<ul style="list-style-type: none"> <li>• Baselines are based on the GUID or unique ID of a particular package: <ul style="list-style-type: none"> <li>• Enterprise Architect checks for that ID as the root element within the XML document being used as a Baseline</li> <li>• When you export a package to XML, the package you export is the root element; likewise when you create a Baseline, the current package is the root package of the XML Baseline</li> <li>• When you save information in a version control system, the current version-controlled package is again the root package of the document</li> </ul> </li> <li>• It is not useful to create a Baseline by importing an XML package file created by version controlling a package that itself contains version-controlled child packages; that type of XML package file contains stubs for the child packages, not full information on the child packages and elements</li> <li>• If a package under version control forms part of a Baseline, and that package is checked in to the model, you cannot merge the original data from the Baseline into that package</li> <li>• XML files must be in the same format used by the</li> </ul>	

Topic	Detail	See also
	Baseline engine - currently the UML 1.3 XMI 1.1 format (plus Enterprise Architect extensions), which contains all the information necessary to reconstruct a UML model, even a UML 2.x model	

### Notes

- The Baseline facility is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- The Compare utility is available in the *Professional* edition of Enterprise Architect, as well as in the Corporate and extended editions above

### 3.7.2.2.1.1 Manage Baselines

Enterprise Architect provides a range of facilities for working with and managing Baselines.

**Access** Right-click model branch package | Package Control | Package Baselines

### Reference

Create, select and process Baselines using the Package Baselines dialog, as indicated below:

Field	Usage	See also
<b>Current Baselines For Package: &lt;Name&gt;</b>	Review the Baselines for the current model branch, listed by version reference with the highest alphabetical/numerical value at the top.  If an entry is longer than the display area, a horizontal scroll bar displays at the bottom of the panel; use this to scroll to the text that is not shown.	<a href="#">Create Baselines</a> <sup>[462]</sup>
<b>Show Differences</b>	Run the Compare <sup>[463]</sup> utility on the selected Baseline and the current model branch or diagram, to display the differences <sup>[468]</sup> between the two.	<a href="#">The Compare Utility</a> <sup>[463]</sup> <a href="#">Check Visual Changes to Diagrams</a> <sup>[466]</sup> <a href="#">Example Comparison</a> <sup>[468]</sup>
<b>Restore to Baseline</b>	Completely restore the model branch from the selected Baseline.	
<b>New Baseline</b>	Create a new Baseline.	<a href="#">Create Baselines</a> <sup>[462]</sup>
<b>Delete Selected</b>	Delete the selected Baseline.	

Field	Usage	See also
<b>Load Other Baselines</b>	<p>Display a drop-down menu that enables you to load Baselines from another model, in either a project file or a DBMS repository.</p> <ul style="list-style-type: none"> <li>For project files, a browser displays; locate the required project file</li> <li>For DBMS repositories, the Windows Data Link Properties dialog displays; select the data provider and click on the <b>OK</b> button to display the Select Data Source dialog, from which you select the required project</li> </ul> <p>In either case, the <i>Connected To:</i> message at the bottom of the Package Baselines dialog changes to the name of the alternative model.</p> <p>To return the dialog to the original project, select the third option on the drop down list: <b>Load From Selected Package</b>.</p>	
<b>Import File</b>	Import an XML 1.1 file from the file system as a new Baseline for this current model branch.	
<b>Export File</b>	Export the selected Baseline to an XML file on disk.	
<b>Compare Model to File</b>	Compare the selected model branch with an XML 1.1 file on disk; a browser displays, which you use to locate the file.	
<b>Options</b>	Set filters  to make the comparison more specific.	<a href="#">Compare Options</a> 

#### Notes

- Package Baseline facilities are available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

#### 3.7.2.2.1.2 Create Baselines

**Access** Project Browser package context menu | Package Control | Package Baselines: New Baseline

#### Reference

Create the new baseline using the New Baseline dialog, as indicated below:

Field	Usage	See also
<b>Name</b>	Display the package name of the currently selected model branch.	<a href="#">Manage Baselines</a> 

Field	Usage	See also
<b>Version</b>	Type a unique version reference for this Baseline, which can consist of any alphanumeric characters.  The Package Baselines dialog sorts the Baselines according to the value of this field.	
<b>Include Sub-packages</b>	Include the entire sub-package hierarchy of this branch in the Baseline; this option defaults to selected.  If you deselect the checkbox, only the immediate contents (XML stubs) of the package are included in the Baseline.	
<b>Note</b>	Edit the default current time and date to any other value.  The field is a single-line entry, for display on the Package Baselines dialog (a one-line-per-entry list).	
<b>OK</b>	Click to create a new Baseline and return to the Package Baselines dialog.	

### Notes

- Package Baseline facilities are available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

#### **3.7.2.2.1.3 The Compare Utility (Diff)**

Enterprise Architect has a comprehensive and powerful built in *Compare (diff)* utility, which enables you to:

- Explore what has changed within a model over time
- Explore how previous versions of a model branch differ from what is currently in the model
- Perform a full model comparison by exporting all of Model A to XML, then using **Compare Model to File** from within the current model (Model B)

Comparing and checking model development at various points in the process is an important aspect of managing change and development, monitoring what is being modified and ensuring the development and design process is on track.

### Access

- Project Browser package context menu | Package Control | Package Baselines: Show Differences**  
- use the Baseline dialog
- Project Browser package context menu | Package Control | Compare with XMI File** (package not under version control)
- Project Browser package context menu | Package Control | Compare with Controlled Version** (package under version control)

**Use to**

- Compare a model branch in Enterprise Architect with a Baseline created using the Baseline functionality (Corporate, Business and Software Engineering, System Engineering and Ultimate editions)
- Compare a model branch in Enterprise Architect with a Baseline stored in a different model
- Compare a model branch in Enterprise Architect with an XML 1.1 file on disk created previously using the Enterprise Architect XML export facility (user selects file)
- Compare a model branch in Enterprise Architect with the current version-controlled XML 1.1 file on disk as created when using Version Control in Enterprise Architect (file automatically selected)

**Guide:**

Topic	Detail	See also
<b>Differencing With Baselines</b>	<p>As a Baseline is stored within a model and contains all the information, elements and connections for a package at a point in time, it can be used within Enterprise Architect to track changes to model elements over time.</p> <p>The Differencing engine first builds a representation of the current package in memory, based on what is currently in the model.</p> <p>It then compares this with the stored Baseline, highlighting changes, new elements, missing elements and elements that have been moved to other packages.</p> <p>It is possible to filter the resultant output to display only one particular kind of change: for example, additions to the model.</p> <p>If a Baseline has been created to ignore child package content, a comparison between that Baseline and the model does not include any child package content in the model.</p> <p>See the example model comparison.</p>	<p><a href="#">Compare Options</a> <sup>[464]</sup></p> <p><a href="#">Create Baselines</a> <sup>[462]</sup></p> <p><a href="#">Example Comparison</a> <sup>[468]</sup></p>

**Notes**

- This utility is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- You cannot compare the current model with an XML 2.1 file; the utility can only compare with an XML 1.1 file

**3.7.2.2.1.4 Compare Options**

The Compare Options dialog enables you to refine the output of the Compare utility when it compares the current model with a Baseline.

To display the dialog, either:

- Click on the **Options** button on the Package Baselines dialog
- Click on the **Compare Options** icon on the Compare Utility tab toolbar

Field	Usage	See also
<b>Always Expand to Differences</b>	<p>Always display the list of elements fully expanded to show changes.</p> <p>If you deselect the checkbox, when the Compare Utility tab is first opened it lists the package contents to element level, and you expand each element as required to show the changed items.</p> <p>For large branches of the model, it is better to leave the checkbox unselected.</p>	
<b>Show Elements that are</b>	<p>List elements that:</p> <ul style="list-style-type: none"> <li>• Have been changed since the Baseline was created</li> <li>• Are in the Baseline only (that is, have been deleted from the model since the Baseline was created)</li> <li>• Are in the model only (that is, have been created since the Baseline was created)</li> <li>• Have not changed since the Baseline was created (you might generally leave this checkbox unselected)</li> </ul>	
<b>Suppress these Changes</b>	<p>Exclude:</p> <ul style="list-style-type: none"> <li>• Changes to diagrams</li> <li>• Changes to the <b>Date Modified</b> field for an item</li> <li>• Changes to the <b>Date Created</b> field for an item</li> <li>• Child items of a deleted item</li> <li>• Changes to advanced properties (defaults to selected)</li> </ul>	
<b>Baseline Diagram Compare Options</b>	<p>Select the checkbox to always open the first parent package for which there is a Baseline, when you select the diagram for comparison from the Project Browser.</p>	

If the Compare Utility tab shows the results of a Baseline comparison, when you click on the **OK** button the display refreshes to refine the information according to the options you have selected.

### Notes

- Package Baseline facilities are available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

### 3.7.2.2.1.5 Check Visual Changes to Diagrams

The Baseline Diagram Compare feature is a quick and easy way to **visually compare** a current diagram with an earlier version from a saved Baseline, and highlight any elements in the diagram that have been Added, Deleted, Resized or Moved.

You can then review these changes and optionally roll back each change if needed to their previous state from the Baseline.

The changes are identified on the **Baseline Diagram Compare** dialog and on the diagram itself. If the diagram is not already open, the compare feature also opens the diagram.

**Access** Any of the following:

- **Project Browser diagram context menu | Compare Diagram to Baseline | <select baseline>: Show Differences**
- **Project Browser Package context menu | Package Control | Package Baselines | <select baseline>: Show Differences | Selected diagram context menu | Compare to Baseline**
- **Diagram context menu | Compare to Diagram Baseline | <select baseline>: Show Differences, or**
- **Select Package | Project | Package Baselines | <select baseline>: Show Differences | Selected diagram context menu | Compare to Baseline**

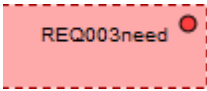

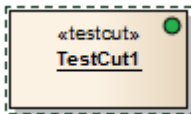

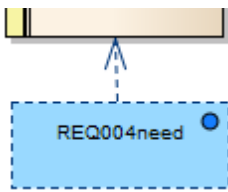

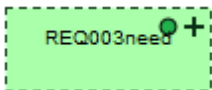

#### Guide

As you work on the dialog, the diagram changes as illustrated and as explained here.

	Name	Status	Action
<input checked="" type="checkbox"/>	 REQ003need	Baseline only	Restore Element & add to Diagram
<input checked="" type="checkbox"/>	 REQ004need	Changed	Restore Element position
<input checked="" type="checkbox"/>	 REQ002need	Changed	Restore Element position
<input checked="" type="checkbox"/>	 TestCut1	Model only	Delete from Diagram

Topic	Detail	See also
<b>Select element for review</b>	<p>The <b>Status</b> column indicates whether the element has been:</p> <ul style="list-style-type: none"> <li>• Moved or re-sized (<i>Changed</i>)</li> <li>• Deleted from the diagram (<i>Baseline only</i>), or</li> <li>• Added to the diagram since the Baseline was captured (<i>Model only</i>)</li> </ul> <p>Click on the item name.</p>	

Topic	Detail	See also
	<p>When an item is selected, the corresponding element on the diagram is highlighted as follows:</p> <ul style="list-style-type: none"> <li>Deleted from the diagram  </li> <li>Added to the diagram  </li> <li>Resized or moved to a new position  </li> </ul> <p>The currently-selected element on the diagram is marked with a dot, as shown, to indicate that it is in focus.</p>	
<b>Position the diagram to show the selected element</b>	<p>To scroll the diagram so that you can see the original (Baseline) position of an element, double-click on the item in the list.</p> <p>To scroll the diagram so that you can see the current (model) position of the element, press and hold (<b>Ctrl</b>) while you double-click on the item.</p>	
<b>Leave the changes in the item as they are</b>	<p>Ensure that the checkbox against the item is not selected.</p> <p>Click on the <b>OK</b> button.</p>	
<b>Roll the changes back to the Baseline position</b>	<p>Click on the checkbox against each required item (or click on the <b>Check All</b> button to select all items).</p> <p>The <b>Action</b> column displays the action required to roll each element's relationship to the diagram back to the Baseline relationship.</p> <p>The corresponding element on the diagram is highlighted as follows:</p> <ul style="list-style-type: none"> <li>Deleted, now being restored  </li> <li>Added, now being removed</li> </ul>	

Topic	Detail	See also
	 <ul style="list-style-type: none"> <li>Resized/repositioned, now being put back to original position</li> </ul> <p>The comparison shows the blue direction arrow for all repositions or resizes that have been checked. For a heavily edited diagram this can be confusing. However, you can hide the arrow for all elements except the one currently in focus; to do this:</p> <ul style="list-style-type: none"> <li>Deselect the <b>Visually link new and old position for checked items</b> checkbox</li> </ul> <p>To roll back the changes for all items for which a checkbox is selected:</p> <ul style="list-style-type: none"> <li>Click on the <b>Apply</b> button</li> </ul>

### Review Changes

Topic	Detail	See also
<b>Interpretation</b>	<p>A hierarchy of model elements is displayed in the left-hand pane. It is clearly visible, from the triangle-based icons and the highlighted lines on the report, which items in the hierarchy have, since the Baseline was captured, been:</p> <ul style="list-style-type: none"> <li>• Changed</li> <li>• Deleted from the model (in the Baseline only)</li> <li>• Added to the model (in the Model only) or</li> <li>• Switched to different packages (changes in the <b>Parent Package</b> property)</li> </ul> <p>If you click on an item in the left hand pane, the right-hand pane displays a table of properties showing the values of those properties in the current model and in the Baseline.</p> <p>For each property where there is a difference between the model and the Baseline, the row is highlighted.</p> <p>The Compare Utility tab enables you to perform operations (such as merging or rolling back changes) on the reported information, using the toolbar, context menu and keyboard.</p>	<a href="#">Compare Utility Tab Options</a> <sup>[470]</sup>
<b>Increase Level of Detail</b>	<p>The right panel of the Compare Utility tab might, for some fields, display only part of the value.</p> <p>It might also not be immediately obvious what a change is.</p> <p>In either case, you can double-click on the property to display full details and to highlight the exact differences; the following example shows the highlighted changes to the <b>Name</b> property.</p>	

Topic	Detail	See also
		

### Notes

- The Compare utility is available in the Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

#### 3.7.2.2.1 Baseline Comparison Tab Options

The Baseline Comparison tab enables you to perform operations on the reported information, using the toolbar, context menu, Merge dialog and certain keyboard keys.

- The toolbar is at the top of the left-hand panel; the icons operate either on the comparison as a whole or on the currently-selected item in the left hand panel of the Baseline Comparison tab
- Each item in the hierarchy has a context menu, which you display by right-clicking on the item; the options displayed depend on the level of the item in the hierarchy
- The Merge dialog enables you to specify which changes to roll back in the model from the baseline
- You can use a selection of keyboard keys to move up and down the hierarchy, or to roll back changes

### Toolbar Options

Option	Action	Shortcut	See also
<b>Refresh</b>	Re-run the comparison to refresh the current display.		
<b>Merge To Model</b>	Merge the values of the currently-selected item in the Baseline back into the model.		
<b>Next Change</b>	Highlight the next changed item (this skips <i>Moved</i> items).		
<b>Previous Change</b>	Highlight the previously-changed item.		
<b>Expand All</b>	Fully expand the selected item.		
<b>Collapse All</b>	Collapse the changed items in the selected item.		

Option	Action	Shortcut	See also
<b>Expand To Changed Items</b>	Expand the selected item to show changed items only (in the event that you have selected to also show unchanged items in the comparison).		<a href="#">Compare options</a> <sup>[464]</sup>
<b>Find in Project Browser</b>	Highlight the item in the Project Browser.		
<b>Log To XML</b>	Log the changes to an XML file. A browser displays, on which you specify the file name and location.		
<b>Compare Options</b>	Display the Compare Options dialog.		<a href="#">Compare Options</a> <sup>[464]</sup>
<b>Manage Package Baselines</b>	Display the Package Baselines dialog.		<a href="#">Manage Baselines</a> <sup>[464]</sup>

#### Context Menu Options

Option	Action	Shortcut	See also
<b>Merge from Baseline</b> <b>Add from Baseline</b>	Restore the item in the model to the Baseline state, or restore a deleted item from the Baseline.		
<b>Delete from Model</b>	Remove a recently-created item from the model.		
<b>Merge From Baseline (with Options)</b>	(For the root node of the hierarchy on the Compare Utility tab.) Display the Merge dialog (see below) which enables you to specify options for rolling back the whole model branch to the Baseline state.		
<b>Refresh</b>	(Object-level items.) Re-run the comparison to refresh the current display.		
<b>Find in Project Browser</b>	Locate and highlight the item in the Project Browser.		
<b>Open Baseline</b>	(For a diagram listed in the comparison.)		<a href="#">Check Visual</a>

Option	Action	Shortcut	See also
<b>Diagram Compare</b>	Displays the Baseline Diagram Compare dialog, showing differences in diagram content and layout.		<a href="#">Changes to Diagrams</a> <sup>[466]</sup>
<b>Expand All</b>	Fully expand the selected item.		
<b>Expand To Changed Items</b>	Expand the selected item to show changed items only.		
<b>Collapse All</b>	Collapse the changed items in the selected item.		
<b>Log To XML</b>	Log the changes to an XML file. A browser displays, on which you specify the file name and location.		
<b>Compare Options</b>	Display the Compare Options dialog.		<a href="#">Compare Options</a> <sup>[464]</sup>

#### Merge Dialog Options

Field/Button/Option	Action	Shortcut	See also
<b>Changed</b>	Restore all changed items in the model branch to the Baseline state.		
<b>In Baseline Only</b>	Restore all deleted items to the model branch from the Baseline.		
<b>In Model Only</b>	Remove all recently-created items from the model branch.		
<b>Moved</b>	Restore all moved items to their original locations, as identified in the Baseline.		
<b>Full Restore from XML</b>	Completely restore the model branch to the version held in the Baseline XML 1.1 file, (using the XML Import function).  (This option automatically selects all the other options.)		

#### Keyboard Keys

- ( **Ctrl+↓** ) - expand and highlight the next changed item
- ( **Ctrl+↑** ) - expand and highlight the previous changed item
- ( **Ctrl+←** ) - undo the changes for a selected item (roll back to the Baseline values)

### 3.7.3 Model Transfer

Enterprise Architect enables you to transfer data between projects, using three different mechanisms.

#### Topics

Topic	Detail	See also
<b>XMI Import and Export</b>	<p>Packages can be exported from and imported into Enterprise Architect models.</p> <p>This greatly improves the flexibility and robustness of Enterprise Architect models by enabling Analysts and Modelers to externalize model elements in XMI for version control, distributed development, post processing and transferring packages between models.</p>	<a href="#">XMI Import and Export</a> <sup>[473]</sup>
<b>CSV Import and Export</b>	<p>You can import and export information about Enterprise Architect elements in CSV format.</p> <p>This enables you to store and retrieve information from spreadsheet tools such as Microsoft Excel.</p>	<a href="#">CSV Import and Export</a> <sup>[497]</sup>
<b>Data Transfer</b>	Enterprise Architect enables you to move complete models between files, and between files and repositories, row by row, table by table.	<a href="#">Perform a Project Data Transfer</a> <sup>[504]</sup>

#### 3.7.3.1 XMI Import and Export

XML Metadata Interchange (XMI), defined by the OMG and based on XML, is an open standard file format that enables the interchange of model information between models and tools.

#### Topics

Topic	Detail	See also
<b>XMI and Enterprise Architect</b>	<p>Enterprise Architect uses XMI as a method of importing and exporting model specifications between different UML packages, Enterprise Architect projects and other tools that support XMI.</p> <p>Enterprise Architect supports the XMI 1.1, 1.2, 2.1 and 2.4.1 specifications. XMI 1.1 has support for UML 1.3, whereas XMI 2.1 is used for UML 2.0 - 2.3.</p> <p>Enterprise Architect does not fully support the older 1.0 specification. When importing or exporting to XMI 1.0, some loss of data occurs due to the limitations of XMI 1.0.</p>	

Topic	Detail	See also
	<p>With XML, model details can be exchanged between different UML tools and other tools that are capable of using XML.</p> <p>Limited support for export to Rational Rose is provided using the Rose version of the XML 1.1 specification, as implemented by Unisys for Rational products.</p> <p>Packages can be exported from and imported into Enterprise Architect models, which greatly improves the flexibility and robustness of the models by enabling Analysts and Modelers to externalize model elements in XML for:</p> <ul style="list-style-type: none"> <li>• Version control</li> <li>• Distributed development</li> <li>• Post processing and</li> <li>• Transferring packages between models</li> </ul> <p>When performing Enterprise Architect-to-Enterprise Architect transfers, ensure that either XML version 1.1 or 2.1 is selected.</p> <p>When importing an XML file over an existing package, all information in the current package is deleted first, before importing from the XML file. Please make sure you do not have important changes that you do not want to lose before importing from XML.</p>	
<b>XMI Tasks</b>	<p>Tasks you might perform in importing and exporting XMI include:</p> <ul style="list-style-type: none"> <li>• Setting XML Options - XMI import, export and package control all rely on saving and loading XML files; you can set a number of options to streamline this process</li> <li>• Exporting a package to XMI in XMI 2.1 (and earlier)</li> <li>• Importing from XMI with support for XMI 2.1 (and earlier)</li> <li>• Setting up controlled packages</li> <li>• Manually controlling a package by linking it to an XMI file</li> <li>• Batch exporting controlled packages</li> <li>• Batch importing controlled packages</li> <li>• Factoring in the limitations of XMI</li> <li>• Applying a UML Data Type Definition (DTD)</li> <li>• Importing a model from IBM Rational Rhapsody</li> </ul>	<p><a href="#">XML Specifications</a> <sup>[639]</sup></p> <p><a href="#">Export to XMI</a> <sup>[475]</sup></p> <p><a href="#">Publish Model Package</a> <sup>[476]</sup></p> <p><a href="#">Import from XMI</a> <sup>[478]</sup></p> <p><a href="#">Controlled Packages</a> <sup>[484]</sup></p> <p><a href="#">Manual Version Control with XMI</a> <sup>[494]</sup></p> <p><a href="#">Batch XMI Export</a> <sup>[492]</sup></p> <p><a href="#">Batch XMI Import</a> <sup>[493]</sup></p> <p><a href="#">Limitations of XMI</a> <sup>[482]</sup></p> <p><a href="#">The UML DTD</a> <sup>[483]</sup></p> <p><a href="#">Import a Rhapsody Model</a> <sup>[482]</sup></p>

**Notes**

- XML 2.1 exported by Enterprise Architect 7.0 (or later) might not be correctly imported into earlier versions of Enterprise Architect
- When performing Enterprise Architect-to-Enterprise Architect transfers, ensure that either XML version 1.1 or 2.1 is selected

#### Learn more

- [XML/XML Technology](#)

### 3.7.3.1.1 Export to XMI

The Export Package to XMI dialog is used to export a package to various XMI (XML-based) formats. This dialog, by default, allows exporting to either **XMI 1.1** or **XMI 2.1**. The exported XMI file contains all the information required for completely round-tripping the package within Enterprise Architect; that is, performing Enterprise Architect-to-Enterprise Architect transfers.

**Access** Click on a package in Project Browser, then:

**Project | Model Import/Export | Export Package to XMI (Ctrl+Alt+E)**  
**Right-click | Import/Export | Export Package to XMI file**

#### Use to

- Move Enterprise Architect model elements between models, for distributed development, manual version control and other benefits

#### Reference

Field/Option/Button	Usage	See also

#### 3.7.3.1.2 Publish Model Package

The Publish Model Package facility is used to export a package to various XML formats, including XMI 1.1, XMI 2.1, ArcGIS and BPMN 2.0 XML; for example you might:

- Export BPMN 2.0 models to BPMN 2.0 XML, or
- Export Enterprise Architect model elements to Rational Rose and other tools that implement the:
  - UML 1.3 XMI 1.1 / XMI 1.0 standard
  - UML1.4 XMI 1.2 standard, or
  - UML 2.x XMI 2.x standard

**Access** Click on a package in Project Browser, then select one of the following:

**Project | Publish Model**  
**Project | Model Import/Export | Export Package to XMI: Publish** or **(Ctrl+Alt+E): Publish**  
**Extensions | Publish | <XML Format Type>**, or  
**Right-click | Import/Export | Export Package to XMI File: Publish**

### Publish Model Package options

Field/Option/ Button	Usage	See also
-------------------------	-------	----------

<b>Root Package</b>	Displays the name of the selected package.	
<b>Filename</b>	Type in or browse for the file path into which the XML file is to be generated.	
<b>XML Type</b>	<p>Select the XML/XMI version to which to export the package.</p> <ul style="list-style-type: none"> <li>• Select <b>UML 2.1</b> if you want to use XMI 2.1 in round-tripping a model</li> <li>• Select <b>UML 2.0, 2.1.1, 2.1.2, 2.2, 2.3</b> or <b>2.4.1</b> if exporting to a tool that requires that specific version of the XMI</li> </ul> <p>The selected version might render some of the following eight options unavailable.</p>	
<b>Export Diagrams</b>	Export all the diagrams in the selected package.	
<b>Export Alternate Images</b>	Export the alternate images used in the diagrams in the selected package.	<a href="#">Image Manager</a> 
<b>Format XML Output</b>	Format the output into readable XML (this takes a few more seconds at the end of the run).	
<b>Write Log File</b>	<p>Write a log of the export activity (recommended).</p> <p>The log file is saved to the directory into which the XML file is exported.</p>	
<b>Use DTD</b>	<p>Use the XMI DTD when exporting to XMI 1.0 or XMI 1.1.</p> <p>Setting this option validates the correctness of the model and checks that no syntactical errors have occurred.</p>	
<b>Exclude EA Extensions</b>	Exclude tool-specific information from the export.	
<b>Unisys/Rose Format</b>	Export in Unisys/Rose compatible XMI format.	
<b>Generate Diagram Images</b>	<p>Generate the exported diagrams in the format you select from the <b>Format</b> drop-down list.</p> <p>The generated diagrams are saved in a package called <i>Images</i> in the directory into which the XML file is exported.</p>	
<b>Stylesheet</b>	Select an XSL Stylesheet to post-process the XML content before saving to file ( <i>optional</i> ).	<a href="#">Resource Window</a> 

	You can post-process the XML content before saving the package to file, using an XSLT to convert the output to HTML, XSL, code or other versions of XML; to do this, you must import the required style sheet into the project through the Resources window.	
<b>View XML</b>	View the exported XML file.	
<b>Export</b>	Initiate XML export.	
<b>Close</b>	Close this dialog.	
<b>Help</b>	Display this Help topic.	
<b>Progress</b>	Indicate the progress of the XML export.	

#### Notes

- When exporting and importing with XML 1.0 with Enterprise Architect, some loss of data occurs due to the limitations of XML 1.0
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Export XML** permission to export to XML
- When you select to apply a Data Type Definition (DTD) during an XML 1.1 export, the UML\_EA.DTD file is written to the output directory into which the XML files are written (unless the UML\_EA.DTD file is already present in the directory); no error is generated if the UML\_EA.DTD file is not present in this directory during the XML export

#### Learn more

- [Limitations of XML](#)<sup>[482]</sup>

- [Export to ArcGIS XML](#)<sup>[1961]</sup>

#### 3.7.3.1.3 Import from XML

You can import a package from an XML (XML-based) file in any of the following formats:

- UML 1.3 (XML 1.0)
- UML 1.3 (XML 1.1)
- UML 1.4 (XML 1.2)
- UML 2.x (XML 2.1)
- MOF 1.3 (XML 1.1)
- MOF 1.4 (XML 1.2)

You can also import the \*.emx and \*.uml2 files generated by tools such as Rational Software Architect (RSA) and Rational Software Modeler (RSM) as well as XML files exported by ArcGIS.

**Access** Click on target package in Project Browser, then:

**Extensions | Import | <XML Format>  
Project | Model Import/Export | Import Package From XMI File** or  
**Right-click | Import/Export | Import Package From XMI**

#### Use to

- Move Enterprise Architect Model elements between models, for distributed development, manual version control and other benefits

#### Import a Package from an XMI file

Field/Option/ Button	Action	See also
<b>Filename</b>	Type the directory path and filename from which to import the XMI file.	
<b>Import diagrams</b>	Select the checkbox to import diagrams.	
<b>Strip GUIDs</b>	Select the checkbox to remove Universal Identifier information from the file on import.  This enables the import of a package twice into the same model; the second import requires new GUIDs to avoid element collisions.	
<b>Write log file</b>	Select the checkbox to write a log of import activity (recommended).  The log file is saved in the directory from which the file is being imported, with the same name as that of the imported file plus the suffix <i>_import.log</i> .	
<b>Import using single transaction</b>	This option defaults to the setting of the <b>Import using single transaction</b> checkbox in the XML Specifications page of the Options dialog. If you wish, you can change the option from the default setting.  If the checkbox is selected, the XMI file is imported in one transaction. This is not recommended for large imports.  If the checkbox is not selected the data items are imported separately; you can identify problem items without the whole import being blocked. If the import is likely to encounter locking issues, or if you are importing a large XMI file, deselect the checkbox.	<a href="#">XML Specifications</a> [639]
<b>Treat Imported Datatypes</b>	If you are importing from Rose XMI 1.1, click on the drop-down arrow and select the datatypes to add to the model.	

Field/Option/ Button	Action	See also
<b>Import</b>	Click to start the import.	
<b>Close</b>	Click to close the dialog.	
<b>Help</b>	Click to display this Help page.	
<b>Import Progress</b>	Indicates the progress of the import.	

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Import XMI** permission to import packages from XMI
- When you import an XML file over an existing package, ALL information in the current package is deleted first; before you import the XML file, please make sure you do not have important changes that you do not want to lose
- If you are importing an XMI 1.1 file that was previously exported with a UML\_EA.DTD file, the UML\_EA.DTD file must be present in the directory into which the XML file is being written; an error occurs if the UML\_EA.DTD file is absent

- [Import ArcGIS File](#) <sup>[1968]</sup>

#### 3.7.3.1.4 Import EMX/UML2 Files

Rational Software Architect (RSA) enables you to add many UML models under a single root. These models can have cross references between them.

However, RSA cannot save the entire root as one file; it saves each UML model as a separate EMX file. This means that an EMX file with cross-references is not self-contained as it references elements in another EMX file.

In releases earlier than release 7.0, Enterprise Architect treats each EMX file as a separate model and hence does not allow for cross-references between them. From release 7.0, Enterprise Architect enables these cross-references.

You therefore have the options of:

- Importing a single EMX/UML2 file or

- Importing a group of related EMX/UML2 files together, thereby retaining the cross-references between the different files

**Access** Click on target package in Project Browser, then:

**Extensions | Import | EMX/UML2**  
**Project | Model Import/Export | Import Package From XMI File: Other XML File Formats | EMX/UML2**, or  
**Right-click | Import/Export | Import Package From XM File: Other XML File Formats | EMX/UML2**

**Use to**

- Import Enterprise Architect Model elements from \*.emx/\*.uml2 files

**Reference**

On the Import Package from EMX/UML2 dialog:

Field/Option/Button	Action	See also
<b>Directory</b>	Click on the ( ... ) (Browse) button.  The Select Import EMX / UML2 File(s) dialog displays, which enables you to select multiple files.  Select the file or files (use ( <b>Ctrl</b> ) + <b>click</b> or ( <b>Shift</b> ) + <b>click</b> to select several files) and click on the <b>Open</b> button to return to the Import Package from EMX/UML2 dialog.	
<b>Selected Files</b>	Lists the selected *.emx/*.uml2 files.	
<b>Write Log File</b>	Select to write a log of import activity (recommended).  The log file is saved in the directory from which the files are being imported, with the name <i>import.log</i> .	
<b>Import</b>	Click to import the *.emx/*.uml2 files.	
<b>Close</b>	Click to close this dialog.	
<b>Help</b>	Click to display this Help topic.	
<b>Import Progress</b>	Indicate the progress of the import.	

### 3.7.3.1.5 Import a Rhapsody Model

If you have developed a UML model in **IBM Rational Rhapsody**, you can import it into an Enterprise Architect project.

Each Rhapsody project contains one Project file (with the file extension *.rpy*), which is associated with a folder with the same name, ending in the prefix *\_rpy*. For example, if the Rhapsody project file is called *CDPlayer.rpy*, it is associated with a folder called *CDPlayer\_rpy*.

The associated folder contains all the project-related files. It could also contain a file named *filesTable.dat*, which lists all the files related to the Rhapsody project.

**Access** [Project Browser | Click on package | Extensions | Import | Rhapsody](#), or [Project Browser | Right-click on package | Import/Export | Import Package From XMI File: Other XML File Formats | Rhapsody](#)

#### Import UML Model from Rhapsody Project Files

Field/Option/ Button	Action	See also
<b>Rhapsody Project</b>	Click on the (...) (Browse) button.  The Select Import Rhapsody Project dialog displays.  Select a Rhapsody Project file, then click the <b>Open</b> button to return to the Import Model From Rhapsody dialog.	
<b>Rhapsody Files</b>	Read the name of the file located in the associated project folder.	
<b>Import</b>	Click on this button to import the Rhapsody model into Enterprise Architect.	
<b>Close</b>	Click on this button to close this dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>Import Progress</b>	Indicates the progress of the import.	

### 3.7.3.1.6 Limitations of XMI

Whilst XMI is a valuable means of specifying a UML model in a common format, it is relatively limited in the amount of additional information it can tolerate using the standard syntax.

#### Topics

Topic	Detail	See also
<b>Notes on Enterprise Architect</b>	<p>A lot of information from an Enterprise Architect model must be converted to Tagged Values, which import into other modeling systems as additional information or are ignored completely.</p> <p>Enterprise Architect can both generate and read:</p> <ul style="list-style-type: none"> <li>• XMI 1.0 and 1.1 using UML 1.3 format</li> <li>• XMI 1.2 using UML 1.4 format, and</li> <li>• XMI 2.1 using UML 2.x format</li> </ul> <p>Round-tripping model elements using XMI in Enterprise Architect is possible using XMI 1.1 or XMI 2.1; XMI 1.1 uses the additional Tagged Values to store the UML 2.x information - this ensures model completeness when round-tripping UML 2.x model elements using XMI 1.1.</p> <p>Please note that Enterprise Architect exclusively uses XMI 1.1 for round-tripping models using Version Control.</p>	
<b>Notes for Exporting to Rose and Other Tools</b>	<p>There are discrepancies in the Unisys/Rose implementation with regard to spelling mistakes and slightly different syntax to the official XMI 1.1 specification, so problems might occur.</p> <p>The way packages are arranged in different models can impact successful import into other systems; experimentation is the only work around for this problem.</p> <p>Some parts of the XMI import/export process do not work as expected in products like Rational Rose; for example, Note Links are not supported, and State Operations import but do not appear in diagrams.</p> <p>Rational Rose only supports import of a full project, not a single package.</p> <p>For best results, it is recommended that you keep the model elements to export to Rose simple and conforming as closely as possible to the UML 1.3 specification.</p>	

### 3.7.3.1.7 The UML DTD

When you import or export Enterprise Architect packages to XML, the import or export process can be validated using a Data Type Definition (DTD).

#### Guide:

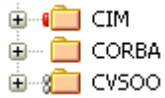

Topic	Detail	See also
<b>Notes on DTDs</b>	<p>The XML parser uses the DTD to validate the correctness of the model and to check that no syntactical errors have occurred.</p> <p>It is always best to use a DTD when moving packages between Enterprise Architect models as it ensures correctness of the XML output, and prevents attempted imports of incorrect XML.</p>	

Topic	Detail	See also
	<p>Several DTDs for XML/UML exist; the OMG defines a standard UML1.3 DTD for use in XML 1.1, and Enterprise Architect uses an extension of this with some additional element extensions for non-standard UML types, such as testing details.</p> <p>Whenever you read an XML file, the XML parser looks in the current directory for the DTD - if specified - using the DOCTYPE element in the XML file.</p> <p>If the parser cannot find the DTD, it records an error and aborts processing; you must ensure the UML_EA.DTD file is in the current XML output path (generated by default).</p>	

### 3.7.3.1.8 Controlled Packages

Controlled packages are a powerful means of 'externalizing' parts of an Enterprise Architect model.

#### Guide:

Topic	Detail	See also
<b>Using Controlled Packages</b>	<p>A controlled package is a package configured to save and load in XML format to a named file; the XML output is UML1.3 compliant XML, with Enterprise Architect extensions to support diagrams and additional model elements.</p> <p>Package XML is standard XML-compliant output that can be loaded into any XML viewer, or used by any XML-based tool to perform manipulations and extracts, such as document or code generators.</p> <p>Controlled packages appear in the Project Browser with a small colored rectangle to the left of the package icon, as shown below for the <i>CIM</i> package:</p>  <p>Using controlled packages you can support:</p> <ul style="list-style-type: none"> <li>• Widely distributed development by having team members submit packages in the form of XML for import into a central Enterprise Architect repository</li> <li>• Version control, by writing model elements in XML text files suitable for version control using standard version control software</li> </ul> <p>Using XML this way enables you to manually connect to third-party version control software outside the Enterprise Architect environment</p> <p>Enterprise Architect internally supports the configuration of</p>	<a href="#">Version Control</a> <sup>[383]</sup>

Topic	Detail	See also
	<p>version control through SCC and CVS</p> <ul style="list-style-type: none"> <li>Import and export of model elements between different models</li> </ul> <p>For example, a Class library can be re-used in many models and kept up to date in target models using controlled packages, reloading packages as required when new versions of the Class model become available</p>	

### Notes

- If you are importing an XML 1.1 file that was previously exported with a UML\_EA.DTD (Data Type Definition) file, the UML\_EA.DTD file must be present in the directory into which the XML file is being written; an error occurs if the UML\_EA.DTD file is absent
- When you select to apply a DTD during an XML 1.1 export, the UML\_EA.DTD file is written to the output directory into which the XML files are written (unless the UML\_EA.DTD file is already present in the directory); no error is generated if the UML\_EA.DTD file is not present in this directory during the XML export

#### 3.7.3.1.8.1 Controlled Package Menu

##### Access **Project Browser package context menu | Package Control**

This menu is for a Package that is not itself under version control (but that might contain child Packages that are under version control).

Option	Action	Shortcut	See also
<b>Lock Package</b>	<p>Select this option to apply a lock on the selected Package.</p> <p>(This option is only displayed when user security is enabled in User/Group locking mode.)</p>		<a href="#">Lock Package</a> <sup>[33]</sup>
<b>Apply/Release User Lock</b>	<p>Select this option to apply or release a user lock on the selected Package.</p> <p>(This option is only displayed when user security is enabled in Require User Lock to Edit locking mode.)</p>		<a href="#">Apply a User Lock</a> <sup>[33]</sup>
<b>Configure (various settings for the Package)</b>	Select this option to display the Package Control Options dialog, and specify whether this Package (and its child Packages) is controlled and which file it is controlled through.	<b>Ctrl+Alt+P</b>	<a href="#">Configure Packages</a> <sup>[48]</sup>
<b>Package Baselines</b>	Select this option to create a Baseline of the current Package, or compare the current Package with a previous Baseline.	<b>Ctrl+Alt+B</b>	<a href="#">Managing Baselines</a> <sup>[46]</sup>

Option	Action	Shortcut	See also
<b>Check In Branch</b>	<p>Select this option for the selected branch of the model (that is, the selected Package and all of its child Packages), to display the Select Packages to Check In dialog, listing all version controlled Packages within that branch that are checked out to you.</p> <p>You can then select Packages in the displayed list, to be submitted for check-in.</p>		<a href="#">Check in a Model Branch</a> <sup>[434]</sup>
<b>Check Out Branch</b>	<p>Select this option for the selected Package, to check out the Package and recursively check out all of its contained sub-Packages.</p> <p>The system retrieves the latest version of the Packages from the central repository, overwriting the current Packages.</p> <p>After check out, the Packages are available for editing.</p>		<a href="#">Check Out a Model Branch</a> <sup>[433]</sup>
<b>Save Package to File</b>	Select this option to save a controlled Package to an XML file.	<b>Ctrl+Alt+S</b>	<a href="#">Save a Package</a> <sup>[491]</sup>
<b>Load Package from File</b>	Select this option to load a previously-saved XML file.	<b>Ctrl+Alt+L</b>	<a href="#">Load a Package</a> <sup>[492]</sup>
<b>View Package XMI</b>	Select this option to display the Package XMI after the Package has been exported to XMI.	<b>Ctrl+Alt+X</b>	
<b>Compare Package with XMI file</b>	(Package not under version control) Select this option to compare the current Package with a previously-saved XMI file of the Package.		<a href="#">The Compare Utility (Diff)</a> <sup>[463]</sup>
<b>Add Branch to Version Control</b>	Select this option to apply version control to all Packages within the selected model branch, in a single operation.		<a href="#">Apply Version Control to Branches</a> <sup>[426]</sup>
<b>Export as Model Branch</b>	Select this option to export a newly created model branch from your own private copy of a model.		<a href="#">Export Controlled Model Branch</a> <sup>[437]</sup>
<b>Import a Model Branch</b>	Select this option to retrieve a model branch and import it into either the source model or another model.		<a href="#">Import Controlled Model Branch</a> <sup>[438]</sup>

Option	Action	Shortcut	See also
<b>Get Package (for version control)</b>	Select this option to gain access from Packages in the version-controlled repository that is currently available in your model.		<a href="#">Version Control</a> <sup>[383]</sup>
<b>Get All Latest (for version control)</b>	<p>Select this option to retrieve the latest version of the Package from the repository. The option is available only for Packages that are checked in.</p> <p>The alternative option <b>Get Latest</b> - if displayed - is not intended for sharing project files and should only be used when users have their own individual databases.</p>		<a href="#">Version Control</a> <sup>[383]</sup>
<b>Scan XMI and Reconcile Model</b>	<p>Select this option to scan the Package XMI files associated with each of the project's controlled Packages and restore any diagram objects or cross-references that are detected as missing from the project.</p> <p>This function is useful in team environments where each user maintains their own private copy of the model database (i.e. multiple private project files) and model updates are propagated through the use of controlled Packages. It provides no benefit when the model is hosted in a single shared database that is accessed by all team members.</p> <p>Each controlled Package is compared with its associated XMI file and, if the cross-reference information in the model does not match the XMI, the system updates the model with the information from the XMI and records the update in the Output window.</p> <p>You can roll back such updates by right-clicking on the entry in the Output window and selecting the context menu option <b>Rollback Update</b> (or <b>Rollback Selected Updates</b> if multiple entries are selected).</p> <p>Closing the model clears the entries in the Output window; an entry in the Output window is also cleared as and when you roll-back the update for it.</p> <p>This functionality is invoked automatically as part of the <b>Get All Latest</b> operation.</p> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-Package references, it is recommended that you invoke <b>Scan XMI and Reconcile Model</b> from time to time, following the re-importation of controlled Packages - for example, after using <b>Get Latest</b> to update a number of Packages - or after performing a number of Package check-outs.</p> <ul style="list-style-type: none"> <li>As a general rule, avoid running <b>Scan XMI and Reconcile Model</b> while you have</li> </ul>		<p><i>Version Control Best Practices</i> white paper</p> <p><a href="http://sparxsystems.com/WhitePapers/Version_Control.pdf">http://sparxsystems.com/WhitePapers/Version_Control.pdf</a></p>

Option	Action	Shortcut	See also
	uncommitted changes in your model <ul style="list-style-type: none"> <li>Generally, you should:               <ul style="list-style-type: none"> <li>Check-out a number of Packages</li> <li>Invoke <b>Scan XML and Reconcile Model</b></li> <li>Make your modifications</li> <li>Commit any outstanding changes before you check-out more Packages and run <b>Scan XML and Reconcile Model</b> again</li> </ul> </li> </ul>		
<b>Re-synch Status With VC Provider</b>	(Version controlled Package.) Select this option to update the version control status value recorded for the selected Package in the Enterprise Architect project to match the value reported by the version control provider, without performing an XML import or export.		
<b>Version Control Settings</b>	Select this option to display the Version Control Settings dialog.		<a href="#">Version Control Settings</a> <sup>[415]</sup>

#### Learn more

- For a Package that is directly under version control, see [Package Version Control Menu](#) <sup>[427]</sup>

#### 3.7.3.1.8.2 Configure Packages

In order to configure a Package to save and load in XML format to a named file, you use the Package Control Options dialog to flag the Package as being controlled and set a number of options. These options include setting the XML filename to save to/load from, the type of XML to import and export, and whether to export and/or import the XML in a batch process. When the Package is configured, this is indicated by a small colored rectangle on the left of the Package icon in the Project Browser, as shown for the *RQ01: Formal Requirements* Package.

**Access** **Right-click Package in Project Browser | Package Control | Configure** (Ctrl+Alt+P)

#### Configure a controlled Package

Field/Button	Description	See also
<b>Control Package</b>	Select the checkbox to indicate that this is a controlled Package.	
<b>For all packages, create placeholders for external references</b>	<p>Select to force all XML 1.1 imports of this Package to exclude incoming relationships and instead create external references.</p> <p>This overrides the <b>Create placeholders for missing External References during XMI 1.1/2.1 Import</b> checkbox in the XML Specifications options for a user, if that checkbox is <b>not</b> selected.</p>	<a href="#">XML Specifications</a> 
<b>Version Control</b>	<p>Leave this field set to <b>(None)</b>, to manage the Package under XML control.</p> <p>The Package Control Options dialog is also used in adding a Package to Version Control and, in this context, is described under the <i>Version Control</i> section.</p>	<a href="#">Configure Controlled Package</a> 
<b>XMI Filename</b>	<p>Type or browse for the path and XML file name into which to export the Package data and from which to import it.</p> <p>You can also enter <b>Local Path Substitution strings</b>; for example, an XML local path definition where:</p> <pre>myLocal Path=" C: \ Documents and Settings\ John\ Desk top\ EA Model s"</pre> <p>So that %myLocal Pat h% CI M. x ml is equivalent to:</p> <pre>C: \ Documents and Settings\ John\ Desk top\ EA Model s\ CI M. x ml</pre>	
<b>UML/XMI Type</b>	<p>Click on the drop-down arrow and select the type of XML to be generated; options include:</p> <ul style="list-style-type: none"> <li>• <b>Enterprise Architect XMI/UML 1.3</b></li> <li>• <b>Rational Rose/Unisys UML 1.3 and</b></li> <li>• <b>Generic XMI 1.0/UML 1.3</b></li> <li>• <b>Enterprise Architect XMI 2.1/UML 2.1</b></li> </ul> <p>For complete import/export round tripping of Packages, currently only <b>Enterprise Architect XMI/UML 1.3</b> is supported.</p>	
<b>Version ID</b>	<p>Type the version number you want to apply to the Package.</p> <p>This field is the same as the <b>Version</b> field on the Package Properties dialog; any change to either field updates the other.</p>	
<b>Owner</b>	Defaults to the name of the Package owner; if necessary, type or select a different name.	

Field/Button	Description	See also
<b>Use DTD</b>	(Optional) Select the checkbox to use a Data Type Definition (DTD) for the imports and exports.  (This option is not available for the <b>Enterprise Architect XMI/UML 1.3</b> or <b>Rational Rose/Unisys UML 1.3</b> types.)	<a href="#">The UML DTD</a> [483]
<b>Log Import/Export</b>	(Optional) Select the checkbox to log import and export activity to a log file.	
<b>Batch Import</b>	(Optional) Select the checkbox to mark the Package as a Batch Import Package.	
<b>Batch Export</b>	(Optional) Select the checkbox to mark the Package as a Batch Export Package.	
<b>Include sub-packages</b>	(For an <b>Enterprise Architect XMI/UML 1.3</b> export) Select the checkbox to include the entire sub-Package hierarchy of this branch in the exported XMI (default).  Deselect the checkbox to include only the immediate contents of the Package in an XML export (XMI stubs).	
<b>OK</b>	Click on this button to set the Package Control options and close the dialog.	

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Configure Packages** permission to configure controlled Packages and Package properties
- For batch import, the file date of the XMI file is stored; you can bypass the batch import if there is no change - that is, the file date of the last import matches that of the current file

### Learn more

- [XMI Import and Export](#) [473]
- [Batch XMI Export](#) [492]
- [Batch XMI Import](#) [493]
- [List of Available Permissions](#) [329]

#### 3.7.3.1.8.3 Remove Package from Control

If required, you can remove the control from a Package. Before removing the Package control, and if it is being used for version control, you must check in the Package.

**Access** **Project Browser | Package Context Menu | Package Control | Configure** (Ctrl+Alt+P)

### Remove control from a Package

Step	Action	See also
1	Select the Package and click on the <b>Configure</b> menu option. The Package Control Options dialog displays.	
2	Deselect the <b>Control Package</b> checkbox. If the Package is under version control, this sets the <b>Version Control</b> field to <b>(None)</b> .	
3	Click on the <b>OK</b> button to remove Package control. Package control for the selected Package has now been removed.	

### Notes

- When disconnecting a Package from version control, the association between the Package and the exported XML file is removed from your model; however, the XML file itself is not removed from version control, nor is it deleted from your local version control working copy folder

This is because it is possible for another model to be using the version controlled Package and still referencing the associated version controlled XML file

### Learn more

- [Check In a Package](#)<sup>[432]</sup>

#### **3.7.3.1.8.4 Save a Package**

Once you have correctly configured a Package, you can save the controlled Package to the designated XML file.

**Access** **Project Browser | Package Context Menu | Package Control | Save Package to File**

### Save a controlled Package to file

Step	Action	See also
1	Select the Package and the <b>Save package to File</b> menu option. The export process executes automatically according to your configured preferences, overwriting any existing file.	

### Notes

- If you are using a version control Package in conjunction with the exported Package files, you must check out the XML file first to enable Enterprise Architect to overwrite the existing version

#### Learn more

- [Configure Packages](#) 

#### 3.7.3.1.8.5 Load a Package

If a Package has been marked for control it is displayed in the Project Browser with a red rectangle to the left of the Package icon. If you have previously saved the controlled Package, you can reload it.

**Access** **Project Browser | Package Context Menu | Package Control | Load package from file**

#### Load a controlled Package from an XML file

Step	Action	See also
1	Select the Package and the <b>Load package from file</b> menu option. If you have configured the Package control details, Enterprise Architect prompts you to confirm the import.	
2	Click on the <b>Yes</b> button to confirm the import. The current Package is deleted and the saved Package is imported.	

#### Notes

- Importing **deletes the current Package entirely from the model, and the action cannot be undone;** you must be careful not to lose any current changes or information

#### Learn more

- [Configure Packages](#) 

#### 3.7.3.1.8.6 Batch XML Export

You can export a group of controlled packages to XML in one step.

**Access** **Project | Model Import/Export | Batch XML Export**

#### How to

To export a group of controlled packages to XML

Step	Action	See also
1	Select the <b>Batch XMI Export</b> menu option. The Batch XMI Export dialog displays.	
2	Select the checkbox against each package to include in this export run. Select the <b>Select All</b> checkbox to select all packages in the list.	
3	Select the <b>Restore Cross References Without Prompting</b> checkbox to automatically restore any missing cross package references without displaying a prompt.	<a href="#">Report Deletion of Cross-Package References</a> <sup>[496]</sup>
3	To save this configuration as the default, click on the <b>Save Settings</b> button.	
4	Click on the <b>Run Export</b> button. Enterprise Architect cycles through each checked package and exports it using the options specified in the Package Control Options dialog. As long as a valid filename exists, Enterprise Architect exports the package to XMI and proceeds to the next package.	<a href="#">Configure Packages</a> <sup>[488]</sup>

**Notes**

- The **Restore Cross References Without Prompting** checkbox is enabled only if the option **Report Cross Package Reference Deletions (XMI 1.1)** is set on the XML Specifications page of the Options dialog
- The option is applicable only to XMI 1.1 controlled packages

**Learn more**

- [XML Specifications](#) <sup>[639]</sup>

**3.7.3.1.8.7 Batch XMI Import**

You can import a group of controlled packages from XMI into Enterprise Architect in one step.

As Enterprise Architect processes each package, it updates the **Status** column against each package name on the Batch XMI Import dialog.

- If the import is successful, Enterprise Architect updates the package status to **Imported**
- If the import is unsuccessful, Enterprise Architect updates the package status to **Not Imported**

Common reasons for an import to fail include:

- The package not being correctly configured
- The last import file date matches the import date of the file currently on disk

**Access** **Project | Model Import/Export | Batch XMI Import**

### **How to**

To import a group of controlled packages from XMI

Step	Action	See also
1	Select the <b>Batch XMI Import</b> menu option. The Batch XMI Import dialog displays.	
2	Select the checkbox against each package to include in the import. Select the <b>Select All</b> checkbox to select all packages in the list.	
3	To save this configuration as the default, click on the <b>Save Settings</b> button.	
4	Click on the <b>Run Import</b> button. Enterprise Architect cycles through each checked package and imports it.	<a href="#">Configure Packages</a> <sup>488</sup>

### **Notes**

- To avoid re-importing the same module multiple times, select the **Check file date before import** checkbox; Enterprise Architect then does not import a file if the last import file date matches that of the one currently on disk

#### **3.7.3.1.8.8 Manual Version Control with XMI**

You can use XMI to support version control by writing model elements in XML text files suitable for use with standard version control software.

Using XMI in this manner enables you to manually connect to third-party version control software outside the Enterprise Architect environment.

Enterprise Architect internally supports the configuration of version control through SCC and CVS configurations.

### **How to**

Before using XMI for version control

Step	Action	See also
1	Select suitable packages in the Project Browser, to be marked as controlled packages.	

Step	Action	See also
2	Configure these with filenames that are visible to a version control system of your choice.	<a href="#">Configure Packages</a> <sup>[488]</sup>
3	Save the controlled packages to establish a model base and check these into the version control system.	<a href="#">Save a Package</a> <sup>[491]</sup>

To apply version control

Step	Action	See also
1	Continue working on a package until versioning is required.	
2	Check out the package XML file from the version control system.	
3	Save the relevant package using the controlled package support.	
4	Check the package back into the version control system.	

To recover an earlier version

Step	Action	See also
1	Save the current version first. This is important, because the package is completely deleted during the import process. If necessary, manually update the version control system.	
2	Get the required package version from the version control system.	
3	Select the package to reload.	
4	Select the <b>Package Control   Load package from file</b> menu option to import the previous version.	<a href="#">Load a Package</a> <sup>[492]</sup>

Step	Action	See also
	Enterprise Architect deletes the controlled package and restores the previous version.	

#### Learn more

- [Version Control](#) <sup>[383]</sup>

#### 3.7.3.1.8.9 Report Deletion of Cross Package References

Your model might contain at least one XML 1.1 controlled Package that is also used in other models, but not necessarily in the same context. For example:

- You have a model of **Power Generation** and a model of **Power Consumption**
- Both models contain the Package called *Power Storage*
- In the Generation model, the *Power Storage* Package has links to a Package called *Turbine Control* (which does not exist in the Consumption model)
- In the Consumption model, the *Power Storage* Package has links to a Package called *Consumer Demand* (which does not exist in the Generation model)
- All Packages are maintained in a master project, **Power Control**, where all the cross-Package relationships exist; compared with Power Control, both Power Generation and Power Consumption are **incomplete**

#### Problem

Consider the process at the end of a work session on *Power Storage* in, say, the **Power Generation** model. When saving the Package to XML, Enterprise Architect has no information on relationships between *Power Storage* and the *Consumer Demand* Package from the **Power Consumption** model, and so these are not represented in the XML file. Consequently, when the XML file is imported into **Power Control**, Enterprise Architect deletes the relationships in the master project because they don't match the file.

#### Solution

You can easily check for and preserve the cross-Package relationships by selecting the **Report Cross Package Reference Deletions (XML 1.1)** checkbox in the Options dialog (**Tools | Options | XML Specifications**). When you save a controlled Package, Enterprise Architect compares the XML for that save with the most recent XML 1.1 revision of the Package. Any items that are missing from the Package are listed on the **Missing Cross References** dialog.

#### Actions

Action	Detail	See also
<b>Merge missing items</b>	Items missing from the exported Package are identified in the Missing Cross References dialog. To regenerate them into the XML file that is being saved: <ul style="list-style-type: none"> <li>• Select the checkbox against each item <b>type</b></li> </ul>	

Action	Detail	See also
	<ul style="list-style-type: none"> <li>Click on the <b>OK</b> button</li> </ul> <p>Items of any type that you do not select are omitted from the saved XML file.</p>	
<b>Abort or cancel this XML Export</b>	<p>If you do not want to proceed with the export (or <b>Check-in</b> or <b>Put Latest</b>) operation:</p> <ul style="list-style-type: none"> <li>Click on the <b>Cancel</b> button</li> </ul>	
<b>Review the details of an entry</b>	<p>To display the details of an entry on the Missing Cross References dialog:</p> <ul style="list-style-type: none"> <li>Double-click on the type name</li> </ul> <p>The details of each item are shown on the Missing &lt;item type&gt; dialog. For any items where <b>information</b> is missing from the XML file, the missing details are grayed-out.</p> <p>To find the item with the missing cross-reference in the Project Browser, either:</p> <ul style="list-style-type: none"> <li>Right-click on the entry in the list and select the <b>Find in Project Browser</b> option, or</li> <li>Click on the item and press <b>(Alt+G)</b></li> </ul>

### 3.7.3.2 CSV Import and Export

Enterprise Architect enables you to import and export information about Enterprise Architect elements to and from CSV text files.

#### Topics

Topic	Detail	See also
<b>Specifications</b>	<p>To import and export element data from Enterprise Architect using CSV files, you must first set up one or more file specifications.</p> <p>You do this because the specification defines what types of value from the spreadsheet are to be imported, and how the information is translated between the spreadsheet and Enterprise Architect.</p>	<a href="#">CSV Specifications</a> <sup>498</sup>

Topic	Detail	See also
<b>Import From CSV</b>	Once you have defined a CSV import specification, you can read in major element characteristics from a CSV text file.	<a href="#">CSV Import</a> <sup>[503]</sup>
<b>Export To CSV</b>	Once you have defined a CSV export specification it is possible to write out major element characteristics to a CSV text file.	<a href="#">CSV Export</a> <sup>[504]</sup>

### 3.7.3.2.1 CSV Specifications

To import and export element data to and from Enterprise Architect using CSV files, you must first set up one or more file specifications.

A file specification defines the:

- Fields from the spreadsheet in the order they are imported or exported
- Filename (optional) and
- Delimiter between columns

Once you have defined one or more specifications, one can be selected in the CSV Import/Export dialog as the current specification to apply during an import or export action.

CSV Import/Exports only imports and exports *elements* (within packages) and their properties; items such as Class attributes cannot be imported or exported through this mechanism.

XML import/export provides a solution to this limitation, as does use of the Automation Interface (Object Model).

**Access**    **Project | Model Import/Export | CSV Import/Export Specifications**

#### Reference

On the CSV Import/Export Specification dialog, complete the fields as required, as indicated in the following table:

Field	Usage	See also
<b>Specification Name</b>	Select the unique name for this specification.	
<b>Delimiter</b>	Specify the character delimiter to use between record fields.  If a field contains an instance of the delimiter, the field is exported wrapped in " (quotation marks) and all instances of " in the field are doubled (that is, " becomes "").	
<b>Notes</b>	Record a brief description of the specification.	

Field	Usage	See also
<b>Default Filename</b>	Select the default filename.	
<b>Default Direction</b>	Set the default action - <b>Import</b> or <b>Export</b> .  A specification can be used in either direction, but this enables you to set the default type.	
<b>Default Types</b>	Limit the element types being exported, by entering a comma-separated list: for example: <i>class,requirement,component,node,object</i> . <ul style="list-style-type: none"> <li>If you specify element types, <b>ONLY</b> elements of those types are exported or imported; therefore, in order to enable the <b>Preserve Hierarchy</b> option to operate (if selected) you must include <b>Package</b> as an element type, otherwise there are no packages in which to preserve the hierarchy</li> <li>If you do not specify any default element types, all elements including Packages are exported or imported and the hierarchy can be preserved</li> </ul>	
<b>Preserve Hierarchy</b>	Include fields generated by Enterprise Architect to embed/reconstruct the package hierarchy.	<a href="#">Using Preserve Hierarchy</a> <sup>[500]</sup>
<b>Available Fields</b>	Select from a list of possible record fields, not yet allocated.	
<b>File Specification</b>	List the record fields (in the order they are plotted across the spreadsheet) already assigned.	
<b>Add Tagged Value Field</b>	<p>Adds a Tagged Value column to the CSV Specification, to import or export the value that an element has for a particular tag.</p> <p>When you click on this button, a prompt displays to select one of two options:</p> <ul style="list-style-type: none"> <li><b>Value</b> - to import or export the content of the Tagged Value <b>Value</b> field; a column heading with the prefix <i>TagValue_</i> is added to the specification</li> <li><b>Notes</b> - to import or export the content of the Tagged Value <b>Notes</b> field (some Tagged Values use the <b>Notes</b> field to accommodate long values, such as &lt;memo&gt; text); a column heading with the prefix <i>TagNotes_</i> is added to the specification</li> </ul> <p>In each case, the Add Tag Value Column dialog displays.</p>	<a href="#">Package Browser Options</a> <sup>[683]</sup>

Field	Usage	See also
	<p>Select either the</p> <ul style="list-style-type: none"> <li>• <b>Global Tagged Values</b> option, or</li> <li>• <b>Tagged Values from the selected Element</b> option, and select the required element using the <b>Other Element</b> button</li> </ul> <p>Now select the required Tagged Value from the <b>Tagged Value</b> drop-down list, and click on the <b>OK</b> button.</p>	
<b>Add Field</b>	Move all selected fields in the top list to the bottom list.	
<b>Remove Field</b>	Move all selected fields in the bottom list back to the available list.	
<b>New</b>	Create a new specification.	
<b>Save</b>	Save changes to the currently selected specification.	
<b>Save As</b>	Save the current specification with a new name.	
<b>Delete</b>	Delete the current specification.	
<b>Close</b>	Close this dialog.	

### Notes

- In **Available Fields** and **File Specification**, the record fields **Created Date** and **Modified Date** are not set when imported from CSV

### Learn more

- [XML Import and Export](#)<sup>[473]</sup>
- [Enterprise Architect Object Model](#)<sup>[2804]</sup>

#### 3.7.3.2.1.1 Using Preserve Hierarchy

The **Preserve Hierarchy** option on the CSV Import/Export Specification dialog includes fields generated by Enterprise Architect to embed/reconstruct the package hierarchy in a CSV import or export.

When selected, the **Preserve Hierarchy** option inserts two fields into the CSV specification that are:

- automatically populated by Enterprise Architect on export and
- used to reconstruct the exported package's hierarchy upon import

Field	Usage	See also
<b>CSV_KEY</b>	A unique identifier for the current element.  This key is unique per export; subsequent exports produce different keys for the same set of elements.	
<b>CSV_PARENT_KEY</b>	The corresponding CSV_KEY of the current element's parent.  If the field is left blank or references a non-existent CSV_KEY, the element is added to the top level of the package.	

It is highly recommended that you do not change these fields if they have been automatically generated by Enterprise Architect's CSV exporter.

If you intend to import hierarchical information from a spreadsheet that was **not** populated by exporting data from Enterprise Architect, you must add these two fields to your spreadsheet as the last two columns, and populate the columns yourself.

For example:

NAME	TYPE	NOTES	PRIORITY	STATUS	CSV_KEY	CSV_PARENT_KEY
Requirement Package	Package	Notes Package1			Package1	
REQ1	Requirement	Notes on REQ1	High	Approved	REQ1	Package1
REQ2	Requirement	Notes on REQ2	High	Approved	REQ2	Package1
REQ2.1	Requirement	Notes on REQ2.1	High	Approved	REQ2.1	REQ2
REQ2.2	Requirement	Notes on REQ2.2	Med	Approved	REQ2.2	REQ2
REQ2.3	Requirement	Notes on REQ2.3	High	Approved	REQ2.3	REQ2
REQ3	Requirement	Notes on REQ3	High	Approved	REQ3	Package1
REQ3.1	Requirement	Notes on REQ3.1	High	Approved	REQ3.1	REQ3
REQ3.2	Requirement	Notes on REQ3.2	High	Approved	REQ3.2	REQ3
REQ4	Requirement	Notes on REQ4	High	Approved	REQ4	Package1
REQ4.1	Requirement	Notes on REQ4.1	High	Approved	REQ4.1	REQ4
REQ4.2	Requirement	Notes on REQ4.2	High	Approved	REQ4.2	REQ4
REQ4.3	Requirement	Notes on REQ4.3	High	Approved	REQ4.3	REQ4

### 3.7.3.2.2 CSV Export

Enterprise Architect enables you to export information about elements to a CSV text file, using a CSV export specification.

If you intend to *re-import* the exported information into Enterprise Architect at some point, it is recommended that you include the **GUID** field in the CSV export specification. This ensures that Enterprise Architect can identify and update existing elements, rather than creating duplicates.

**Access** [Project Browser](#) | [Package Context Menu](#) | [Import/Export](#) | [CSV Import/Export](#)

**How to**

To export data in CSV format, follow the steps below

1. In the Project Browser, right-click on the package containing the elements to export and select the **CSV Import/Export** menu option.
2. The CSV Import/Export dialog displays; complete the fields as required, as indicated in the following table:

Field	Usage	See also
<b>Package</b>	Confirm the name of the current selected package.	
<b>Specification</b>	Specify the name of the export specification <sup>[475]</sup> to use.	<a href="#">CSV Specifications</a> <sup>[498]</sup>
<b>Edit/New</b>	Edit the export specification or create a new one.	
<b>File</b>	Specify the filename to export to.	
<b>Types</b>	<p>List the element types to export: leave blank for all, or enter a comma-separated list of types.</p> <p>If you specify element types, <b>ONLY</b> elements of those types are exported; therefore, to enable the <b>Preserve Hierarchy</b> option in the specification to operate (if selected) you must include <i>Package</i> as an element type, otherwise no Packages are exported in which to preserve the hierarchy.</p> <p>If you do not specify any element types, all elements including Packages are exported and the hierarchy can be preserved.</p>	
<b>Action</b>	Select the <b>Export</b> radio button to export to file.	
<b>Print Results</b>	Print out the result list.	
<b>View File</b>	View the resultant CSV file with the default Windows application for CSV files.	
<b>Run</b>	Perform the export.	
<b>Close</b>	Exit this dialog.	

#### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have both **Export XMI** and **Import XMI** permissions to use the **CSV Import/Export** option

**Learn more**

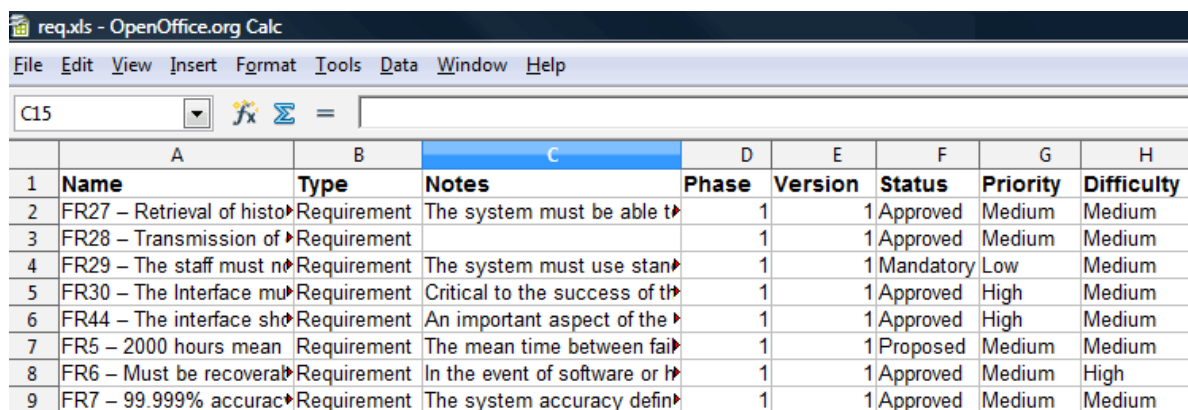

- [List of Available Permissions](#) <sup>329</sup>

**3.7.3.2.3 CSV Import**

Enterprise Architect enables you to import information about elements from a CSV text file, using a CSV export specification.

You import the CSV file into a selected package; if this package or any element within the package has a lock on it, you cannot import the CSV file into it. The **Import** option on the dialog is grayed out.

The format and content of the source data file should resemble the following:

The screenshot shows a spreadsheet window titled 'req.xls - OpenOffice.org Calc'. The spreadsheet contains a table with 9 rows and 9 columns. The columns are labeled A through H. The data is as follows:

	A	B	C	D	E	F	G	H
1	<b>Name</b>	<b>Type</b>	<b>Notes</b>	<b>Phase</b>	<b>Version</b>	<b>Status</b>	<b>Priority</b>	<b>Difficulty</b>
2	FR27 – Retrieval of histo	Requirement	The system must be able to	1	1	Approved	Medium	Medium
3	FR28 – Transmission of	Requirement		1	1	Approved	Medium	Medium
4	FR29 – The staff must not	Requirement	The system must use stan	1	1	Mandatory	Low	Medium
5	FR30 – The Interface mu	Requirement	Critical to the success of th	1	1	Approved	High	Medium
6	FR44 – The interface sho	Requirement	An important aspect of the	1	1	Approved	High	Medium
7	FR5 – 2000 hours mean	Requirement	The mean time between fai	1	1	Proposed	Medium	Medium
8	FR6 – Must be recovera	Requirement	In the event of software or h	1	1	Approved	Medium	High
9	FR7 – 99.999% accurac	Requirement	The system accuracy defin	1	1	Approved	Medium	Medium

**Access** [Project Browser](#) | [Package Context Menu](#) | [Import/Export](#) | [CSV Import/Export](#)

**How to**

To import data in CSV format

1. In the Project Browser, right-click on the package to import into and select the **CSV Import/Export** context menu option.
2. The CSV Import/Export dialog displays; set the required options; as outlined below:

Field	Usage	See also
<b>Package</b>	Confirm the name of the current selected package.	
<b>Specification</b>	Specify the name of the import specification <sup>2613</sup> to use.	<a href="#">Import specification</a> <sup>498</sup>
<b>Edit/New</b>	Edit the import specification or create a new one.	
<b>File</b>	Specify the spreadsheet filename to import from.	
<b>Types</b>	Not used for import.	

Field	Usage	See also
<b>Action</b>	Select the <b>Import</b> radio button to import from the file (grayed-out if the package or a child item in the package is locked).	
<b>Print Results</b>	Print out the result list.	
<b>View File</b>	View the source CSV file with the default Windows application for CSV files.	
<b>Run</b>	Perform the import.	
<b>Close</b>	Exit this dialog.	

#### Notes

- When importing, Enterprise Architect checks the specification to see if there is a GUID field included; if there is, Enterprise Architect attempts to locate the element identified by the GUID and, if successful, updates the current element rather than creating a new one
- If no GUID field is defined, or Enterprise Architect cannot locate the identified element, a new element is created and placed in the current package; during import, **Type** is a mandatory field in the source file and must match one or more of the legal Enterprise Architect element types: for example: Requirement, or Class
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have both **Export XMI** and **Import XMI** permissions to use the **CSV Import/Export** option

- [Enterprise Architect element types](#)<sup>[289b]</sup>

### 3.7.3.3 Perform a Project Data Transfer

In normal system maintenance, it is likely that at some point you need to relocate data between storage systems. In any edition of Enterprise Architect, you might need to transfer all records from one project file to another (recommended after serious network crash or repeated database corruption). In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, you might need to:

- Transfer an existing project file to a DBMS repository such as SQL Server or MySQL
- Transfer a DBMS repository to an existing project file
- Move a repository from one DBMS to another (including moving between servers using the same DBMS)
- Copy all records from a JET 3.5 to JET 4 (Access 2000 or XP) repository - or back the other way

[Access](#) [Tools](#) | [Data Management](#) | [Project Transfer](#)

### Perform a project data transfer

Step	Action	See also
1	Click on the option for the required transfer type: <ul style="list-style-type: none"> <li>• <b>.EAP to .EAP</b></li> <li>• <b>DBMS to .EAP</b></li> <li>• <b>.EAP to DBMS</b></li> <li>• <b>DBMS to DBMS</b></li> </ul>	
2	In the <b>Source Project</b> and <b>Target Project</b> fields, type or select the name or connection string for the Source and Target projects.	
3	If you want to capture the transfer in a log file, select the <b>Logfile</b> checkbox and browse for the appropriate log file location.	
4	Click on the <b>Transfer</b> button.	
5	It is good practice to do a Project Compare after this process to verify that all records are written.	<a href="#">Compare Projects</a> 

### Notes

- Take a backup of the target project to ensure that you can recover any important information it already contains; in a transfer, all records in the target repository are overwritten
- You cannot move a model from a source .EAP file of a version earlier than 3.5.0
- When performing an EAP to DBMS transfer, if the EAP file has replication enabled, the replication must be removed before performing the transfer
- When transferring a model to a DBMS, you cannot transfer the data into an empty database - the tables must already exist; if they do not, run the corresponding script supplied by Sparx Systems to create the required tables
- When transferring a model into a project file, similarly, the target project file must already exist, to provide the data structures to transfer data into
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Transfer Data** permission to transfer project data between repositories

### Learn more

- [Sparx Systems Scripts webpage](#)
- [Remove Replication](#) 

- [List of Available Permissions](#) <sup>329</sup>

### 3.7.3.3.1 Copy Packages Between Projects

It is possible to copy and move individual **packages** between **projects**, exporting and importing the packages as **XMI** files. You can also duplicate larger structures, such as complete models or projects. This gives you a high level of flexibility in building a project from re-usable parts and from elements produced in widely-dispersed geographic regions.

**Access** **Project Browser | Package Context Menu | Import/Export | Export package to XMI file**  
**Project Browser | Package Context Menu | Import/Export | Import package from XMI file**

#### Copy a package from one Enterprise Architect project to another

Step	Action	See also
1	Open the project to copy <b>from</b> .	
2	In the Project Browser, right-click on the package to copy and select the <b>Export package to XMI file</b> option. The Export Package to XMI dialog displays.	
3	Select the appropriate options and filename.	<a href="#">Export to XMI</a> <sup>475</sup>
4	Click on the <b>Export</b> button to begin the export process.	
5	When the export is complete, open the project to copy <b>into</b> .	
6	In the Project Browser, navigate to the location to import the package into.	
7	Right-click and select the <b>Import package from XMI file</b> option. The Import Package from XMI dialog displays.	
8	Select the appropriate options and filename.	<a href="#">Import from XMI</a> <sup>478</sup>
9	Click on the <b>Import</b> button. The package is copied from the source project to the destination project.	

#### Notes

- If the package you are importing already exists in the target project (that is, it has been imported previously), you must either import **over** the existing package or select the **Strip GUIDs** option

In the latter case, the system creates a copy of the original package

#### Learn more

- [Copy a Package](#)<sup>[775]</sup>
- [Copy Elements Between Packages](#)<sup>[915]</sup>

### 3.7.4 Compare Projects

A number of operations can make changes to your project that you either want to monitor carefully or not have at all. Such events include:

- Recovering from a database crash
- Restoring a backup
- Performing a Project Data Transfer
- Importing from XML, and
- Deleting model elements

You might have made a copy of the original project or the purpose of the operation is to generate a copy, in which case you can compare the size and row counts of the 'before' and 'after' copies as a convenient 'sanity check'. The copies can be on different platforms; you have options to:

- Compare a project file to another project file
- Compare a project file to a DBMS-based repository
- Compare two DBMS repositories

The comparison examines the number of project rows in each database, producing a report indicating the total records in each and the difference in record count between the two. If discrepancies are found, you must investigate further manually. The comparison does not examine the actual **data** in the tables.

**Access** [Tools | Data Management | Project Compare](#)

#### Compare two projects

Step	Action	See also
1	On the Project Compare dialog, select the radio button for the database types of the two projects you want to compare: <ul style="list-style-type: none"> <li>• <b>.EAP to .EAP</b></li> <li>• <b>DBMS to .EAP</b></li> <li>• <b>.EAP to DBMS</b></li> <li>• <b>DBMS to DBMS</b></li> </ul>	
2	In the <b>Source Project</b> and <b>Target Project</b> fields, type the name or connection string for the source and target projects to compare.	

Step	Action	See also
3	Click on the <b>Compare Projects</b> button. The results of the comparison display in the panel at the bottom of the dialog.	
4	If you want to print the results of the comparison, click on the <b>Print List</b> button.	

### 3.8 Project Management

Enterprise Architect provides strong support for:

- Project Management, in estimating project size, measuring risk and effort, and assigning resources to elements
- Change control and maintenance

#### Topics

Topic	Detail	See also
<b>Metrics and Estimation</b>	<p>Project estimation is working out how much time and effort is required to build and deploy a solution.</p> <p>Enterprise Architect provides the Use Case metrics facility as a means of:</p> <ul style="list-style-type: none"> <li>• Measuring the complexity of a system</li> <li>• Getting an indication of the effort required to implement the model</li> <li>• Getting an indication of the project timescale</li> </ul> <p>You base these estimates on carefully-calibrated metrics.</p>	<a href="#">Use Case Estimation</a> <sup>[584]</sup>

### 3.8.1 The Project Management Window

The Project Management window enables you to input the following quantities associated with an element contained in the model:

- Resources - the people who work on a project, who can be assigned roles and allocated tasks
- Effort - effort expended in work on the element
- Risks - risk associated with the element
- Metrics - metrics measured for an element

Each of these four quantities has a separate tab in the window.

**Access** **Element | Project Management** (Ctrl+Shift+7)

#### Reference

Action	Usage	See also
<b>New</b>	Create a new item.	<a href="#">Resource Allocation</a> <sup>[512]</sup> <a href="#">Effort Management</a> <sup>[518]</sup> <a href="#">Risk Management</a> <sup>[519]</sup> <a href="#">Metrics</a> <sup>[520]</sup>

<b>Save</b>	Save changes to an item.	
<b>Save As New</b>	Duplicate an existing entry. You must change an item's Role for this to become enabled.	
<b>Delete</b>	Delete an item from the list.	
<b>Sort</b>	Sort the items in the list into alphabetical order.	
<b>Print</b>	Print item data from the list.	
<b>Browse Element</b>	Display the Element Browser window for the selected element, to list and select the project management items for the element.	<a href="#">The Element Browser</a> <sup>[989]</sup>
<b>Show/Hide Properties</b>	Swap between detailed and summary window styles.	
<b>Help</b>	Show help contents for this window.	

### Notes

- Click on an element in the Project Browser to display project management information for that element in the Project Management window
- The window has two formats:
  - *List* mode - provides a detailed list showing several columns of information
  - *Item* mode - a summary list plus an editor to add or edit information for a single selected item
- Toggle between these modes using the **Show/Hide Properties** button in the window toolbar; each tab toggles between Item mode and List mode independently
- Columns in the item list can be reorganized, added, removed, grouped, filtered and sorted using the options provided in the **List Header** facilities
- An asterisk on a tab name indicates that the tab contains saved information; if there is no information for a category of item, or the information has not yet been saved, its tab has no asterisk
- Right-click on the list to view the context menu, which enables you to add and delete list items

#### 3.8.2.1 Resource Allocation

In developing a model, people (or **resources**) in a number of **roles** might perform **tasks** on model structures. As a Project Manager, you can assign resources to tasks on **elements** (including Packages) in the model, planning and monitoring the work that they do within the timeframe you have allocated for that work to be completed. You can do this using the Project Management and/or Project Gantt View facilities.

**Access** Click on element and:

**Project | Project Gantt View > Element View | right click element | Assign Resource, or  
Element | Project Management (Ctrl+Shift+7) > Resource Allocation: New**

**Enter resource allocation details for an element**

Field/Option/ Button	Action	See also
<b>Resource</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Type in the name of the resource being assigned to work associated with the element, or</li> <li>Click on the drop-down arrow and click on the name of the resource</li> </ul> <p>If you want to assign more than one resource to the task on the element, you follow a slightly different procedure.</p>	<a href="#">Assign Multiple Resources</a> 515
<b>Role or Task</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Type in the role name or task performed by the selected resource, or</li> <li>Click on the drop-down arrow and click on the role performed by the resource</li> </ul>	
<b>Start Date</b>	<p>This field defaults to today's date.</p> <p>If you want to assign a different start date for the task:</p> <ol style="list-style-type: none"> <li>Click on the down arrow.</li> <li>If necessary, click on the left or right arrow to select the previous or next month.</li> <li>Click on the appropriate day of the month as the start date.</li> </ol> <p>The field immediately changes to the selected date.</p>	
<b>End Date</b>	<p>This field defaults to today's date.</p> <p>If you want to assign a different end date for the task:</p> <ol style="list-style-type: none"> <li>Click on the down arrow.</li> <li>If necessary, click on the right arrow to select the next month.</li> <li>Click on the appropriate day of the month as the end date.</li> </ol> <p>The field immediately changes to the selected date.</p>	
<b>Complete %</b>	<p>If the task is already in progress, type in the current percentage completion.</p>	

Field/Option/ Button	Action	See also
<b>Expected Time</b>	<p>Type in the number of whole time units the task is expected to take. (The value must be an integer, so you cannot record part units.)</p> <p>The unit of time you adopt is by agreement within the project, and depends on the granularity of the work being recorded. Most tasks are completed in a number of hours or a number of days; use the smallest practical unit that you can record as a whole number.</p> <p>Apply the same units as used for the <b>Allocated Time</b> and <b>Time Expended</b> fields.</p>	
<b>Allocated Time</b>	<p>Type in the number of time units the task can be spread over. #### 3.8.2.1.1 Assign Multiple Resources

When you have a large unit of work associated with an element - such as a Package element - you might want to assign several resources to that element to perform that unit of work. You can assign each person individually, but if the resources have the same role or task you can assign all of them together in one operation, using the Assigned Resources dialog.

#### Access **Click on element and:**

**Project | Project Gantt View > Element View | right click element | Assign Resource, or  
Element | Project Management > Resource Allocation: Show/Hide (to show List view): New**

#### Assign multiple resources to an element

Field/Option/ Button	Action	See also
<b>Resource</b>	<p>(To assign a <b>single</b> resource, simply type in the name or click on the drop-down arrow and select the name from the list. In Project Management, it is simpler to assign single resources directly through the Project Management window.)</p> <p>For <b>multiple</b> resources, click on the <b>Browse ( ... )</b> button to display the Assign Resource dialog.</p> <ol style="list-style-type: none"> <li>1. Select the checkbox against each resource to assign to the element; to select all resources listed, click on the <b>Select All</b> button.</li> <li>2. Click on the <b>OK</b> button to close the dialog and add the selected resources to the <b>Resource</b> field.</li> </ol> <p>The <b>Resource</b> field now shows the selected resources, but grayed out. The drop-down arrow also is not active. To change the resources in the field, click on the <b>Browse</b> button again and select/clear the appropriate checkboxes.</p>	<a href="#">Resource Allocation</a> 512
<b>Role or Task</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Type in the role name or task that is common to all the selected resources, or</li> <li>• Click on the drop-down arrow and click on the role that is common to all the resources</li> </ul>	
<b>Start Date</b>	<p>This field defaults to today's date.</p> <p>If you want to assign a different start date for the task:</p> <ol style="list-style-type: none"> <li>1. Click on the down arrow.</li> <li>2. If necessary, click on the left or right arrow to select the previous or next month.</li> <li>3. Click on the appropriate day of the month as the start date.</li> </ol> <p>The field immediately changes to the selected date.</p>	
<b>End Date</b>	<p>This field defaults to today's date.</p> <p>If you want to assign a different end date for the task:</p> <ol style="list-style-type: none"> <li>1. Click on the down arrow.</li> <li>2. If necessary, click on the right arrow to select the next month.</li> <li>3. Click on the appropriate day of the month as the end date.</li> </ol> <p>The field immediately changes to the selected date.</p>	
<b>Complete %</b>	If the task is already in progress, type in the current percentage completion.	
<b>Expected Time</b>	Type in the number of time units the task is expected to take. (The value must be an integer, so you cannot record part units.)	

Field/Option/ Button	Action	See also
	<p>The unit of time you adopt is by agreement within the project, and depends on the granularity of the work being recorded. Most tasks are completed in a number of hours or a number of days; use the smallest practical unit that you can record as a whole number.</p> <p>Apply the same units as used for the <b>Allocated Time</b> and <b>Time Expended</b> fields.</p>	
<b>Allocated Time</b>	<p>Type in the number of time units the task can be spread over. <b>Description</b>	Type (and, if you prefer, format) a description of the work being done by the resources (this text is also displayed in the Notes window, but it cannot be edited in that window).	<a href="#">Notes</a> 
<b>History</b>	(As the task progresses, you add text to this tab to record the activities, progress, problems and outcomes of the task. This text is also displayed in the Notes window, but it cannot be edited in that window.)	
<b>OK</b>	Click on this button to <b>save</b> the data you have entered, and close the dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the data you have entered, and close the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

**Notes**

- When the resource details are displayed on the Project Gantt Chart or Project Management dialog, each resource has their own record containing, initially, the same data; however, each resource can be monitored and their progress recorded separately
- If you assign resources that are already in a multiple resource assignment to the selected element, a prompt displays for you to confirm that you are **updating** the assignment of that resource, or now **omitting** that resource from the current assignment

### 3.8.2.2 Effort Management

In Enterprise Architect, the Project Manager can allocate effort (as time) to work on a given model element. To select the element to which to allocate effort, click on the required element in the Project Browser.

**Access** **Element | Project Management > Effort: New**

#### Enter effort allocation details for an element

Step	Action	See also
1	Select the element in the Project Browser.	
2	Select the <b>Project Management</b> menu option. The Project Management window displays, showing the Resource Allocation tab.	
3	Click on the Effort tab.	
4	Click on the <b>New</b> icon on the Project Management window toolbar.	
5	On the Effort tab enter the: <ul style="list-style-type: none"> <li>• Name of the effort (a short description)</li> <li>• Type of the effort (type the name or click on the drop-down arrow and select; the selection list is drawn from the global Effort Type list, but any new efforts you type in the Type field are not added to the list)</li> <li>• Time the effort is expected to expend</li> <li>• Notes on effort (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Effort Types</a> <sup>[522]</sup> <a href="#">Notes</a> <sup>[1142]</sup>
6	Click on the <b>Save</b> icon in the Project Management window toolbar.	

Step	Action	See also

### Notes

- To edit existing Effort items for this element, click on the required item in the:
  - List panel to the left of the window, in *Item* mode
  - List, in List mode, or
  - Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; effort item icons have an **E** in the bottom right corner
- Although Enterprise Architect does not currently provide detailed reports on effort within a model, you can use the Automation Interface or similar tools to create your own custom reports based on effort information you enter

### Learn more

- [Enterprise Architect Object Model](#)<sup>[2804]</sup>

### 3.8.2.3 Risk Management

In Enterprise Architect, the Project Manager can allocate the possible weighting of defined risks to work on a given model element.

To select the element to which to allocate risk weightings, click on the required element in the Project Browser.

**Access**    **Element | Project Management > Risks: New**

### Use to

- Enter the details of risks that might impact work on an element

### How to

To enter risk details for an element

Step	Action	See also
1	Select the element in the Project Browser.	
2	Select the <b>Project Management</b> menu option. The Project Management window displays, showing the Resource Allocation tab.	

Step	Action	See also
3	Click on the Risks tab.	
4	Click on the <b>New</b> icon on the Project Management window toolbar.	
5	On the Risks tab enter the: <ul style="list-style-type: none"> <li>Name of the risk (a short description)</li> <li>Type of the risk (Mandatory: type the name or click on the drop-down arrow and select; the selection list is drawn from the global Risk Type list, but any new risks you type in the Type field are not added to the list)</li> <li>Weighting allocated to the risk</li> <li>Notes on the risk (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Risk Types</a> <sup>[524]</sup> <a href="#">Notes</a> <sup>[1142]</sup>
6	Click on the <b>Save</b> icon in the Project Management window toolbar.	

### Notes

- The risks described here are not the same as those represented by Risk elements; the risks described above are properties of a single element, whilst the Risk element represents something that can impact a range of other elements
- If you select a global risk type from the **Type** drop-down list and the associated **Weight** field is empty, the default Weight value is allocated to the **Weight** field on the Risks tab
- To edit existing Risk items for this element, click on the required item in the:
  - List panel to the left of the window, in *Item* mode
  - List, in List mode
  - Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; risk item icons have an **Ri** in the bottom right corner
- Although Enterprise Architect does not currently provide detailed reports on risks within a model, you can use the Automation Interface or similar tools to create your own custom reports based on risk information you enter

### 3.8.2.4 Metrics

In Enterprise Architect, the Project Manager can allocate the possible weighting of defined metrics to work on a given model element.

To select the element to which to allocate metric weightings, click on the required element in the Project

Browser.

**Access** **Element | Project Management > Metrics: New**

### **Use to**

- Enter the details of metrics that you might apply to work on an element

### **How to**

To enter metric details for an element

Step	Action	See also
1	Select the element in the Project Browser.	
2	Select the <b>Project Management</b> menu option. The Project Management window displays, showing the Resource Allocation tab.	
3	Click on the Metrics tab.	
4	Click on the <b>New</b> icon on the Project Management window toolbar.	
5	On the Metrics tab enter the: <ul style="list-style-type: none"> <li>• Name of the metric (a short description)</li> <li>• Type of the metric (Mandatory: type the name or click on the drop-down arrow and select; the selection list is drawn from the global Metric Type list, but any new metrics you type in the Type field are not added to the list)</li> <li>• Weighting allocated to the metric</li> <li>• Notes on the metric (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Metric Types</a> <sup>[523]</sup> <a href="#">Notes</a> <sup>[1142]</sup>
6	Click on the <b>Save</b> icon in the Project Management window toolbar.	

### **Notes**

- If you select a global metric type from the **Type** drop-down list and the associated **Weight** field is empty, the default Weight value is allocated to the **Weight** field on the Metrics tab
- To edit existing Metric items for this element, click on the required item in the:
  - List panel to the left of the window, in *Item* mode
  - List, in List mode

- Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; metric item icons have an **M** in the bottom right corner
- Although Enterprise Architect does not currently provide detailed reports on metrics within a model, you can use the Automation Interface or similar tools to create your own custom reports based on metric information you enter

#### Learn more

- [The Element Browser](#)<sup>[989]</sup>
- [Enterprise Architect Object Model](#)<sup>[2804]</sup>

### 3.8.2.5 Effort Types

Enterprise Architect enables you to add an effort *type* to the global list of effort types that can be added to any element in the model.

The global list of effort types displays in the **Type** field drop-down list on the Effort tab of the Project Management window.

**Access** **Settings | Project Types | Project Indicators > Effort: New**

#### Use to

- Specify the effort types used when assigning effort to an element

#### How to

To add a new effort type to the global list

Step	Action	See also
1	Select the <b>Project Indicators</b> menu option. The Project Indicators dialog displays.	
2	Click on the Effort tab.	
3	Click on the <b>New</b> button. (To edit an existing effort type, click on the effort type name in the <b>Defined Effort Types</b> list.)	
4	Complete the fields as follows: <ul style="list-style-type: none"> <li>• In the <b>Effort</b> field type the name of the effort type</li> <li>• In the <b>Description</b> field type a short description of the effort type</li> <li>• In the <b>Weight</b> field type the default weighting to apply to the effort type</li> <li>• In the <b>Note</b> field, type any additional information on the effort type</li> </ul>	

Step	Action	See also
5	Click on the <b>Save</b> button.	

### Notes

- Although Enterprise Architect does not currently provide detailed reports on effort within a model, you can use the Automation Interface or similar tools to create your own custom reports based on effort information you enter
- You can transport effort types between models, using Export Reference Data and Import Reference Data

## 3.8.2.6 Metric Types

Enterprise Architect enables you to add a metric *type* to the global list of metric types that can be added to any element in the model.

The global list of metric types displays in the **Type** field drop-down list on the Metrics tab of the Project Management window.

**Access** **Settings | Project Types | Project Indicators > Metric: New**

### Use to

- Specify the metric types used when assigning metrics to an element

### How to

To add a new metric type to the global list

Step	Action	See also
1	Select the <b>Project Indicators</b> menu option. The Project Indicators dialog displays.	
2	Click on the Metric tab.	
3	Click on the <b>New</b> button. (To edit an existing metric type, click on the metric type name in the <b>Defined Metrics</b> list.)	

Step	Action	See also
4	Complete the fields as follows: <ul style="list-style-type: none"> <li>• In the <b>Metric Type</b> field type the name of the metric type</li> <li>• In the <b>Description</b> field type a short description of the metric type</li> <li>• In the <b>Weight</b> field type the default weighting to apply to the metric type</li> <li>• In the <b>Note</b> field, type any additional information on the metric type</li> </ul>	
5	Click on the <b>Save</b> button.	

### Notes

- Although Enterprise Architect does not currently provide detailed reports on metrics within a model, you can use the Automation Interface or similar tools to create your own custom reports based on metric information you enter
- You can transport metric types between models, using Export Reference Data and Import Reference Data

## 3.8.3 The Project Status View

The Project Status view documents tasks and issues that relate directly to the current project, and lists the statistics of the project.

**Access** **Project | Project Status > <Tab>**

### Tabs

Tab	Detail	See also
<b>Tasks</b>	Review major <b>project tasks</b> that require attention.	<a href="#">Project Tasks</a> [526]
<b>Issues</b>	Review <b>events</b> , <b>occurrences</b> and <b>situations</b> that impact on project development and delivery. You can also generate a document report on these <b>issue</b> items.	<a href="#">Project Issues</a> [526]
<b>Project Statistics</b>	Review the <b>project statistics</b> , on the Project Statistics tab. This simply lists the numbers of packages, diagrams, elements, connectors, elements of each type and element features of each type in the project.  For certain items, such as element risks, metrics and effort, if there are no instances of that particular object type it is still listed but with a count of 0.	

#### Notes

- You can add or work on an item in the Project Status view by *right-clicking* (context menu) or *double-clicking* on the blank or completed item line
- The Project Status view context menu has options for filtering tasks and issues by status; you can also rearrange the sort-order by clicking in the title bar of the column that the items are to be indexed on

### 3.8.3.1 Project Tasks

The **Tasks** tab of the Project Status view provides a convenient 'To Do' list of major project work items that are not recorded elsewhere, and can be used to track events such as requests or corrections.

**Access**    **Project | Project Status > Tasks**

#### Notes

- Right-click on the list to view the context menu, and select to add, modify or delete tasks, or to set a status filter
- You can re-organize the display of the listed tasks using the List Header facilities for reported information
- To print out the currently displayed items, select the **Print List** context menu option
- You can transport task definitions between models using Export Reference Data and Import Reference Data

#### Learn more

- [Add, Modify and Delete Tasks](#) [527]
- [Export Reference Data](#) [376]
- [Import Reference Data](#) [380]
- [List Header](#) [677]

### 3.8.3.1.1 Add, Modify and Delete Tasks

This topic explains how to add, edit and delete project tasks.

**Access**    **Project | Project Status > Tasks**  
**Project | Calendar > Project Tasks mode**

#### Maintain Tasks

Step	Action	See also
1	<p>If creating a new task:</p> <ul style="list-style-type: none"> <li>Double-click in a blank area of the Tasks tab, or on a cell of the Calendar</li> </ul> <p>If editing an existing item:</p> <ul style="list-style-type: none"> <li>Double click on the item on the Tasks tab or Calendar</li> </ul> <p>The Task Detail dialog displays.</p>	<p><a href="#">The Project Status View</a> <sup>[525]</sup></p> <p><a href="#">Project Calendar</a> <sup>[571]</sup></p>
2	<p>Enter or update the following details of the task, selecting a value from the field's drop-down list where appropriate:</p> <ul style="list-style-type: none"> <li>The task name</li> <li>Automatic naming - if you have set up automatic naming conventions, click on the <b>Auto</b> button to insert the predefined element name and counter text; if you already have some text in the <b>Name</b> field, it is over-written by the automatic naming text</li> <li>The task type</li> <li>The task owner</li> <li>The expected start and end date for the task (select the check boxes to activate the dates)</li> <li>The current status of the task</li> <li>The person this task has been assigned to</li> <li>The task priority: high, medium or low</li> <li>The expected total time for the task and the actual time expended (in complete units; the type of unit must be agreed across the project)</li> <li>The percentage completion</li> <li>The phase associated with this task</li> <li>A description of the task</li> <li>Any progress history appropriate to the task</li> </ul>	<p><a href="#">Set Auto Naming and Auto Counters</a> <sup>[904]</sup></p>
3	Click on the <b>Apply</b> button.	

Step	Action	See also
4	To create another entry click on the <b>New</b> button or, to close, click on the <b>OK</b> button.	
5	To delete a task: <ul style="list-style-type: none"> <li>Right-click on the task and select the <b>Delete</b> context menu option</li> <li>Click on the <b>Yes</b> button on the confirmation prompt</li> </ul>	

#### Notes

- Owner** and **Assigned** fields are filled from the Project Authors, Resources and Project Clients

#### Learn more

- [Project Authors](#) <sup>[1153]</sup>
- [Resources](#) <sup>[1156]</sup>

### 3.8.3.2 Project Issues

Any identified issues can be recorded against the current project, on either the:

- Issue Detail dialog from the Issues tab of the Project Status view, or
- Project Issues dialog

These two dialogs have very similar fields.

For each Issue, you record the description, date, owner and status.

**Access** **Project | Project Status > Issues** or  
**Project | Documentation | Issues**

Usage	See also
Add, edit and delete Issues	<a href="#">Add, Delete and Modify Issues</a> <sup>[529]</sup>
Generate and view a rich text format report of your issue list	<a href="#">Report From Project Issues Dialog</a> <sup>[531]</sup> <a href="#">Report From Project Issues Tab</a> <sup>[531]</sup> <a href="#">Report Output Sample</a> <sup>[532]</sup>

**Notes**

- You can transport these issue definitions between models, using **Export Reference Data** and **Import Reference Data**
- To print out the currently displayed items, select the **Print List** context menu option
- You can re-organize the display of the listed tasks using the List Header facilities for reported information
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Issues** permission to update and delete Issues records

**Learn more**

- [Export Reference Data](#)<sup>[378]</sup>
- [Import Reference Data](#)<sup>[380]</sup>
- [List Header](#)<sup>[677]</sup>
- [List of Available Permissions](#)<sup>[329]</sup>

**3.8.3.2.1 Add, Delete and Modify Issues**

You can maintain project issue records using either the:

- Issue Detail dialog from the Issues tab of the Project Status view, or
- Project Issues dialog

These two dialogs have very similar fields.

**Access** **Project | Project Status > Issues** or  
**Project | Documentation | Issues**

**Maintain Project Issues**

Step	Action	See also
1	<p>If creating a new issue:</p> <ul style="list-style-type: none"> <li>• On the Issues tab of the Project Status view, double-click in a blank area to display the Issue Detail dialog, click on the <b>New</b> button</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>• On the Project Issues dialog, click on the <b>New</b> button</li> </ul> <p>If editing an existing item:</p> <ul style="list-style-type: none"> <li>• On the Issues tab of the Project Status view, double-click on an item to display the Issue Detail dialog</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>• On the Project Issues dialog, click on the item within the <b>Project Issues &amp; Discussion</b> list</li> </ul>	<p><a href="#">The Project Status View</a><sup>[625]</sup></p>

2	<p>Enter or update the following issue details, selecting a value from the field's drop-down list where appropriate:</p> <ul style="list-style-type: none"> <li>• The issue name</li> <li>• Automatic naming - if you have set up automatic naming conventions, click on the <b>Auto</b> button to insert the predefined element name and counter text; if you already have some text in the <b>Name</b> field, it is over-written by the automatic naming text</li> <li>• The issue priority</li> <li>• The date the issue was raised</li> <li>• The issue status</li> <li>• The issue owner</li> <li>• A description of the issue</li> <li>• The name of the person who resolved the issue</li> <li>• The date on which the issue was resolved (select the check box to activate the date)</li> <li>• Any comments on the resolution</li> </ul>	<a href="#">Set Auto Naming and Auto Counters</a> 
3	Click on the <b>Apply</b> or <b>Save</b> button.	
4	If the issue is closed (and all the <b>Resolution</b> fields are completed), click on the <b>Close Issue</b> button.	
5	To create another entry, click on the <b>New</b> button, or to close, click on the <b>OK</b> or <b>Close</b> (Project Issues dialog) button.	
6	<p>To delete an issue:</p> <ul style="list-style-type: none"> <li>• On the Issues tab, right-click on the entry and select the <b>Delete</b> context menu option, then click on the <b>Yes</b> button on the confirmation prompt</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>• On the Project Issues dialog, click on the item in the <b>Project Issues &amp; Discussion</b> list, ensure that the <b>Resolution</b> fields are complete, then click on the <b>Delete</b> button</li> </ul>	

### Notes

- You cannot delete a Closed issue through the Project Issues dialog
- You can filter the list of issues by status, to include or exclude:
  - On the Issues tab, all issues or just Open, Closed or Under Review issues, using the **Set Term Filter** context menu option
  - On the Project Issues dialog, closed issues, using the **Show Closed Issues** checkbox

### 3.8.3.2.2 Report From Project Issues Dialog

This topic explains how to generate a document report on your project issue records using the Project Issues dialog.

**Access** [Project | Documentation | Issues](#)

#### Use to

- Generate and view a document report on project issues

#### How to

To generate your project issues report

Step	Action	See also
1	On the Project Issues dialog, click on the <b>Report</b> button. The Save As dialog displays.	
2	Browse for and select the appropriate file location. In the <b>File name</b> field, type the file name for the report.	
3	Click on the <b>Save</b> button. A status message displays when the report has been generated.	
4	Click on the <b>OK</b> button and then on the <b>View RTF</b> button. The report displays in your default viewer.	<a href="#">Report Output Sample</a> <sup>[532]</sup>

### 3.8.3.2.3 Report From Project Issues Tab

This topic explains how to generate a document report on your project issue records using the Issues tab of the Project Status view.

**Access** [Project | Project Status > Issues | Create RTF Report](#)

#### Use to

- Generate and view a document report on project issues

#### Generate your project issues report

Step	Action	See also
1	Right-click on the Issues tab; select the <b>Create RTF Report</b> context menu option. The Save As dialog displays.	
2	Browse for and select the appropriate file location. In the <b>File name</b> field, type the file name for the report.	
3	Click on the <b>Save</b> button. A status message displays when the report has been generated.	
4	Click on the <b>OK</b> button and then on the <b>View RTF</b> button. The report displays in your default viewer.	<a href="#">Report Output Sample</a> <sup>[532]</sup>

#### 3.8.3.2.4 Report Output Sample

The following illustration is an example of the output from an *Issues* report.

### List of Project Issues: 24-Jul-2010 9:47:00 AM

Issue	Date/Owner	Description	Resolution
Test servers will be delayed	24/07/2010 Eloise Norman	The test server builds have been delayed because the particular (unusual) memory requirements to match the customer's site are not available on shore. They are being sourced from Singapore but it will delay the builds and delivery of the machines.	Closed: 24/07/2010 Geoffrey Sparks  The machines will be built and delivered using standard memory and the proprietary memory will be added later. All performance tests will be delayed until the memory is available.
Public Holidays	24/07/2010 Joanna Stoa	The schedule includes staff working on public holidays. A number of staff have indicated that contrary to what they stated earlier they are not available.	Open: 24/07/2010
Compiler Version disparity	24/07/2010 Eloise Norman	A number of the developers have downloaded different versions of a number of the compilers. This has lead to	Under Review: 24/07/2010

		unpredictable builds impacting on testing.

### 3.8.4 Project Glossary

The Project Glossary enables you to set up a list of defined terms for your project, review the technical and business terms already defined for a model, add to the list, delete or change items, and filter the list to exclude by type.

**Access** **Project | Glossary** ( Alt+2 )

Usage	See also
Add, delete and modify the project glossary entries through either the: <ul style="list-style-type: none"> <li>Glossary view, or</li> <li>Glossary dialog</li> </ul>	<a href="#">Project Glossary View</a> <sup>[534]</sup> <a href="#">The Glossary Dialog</a> <sup>[535]</sup>
Separate glossary items by category; for example, Business terms and Technical terms.	<a href="#">Project Glossary View</a> <sup>[534]</sup> <a href="#">The Glossary Dialog</a> <sup>[535]</sup>
Save the glossary in Rich Text format for inclusion as part of a larger project document.	<a href="#">Generate a Report</a> <sup>[536]</sup>
Create glossary terms and definitions from text in the Notes window, or from any <b>Notes</b> or <b>Description</b> fields that have the Notes toolbar.	<a href="#">Notes</a> <sup>[1142]</sup>
Insert existing glossary terms into any other <b>Notes</b> fields.	<a href="#">Notes</a> <sup>[1142]</sup>

#### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Glossary** permission in order to create, update or delete Glossary items; if security is not enabled, you can manage Glossary items without any permissions
- You might include a Glossary Report in your project requirements or functional specifications documents
- You can transport glossary definitions between models, using Export Reference Data and Import Reference Data

#### Learn more

- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

### 3.8.4.1 Project Glossary View

The Project Glossary view displays the glossary terms already defined for your model. You can use this View to:

- Add glossary terms
- Modify glossary terms
- Change a definition type for all terms of that type
- Filter the display show terms of a specific type only
- Print the displayed list of terms
- Delete glossary terms

**Access** **Project | Glossary** ( Alt+2 )

Right-click on an entry on the Glossary view, and select the appropriate context menu option for the operation you intend to perform (as listed above); if you select the:

- **Add New** or **Modify Selected** options, the Glossary Detail dialog displays; complete the fields as indicated:

Field	Action	See also
<b>Term</b>	(Mandatory) Type the term to include in the glossary.	
<b>Type</b>	(Mandatory) Select the required type.  If you require a different glossary type, click on the ( ... ) (browse) button and specify the name of the new type.  This field applies the type <i>only</i> to the selected term; you can rename a type for <i>all</i> terms of that type, using the context menu as described below.	
<b>Meaning</b>	Type the definition or description of the term.  If necessary, format the text of this description using the Notes toolbar at the top of the field.	<a href="#">Notes</a> 
<b>New</b>	Clear the dialog fields so that you can define a new Glossary term.	
<b>Apply</b>	Save the new or updated glossary entry.	
<b>Delete</b>	Delete the entry.  A prompt displays to confirm the deletion; click on the <b>Yes</b> button to remove the term from the glossary.	

- **Rename type** option, the Rename Glossary Type dialog displays on which you enter the alternative type name (either one of the existing types or a new type); when you click on **OK**, *all* entries of the

original type are changed to the new type

- **Set term filter** option, the Term Type Filter dialog displays on which you enter the type of glossary term to list; when you click on **OK**, only items of that type are shown on the Glossary view
- **Remove term filter** option, the Glossary view refreshes to show glossary items of all types
- **Print List** option, the Print dialog displays on which you define the printing parameters; when you click on **OK**, the currently-displayed list prints out
- **Delete** option, a prompt displays to confirm the deletion; click on the **Yes** button to remove the term from the glossary

#### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Glossary** permission in order to create, update or delete Glossary items; if security is not enabled, you can manage Glossary items without any permissions

### 3.8.4.2 The Glossary Dialog

Using the Glossary dialog, you can create, maintain and delete definitions of terms used in your project, as a Glossary. When reviewing the Glossary terms, you can filter the list to display terms of a specific type.

**Access** [Project | Documentation | Glossary](#)

#### Maintain Glossary terms

Field	Usage	See also
<b>Glossary Term</b>	Type the term to include in the glossary.	
<b>Glossary Type</b>	(Mandatory) Select the required type.  If you require a different glossary type, click on the ( ... ) (browse) button and specify the name of the new type.  This field applies the type <i>only</i> to the selected term; you can <i>rename</i> a type for all terms of that type <sup>[534]</sup> , using the Glossary view.	<a href="#">Project Glossary View</a> <sup>[534]</sup>
<b>Description</b>	(Mandatory) Type the definition or description of the term.  If necessary, format the text of this description using the Notes toolbar at the top of the field.	<a href="#">Notes</a> <sup>[1143]</sup>
<b>Limit Display To</b>	Select the appropriate glossary type to filter the <b>Type   Term</b> list to show entries of that type only.  Select <b>All</b> to display all glossary entries.	
<b>New</b>	Clear the dialog fields so that you can define a new Glossary term.	
<b>Type   Term</b>	Review the list of defined glossary terms; click on an entry to edit it in	

Field	Usage	See also
	the dialog fields.	
<b>Save</b>	Save the new or updated glossary entry.	
<b>Delete</b>	Delete the entry selected from the <b>Type   Term</b> list.	
<b>Report</b>	Generate and print a glossary report.	<a href="#">Generate a Report</a> <a href="#">Glossary Report Output Sample</a>

#### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Glossary** permission in order to create, update or delete Glossary items; if security is not enabled, you can manage Glossary items without any permissions

### 3.8.4.3 Generate a Report

You can generate a rich text format file of your model's glossary, which you can either print or attach to any other appropriate document file.

The file can contain all glossary entries, or just those of selected types.

Access **Project | Documentation | Glossary: Report**

#### Use to

- Generate a formatted RTF document file of your model glossary

#### Generate an RTF report of the project Glossary

Step	Action	See also
<b>1</b>	Select the <b>Glossary</b> menu option. The Glossary dialog displays.	
<b>2</b>	Click on the <b>Report</b> button. The Glossary Report dialog displays.	
<b>3</b>	In the <b>Filename</b> field, type or select a filename for the glossary.	

Step	Action	See also
4	In the <b>Heading</b> field, type a suitable heading for the glossary.	
5	In the <b>Include Glossary Items</b> panel, select the checkbox for each type of glossary entry to include. To select all types of entry, click on the <b>Select All</b> button.	
6	If necessary, to define the page setup and language for the report, click on the <b>Page Setup</b> and/or <b>Language</b> buttons.	
7	To include page breaks, select the <b>Page break between sections</b> checkbox.	
8	Click on the <b>Generate</b> button to generate the report.	
9	Click on the <b>View</b> button to open the report.	<a href="#">Glossary Report Output Sample</a> 537

#### 3.8.4.3.1 Glossary Report Output Sample

An example of the output from a Glossary report is shown below:

## Glossary

### **Business Terms**

#### *Accounting Periods*

A defined period of time whereby performance reports can be extracted. (normally 4 week periods).

#### *Customer*

A person or a company that requests An entity to transport goods on their behalf.

### **Technical Terms**

#### *Association*

A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.

#### *Component Model*

The component model provides a detailed view of the various hardware and software

components that make up the proposed system. It shows both where these components reside and how they inter-relate with other components. Component requirements detail what responsibilities a component has to supply functionality or behavior within the system.

#### ***Deployment Model***

A model of the system as it is physically deployed.

#### ***Extends Relationship***

A relationship between two Use Cases in which one Use Case 'extends' the behavior of another. Typically this represents optional behavior in a Use Case scenario - for example a user might optionally request a list or report at some point in a performing a business Use Case.

### **3.8.5 Project Task Allocation**

Using the Project Gantt View, you can review the allocation of work to elements in the project, focussing on either the elements that require work, or the resources required to perform the work. The window primarily shows information that is entered through other windows and dialogs, but once a record exists in the window you can edit it and, for example, add to or change the resources on an element.

**Access** [Project | Project Gantt View](#)

#### **Project Task Views**

View	Detail	See also
<b>Resource View</b>	The Resource View shows the current commitments of each allocated resource in the project as a list of allocation records and a Gantt chart of the progress of the allocations.	<a href="#">Resource View</a> <sup>[538]</sup>
<b>Element View</b>	The Element View lists the elements in the project that have resources assigned to them, and the resources assigned to each element, as a list of allocation records and a Gantt chart of the progress of the allocations.	<a href="#">Element View</a> <sup>[542]</sup>
<b>Report View</b>	A Resource report shows how your resources are deployed in your project, displaying a list of all elements that have resources allocated to them.	<a href="#">Report View</a> <sup>[546]</sup>

- [The Gantt View](#) <sup>[594]</sup>

#### **3.8.5.1 Resource View**

The Resource view shows the current commitments of each allocated resource in the project as a list of allocation records and a Gantt chart of the progress of the allocations.

The display initially shows the resources and their overall commitment; click on the 'plus-box' to the left of the name of the resource to expand the entry to show the elements and the allocation period for each element.

The display shows both complete allocations and those that are still in progress; an internal filter hides completed allocations two weeks after the end date, and incomplete allocations one month after the end

date. Tasks you can perform include checking the:

- Dates on which specific resources or all resources are currently allocated
- Elements to which each resource is allocated
- Dates on which a resource is allocated to work on a specific element
- General progress of the resource in completing the work
- Specific details of the allocation of a resource to an element and task or role

**Access** **Project | Project Gantt View > Resource View**

#### Resource View options

Option	Action	See also
<b>Filter the display to include elements having certain properties</b>	<p>Right-click on the list and select the <b>Show Filter Bar</b> context menu option.</p> <p>The Filter Bar displays underneath the heading bar. Type a text string in the field above a column to immediately filter the list for entries that have the text string in the values in that column.</p> <p>To delete a filter string altogether, click on the blue cross at the right of the field.</p> <p>If you no longer want to use the filter bar, right click on the list and select the <b>Hide Filter Bar</b> option.</p>	<a href="#">List Header</a> 
<b>Filter the display to exclude elements by status</b>	<p>(A feature of the Project Gantt View only, taking effect under your user ID.)</p> <p>Right-click on the window and select the <b>Apply Element Status Filter</b> context menu option.</p> <p>The Excluded Status Types dialog displays; select the checkbox against one or more statuses to exclude elements having those statuses from the list.</p> <p>You can select all checkboxes at once by clicking on the <b>Select All</b> button, and clear all selections by clicking on the <b>Clear All</b> button.</p> <p>Click on the <b>OK</b> button to immediately apply the filter, which stays in effect until you specifically change it.</p>	
<b>Filter the display by Start or Completion date</b>	<p>The display default is to show current tasks for which the end date has not yet occurred. Right-click on the list and select one of the context menu options:</p> <ul style="list-style-type: none"> <li>• <b>Include Completed Tasks Within the Last...</b> - to display incomplete tasks <b>and</b> tasks completed only within the last period; you can set this period to <b>7</b>, <b>30</b>, or <b>90</b> days, or you can include <b>all</b> completed tasks, or <b>hide</b> all completed tasks</li> <li>• <b>Include Future Tasks Starting in...</b> - to display current incomplete tasks and completed tasks (depending on the setting of the option above) <b>and future</b> tasks that have been</li> </ul>

<b>Resource Allocation records for the element</b>	<p>options:</p> <ul style="list-style-type: none"> <li>• <b>Show Element Project Management Window</b> (if the window is closed or hidden)</li> <li>• <b>Find Task in Element Project Management Window</b> (if the window is visible but showing the details of another element)</li> </ul> <p>The Project Management window displays at the Resource Allocation tab, with the details of the selected entry shown in the fields and the other resource allocations for the element listed in the left-hand panel.</p> <p>You can edit the details and, if necessary, change the resource allocated to the element.</p>	<p><a href="#">The Project Management Window</a> <sup>[510]</sup></p> <p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">Assign Multiple Resources</a> <sup>[515]</sup></p>
<b>Assign a new resource to an element</b>	<p>Right-click on the appropriate element in an expanded resource item, and select the <b>Assign Resource</b> context menu option.</p> <p>The Assigned Resources dialog displays; complete this as for the Resource Allocation tab of the Project Management window.</p>	<p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">The Project Management Window</a> <sup>[510]</sup></p>
<b>Reposition the Gantt chart to automatically show the end date of a selected allocation</b>	<p>Right-click on the display and select the <b>Go to   Auto Sync with Task End Date</b> option.</p> <p>Whilst this option is selected (with a tick next to it), whenever you click on an allocation in the Resource view the display adjusts to show the end date of the task in the center of the chart.</p>	
<b>Reposition the Gantt chart to show the start date or end date of an allocation, or today's date</b>	<p>Right-click on the entry and select the required option:</p> <ul style="list-style-type: none"> <li>• <b>Go To   Task Start Date</b></li> <li>• <b>Go To   Task End Date</b></li> <li>• <b>Go To   Today's Date</b></li> </ul> <p>The display shifts to put the required date in the <b>center</b> of the chart.</p>	
<b>Locate the element in the Project Browser</b>	<p>Right-click on the element name and select the <b>Find in Project Browser</b> context menu option.</p> <p>The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted.</p>	
<b>Save an image of the Gantt chart to file</b>	<p>Right-click on the tab and select the <b>Save Image to File</b> context menu. option</p> <p>The Save As Image dialog displays, on which you specify the file name, location and graphics file type to save to.</p>	
<b>Save an image</b>	Right-click on the tab and select the <b>Copy Image to Clipboard</b>	

Option	Action	See also
<b>of the Gantt chart to the clipboard</b>	context menu option.  You can paste the image from the clipboard into your preferred graphics package.	

#### Learn more

- [The Gantt View](#)<sup>[594]</sup>

### 3.8.5.2 Element View

The Element View of the Project Gantt View lists the elements in the project that have resources assigned to them. It shows the resources assigned to each element as a list of allocation records and as a Gantt chart of the progress of the allocations. An allocation can be partial, in that a role or task is assigned but no specific resource has been identified.

The display initially shows the elements and their overall resource commitment; click on the 'plus-box' to the left of the name of the element to expand the entry to show the resources and the allocation period for each resource. You can then:

- Check the dates on which specific elements have resources currently allocated
- Check which resources are currently allocated to an element
- Assign further resources to the element
- Check the dates on which a resource is allocated to work on a specific element
- Check the general progress of the resource in completing the work
- Check the specific details of the allocation of a resource to an element and task or role

The display shows both complete allocations and those that are still in progress; an internal filter hides completed allocations two weeks after the end date.

The Element View provides most of the same features as the **diagram Gantt View** and the **Package Browser Gantt View**, and complements the Resource View and Personal Tasks View of work allocation on the project.

**Access** **Project | Project Gantt View > Element View**  
**(Right-click on a diagram | Switch to Gantt View)**  
**(Project Browser | right-click Package | Package Browser | Gantt View)**

### 3.8.5.3 Report View

The *Report View* shows how your resources are deployed in your project, displaying:

- A list of all elements that have resources allocated to them, and the type of each element
- The resource allocated, and the role played by that resource
- The start and end dates of the allocation
- The time allocated, expected and expended
- The percentage completion of the allocation

You can tailor the displayed information by:

- Hiding columns of information
- Grouping types of information
- Filtering the data by status
- Filtering the data by start date or end date
- Filtering any column to show only a specific value

Having displayed the information you require, you can print it.

**Access** [Project | Project Gantt View > Report View](#)

#### Report View Options

Option	Action	See also
<b>Run the report</b>	Click on the first icon in the Report View toolbar (the rotating arrows). The report results display. If you have the report open for a while, you can update the information; either: <ul style="list-style-type: none"> <li>• Run the report again or</li> <li>• Right-click on the content and select the <b>Refresh</b> context menu option</li> </ul>	
<b>Adjust column headings</b>	Drag and drop column headings into the sequence you require. Right-click on the column headings and select the <b>Field Chooser</b> context menu option, to add or remove columns using the Field Chooser dialog.	
<b>Group entries by column heading</b>	Right-click on the column headings and select the <b>Enable Group Box</b> context menu option, to cluster the report information according to your preferred hierarchy of column headings.	<a href="#">List Header</a> 
<b>Filter columns</b>	Either: <ul style="list-style-type: none"> <li>• Click on the third toolbar icon from the <i>right</i> (the spy glass),</li> </ul>	

Option	Action	See also
	<p>or</p> <ul style="list-style-type: none"> <li>Right-click on the column headings and select the <b>Toggle Filter Bar</b> context menu option</li> </ul> <p>The filter field displays at the top of every column.</p> <p>Type in whatever text string you require in the appropriate column to filter the report to show only entries containing that text string in that column.</p>	
<b>Filter by degree of completion</b>	<p>In the first field in the toolbar, click on the drop-down arrow and select one of the following values:</p> <ul style="list-style-type: none"> <li><b>All</b> - Display all entries regardless of degree of completion</li> <li><b>Completed</b> - Display only those entries where the allocation is 100% completed</li> <li><b>Above cut-off</b> - Display only those entries that are more than a certain percentage complete</li> <li><b>Below cut-off</b> - Display only those entries that are less than a certain percentage complete</li> </ul> <p>In the second field in the toolbar, either type a threshold value or increment to the value using the up/down arrows, to set the percentage completion for the <b>Above/Below cut-off</b> options.</p>	
<b>Filter according to start/end date</b>	<p>Click on the fourth toolbar icon from the right (the funnel).</p> <p>The Resource Filters dialog displays.</p> <p>In the <b>Start Date</b> and/or <b>End Date</b> field, click on the drop-down arrow and select the appropriate qualifier:</p> <ul style="list-style-type: none"> <li><b>After</b></li> <li><b>Before</b></li> <li><b>Equal To</b></li> <li><b>Not Equals</b></li> </ul> <p>In the date fields, click on the checkbox to activate the fields and either type in the day, month and year or click on the drop-down arrow to select the date from a calendar.</p> <p>The fields have an AND relationship; an entry must satisfy both date criteria before it is displayed.</p>	
<b>Display the properties of the element to which the resource is assigned</b>	<p>Right-click on the entry and select the <b>Show Element Properties</b> context menu option.</p> <p>The Properties dialog for the element displays.</p>	<a href="#">Properties Dialog</a> <sup>[956]</sup>

Option	Action	See also
<b>Display the resource allocation details</b>	<p>Right-click on the entry and select the <b>Show Task Properties</b> context menu option.</p> <p>The Assigned Resources dialog displays.</p>	<p><a href="#">Resource Allocation</a><sup>[512]</sup></p> <p><a href="#">The Project Management Window</a><sup>[510]</sup></p>
<b>Display the Resource Allocation records for the element</b>	<p>Right-click on the entry and select either of the context menu options:</p> <ul style="list-style-type: none"> <li>• <b>Show Element Project Management Window</b> (if the window is closed or hidden)</li> <li>• <b>Find Task in Element Project Management Window</b> (if the window is visible but showing the details of another element)</li> </ul> <p>The Project Management window displays at the Resource Allocation tab, with the details of the selected entry shown in the fields and the other resource allocations for the element listed in the left-hand panel.</p> <p>You can edit the details and, if necessary, change the resource allocated to the element.</p>	<p><a href="#">Resource Allocation</a><sup>[512]</sup></p> <p><a href="#">The Project Management Window</a><sup>[510]</sup></p>
<b>Locate the element in the Project Browser</b>	<p>Right-click on the entry and select the <b>Find in Project Browser</b> context menu option.</p> <p>The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted.</p>	
<b>Print the report</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the second toolbar icon from the right (the printer) or</li> <li>• Right-click on an entry in the report and select the <b>Print</b> context menu option</li> </ul> <p>The Print dialog displays, on which you specify the printer to use and the characteristics of the print job.</p>

### 3.8.6 Spell Checking

Enterprise Architect provides a powerful spell checking facility. This operates at both project level and Package level.

#### Topics

Topic	Detail	See also
<b>Automatic Spell Checking</b>	The spell checker can be set to run automatically, so that it highlights possible errors in text as it is created or pasted in: <ul style="list-style-type: none"> <li>• Select <b>Tools   Options &gt; Objects</b></li> <li>• Deselect or select the <b>Disable spelling</b> checkbox</li> </ul>	
<b>Spelling Configuration</b>	You can configure what types of text error the spell checker should detect, using the Spelling Options dialog.	<a href="#">Select Spell Checker Options</a> [550]
<b>Using Languages Other Than English</b>	Enterprise Architect is supplied with dictionaries for US English, Canadian English and British English; you can download a set of dictionaries for other languages from the Sparx Systems website.	<a href="#">Use Languages Other Than English</a> [552]
<b>Using the Spell Checker</b>	You can run the spell checker manually on the whole model, or on a selected Package.	<a href="#">Using the Spell Checker</a> [553]
<b>Correcting Text</b>	As the spell check progresses, Enterprise Architect highlights any errors or unknown words; you have several options for responding to these potential spelling errors.	<a href="#">Correcting Words</a> [554]

#### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options

#### Learn more

- [List of Available Permissions](#) [329]

### 3.8.6.1 Select Spell Checker Options

You can configure the spell checker to ignore or detect specific types of text conformation. Ignoring the conformation means to skip over the text without identifying it as an error.

**Access** [Tools](#) | [Spelling Tools](#) | [Spelling Options](#)

#### Configure the spell checker

Option	Action	See also
<b>Ignore capitalized words</b>	Ignore any words beginning with a capital letter, such as <i>David</i> . You might enable this option if the text being checked contains many proper names.	
<b>Ignore all-caps words</b>	Ignore any words containing all capital letters, such as <i>RADAR</i> . You might enable this option if the text being checked contains many acronyms.	
<b>Ignore Words with Numbers</b>	Ignore any words containing embedded digits, such as <i>Win95</i> and <i>Q4</i> . You might enable this option if the text being checked contains many code words or other symbols containing digits.	
<b>Ignore Words with Mixed Case</b>	Ignore any words containing an unusual mixture of upper- and lower-case letters, such as <i>MicroHouse</i> and <i>CapsLock</i> . You might enable this option if the text being checked contains many variable names or other symbols that use changes in letter-case to distinguish words.	
<b>Ignore Domain Names</b>	Ignore any words that appear to be Internet domain names, such as <i>wintertree-software.com</i> .	
<b>Report Doubled Words</b>	Detect any word appearing twice in a row, such as <i>the the</i> .	
<b>Case Sensitive</b>	Distinguish between capitalized and non-capitalized words. For example, <i>canada</i> would be considered as different from <i>Canada</i> , and therefore reported as a misspelling. When the option is <b>disabled</b> , <i>canada</i> and <i>Canada</i> are considered to be identical. Note that the performance of the spell checker is reduced if this option is disabled.	
<b>Phonetic</b>	Suggest alternative words based on phonetic (sounds-like)	

Option	Action	See also
<b>Suggestions</b>	<p>similarity to the misspelled word; this option tends to improve the correction of badly misspelled words.</p> <p>Enabling this option increases the time required to locate suggestions.</p> <p>Note that either this option or the <b>Typographical Suggestions</b> option must be enabled in order to list suggestions of alternative words.</p>	
<b>Typographical Suggestions</b>	<p>Suggest alternative words based on typographical (looks-like) similarity to the misspelled word. This option is appropriate for people who are generally good spellers.</p> <p>Note that either this option or the <b>Phonetic Suggestions</b> option must be enabled in order to list suggestions of alternative words.</p>	
<b>Suggest Split Words</b>	<p>Suggest two separate words as a replacement for a misspelling containing two joined words.</p> <p>For example, <i>is the</i> would be suggested as a replacement for <i>isthe</i>.</p>	
<b>Auto Correct</b>	<p>Automatically change words marked with <i>Auto Change</i> actions to their specified replacements.</p> <p>When this option is <b>disabled</b>, a confirmation prompt displays before the words are changed.</p>	
<b>Main Dictionary Language</b>	<p>Set the language of the main dictionary used to check spelling; the drop-down list shows only languages for which dictionaries are installed on your system.</p> <p>To check spelling in a different language, select the language in the list.</p>	<a href="#">Use Languages Other Than English</a> <sup>[552]</sup>
<b>Suggestions</b>	<p>Determine the speed and accuracy of the initial automatic search for suggested replacements for misspelled words.</p> <p>Click on the appropriate radio button for your choice.</p>	
<b>OK</b>	Close the <b>Options</b> dialog, and save any changes made to the option settings.	
<b>Cancel</b>	Close the <b>Options</b> dialog, and discard any changes made to the option settings.	

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any

spell check or change any spell check options

#### Learn more

- [List of Available Permissions](#) <sup>[329]</sup>

### 3.8.6.2 Use Languages Other Than English

Enterprise Architect is supplied with three dictionaries, for US English, Canadian English and British English. Additional dictionaries are available as a pack, for download from the registered pages of the Sparx Systems website.

The dictionaries in this downloadable file enable spell checking in the following languages:

- Brazilian
- Danish
- Dutch
- Finnish
- French (Continental)
- German
- Italian
- Norwegian
- Portuguese
- Spanish and
- Swedish

#### Download the additional language dictionary pack

Step	Action	See also
1	Access the registered user page on the Sparx Systems web site.	<a href="#">Registered User page</a>
2	At the end of the page, download the <i>EADict.zip</i> file from the Enterprise Architect Dictionary section.	
3	Unzip the file into the Enterprise Architect install directory - <i>C:\Program Files\Sparx Systems\EA</i> .  This makes the non-English spelling dictionaries available to the Enterprise Architect spell checker.	<a href="#">Select Spell Checker Options</a> <sup>[550]</sup>

#### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options

- Enterprise Architect .EAP files default to use Jet 3.5 as the database engine; this does not support unicode character sets, which makes the use of certain languages - such as Polish - difficult, including spell checking words in those languages

If you use such languages, it is recommended that you either upsize to a DBMS repository or set **JET 4.0** as the database engine

If your .EAP project is not in a Jet 4.0 database, you should also download a copy of the Jet 4.0 EABase model from the Sparx Systems website, and do an **EAP to EAP** transfer of your model into the Jet 4.0 file

#### Learn more

- [Server Based Repositories](#) <sup>[214]</sup>
- [General Options](#) <sup>[605]</sup>

### 3.8.6.3 Using the Spell Checker

Enterprise Architect has an inbuilt spell checker, which you can configure to detect a range of types of possible spelling error in your project, and to use one of several language dictionaries other than English.

**Access** **Tools | Spelling Tools | Spell Check Project**  
**Tools | Spelling Tools | Spell Check Current Package**

#### Run the spell checker

Step	Action	See also
1	Select the <b>Spell Check Project</b> or <b>Spell Check Current Package</b> menu option, as required.  The Spell Check dialog displays.	
2	( <b>Spell Check Project</b> option.) Select the checkbox against each of the items to spell check within your model.	
3	Click on the <b>Start</b> button to begin the spell check.  As the spell check proceeds, the text being checked displays in the text panel at the bottom of the screen; if an error is detected, the Check Spelling dialog displays, offering several options to correct the error.	<a href="#">Correcting Words</a> <sup>[554]</sup>

#### Notes

- You can use the **Spell Check Project** menu option to check spelling for the entire project
- The **Spell Check Current Package** option only checks the Package currently open, and you cannot

select items to check

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options

#### Learn more

- [List of Permissions](#)

### 3.8.6.3.1 *Correcting Words*

As a spell check progresses, Enterprise Architect highlights any errors or unknown words in the Check Spelling dialog. The inbuilt spell check stores user-defined words in the user dictionary (%APPDATA%\Sparx Systems\EALuserdic.tlx). During the spell check process, if you add a word, it is written into this file for later reference. While the spell check is in progress you can:

- Correct the spelling of a word
- Ignore the error
- Add the word to the user dictionary
- Suggest alternatives or
- Otherwise assist in the spelling correction process

#### Correct spelling

As the Spell Checker identifies possibly mis-spelled words, make the appropriate response:

Action	See also
<ul style="list-style-type: none"> <li>• Modify the spelling by hand and click on the <b>Change</b> or <b>Change All</b> button to change the word to that spelling</li> <li>• Click on a suggested alternative and click on the <b>Change</b> or <b>Change All</b> button to change the word to that spelling</li> <li>• Click on the <b>Ignore</b> or <b>Ignore All</b> button to exclude the word from the spell check</li> <li>• Click on the <b>Add</b> button to add the word to the user dictionary</li> <li>• Click on the <b>Suggest</b> button to list alternative spellings or words</li> <li>• Click on the <b>Cancel</b> button to abort the spell check entirely</li> </ul>	

### 3.8.7 *Personal Tasks*

Using the Personal Tasks view, you can record and manage your personal work within the project. This view displays information based upon your identity as a defined Author on the project.

Access **View | Personal Tasks**

#### Topics

Topic	Detail	See also
<b>Allocated Work</b>	Presents a Gantt chart on which you record the work that you are currently engaged in.	<a href="#">Review Allocated Work</a> <sup>[555]</sup>
<b>Project Tasks</b>	Enables you to monitor and maintain the work tasks that have been assigned to you, or that you have created yourself.	<a href="#">Monitor Your Tasks</a> <sup>[559]</sup>
<b>Workflow</b>	Enables you to list and run model searches defined by Workflow scripts.	<a href="#">Monitor Workflow</a> <sup>[560]</sup>
<b>Working Sets</b>	Enables you to capture your current work area (diagrams and facilities currently open) as a working set for subsequent re-use.	<a href="#">Working Sets</a> <sup>[561]</sup>

#### Learn more

- [The Gantt View](#) <sup>[594]</sup>

### 3.8.7.1 Review Allocated Work

The Allocated Work tab lists the elements to which *your* model Author ID has been allocated as a resource, where your Author ID is the same as:

- Your Enterprise Architect security user ID, if security has been enabled, or
- Your workstation login ID if security has not been enabled

For each element, the tab:

- In the left-hand panel lists the roles or tasks assigned to you as a resource on that element, for which the **Complete %** field value is less than **100**
- In the right hand panel displays a Gantt chart showing your progress in performing each role or task

You can add further work items for an element through the Allocated Work tab; however, you cannot delete any records. A record is no longer listed when the **Complete %** field value is **100**.

You or your supervisors can also add records through the Resource Allocation tab of the Project Management window.

**Access** [View | Personal Tasks > Allocated Work](#)

#### Select Allocated Work options

Option	Action	See also
<b>Review element properties</b>	Double-click on the element name. (Alternatively, right-click on the element name and select the <b>Show Element Properties</b> context menu option.)	<a href="#">Properties Dialog</a> <sup>[956]</sup>

Option	Action	See also
	The Properties dialog for the element displays; review the pages as required.	
<b>Review resource task details</b>	<p>Double-click on the task item.</p> <p>(Alternatively, either:</p> <ul style="list-style-type: none"> <li>• Double-click on the progress bar for the item on the Gantt chart, or</li> <li>• Right-click on the task or role name and select the <b>Show Task Properties</b> context menu option)</li> </ul> <p>The Assigned Resources dialog displays, which has the same content, format and functions as the Resource Allocation tab of the Project Manager window, in Item mode.</p> <p>Should it be necessary to reassign the item to another resource, click on the drop-down arrow on the <b>Resource</b> field and select the appropriate Author ID; when you save the changes, the item no longer appears in the list of tasks assigned to you.</p>	<p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">The Project Management Window</a> <sup>[510]</sup></p>
<b>Create new task item</b>	<p>Right-click on the element name and select the <b>Add Resource</b> context menu option.</p> <p>The Assigned Resources dialog displays, with your Author ID in the grayed-out <b>Resource</b> field.</p> <p>Complete the dialog as for the Resource Allocation tab of the Project Manager window.</p>	<p><a href="#">Resource Allocation</a> <sup>[512]</sup></p>
<b>Refresh display to incorporate changes</b>	<p>Your work item can be edited in a number of places in Enterprise Architect, such as the Project Task Allocation window and the Resource Allocation tab; the element to which it is assigned can be edited in these and many other areas.</p> <p>To refresh the display with any changes made elsewhere, right-click on the display and select the <b>Refresh</b> context menu option.</p>	<p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">Project Task Allocation</a> <sup>[538]</sup></p> <p><a href="#">Properties Dialog</a> <sup>[956]</sup></p>
<b>Display the Resource Allocation records for the element</b>	<p>Right-click on the entry and select either of the context menu options:</p> <ul style="list-style-type: none"> <li>• <b>Show Element Project Management Window</b> (if the window is closed or hidden)</li> <li>• <b>Find Task in Element Project Management Window</b> (if the window is visible but showing the details of another element)</li> </ul> <p>The Project Management window displays at the Resource Allocation tab, with the details of the selected entry shown in the fields and the other resource allocations for the element listed in the left-hand panel.</p> <p>You can edit the details and, if necessary, change the resource allocated to the element.</p>	<p><a href="#">The Project Management Window</a> <sup>[510]</sup></p> <p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">Assign Multiple Resources</a> <sup>[515]</sup></p>

Option	Action	See also
<b>Display tasks for today only, or for another day only</b>	<p>Right-click on the display and select the option:</p> <ul style="list-style-type: none"> <li>• <b>Show only Active tasks for today</b> - to show only tasks that are in progress today</li> <li>• <b>Show only Active tasks for another day</b> - to show only tasks that were in progress on a specific day in the past, or that are scheduled to be in progress on a day in the future; a calendar dialog displays from which you select the day to examine</li> </ul>	
<b>Filter the display by Start or Completion date</b>	<p>The display default is to show current tasks for which the end date has not yet occurred. Right-click on the list and select one of the context menu options:</p> <ul style="list-style-type: none"> <li>• <b>Include Completed Tasks Within the Last...</b> - to display incomplete tasks <b>and</b> tasks completed only within the last period; you can set this period to <b>7</b>, <b>30</b>, or <b>90</b> days, or you can include <b>all</b> completed tasks, or <b>hide</b> all completed tasks</li> <li>• <b>Include Future Tasks Starting in...</b> - to display current incomplete tasks and completed tasks (depending on the setting of the option above) <b>and future</b> tasks that have been recorded and are due to start within the next period; you can set this period to <b>7</b>, <b>30</b> or <b>90</b> days, or you can show <b>all</b> tasks that have been recorded but are not yet due to start</li> </ul>	
<b>Identify overdue tasks amongst the items</b>	<p>Right-click on the display and select the <b>Display Highlight For Overdue items</b> option and one of its sub-options:</p> <ul style="list-style-type: none"> <li>• <b>Show in Red</b> - to display the uncompleted percentage of the task bars for overdue items on the Gantt chart in red</li> <li>• <b>Show in Red to Current Date</b> - to extend the task bars of the overdue items to today's date, and display them in red</li> <li>• <b>None</b> - to cancel any overdue item highlighting that has been set</li> </ul>	
<b>Display ONLY overdue tasks</b>	<p>Right-click on the display and select the <b>Show Overdue Items Only</b> option.</p> <p>The display shows only those items for which the end date has passed but that are not 100% complete. These items do not have red highlighting.</p>	
<b>Locate the element in the Project Browser</b>	<p>Right-click on either the element or the work item and select the <b>Find in Project Browser</b> context menu option.</p> <p>The appropriate package hierarchy expands in the Project Browser, and the selected element is highlighted.</p>	
<b>Reposition the Gantt chart to automatically show the end date of a selected</b>	<p>Right-click on the display and select the <b>Go to   Auto Sync with Task End Date</b> option.</p> <p>Whilst this option is selected (with a tick next to it), whenever you click on an allocation in the Allocated Work tab the display adjusts to show the end date of the task in the center of the chart.</p>	

Option	Action	See also
<b>allocation</b>		
<b>Expose hidden sections of the work item progress</b>	<p>Some items might cover a long period of time, and you might not be able to display the complete progress line for the item in the Gantt chart.</p> <p>To locate the start point, expected end point, or today's date on the progress line for an item, right-click on either the item or the progress line and select the appropriate context menu option:</p> <ul style="list-style-type: none"> <li>• <b>Go To   Task Start Date</b></li> <li>• <b>Go To   Task End Date</b></li> <li>• <b>Go To   Today's Date</b></li> </ul> <p>The Gantt chart shifts left or right to position the required point in the center of the display.</p>	
<b>Execute Scripts</b>	<p>If scripts have been defined for analyzing the task data, click on the <b>Scripts</b> option to display the list of script names. Click on the appropriate name to execute the script on the selected item or items.</p>	
<b>Filter the work items</b>	<p>You can refine the list of work items to show only those containing text that matches the filter item.</p> <p>Right-click on the tab and select the <b>Show Filter Bar</b> context menu option.</p> <p>The filter bar displays at the top of the panel; type in the filter text.</p> <p>As you type, the items listed and the Gantt chart are filtered to show only items where the item names match the text string.</p> <p>The filter does not operate on the element names.</p> <p>If you do not want to use the filter, right-click on the tab and select the <b>Hide Filter Bar</b> context menu option.</p>	
<b>Capture an image of the Allocated Work data as a graphics file</b>	<p>Right-click on the tab and select the <b>Save Image to File</b> context menu option.</p> <p>The Save As Image dialog displays, on which you specify the file name, location and graphics file type to save to.</p>	
<b>Copy an image of the Allocated Work data to the clipboard</b>	<p>Right-click on the tab and select the <b>Copy Image to Clipboard</b> context menu option.</p> <p>You can paste the image from the clipboard into your preferred graphics package.</p>

### 3.8.7.2 Monitor Your Tasks

The Project Tasks tab lists the tasks that you either:

- Own, or
- Are assigned to

These tasks can be created through the:

- Project Tasks tab itself
- Tasks tab of the Project Status window
- Project Tasks view of the Resource Calendar

**Access**   **View | Personal Tasks > Project Tasks**

#### Use to

- Review the status and progress of tasks that you are responsible for
- Create new tasks
- Update existing tasks
- Delete tasks
- Modify and filter the display of task information

#### Make selections from the options

Option	Action	See also
<b>Add or Modify a task</b>	You add or modify a task through the Task Detail dialog, which displays when you double-click on an entry (edit) or blank line (create).	<a href="#">Add, Modify and Delete Tasks</a> <sup>[527]</sup>
<b>Delete a task</b>	Right-click on the message and select the <b>Delete</b> context menu option.  You are prompted to confirm the deletion.	
<b>Select columns</b>	Right-click on the column headings and select the <b>Field Chooser</b> menu option, which enables you to add or remove specific columns from the display.  You can also click on the column headings and drag them across the header bar to reposition the columns in a different sequence.	<a href="#">List Header</a> <sup>[677]</sup>
<b>Reorganize tasks in the list</b>	Either: <ul style="list-style-type: none"> <li>• Click on the column heading and click on the arrow head to list items in order or reverse order, or</li> </ul>	<a href="#">List Header</a> <sup>[677]</sup>

Option	Action	See also
	<ul style="list-style-type: none"> <li>Right-click on the column headings and select the <b>Enable Group Box</b> option to organize the messages into groups</li> </ul> <p>You can also use the filter bar to filter the display on an appropriate column value, such as the value <b>New</b> in the <b>Status</b> column; to display or hide the filter bar, right-click on the column headings and select the <b>Toggle Filter Bar</b> context menu option.</p>	
<b>Set persistent Status filter</b>	<p>Right click on the tab and select the <b>Set term filter</b> context menu option.</p> <p>The Filter by Status dialog displays, which enables you to select to list tasks of any status or only of one specific status.</p> <p>The filter you set persists when you close the Personal Tasks window or exit from Enterprise Architect.</p>	
<b>Print the task list</b>	<p>Right click on the tab and select the <b>Print List</b> context menu option.</p> <p>The Print dialog displays, on which you specify the local printer and the print characteristics.</p>

### 3.8.7.3 Monitor Workflow

The Workflow tab lists all of the workflow-related searches that have been defined for you. You can select and execute any of the searches listed within this tab.

**Access** **View | Personal Tasks > Workflow**

On the Workflow tab, double-click on the required script to execute it.

#### Notes

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

#### Learn more

- [Workflow Scripts](#)<sup>[36]</sup>

### 3.8.7.4 Working Sets

As you perform work on your model, you open various windows, diagrams and views, and you will probably need to return to these same views in a later work session. At the end of your work session, you can capture your current work environment as a **working set**, which you use to return to that exact environment later, either when you choose to or by having the system automatically recreate it when you next log on to Enterprise Architect. You can also create a working set as an empty definition to which you add specific windows, diagrams and views, from either the **Working Sets tab** or from a **Working Set Artifact element**.

You can use the working set to pick up your work from where you left off, or as a set of 'home pages' to start from each day. You can also open multiple working sets, which combines the views from each set. This can be useful to check the progression between different stages in a piece of work.

A working set is initially a personal list, not visible to or active for any other user. You can convert it into a global set to share with other users of your model; for example, if a working set shows a cross-section of an aspect of the model you want to demonstrate or have reviewed.

**Access** [View | Personal Tasks > Working Sets](#)

#### Manage working sets

Option	Action	See also
<b>Create a working set from open diagrams or files</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the first icon in the toolbar, or</li> <li>Right-click on the body of the tab and select the <b>Create Working Set</b> context menu option, or</li> <li>Right-click on the body of the tab and select the <b>Create Working Set From</b> context menu option, and either the <b>Open Diagrams</b> or <b>Open Files</b> sub-option as appropriate</li> </ul> <p>The Create Working Set dialog displays, listing the diagrams and views that are currently open, in the order in which they were opened. If you wish, you can change the order using the 'hand' buttons at the bottom of the dialog.</p> <p>Select the checkbox against each item that you want to retain in the working set, or click on the <b>Include All</b> button. If you selected the <b>Create Working Set From</b> option, the checkboxes against the open diagrams or the open files are already selected.</p> <p>In the <b>Name</b> field, type a name for the working set.</p> <p>You can either:</p> <ul style="list-style-type: none"> <li>Immediately click on the <b>OK</b> button to create the working set from the selected items, or</li> <li>Add other selections as described for <i>Create a new working set</i> (below)</li> </ul>	
<b>Create a new working set</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the first icon in the toolbar, or</li> <li>Right-click on the body of the tab and select the <b>Create Working Set</b> context menu option, or</li> </ul>	

Option	Action	See also
	<ul style="list-style-type: none"> <li>Switch to an open diagram, drag a <b>Working Set</b> icon from the Artifacts page of the Diagram Toolbox onto the diagram, right-click on the new Working Set Artifact element and select the <b>Edit Working Set</b> option</li> </ul> <p>The Create Working Set dialog displays.</p> <p>In the <b>Name</b> field, type a name for the working set.</p> <p>To add a diagram or view, click on the <b>Add Other</b> button and select an option from the list:</p> <ul style="list-style-type: none"> <li><b>Add Diagram</b></li> <li><b>Add Matrix Profile</b></li> <li><b>Add Search</b></li> <li><b>Add Team Review</b></li> <li><b>Add Document Template</b></li> <li><b>Add Resource Document</b></li> </ul> <p>You are prompted to select the required diagram, profile, search, Team Review topic, document report template or Resource document name(s); each view is then added to the list with its checkbox selected.</p> <p>Click on the <b>Add Other</b> button again, to select the next item.</p> <p>When you have all the diagrams and views you need, click on the <b>OK</b> button to create the working set.</p>	<a href="#">Artifact</a> <sup>[1358]</sup>
<b>Open an existing working set</b>	<p>A Working Set created on the Working Sets tab is indicated by this icon .</p> <p>A Working Set created as an Artifact element is indicated in the list by this icon .</p> <p>Click on a working set name and either:</p> <ul style="list-style-type: none"> <li>Select the third icon in the toolbar or</li> <li>Right-click and select the <b>Open Working Set</b> context menu option</li> </ul> <p>Enterprise Architect opens all the diagrams and views listed in that set.</p> <p>If you already have a working set open, the 'new' set of views is <b>added</b> to the original set, with the last-listed diagram or view on top and in focus.</p> <p>You open one Model Search, Matrix profile or Team Review at a time; therefore, the last-opened Search, profile or Team Review replaces the previous instances.</p>	
<b>Automatically apply a working set when the</b>	Right-click on the working set name and select the <b>Apply when model opens</b> context menu option.	

Option	Action	See also
<b>model is opened</b>	<p>This option is a toggle that turns the same option off for the previous working set on which it was selected.</p> <p>The folder turns green, indicating that the option is 'on' for this working set.</p> <p>When you close the model and subsequently open it, the diagrams and views in the working set are automatically opened.</p>	
<b>Share a working set</b>	<p>Right-click on the working set name and select the <b>Share Working Set</b> context menu option.</p> <p>The folder icon on the left of the working set name in the list now contains an icon depicting the globe, and the working set is available in the Working Sets tab of every other user of the model.</p> <p>This setting is not reversible; to make the global list into a personal list, make a copy of it (see below).</p>	
<b>Add an open view or diagram to a working set</b>	<p>If, in your work, you open a diagram or view that you decide to add to a working set:</p> <p>Click on the Working Sets tab, right-click on the required set name and select the <b>Add Active View</b> context menu option.</p> <p>The open view is added to the working set.</p>	
<b>Duplicate a working set</b>	<p>If you want to use a variation of a working set without losing the original, you can create a copy and amend that copy as required.</p> <p>Right-click on the source working set and select the <b>Copy as New</b> context menu option.</p> <p>The Create Working Set dialog displays.</p> <p>In the <b>Name</b> field, type a name for the working set.</p> <p>Each of the listed diagrams and views is already selected; make any changes you require, and click on the <b>OK</b> button to save the list as a new working set.</p>	
<b>Edit a working set</b>	<p>To change the diagrams and views in a working set, or change the set name, click on the set name and either:</p> <ul style="list-style-type: none"> <li>Click on the second icon in the toolbar or</li> <li>Right-click and select the <b>Edit</b> context menu option</li> </ul> <p>The Create Working Set dialog displays.</p> <p>Make any changes you require, and click on the <b>OK</b> button to save the changes.</p>	
<b>Delete a working set, or a view in working set</b>	<p>Expand the working set and select a specific item (to remove that item) or the set name (to move the whole set)</p> <p>Either:</p>	

Option	Action	See also
	<ul style="list-style-type: none"> <li>Click on the fifth icon in the toolbar or</li> <li>Right-click on the set and select the <b>Delete Working Set Item</b> context menu option</li> </ul> <p>A prompt displays to confirm the deletion; click on the <b>Yes</b> button.</p> <p>The item or set is removed.</p> <p>If you delete a working set that you have opened, the diagrams and views from that set remain open until you specifically close each one or close Enterprise Architect.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>When you create a Working Set on a diagram, using the icon from the Common page of the Diagram Toolbar, the Working Set persists in the Personal Tasks view if you delete the element from the <b>diagram</b>, but <b>not</b> if you delete the element from the <b>Project Browser/model</b></li> </ul>	
<b>Save floating window layout in working set</b>	<p>If any of the selected diagrams or views in your working set are floating windows, the Create Working Set or Edit Working Set dialog includes the item <b>Save Workspace Layout</b>.</p> <p>Select this checkbox; the working set captures the complete current workspace layout, including the locations of the floating or docked views.</p> <p>Next time you load the working set, the captured workspace layout is reapplied.</p>	<a href="#">Window Menu</a> [121]  <a href="#">Manage Workspace Layout</a> [163]
<b>Track working set/views last opened</b>	<p>You might use several working sets in a work session, and close some views and open others.</p> <p>To capture the diagrams and views you actually have open when you close down Enterprise Architect, right click on the body of the tab and select the <b>Store Main Tab View History</b> context menu option. A new, empty working set folder displays at the top of the list - <i>Windows open when Model was last closed</i>.</p> <p>When you reopen the model in a new work session, this new folder is automatically populated with a list of the diagrams and views that were open when you last closed the model; this is a read-only set that cannot be edited.</p> <p>You can expand the set and double-click on specific windows to re-open them, or right-click on the set and use the <b>Open Working Set</b> option to reopen all the diagrams and views you had open before.</p> <p>However, it is recommended that you use the <b>Apply when model opens</b> context menu option on the set; thereafter, whenever you open the model, all the diagrams and views you had open when you closed the model are automatically re-opened.</p>	
<b>Locate a diagram from the working set</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Right-click on the diagram name and select the <b>Find in Project Browser</b> context menu option, or</li> </ul>	

Option	Action	See also
<b>in the Project Browser</b>	<ul style="list-style-type: none"> <li>Click on the diagram name and click on the <b>Locate in Project Browser</b> toolbar icon ()</li> </ul> <p>The section of the Project Browser containing the diagram is expanded, and the diagram name is highlighted.</p>	
<b>Locate a Working Set Artifact element in the model</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Right-click on the element name and select the <b>Find in Project Browser</b> context menu option, or</li> <li>Click on the element name and click on the <b>Locate in Project Browser</b> toolbar icon ()</li> </ul> <p>The section of the Project Browser containing the element is expanded, and the element name is highlighted.</p>

### 3.8.8 Model Mail

The **Model Mail** tab shows all emails that you have received from project team members within the project, under your User Security ID. You can open and respond to these emails and create new ones.

The **Sent Items** tab shows all the emails you have sent to project team members under your User Security ID. You can forward these emails and make further responses (see the final table in this topic).

This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, with User Security enabled; the mail system uses the individual and group users defined in User Security.

**Access** [View | Model Mail](#)

#### Use to

- Read messages from other project team members
- Read and respond to messages sent to you as a member of a group that has a shared mail inbox
- Organize and sort both sent and received messages
- Create new messages, and reply to and forward received messages
- Delete messages from your Inbox and Sent Items mailboxes

#### Review your Model Mail messages

Field/Option/ Button	Action	See also
<b>Open a message</b>	Double-click on the message.  If the message contains a hyperlink, click on the link to open or display the target file or object.	
<b>Flag</b>	Check the flag color to establish the significance of the message (the meanings of the flag colors should be defined within the project team).	
<b>Status</b>	Check for the read or unread icon; unread message items are anyway displayed in bold.	
<b>Sender</b>	The name of the project team member who sent the message.	
<b>Subject</b>	The topic of the message.	
<b>Date</b>	Indicates the age of the message, whether it was sent: <ul style="list-style-type: none"> <li>• Today</li> <li>• Yesterday</li> <li>• This week</li> <li>• This Month</li> <li>• Last Month</li> <li>• Older</li> </ul>	
<b>Sent</b>	The exact date and time the message was sent.	
<b>Select Columns</b>	<p>Right-click on the column headings and select the <b>Field Chooser</b> menu option, which enables you to add or remove specific columns from the display.</p> <p>You can also click on the column headings and drag them across the header bar to reposition the columns in a different sequence.</p> <p>Adding the <b>To</b> column will display the user account or group name that this mail item was sent to; this column is useful to identify whether the message was sent to you as an individual or as a member of a <b>Group</b> with a <b>Shared Mail</b> inbox - if you received the message as a member of a shared mail group, remember that your actions on this message will also affect all other members of this group.</p>	<a href="#">List Header</a> [677]
<b>Filter Columns</b>	<p>You can filter the mail items listed by displaying the Filter Bar (right-click on the column headings and select the <b>Toggle Filter Bar</b> option) and typing in the value (or partial value) to filter on.</p> <p>For example, if you type your group mail account name in the filter field for the <b>To</b> column, you will list only those mail items sent to the group</p>	<a href="#">Maintain Groups</a> [320]

Field/Option/ Button	Action	See also
	<p>mail address, not those sent to you as an individual.</p> <p>To clear the value of a filter field, click on the blue cross against that field.</p>	
<b>Reorganize messages in the list</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on a column heading to toggle sorting of list items by this column in ascending or descending order, or</li> <li>Right-click on the column heading and select the <b>Enable Group Box</b> option to organize the messages into groups</li> </ul>

### 3.8.8.1 Create a Message

The **Model Message** dialog enables you to compose messages to project team members within the project, under your Author ID.

Access **View | Model Mail**

#### Use to

- Create messages to other project team members
- Reply to messages from other team members
- Forward messages to other team members
- Link model components to the message, or add hyperlinks to files or other objects of relevance

#### How to

To create a message to another project team member as a new message, a reply to a message, or a forwarded message

Step	Action	See also
<b>1</b>	If your message or response concerns a diagram or model object, you could click on that object in the Project Browser now so that it is immediately available to be linked to your message.	
<b>2</b>	Select the appropriate toolbar icon, context menu option or message button to create, reply to or forward a message. The <b>Model Message</b> dialog displays.	<a href="#">Model Mail</a> <sup>565</sup>
<b>3</b>	If you are creating or forwarding a message, or you want to send a reply to a wider audience, for <i>each</i> person you intend to send the message to: <ul style="list-style-type: none"> <li>• Click on the <b>To:</b> button</li> </ul>	

Step	Action	See also
	<p>A list of project team member and group IDs displays</p> <ul style="list-style-type: none"> <li>• Scroll to the required name and double-click on it The name is added to the <b>To:</b> field</li> </ul>	
4	In the <b>Subject</b> field, type or edit the subject of the message as necessary.	
5	In the <b>Flag</b> field click on the drop-down arrow and on the appropriate flag color or option for your message.	
6	<p>In the text panel, write the text of your message.</p> <p>You can format the text using the facilities of the Notes toolbar at the top of the field.</p>	<a href="#">Notes Toolbar</a> 
7	<p>If you intend to link a diagram or model object to this message, place the cursor at the appropriate position in your message text and click on the <b>Insert Quick Link</b> button.</p> <p>Select the object you highlighted in Step 1; a hyperlink to that object is inserted in the message text.</p>	
8	<p>If you did not select a model object and now intend to link to one, or you want to link to another target such as a file, Model Search or Team Review message, click on either:</p> <ul style="list-style-type: none"> <li>• The <b>Hyperlink</b> icon in the toolbar or</li> <li>• The <b>Insert Quick Link</b> button and select the <b>Other</b> option</li> </ul> <p>The Hyperlink Details dialog displays; create the required link.</p>	<a href="#">Hyperlinks</a> 
9	Click on the <b>Send</b> button to send the message to the recipients.	

### Notes

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, with User Security enabled

## 3.8.9 Project Calendar

The Project Calendar provides a project management overview in calendar format of the deployment of resources, timeframes for tasks, and upcoming project events such as meetings and milestones. The calendar displays in the Diagram View workspace, consisting of a:

- Calendar panel, displaying months of the year
- Diary panel sectioned into days or weeks
- Toolbar at the top of the window, which enables you to define what information is displayed and how it is formatted

**Access** **Project | Calendar**

Screen area	Description	See also
<b>Calendar Panel</b>	<p>The calendar panel, when viewed normally on the screen, displays a calendar of six months that by default includes the current month.</p> <p>By closing or reducing other panels on the screen, and depending on the size of your screen, you can show the months for a period of up to 3 years and six months.</p> <p>You can review data for up to several decades into the past, if such data has been recorded, and plan ahead for up to several decades into the future; to display future or past months, either:</p> <ul style="list-style-type: none"> <li>Click on the arrows in the names of the months on the left and right of the top row of months, or</li> <li>Click and hold the mouse on the name of a month so that a list of months and years displays, then move the mouse forwards to scroll up the list or backwards to scroll down the list; when you reach the required month, ensure that it is highlighted and release the mouse button</li> </ul> <p>On the calendar, today's date has a red border; if you have scrolled the calendar so that today's date is not shown, click on the second icon in the toolbar () to position the current month in the top left of the calendar with today's date highlighted.</p>	
<b>Diary Panel</b>	<p>The diary panel displays a set of day fields, each of which can contain one or more markers for an event or task.</p> <p>The content of the display is determined by the selections you make in the toolbar, and principally by the object type you select from the first drop-down field:</p> <ul style="list-style-type: none"> <li>Project Calendar</li> <li>Allocated Resources</li> <li>Project Tasks</li> </ul> <p>The structure of the display depends on the period you want to review, specified using the icons on the toolbar:</p> <ul style="list-style-type: none"> <li>1 day (Project Calendar only)</li> <li>5 days (Mon - Fri) (Project Calendar only)</li> <li>7 days (Mon - Sun)</li> <li>31 days</li> </ul> <p>However, in the Calendar panel you can highlight specific periods of between 1 and 7 days (Project Calendar only) and 14, 21, 28, 35 and 42 days, to display just those periods in the Diary panel.</p> <p>If you select a period of between 1 and 7 days, each day is divided into one hour time intervals; you can adjust the time intervals for these periods, using the toolbar (see below).</p>	<a href="#">Calendar</a> <sup>[574]</sup> <a href="#">Allocated Resources</a> <sup>[578]</sup> <a href="#">Project Tasks</a> <sup>[526]</sup>

Screen area	Description	See also
	<p>For the current day, the current time is also highlighted.</p> <p>Also, if you click on today's date in the Calendar panel the Diary panel changes to show the shortest period (7 days or 1 day) for the object type, again with adjustable time intervals for the times of day.</p> <p>For displays of 7 or more days, you can scroll up or down to display the information for earlier or later dates; if you scroll away from today's date, you can return to it by right-clicking anywhere on the display and selecting the <b>Show Today</b> context menu option (not Project Calendar).</p>	
<b>Toolbar</b>	<p>The toolbar options modify what is displayed on the Diary panel, and enable you to add certain kinds of information.</p> <p>The icons and fields in the toolbar, from left to right, have the following functions:</p> <ul style="list-style-type: none"> <li>• <b>Add New &lt;object&gt;</b> - enables you to create a new record for an event or task</li> <li>• <b>Assign Resource</b> - for Allocated Resources, enables you to assign a new resource to the task</li> <li>• <b>Show Today</b> - re-focuses the Diary panel and Calendar panel on today's date, for any object type</li> <li>• <b>1, 5, 7, 31</b> - sets the number of days displayed in the Diary panel</li> <li>• First drop-down - identifies the type of information to display: Calendar events, allocated Resources, or Tasks</li> <li>• Second drop-down - identifies the type or characteristic of object to filter for (and depends on the value selected in the first field)</li> <li>• Third drop-down - for Allocated Resources, identifies the element type to filter for</li> <li>• Options: <ul style="list-style-type: none"> <li>• <b>Configure Event Subtypes</b> - Displays the Configure Subtype dialog, which you use to define categories of event to record on the Calendar</li> <li>• <b>Time Scale</b> - where the display includes times of day, enables you to reset the time interval</li> <li>• <b>Show End Time</b> - for the Project Calendar, where the times of day are NOT shown and an event occurs within one day, this shows or hides the time at which the event finishes (the start time displays automatically)</li> <li>• <b>Show Time As Clocks</b> - toggle between showing start and end times in digital format and as a clock face</li> <li>• <b>Compress Weekend Days</b> - in 31-day format, toggle between showing Saturday and Sunday as separate fields and a pair of half-fields</li> <li>• <b>Show ToolTips</b> - toggle between showing and hiding mouse roll-over tooltips</li> </ul> </li> </ul>	<a href="#">Configure Event Subtypes</a> <sup>577</sup>

**Notes**

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them

### 3.8.9.1 Calendar

**Project Calendar** is a display mode of the project Calendar facility. In Project Calendar mode, the Diary panel shows the selected period of time (see the *Project Calendar* topic) containing flags for each *event* that takes place in or through that period. These events can be, for example, meetings, staff absences or commitments, product releases or public holidays.

You can customize the range of events that you record, using the Configure Subtype dialog.

Access **Project | Calendar > Project Calendar**

#### Record an event in the Project Calendar

Step	Action	See also
1	Double click on the required day, or the first day in a longer period. The Project Event dialog displays.	
2	In the <b>Subject</b> field, type the name of the event.	
3	If the event is to take place at a specific place, in the <b>Location</b> field type the name of the place or room.	
4	In the <b>Category</b> field, click on the drop-down arrow and select the appropriate categorization: <ul style="list-style-type: none"> <li>• <b>Event</b> (such as an external trade show, or internal presentation)</li> <li>• <b>Meeting</b> (whether internal or external)</li> <li>• <b>Milestone/Objective</b> (such as a product test or release)</li> <li>• <b>People</b> (an absence or commitment of a specific staff member)</li> </ul>	
5	If the event is likely to occupy one complete day, select the <b>All day event</b> checkbox; this: <ul style="list-style-type: none"> <li>• Places the event icon at the top of the day field in the Diary, above any time sections</li> <li>• Hides the time sections of the <b>Start time</b> and <b>End time</b> fields</li> </ul>	
6	In the <b>Start time</b> and <b>End time</b> fields, specify the start and end dates and/or times of the event.  In the date section of each field, either: <ul style="list-style-type: none"> <li>• Click on the drop-down arrow to display the current month and select the month and date, or</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Click on the 'spin' arrows to roll the date forwards or backwards by one day at a time</li> </ul> <p>In the time section of each field, click on the hour or minute components (which are separate) and either:</p> <ul style="list-style-type: none"> <li>Type in the required time or</li> <li>Click on the 'spin' arrows to roll the time backwards or forwards</li> </ul>	
7	<p>In the <b>Event Type</b> field, click on the drop-down arrow and select an appropriate type label for the event; the options change depending on the value you selected for the <b>Category</b> field.</p> <p>This provides the fill color for the event icon, as indicated by the fill box next to each option.</p>	
8	In the <b>Defined as</b> field, click on the drop-down arrow and select the indicator for whether the event is internal or external to your organization.	
9	If the event consists of a telephone call, select the <b>Phone Call</b> checkbox.	
10	In the description field, type any notes required on the event; these display in the mouse roll-over tool tip for the event on the Diary panel.	
11	If this event repeats at regular intervals, click on the <b>Recurrence</b> button and complete the Event Recurrence dialog (see below).	
12	Click on the <b>OK</b> button to save the event and display it on the Calendar.	

#### Define a recurring event

Step	Action	See also
1	<p>In the <b>Start</b> and <b>End</b> fields, specify the start and end times of the event; click on the hour or minute components (which are separate) and either:</p> <ul style="list-style-type: none"> <li>Type in the required time or</li> <li>Click on the 'spin' arrows to roll the time backwards or forwards</li> </ul>	
2	In the <b>Duration</b> field, click on each of the day(s), hours and minutes portions and either type or 'spin' to the required value.	

Step	Action	See also
	<p>The hours and minutes portions are linked to the <b>Start</b> and <b>End</b> fields, so that:</p> <ul style="list-style-type: none"> <li>As you edit the <b>Start</b> field or the <b>Duration</b> field, the <b>End</b> field adjusts to maintain the duration relative to the start time</li> <li>As you edit the <b>End</b> field, the <b>Duration</b> field changes to match the difference between the start and end times</li> </ul>	
3	<p>In the Recurrence pattern panel, select the appropriate radio button for the frequency of the event.</p> <p>As you select the radio button, the fields on the right of the panel change to further define when the event recurs.</p>	
4	<p>Select the appropriate radio buttons and field values, with the following guidance:</p> <ul style="list-style-type: none"> <li><i>Daily</i> can be every 1, 2, 3, 4, 5 or 6 days, or every day of the working week</li> <li><i>Weekly</i> is on one or more specific days of the week, the events being separated by a period of between 1 and 51 complete weeks</li> <li><i>Monthly</i> can be on a specific date or a specific day of the month, the events being separated by a period of between 1 and 11 complete months</li> <li><i>Yearly</i> can be on a specific date or a specific day of a specific month</li> </ul>	
5	<p>In the Range of recurrence panel, in the <b>Start</b> field, specify the date on which the event cycle begins.</p> <p>Click on the day, month and year components (which are separate) and either:</p> <ul style="list-style-type: none"> <li>Type in the required value or</li> <li>Click on the 'spin' arrows to roll the date backwards or forwards</li> </ul>	
6	<p>Select the appropriate radio buttons to indicate that the recurrence cycle:</p> <ul style="list-style-type: none"> <li>Has no defined end point</li> <li>Ends after a specific number of occurrences of the event (type in the number)</li> <li>Ends by a specific date (enter the date)</li> </ul>	
7	<p>Click on the <b>OK</b> button, and again on the Project Event dialog.</p> <p>The event icon displays at all points in the Calendar where it is scheduled to occur, as defined in the Event Recurrence dialog; the recurrence is indicated by a graphic depicting two recirculating arrows.</p>	
8	<p>If the recurrence is no longer required:</p> <ul style="list-style-type: none"> <li>Double-click on the icon for any occurrence of the event, to display the Project Event dialog</li> <li>Click on the <b>Recurrence</b> button to display the Event Recurrence dialog</li> <li>Click on the <b>Remove Recurrence</b> button; the Event Recurrence dialog closes</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Click on the <b>OK</b> button; the Project Event dialog closes</li> </ul> <p>Only the first occurrence of the event remains in the Calendar.</p>	

### Notes

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the above editions, if security is enabled you must have **Manage Project Calendar** permission in order to create, update or delete Project Calendar events; if security is not enabled, you can change data without this permission
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them
- You can transport a calendar of defined events between projects, using the **Export Reference Data** and **Import Reference Data** options

### Learn more

- [Project Calendar](#)<sup>[57]</sup>
- [Configure Event Subtypes](#)<sup>[57]</sup>
- [List of Available Permissions](#)<sup>[329]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

#### 3.8.9.1.1 Configure Event Subtypes

The Configure Subtype dialog enables you to define additional types of event to record on the Project Calendar, such as:

- Define a new event type within a select event category
- Change an existing event type
- Delete an existing event type

**Access** **Project | Calendar:**  **| Configure Event Subtypes**

### Manage the event types for your project

Step	Action	See also
1	On the Configure Subtype dialog, in the <b>Category</b> field, click on the drop-down arrow and select the appropriate category for the event.	
2	Click on the <b>Type</b> field and type a suitable name for the event type (or select an existing	

Step	Action	See also
	event from the list below the <b>Category</b> field).	
3	In the <b>Color</b> field, click on the drop-down arrow and select or define a color for the event icon.	
4	Click on the <b>Save</b> button to save the new or edited event type to the list for the specified category.  Click on the <b>New</b> button if you are going to create another event type.	
5	If the event type is no longer required, click on the <b>Delete</b> button.	
6	If required, you can change the sequence of the event types in the displayed list, using the ' <b>Up Hand</b> ' and ' <b>Down Hand</b> ' buttons at the bottom of the dialog.	
7	Click on the <b>OK</b> button to close the dialog; any new event types are available for use in the Project Calendar.	

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Project Calendar** permission in order to create or delete Project Calendar event subtypes; if security is not enabled, you can change data without this permission
- You can transport your defined event types between projects, using the **Export Reference Data** and **Import Reference Data** options

### Learn more

- [Import Reference Data](#)<sup>[380]</sup>

### 3.8.9.2 Allocated Resources

**Allocated Resources** is a display mode of the project Calendar facility, that you can use to:

- Review the allocation of resources across the project over a period of time
- Review the status of the work assigned to those resources
- Display and edit the details of the task assigned to a resource
- Allocate further resources to an element
- Delete a resource allocation from an element
- Create and send an email to the resource allocated to an element

In Allocated Resources mode, the Diary panel shows the selected period of time (see the *Project Calendar* topic), with at least one icon representing each element in the project to which a resource has been allocated during that period. If an element has more than one allocated resource, each element:resource combination is represented separately.

Each icon shows the element name and resource name, and indicates the status of the assigned work with one of the following symbols:

- a green square, indicating that the resource has been assigned the work
- a green tick, indicating that the resource has completed the assigned work
- a red square, indicating that the resource has not completed the assigned work
- a square divided diagonally with green and red halves, indicating that the assigned work is to be completed within one working day

Typically, while the work is in progress a resource is represented by:

- An icon with a green square on the day the work is planned to start, and
- An icon with a red square on the day the work is planned to finish

When the work is complete, the icons on both days display the green tick.

Resources are initially allocated to elements through the:

- Resource Allocation tab of the Project Management window, or
- Allocated Work tab of the Personal Tasks window

You can then *edit* these allocations through either of those windows or through the Allocated Resources Calendar itself.

**Access**   **Project | Calendar > Allocated Resources**

### **Allocate Resources**

Option	Usage	See also
<b>Display/edit details of an allocated resource</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on any icon for that element:resource combination, or</li> <li>• Right-click on the icon and select the <b>Properties</b> context menu option</li> </ul> <p>The Assigned Resources dialog displays, showing the details of the assignment of the resource to a task on the element.</p> <p>This dialog has the same content, format and functions as the Resource Allocation tab of the Project Manager window, in Item mode.</p>	<p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">The Project Management Window</a> <sup>[510]</sup></p>

Option	Usage	See also
<b>Add resource to element</b>	<p>Right-click on any icon for the element and select the <b>Assign Resource to &lt;element name&gt;</b> context menu option.</p> <p>The Assigned Resources dialog displays, showing the start and end dates both set to the date from which you selected the icon, and the <b>Allocated Time</b> field set to <b>1</b>; all other fields are blank.</p> <p>This dialog has the same content, format and functions as the Resource Allocation tab of the Project Manager window, in Item mode.</p> <p>Specify the resource and the role or task that resource is performing, and define the period for which the resource is allocated to the element.</p>	<p><a href="#">Resource Allocation</a> [512]</p> <p><a href="#">The Project Management Window</a> [510]</p>
<b>Message Resource</b>	<p>Right-click on any icon for the element:resource combination and select the <b>Message Resource &lt;resource name&gt;</b> context menu option.</p> <p>The Model Message dialog displays, on which you create and send your message to the resource allocated to the element.</p>	<a href="#">Create a Message</a> [570]
<b>Delete resource from element</b>	<p>Right-click on any icon for the element:resource combination, and select the <b>Delete Resource from &lt;element name&gt;</b> context menu option.</p> <p>A prompt displays to confirm the deletion; click on the <b>Yes</b> button.</p> <p>The icon and any corresponding icons for that element:resource combination are deleted from the calendar, and the resource is no longer allocated to that element.</p>	
<b>Locate element in diagrams in which it is used</b>	<p>Right-click on any icon for the element, and select the <b>Find in all Diagrams</b> context menu option.</p> <p>If the element is used in only one diagram, that diagram displays.</p> <p>If the element is used in more than one diagram the Element Usage dialog displays, listing the diagrams in which the element occurs.</p> <p>Select the required diagram and click on the <b>Open</b> button to display that diagram.</p> <p>This option also operates on Port and Part Property Type Classifiers.</p>	<a href="#">Show Element Use</a> [910]
<b>Locate element in Project Browser</b>	<p>Right-click on any icon for the element, and select the <b>Find in Project Browser</b> context menu option.</p> <p>The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted.</p>	

Option	Usage	See also
<b>Locate resource allocation start date corresponding to allocation end date</b>	<p>Firstly, click on the end date icon for the element:resource combination to highlight it; the corresponding start date icon is also highlighted.</p> <p>If the start date icon is not in view, right-click on the end date icon and select the <b>Show Start/End</b> context menu option; the display scrolls to show the start date and the start date cell is highlighted.</p>	
<b>Locate resource allocation end date corresponding to allocation start date</b>	<p>Firstly, click on the start date icon for the element:resource combination to highlight it; the corresponding end date icon is also highlighted.</p> <p>If the end date icon is not in view, right-click on the start date icon and select the <b>Show Start/End</b> context menu option; the display scrolls to show the end date and the end date cell is highlighted.</p>	
<b>Refocus display on today's date</b>	<p>Right-click anywhere on the display and select the <b>Show Today</b> context menu option.</p> <p>The display returns to today's date, which is highlighted and outlined.</p>	

#### Notes

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the above editions, if security is enabled you must have **Manage Project Settings** permission in order to allocate resources to or remove resources from the Project Calendar; if security is not enabled, you can change data without this permission
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them
- As the start and end icons for a *completed* task are identical, and one-day tasks have only one icon, the methods to show the corresponding start date or end date for an icon are also useful to show whether the icon *is* for a start or end date, or for a one-day task; alternatively, double-click on the icon and review the allocation dates

#### Learn more

- [Project Calendar](#)<sup>[57]</sup>
- [List of Available Permissions](#)<sup>[329]</sup>

### 3.8.9.3 Project Tasks

**Project Tasks** is a display mode of the project Calendar facility, that you can use to:

- Review the tasks across the project over a period of time
- Review the progress of those tasks
- Create new tasks
- Display and edit the details of the task
- Allocate a resource to a task

- Delete a task
- Create and send an email to the resource assigned to a task
- Create and send an email to the owner of the task

In Project Tasks mode, the Diary panel shows the selected period of time (see the *Project Calendar* topic), with at least one icon representing each *project task* scheduled during that period. The icon represents an independent record of the task - there are no comparisons or validations of the tasks. Therefore you can have separate icons for the same task, with different resources allocated or no resources allocated; you can even have identical task records, if these serve a purpose for you.

Each icon shows the task name and resource name, and indicates the status of the task with one of the following symbols:

- a green square, indicating that the task has been scheduled
- a green tick, indicating that the task is complete
- a red square, indicating that the task is incomplete
- a square divided diagonally with green and red halves, indicating that the task is to be completed within one working day

Typically, while a task is in progress it is represented by:

- An icon with a green square on the day the work is planned to start, and
- An icon with a red square on the day the work is planned to finish

When the work is complete, the icons on both days display the green tick.

Tasks can be created and managed through this view of the Project Calendar, or the:

- Tasks tab of the Project Status window, or
- Project Tasks tab of the Personal Tasks window

**Access** **Project | Calendar > Project Tasks**

### **Manage Project Tasks**

Option	Usage	See also
<b>Create a task</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on the date cell in which the task is to start</li> <li>• Right-click on the cell and select the <b>Add New Task</b> context menu option, or</li> <li>• Click on the down-arrow next to the first icon in the Calendar toolbar, and select the <b>New Task</b> option</li> </ul> <p>The Task Details dialog displays, through which you create the task.</p>	<a href="#">Add, Modify and Delete Tasks</a> <sup>527</sup>

Option	Usage	See also
<b>Display and edit a task</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on the task</li> <li>• Right-click on the cell and select the <b>Properties</b> context menu option, or</li> <li>• Click on the down-arrow next to the first icon in the Calendar toolbar, and select the <b>Properties</b> option</li> </ul> <p>The Task Details dialog displays; if necessary, edit the information.</p>	<a href="#">Add, Modify and Delete Tasks</a> <sup>[527]</sup>
<b>Allocate a resource to a task</b>	<p>Certain tasks might not initially be assigned to a resource, but might later require specific assignment to finish them off.</p> <p>Open the task to edit it, click on the drop-down arrow in the <b>Assigned</b> field and select the required resource.</p>	
<b>Delete a task</b>	<p>Right-click on any icon for the required task and select the <b>Delete '&lt;task-name&gt;'</b> context menu option.</p> <p>You are prompted to confirm the deletion; click on the <b>Yes</b> button.</p>	
<b>Create and send a message to the task owner</b>	<p>Right-click on any icon for the task and select the <b>Message Owner</b> context menu option.</p> <p>The Model Message dialog displays, on which you create and send your message to the user who owns the task (as identified in the Task Details dialog).</p> <p>If the task does not have a defined owner, this option does not operate.</p>	<a href="#">Create a Message</a> <sup>[570]</sup>
<b>Create and send a message to the resource assigned to the task</b>	<p>Right-click on any icon for the task and select the <b>Message Assigned &lt;resource name&gt;</b> context menu option.</p> <p>The Model Message dialog displays, on which you create and send your message to the resource assigned to complete the task (as identified in the Task Details dialog).</p> <p>If the task does not have a defined resource, this option does not operate.</p>	
<b>Locate task start date corresponding to task end date</b>	<p>Firstly, click on the end date icon for the task to highlight it; the corresponding start date icon is also highlighted.</p> <p>If the start date icon is not in view, right-click on the end date icon and select the <b>Show Start/End</b> context menu option; the display scrolls to show the start date and the start date cell is highlighted.</p>	
<b>Locate task end date corresponding</b>	<p>Firstly, click on the start date icon for the task to highlight it; the corresponding end date icon is also highlighted.</p> <p>If the end date icon is not in view, right-click on the start date icon</p>	

Option	Usage	See also
<b>to task start date</b>	and select the <b>Show Start/End</b> context menu option; the display scrolls to show the end date and the end date cell is highlighted.	
<b>Refocus display on today's date</b>	Right-click anywhere on the display and select the <b>Show Today</b> context menu option.  The display returns to today's date, which is highlighted and outlined.	

### Notes

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them

## 3.8.10 Use Case Estimation

Project estimation is the task of working out how much time and effort is required to build and deploy a solution.

The Use Case metrics facility in Enterprise Architect provides a starting point for estimating project effort; using this facility you can get a rough measure of the complexity of a system and some indication of the effort required to implement the model. Like all estimation techniques, Use Case metrics requires some experience with previous projects to 'calibrate' the process.

There is additional information available on Use Case metrics on the Sparx Systems website.

### Topics

Topic	Detail	See also
<b>Calibrating</b>	<p>The following values must be carefully calibrated in order to gain the best possible estimates:</p> <ul style="list-style-type: none"> <li>• Technical Complexity Factors, which are values that attempt to quantify the difficulty and complexity of the work in hand</li> <li>• Environment Complexity Factors, which are values that attempt to quantify non-technical complexities such as team experience and knowledge</li> <li>• Default Hour Rate, which sets the number of hours per Use Case point</li> </ul>	<p><a href="#">Technical Complexity Factors</a> <sup>[585]</sup></p> <p><a href="#">Environment Complexity Factors</a> <sup>[586]</sup></p> <p><a href="#">Default Hours</a> <sup>[588]</sup></p>

Topic	Detail	See also
<b>Estimating</b>	<p>Once you have entered all the calibration values, you can estimate the project timescale through the Use Case Metrics tab of the QA Reports view.</p> <p>The estimation process also draws on information on Use Cases recorded in the Project management window, in particular on the Resource Allocation tab.</p>	<p><a href="#">Estimating Project Size</a> <sup>588</sup></p> <p><a href="#">Resource Allocation</a> <sup>512</sup></p>

#### Learn more

- [Project Estimation Using Use Case Metrics](#)

### 3.8.10.1 Technical Complexity Factors

**Technical Complexity Factors** (TCFs) are used in the Use Case Metrics estimation technique.

The EABase.eap model contains a default set of TCFs, which you can add to or modify using the Estimation Factors dialog. This set of factors should include all factors that could affect the technical complexity of the project environment.

**Access** [Settings](#) | [Project Types](#) | [Estimation Factors](#) > [Technical Complexity Factors](#)

#### Maintain Technical Complexity Factors

Step	Action	See also
<b>1</b>	<p>On the Technical Complexity Factors tab, either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>New</b> button to add another TCF, or</li> <li>• Click on the required factor in the <b>Defined Technical Types</b> list to edit it (go to step 3)</li> </ul>	
<b>2</b>	In the <b>Factor Number</b> field, type the appropriate TCF number.	
<b>3</b>	In the <b>Description</b> field, type or edit the TCF description.	
<b>4</b>	<p>In the <b>Weight</b> field, type or edit the technical complexity weighting.</p> <p>This indicates how much technical complexity you assign to a factor; for example, <i>the system is to be developed in ADA</i> might warrant a higher weight than <i>the system is to be a shell script</i>.</p>	
<b>5</b>	<p>In the <b>Value</b> field, type or edit a value representing the degree of influence the factor has on the project.</p> <p>As a suggested gauge:</p>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>0</b> indicates no influence</li> <li>• <b>3</b> indicates average influence</li> <li>• <b>5</b> indicates strong influence</li> </ul>	
<b>6</b>	Click on the <b>Save</b> button.	
<b>7</b>	<p>Examine the <b>Defined Technical Types</b> list, and scroll across it to show the <b>Ex Value</b> column (<b>Weight x Value</b>).</p> <p>The summed <b>Ex Values</b> yield the <b>Unadjusted TCF</b> value (at the bottom of the dialog).</p> <p>The <b>Unadjusted TCF</b> value is combined with the Environment Complexity Factors to skew the overall complexity up or down, depending on the level of technical complexity and the corresponding level of environmental support.</p>	<a href="#">Environment Complexity Factors</a> <sup>[586]</sup>

#### Notes

- The TCF Weight evaluates its respective factor, but is irrelevant to a project; the **Value** field assesses each factor's role within a project and, for most purposes, is the only field requiring adjustment
- The supplied factors and their associated weights are defined by the *Use Case Points Method*, although they can be adjusted to suit a project's specific requirements
- You can transport the Technical Complexity Factors between models, using Export Reference Data and Import Reference Data

#### Learn more

- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

### 3.8.10.2 Environment Complexity Factors

**Environment Complexity Factors** (ECFs) are used in the Use Case Metrics estimation technique.

The EABase.eap model contains a default set of ECFs, which you can add to or modify using the Estimation Factors dialog. This set of factors should include all factors that could affect the general design and development environment, including team experience and knowledge, team size, expertise and other non-functional environmental factors.

**Access** [Settings](#) | [Project Types](#) | [Estimation Factors](#) > [Environment Complexity Factors](#)

#### Maintain Environment Complexity Factors

Step	Action	See also
<b>1</b>	On the Environment Complexity Factors tab, either:	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Click on the <b>New</b> button to add another ECF, or</li> <li>Click on the required factor in the <b>Defined Environment Types</b> list to edit it (go to step 3)</li> </ul>	
2	In the <b>Factor Number</b> field, type the appropriate ECF number.	
3	In the <b>Description</b> field, type or edit the ECF description.	
4	In the <b>Weight</b> field, type or edit the environment complexity weighting. This indicates how much complexity you assign to a factor.	
5	In the <b>Value</b> field, type or edit a value representing the degree of influence the factor has on the project. As a suggested gauge: <ul style="list-style-type: none"> <li>0 indicates no influence</li> <li>3 indicates average influence</li> <li>5 indicates strong influence</li> </ul>	
6	Click on the <b>Save</b> button.	
7	Examine the <b>Defined Environment Types</b> list, and scroll across it to show the <b>Ex Value</b> column ( <b>Weight x Value</b> ).  The summed <b>Ex Values</b> yield the <b>Unadjusted ECF value</b> (at the bottom of the dialog).  The <b>Unadjusted ECF</b> value is combined with the Technical Complexity Factors to skew the overall complexity up or down, depending on the level of technical complexity and the corresponding level of environmental support.	<a href="#">Technical Complexity Factors</a> <sup>[585]</sup>

### Notes

- The ECF Weight evaluates its respective factor, but is irrelevant to a project; the **Value** field assesses each factor's role within a project and, for most purposes, is the only field requiring adjustment
- The supplied factors and their associated weights are defined by the *Use Case Points Method*, although they can be adjusted to suit a project's specific requirements
- You can transport the Environment Complexity Factors between models, using Export Reference Data and Import Reference Data

### Learn more

- [Export Reference Data](#) <sup>[376]</sup>

- [Import Reference Data](#)<sup>[380]</sup>

### 3.8.10.3 Default Hours

Setting an hourly rate is the most difficult factor in an accurate estimation. Typical ranges can vary from 10 to 30 hours per Use Case point.

Studying the **Use Case Points Method**, from which this variable is defined, can help you to understand its role in the estimation and facilitate selection of a suitable initial value.

The best way to estimate this value is through analysis of previous completed projects. By calculating the project estimation on a completed project for which the Use Cases and environment are configured within Enterprise Architect, you can adjust the hour rate to render an appropriate value for your unique work environment.

**Access**   **Settings | Project Types | Estimation Factors > Default Hour Rate**

#### Set the default hour rate per adjusted Use Case point

Step	Action	See also
1	In the <b>Duration</b> field, type the number of hours per Use Case Point.	
2	In the <b>Hourly Rate</b> field, type the cost per hour.	
3	Click on the <b>Close</b> button.	

#### Notes

- The values you enter are stored as local settings on your computer only
- This option is also active in the 'Lite', read-only version of Enterprise Architect

#### Learn more

- [Project Estimation Using Use Case Metrics](#)
- [The Read-only 'Lite' Edition](#)<sup>[23]</sup>

### 3.8.10.4 Estimating Project Size

Enterprise Architect uses a simple estimation technique based on the established:

- Number of Use Cases to be built
- Difficulty level of those Use Cases
- Project environment factors and
- Build parameters

This technique is of value only once you have developed a couple of known projects to use as a baseline.

Please DO NOT use the provided 'guesstimates' as a real world measure until you have some real world base lines to measure against.

**Access** Select package in Project Browser:

**Project | QA Reports & Metrics > Use Case Metrics**, or  
**Right-click | Documentation | Package Metrics > Use Case Metrics**

#### Complete a Use Case Metrics Estimation

Field	Usage	See also
<b>Root Package</b>	Confirm the root package in the hierarchy.  All Use Cases under this package could potentially be included in the report.	
<b>Reload</b>	Re-run the load from the selected package, usually after you change the filter criteria.	
<b>Phase like</b>	Include Use Cases with a phase that matches the wildcard value in the field.  Use * to match any characters, for example 1.* for 1.1 and 1.2.	
<b>Keyword like</b>	Include Use Cases with a keyword that matches the wildcard value in the field.  Use * to match any characters.	
<b>Bookmarked</b>	Include all Use Cases, or only those that are tagged, or those that are not tagged.	
<b>Use Cases</b>	Check the total count of Use Cases in the estimate.  The Use Cases and their parameters are listed in the panel underneath this field.	
<b>Include Actors</b>	Select to include Actors in the estimate.	
<b>Technical Complexity Factor</b>	Review the parameters that describe the degree of technical complexity of the project.  While the <b>Unadjusted TCF Value</b> comes from the Technical Complexity Factors tab of the Estimation Factors dialog, the other values compose the Use Case Points Method formula.  Modify these fields with caution.  The final project estimate is directly proportional to the TCF.	<a href="#">Technical Complexity Factors</a> <sup>[585]</sup>

Field	Usage	See also
<b>Environment Complexity Factor</b>	<p>Review the parameters that calculate the degree of environmental complexity of the project, from factors such as programmer motivation or experience.</p> <p>The listed parameters compose the formula calculating the ECF, defined by the Use Case Points Method; the only parameter affected by the project is the <b>Unadjusted ECF Value</b>, derived from the Environment Complexity Factors tab of the Estimation Factors dialog.</p> <p>The final project estimate is directly proportional to the ECF.</p>	<a href="#">Environment Complexity Factors</a>
<b>Unadjusted Use Case Points (UUCP)</b>	Check the sum of the Use Case complexity numbers.	
<b>Ave Hours per Use Case</b>	<p>Check the average number of hours assigned to easy, medium and difficult Use Cases.</p> <p>You cannot change these figures.</p>	
<b>Total Estimate</b>	<p>Review the detailed breakdown of the final figure.</p> <p>You must tailor the hours per Use Case Point figure to the level that matches your type of project and capability based on known previous project outcomes.</p>	
<b>Default Rate</b>	Set the default hours to be fed into the final calculation.	<a href="#">Default hours</a>
<b>Re-Calculate</b>	Re-run the estimate, usually after you change the hours or Use Case point number.	
<b>Report</b>	Produce a rich text formatted report from the current estimate.	
<b>View Report</b>	Display the last-generated report.	

### 3.8.11 Update Package Status

Often a complete Package structure moves from one status to another (such as for release) in one operation. To help facilitate this, Enterprise Architect supports a 'bulk' update of Package and element **Status**, **Phase** and **Version**, which also provides the option of defining the scope of the update.

**Access** [Project Browser package context menu | Advanced | Update Package Status](#)

[Update Status across a Package](#)

Field	Action	See also
<b>New Status</b>	Type in or select the new status of the Package.	
<b>New Phase</b>	Type the new phase.	
<b>New Version</b>	Type the new version.	
<b>Modified Date</b>	Defaults to today's date; if the change takes effect on a different date, use the 'spin' arrows to select that date.	
<b>Set Date</b>	Defaults to selected to apply the Modified Date; if necessary, deselect to ignore the date stamp on the change.	
<b>Recursively update all child packages</b>	Select to apply the changes through all child Packages of the selected Package; deselect to apply the changes to only the selected Package.	
<b>Include Elements</b>	Defaults to selected; if the changes are to apply only to Package elements, deselect the checkbox.	
<b>Include Element Requirements</b>	Defaults to selected, to update the element requirements' <b>Status</b> field; deselect to ignore this field.	
<b>Include Element Constraints</b>	Defaults to selected, to update the constraints' <b>Status</b> field; deselect to ignore this field.	
<b>OK</b>	Click on this button to update all required elements to the new status.	

### 3.8.12 Manage Bookmarks

A bookmark is a visual clue that something is different about an element; it is represented by a small red triangle that displays above the element in the diagram.

You can assign any meaning to the bookmark as is appropriate to your model.

You can bookmark:

- Single elements manually, or
- All elements in a package automatically when they assume a defined status

### Guide

To work with bookmarks, select from the options described below:

Option	Usage	See also
<b>Bookmark a selected element in a diagram</b>	Either: <ul style="list-style-type: none"> <li>• Press <b>(Shift+Space)</b>, or</li> <li>• Select the <b>Edit   Bookmark Selected</b> menu option</li> </ul>	
<b>Clear a bookmark on a selected element</b>	Use either of the above two options again.	
<b>Bookmark Multiple Elements in a Package</b>	Select <b>Project Browser package context menu   Bookmarks</b> The Manage Bookmarks dialog displays, enabling you to automatically bookmark any elements (and, if required, their children) in the package that have: <ul style="list-style-type: none"> <li>• New changes defined in the Maintenance window</li> <li>• New defects defined in the Maintenance window, and/or</li> <li>• Test scripts defined in the Testing window</li> </ul> This is useful to highlight elements that have additional project information.	
<b>Clear all elements of bookmarks</b>	To clear all bookmarks: <ul style="list-style-type: none"> <li>• Throughout the current package, click on the <b>Clear All</b> button on the Manage Bookmarks dialog</li> <li>• In the current diagram, select the <b>Edit   Clear All Bookmarks</b> menu option</li> </ul>	

### Notes

- You should reload the project to update it with the new or cleared bookmarks
- The Model Search window enables searching based on bookmarked elements

### Learn more

- [Working on Maintenance Items](#)  <sup>2623</sup>

- [Refresh View of Shared Project](#)  <sup>308</sup>

- [Create & Modify Searches](#) <sup>[709]</sup>

### 3.8.13 Monitor Change Events

You can automatically monitor work events in your project, using the Model Views facility.

#### Guide

Topic	Detail	See also
<b>Model Views</b>	<p>This facility enables you to:</p> <ul style="list-style-type: none"> <li>• Automatically refresh a search in a View at an interval that you define</li> <li>• Notify you if the results of the search change between two consecutive searches</li> </ul> <p>You can therefore use Model Views to monitor various events in the development project, depending on how you set up the search in a View.</p>	<a href="#">Model Views Operations</a> <sup>[693]</sup>
<b>Example</b>	<p>You could set up a search to detect:</p> <ul style="list-style-type: none"> <li>• Change items, or Issue items, so that Enterprise Architect would notify you as new items were created</li> <li>• Element Status, Type, Phase, Version, Priority and/or date of last update, so that Enterprise Architect would notify you as items were progressed to: <ul style="list-style-type: none"> <li>• Fall in to the level of work represented by the search categories or</li> <li>• Move out of the categories into the next level of work</li> </ul> </li> <li>• Tagged Values, so that - again - as items were changed to satisfy the criteria of a sequence of searches, the progression of items through a set of stages could be checked and managed</li> </ul>	
<b>Personalization</b>	<p>People responsible for different stages in a process could have their own Model View searches so that:</p> <ul style="list-style-type: none"> <li>• As a development, validation or authorization task falls due the responsible person is automatically notified, and</li> <li>• When the work is complete both the next person in line and the overseeing manager are notified</li> </ul>	

#### Notes

- This facility is available in the Enterprise Architect Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions

### 3.8.14 The Gantt View

Using the Gantt View, you can visualize elements and assigned resources in a Gantt Chart format, to review the breakdown of work for a specific project. The Gantt View illustrates a project schedule by showing the start and finish dates of assigned resources, so that a Project Manager can quickly see the current project status using the percent-complete bar shading and the percent-complete, resource name and status columns.

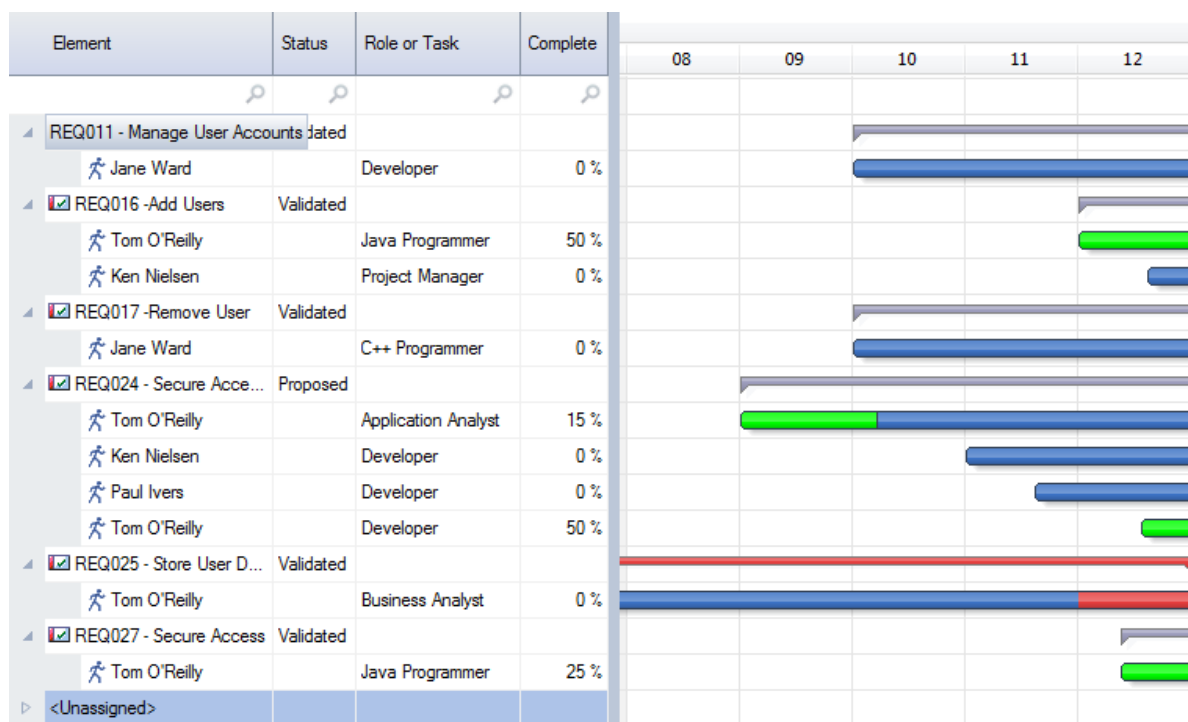

Overdue items can quickly be identified in red by selecting the **Toggle Highlight of Overdue Items** option from the Gantt view's context menu.

There are four different Gantt Views available within Enterprise Architect:

- **Diagram Gantt View** - Show all the elements on a diagram in a Gantt Chart - view or assign resources to them
- **Personal Tasks** - Show all the elements in the model that you have been assigned as a resource to work on
- **Project Gantt View** - Show all the resources in the model and what elements they have been assigned to
- **Package Browser Gantt View** - Show all the elements in a Package and its sub-Packages and see what resources have been assigned to them

**Access** **Right-click on a diagram | Switch to Gantt View**, or  
**View | Personal Tasks**, or  
**Project | Project Gantt View**, or  
**Right-click on a Package in the Project Browser | Package Browser | Gantt View**

#### Gantt View

**Notes**

- Items in the list pane can be filtered; right-click on the column headings in the list pane to toggle the Filter Bar between hidden or shown, or to edit the filter

### 3.9 Project Maintenance

This topic highlights some administrative functions you might have to carry out to maintain your model.

#### Topics

Topic	Detail	See also
<b>Check the integrity of the data in a project</b>	If you have a failed XML import, network crash or other unforeseen event that could disrupt the integrity of information in the model, it is recommended that you run a Project Integrity Check.	<a href="#">Check Project Data Integrity</a> <sup>[597]</sup>
<b>Reset Auto Increment Columns in Tables</b>	XML Import/Export can affect the table auto increment column values and push them towards the maximum datatype value; you can re-sequence the columns to avoid this problem.	<a href="#">Reset Table Auto Increment or Identity Columns</a> <sup>[598]</sup>
<b>Upgrade an old project to enable use of new features</b>	The structure of Enterprise Architect project files is occasionally changed to support more features; when this happens, existing project files must be upgraded to the new format to ensure correct operation and to take advantage of all the new features.	<a href="#">Upgrade a Project</a> <sup>[599]</sup>
<b>Rename a project</b>	If you want to rename an Enterprise Architect project, you can do so through Windows Explorer.	<a href="#">Rename a Project</a> <sup>[601]</sup>
<b>Compact a project</b>	After some time, a project .EAP file might benefit from compacting to conserve space.	<a href="#">Compact a Project</a> <sup>[601]</sup>
<b>Repair a project if it did not close properly</b>	If a project has not been closed properly, such as during system or network outages, on rare occasions the .EAP file does not re-open correctly.	<a href="#">Repair a Project</a> <sup>[602]</sup>

#### Notes

- You only rename, compact and repair models created as .EAP files; these processes are not required for models stored in a DBMS

### 3.9.1 Check Project Data Integrity

If you have a failed XML import, network crash or other unforeseen event that could disrupt the integrity of information in the model, it is recommended that you run the *Project Integrity Check* function to check that your project data is structurally complete.

You can select a variety of items to check. The integrity check examines all database records and ensures there are no 'orphaned' records or inaccurate or unset identifiers. This function does NOT check UML conformance, only the data relationships and repository structure.

You can run the integrity checker first in report mode to discover if anything should be corrected, and then run it again in 'recover/clean' mode.

When Enterprise Architect 'cleans' the model, it attempts to recover lost packages and elements, and generates a new package at the model root level called *\_recovered\_*. Check through any elements that are found and, if required, drag them into the model proper. If they are not required, delete them.

**Access** [Tools | Data Management | Project Integrity Check](#)

#### Check the data integrity of your project

Step	Action	See also
1	Open the project.	
2	Select the <b>Project Integrity Check</b> menu option. The Project Integrity Check dialog displays.	
3	Select the checkbox for each check to run: <ul style="list-style-type: none"> <li>Package Structure</li> <li>Object Structure</li> <li>Object Features</li> <li>All GUIDs</li> <li>Cross References</li> <li>Connectors</li> <li>UML 2.0 Migration (see below)</li> </ul>	
4	Select either: <ul style="list-style-type: none"> <li>the <b>Report Only</b> option to just view a report on the state of your model, or</li> <li>the <b>Recover/Clean</b> option to recover and clean your project; before selecting this option back up your project file first</li> </ul>	
5	To write a log of the integrity check, click on the <b>Save Results</b> button and select a log file.	

Step	Action	See also
6	<p>Click on the <b>Go</b> button to run the check.</p> <p>If you want to display the resulting information in a more readable layout, you can resize the dialog and its columns.</p>	

### UML 2.0 Migration

The UML 2.0 Migration check enables you to migrate the project from UML 1.3 semantics to UML 2.0 semantics. The migration process currently converts activities that are invocations of operations into called operation actions as per the UML 2.0 specification.

The UML 2.0 Migration option is an exclusive process that does not enable any of the other checks to be selected. When you click on the **Go** button to perform the migration, a prompt displays for you to confirm the operation.

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Check Data Integrity** permission to perform a data integrity check

### Learn more

- [List of Permissions](#)<sup>[329]</sup>
- [Run SQL Patches](#)<sup>[601]</sup>

## 3.9.2 Reset Table Auto Increment or Identity Columns

This topic explains possible impacts of XML Export/Import on table auto increment columns, and how to re-sequence the columns whose value approaches the maximum datatype value.

### Topics

Topic	Detail	See also
<b>XML Export/Import</b>	<p>XML Export/Import can cause gaps in the numbering sequence of auto increment columns.</p> <p>Each XML Import deletes rows from several tables; the import then adds rows starting from the maximum value of the auto increment column.</p> <p>Repeated XML imports can result in the value of the auto increment approaching the maximum value of the database datatype; for example, SQL Server's <i>int</i> datatype has a maximum value of <b>2,147,483,647</b>.</p>	
<b>Replication</b>	<p>Large auto increment values can also arise where the project originated as an EAP replica or design master.</p> <p>The Jet engine assigns random values for auto increment columns with each XML Import into the project.</p>	<a href="#">Replication</a> <sup>[310]</sup>

Topic	Detail	See also
	These random values can approach the maximum range of the repository data type, which could present a problem when the EAP project is transferred to a repository.	

**Access** [Tools](#) | [Data Management](#) | [Reset IDs](#)

### How to

To re-sequence auto increment columns

Step	Action
1	Open the project.
2	<p>Select the <b>Reset IDs</b> menu option.</p> <p>A dialog displays listing all non-empty tables that contain an auto increment or identity column.</p> <ul style="list-style-type: none"> <li>The <b>Rows</b> column shows the number of rows in the table</li> <li>The <b>Maximum ID</b> column shows the current maximum value of the auto increment column</li> <li>The <b>Action</b> column shows either <b>No Action</b> or <b>Reset</b>, depending on how close the column value is to the datatype's maximum</li> </ul> <p>Tables requiring a reset are automatically selected in the list.</p>
3	Click on the <b>Go</b> button to reset the auto increment column values.

### Notes

- Project Auditing must to be disabled before auto incremented IDs can be reset.

### Learn more

- [Auditing](#) <sup>446</sup>

## 3.9.3 Upgrade a Project

The structure of Enterprise Architect project files is occasionally changed to support more features. In such cases, the project might have to be upgraded.

Topic	Detail	See also
<b>Upgrading</b>	Upgrading to the new file structure is a simple and quick process that brings your project to the current level to:	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Ensure correct operation and</li> <li>• Support all the latest Enterprise Architect features</li> </ul>	
<b>Initial Check</b>	When you load a project that was created in an early release of Enterprise Architect (for example, an archived project) using a recent release of Enterprise Architect, the system determines whether the project should be upgraded and, if the upgrade is necessary, displays the Upgrade Wizard.	
<b>The Upgrade Project Wizard</b>	<p>The Upgrade Project Wizard takes you through the upgrade process and:</p> <ul style="list-style-type: none"> <li>• Advises you of the necessity to upgrade</li> <li>• Advises you to back up the current project; it is essential to back up before any changes are made</li> <li>• Checks which upgrade path is required</li> <li>• Guides you through the steps to perform the upgrade</li> <li>• Opens the newly converted project</li> </ul>	

#### Notes

- If you are using replication in your models, and the upgrade wizard detects that the project you are opening is a replica and not a Design Master, a different upgrade path is required
- Once upgraded, the project cannot be opened with the version of Enterprise Architect in which it was created

#### Learn more

- [Replication](#)<sup>[310]</sup>
- [Upgrade Replicas](#)<sup>[600]</sup>

### **3.9.3.1 Upgrade Replicas**

Models that have replication features added might have to be upgraded differently from regular projects.

- If the model is a Design Master (the root model of all other replicas) then you can upgrade the model to suit the current version of Enterprise Architect; after upgrading a Design Master you should re-create the replicas, rather than synchronizing
- If the model is not a Design Master, you must first remove the replication features, then upgrade the project in the normal manner; the Upgrade Wizard guides you through the steps

#### Learn more

- [Upgrade a Project](#)<sup>[599]</sup>
- [Replication](#)<sup>[310]</sup>
- [Design Masters](#)<sup>[311]</sup>

### 3.9.4 Run SQL Patches

Occasionally, Sparx Systems might release a patch to correct a model fault.

**Access** [Tools](#) | [Data Management](#) | [Run Patch](#)

The patch generally checks how many records are to be updated, and reports on what is to be done.

### 3.9.5 Rename a Project

If you want to rename a project, you can only do so at the Windows file system level, using Windows Explorer.

#### Rename an Enterprise Architect project file

Step	Action
1	If you have the project open, close it.
2	Ensure no other users have the file open.
3	Open Windows Explorer and navigate to the project.
4	Rename the project file using Windows Explorer.
5	You should keep the file extension to preserve compatibility with the default project type, as installed in the registry at installation time.

### 3.9.6 Compact a Project

After a long period of use and development, a project .EAP file might occupy more disc space than necessary. You can move the project to a local drive and compact the file to recover some of this space.

**Access** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Compact .EAP File](#)

#### Compact a project

Step	Action
1	If you have the project open, shut it down.
2	Ensure no other users have the file open.

Step	Action
3	Select the <b>Compact .EAP File</b> menu option.
4	Follow the on-screen instructions to complete the process.

#### Notes

- Always compact projects on a **local** drive, never on a **network** drive
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Administer Database** permission to compact a project

#### Learn more

- [List of Available Permissions](#) <sup>329</sup>

### 3.9.7 Repair a Project

If a project has not been closed properly, such as during system or network outages or on poor network connections, on rare occasions the .EAP file does not re-open correctly. A message displays informing you the project is of an unknown database format or is not a database file. In such cases, you can move the project file to a local drive and repair it.

**Access** **Tools | Data Management | Manage .EAP File | Repair .EAP File**

#### Repair a project that was not closed properly

Step	Action	See also
1	Ensure that all users are logged off the project you are attempting to repair.	<a href="#">General Options</a> <sup>605</sup> (page of the Options dialog)
2	Copy the project file to a <b>local drive</b> on your workstation.	
3	In Enterprise Architect, select <b>Tools   Options</b> to display the Options dialog. On the General page, deselect the <b>Use Jet 4.0 - requires restart</b> checkbox.	
4	Close and restart Enterprise Architect - you do not need to open any model, including the one you are repairing.	

Step	Action	See also
5	Select the <b>Repair .EAP File</b> menu option, and follow the on-screen instructions.	
6	Once you have repaired the project, it is recommended that you perform a data integrity check.	<a href="#">Check Project Data Integrity</a> <sup>[597]</sup>

### Notes

- Always repair projects on a **local** drive, never on a **network** drive
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Administer Database** permission to repair a project

### Learn more

- [List of Available Permissions](#)<sup>[329]</sup>

### 3.10 Local Options

Enterprise Architect has a wide range of default settings for controlling how the system **displays and works** with models and model elements. You can **customize** these settings to define your preferred behaviour of the system. Most of the settings are stored in your registry so they are set for **your** use only. For a networked workplace, registry settings can be copied down to any network workstation you log in to. Otherwise, the settings control operations under your login on the current **machine** only.

The settings are grouped according to their actions on specific functional areas, on a number of pages of the Options dialog.

**Access**   **Tools | Options (Ctrl+F9)**

#### Option Groups

Group/Page	Action	See also
<b>General Options</b>	Control the behavior of the <b>system</b> as a whole.	<a href="#">General Options</a> <sup>[605]</sup>
<b>Diagram (New Diagram Defaults)</b>	Set the general properties of all diagrams you create.	<a href="#">Diagram Options</a> <sup>[608]</sup>
<b>Diagram - Themes</b>	Create and apply display themes for all diagrams that you open.	<a href="#">Diagram Theme Options</a> <sup>[611]</sup>
<b>Diagram - Standard Colors</b>	Set the display colors and background colors of objects and properties in diagrams across the system.	<a href="#">Standard Colors</a> <sup>[616]</sup>
<b>Diagram - Appearance</b>	Control how elements are displayed on a diagram.	<a href="#">Diagram Appearance Options</a> <sup>[621]</sup>
<b>Diagram - Behavior</b>	Control how a diagram responds to actions taken on it.	<a href="#">Diagram Behavior Options</a> <sup>[625]</sup>
<b>Diagram - Sequence (diagram display)</b>	Control the appearance and behaviour of Sequence diagrams specifically.	<a href="#">Sequence Diagram Options</a> <sup>[629]</sup>
<b>Objects (display)</b>	Configure the properties and behaviors of elements created on your diagrams.	<a href="#">Object Display Options</a> <sup>[631]</sup>

Group/Page	Action	See also
<b>Links (Connector display)</b>	Define the creation, behavior and notation of connectors on your diagrams.	<a href="#">Connector Display Options</a> 
<b>Communication Colors (of Communication Messages)</b>	Set the colors of Messages you create in Communication diagrams.	<a href="#">Communication Message Colors</a> 
<b>XML Specifications</b>	Configure the settings for working with XML.	<a href="#">XML Specifications</a> 
<b>Source Code Engineering</b>	Set general options that apply to all languages when generating code from models, including the default language in which to generate code.	<a href="#">Source Code Engineering</a>

<b>Object Lifetimes</b>	Enable the creation of constructors and destructors for Object Lifetimes.	<a href="#">Object Lifetimes</a> 
<b>Attribute/Operations</b>	Set the system actions on attributes and operations.	<a href="#">Attribute/Operations</a> 
<b>Code language specifications</b>	Define how the system handles a particular language when generating code, including the default source directory and the default editor for a specific code language.	<a href="#">ActionScript</a>  <a href="#">C</a>  <a href="#">C#</a>  <a href="#">C++</a>  <a href="#">Delphi</a>  <a href="#">Java</a>  <a href="#">PHP</a>  <a href="#">Python</a>  <a href="#">Visual Basic</a>  <a href="#">VB.Net</a> 

### 3.10.1 General Options

You can control how the system behaves when you open a project, including setting the home directories and web pages the project refers to and how the Project Browser responds when items are selected in it.

**Access**   **Tools | Options (Ctrl+F9) | General**

Control system behavior

Field/Button	Action	See also
<b>Author</b>	Defaults to your user name as the name to which the <b>Author</b> field on the diagram or element Properties dialog defaults when objects are created and modifications are made.  Optionally, click on the drop-down arrow and select another name for the properties <b>Author</b> field to display.	<a href="#">General Tab</a> <sup>[824]</sup> <a href="#">General Settings</a> <sup>[958]</sup>
<b>Clipboard</b>	Click on the drop-down arrow and select the graphic format in which to save images to the Microsoft Windows clipboard; <b>Metafile</b> has the best detail.	<a href="#">Copy Image to Clipboard</a> <sup>[842]</sup> <a href="#">Edit Menu</a> <sup>[80]</sup>
<b>Double click on browser</b>	Defaults to <b>Shows Properties</b> (dialog) as the action the Project Browser takes when you double-click on an item.  Optionally, select the radio button for a different response that you want the Project Browser to make.	<a href="#">Set Default (Project Browser) behavior</a> <sup>[672]</sup>
<b>Use Jet 4.0 - requires restart</b>	Select the checkbox to set JET 4.0 as the database engine; this ensures compatibility with .EAP files that are in turn compatible with versions of MS Access later than Access 97, and that support unicode character sets.  If your project is not in a Jet 4.0 database, you should also download a copy of the <b>Jet 4.0 EABase Model</b> from the Sparx Systems website, and do a <b>.EAP to .EAP transfer</b> of your model into the Jet 4.0 file.  If the checkbox is not selected, the database engine is <b>Jet 3.5</b> .	<a href="#">Link to Jet 4.0 EABase Model</a> <a href="#">Perform a Project Data Transfer</a> <sup>[504]</sup>
<b>Use extended « and » characters</b>	The checkbox defaults to selected to apply the guillemet characters to stereotype names; recommended for double byte character sets.  Deselect the checkbox to hide the guillemet characters.	<a href="#">Stereotype Visibility</a> <sup>[1456]</sup>
<b>Allow custom RTF tags in reports</b>	Select the checkbox to use customized rich text format code in report templates when you generate reports <b>with the Legacy RTF Report Generator</b> .  In releases of Enterprise Architect from <b>7.0</b> onwards, with the notes-formatting facility, this option is not really necessary.	<a href="#">The Legacy RTF Report Generator</a> <sup>[2720]</sup> <a href="#">Notes Toolbar</a> <sup>[1143]</sup>
<b>Project Directory</b>	Type in the default directory location for the Enterprise Architect project files you create.	
<b>File Directory</b>	Type in the default directory name for the shared files you define on the Files tab of an element's Properties dialog (maximum 50 characters).	<a href="#">Associated Files</a> <sup>[988]</sup>

Field/Button	Action	See also
<b>Web Home</b>	Type in the URL of the default home page to open when you click on the <b>Home</b> button in the internal web browser.	<a href="#">The Web Browser</a> <sup>[170]</sup>
<b>Web Search</b>	Type in the URL of the default web page to open when you click on the <b>Web Search</b> button in the internal web browser.	
<b>Web Mail</b>	Type in the email server address ( <b>http://xxxxx/exchange/</b> ) for accessing email within Enterprise Architect, through the web browser.	
<b>Confirm Deletes</b>	The checkbox defaults to selected to display a confirmation prompt whenever you delete a model component.  Only clear this checkbox to bypass the prompt if you are an experienced user and have taken other measures to identify and recover from accidental deletes.	<a href="#">Delete Elements from Diagram and Model</a> <sup>[92]</sup> <a href="#">Delete Diagram</a> <sup>[839]</sup>
<b>Allow Free Sorting</b>	Select the checkbox to allow you to manually reorganize elements within a Package regardless of element type, in the Project Browser.	<a href="#">Order Package Contents</a> <sup>[672]</sup>
<b>Show Stereotypes</b>	The checkbox defaults to selected to display element and feature stereotype names as part of the object names in the Project Browser.  Deselect the checkbox to hide the stereotype names.	<a href="#">Set Default Behavior</a> <sup>[672]</sup>
<b>Always open maximized</b>	The checkbox defaults to selected to set Enterprise Architect to open in a full-screen (maximized) window on start-up.  Deselect the checkbox to set Enterprise Architect to open in a smaller window.	
<b>Hide Properties Info Section</b>	The checkbox defaults to selected to hide the properties information bar at the bottom of the element Properties <b>window</b> .  Deselect the checkbox to expose the information bar.	<a href="#">Properties Window</a> <sup>[992]</sup>
<b>Docked Windows Tabs on Bottom (requires restart)</b>	The checkbox defaults to selected to display any tabs on a <b>docked window</b> at the bottom of the window.  Clear the checkbox to show the window tabs at the top of the window.	
<b>Main Diagram Tabs at Bottom</b>	The checkbox defaults to selected to display the <b>diagram tabs</b> at the bottom of the Diagram View.	

Field/Button	Action	See also
<b>(requires restart)</b>	Clear the checkbox to show the tabs at the top of the Diagram View.	
<b>File Loading Strategy</b>	<p>Click on the drop-down arrow and select the model loading behavior for project files; choose either:</p> <ul style="list-style-type: none"> <li>• <b>Load on Demand (Lazy Load)</b></li> <li>• <b>Preload Entire Model</b></li> </ul> <p><b>Load on Demand</b> does not load the full project view when you load a model; instead, only the parts that are necessary to display the visible portion of the tree are loaded.</p> <p>This means that the model loads faster and you can begin work sooner, but at the expense of later small delays as the system loads specific portions of the model.</p> <p>For server connections, the <b>Load on Demand</b> option is automatically set when the connection is created.</p>	

#### Learn more

- [Local Options](#) <sup>604</sup>

### 3.10.2 Diagram Options

In order to maintain consistency in the format, layout and visibility of objects in your diagrams, you can define a number of default settings to apply to all diagrams that you display, whether you are creating them or reviewing them. You can change or reverse many of these default settings for your view of individual diagrams (whether you created them or another user created them), on the Diagram Properties dialog.

Access   **Tools | Options**   (Ctrl+F9)   | **Diagram**

#### Control diagram set up

Field/Button	Action	See also
<b>Default Page Size</b>	<p>Show (underneath the field name) the default page size for diagrams.</p> <p>You set the default page size using the <b>Page Setup</b> button (below).</p>	
<b>Page Setup</b>	<p>Click on this button to define the page dimensions for diagrams that you create.</p> <p>The Page Setup dialog displays, on which you set the page size, orientation, printer paper tray, and page margins.</p>	<a href="#">Set Up Diagram Page</a> <sup>870</sup>

Field/Button	Action	See also
<b>Print with Border</b>	Select the checkbox to set the default to printing a border on all diagrams you have created.	
<b>Landscape</b>	This checkbox is controlled from the Page Setup dialog. When selected, any diagrams that you create will default to being printed in landscape orientation.	
<b>Show Public Features</b> <b>Show Protected Features</b> <b>Show Private Features</b>	Select any or all of the checkboxes to automatically show Class features with the scope of public, protected and/or private on the diagrams you create.	
<b>Show Diagram Notes</b>	Select the checkbox to display, by default, the diagram details (name, parent package, version and author) in the top left corner of any new diagram that you create.  Selecting this checkbox sets the <b>Show Diagram Details</b> checkbox to selected on the Diagram Properties dialog for the new diagram.	<a href="#">Configure Diagram Display</a> <sup>[825]</sup>
<b>Use Opaque Diagram Labels</b>	Select any or all of the checkboxes to specify which renditions of your diagrams should have opaque diagram labels; <b>Screen</b> and <b>Printing</b> are most often applicable.  An opaque label is a connector or element label that, when the label overlaps the connector line or border, hides the line rather than allowing it to show through the label text.	
<b>Disable fully scoped object names</b>	Select this checkbox to disable the use of fully scoped object names for elements in a diagram; deselect the checkbox when the elements are in their home package.  A scoped object name has the format <i>MyClasses::foo</i> , where the :: character indicates that the Class is within another namespace.	
<b>Allow change of Created Date</b>	Select this checkbox to allow you to change the diagram creation date on any diagram, through the Diagram Properties dialog.	
<b>Zoom to best scale</b>	Select this checkbox to resize all diagrams that you open to neatly fit the monitor screen.	
<b>Auto-pan with middle mouse button</b>	Select this checkbox to turn on auto-panning using the middle mouse button. In this case, when you hold down the middle mouse button a <b>black</b> compass icon displays, and as you move the cursor away from this icon the diagram scrolls in that direction.	

Field/Button	Action	See also
	If you deselect the checkbox, when you hold down the middle mouse button a <b>white</b> compass icon displays, and as you move this icon the whole diagram moves with it across or up and down the screen.	
<b>Enable Connector line jumps</b>	Defaults to selected, so that solid-line connectors show 'hoop' icons or 'jumps' when they cross, on all diagrams that you open.  Deselect to disable line jumps so that connectors simply cross with no 'hoop' icon at the intersection.	<a href="#">Connector Styles</a> 
<b>Scale Saved Bitmaps to</b>	When you save a diagram as a bitmap, you can leave it scaled to 100% or click on the drop-down arrow and select to save the bitmap at a higher <i>resolution</i> of 200% or 400%, suitable for using in published works.	
<b>Image Memory Limit</b>	When you generate images for document or web reports or save images to file, the memory limit for storing this image defaults to 48 MB. If the image is beyond this limit, the system starts to scale down the image.  You can click on the drop-down arrow and select a lower or higher memory limit for the image files of your diagrams. A low memory setting means the system scales the image sooner.	
<b>Diagram Frames</b>	Click on any or all of the checkboxes to specify which saved images of your diagrams will automatically include a diagram frame around them - those saved to disk, those printed out, and/or those saved to the default system clipboard.  A diagram frame is a labeled outline around the diagram image, providing both a border and a reference.  These diagram frames are not the same as the Diagram Frame <b>element</b> in which you can enclose a diagram image or reference when you drag the diagram from the Project Browser onto another diagram.	<a href="#">Diagram Frame</a> 
<b>Show Tooltips</b>	Select the checkbox to display a tooltip when the cursor is 'rolled over' an element on a diagram you have opened.  If you have selected the <b>Show Tooltips</b> checkbox, select the checkbox against each item of information to be displayed as part of a tooltip.  If you select the <b>Notes</b> checkbox, consider whether the <b>Max Characters</b> value is appropriate to represent the text of your element <b>Notes</b> fields. This field defines the maximum number of characters of notes text included in the tooltip; if you want to show less text or more, reset the character limit accordingly.	

Field/Button	Action	See also
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.

- [Sequence Diagram Options](#) <sup>[629]</sup>

### 3.10.2.1 Diagram Theme Options

It is possible to apply a **theme** to all diagrams in the project that you display on your workstation; that is, how the diagrams and their contents appear when you display them in the Diagram View. By applying a theme you can change the color, font, gradient, line thickness and background image (**tile**). Each design helps bring your diagrams to life with brighter colors, better contrast and stylish new designs. As you select a theme, the appearance settings are immediately applied to any diagram that you have open. Enterprise Architect includes a number of basic built-in themes, which are useful to a wide range of users and are good examples of how a theme can enhance the diagrams that you have open.

You can also create your own themes, capturing the set of colors, text font, line thicknesses and/or gradient properties that you have **currently** defined in the Options dialog, on the:

- Gradients and Background page
- Standard Colors page
- Appearance page, and
- Links page

You select or deselect a checkbox for each set of properties you want to include or exclude, from the Options dialog pages.

**Access** **Tools | Options (Ctrl+F9) | Diagram | Themes**

### Configure themes for diagrams and elements

Field/Option/ Button	Action	See also
<b>Name</b>	Click on the drop-down arrow and select the theme you want to either: <ul style="list-style-type: none"> <li>• Apply as the default appearance of your diagrams</li> </ul>	

Field/Option/ Button	Action	See also
	<ul style="list-style-type: none"> <li>Edit (user-defined theme)</li> <li>Use as the base for a new user-defined theme, or</li> <li>Delete (user-defined theme)</li> </ul>	
<b>Delete</b>	<p>Click on this button to delete the selected user-defined theme.</p> <p>A prompt displays for you to confirm the deletion. Click on the <b>Yes</b> button.</p> <p>The <b>Name</b> field defaults to <b>High Contrast White</b>; click on the drop-down arrow and select another theme to apply instead of the deleted theme.</p>	
<b>Font</b>	<p>Select the check box to include the User Font <b>Font Face</b> and <b>Font Size</b> settings from the Appearance page of the Options dialog (click on the <b>Configure Default Element Fonts</b> button on the Appearance page to set these fields).</p> <p>Deselect the check box to retain the previous font applied <b>to the diagram</b>.</p>	<a href="#">Diagram Appearance Options</a> <sup>[622]</sup>
<b>Color</b>	<p>Select the check box to include the element, connector and diagram colors defined on the Gradients and Background page and the Standard Colors page.</p> <p>Deselect the checkbox to retain the previous set of colors applied <b>to the diagram</b>.</p>	<a href="#">Diagram Gradients and Backgrounds</a> <sup>[613]</sup> <a href="#">Standard Colors</a> <sup>[616]</sup>
<b>Line Thickness</b>	<p>Select the check box to include the <b>Default Element Border Width</b> from the Appearance page, and the <b>Pen Width</b> (for connector line thickness) from the Link page of the Options dialog.</p> <p>Deselect the checkbox to retain the previous set of line widths applied <b>to the diagram</b>.</p>	<a href="#">Diagram Appearance Options</a> <sup>[622]</sup> <a href="#">Links</a> <sup>[635]</sup>
<b>Gradient</b>	<p>Select the check box to apply the setting of the <b>Show Gradient Fill for Paper Color</b> checkbox (which applies a color gradient to the background color of the diagrams you display) and the <b>Gradient Fill Direction for an Element</b> field on the Gradients and Background page of the Options dialog.</p> <p>Deselect the checkbox to retain the previous color gradient settings applied <b>to the diagram</b>.</p>	<a href="#">Diagram Gradients and Backgrounds</a> <sup>[613]</sup>
<b>Background Image</b>	<p>Select the checkbox to incorporate the currently-set diagram background image in the theme.</p>	<a href="#">Diagram Gradients and Backgrounds</a> <sup>[613]</sup>
<b>Save</b>	<p>Click on this button to either:</p>	

Field/Option/ Button	Action	See also
	<ul style="list-style-type: none"> <li>Create a new user defined theme, or</li> <li>Save changes to an existing theme</li> </ul> <p>The Diagram Theme dialog displays for the theme name. Either:</p> <ul style="list-style-type: none"> <li>Type in a name for the theme and click on the <b>OK</b> button to create the new theme, or</li> <li>Simply click on the <b>OK</b> button and then click on the <b>Yes</b> button to save the updates to the theme under the same theme name</li> </ul>	
<b>Close</b>	<p>Click on this button to close the Options dialog.</p> <p>If you have <b>edited</b> an existing theme, this applies all changes to the theme to the diagrams you have open.</p>	

**Notes**

- You cannot edit or delete a **built-in** theme; you can use a built-in theme as the base for a user-defined theme
- A theme draws its properties from other pages of the Options dialog, therefore if you select the **Gradient** checkbox the theme will apply the status of the **Show Gradient Fill for Paper Color** checkbox on the Gradients and Background page, when that status might be **disabled** because you have applied a background tile image

**3.10.2.2 Diagram Gradients and Backgrounds**

When reviewing the diagrams in your model, you have a range of options for managing the display and appearance of the diagrams and their contents. These options include setting the **color** and **shading** of the diagram and elements, and the style of the page border of the diagram. You can also, instead of using the color wash, select a **tiled** background image for the diagrams you display, from a set of system-supplied images or from images that you have created or downloaded to a local system folder yourself.

**Access**    **Tools | Options (Ctrl+F9) | Diagram | Gradients and Background**

**Set diagram backgrounds and shading**

Field/Option/ Button	Action	See also
<b>Diagram Background</b>		
<b>Tile</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Type in the file path for a .jpg, .bmp or .png graphics file to use as a background for all your diagrams, or</li> <li>Click on the <b>Select Tile</b> button to the right of the field and select a file (by default from the Enterprise Architect supplied tiles folder, but you can browse to any other file location for the required file)</li> </ul>	

Field/Option/ Button	Action	See also
	<p>The selected background is immediately applied to any diagrams you have open, and the field displays the location of the background graphic file, such as:</p> <p style="padding-left: 40px;">C:\Program Files\Sparx Systems\EA\BackgroundTiles\Aqua_03.jpg</p> <p>If you no longer want to apply a background tile to your diagrams, click on the <b>Clear File</b> button to clear the field.</p>	
<b>Paper</b>	<p>Click on the drop-down arrow to change the <b>background</b> color of the <b>diagrams</b> you display.</p> <p>This field is disabled if you have selected a background tile (above). The field is re-enabled when the file path is deleted from the <b>Tile</b> field.</p>	
<b>Page Border Style</b>	<p>Click on the drop-down arrow and select the option for the type of page border you want to use when displaying diagrams on your monitor. You can choose from:</p> <ul style="list-style-type: none"> <li>• <b>Solid</b> (the default) - pages are framed by a solid dark gray line on the screen</li> <li>• <b>Dash</b> - pages are framed by a broken dark gray line</li> <li>• <b>Dash (with white line)</b> - pages are framed by a broken dark gray line on a solid pale background</li> <li>• <b>Dot</b> - pages are framed by a dotted dark grey line</li> <li>• <b>Dot (with white line)</b> - pages are framed by a dotted dark gray line on a solid pale background line</li> <li>• <b>Chiselled</b> - pages are framed by a thin black line bordered by a thicker dark gray line to the right or below</li> </ul> <p>If you cannot see the page border on a diagram, right-click on the diagram and select the <b>Properties</b> option, then check that the <b>Hide Page Border (All Diagrams)</b> option is <i>not</i> selected and that the <b>Show Page Border (Current Diagram)</b> is selected.</p>	<a href="#">Configure Diagram Display</a> <sup>825</sup>
<b>Show Gradient Fill for Paper Color</b>	<p>Select the checkbox to apply a color <b>gradient</b> to the background color of the diagrams you display. You set the background color itself in the <b>Paper</b> field (above).</p> <p>Deselect the checkbox to apply the background color uniformly to the diagram background.</p> <p>This checkbox is disabled if you have selected a background tile (above). The checkbox is re-enabled when the file path is deleted from the <b>Tile</b> field.</p>	
<b>Element Fill</b>		

Field/Option/ Button	Action	See also
<b>Gradient Fill Direction For an Element</b>	<p>Click on the drop-down arrow and select the <b>direction</b> of the color gradient applied to the <b>element</b> fill color.</p> <p>Select <b>&lt;none&gt;</b> to apply the element fill color uniformly to the element, with no color gradient.</p>	
<b>Gradient Style for Element</b>	<p>Click on the drop-down arrow and select the <b>style</b> to apply to the element fill color gradient. The options apply:</p> <ul style="list-style-type: none"> <li>On the left or upper edge of each element, a band of the gradient color that fades in the fill direction defined above, and that has an angled line or curve on the inner boundary</li> <li>On the right or lower side of each element, a band of the gradient color that fades at 90 degrees to the gradient direction defined above</li> </ul> <p>Select <b>&lt;none&gt;</b> to have a single band of color fading across the element in the fill direction (above).</p>	
<b>Fill</b>	<p>Click on the drop-down arrow and select the <b>fill</b> color of all <b>elements</b> (except Screen elements and Notes) on the diagrams you display.</p> <p>You can also change the element fill color on the Standard Colors page, where you can define the fill color of Screen and Notes elements as well.</p> <p>You can quickly make fill color changes using the <b>Hue</b>, <b>Saturation</b> and <b>Luminosity</b> fields, below, in combination. The <b>Fill</b> field reflects the color changes as you make them, but having a diagram open with large elements also shows the changes immediately and very clearly.</p>	<a href="#">Standard Colors</a> 
<b>Revert</b>	Click on this button to reset the fill color to the previously saved color. If you have been testing new colors but have not closed and re-opened the Options dialog, you can return to the color you originally changed from.	
<b>Hue</b>	Click on the slider icon and drag it along the line to set the basic primary color or combination of two primary colors. The numerical value of the color (the <b>H</b> value in the HSL code) displays in the field to the right of the slider.	
<b>Saturation</b>	Click on the slider icon and drag it along the line to set the color saturation (the degree of grayness in the color). The numerical value of the saturation (the <b>S</b> value in the HSL code) displays in the field to the right of the slider.	
<b>Luminosity</b>	Click on the slider icon and drag it along the line to set the color luminosity (the degree of light in the color, from none (black) to full (white)). The numerical value of the luminosity (the <b>L</b> value in the HSL code) displays in the field to the right of the slider.	

Field/Option/ Button	Action	See also
<b>Gradient Options</b> (ineffective if the <b>Gradient Fill Direction For an Element</b> field is set to <none>)		
<b>Tint Amount</b>	<p>Click on the slider icon and drag it along the line to set the degree of tint in the color gradient. Moving from the left end the slider sets completely black at the top of the gradient, through no tint to completely white at the top of the gradient.</p> <p>The percentage tint displays in the field to the right of the slider, showing <b>-50%</b> for the left end of the slider, <b>0%</b> (the default) in the center and <b>50%</b> at the right end.</p> <p>To reset the <b>Tint Amount</b> to the system default (which is a slight, dusky gradient), click on the <b>Default</b> button.</p>	
<b>Fill Amount</b>	<p>Click on the slider icon and drag it along the line to set the degree of fill of the gradient. From the left end the slider sets, effectively, no gradient (<b>0%</b>) through to starting the gradient immediately at one edge of the element and building right across the element (<b>100%</b>).</p> <p>The percentage gradient fill displays in the field to the right of the slider.</p> <p>To reset the <b>Fill Amount</b> to the system default (<b>80%</b>), click on the <b>Default</b> button.</p>	
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.

### 3.10.2.3 Standard Colors

On a model diagram, the objects and texts are rendered in the system default colors. You can **change** any of these default colors to either one of a range of standard colors, or a color that you define yourself. Another user viewing the same model diagrams will still see the diagrams in either the standard default colors or colors **that** user has selected for their own use.

If you define and select a 'non-standard' color for an object type, that color is shown in the color pallet whilst it is the selected color for that object type. If you then select a different color, the non-standard color is no longer available in the pallet. You can, however, define up to 16 **custom** colors that are **permanently available** to use in changing the appearance of individual elements, through the Default Appearance dialog and diagram Format Toolbar.

**Access**   **Tools | Options (Ctrl+F9) | Diagram | Standard Colors**

#### Set the Color of an Object Type

The top 14 fields on the Standard Colors page each shows a color strip displaying the currently-set color for the corresponding type of object or feature, and a down-arrow.

Step	Action
1	<p>On the selected field, click on the down arrow.</p> <p>A color pallet displays, showing a small range of standard colors and, if the object is currently set to a <b>non-standard</b> color, an additional square to the right of the <b>Other</b> button to show that color.</p>
2	<p>If the color you want to use is shown on the pallet, click on it to select it and to return to the Standard Colors page.</p>
3	<p>If the color you want to use is not shown, click on the <b>Other</b> button.</p> <p>The Color dialog displays showing the Standard tab, offering a larger range of standard colors.</p>
4	<p>If the color you want to use is shown on the pallet, click on it to show that color in the New panel and (optionally) compare it with the currently-set color in the Current panel.</p> <p>Click on the <b>OK</b> button to set the selected color and to return to the Standard Colors page.</p>
5	<p>If a suitable color is not available in the extended pallet, click on the Custom tab. This contains:</p> <ul style="list-style-type: none"> <li>• A spectrum panel, with a 'sampler' icon; move the icon around the panel to change the color shown in the New panel</li> <li>• A Luminosity bar; move the arrow on the right up and down to change the intensity of the color shown in the New panel</li> <li>• <b>Hue</b>, <b>Sat</b>(uration) and <b>Lum</b>(inosity) (HSL) fields, and <b>Red</b>, <b>Green</b> and <b>Blue</b> (RGB) fields; type and increment or decrement the decimal values to either: <ul style="list-style-type: none"> <li>• make slight modifications to a color or</li> <li>• exactly define a color for which you know the HSL and/or RGB values</li> </ul> </li> </ul> <p>As you define the color it changes in the New panel; (optionally) compare it with the currently-set color in the Current panel and adjust it as necessary.</p> <p>When you have defined your color, click on the <b>OK</b> button to select it and to return to the Standard Colors page.</p>
6	<p>As an alternative to selecting a standard color or defining a new one, you can capture a color that is used elsewhere on your <b>current</b> monitor screen.</p> <p>Click on the <b>Select</b> button to redisplay the cursor as an 'eye-dropper' icon; move this around the screen to the color you want to sample.</p> <p>Position the cursor so that the color is under the tip of the 'eye-dropper' and shown in the New panel.</p> <p>Click the left mouse button to capture the color, then click on the <b>OK</b> button to select it and to return to the Standard Colors page.</p>
7	<p>Click on the <b>Close</b> button to save your changes and close the Options dialog.</p>

**Object Types for which to set Colors on all diagrams you display**

Field	Effect	See also
<b>Element</b>		
<b>Fill</b>	<p>Define the <b>fill</b> color of all <b>elements</b> (except Screen elements and Notes - see below) on the diagrams you display.</p> <p>This color can also be <b>changed</b> on the Gradients and Backgrounds page, and <b>overridden</b> by any other fill color definition in your model, such as the Format Toolbar fill setting, element default appearance, Template Element package or stereotype definition.</p>	<a href="#">Diagram Gradients and Backgrounds</a> <sup>[613]</sup>
<b>Line</b>	Define the <b>line</b> color of all element <b>borders</b> on the diagrams you display.	
<b>Text</b>	Define the <b>font</b> color of <b>element text</b> and labels on the diagrams you display (including Text elements).	
<b>Shadows</b>	Define the color of element <b>outline shadows</b> on the diagrams you display (including Notes).	
<b>Attributes</b>	Define the <b>font</b> color of <b>attribute text</b> in the attribute <b>compartment</b> of all elements on the diagrams you display.	
<b>Methods</b>	Define the <b>font</b> color of method ( <b>operation</b> ) <b>text</b> in the operation <b>compartment</b> of all elements on the diagrams you display.	
<b>Behaviors</b>	Define the color for <b>behaviors</b> in <b>Activity</b> diagrams you display.	
<b>Notes</b>	Define the color of <b>text</b> in the element <b>notes compartment</b> of all elements on the diagrams you display.	
<b>Screen</b>	Define the <b>fill</b> color of <b>Screen</b> elements on <b>User Interface</b> diagrams you display.	
<b>Note &amp; Constraint Elements</b>		
<b>Fill</b>	Define the <b>fill</b> color of <b>Note</b> and <b>Constraint</b> elements on the diagrams you display.	
<b>Text</b>	Define the <b>font</b> color of Note and Constraint <b>text</b> on the diagrams you display.	

Field	Effect	See also
<b>Note Line</b>	Define the <b>line color</b> of the borders on <b>Note</b> elements on the diagrams you display.	
<b>Constraint Line</b>	Define the <b>line color</b> of the borders on <b>Constraint</b> elements on the diagrams you display.	
<b>Others</b>		
<b>Connector Lines</b>	Define the <b>line color</b> of all <b>connectors</b> on the diagrams you display.	

### Notes

- To override the default appearance of a **specific** element on **all diagrams** on which it is found, right-click on the element and select the **Appearance | Default Appearance** context menu option; the Default Appearance dialog displays
- To change the appearance of a specific element on the **current** diagram only, use the Format Toolbar; which automatically displays at the top of every diagram.

### Learn more

- [Create Custom Colors](#)<sup>[619]</sup>
- [Format Toolbar](#)<sup>[785]</sup>

#### 3.10.2.3.1 Create Custom Colors

If the standard colors available through the color palettes do not meet your requirements, you can define up to 16 custom colors that you apply to individual elements and connectors through the diagram Format Toolbar, Connector Appearance dialog and element Default Appearance dialog.

By applying such custom colors within a template diagram, you can render all elements of the same type with the same custom color, for all users of the project.

If another user has a set of custom colors that you want to use, or a project manager has defined colors specifically for the project, they can export these colors to the project file and you can then **import** them directly as your custom color pallet. If you have your own colors in the pallet, they are overwritten by the imported set.

**Access** **Tools | Options (Ctrl+F9) | Standard Colors: Define Colors**

### Define your custom colors

Step	Action	See also
<b>1</b>	On the Color dialog, click on the <b>Define Custom Colors »</b> button.	

Step	Action	See also
	The Color dialog is extended to provide color selection fields on the right of the dialog.	
2	<p>Click on an empty block in the <b>Custom colors</b> pallet (or, if you are <i>replacing</i> a color, click on that color block in the pallet) and on the:</p> <ul style="list-style-type: none"> <li>• Spectrum panel, move the 'sampler' icon around the panel to change the color shown in the <b>Color Solid</b> box</li> <li>• Luminosity bar, move the arrow on the right up and down to change the intensity of the color shown in the <b>Color Solid</b> box</li> <li>• <b>Hue</b>, <b>Sat</b>(uration) and <b>Lum</b>(inosity) (HSL) fields, and <b>Red</b>, <b>Green</b> and <b>Blue</b> (RGB) fields; type decimal values to either: <ul style="list-style-type: none"> <li>• make slight modifications to a color or</li> <li>• exactly define a color for which you know the HSL and/or RGB values</li> </ul> </li> </ul> <p>As you define the color it changes in the <b>Color Solid</b> box.</p>	
3	When you have finished creating the color, click on the <b>Add to Custom Colors</b> button to add the color to the selected <b>Custom colors</b> block.	
4	Repeat steps 2 and 3 for any other custom colors you want to define.	
5	Click on the <b>OK</b> button to close the Color dialog.	
6	<p>To make the custom colors available for your use, select the <b>Show Project Custom Colors in Color Combo Boxes</b> checkbox.</p> <p>The 16 squares dedicated to custom colors are displayed at the end of the color selection pallets on the diagram Format Toolbar, Connector Appearance dialog and element Default Appearance dialog.</p>	<a href="#">Format Toolbar</a> <a href="#">Set an Element's Default Appearance</a> <a href="#">Connector Appearance Options</a>
7	Click on the <b>Close</b> button to close the Options dialog.	

### Notes

- For changes to the custom colors to be reflected in the Format Toolbar pallets, you might need to close and re-open the model and reset the Toolbar (**Tools | Customize > Toolbars**, select the **Format Tool** checkbox and click on the **Reset** button)
- If you want to export your colors to the project file to make them available for others to import, use the **Settings | Colors | Set Project Colors** menu option
- If you want to import someone else's colors from the project file as your custom colors, use the

**Settings | Colors | Get Project Colors** menu option

[Learn more](#)

- [Get/Set Custom Project Colors](#)<sup>[62]</sup>

### 3.10.2.3.2 Get/Set Custom Project Colors

If more than one person is working on a project, you might want to share a set of custom colors with other team members, or possibly provide special colors for use across the whole project. You would then:

- Capture the custom or project colors you have defined, in the project file, or
- Retrieve a set of colors someone else has defined, from the project file

**Access**    **Settings | Colors | Set Project Custom Colors**  
**Settings | Colors | Get Project Custom Colors**

#### Set custom project colors in the project file

Step	Action	See also
1	Define the custom colors on the Standard Colors page of the Options dialog.	<a href="#">Create Custom Colors</a> <sup>[61]</sup>
2	Select the <b>Set Project Custom Colors</b> option. The following message displays: <i>Project Custom Colors export successful. 16 custom colors saved to the project file.</i>	
3	Click on the <b>OK</b> button. Notify the appropriate users that the colors are available for importing.	

#### Get project custom colors from the project file

Step	Action	See also
1	Select the <b>Get Project Custom Colors</b> option. The following message displays: <i>Project Custom Colors import successful. 16 custom colors imported from the project file.</i>	
2	The custom colors are now available at the end of the color pallets of the Default Appearance dialog, of the Connector Appearance dialog and of the Font Color, Fill Color and Line Color drop-downs in the diagram Format Toolbar.	<a href="#">Set an Element's Default Appearance</a>

Step	Action	See also
	If the colors do not show, select <b>Tools   Options   Standard Colors</b> and select the <b>Show Project Custom Colors in Color Combo Boxes</b> checkbox.	 <a href="#">Format Toolbar</a> 

### 3.10.2.4 Diagram Appearance Options

It is possible to configure the appearance of diagrams and elements in your models; that is, how diagrams and their contents appear when displayed in the Diagram View. There is a wide range of options you can set to create this display configuration. As you select an option, it has immediate effect on any diagram that you have open, so you can see what the change in appearance is.

**Access** **Tools | Options (Ctrl+F9) | Diagram | Appearance**

#### Configure the appearance of diagrams and elements

Field/Button	Action	See also
<b>Configure Default Element Fonts</b>	Click on this button to set the default text fonts to use on diagrams either across the model or that you have created yourself. A font defined across the model overrides the font for diagrams you create yourself.	<a href="#">Set Default Fonts</a> 
<b>Renderer</b>	<p>Render smooth curves and diagonal lines in diagrams, so that staggered vertical or horizontal pixels are less obvious. Click on the drop-down arrow and select the type of renderer you prefer to use:</p> <ul style="list-style-type: none"> <li><b>Basic</b> is GDI32; it does not provide anti-aliasing and gradient fills</li> <li><b>Enhanced-1</b> is parallel to Windows GDI+ but internal to Enterprise Architect; it provides anti-aliasing and gradient fills, and operates well across different platforms</li> <li><b>Enhanced-2</b> is Windows GDI+; this can vary across different platforms, performing better than <b>Enhanced-1</b> in some environments, and less well in others</li> </ul> <p>Experiment with these options and see which works best for your system and requirements.</p>	
<b>GDI Plus Metafiles</b>	<p>This checkbox defaults to selected, to include the use of GDI+ metafiles in your diagrams.</p> <p>Deselect the checkbox if you do not want to use GDI+ metafiles.</p>	
<b>Default Element Border Width</b>	Click on the drop-down arrow and select the default element border width (1, 2 or 3 pixels).	

Field/Button	Action	See also
<b>Scale view by</b>	<p>Click on the drop-down arrow and select the percentage (from 0 to 50, in increments of 10) by which you can automatically increase the size of all objects on a diagram you are viewing, without affecting other users reading that diagram.</p> <p>You can perform the same function with the <b>Zoom Slider</b> on the Status bar; changes in the 'zoomed' display scale of a diagram update this field and affect any other diagrams that you open.</p> <p>This has no impact any other diagram Zoom facility in the system.</p>	<a href="#">Status bar</a> <sup>1501</sup>
<b>Print in Color</b>	<p>Select the checkbox to print your diagrams in color.</p> <p>Deselect the checkbox to print the diagrams in black and white.</p>	
<b>Anti-aliased text</b>	<p>Select the checkbox to force text anti-aliasing in diagrams.</p> <p>If you deselect the checkbox, the system applies the MS Windows default setting. Therefore, if you do not want to use anti-aliasing, ensure that the Windows anti-aliasing default is <b>also</b> set to <b>OFF</b>.</p>	
<b>Compress text to fit within Element</b>	<p>Select the checkbox to compress element text within the current element boundaries, when text at <i>zoom</i> levels other than 100% would not fit inside those boundaries.</p> <p>Deselect the checkbox to expand the element boundaries under those conditions.</p>	
<b>Italic Note Element Text</b>	Select the checkbox to display the text of Note elements in italics.	
<b>Use Element Group Style</b>	<p>Select the checkbox to apply a different fill color to each object type, with objects derived from a common element having the same color (for example, Object, Boundary, Control and Lifeline elements are the same color).</p> <p>Overrides all other settings for element fill colors.</p>	
<b>Bold Element Names</b>	Select the checkbox to display element names in bold text.	
<b>Element Shadows On</b>	Select the checkbox to display a shadow around the bottom and right edges of each element in a diagram.	
<b>Invert rotated text for metafiles</b>	Select the checkbox to use a different text format when external metafile readers are causing issues.	
<b>Round edges for elements</b>	Select the checkbox to soften the corners of all elements that have a rectangular appearance, so that they have rounded corners.	

Field/Button	Action	See also
<b>Hand Draw Mode Font</b>	Click on the drop-down arrow and select the font to be used in any diagram you display that has the <b>Hand Drawn</b> diagram option selected.	<a href="#">Configure Diagram Display</a> <sup>825</sup>
<b>Default</b>	Click on this button to re-set the font you see used in hand-drawn diagram mode to the system default (Segoe Print).	
<b>Italic</b>	For diagrams displayed in Hand Draw mode, select this checkbox to display text in italics.	
<b>Use Watermark</b>	Select the checkbox to add a watermark to any diagrams that you print.	
<b>Text</b>	Type in the text to use as watermark text. If the <b>Use Watermark</b> checkbox is selected, this text is displayed on any diagrams that you print.	
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.	

#### 3.10.2.4.1 Set Default Fonts

A diagram in your model uses a standard font that is applied either to all diagrams every user displays across the model, or to any diagrams you display that you created yourself.

You can define both Model and User fonts, but the Model font overrides the User font, to ensure that all members of the project team have a consistent and coherent view of the model. This avoids the problem of one user creating a diagram in a small font, and another user trying to view it in a larger font, which distorts the diagram.

It is recommended that a project authority sets the Model font, and all project members abide by it and do not change it without project approval. In editions where security is enabled, changes can be restricted by allocating permission only to the project authority.

**Access** **Tools | Options (Ctrl+F9) | Diagram | Appearance: Configure Default Element Fonts**

#### Control default diagram fonts

Field/Button	Action	See also
<b>Model Font : Font Face</b>	Click on the drop-down arrow and select the <b>font typeface</b> to apply across the model.	

Field/Button	Action	See also
<b>Model Font : Font Size</b>	Click on the drop-down arrow and select the <b>font size</b> to apply across the model.	
<b>Clear</b>	Click on this button to clear the model <b>Font Face</b> and <b>Font Size</b> fields.	
<b>User Font: Font Face</b>	Click on the drop-down arrow and select the <b>font typeface</b> to apply to <b>your</b> diagrams if no model font is specified.	
<b>User Font: Font Size</b>	Click on the drop-down arrow and select the <b>font size</b> to apply to <b>your</b> diagrams if no model font size is specified.	
<b>Restore Defaults</b>	Click on this button to restore the system defaults to the user <b>Font Face</b> and <b>Font Size</b> fields.	

#### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Project Settings** permission to set, change or clear the **Model Font** fields
- Both model and user fonts are overridden by specifically-defined element fonts, so that the element is viewed as designed regardless of the model or user defaults; to define the font for a specific element, right-click on the element in a diagram and select the **Appearance | Set Font** context menu option
- If you cannot read the diagrams because the default font makes the objects and text too small, you can scale up all objects (that is, all diagram displays) to a more readable size for you only; the objects are not scaled up for other users

Everything on the diagram is enlarged to the same extent, so it remains in proportion and readable; to do this, return to the Diagram Appearance page of the Options dialog and enter a suitable percentage value in the **Scale view by** field

### 3.10.2.5 Diagram Behavior Options

As you create and edit diagrams in your model, the system can respond in different ways to the types of object you are adding to a diagram. You can configure a range of options to control what response the system makes to the object you are adding or the action you are performing.

**Access**   **Tools | Options (Ctrl+F9) | Diagram | Behaviour**

Control diagram behavior

Field/Button	Action	See also
<b>Auto Instance</b>	<p>Select the checkbox to automatically create <b>object instances</b> when dragging certain element types - such as Class and Component - from the Project Browser onto the diagram, with the dragged element as the classifier.</p> <p>Deselect the checkbox to paste the element as a link.</p>	<a href="#">Paste from Project Browser</a> 833
<b>Instance has Classifier style</b>	<p>Select the checkbox to automatically apply the <b>classifier style</b> of the element from which an instance is instantiated, when the instance is created either through the Paste Element dialog or when <b>Auto Instance</b> is selected.</p> <p>The classifier style is the default appearance of the classifier, such as fill color and text font.</p>	
<b>Show Life Lines</b>	<p>Select the checkbox to adjust the alignment of life lines for Sequence elements.</p>	
<b>Layout uses all relations</b>	<p>Select the checkbox to automatically take connectors of all types into account when you lay out the diagram; deselect the checkbox to ignore Association connectors in automatically laying out the elements.</p> <p>The elements with Association connectors are moved as if they do not have those relationships, although the connectors themselves are still depicted on the diagram.</p> <p>This option acts through the <b>Diagram   Layout Diagram</b> command, and through the <b>Digraph</b> option of the Layout Tools window (<b>Diagram   Diagram Layout</b>).</p>	<a href="#">Layout Diagrams</a> 874
<b>Auto Save Changes</b>	<p>Select the checkbox to automatically save your changes as you work. No prompts are displayed asking you to save the changes.</p> <p>Deselect the checkbox to display prompts to save your changes when you attempt to close the diagram without having saved it.</p>	
<b>Show 'Hidden' Parents</b>	<p>Select the checkbox to list each element's parent elements that are not already part of the diagram, in the top right corner of the element in the diagram.</p> <p>Deselect the checkbox to not list the parent elements.</p>	<a href="#">Set Element Parent</a> 908
<b>Auto Group Elements</b>	<p>Select the checkbox to also move contained elements when you are moving their container elements. Deselect the checkbox to move the container elements independently.</p>	

Field/Button	Action	See also
	You can toggle to the <b>opposite</b> setting of this option when moving an element on a diagram, by pressing and holding ( <b>Alt</b> ).	
<b>Show Linked Items in Package</b>	<p>Select the checkbox to include external elements in the package contents list in a package element on a diagram. For this to take effect, the <b>Package Contents</b> checkbox must be selected on the Elements tab of the Diagram Properties dialog for the diagram.</p> <p>Deselect the checkbox to omit external elements from the list.</p>	<a href="#">Define Element Characteristics</a> <small>[828]</small>
<b>Show Package Item Scope</b>	<p>Select the checkbox to display the scope indicators (such as <b>+</b>, <b>#</b> and <b>-</b>) against the elements in the contents list within a package element. For this to take effect, the <b>Package Contents</b> checkbox must be selected on the Elements tab of the Diagram Properties dialog for the diagram.</p> <p>Deselect the checkbox to hide these indicators in the list.</p>	<a href="#">Modeling Conventions</a> <small>[2080]</small> <a href="#">Define Element Characteristics</a> <small>[828]</small>
<b>Shift-Mouse Autoscroll</b>	Select the checkbox to enable you to press and hold ( <b>Shift</b> ) and press the middle mouse button while you move the mouse, to autoscroll around diagrams.	
<b>Use Automatic SubActivities</b>	Select the checkbox to automatically create a new Structured Activity element when you drag one Activity diagram from the Project Browser onto another Activity diagram, and select the <b>Hyperlink</b> option.	<a href="#">Structured Activity</a> <small>[1338]</small> <a href="#">Diagram Frame</a> <small>[1296]</small>
<b>Always Highlight Context Element</b>	<p>Select the checkbox to show a hatched border around any element when you select it, along with the tracking handles (see <b>Tracking Handle Size</b> below).</p> <p>Deselect the checkbox to show only the tracking handles when you select an element.</p>	<a href="#">Highlight Context Element</a> <small>[930]</small>
<b>Objects Snap to Grid</b>	<p>Select the checkbox to make all elements on a diagram always align with the nearest grid point.</p> <p>Deselect the checkbox to position elements at a precise point regardless of the grid.</p>	
<b>Show Grid</b>	<p>Select the checkbox to display the grid points as pale gray dots. If you specify a large grid size (below) the grid points can be hard to see.</p> <p>Deselect the checkbox to hide the grid points.</p>	

Field/Button	Action	See also
<b>Grid Size</b>	<p>If you have selected the <b>Objects Snap to Grid</b> checkbox, type in the separation of the grid points, in pixels.</p> <p>If you deselect the <b>Objects Snap to Grid</b> checkbox the value is grayed out, but it remains in the field and is applied again if you re-select the checkbox.</p>	
<b>Auto Tidy</b>	Select the check box to automatically tidy line angles for custom connectors; this 'nudges' the custom line into horizontal and vertical increments.	<a href="#">Connector Styles</a> [1117]
<b>Tidy line gap</b>	Type in the maximum distance, in pixels, that the <b>Auto Tidy</b> option (above) can adjust the end point of a non-orthogonal line to make it orthogonal, for custom connectors.	<a href="#">Connector Styles</a> [1117]
<b>Alias only</b>	<p>Select the radio button to display, on elements with aliases, the alias instead of the element name.</p> <p>This option and the next two options take action on diagrams for which the <b>Use Alias if Available</b> checkbox is selected on the Diagram Properties dialog.</p>	<a href="#">Configure Diagram Display</a> [825]
<b>Alias and Name</b>	Select the radio button to display, on elements that have aliases, both the element name and the Alias in the format <i>(Alias) name</i> .	
<b>Use alias field for role</b>	Select the checkbox to use the <b>Alias</b> property of instances of elements to show the <b>Role</b> property.	
<b>Enable Presentation Mode</b>	<p>Select the checkbox to display your diagrams in <b>Presentation Mode</b>.</p> <p>In Presentation Mode, you can display a diagram in a presentation and, when you click on an element on the diagram, the element is highlighted with a solid colored border. This provides a more visually appealing highlight of the element you are discussing.</p> <p>In Presentation Mode, the 'tracking handles' (below) are hidden.</p>	
<b>Highlight</b>	<p>Click on the drop-down arrow and select the color in which to highlight elements in Presentation mode.</p> <p>You can select either:</p> <ul style="list-style-type: none"> <li>• One of the available colors</li> <li>• The <b>Other</b> button, or</li> <li>• (If you have previously changed the color) the <b>Default</b> color button (Aqua)</li> </ul>	<a href="#">Standard Colors</a> [616]

Field/Button	Action	See also
	<p>The <b>Other</b> button displays the Colors dialog, from which you can select a preset color from the Standard tab or define a custom color on the Custom tab.</p> <p>Click on the <b>OK</b> button to apply the new color as the highlight in diagram presentations.</p>	
<b>Tracking Handle Size</b>	<p>Click on the drop-down arrow and select the size of the 'size change handles' or 'tracking handles' on an element, connector or label in a diagram. These display when you click on the object to select it.</p> <p>You can select:</p> <ul style="list-style-type: none"> <li>• <b>Small</b> (the default, 8 pixels)</li> <li>• <b>Medium</b> (12 pixels), or</li> <li>• <b>Large</b> (16 pixels)</li> </ul> <p>If <b>Enable Presentation Mode</b> (above) is selected, the 'tracking handles' are hidden. You can still expand or contract the element by dragging on the corners, ends or mid-points of the object.</p>	
<b>Color</b>	<p>Click on the drop-down arrow and select the fill color of the 'tracking handles' (above) from the list:</p> <ul style="list-style-type: none"> <li>• <b>White</b></li> <li>• <b>Light Gray</b></li> <li>• <b>Dark Gray</b> or</li> <li>• <b>Black</b></li> </ul>	
<b>Close</b>	Click on this button to save your changes and close the Options dialog.	

#### Notes

- If you have a diagram open when you reset any of these diagram behavior options, you might need to close the diagram and open it again to see the effect

### 3.10.2.6 Sequence Diagram Options

When you are modeling using Sequence diagrams, there are a number of rendering features that are specific to that diagram type, such as the focus of the control indicator. You can define default settings for these features, in addition to the more-general diagram settings that you define on the other diagram pages of the Options dialog.

Access   **Tools | Options (Ctrl+F9) | Diagram | Sequence**

**Control display of Sequence diagrams**

Field/Button	Action	See also
<b>Message Spacing</b>	Type in the vertical gap (in points, between 15 and 45) to maintain between Sequence Messages.  This spacing can be overridden manually by dragging a Message up or down.	
<b>Default page layout is Landscape</b>	Select the checkbox to set the default orientation of your Sequence diagrams to landscape.	
<b>Show Sequence Numbering</b>	Select the checkbox to display sequence numbers against the Sequence Messages on the diagrams. (This option has immediate effect.)	
<b>Assume right to left messages are Return</b>	Select the checkbox to automatically render <b>new</b> Messages passing from right to left as Return Messages.	
<b>Default concurrency is Asynchronous</b>	Select the checkbox to set the default concurrency for Sequence Messages to <b>Asynchronous</b> .  Deselect the checkbox to set the default concurrency to <b>Synchronous</b> .	<a href="#">Message (Sequence Diagram)</a> 
<b>Enable tooltips when re-ordering messages</b>	Select the checkbox to display a tooltip when you attempt to move one Message above or below another. The tooltip is to remind you that to swap the Message positions, and thus re-order the Messages, you must hold down the <b>Alt</b> key.  If you do not hold down the <b>Alt</b> key the selected Message will move close to the next Message but will not go past it.  To avoid displaying the tooltip, deselect the checkbox. This is only advisable if you are familiar with the requirement to use the <b>Alt</b> key.	<a href="#">Layout of Sequence Diagrams</a> 
<b>Width</b>	Click on the drop-down arrow and select the line width (in points, between <b>0</b> and <b>20</b> ) of the 'focus of control' rectangle (the body at the start and end of a Message, on the Lifeline).  (This option takes effect when a new element is added, an existing element is repositioned, or the diagram is closed and re-opened.)	
<b>Assume message returns</b>	Select the checkbox to set implicit Return Messages when none are explicitly drawn (recommended).  Deselect the checkbox to use Return Messages only when they are explicitly created.	

Field/Button	Action	See also
<b>GarbageCollect</b>	Select the checkbox to automatically truncate the Lifelines for elements that have a defined lifecycle, by drawing an <b>X</b> after the last Message (that is, assume garbage collect rather than explicit delete).	<a href="#">Denote Lifecycle of an Element</a> <small>[1251]</small>
<b>Name</b>	Click on the ( ... ) button to display the MS Windows Font dialog, and define how the caption bar text (above the Sequence diagram) is rendered. The caption bar shows each element name immediately above its element in the diagram.  This feature is particularly useful for non-English character sets.  Changes take effect immediately after the Options dialog is closed.	
<b>Size</b>	Click on the drop-down arrow and select the font size of the caption bar text.  This overrides the font size set in the MS Windows Font dialog, above.	
<b>Use System</b>	Select this check box to override (but not overwrite) the <b>Name</b> and <b>Size</b> settings with the system default heading font definition.	
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.	

### 3.10.3 Object Display Options

In modeling with elements, you can configure the standard contents of the elements you create and view and, in diagrams, how they are rendered and how the system responds to actions you take on them.

Access   **Tools | Options (Ctrl+F9) | Objects**

#### Control element appearance and behavior

Field/Button	Action	See also
<b>Version</b>	Type in the default version number or code for new elements.	
<b>Phase</b>	Type in the default phase number or code for new elements.	
<b>Highlight References</b>	Select the checkbox to highlight parameters in operations that are passed by reference rather than value.	<a href="#">Operation Parameters by Reference</a> <small>[1031]</small>

Field/Button	Action	See also
<b>Reference Char(s)</b>	Type in a character or character string to act as the reference.	
<b>Prefix/Suffix</b>	Select the appropriate radio button to display the <b>Reference Char(s)</b> value as either a prefix or a suffix on the operation parameter.	
<b>Warn about spaces in class names</b>	Select the checkbox to display a warning message when a Class, operation or attribute name has embedded spaces (which can cause coding problems).  Deselect the checkbox to hide such messages.	
<b>Classes honor analysis stereotypes</b>	Select the checkbox to show Classes as their stereotype; for example, if a Class is stereotyped as a Boundary, it appears as a Boundary rather than a Class.  Deselect the checkbox to show the element as its base type; that is, as a Class.	
<b>Show stereotype icon for requirements</b>	Select the check box to show a code letter in the top right corner of Requirement (E, for external), Change (C) and Issue (I) elements.  Deselect the checkbox to hide the indicator letter.	<a href="#">Requirements</a> <sup>1763</sup> <a href="#">Changes</a> <sup>2633</sup> <a href="#">Issues (Defects)</a> <sup>2631</sup>
<b>Support for Composite Objects</b>	Select the checkbox to: <ul style="list-style-type: none"> <li>• Display a hashed border within a valid parent element when you drag a potential child element onto it in a diagram</li> <li>• Automatically embed the child element in their parent element in the model, when you drag and drop the child element onto the parent element in a diagram</li> <li>• Automatically disengage the child element from the parent (break the child-parent relationship) in the model when you drag the child element out of its parent element</li> </ul> Deselect the checkbox to not display the hashed border and to not embed the child element in the parent in the model.	<a href="#">Move Elements Within Diagrams</a> <sup>917</sup>
<b>Auto-resize marks diagram 'dirty'</b>	Select the checkbox to set auto-resizing of elements as an unsaved change to the diagram (displaying an asterisk on the diagram tab), so that you must manually save the diagram to protect the change.  Deselect the checkbox to automatically save autosizing changes.	

Field/Button	Action	See also
<b>Highlight {abstract} elements</b>	Select the check box to indicate, on a diagram, Classes set as <b>abstract</b> by displaying the tag <code>{abstract}</code> below and to the right of the Class name.	<a href="#">Element Details</a> <sup>[959]</sup>
<b>Allow elongated Use Cases</b>	Select the checkbox to allow Use Cases or Use Case extension points to elongate to accommodate long names.  If you deselect the checkbox, Use Case re-sizing is proportional and the 'make same height/width' menu options are blocked.	<a href="#">Operations on Multiple Elements</a> <sup>[951]</sup>
<b>Show status colors on diagrams</b>	Select the checkbox to display color coding in Requirement, Change and Issue elements.  Deselect the checkbox to display the status bands and element shadows in the <b>standard fill and shadow colors</b> .  You can increase the range of element types to use status color coding on, through the Status page of the General Types dialog ( <b>Settings   Project Types   General Types</b> ).	<a href="#">Color Code External Requirements</a> <sup>[1776]</sup>  <a href="#">Status Types</a> <sup>[1159]</sup>
<b>Copy inheritance links on duplicate</b>	Select the checkbox to duplicate Inheritance and Realization connectors when you copy their elements.	
<b>Port and Part type visible by default</b>	Select the checkbox to show Port and Part types on the diagram by default.	
<b>Show buttons for selected Object on diagram</b>	Select the checkbox to enable the display of the floating toolbar buttons to the right of an object when you select it.    Deselect the checkbox to not display these toolbar buttons or element icons.	<a href="#">Element Icons</a> <sup>[954]</sup>
<b>Edit Object on New</b>	Select the checkbox to automatically display the element Properties dialog when a new element is added to a diagram.  Deselect the checkbox to simply create the element without displaying the Properties dialog.	
<b>Show «column» stereotype</b>	Select the checkbox to show the «column» stereotype as a heading in Table elements, when data modeling.  Deselect the checkbox to just display the column names without the «column» heading.	<a href="#">Example Data Model Diagram</a> <sup>[2337]</sup>
<b>Extend Complexity</b>	Select the checkbox to extend levels of complexity to five levels in the <b>Complexity</b> field in the element Properties dialog:	<a href="#">General Settings</a> <sup>[958]</sup> (of element

Field/Button	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Easy</b></li> <li>• <b>Medium</b></li> <li>• <b>Difficult</b></li> <li>• <b>Extreme</b></li> <li>• <b>Unknown</b></li> </ul> <p>Deselect the checkbox to restrict the field to three options (omitting <b>Extreme</b> and <b>Unknown</b>).</p>	properties)
<b>UML 1.5 Components</b>	Select the checkbox to perform your modeling using UML 1.5 components (Enterprise Architect versions from 4.0 onwards default to using UML 2.x).	
<b>Show State Compartment</b>	Select the checkbox to show, in a State element, the State compartment divider under the State name.	<a href="#">Example State Machine</a> <sup>[1205]</sup>
<b>Show Duplicate Tags</b>	<p>Select the checkbox to enable duplicate tag names to be shown in the element Tagged Values compartment and in the Tagged Values window for the element.</p> <p>The system defaults to hiding duplicate tag names, to avoid displaying inherited and overridden Tagged Values. It is useful to display the duplicate tags when you are revising them; for example, when you are adding namespaces and labels in ODM.</p>	<a href="#">ODM Commands</a> <sup>[1980]</sup>
<b>Group Operations by Stereotype</b>	<p>Select the checkbox to group an element's operations by their stereotype, in the element's operations compartment on the diagram.</p> <p>The order in which the stereotypes are listed is determined by the order of the operations in the Operations dialog for the element - if operation AA with stereotype Z is the first in the operation list, stereotype ZZ is first in the stereotype list.</p> <p>Deselect the checkbox to list the operations ungrouped, in the order in which they appear in the Operations dialog for the element..</p>	<a href="#">General Properties of Operations</a> <sup>[1015]</sup>
<b>Group Attributes by Stereotype</b>	<p>Select the checkbox to group an element's attributes by their stereotype, in the element's attributes compartment on the diagram.</p> <p>The order in which the stereotypes are listed is determined by the order of the attributes in the Attributes dialog for the element - if attribute AA with stereotype Z is the first in the attribute list, stereotype ZZ is first in the stereotype list.</p> <p>Deselect the checkbox to list the attributes ungrouped, in the order in which they appear in the Attributes dialog for the element.</p>	<a href="#">General Properties of Attributes</a> <sup>[1001]</sup>

Field/Button	Action	See also
<b>Sort Features Alphabetically</b>	<p>Select the checkbox to list element features of each type alphabetically. Features include Attributes, Operations, Tags, Constraints and Test Cases.</p> <p>Deselect the checkbox to list the features in the order in which they are defined (if not alphabetical) in the corresponding dialog or window for the feature.</p> <p>To observe the effects of selecting or deselecting the checkbox, you must close the diagram and reload it.</p>	
<b>Disable spelling</b>	<p>Select the checkbox to turn off automatic spell checking.</p> <p>Deselect the checkbox to resume automatic spell checking.</p> <p>The spelling checker operates on the view, dialog or window where you initially enter the text strings.</p>	<a href="#">Spell Checking</a> 
<b>Advanced</b>	<p>Click on this button to specify which types of element should be listed in document reports and in diagram packages.</p> <p>Some types of element do not appear in packages and in document output by default. You use this facility to include such types.</p>	<a href="#">Customize Visibility of Elements</a> 
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.	

### 3.10.4 Connector Display Options

It is possible to configure a number of settings that control the creation, behavior and notation for the connectors that you define in your diagrams.

Access   **Tools | Options (Ctrl+F9) | Links**

#### Control connector appearance and behavior

Field/Button	Action	See also
<b>Edit Connector on New</b>	<p>Select the checkbox to automatically open the connector Properties dialog each time you create a new connector on a diagram.</p> <p>Deselect the checkbox to simply create connectors without displaying the Properties dialog to assign a name or properties.</p>	<a href="#">Connect Elements</a> 
<b>Association default = source</b>	Select the checkbox to automatically set the direction of <b>new</b> Associations, flowing from source to target element (that is, with	<a href="#">Association</a> 

Field/Button	Action	See also
<b>--&gt; target</b>	<p>an arrow head at the target end).</p> <p>Deselect the checkbox to create Associations with <b>no</b> direction (no arrowhead on the connector line.)</p>	
<b>Generalization link style Default = Tree</b>	<p>Select the checkbox to show Generalizations in vertical tree-style, forming a hierarchy where multiple links to elements exist.</p> <p>Deselect the checkbox to create Generalizations in Auto Route style.</p>	<a href="#">Generalization</a> 
<b>Shade Qualifier boxes</b>	<p>Select the checkbox to lightly shade all Qualifier boxes on Associations in the diagrams you open (see <b>Suppress Qualifier Boxes</b>, below.)</p> <p>Deselect the checkbox to prevent shading of the Qualifier boxes.</p>	
<b>Draw Aggregations Reversed</b>	<p>Select the checkbox to draw Aggregate and Composite connectors from target element to source element (the diamond on the source end of the line).</p> <p>Deselect the checkbox (the default), to draw these connectors from source to target (the diamond on the target end of the line).</p>	<a href="#">Aggregation</a>  <a href="#">Composition</a> 
<b>Prompt on connector deletes</b>	<p>Select the checkbox to display a prompt before deleting connectors, offering the choice of hiding the connector on the diagram or deleting it completely.</p> <p>If you deselect this option, the delete operation defaults to the last-set option on the dialog.</p>	<a href="#">Delete Connectors</a> 
<b>Suppress Link Constraints</b>	<p>Select the checkbox to hide any constraints set on connectors in the diagrams you open.</p> <p>Deselect the checkbox to allow the constraints to display on the connector lines.</p>	<a href="#">Connector Constraints</a> 
<b>Suppress Qualifier boxes</b>	<p>Select the checkbox to hide the qualifiers (in their boxes) on Association connectors.</p> <p>Deselect the checkbox to show the qualifiers on the diagrams you open.</p>	<a href="#">Qualifiers</a> 
<b>Show Uses arrowheads</b>	<p>Select the checkbox to show an arrowhead on the target end of each Use connector in a Use case diagram.</p> <p>Deselect the checkbox to show the connector as a simple line.</p>	<a href="#">Use</a>  <a href="#">Show Uses Arrow Head</a> 
<b>Show Override Operation dialog</b>	<p>Select the checkbox to show the Override Operation dialog automatically when adding Generalization and Realization</p>	<a href="#">Override Parent Operations</a> 

Field/Button	Action	See also
<b>on new connector</b>	connectors between Classes and Interfaces, if the target element has features that can be overridden.	
<b>Suppress ' + ' Role Scope</b>	<p>Select the checkbox to hide the 'Public' indicator (+, when <b>Access</b> = <b>Public</b> in the connector role properties) of the source and/or target role on a connector.</p> <p>Deselect the connector to allow the + symbol to display.</p> <p>When changing this setting, you might need to reload the diagram to see the change take effect.</p>	<a href="#">Source Role</a> <sup>[1130]</sup>
<b>Strict Connector Syntax</b>	Select this checkbox to check that each new connector complies with UML, BPMN 2.0 and SysML 1.2 & 1.3 syntax as you add it, and to enforce compliance.	
<b>Pen Width</b>	Click on the drop-down arrow and select the default connector line width (between <b>1</b> and <b>4</b> pixels).	
<b>Routing</b>	Click on the drop-down arrow and select the default connector style for new connectors ( <b>Direct</b> , <b>Routed</b> or <b>Custom</b> ).	<a href="#">Connector Styles</a> <sup>[1114]</sup>
<b>Enable</b>	<p>Select the checkbox to enable the Quick Linker, showing the Quick Linker arrow when you click on an element on the diagram.</p> <p>Deselect the checkbox to hide the Quick Linker arrow and make the Quick Linker unavailable.</p>	<a href="#">The Quick Linker</a> <sup>[896]</sup>
<b>Show Help</b>	Select the checkbox to add a <b>Help</b> option at the end of the Quick Linker menu, to display the Quick Linker Help topic.	
<b>Center to center</b>	<p>Select this radio button to set the orientation of the dashed <b>guide line</b> for new connectors to anchor on the center of the source element and, as you approach the target element, the center of that element.</p> <p>The guide line displays both when you are dragging the Quick Linker arrow and when you have dragged a connector icon from the Diagram Toolbox.</p>	
<b>Exact placement</b>	<p>Select this radio button to set the orientation of the dashed <b>guide line</b> for new connectors to the exact point on the element you drag from and the exact position of the cursor as you drag to the target element.</p> <p>This option enables the <b>Force perpendicular line</b> checkbox.</p>	
<b>Force</b>	Select this checkbox to set the orientation of the dashed <b>guide line</b>	

Field/Button	Action	See also
<b>perpendicular line</b>	for new connectors to a perpendicular line between the source and target element edges, wherever this is possible.  You can toggle between this effect and the <b>Exact Placement</b> effect by holding <b>[Ctrl]</b> as you move the cursor between the source and target elements.	
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.	

#### Notes

- For the **Draw Aggregations Reversed** option, all tools have the parent as the target and the child as the source of the connector, which is a requirement of UML; only the direction in which you drag the mouse to draw the connector is changed

### 3.10.5 Communication Message Colors

Communication diagrams illustrate how components interact and exchange information in a process. They have a large number of messages that indicate the timing or sequence of events in the communication process. You can define the sequence of these messages using sequence **numbers**, which also help you to **group** messages within a stage in the sequence. To help make the sequence easier to see at a glance, you can also:

- Select to display the messages in color
- Set a color for each group of messages

**Access** **Tools | Options (Ctrl+F9) | Communication Colors**

#### Notes

- Select the **Use Communication Message Coloring** checkbox to turn on message coloring in the Communication diagrams you open; when you select this option, Communication messages display in different colors depending on the sequence group they belong to on the diagram - for example, messages 1.n are black, 2.n are red and 3.n are green
- Click on the down arrow in the color field for each numerical message group and click on the color to set for that group; if you have more than eight groups in the sequence the color pattern repeats, so group 9 messages are the same color as group 1 messages, and group 10 messages are the same color as group 2 messages
- Click on the **Close** button to save the changes you have made, and to close the Options dialog

### 3.10.6 XML Specifications

Many of the model development and management tasks you perform operate either directly or indirectly with XML. You can set defaults on a number of settings to standardize the way in which you use XML in your own modeling activities. You can override several of these settings on any specific XML import or export, especially when publishing a model package in XML to another modeling language or tool.

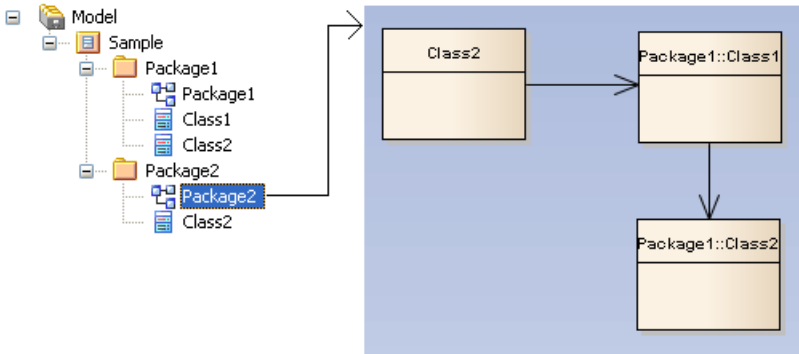

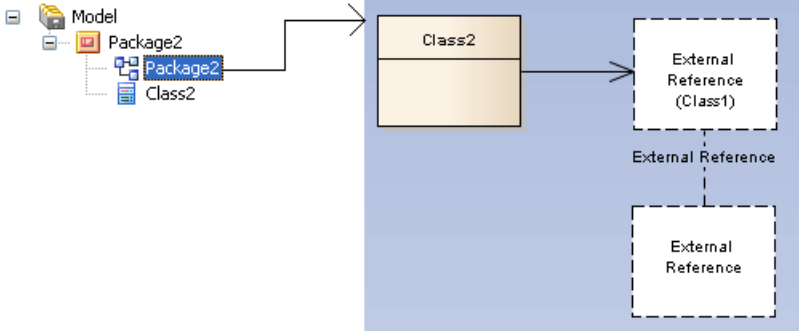

**Access**   **Tools | Options (Ctrl+F9) | XML Specifications**

#### Set XML Specification Options

Field/Button	Action	See also
<b>Editor</b>	Specify the default editor for reviewing any XML documents you open within the system. Either: <ul style="list-style-type: none"> <li>Type in the location of the editor <b>.exe</b> file, or</li> <li>Click on the ( ... ) button and browse for the location</li> </ul>	
<b>Format XML Output</b>	Select the checkbox to set <b>formatting</b> of your XML output into human-readable form as the default.  Deselect the checkbox to show the XML as unformatted code.	<a href="#">Publish Model Package</a> <sup>[476]</sup>
<b>Write Log</b>	Select the checkbox to write the execution activity to a <b>log file</b> when you import or export XML.  Deselect the checkbox to not record the activity of the import or export to a log file.	
<b>Use DTD</b>	Select the checkbox to default to using a <b>Data Type Definition (DTD)</b> in your XML imports and exports. A DTD validates the correctness of the model and checks that no syntactical errors have occurred.  Deselect the checkbox to set the default to not using a DTD.	<a href="#">The UML DTD</a> <sup>[483]</sup>
<b>Export Diagrams</b>	Select the checkbox to default to including diagrams when you export XML to another format or tool.	<a href="#">Publish Model Package</a> <sup>[476]</sup>
<b>Export Alternate Images</b>	Select the checkbox to export any alternative images used in the model when you export to XML.	<a href="#">Using the Image Manager</a> <sup>[860]</sup>  <a href="#">Sharing Reference Data</a> <sup>[374]</sup>
<b>Code Page</b>	Defaults to <b>windows-1252</b> ; if you do not want to use this Code Page, type in your preferred code page reference.  Setting a <b>null</b> encoding string results in the encoding tag being entirely	

Field/Button	Action	See also
	<p>omitted from the XML output.</p> <p>Click on the <b>Default</b> button to restore the setting to the default Code Page.</p>	
<b>Import using single transaction</b>	<p>Select the checkbox to make all XML <b>import</b> operations and all <b>Paste Package from Clipboard</b> operations default to being performed within a single transaction.</p> <p>Deselect this checkbox to make all XML imports and paste package operations default to being performed <b>data item by data item</b>, so that one failure does not block the whole operation (recommended for large imports/copies).</p> <p>In either case, in any specific XML import operation the setting can be overridden.</p>	<a href="#">Import from XML</a> <sup>[478]</sup> <a href="#">Copy a Package</a> <sup>[775]</sup>
<b>Validate XML against Schema/DTD</b>	Select the checkbox to validate the XML format against the schema or Data Type Definition when loading an imported XML file.	
<b>Export Diagram Images</b>	Select the checkbox to export diagrams as <b>images</b> when you export to XML.	
<b>Image Type</b>	If you select the <b>Export Diagram Images</b> option (above), click on the drop-down arrow and select the image format to export to. Select from <b>metafile, bitmap, .gif, .png</b> and <b>.jpeg</b> .	
<b>Create placeholders for missing External References during XML 1.1/2.1 Import</b>	<p>Select the checkbox to show, during the import of an Enterprise Architect-exported XML 1.1/2.1 file, any missing:</p> <ul style="list-style-type: none"> <li>Diagram elements, using a Boundary element as a placeholder</li> <li>Diagram connectors, using a Dependency connector as a placeholder</li> </ul> <p>When importing an Enterprise Architect-exported XML 1.1/2.1 file with cross-package references, use this option to visually show the diagram items that are not yet in the model.</p> <p>A sample scenario would be, as shown below, exporting <i>Package2</i> to XML 1.1 from <i>Master.EAP</i> and importing it into <i>New.EAP</i> - the Classes <i>Class1</i> and <i>Class2</i> and the connector between them are shown using a placeholder on the diagram <i>Package2</i>.</p>	

Field/Button	Action	See also
	<p>Master.EAP :</p>  <p>New.EAP :</p>  <p>If the file is for a package under package control or version control, and this checkbox is <b>not</b> selected, it is overridden if the <b>For all packages, create placeholders for external references</b> checkbox is selected on the Version Control Settings dialog and/or Package Control Options dialog.</p>	<p><a href="#">Version Control Settings</a> <sup>[415]</sup></p> <p><a href="#">Configure Packages</a> <sup>[488]</sup></p>
<b>Prefix EA tagged values in XMI 1.0 with ea\$</b>	Select the checkbox to prefix any Enterprise Architect Tagged Values within any <b>XMI 1.0</b> you create, with <b>ea\$</b> .	
<b>Update Last Save Time</b>	Select the checkbox to update the timestamp of the last time each controlled package was saved.	
<b>Report Cross Package Reference Deletions (XMI 1.1)</b>	Select the checkbox to report any Package cross-references that would be deleted when a Controlled Package from a completed model is exported to XMI 1.1.	<a href="#">Report Deletion of Cross-Package References</a> <sup>[496]</sup>
<b>Default XML Directory</b>	Type in the location of the default XML directory to use when importing and exporting XML, or click on the [ ... ] (Browse) button and browse for the location.	

Field/Button	Action	See also
<b>Close</b>	Click on this button to save the changes you have made, and to close the Options dialog.	

#### Notes

- If **Export Alternate Images** is set, and you have packages in your model under version control, then any alternative images used in those packages are also exported to the version control repository when you check in the packages; in this case, you would only select the checkbox if the alternative images are subject to frequent change

Otherwise, do not select this option and instead use the **Export Reference Data** and **Import Reference Data** options to manage alternative images

## 4 Navigate, Search and Trace

This section explains how you **navigate** through the model structures in Enterprise Architect, locate and display specific information, and trace the origins, development and fate of the model elements. While the **Project Browser** provides an effective hierarchical view of the model, large models can present particular challenges, and tracing **dependencies** and **relationships** is not always a simple task. Fortunately, Enterprise Architect has a number of tools designed to meet just these requirements.

## 4.1 Navigate: Exploring Your Model

Navigating is the process of systematically exploring the structure of your model using the hierarchical and list based views, such as the Project Browser. It is particularly useful when you are familiar with the structure of a model and its packaged contents. Whereas Searching provides a flat and random set of results, the Project and Package Browsers provide a highly structured viewpoint, reflecting the exact structure of your model.

### 4.1.1 The Project Browser

Using the Project Browser, you can navigate through the Enterprise Architect project space. It displays Packages, diagrams, elements and element features in a tree-like structure, reflecting the arrangement of elements and Packages within your model. The Project Browser is the primary mechanism for browsing and exploring your model and is the jumping off point for many of the most important features in Enterprise Architect. You can use it to:

- Review the structure, content and organization of your model
- Drill down to specific elements

- Drag and drop elements and Packages within the model
- Copy (duplicate) whole Packages
- Import/export model information
- Set up version control, locking, execution analysis and many other aspects of the model tied to a particular Package
- Document models
- Import code, xmi and csv files, database schema and other external data sources

If you right-click on an item in the Project Browser to display the context menus, you can perform additional actions such as adding new Packages, creating diagrams, renaming items, creating documentation and other reports, and deleting model elements. You can also edit the name of any item in the Project Browser by selecting the item and pressing **F2**.

**Access** **View | Project Browser ( Alt+0 )**

### Views

The Project Browser can be divided into Views, each of which contains diagrams, Packages and other elements. A default View hierarchy is described here, but you can create different Views to suit your requirements:

View	Description
Use Case View	The functional and early analysis View, containing Business Process and Use Case models.
Dynamic View	The dynamics of your system, containing State Charts, Activity and Interaction diagrams.
Logical View	The Class Model and Domain Model View.
Component View	A View for your system components. The high level view of what software is to be built (such as executables, DLLs and components).
Deployment View	The physical model; what hardware is to be deployed and what software is to run on it.
Custom View	A work area for other Views, such as formal requirements, recycle bin, interview notes and non-functional requirements.

### Selective Collapse to the parent element or Package

When you are working on an expanded project in the Project Browser, you might want to locate the parent element or Package of an item, and/or collapse the structure under that parent element or Package.

Step	Action	See also
1	Position the cursor on an item within the element or Package.	
2	Press ( ← ) on the keyboard to highlight the parent.	
3	Press the key again to collapse the structure under that parent element or Package.

### 4.1.1.1 Project Browser Context Menus

The Project Browser provides a wide range of options to work on the objects it contains. These options are presented through a number of **context-sensitive menus**.

#### Learn more

- [Model \(Root Node\) context menu](#) <sup>[648]</sup>
- [Package Context Menu](#) <sup>[651]</sup>
- [Element Options in the Project Browser](#) <sup>[660]</sup>
- [Diagram Context Menu](#) <sup>[665]</sup>
- [Operation Context Menu](#) <sup>[667]</sup>

#### 4.1.1.1.1 Model (Root Node) Context Menu

The **Root Node** in the Project Browser is the **Model** element. You can have more than one model element. The first level Packages beneath the Model node are sometimes referred to as **Views** as they commonly divide a model into categories such as Use Case Model and Logical Model.

**Access**    **Right-click on the Root Node**

#### Options

Option	Action	Shortcut	See also
<b>Extensions</b>	<p>Select this option to access a submenu of enabled Technologies on the system (for example, ArcGIS or TOGAF), each of which provides options for performing technology-specific operations on the Package.</p> <p>This option is available in the Professional, Corporate and Extended editions of Enterprise Architect.</p>		<a href="#">Geodatabase Design for ArcGIS</a> <sup>[1944]</sup>

Option	Action	Shortcut	See also
<b>Scripts</b>	<p>Select this option to list the scripts enabled for execution directly from the Project Browser.</p> <p>(The option is not available if no Project Browser scripts exist.)</p> <p>Click on a script name to run that script.</p>		<a href="#">Script Group Properties</a> <sup>[2794]</sup>
<b>Add</b>	Select this option to access the <b>Add</b> submenu; see below.		
<b>Rename Model</b>	Select this option to display a simple prompt for a new name to apply to the current model.		
<b>Package Control</b>	Select this option to access the <b>Package Control</b> submenu.		<a href="#">Package Control</a> <sup>[485]</sup>
<b>Update Package Status</b>	Select this option to change the status, phase and/or version of all elements and child Packages in the selected Package.		<a href="#">Update Package Status</a> <sup>[590]</sup>
<b>Apply/Release User Lock</b>	<p>Select this option to apply or release a user lock on the selected Package.</p> <p>(This option is only displayed when user security is enabled in <b>Require User Lock to Edit</b> locking mode.)</p>		<a href="#">Apply a User Lock</a> <sup>[339]</sup>
<b>Lock Package</b>	<p>Select this option to apply a lock on the selected Package.</p> <p>(This option is only displayed when user security is enabled in <b>User/Group</b> locking mode.)</p>		<a href="#">Lock Package</a> <sup>[337]</sup>
<b>Apply Auto Naming to Elements</b>	Select this option to apply configured auto naming conventions to existing elements in the selected Package.		<a href="#">Apply Auto Naming to Existing Elements</a> <sup>[906]</sup>
<b>Copy Package to Clipboard</b>	Select this option to copy the selected Package to the clipboard, to be copied into another Package in either the same project file or a different project file.		<a href="#">Copy the selected Package</a> <sup>[775]</sup>
<b>Paste Package from Clipboard</b>	Select this option to paste a Package from the clipboard into the selected Package.		<a href="#">Paste a Package</a> <sup>[775]</sup>

Option	Action	Shortcut	See also
<b>Find in Project Browser</b>	Select this option to find a specified term in the Project Browser.	<b>Ctrl+Shift+F</b>	
<b>Expand Branch</b>	Select this option to expand all items in this branch of the Project Browser.		
<b>Collapse Branch</b>	Select this option to collapse all items in this branch of the Project Browser.		
<b>Import Model from XMI</b>	Select this option to import a model from its XMI file to under this root node.	<b>Ctrl+Alt+I</b>	<a href="#">Import a model</a> <sup>[473]</sup>
<b>Export Model to XMI</b>	Select this option to export the model under this root node to an XMI file.	<b>Ctrl+Alt+E</b>	<a href="#">Export a model</a> <sup>[473]</sup>
<b>Generate Documentation</b>	Select this option to generate documentation on the contents of the model.	<b>F8</b>	<a href="#">Document Reports</a> <sup>[2640]</sup>
<b>HTML Report</b>	Select this option to generate web documentation on the contents of the model.	<b>Shift+F8</b>	<a href="#">Web Reports</a> <sup>[2744]</sup>
<b>Diagrams Only Report</b>	Select this option to generate a Diagrams Only report for the model.	<b>Ctrl+Shift+F8</b>	<a href="#">Diagrams Only Report</a> <sup>[2741]</sup>
<b>Copy Reference</b>	Select this option to copy a reference to the root node to the Enterprise Architect clipboard. Select the appropriate sub-option to copy the: <ul style="list-style-type: none"> <li>Selected Package hierarchy structure (Node path) or</li> <li>Node GUID</li> </ul>		
<b>Delete Project Root</b>	Select this option to delete the Model root node, <b>after</b> you have already deleted all of its subordinate Views and Packages.  A prompt displays for you to confirm the deletion.		
<b>Help</b>	Select this option to display the Help topic for the Project Browser.		

**Add Submenu**

Option	Action	Shortcut	See also
<b>Add Model (root node)</b>	Select this option to create a new model root, without any subordinate structure or content.  A prompt for the model name displays.		
<b>Add View</b>	Select this option to create a new View (Package) underneath the model root node.  The Create New View dialog displays.		<a href="#">Add Views</a> 
<b>Add a Model using Wizard</b>	Select this option to add further models using the Model Wizard.  The list of available Model Pattern Technologies includes the MDG Technology Builder, which creates a Model Package containing templates that you can use to generate a new MDG Technology containing a set of Profiles.	<b>Ctrl+Shift +M</b>	<a href="#">Model Wizard</a>

#### 4.1.1.1.2 Package Options in the Project Browser

**Access** **Project Browser | Right-click on Package or View**

##### Options

Option	Action	Shortcut	See also
<b>Extensions</b>	Select this option to access a submenu of enabled Technologies on the system (for example, ArcGIS or TOGAF), each of which provides options for performing technology-specific operations on the Package.  This option is available in the Professional, Corporate and Extended editions of Enterprise Architect.		<a href="#">Geodatabase Design for ArcGIS</a> 
<b>Scripts</b>	Select this option to list the scripts enabled for execution directly from the Project Browser.  (This option does not display if no Project Browser scripts exist.)  Click on a script name to run that script.		<a href="#">Script Group Properties</a> 

<b>Properties</b>	Select this option to display the Properties dialog for the Package element.		<a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Linked Document</b>	Select this option to create or display a linked document for the Package or View.	<b>Ctrl+Alt+D</b>	<a href="#">Linked documents</a> <sup>[1044]</sup>
<b>Delete Linked Document</b>	Select this option to delete the linked document attached to the Package.  The system prompts you to confirm the deletion.		
<b>Advanced</b>	Select this option to access a sub-menu of options for performing more-specialized operations on the Package.		<a href="#">Advanced Sub-Menu</a> <sup>[654]</sup>
<b>List View</b>	Select this option to display the Package contents in the <b>Package Browser</b> in <b>List View</b> mode.		<a href="#">Package Browser</a> <sup>[673]</sup>
<b>Gantt View</b>	Select this option to display the Package contents in the <b>Package Browser</b> in <b>Gantt View</b> mode		<a href="#">The Gantt View</a> <sup>[594]</sup>
<b>Specification Manager</b>	Select this option to display the Package contents in the <b>Specification Manager</b> .  You can display the Specification Manager at the same time as either the Package Browser or Gantt View.		<a href="#">Specification Manager</a> <sup>[1728]</sup>
<b>Add a Model using Wizard</b>	Select this option to add another Model Package to the model or View, using the Model Wizard.	<b>Ctrl+Shift+M</b>	<a href="#">Model Wizard</a> <sup>[753]</sup>
<b>Add a Package</b>	Select this option to add another Package to the selected Package.	<b>Ctrl+W</b>	<a href="#">Add a Package</a> <sup>[772]</sup>
<b>Add Diagram</b>	Select this option to add a new diagram to the selected Package.		<a href="#">Add New Diagrams</a> <sup>[822]</sup>
<b>Add Element</b>	Select this option to add a new element to the selected Package.	<b>Ctrl+M</b>	<a href="#">Add Elements Directly To Packages</a> <sup>[903]</sup>
<b>Package Control</b>	Select this option to submit the selected Package (s) to Package control and version control.		<a href="#">Controlled Package Menu</a> <sup>[485]</sup> <a href="#">Package Version</a>

			<a href="#">Control Menu</a> <sup>[427]</sup>
<b>Copy/Paste</b>	Select this option to access a menu of options for copying and moving the Package contents to other areas of the model.		<a href="#">Copy/Paste Submenu</a> <sup>[654]</sup>
<b>Move Up</b>	Select this option to move the Package further up the list in the Project Browser.		
<b>Move Down</b>	Select this option to move the Package further down the list in the Project Browser.		
<b>Contents</b>	Select this option to reorganize the Package contents after making changes.		<a href="#">Contents Sub-menu</a> <sup>[655]</sup>
<b>Find in All Diagrams</b>	Select this option to list all diagrams in which this Package is depicted, in the Element Usage dialog.	<b>Ctrl+U</b>	<a href="#">Show Element Use</a> <sup>[910]</sup>
<b>Documentation</b>	Select this option to produce a variety of reports and documentation on the model.		<a href="#">Documentation Sub-menu</a> <sup>[656]</sup>
<b>Code Engineering</b>	Select this option to perform Code Engineering functions.		<a href="#">Code Engineering Options</a> <sup>[657]</sup>
<b>Execution Analyzer</b>	Select this option to display the Execution Analyzer window, with the Analyzer Scripts for the selected Package expanded.  If no Analyzer Scripts have been configured you are given the opportunity to create one.		<a href="#">Execution Analyzer</a> <sup>[2527]</sup>
<b>Import/Export</b>	Select this option to import and export the Package contents using XML text files.		<a href="#">Import/Export Sub-menu</a> <sup>[659]</sup>
<b>Set View Icon</b>	Select this option to change the display icon for the selected Package (View level Packages only).		<a href="#">Views</a> <sup>[769]</sup>
<b>Delete &lt;packagename&gt;</b>	Select this option to delete the selected Package and its contents. A prompt displays to confirm the deletion.		
<b>Help</b>	Select this option to display the Help topic for the Project Browser.		

#### 4.1.1.1.2.1 Advanced Sub-Menu

In the Project Browser, right-click on a Package and select the **Advanced** context menu option.

Option	Action	Shortcut	See also
<b>Turn On Level Numbering</b> (Turn Off Level Numbering)	<p>Select this option to add a sequence number to each element in the Package, based on the element's position in the Package hierarchy.</p> <p>For nested elements, the numbering indicates level; that is:</p> <p>3.2 3.2.1 3.2.1.1</p> <p>This option is only available for Packages, and the numbering only applies to the elements in the Package, not to the diagrams.</p> <p>If elements are added, moved or deleted from the Package, the numbering automatically adjusts.</p>		<a href="#">Model Requirements</a> <sup>[1766]</sup>
<b>Update Package Status</b>	Select this option to provide a bulk update on the status, phase and version of a Package and its elements.		<a href="#">Update Package Status</a> <sup>[590]</sup>
<b>Apply Auto Naming to Elements</b>	Select this option to apply configured auto naming conventions to existing elements in the selected Package.		<a href="#">Apply Auto Naming to Existing Elements</a> <sup>[906]</sup>
<b>Transform Package</b>	Select this option to perform a model transformation on the selected Package.	<b>Ctrl+Shift+H</b>	<a href="#">Transform Elements</a> <sup>[2017]</sup>
<b>Save Package as UML Profile</b>	Select this option to save the selected Package as a UML Profile.		<a href="#">Using UML Profiles</a> <sup>[1472]</sup>

#### 4.1.1.1.2.2 Copy/Paste Submenu

In the Project Browser, right-click on a Package and select the **Copy/Paste** context menu option.

Option	Action	Shortcut	See also
<b>Cut</b>	Select this option to remove the selected Package from its parent Package, to be pasted under another Package. The selected Package remains where it is until the <b>Paste</b> operation (below) is invoked.	<b>Ctrl+X</b>	<a href="#">Move Elements Between Packages</a> <sup>[913]</sup>
<b>Paste</b>	Select this option to paste a <b>cut</b> Package under the selected Package. If the selected Package is not a valid target, the <b>Paste</b> option is grayed out.	<b>Ctrl+V</b>	

Option	Action	Shortcut	See also
	(This option is not available for <b>copied</b> Packages - use the <b>Paste Package from Clipboard</b> context menu option.)		
<b>Copy Package to Clipboard</b>	Select this option to copy the selected Package to the clipboard, to be copied into another Package in the same project file or a different project file.	<b>Ctrl+C</b>	<a href="#">Copy a Package</a> [77]
<b>Paste Package from Clipboard</b>	Select this option to paste a Package from the clipboard into the selected Package.	<b>Ctrl+V</b>	
<b>Paste Element (s) from Clipboard</b>	Select this option to paste elements copied to the clipboard into the selected Package.	<b>Ctrl+V</b>	<a href="#">Copy Elements Between Packages</a> [915]
<b>Paste Diagram</b>	If you have copied a diagram from another Package, select this option to paste the diagram into the currently-selected Package.		
<b>Copy Node Path to Clipboard</b>	Select this option to copy the Package's node path (hierarchy structure) to the Enterprise Architect clipboard, as a reference.		
<b>Copy Node GUID to Clipboard</b>	Select this option to copy the Package's node GUID to the Enterprise Architect clipboard, as a reference.		

#### 4.1.1.1.2.3 Contents Sub-Menu

In the Project Browser, right-click on a Package and select the **Contents** context menu option.

Option	Action	Shortcut	See also
<b>Find in Project Browser</b>	Select this option to search the Project Browser for specific elements (identified using the Find in Project Browser dialog).	<b>Ctrl+Shift+F</b>	
<b>Bookmarks</b>	Select this option to bookmark all elements in the selected folder.		<a href="#">Manage Bookmarks</a> [59]
<b>Expand Branch</b>	Select this option to expand all of the items in the Project Browser.		
<b>Collapse</b>	Select this option to collapse all of the items in the Project		

Option	Action	Shortcut	See also
<b>Branch</b>	Browser.		
<b>Reset Sort Order</b>	Select this option to return sorting of Package contents to list in alphabetical order.		
<b>Reload Current Package</b>	Select this option to refresh the current Package in the Project Browser.		<a href="#">Refresh Model View</a> [308]

#### 4.1.1.1.2.4 Documentation Sub-Menu

In the Project Browser, right-click on a package and select the **Documentation** context menu option.

Option	Description	Shortcut	See also
<b>Generate Documentation</b>	Select this option to design and generate reports and documentation on the contents of the selected Package.  The Document Generation dialog displays.	<b>F8</b>	<a href="#">Document Reports</a> [2640]
<b>HTML Report</b>	Select this option to design and generate web documentation on the contents of the selected Package.  The Publish as HTML dialog displays.	<b>Shift+F8</b>	<a href="#">Create a Web Page Report</a> [2744]
<b>Diagrams Only Report</b>	Select this option to generate a Diagrams Only report, which describes the diagrams in the selected Package.  The Export Diagrams to RTF Document dialog displays.	<b>Ctrl+Shift+F8</b>	<a href="#">Diagrams Only Report</a> [2741]
<b>Testing Report</b>	Select this option to generate a Testing report, which describes the software development tests defined for the selected Package.  The Generate Test Documentation dialog displays.		<a href="#">Test Documentation</a> [2617]
<b>Open in Relationship Matrix</b>	Select this option to open the Relationship Matrix with the selected Package as the source or target Package for the Matrix.		<a href="#">Relationship Matrix</a> [727]
<b>Generated Report Options</b>	Select this option to exclude the selected Package from any reports generated from now		<a href="#">Exclude Package from Report</a> [2761]

Option	Description	Shortcut	See also
	onwards, or to include the excluded Package in reports again.		
<b>Copy Documentation Bookmark</b>	<p>When using the Legacy Report Generator, if you want to create a complex document that consists of <b>sections</b> of one or more document reports, rather than one <b>complete</b> report, you can create a master document in Microsoft Word™ and within it create links to the report sections using their <b>bookmarks</b>.</p> <p>Select this menu option to copy the bookmark on the selected Package to the clipboard, to be pasted into a search or other reference to the bookmark.</p>		<a href="#">Document Bookmarks</a> <sup>[2730]</sup>
<b>Package Metrics</b>	<p>Select this option to perform some calculations on the selected Package to establish Project Metrics for planning purposes.</p> <p>The <b>QA Reports view</b> opens on the Use Case Metrics tab.</p>		<a href="#">Estimating Project Size</a> <sup>[588]</sup>

#### 4.1.1.1.2.5 Code Engineering Options

**Access** Project Browser, right-click on a Package | Code Engineering

Option	Description	Shortcut	See also
<b>Generate Source Code</b>	Select this option to generate the code for the elements in the selected Package.	<b>Ctrl+Alt+K</b>	<a href="#">Generate a Package</a> <sup>[2115]</sup>
<b>Import Source Directory</b>	Select this option to import code from all source files in a complete directory structure, which helps you to add or synchronize multiple files in a directory.	<b>Ctrl+Shift+U</b>	<a href="#">Import Source Directory</a> <sup>[2142]</sup>
<b>Import from source File(s)</b>	Select this option to import source code into the project from one or more external source files.		<a href="#">Import Source Code</a> <sup>[2138]</sup>
<b>Import Binary Module</b>	<p>Select this option to import binary into your model from external source files. Files you can currently import include:</p> <ul style="list-style-type: none"> <li>• Java Archive (.jar)</li> <li>• .Net PE file (.exe, .dll) - Native Windows DLL and EXE files are <b>not</b> supported, only PE files containing .NET assembly data</li> </ul>		<a href="#">Import Binary</a> <sup>[2143]</sup>

Option	Description	Shortcut	See also
	<ul style="list-style-type: none"> <li>Intermediate Language file (.il)</li> </ul>		
<b>Import Resource Script</b>	Select this option to import Microsoft Windows™ <b>Resource Scripts</b> (as .rc files), which contain the Win32 dialog definitions (those with the stereotype «win32Dialog») for an application's graphical user interface.		<a href="#">Import Resource Script</a> <sup>[214]</sup>
<b>Synchronize Package With Code</b>	Select this option to synchronize the elements in the selected Package in the Project Browser with the source code.	<b>Ctrl+Alt+M</b>	<a href="#">Update Package Contents</a> <sup>[211]</sup> <a href="#">Element Options in the Project Browser</a> <sup>[66]</sup> <a href="#">Operation Menu - Project Browser</a> <sup>[66]</sup>
<b>Generate DDL</b>	Select this option to generate DDL from the selected Package, for Tables, Stored Procedures and Views.		<a href="#">Generate DDL</a> <sup>[238]</sup>
<b>Import DB schema from ODBC</b>	Select this option to import database schema into a standard UML model, to initially create a database definition and subsequently update the model from the live database.		<a href="#">Import DB schema from ODBC</a> <sup>[237]</sup>
<b>Generate XML Schema</b>	Select this option to forward-engineer an XML Schema model into W3C XML Schema (XSD) files.		<a href="#">Generate XSD</a> <sup>[241]</sup>
<b>Import XML Schema</b>	Select this option to reverse engineer a W3C XML Schema (XSD) file to create or overwrite a Package of your UML Class model.		<a href="#">Import XSD</a> <sup>[242]</sup>
<b>Generate WSDL</b>	Select this option to forward-engineer a WSDL model into WSDL 1.1 files.		<a href="#">Generate WSDL</a> <sup>[244]</sup>
<b>Import WSDL</b>	Select this option to reverse engineer a WSDL 1.1 file to create or overwrite a Package of your UML Class model.		<a href="#">Import WSDL</a> <sup>[244]</sup>
<b>Reset Options for this Package</b>	<p>Select this option to manually reset the stored options for all Classes in a Package.</p> <p>Some Class options are stored when a Class is created, and so for existing Classes are not updated by changes to</p>		<a href="#">Reset Options</a> <sup>[227]</sup>

Option	Description	Shortcut	See also
	the Options dialog. These include the code language, whether child Packages are processed, and whether filenames are cleared, and are the options you update using this method.		
<b>Reset DBMS Options</b>	Select this option to map the DBMS data types of the Package to the data types of another DBMS.		<a href="#">Reset DBMS Options</a> <sup>[2349]</sup>
<b>Set as Namespace Root</b> <b>Clear Namespace Root</b>	Select these options to set the selected Package as the Namespace Root for its hierarchy, or to clear the Package as a namespace root.		<a href="#">Namespaces</a> <sup>[2120]</sup>
<b>Suppress Namespace</b> <b>Show Namespace</b>	Select these options to temporarily omit the selected Package from a namespace definition, and to restore it again.		
<b>Live Code Generation</b>	Select this option to generate code from the elements in the Package as they are added or changed.		

#### 4.1.1.1.2.6 Import/Export Sub-Menu

In the Project Browser, right-click on a Package and select the **Import/Export** context menu option.

Option	Description	Shortcut	See also
<b>Import package from XMI file</b>	Select this option to <b>import</b> a Package from an <b>XMI</b> (XML based) file into the currently-selected Package.	<b>Ctrl+Alt +I</b>	<a href="#">Import Package</a> <sup>[478]</sup>
<b>Export package to XMI file</b>	Select this option to <b>export</b> the currently selected Package to an <b>XMI</b> (XML based) file.	<b>Ctrl+Alt +E</b>	<a href="#">Export Package</a> <sup>[475]</sup>
<b>CSV Import / Export</b>	Select this option to <b>import</b> or <b>export</b> information on the model elements in the selected Package, in <b>CSV</b> format.	<b>Ctrl+Alt +C</b>	CSV <a href="#">Import</a> <sup>[503]</sup> / <a href="#">Export</a> <sup>[501]</sup>

#### 4.1.1.1.3 Element Options in the Project Browser

The element context menu in the Project Browser is available for all types of element. It provides options for performing a wide range of operations on both individual elements and multiple elements, including adding element properties and features, and moving the element around the project or between projects.

##### **Access**    **Project Browser | Right click on element**

Option	Action	Shortcut	See also
<b>Extensions</b>	Select this option to access a list of enabled Technologies on the system (for example, ArcGIS or TOGAF), each of which provides options for performing technology-specific operations on the element.  This option is available in the Professional, Corporate and Extended editions of Enterprise Architect.		<a href="#">Geodatabase Design for ArcGIS</a> <sup>[1944]</sup>
<b>Scripts</b>	Select this option to access a list of the scripts enabled for execution directly from the Project Browser.  (This option does not display if no Project Browser scripts exist for operating on elements.)		<a href="#">Scripts</a> <sup>[2794]</sup>
<b>Properties</b>	Select this option to display the element Properties dialog, to view and modify the element properties.		<a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Linked Document</b>	Select this option to create or edit a Linked Document (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions).	<b>Ctrl+Alt+D</b>	<a href="#">Linked Documents</a> <sup>[1044]</sup>
<b>Delete Linked Document</b>	Select this option to delete the Linked Document attached to the selected element.		
<b>Generate Documentation</b>	Select this option to generate a range of reports and other documents on the element.	<b>F8</b>	<a href="#">Document Reports</a> <sup>[2640]</sup>
<b>Lock</b>	Select this option to apply or release a lock for editing the selected element. (The option is displayed only when user security is enabled in <b>User/Group</b> locking mode.)		<a href="#">Lock Model Elements</a> <sup>[336]</sup>
<b>Apply/Release User Lock</b>	Select this option to apply or release a user lock on the selected element. (The option is displayed only when user security is enabled in <b>Require User Lock to Edit</b> locking mode.)		<a href="#">Apply a User Lock</a> <sup>[339]</sup>

<b>Add</b>	Select this option to access a submenu of options for creating a child element and diagram (Classifier elements) or a connector to another element.		<a href="#">Add Sub-Menu</a>  <small>662</small>
<b>Attributes</b>	Select this option to display the Attribute dialog ready to create a new attribute.	<b>F9</b>	<a href="#">General Properties of Attributes</a>  <small>1007</small>
<b>Operations</b>	Select this option to display the Operations dialog ready to create a new operation.	<b>F10</b>	<a href="#">General Properties of Operations</a>  <small>1015</small>
<b>Override Attribute Initializers</b>	(For a Class element with attributes.) Select this option to pre-define initial values for attributes that can be used to override existing defaults.	<b>Ctrl+Shift+R</b>	<a href="#">Display Inherited Attributes</a>  <small>1007</small>
<b>Copy/Paste</b>	Select this option to access a menu of options for copying and moving the Package contents to other areas of the model.		<a href="#">Element Copy/Paste Submenu</a>  <small>663</small>
<b>Move Up</b>	Select this option to move the element up in the list of elements within this Package.		
<b>Move Down</b>	Select this option to move the element up in the list of elements within this Package.		
<b>Find in all Diagrams</b>	Select this option to locate the element in all open diagrams.  This option also operates on Port and Part Property Type Classifiers.	<b>Ctrl+U</b>	<a href="#">Show Element Use</a>  <small>910</small>
<b>Locate in Current Diagram</b>	Select this option to select the element in the currently-visible diagram.  If the element is not in the diagram, this option is grayed-out.		
<b>View Audit History</b>	Select this option to open the Audit View to see a history of changes made to the selected element.		<a href="#">The Audit View</a>  <small>457</small>
<b>Code Engineering</b>	Select this option to access a submenu of options to generate, view and synchronize code for the selected elements.		<a href="#">Element Code Engineering Menu</a>  <small>664</small>

<b>Rule Composer</b>	For a Rule Task element, select this option to invoke the Rule Composer in Business Rule Modeling.		<a href="#">Compose Business Rules</a> <small>[1833]</small>
<b>Delete &lt;element Name&gt;</b>	Select this option to delete the element. A prompt displays for you to confirm the deletion.		
<b>Help</b>	Select this option to display the Help topic for the Project Browser.		

#### 4.1.1.1.3.1 Add Sub Menu

The **Add** submenu provides a list of appropriate elements that can be added as child elements to the selected element. It also provides options for creating child diagrams, including Composite diagrams, and for adding connectors.

**Access** **Project Browser** | **Right-click element** | **Add**

Option	Action	See also
<b>Port</b>	Select this option to add a Port element to the border of the selected element.	<a href="#">Port</a> <small>[1384]</small>
<b>Activity</b>	Select this option to add an Activity behavior element and one of its associated diagrams to the selected classifier element.	<a href="#">Activity</a> <small>[1279]</small> <a href="#">Classifiers and Instances</a> <small>[1009]</small>
<b>Interaction</b>	Select this option to add an Interaction behavior element and one of its associated diagrams to the selected classifier element.	<a href="#">Interaction Occurrence</a> <small>[1317]</small> <a href="#">Classifiers and Instances</a> <small>[1009]</small>
<b>State Machine</b>	Select this option to add a State Machine Behavior element and one of its associated diagrams to the selected classifier element.	<a href="#">State Machine</a> <small>[1338]</small> <a href="#">Classifiers and Instances</a> <small>[1009]</small>
<b>RuleFlow Activity</b>	Select this option to add a Rule Flow Activity element and associated diagram to a Class, in Business Rule Modeling.	<a href="#">Create a Rule Flow Activity</a> <small>[1826]</small>
<b>Composite Structure Diagram</b>	Select this option to set the selected element as a Composite Element and create a new Composite Structure Diagram (if none exists). If the selected element already contains a child diagram, the existing diagram will instead be referenced as the element's composite diagram.	<a href="#">Composite Elements</a> <small>[936]</small> <a href="#">Composite Structure Diagram</a> <small>[1188]</small>

Option	Action	See also
<b>Select Composite Diagram</b>	Select this option to set the selected element as Composite and link it to a specified diagram. The linked diagram may exist anywhere within the current repository.	
<b>Add Diagram</b>	Select this option to create a diagram to explain or expand on the selected classifier element, using the New Diagram dialog.	<a href="#">Add New Diagrams</a> [822]
<b>Add Custom Reference</b>	Select this option to set up cross references between elements in a diagram and the selected element in the Project Browser.	<a href="#">Cross references</a> [916]
<b>Create Link</b>	Select this option to create a connector to another element.	<a href="#">Create Connector in Project Browser</a> [1118]

#### Notes

- Elements such as Actors, Classes and Activities can define a large amount of information that can be conveniently represented by or expanded in a child diagram; the **Add** sub-menu for these elements provides all of the options listed above
- Elements such as Timing, Exit and History have much more specific functions that do not require expansion; the **Add** sub-menu for these elements only provides the **Create Link** option

#### 4.1.1.1.3.2 Element Copy/Paste Submenu

The **Copy/Paste** context menu provides a range of options for copying or moving elements between Packages or between models, within the Project Browser.

**Access** **Project Browser | Right-click element | Copy/Paste**

Option	Action	Shortcut	See also
<b>Copy Element(s) to Clipboard</b>	Select this option to copy the selected elements to the clipboard, to be pasted into another Package in the same project file or a different project file using the <b>Paste Elements from Clipboard</b> menu option in the <b>Package</b> context menu.		
<b>Cut</b>	Select this option to remove the selected element from its parent Package, to be pasted under another element or Package. The selected element remains where it is until the <b>Paste</b> operation (below) is invoked.	<b>Ctrl+X</b>	<a href="#">Move Elements Between Packages</a> [913]
<b>Paste</b>	Select this option to paste a <b>cut</b> element under the selected element or Package. If the selected element is not a valid target, the <b>Paste</b> option is grayed out.	<b>Ctrl+V</b>	

Option	Action	Shortcut	See also
	(This option is not available for <b>copied</b> elements - use the <b>Paste Package from Clipboard</b> menu option in the <b>Package</b> context menu.)		<a href="#">Copy Elements Between Packages</a> [915]
<b>Copy Documentation Bookmark</b>	When using the Legacy Report Generator, if you want to create a complex document that consists of <b>sections</b> of one or more document reports, rather than one <b>complete</b> report, you can create a master document in Microsoft Word™ and within it create links to the report sections using their <b>bookmarks</b> .  Select this menu option to copy the bookmark to the clipboard, to be pasted into a search or other reference to the bookmark.		<a href="#">Document Bookmarks</a> [2730]
<b>Copy Node Path to Clipboard</b>	Select this option to copy the Package's node path (hierarchy structure) to the Enterprise Architect clipboard, as a reference.		
<b>Copy Node GUID to Clipboard</b>	Select this option to copy the Package's node GUID to the Enterprise Architect clipboard, as a reference.

#### 4.1.1.1.4 Diagram Menu - Project Browser

Right-click on a diagram name in the Project Browser to open the **Diagram** context menu.

Option	Action	Shortcut	See also
<b>Extensions</b>	Select this option to access a submenu of enabled Technologies on the system (for example, ArcGIS or TOGAF), each of which provides options for performing technology-specific operations on the diagram.  This option is available in the Professional, Corporate and Extended editions of Enterprise Architect.		<a href="#">Geodatabase Design for ArcGIS</a> 
<b>Scripts</b>	Select this option to list the scripts enabled for execution directly from the Project Browser.  (This option does not display if no Project Browser scripts exist.)		<a href="#">Scripts</a> 
<b>Properties</b>	Select this option to display the diagram Properties dialog, to view and modify the diagram's properties.	<b>F5</b>	<a href="#">Set Diagram Properties</a> 
<b>Open</b>	Select this option to open the diagram in the Diagram View.		
<b>View Diagram As</b>	Select this option to display the contents of the selected diagram in an alternative viewing mode: <ul style="list-style-type: none"> <li>• <b>List View</b> - Show all elements on the selected diagram in a tabular list format</li> </ul>		<a href="#">Diagram List</a>  <a href="#">The Gantt View</a> 

Option	Action	Shortcut	See also
	<ul style="list-style-type: none"> <li>• <b>Gantt View</b> - Show all elements on the selected diagram in a Gantt Chart format</li> </ul>		
<b>View as Diagram</b>	Select this option to switch the display format back to elements rendered on a diagram.		
<b>Copy Diagram</b>	Select this option to copy the diagram for pasting into another location.		<a href="#">Copy a Diagram</a> 
<b>Copy Documentation Bookmark</b>	Select this option to copy a bookmark on the diagram to the clipboard.		<a href="#">Document Bookmarks</a> 
<b>Add Custom Reference</b>	Select this option to add this diagram as a cross reference to other elements.		<a href="#">Set Up Cross References</a> 
<b>Print Diagram(s)</b>	<p>Select this option to print the currently-selected diagram or diagrams (hold <b>Ctrl</b> or <b>Shift</b> while selecting).</p> <p>The Print dialog displays, on which you specify the print parameters.</p>	<b>Ctrl+P</b>	
<b>Copy Reference</b>	<p>Select this option to copy a reference to the diagram node to the Enterprise Architect clipboard.</p> <p>Select the appropriate sub-option to copy the:</p> <ul style="list-style-type: none"> <li>• selected hierarchy structure (node path) or</li> <li>• node GUID</li> </ul>		
<b>Cut</b>	<p>Select this option to <b>remove</b> the selected diagram from its current location, to be pasted under another Package or element. The selected diagram remains where it is until the Paste operation is invoked.</p> <p>To paste the diagram, use the:</p> <ul style="list-style-type: none"> <li>• <b>Copy/Paste   Paste Diagram</b> option on the Package context menu, or</li> <li>• <b>Copy/Paste   Paste</b> option on the element context menu</li> </ul>		
<b>Paste</b>	Not used.		

Option	Action	Shortcut	See also
<b>Compare Diagram to Baseline</b>	<p>Select this option to perform a visual comparison of the selected diagram against a version from a previously saved baseline.</p> <p>In this comparison, you can roll-back individual changes made to this diagram since the baseline was created.</p>		<a href="#">Check Visual Changes to Diagrams</a> <sup>[466]</sup> <a href="#">Manage Baselines</a> <sup>[467]</sup>
<b>Move up</b>	Select this option to move the diagram up in the list of diagrams within this Package.		
<b>Move down</b>	Select this option to move the diagram down in the list of diagrams within this Package.		
<b>Delete '&lt;diagram name&gt;'</b>	<p>Select this option to delete the selected diagram.</p> <p>A prompt displays to confirm the deletion.</p>		
<b>Delete selected items</b>	<p>Select this option to delete <b>several</b> selected diagrams in the same Package (hold <b>Ctrl</b> or <b>Shift</b> while selecting).</p> <p>A prompt displays to confirm the deletion of each diagram separately, or all together.</p>		
<b>Help</b>	Select this option to display the Help topic for the Project Browser.		

#### 4.1.1.1.5 Operation Menu - Project Browser

To display the **Operation** (or Method) context menu, right-click on an Operation name in the Project Browser.

A very similar menu displays if you right-click on an **Attribute** name in the Project Browser.

Option	Action	Shortcut	See also
<b>Extensions</b>	<p>Select this option to access a submenu of enabled Technologies on the system (for example, ArcGIS or TOGAF), each of which provides options for performing technology-specific operations on the operation.</p> <p>This option is available in the Professional, Corporate and Extended editions of Enterprise Architect.</p>		<a href="#">Geodatabase Design for ArcGIS</a> <sup>[1944]</sup>
<b>Scripts</b>	Select this option to list the scripts enabled for execution directly from the Project Browser.		<a href="#">Script Group Properties</a> <sup>[2794]</sup>

Option	Action	Shortcut	See also
	<p>(This option does not display if no Project Browser scripts exist.)</p> <p>Click on a script name to run that script.</p>		
<b>Executable Statemachine</b>	(For Attributes.) Select this option to access a submenu of options for treating the <b>Attribute</b> like an <b>Executable Statemachine Artifact</b> and generating code from it.		<a href="#">Code Generation - State Machines</a> <sup>[2122]</sup>
<b>Generate Code</b>	<p>Select this option to generate code from the operation, within its parent Class.</p> <p>The Generate Code dialog displays.</p>	<b>F11</b>	<a href="#">Generate a Single Class</a> <sup>[2113]</sup>
<b>Synchronize With Code</b>	<p>Select this option to synchronize the operation with its code.</p> <p>You can also synchronize Class elements from the source code on a diagram, and reverse engineer or forward engineer model Packages and code to synchronize them and incorporate changes made in one but not in the other.</p>	<b>F7</b>	<a href="#">Import Source Code</a> <sup>[2136]</sup> <a href="#">Element Options in the Project Browser</a> <sup>[660]</sup> <a href="#">Update Package Contents</a> <sup>[2117]</sup>
<b>View Source Code</b>	Select this option to open the Source Code Viewer and display the code for the operation.	<b>F12</b>	<a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>Operation Properties</b>	Select this option to display the Properties dialog for the operation, to view and edit the properties of the operations in the parent element.		<a href="#">General Properties of Operations</a> <sup>[1015]</sup>
<b>Find in all Diagrams</b>	(For Operations.) Select this option to locate any elements derived from the operation in any diagram in the models.	<b>Ctrl+U</b>	<a href="#">Show Element Use</a> <sup>[910]</sup>
<b>Copy Reference</b>	<p>Select this option to copy a reference to the operation to the Enterprise Architect clipboard.</p> <p>Select the appropriate sub-option to copy the:</p> <ul style="list-style-type: none"> <li>Selected hierarchy structure (node path)</li> <li>Node GUID</li> </ul>		
<b>Cut</b>	<p>Select this option to cut the operation from its current element and paste it into another element. The operation does not move from the original element until you paste it into the target.</p> <p>Use the element <b>Copy/Paste   Paste</b> menu option to paste the operation into its new parent.</p>		<a href="#">Element Copy/Paste Submenu</a> <sup>[663]</sup>

Option	Action	Shortcut	See also
<b>Paste</b>	Not used.		
<b>Delete Operation</b>	Select this option to delete the operation.  The operation is immediately removed from the element.		
<b>Help</b>	Select this option to display the Help topic for the Project Browser.		

### Notes

- You can display an equivalent context menu for an attribute by right-clicking on the attribute in the Project Browser

#### 4.1.1.2 Project Browser Toolbar

The Project Browser toolbar provides access to a range of operations you can perform on your project structure and content.

**Access** [View | Project Browser](#)

### Options

Option	Action	Shortcut	See also
<b>New Model from Pattern</b>	Create a new Model Package in the project, from a predefined UML or Technology pattern.  The list of available Model Pattern Technologies includes the MDG Technology Builder, which creates a Model package containing templates that you can use to generate a new MDG Technology containing a set of Profiles.	<b>(Ctrl+Shift+M)</b>	<a href="#">Model Wizard</a> <sup>[753]</sup>
<b>New Package</b>	Create a new child package under the selected package.		<a href="#">Add a Package</a> <sup>[772]</sup>
<b>New Diagram</b>	Create a new child diagram under the selected package or element.		<a href="#">Add New Diagrams</a> <sup>[822]</sup>

<b>New Element</b>	Create a new child element under the selected package or element.		<a href="#">Add Elements Directly to Packages</a> <sup>[903]</sup>
<b>Find in Project Browser</b>	Perform a simple search for a text string in the Project Browser.		
<b>Documentation</b>	Provide options to generate, on the selected Package in the Project Browser, a: <ul style="list-style-type: none"> <li>Document report</li> <li>Web report or</li> <li>Diagram Only report</li> </ul>	(F8) (Shift+F8) (Ctrl+Shift+F8)	<a href="#">Generate Document Reports</a> <sup>[2642]</sup> <a href="#">Web Reports</a> <sup>[2744]</sup> <a href="#">Diagrams Only Report</a> <sup>[2741]</sup>
<b>Code and DB Generation</b>	Provide options to: <ul style="list-style-type: none"> <li>Generate source code</li> <li>Generate DDL</li> <li>Import a source directory</li> <li>Import a binary module</li> <li>Import a database schema</li> <li>Generate package contents to synchronize with package code</li> <li>Reset the source code language</li> </ul> <p>All these options operate on the selected package.</p>	(Ctrl+Alt+K) (Ctrl+Shift+U) (Ctrl+Alt+M)	<a href="#">Generate a Package</a> <sup>[2115]</sup> <a href="#">Generate DDL for a Package</a> <sup>[2381]</sup> <a href="#">Import a Directory Structure</a> <sup>[2142]</sup> <a href="#">Import Binary Module</a> <sup>[2143]</sup> <a href="#">Import Database Schema</a> <sup>[2376]</sup> <a href="#">Update Package Contents</a> <sup>[2117]</sup> <a href="#">Reset Options</a> <sup>[2279]</sup>
<b>Move Element Up</b>	Move the selected package or element further up the Project Browser, within its parent package.		
<b>Move Element Down</b>	Move the selected package or element further down the Project Browser, within its parent package.		
<b>Help</b>	Display the Help topic on the Project Browser.		

#### 4.1.1.3 Project Browser Icon Overlays

The Project Browser displays the status of each package in the model by overlaying status icons on the package icon. The following table describes what each overlaid icon means.

Icon Overlay	Indicates that...	See also
	This package is controlled and is represented by an XML file on disk; version control either is not being used or is not available.	<a href="#">Controlled Packages</a> <sup>[484]</sup>

Icon Overlay	Indicates that...	See also
	You can edit the package.	
	This package is version controlled and checked out to you, therefore you can edit the package.	<a href="#">Use Version Control</a> <sup>[422]</sup>
	This package is version controlled and not checked out to you, therefore you cannot edit the package (unless you check the package out).	<a href="#">Use Version Control</a> <sup>[422]</sup>
	This package is version controlled, but you checked it out whilst not connected to the version control server.  You can edit the package but there could be version conflicts when you check the package in again.	<a href="#">Offline Version Control</a> <sup>[392]</sup>
	This package is a namespace root, which denotes where the namespace structure starts; packages below this point are generated as namespaces to code.	<a href="#">Namespaces</a> <sup>[2120]</sup>
	The version-controlled package has been flagged as <i>Read Only</i> , using a package control method applied through the Automation Interface - as a script, for example.  The icon displays with other package control icons except for the 'blue box' icon (above) which takes precedence.  The <i>Read Only</i> flag can be applied to packages whether they are checked-in or checked-out.	<a href="#">Package Class</a> <sup>[2835]</sup>
<MDG Add-In icon>	MDG Add-Ins specify their own icon to denote that this branch of the model belongs to that Add-In.  All packages connected to an MDG Add-In correspond to a namespace root, so the namespace root icon is not displayed.	<a href="#">MDG Add-Ins</a> <sup>[3097]</sup>

Similarly, the Project Browser indicates attribute and operation scope status with icons. The following table describes what each indicator icon means.

Icon Overlay	Indicates that...	See also
	The attribute or operation is scoped as protected.	
		
	The attribute or operation is scoped as private.	

Icon Overlay	Indicates that...	See also
		

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, if project User Security is on, the Project Browser also has element locking indicators (red and blue exclamation marks) that indicate the lock status of individual elements and packages

The availability of these elements for editing depends on whether user locks are required or not

### Learn more

- [Locked Element Indicators](#)<sup>[340]</sup>

#### 4.1.1.4 Order Package Contents

Ordering elements is very important when it comes to structuring your model, especially packages. Report documents honor any custom ordering when printing documentation. You can change the order of elements listed in the Project Browser.

By default, elements are first listed in:

- Order of type, then
- Order of set position, then
- Alphabetically

You can use the context menu options to move an element up or down within its type, but not outside its type. This means you can re-sequence Packages or Diagrams or Use Cases, but you cannot mix up elements.

However, you can change this default behavior to allow elements to be re-ordered within the package, **regardless** of type.

### Learn more

- [Set Default Behavior](#)<sup>[672]</sup>

#### 4.1.1.5 Set Default Behavior

The General page of the Options dialog provides several options for altering the look and behavior of the Project Browser.

**Access** [Tools](#) | [Options](#) | [General](#)

Panel	Option	Effect	See also

Panel	Option	Effect	See also
		Properties dialog (if available) displays.	
	<b>Opens Branch</b>	When an item in the Project Browser is double-clicked, the hierarchy expands to show the item's children.  If there are no children, nothing happens.	
	<b>Opens Branch &amp; Diagram</b>	As above, but also opens the first diagram beneath the item, if applicable.	
<b>Project Browser</b>	<b>Allow Free Sorting</b>	Enables you to re-order elements within a package <b>regardless</b> of type, within the Project Browser.	<a href="#">Order Package Contents</a> <sup>[672]</sup>
	<b>Show Stereotypes</b>	When a stereotype is defined for an element, the stereotype name then displays in front of the element name.  You set the stereotype of an element in its Properties dialog.  Shut down and restart Enterprise Architect to enable this change to take effect.	

### 4.1.2 Package Browser

If you want to quickly create and operate on elements in a **Package**, you can use the **Package Browser** as a workbench. The Package Browser is a tabular, editable view of the elements in a selected Package, which can be displayed either in the Diagram View or as a floating window, and as either a List display or a Gantt chart. It can be particularly useful for setting up a Package for a specific purpose, such as when an Analyst creates and maintains formal requirement definitions within the model. When you have checked the contents of the Package, you can either print the list of elements or generate a document report on all or a subset of the elements.

The Package Browser is related to, and can be used in conjunction with, the:

- **Diagram List**, which lists the elements in a selected **diagram**, and
- **Specification Manager**, which is a document-based interface to the Package, providing the means of creating and reviewing elements as text representations of model objects in that Package

**Access** **Project Browser > Package | View | Package Browser (Ctrl+Alt+R)**

**Project Browser > right-click Package | List View**

**Project Browser > right-click Package | Gantt View**

**Diagram > right-click Package | Package Browser**

**Features**

Feature	Detail	See also
<b>Select Standard View or Gantt View</b>	<p>When you select one of the menu paths, above, a submenu displays for you to select the <b>Standard View</b> of the Package Browser, or the <b>Gantt View</b>.</p> <ul style="list-style-type: none"> <li>• <b>Standard (or List) View</b> lists all the elements in the Package, with their properties; it has two formats, in which the elements are either grouped by model hierarchy or grouped (by you) according to one or more properties</li> <li>• <b>Gantt View</b> lists all the elements in the Package, grouped by model hierarchy, but showing the percent-completion of all tasks associated with each element with the work timeline for each element and for each resource assigned to work on the element</li> </ul> <p>Once you have displayed one of these views, you can switch to the other by right-clicking on the display and selecting the appropriate context menu option:</p> <ul style="list-style-type: none"> <li>• <b>Switch to List View</b> or</li> <li>• <b>Switch to Gantt View</b></li> </ul>	<p><a href="#">Element View</a> <sup>[542]</sup></p> <p><a href="#">The Gantt View</a> <sup>[594]</sup></p> <p><a href="#">Package Browser Options</a> <sup>[679]</sup></p>
<b>Switch Standard View Formats</b>	<p>In Standard View, the Package Browser has two formats:</p> <ul style="list-style-type: none"> <li>• <b>User Defined</b> format, initially a flat list, where <b>you</b> can define how the element information is grouped on the screen using the value-grouping band below the toolbar</li> <li>• <b>Model Hierarchy</b> format, where the elements are already organized into their Package and element hierarchies in the display</li> </ul> <p>You switch between these formats using the <b>Show Hierarchy</b> button (  ) in the toolbar.</p>	<p><a href="#">List Header</a> <sup>[677]</sup></p>
<b>Change Standard View display</b>	<p>It is possible to reorganize the information in the Project Browser in a number of ways:</p> <ul style="list-style-type: none"> <li>• In User Defined format, sort the items by any column value in ascending or descending order, by clicking on the column header; initially the elements are listed in numerical order (if level numbering is turned on in the Project Browser) or alphabetical order within type</li> <li>• In User Defined format, apply a diagram filter for elements (the <b>Fade</b>, <b>Gray Scale</b> and <b>Hide</b> modes reduce the number of elements listed; <b>Select</b> mode has no effect)</li> <li>• In either format, change the sequence of columns by dragging column headers left or right <ul style="list-style-type: none"> <li>• In Model Hierarchy format, the <b>Name</b> column is always on the left; you cannot move any other column into that position, although you can rearrange the order of the rest of the columns</li> </ul> </li> </ul>	<p><a href="#">Diagram filters</a> <sup>[718]</sup></p>

Feature	Detail	See also
	<p>Because of this, if you group or sort information in User Defined format and switch to Model Hierarchy format your information structure is altered, and it is not restored when you switch back to User Defined format</p>	
<b>Show Elements in a Child Package</b>	<p>Double-click on the child Package in the list to re-focus the display, showing the contents of that Package only.</p> <p>In either format, click on the  button in the toolbar to expand or collapse the contents of the child Packages.</p>	
<b>Display Element Properties</b>	Double-click on the <b>element</b> line to display the element Properties dialog.	
<b>Select Items</b>	<p>Select:</p> <ul style="list-style-type: none"> <li>• an element by clicking on it</li> <li>• a specific value by clicking twice on it (not double-clicking); either the value becomes directly editable (overtyping or selecting from drop-down) or the Properties dialog displays in which you can edit the value</li> <li>• several individual elements by holding <b>Ctrl</b> as you click on them</li> <li>• a range of elements by holding <b>Shift</b> as you click on the first and last in the range</li> </ul>	
<b>Add new items to the Package</b>	<p>Click on a listed element and press <b>Ctrl+N</b> or <b>Insert</b>, or right-click and select the <b>Add New</b> context menu option. The New Element dialog displays; complete the fields and click on the <b>Create</b> button.</p> <ul style="list-style-type: none"> <li>• In Model Hierarchy format, the new element is inserted as a <b>sibling</b> of the <b>selected element</b>, in its parent Package</li> <li>• In User Defined format, the new element is added to the <b>root Package</b> selected for display in the Package Browser</li> </ul>	<a href="#">Add Elements Directly to Packages</a> <sup>[903]</sup>
<b>Add a child element to the selected element</b>	<p>Click on the selected element and press <b>Ctrl+Shift+N</b>. The New Element dialog displays; complete the fields and click on the <b>Create</b> button.</p> <ul style="list-style-type: none"> <li>• in Model Hierarchy format, the new element is inserted as a <b>child</b> of the <b>selected element</b></li> <li>• in User Defined format, the new element is added to the <b>root Package</b> selected for display in the Package Browser</li> </ul>	<a href="#">Add Elements Directly to Packages</a> <sup>[903]</sup>
<b>Add elements to the Package Browser</b>	Drag the required elements from anywhere in the Project Browser. The element is listed in the Package Browser, and moved into the target Package in the Project Browser.	

Feature	Detail	See also
	You can also drag elements <i>from</i> the Package Browser <i>into</i> a package in the Project Browser, in either List view or Gantt view.	
<b>Add elements to a diagram from the Package Browser</b>	<p>In either List view or Gantt view, you can drag one or more elements from the Package Browser onto a diagram to immediately create an <b>instance</b> of each element on the diagram (and in the Project Browser for the diagram's parent Package).</p> <p>Click each element (pressing <b>Ctrl</b> or <b>Shift</b> for multiple selections) to select it before dragging it onto the diagram.</p> <p>One advantage of dragging elements from the Gantt view is that it provides the additional filter on task or resource, so that you can isolate elements to be copied to a diagram or Package specific to a task or resource.</p>	
<b>Delete elements from the list</b>	<p>Select the item and press <b>Ctrl+D</b>. This deletes the element from all diagrams and from the model itself.</p> <p>In Model Hierarchy format, you cannot delete a parent element until all its child elements have been removed or deleted.</p>	
<b>Include each element's notes (documentation)</b>	<p>Notes are shown underneath the element.</p> <p>To add or edit notes, click on the item and press <b>Ctrl+Shift+Space</b> to transfer control to the Notes window, in which you create or edit the note text.</p> <p>Alternatively, right-click on the element line and select the <b>Edit Notes</b> context menu option.</p>	<a href="#">Package Browser Options</a> <sup>[679]</sup>
<b>Review the element's custom (advanced) properties</b>	<p>Click on the item and press <b>Ctrl+Enter</b>.</p> <p>The Custom Properties dialog for the element displays.</p>	
<b>Further Work</b>	You can do further work on the Package Browser using the toolbar and context menu options.	<a href="#">Package Browser Options</a> <sup>[679]</sup>

#### 4.1.2.1 List Header

In your work on your project you might use any of a number of 'listing' reports in which information is organized in several columns. Such reports include the:

- Package Browser
- Diagram List
- Model Search
- Model Mail window
- Attribute and Operation dialog General pages
- Testing and Maintenance tabs of the QA Reports and Metrics view
- The Gantt View
- The Project Management window

In these reports, you can quickly and easily reorganize the sequence and combination of columns to present the information in the most appropriate format to suit your needs, and filter the data according to the values of the text strings displayed in the column fields.

#### Reorganize layout of display

Tool	Description
<b>View Header</b>	<p>Drag a column header here to group by that column.</p>  <p>The View Header defines the columns of information that are presented by the report, and the order in which data items are presented.</p> <p>To review the column headings:</p> <ul style="list-style-type: none"> <li>• Right-click on the header to display the <b>Field Chooser</b> context menu option; the Field Chooser dialog displays</li> </ul> <p>This enables you to add columns to or remove columns from the output; between them, the View Header and Field Chooser dialog show the full range of column headers available.</p> <p>To add a column heading to the View Header:</p> <ul style="list-style-type: none"> <li>• Drag it from the Field Chooser dialog onto the header to the position you want the column of data to display</li> <li>• When you have selected the column headings you require, click on the red cross in the top right corner of the Field Chooser dialog to close it</li> </ul> <p>To remove a column from the output:</p> <ul style="list-style-type: none"> <li>• Drag the column heading downwards out of the View Header</li> </ul> <p>To change the sequence of columns:</p> <ul style="list-style-type: none"> <li>• Drag the required column header left or right, as appropriate</li> </ul>

Tool	Description
<b>Value Grouping</b>	<p>For most reports, and when the Package Browser or Diagram List is in <i>User Defined</i> format, you can organize the reported data according to the value of one or more of the column categories (this facility is not available in the Package Browser in <i>Model Hierarchy</i> format).</p> <p>You might organize the data by <b>Type</b>, and within each Type by <b>Name</b>; if you then click on any other column heading, the data within this grouping is further sorted with the values of the selected column (for example, <b>Created</b>) in ascending or descending order.</p> <p>To set up the value grouping, drag the column heading representing the primary grouping (such as <b>Author</b>) onto the <b>Drag a column header here to group by that column</b> field.</p> <p>Now drag the column heading for the next level of grouping (such as <b>Status</b>) to the right of the first heading; the two heading titles display as connected blocks, as shown below:</p>  <p>You can, if required, add further levels of grouping by dragging other column headings onto the hierarchy (such as <b>Created</b>), and restructure the order by dragging existing or additional headings into the level you want them to hold.</p> <p>For example, you could make <b>Type</b> the secondary grouping by dragging it to the right of <b>Author</b>, or drop <b>Status</b> between <b>Author</b> and <b>Type</b>.</p> <p>To remove a grouping level, drag the appropriate column heading out of the sequence and below the View header; any subordinate groupings move up a level.</p>
<b>Filter Bar</b>	<p>The Filter Bar displays underneath the column headings; you can hide or show it using the <b>Toggle Filter Bar</b> icon in the toolbar.</p> <p>The Filter Bar consists of a row of fields, one field per column; as you type a value into one of these fields, the item lists are automatically filtered to show entries with a value in the corresponding column that contain the text string in the field.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>If you type the letter <b>F</b> in the Filter Bar field under the <b>Author</b> column, the results immediately reduce to entries for which the letter <b>F</b> occurs anywhere in the name (<b>F</b>red, <b>F</b>itzgibbon, <b>R</b>ufus, <b>W</b>olf)</li> <li>If you then go on to type <b>Fi</b>, the results immediately reduce again to entries for which the combination <b>fi</b> appears in the name (<b>F</b>itzgibbon, <b>A</b>mal<b>fi</b>)</li> </ul> <p>For reports and displays that identify the percentage completion of a task or piece of work, you can specify a percentage value or a range to display items that match that value. In the Filter Bar, in the field under the <b>%Completed</b> or <b>Complete</b> field, type:</p> <ul style="list-style-type: none"> <li><b>&lt;x</b> to display items less than x percent complete; for example, <b>&lt;30</b> (all items less than 30 percent complete, but <b>not</b> those exactly 30 percent complete)</li> <li><b>&gt;x</b> to display items more than x percent complete; for example, <b>&gt;30</b> (all items more than 30 percent complete, but <b>not</b> those exactly 30 percent complete)</li> <li><b>x</b> to display items <b>exactly</b> x percent complete; for example, <b>30</b> (all items exactly 30 percent complete)</li> <li><b>-x</b> to display items exactly x percent complete and less than that; for example, <b>-30</b></li> </ul>

Tool	Description
	<p>(all items less than 30 percent complete <b>and</b> those exactly 30 percent complete)</p> <ul style="list-style-type: none"> <li>• <b>x-</b> to display items exactly x percent complete and more than that; for example, <b>+30</b> (all items more than 30 percent complete <b>and</b> those exactly 30 percent complete)</li> <li>• <b>x-y</b> to display items between x-1 percent complete and y+1 percent complete; for example <b>30-45</b> (all items <b>between</b> 30 and 45 percent complete, including those <b>exactly</b> 30 percent and 45 percent complete)</li> </ul>

#### 4.1.2.2 Package Browser Options

In building and managing your model you can use the Package Browser as a workbench to perform many operations, such as reorganizing the package structure, adding new packages and elements, and generating reports on the package contents. You can also modify the display by:

- Filtering the elements listed, by type or by Toolbox group
- Adding columns to show the values of specific tags on the elements

To perform all of these operations, you select options on either the Project Browser toolbar or the context menu.

**Access** **Project Browser > Right-click package | Package Browser > Toolbar**  
**Project Browser > Right-click package | Package Browser > right-click on items**

#### Toolbar Options

Icon	Action	Shortcut	See also
	Add a new element to the package. The New Element dialog displays.	<b>Ctrl+N</b>	<a href="#">Add Elements Directly to Packages</a> <sup>[903]</sup>
	Display the Notes window, to add or edit notes for the selected element. The cursor is positioned at the start of the text entry area of the window.	<b>Ctrl+Shift+Space</b>	<a href="#">Notes</a> <sup>[1142]</sup>

	<p>Delete the selected element from all diagrams and from the model.</p> <p>A confirmatory prompt displays; click on the <b>Yes</b> button.</p>	<b>Ctrl+D</b>	
	<p>Print the current contents of the Package Browser.</p> <p>The Print dialog displays, on which you specify the print job.</p>		
	<p>Display the Generate Documentation dialog, to create one document report on the selected element(s). You can apply the full facilities of this dialog to tailor the report to your requirements.</p>		<a href="#">Generate Documentation</a> <small>[2644]</small>
	<p>Click on the drop-down arrow and select:</p> <ul style="list-style-type: none"> <li>• A specific element type from the drop-down list, or</li> <li>• <b>All</b> to list elements of all types in the package</li> </ul> <p>The report then lists only elements of the selected type(s).</p>		
	<p>Select another toolbox or technology - select the UML, Extended or MDG Toolbox category to set the types of element shown in the drop-down element filter list (above).</p>		
	<p>Toggle between:</p> <ul style="list-style-type: none"> <li>• Including child packages and their contents in the list, and</li> <li>• Showing only the first-level contents of the selected diagram or package</li> </ul>		
	<p>Toggle the display between:</p> <ul style="list-style-type: none"> <li>• Model Hierarchy format and</li> <li>• User-Defined, value-grouping format</li> </ul>		<a href="#">Package Browser</a> <small>[673]</small> <a href="#">List Header</a> <small>[677]</small>
	<p>Display a short menu from which you can select to:</p> <ul style="list-style-type: none"> <li>• Hide the contents of the Notes compartment of each element</li> <li>• Display the first few words as a preview, or</li> <li>• Display the full text of each note</li> </ul>		

	Display or hide the Filter Bar fields underneath the column headings, in any of which you can type a text string to filter the data in the corresponding column to show only data containing the typed string.		<a href="#">List Header</a> <sup>[677]</sup>
	Change the display to show the contents of the <b>parent</b> package of the selected package.	<b>Ctrl+Shift+Up</b>	
	Display Help on the Package Browser.		

### Context Menu Options

Option	Description	Shortcut	See also
<b>Properties</b>	Display the Properties dialog for the selected element.		<a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Edit Notes</b>	Add or edit notes on the element, in the Notes window.	<b>Ctrl+Shift+Space</b>	<a href="#">Notes</a> <sup>[1142]</sup>
<b>Create Linked Document</b> (Edit Linked Document)	Create (or edit) a Linked Document. (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions.)	<b>Ctrl+Alt+D</b>	<a href="#">Linked Documents</a> <sup>[1044]</sup> <a href="#">Create Linked Document on an Element</a> <sup>[1047]</sup> <a href="#">Edit Linked Documents</a> <sup>[1048]</sup>
<b>Delete Linked Document</b>	(If the element has a linked document.) Delete the existing linked document.		
<b>Add New Element</b>	If the <b>Display elements of this type</b> field in the toolbar is set to: <ul style="list-style-type: none"> <li><b>All</b>, display the New Element dialog, through which you create an element of any type</li> <li>A specific element type, add an element of that type to the package in the Package Browser or to the diagram in the Diagram List, and to the Project Browser</li> </ul>		<a href="#">Add Elements Directly to Packages</a> <sup>[903]</sup>
<b>Find in Diagrams</b>	Display:		

Option	Description	Shortcut	See also
	<ul style="list-style-type: none"> <li>The diagram that uses the element, or</li> <li>If the element is used in multiple diagrams, the Element Usage dialog, which lists the diagrams that contain the element</li> </ul>		<a href="#">Show Element Use</a> <sup>[910]</sup>
<b>Find In Project Browser</b>	Highlight the selected element in the Project Browser.		
<b>Bookmark Item</b>	Bookmark the element.		
<b>Switch to Gantt View</b>	If in Standard (or List) View format, switch the display to Gantt View format.		<a href="#">Package Browser</a> <sup>[673]</sup> <a href="#">Element View</a> <sup>[542]</sup>
<b>Documentation</b>	<p>Generate a document report; you have two options:</p> <ul style="list-style-type: none"> <li>Generate a separate report on each selected object in the report</li> <li>Generate one report on all selected objects</li> </ul> <p>In either case, the Generate Documentation dialog displays. If you have selected to generate separate reports, the Generate Documentation dialog displays separately for each report in turn.</p> <p>You also have the option to print out the Package Browser list itself.</p>		<a href="#">Generate Documentation</a> <sup>[2644]</sup>
<b>Sort Contents</b>	<p>In <i>Model Hierarchy</i> format, synchronize the list with the Project Browser hierarchy, to ensure that all element and package hierarchies and sequences are - if necessary - updated.</p> <p>Normally changes are updated automatically, but there can be delays if changes are made outside the Package Browser.</p>		
<b>Reload</b>	Reload the list of elements to refresh the order and content with any recent changes.		
<b>Add Tag Value Column</b>	Add a column to show the values for a selected Tagged Value, for each element in the list (see below).		
<b>Columns Layout</b>	Preserve, apply or delete a profile of the column layout of the Package Browser display. A layout		

Option	Description	Shortcut	See also
	<p>consists of the number of columns and (where the workstation screen layout permits) the column widths.</p> <p>When you mouse-over this option, a submenu displays:</p> <ul style="list-style-type: none"> <li>• <b>Load Columns Layout</b> - displays a dialog in which you select to apply the default layout (all possible columns) or one that you have previously saved; click on the <b>OK</b> button to apply the layout</li> <li>• <b>Save Columns Layout</b> - displays a dialog in which you specify the name under which to save the layout - you can replace an existing layout by clicking on the drop-down list and selecting the name, or save as a new layout by typing a new name</li> <li>• <b>Delete Columns Layout</b> - displays a dialog in which you specify the layout profile to delete; when you click on the <b>OK</b> button, the profile is deleted (and cannot be retrieved again) but if that profile was in use when it was deleted, the layout persists until it is specifically changed, even if you close and re-open the Package Browser</li> </ul>		
<b>Print</b>	<p>Print the contents of the Package Browser.</p> <p>The Print dialog displays, on which you specify the print job.</p>		
<b>Delete Selected</b>	<p>Delete the selected element from the Package Browser.</p> <p>A confirmatory prompt displays; click on the <b>Yes</b> button.</p>		

### Add Tagged Value Column

If you want to show the value that any element in the list has for a particular tag, you can add a *read-only* column for the tag. There are two ways in which to do this:

Method	Action	See also
<b>1</b>	Open the Tagged Values window for the element and drag the tag onto the Package Browser; a new column is added for each tag you drag onto the list.	
<b>2</b>	Right-click on the element in the Package Browser or Diagram List and select the <b>Add Tag Value Column</b> context menu option; the Add Tag Value Column dialog displays.	

Method	Action	See also
	<p>Either type the tag name into the <b>Tagged Value</b> field, or select one of the two options:</p> <ul style="list-style-type: none"> <li>• <b>Global Tagged Values</b> - populates the <b>Tagged Value</b> drop-down list with all global Tagged Values in the project; this enables you to select a Tagged Value that is applicable to a large number of elements</li> <li>• <b>Tagged Values from the selected Element</b> - populates the <b>Tagged Value</b> drop-down list with the Tagged Values defined for the selected element (as listed on the Tagged Values window for that element); this enables you to filter the initial selection to a specific set of tags</li> </ul> <p>When you have selected the required tag, click on the <b>OK</b> button to insert a column for that tag into the Package Browser or Diagram List header.</p>	

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if Auditing is turned on and the Package Browser is open, you can view a history of changes to any selected element or connector, in the Audit History tab of the Output window (if Security is enabled, you must have at least **Audit View** permissions to display the audit history)

## 4.1.3 Diagram List

The Diagram List is a tabular, editable view of elements in a selected diagram, which can be displayed in the main workspace. You can use the Diagram List to:

- Streamline the process of creating and updating elements in a diagram selected from the Project Browser; this can be particularly useful for analysts to create and maintain formal requirement definitions within the model
- Print the list or generate a document report directly from the entries on the list

**Access** **diagram | Diagram | Show Diagram As | List View**  
**Project Browser > diagram ( Ctrl+Alt+R )**  
**diagram > Right-click | Switch to List View**

### Topics

Topic	Detail	See also
<b>The Diagram List</b>	The Diagram List is related to the Package Browser, which lists the elements in a selected package; however, the Package Browser has a wider range of options.	<a href="#">Package Browser</a> <sup>[673]</sup>

Topic	Detail	See also
<b>Formats</b>	The Diagram List is displayed in <i>User Defined</i> format, where you can change how the element information is structured on the screen using the value-grouping band below the toolbar.	<a href="#">List Header</a> <sup>[677]</sup>
<b>Change display</b>	<ul style="list-style-type: none"> <li>Sort the items by any column value in ascending or descending order, by clicking on the column header; initially the elements are listed in numerical order (if level numbering is turned on in the Project Browser) or alphabetical order within type</li> <li>Apply a diagram filter for elements (the <b>Fade</b>, <b>Gray Scale</b> and <b>Hide</b> modes reduce the number of elements listed; <b>Select</b> mode has no effect)</li> <li>Change the sequence of columns, by dragging column headers left or right</li> </ul>	<a href="#">Diagram filters</a> <sup>[718]</sup>
<b>Display Element Properties</b>	Double-click on the element entry.	
<b>Select Items</b>	Select: <ul style="list-style-type: none"> <li>an element by clicking on it</li> <li>a specific value by clicking twice on it (not double-clicking); either the value becomes directly editable or the Properties dialog displays in which you can edit the value</li> <li>several individual elements by holding ( <b>Ctrl</b> ) as you click on them</li> <li>a range of elements by holding ( <b>Shift</b> ) as you click on the first and last in the range</li> </ul>	
<b>Add new items to the diagram</b>	Create new elements on the Diagram List, using the toolbar or context menu options; these elements are automatically added to the diagram.	<a href="#">Package Browser Options</a> <sup>[679]</sup>
<b>Delete elements from the list</b>	Select the item and press ( <b>Ctrl+D</b> ).	
<b>Include each element's notes (documentation)</b>	Notes are shown underneath the element. To add or edit notes, click on the item and press ( <b>Ctrl+Space</b> ) to transfer control to the Notes window, in which you create or edit the note text.	<a href="#">Package Browser Options</a> <sup>[679]</sup>
<b>Review the element's custom (advanced)</b>	Right-click on the item and select the Properties context menu option, then select the Advanced page.	

Topic	Detail	See also
<b>properties</b>		
<b>Further Options</b>	<p>You can do further work on the Diagram List using the same toolbar and context menu options as for the Package Browser, except that the Diagram List <i>does not have</i>:</p> <ul style="list-style-type: none"> <li>The <i>Model Hierarchy</i> format and hence does not have the <b>Show Hierarchy</b> button () in the toolbar</li> <li>The  toggle button</li> <li>The  toggle button</li> </ul> <p>The Diagram List <i>does have</i> these additional context menu options:</p> <ul style="list-style-type: none"> <li><b>Diagram View</b> - show the elements of the selected diagram as a diagram instead of as the Diagram List</li> <li><b>Gantt View</b> - show the list as a Gantt chart of resource allocations</li> <li><b>Diagram Properties</b> - display the Diagram Properties dialog for the diagram</li> </ul>	<a href="#">Package Browser Options</a> <sup>[679]</sup> <a href="#">Diagram Properties</a> <sup>[823]</sup>  <a href="#">The Gantt View</a> <sup>[594]</sup>

#### 4.1.4 Model Views

The Model Views facility captures information on the objects in your model from different perspectives that you define yourself, helping you to encapsulate your model under the areas you are interested in.

**Access** **View | Model Views** (Ctrl+Shift+5)

#### Topics

Topic	Detail	See also
<b>View Root Nodes</b>	<p>There are three types of View root-node available:</p> <ul style="list-style-type: none"> <li><i>Model Views</i> - stored in the model and visible to all users; you can have many of these</li> <li><i>My Views</i> - stored locally on your machine and visible only to you; you can have only one of these</li> <li><i>Technology-defined Views</i> - read only; each View is stored with and populated by the corresponding active MDG Technology</li> </ul>	<a href="#">Model Views Operations</a> <sup>[693]</sup> <a href="#">Team Review Tools</a> <sup>[343]</sup> <a href="#">Team Review Connections</a> <sup>[363]</sup> <a href="#">Model Views</a>

Topic	Detail	See also
	<p>Additionally, there is a <i>Recent Team Reviews</i> folder that contains current correspondence from the Team Review concerning items that are held in any of the Views; this folder has a separate repository of postings for each Team Review server connection you access through the model. You can control how recent these postings must be, and how many are to be listed.</p> <p>When you open the Model Views window for the first time on a project, a <i>Model Views</i> root section, <i>My Views</i> root section and <i>Recent Team Reviews</i> folder are added for you. These can not be deleted or renamed; however, you can create further Model View root nodes that you can modify and delete.</p>	<a href="#">Context Menus</a> <sup>[690]</sup>
<b>Subordinate Folders</b>	<p>Under the <i>My Views</i> root node you can add a single level of <i>View</i> folders, which enable you to group <i>Search View</i> folders as best suit your requirements.</p> <ul style="list-style-type: none"> <li>• A <i>Search View</i> is a folder of elements or structures that you assemble by assigning a model search to the folder; when you double-click on or expand the folder, the search runs and refreshes the folder contents</li> <li>• You can also set a search to refresh at a defined interval, and to notify you if new results are found</li> </ul> <p>Under a <i>Model View</i> root node you can create Views folders that can contain Search View folders, <i>Slideshow</i> folders and <i>Favorites</i> folders.</p> <ul style="list-style-type: none"> <li>• A <i>Slideshow folder</i> contains diagrams only, which you can display as a slide show with diagrams being shown in the sequence in which they are listed in the folder</li> </ul> <p>One folder represents one slide show - you can run the slide show automatically or manually; in either case the diagrams are closed after they have been displayed</p> <ul style="list-style-type: none"> <li>• A <i>Favorites</i> folder gives you easy access to commonly-used items in the Project Browser; to create hyperlinks in a Favorites folder to the required items in the Project Browser, drag items from the Project Browser into the Favorites folder</li> </ul> <p>You can also export all of the View folders containing Views from any root section as an XML file, and import a <i>Views XML file</i> as an additional, editable <i>Model View</i> root node.</p> <p>These are single-level items; if you drag a Package into the Favorites folder, you cannot expand that Package there.</p> <p>To select specific items inside a Package, expand it in the Project Browser and then drag the items into the Favorites folder.</p>	<a href="#">Model Views Operations</a> <sup>[693]</sup> <a href="#">Diagram Slide Show</a> <sup>[695]</sup>

Topic	Detail	See also
<b>Key to Model View Contents</b>	<p>Items on the model view can be identified by their accompanying icons:</p> <ul style="list-style-type: none"> <li> - A Model Views root node</li> <li> - A View Folder</li> <li> - A Favorites Folder</li> <li> - A View (search-based)</li> <li> - A Slideshow Folder</li> <li> - The My Views root node</li> <li> - The UPDM (DoDAF-MODAF) View (a Technology-defined View)</li> <li> - The <i>Recent Team Reviews</i> folder</li> <li> - A repository of documents from a selected Team Review, concerning elements in the Model Views</li> <li> - The recent posts folder for the selected team review</li> </ul>	
<b>Accessing Operations</b>	<p>To perform operations on the Model View contents, you can use the:</p> <ul style="list-style-type: none"> <li>• Model Views window Toolbar or the</li> <li>• Item context menus</li> </ul> <p>Each level of the Model Views hierarchy has a slightly different context menu.</p>	<a href="#">Model Views Toolbar</a> <sup>[688]</sup> <a href="#">Model Views Context Menus</a> <sup>[690]</sup>

#### 4.1.4.1 Model Views Toolbar

**Access** **View | Model Views > Toolbar**

##### Toolbar Options

The availability of the **Model Views** toolbar options depends on the type of object selected. The options are, from left to right:

Icon	Action	Shortcut	See also
	Click on this icon to display the appropriate <b>Properties</b> dialog for the selected item.	Double-click on the item, or	

Icon	Action	Shortcut	See also
		<b>Enter</b>	
	Click on this icon to locate the selected object in any diagrams in which it has been used in the model, and either: <ul style="list-style-type: none"> <li>• Display the single diagram with the object highlighted or</li> <li>• List the several diagrams in which the object has been located</li> </ul>		
	Click on this icon to locate and highlight the selected object in the Project Browser.		
	Click on this icon to create a new <i>Model View</i> root node, and to display the New Model View dialog in which you enter the root node name.		
	Click on this icon to create a new <i>Views</i> folder in the currently-selected root node.		
	Click on this icon to create a new <i>Favorites</i> folder in the currently-selected <i>Views</i> folder.		
	Click on this icon to create a new Slideshow folder in the currently-selected <i>Views</i> folder.		<a href="#">Diagram Slideshow</a> <sup>[695]</sup>
	Click on this icon to create a new <i>View</i> in the currently-selected <i>Views</i> folder, and to display the Create New View dialog to define the search that populates the View.		<a href="#">Model Views Operations</a> <sup>[693]</sup>
	Click on this icon to refresh the selected <i>Model Views</i> root node, folder, <i>View</i> or <i>Favorites</i> ; for a <i>View</i> , this runs the Model Search defined in the View properties.		
	Click on this icon to move the currently-selected object up or down <b>within its type</b> ; you cannot move - for example - a Package below a diagram, or a View above a Favorites folder.		
	Click on this icon to delete the selected object and - if appropriate - its contents. A prompt displays to confirm deletion.  You cannot delete the original <i>Model Views</i> , <i>My Views</i> or <i>Recent Team Reviews</i> root nodes, or any technology-defined Views.		

Icon	Action	Shortcut	See also
	Click on this icon to display Help on the Model Views.		

#### 4.1.4.2 Model Views Context Menus

**Access** **View | Model Views: Right-click on object**

##### Options

The Model Views window context menus display different options, depending on which level of the Model Views hierarchy you right-click on.

Menu Option	Action	Shortcut	See also
<b>Properties</b>	<p>(Not for the <i>My Views</i>, <i>Recent Team Reviews</i>, initial <i>Model Views</i> or <i>Technology-defined</i> root nodes.)</p> <p>Display the appropriate Properties dialog for the selected object.</p> <p>You can edit any of the properties, if required; changes to objects populated from the model are reflected in all other views (Properties window, diagrams, reports) of that object.</p> <p>The <b>Properties</b> option for the <i>Documents and Comments</i> folder displays the Recent Post Options dialog, which enables you to specify the number of days back from which to extract postings from the Team Review, and the number of postings to list.</p> <p>The <b>Properties</b> option for a <i>Slideshow</i> folder displays the Slideshow Properties dialog, which enables you to automate the slide show and set the number of seconds for which each diagram is displayed.</p> <p>If you deselect the <b>Enable</b> checkbox, you must press <b>Spacebar</b> to display each diagram.</p>		<a href="#">Diagram Slide Show</a> <sup>[695]</sup>
<b>New Views Folder</b>	<p>(Root node only.)</p> <p>Display a prompt for the <i>Views folder</i> name and create the folder in the selected root node.</p>		
<b>Import Views From XML</b>	<p>(Root node only.)</p> <p>Prompt for the XML file location and create a new <i>Model Views</i> node to hold the imported Views.</p>		
<b>Export to XML (Views Only)</b>	<p>(Root node only.)</p>		<a href="#">Model Views Operations</a> <sup>[693]</sup>

Menu Option	Action	Shortcut	See also
	Prompt for a file path and name, and copy all Views under the selected root node to an XML file at that location.		
<b>Remove Model View</b>	(Not for the <i>My Views</i> , initial <i>Model Views</i> or <i>Technology-defined</i> root nodes.)  Display a prompt to delete the selected user-defined Model View and, if confirmed, delete the root node and all contents.		
<b>New Search Folder</b>	( <i>View</i> folder only.)  Display the Create New View dialog (similar to the View Properties dialog) for you to define the search that populates the View.		<a href="#">Model Views Operations</a> <sup>[693]</sup>
<b>New Favorites Folder</b>	( <i>View</i> folder only.)  Display the Create a new favorites based folder dialog, which prompts for the folder name.		
<b>New Slideshow</b>	( <i>Model View</i> , <i>View</i> folder only.)  Display the Create a new slideshow dialog, in which you type the name of the slide show.  You must use the Properties dialog to define the properties of the slide show.		<a href="#">Diagram Slide Show</a> <sup>[695]</sup>
<b>Open Search</b>	( <i>View</i> only.)  Display the Model Search tab in the main work area, listing the full results of the search and giving access to all the facilities of the Model Search.	<b>Shift+Space</b>	<a href="#">Customizing the Search View</a> <sup>[708]</sup>
<b>Refresh</b>	Refresh the search and open the View or Documents and Comments repository to show the elements or documents retrieved by the search.	<b>Space</b>	
<b>Double Click Opens Search</b>	Enable you to perform the Open Search function by double-clicking on the View.  If you deselect this option, double-click refreshes the search and opens the View to show the elements retrieved by the search.		
<b>Open Team Review</b>	Open the Project Team Review at the top level (Category).		

Menu Option	Action	Shortcut	See also
<b>Edit Connections</b>	Display the Team Review Server Connections dialog, to select which review to open.		<a href="#">Team Review Connections</a> <sup>[363]</sup>
<b>Remove Folder</b>	(View folder only.) Display a prompt to delete the selected Views folder and, if confirmed, delete the folder and all contents.		
<b>Remove View</b>	Display a prompt to delete the selected View and, if confirmed, delete the View and all contents.		
<b>Remove Favorites</b>	Display a prompt to delete the selected <i>Favorites</i> folder and, if confirmed, delete the folder and all contents.		
<b>Remove Slideshow</b>	Display a prompt to confirm deletion of the selected slide show and, if confirmed, delete the slide show and all its diagrams.		
<b>Run Slideshow</b>	Run the slide show in the Diagram View.		<a href="#">Diagram Slide Show</a> <sup>[695]</sup>
<b>Run Slideshow Full Screen</b>	Run the slide show in full screen mode, so that the slide show fills the whole screen.		
<b>Stop Slideshow</b>	Cancel execution of the slide show running in the Diagram View.	<b>Esc</b>	
<b>In Project Browser</b>	(An element, diagram or Package object only.) Highlight the selected item in the Project Browser.		
<b>In Diagrams</b>	(An element or child Package object only.) Locate the selected object in any diagrams in which it has been used in the model, and either: <ul style="list-style-type: none"> <li>• Display the single diagram with the object highlighted or</li> <li>• List the several diagrams in which the object has been located</li> </ul>		
<b>Remove Linked Item</b>	(An element, diagram or Package object only.) Display a prompt to delete the selected object and, if confirmed, remove the object from the folder.  This has no effect on the object in the Project Browser or		

Menu Option	Action	Shortcut	See also
	any diagrams. You would not delete an object in a View, as it is replaced the next time the View is refreshed.		
<b>Help</b>	Display Help on Model Views.		

#### 4.1.4.3 Model Views Operations

From the Model Views window you can perform a number of operations to define the information you extract from the model and to further process that information, as described here.

Access **View | Model Views**

##### Operations

Operation	Detail	See also
<b>Define View Search</b>	<p>When you:</p> <ul style="list-style-type: none"> <li>Create a View, the Create New View dialog displays</li> <li>Display the View properties, the View Properties dialog displays</li> </ul> <p>These dialogs are identical.</p> <p>In the <b>Name</b> field, type a name for the View.</p> <p>In the <b>Search</b> field, either:</p> <ul style="list-style-type: none"> <li>Click on the drop-down arrow and select an existing search from the lists, or</li> <li>Click on the ( ... ) (Browse) button to display the Manage Searches dialog, edit an existing search or define a new one, then <b>Close</b> the dialog and select that search name in the <b>Search</b> field</li> </ul> <p>A custom SQL search statement should return the <i>guid</i> and <i>type</i> of the object found so that the system can search for the selected item in the Project Browser.</p> <pre>SELECT ea_guid AS CLASSGUID, Object_Type AS CLASSTYPE, Name FROM t_object</pre> <p>If required, in the <b>Search Term</b> field type a specific value to search for.</p> <p>If you are working with the Corporate or extended versions of Enterprise Architect, and you want the search to run automatically and refresh the results, select the <b>Refresh this search</b> checkbox.</p> <p>The <b>Frequency</b> field has three sections, for hours, minutes and seconds; click on the appropriate section and use the up and down arrows at the end of the field to set the interval for refreshing the search results.</p>	<p><a href="#">Create &amp; Modify Searches</a> </p>

Operation	Detail	See also
	<p>You can also set the refresh to display a pop-up notification if the search results change. To do this, select the <b>Notify me when new results found</b> checkbox.</p> <p>Click on the <b>OK</b> button; the View is created (or updated) in a collapsed state.</p> <p>When you expand the View, the search executes and populates the View.</p>	
<b>Display Recent Postings</b>	<p>If a new document is added to the Team Review, or an existing document is updated, that document is also added automatically to the <i>Recent Team Reviews</i> / <i>&lt;Connection&gt; / Documents and Comments</i> folder in the Model View.</p> <p>To open a document, double-click on the entry; the Team Review tab displays, showing the selected message.</p> <p>You can control how many documents are displayed, and for what period of time, using the Model Views context menu for the <i>Recent Team Reviews</i> folder.</p>	<a href="#">Model Views</a> [686] <a href="#">Model Views Context Menus</a> [690]
<b>Move Objects Into Favorites</b>	<p>Drag any required Package, diagram or element from the Project Browser into the required <i>Favorites</i> folder.</p>	
<b>Move Objects Between Views</b>	<p>Views and <i>Favorites</i> folders are fixed in the <i>Views</i> folder in which you create them, and you cannot move them.</p> <p>However, you can:</p> <ul style="list-style-type: none"> <li>• Copy (by dragging) objects from any View into any <i>Favorites</i> folder, and</li> <li>• Move (by dragging) objects between any two <i>Favorites</i> folders</li> </ul>	
<b>Use Objects From Model Views</b>	<p>To make use of an element, diagram or Package held in any View or <i>Favorites</i> folder, click on the item and drag it into a diagram or a Team Review posting</p> <p>The item behaves in the same way as if you dragged it from the Project Browser.</p>	<a href="#">Team Review</a> [343]
<b>Create Documents containing Objects</b>	<p>A very useful feature of the Model Views facility is the ability to drag separate items from the Views into an existing <b>Linked Document</b>.</p> <p>To do this you create your Linked Document, generate your Model View, and open the document and Model View as docked windows. You then drag the items - individually or as a multiple selection - from the View into the document, selecting one of two options:</p> <ul style="list-style-type: none"> <li>• <b>Insert as Hyperlink(s)</b> and</li> <li>• <b>Render as RTF</b></li> </ul> <p>If you select <b>Insert as Hyperlink(s)</b>, a hyperlink is embedded in the document for each dragged object, linking to the object in the Project</p>	<a href="#">Create Document Artifact</a> [1046] <a href="#">Create Linked Document on an Element</a> [1047]

Operation	Detail	See also
	<p>Browser.</p> <p>If you select <b>Render as RTF</b>, a prompt displays for you to select the RTF template (if any) from which to generate a small report on the dragged objects. You can select different templates for different objects. However, there needs to be compatibility between the selected object type (such as <i>Diagram</i>) and the RTF template used (such as <i>Diagram report</i>).</p> <p>You can have hyperlinked objects and RTF-rendered objects in the same document.</p>	
<b>Export/ Import Views</b>	<p>You export Views to create an XML file that you can:</p> <ul style="list-style-type: none"> <li>• Import into another model as a user-created Model View or</li> <li>• Call from an MDG Technology Selection (MTS) file to access the Technology-defined View provided by the active MDG Technology</li> </ul> <p>The export and import functions are available from the Model Views root-node context menus.</p> <p>When you use the export function, it acts on the complete set of View folders in the selected <i>My Views</i> root node, <i>Model Views</i> root node, or user-generated root node; you cannot export individual Views, nor can you export Favorites folders.</p> <p>The function displays the Save As dialog, on which you browse for the directory location for the exported XML file, and specify the file name.</p> <p>When you use the import function, it displays the Select Import Filename dialog on which you browse for the directory and XML file you want to import; the import creates a new Model View folder with the same name as the copied root node.</p>	<a href="#">Model Views Context Menus</a> 
<b>Set Up a Technology- Defined View</b>	<p>To set up the Technology-defined View for an MDG Technology, you:</p> <ol style="list-style-type: none"> <li>1. Create a user-generated Model View in Enterprise Architect while using the technology.</li> <li>2. Populate it with the required View folders and Views.</li> <li>3. Export the Views from that Model View as an XML file to an appropriate location.</li> <li>4. Create a call to the file from the technology's MTS file.</li> </ol> <p>Thereafter, any model for which the MDG Technology is active automatically displays those Views in a Technology-defined View.</p>	<a href="#">Create MDG Technologies</a> 

#### 4.1.4.4 Diagram Slide Show

The Slide show facility in the Model Views window enables you to create and run screen-based presentations of sets of diagrams. When you run a slide show, it displays the diagrams in the folder in the sequence in which they are listed in the folder. After each diagram has been displayed, it is closed. You can use this facility to:

- Create a slide show as a folder within a Views folder under a Model View node
- Run a slide show manually

- Run a slide show automatically with each diagram displaying for a period that you define
- Display a slide show within the Enterprise Architect work area
- Display a slide show in full screen mode
- Delete a slide show

**Access**   **View | Model Views**

**Create a slide show**

Step	Action	See also
1	Under a Model Views node, click on the Views folder to contain the slide show.	
2	<p>Either:</p> <ul style="list-style-type: none"> <li>• Right-click on the Views folder and select the <b>New Slideshow</b> option or</li> <li>• Click on the <b>New Slideshow folder</b> icon in the Model Views toolbar</li> </ul> <p>The Create a New Slideshow Folder dialog displays.</p>	
3	In the <b>Name</b> field, type the name of the slide show.	
4	<p>Click on the <b>OK</b> button.</p> <p>The new slide show folder is added to the selected View folder.</p>	
5	Dock the Project Browser window separately from the Model Views window.	<a href="#">Dock Windows</a> <sup>[128]</sup>
6	<p>Drag the diagrams to be displayed as part of the slide show from the Project Browser into the new slide show folder.</p> <p>Organize the diagrams in the order in which they are to be displayed, using the up/down green arrows in the Model Views toolbar.</p> <p>To remove a diagram that is not required, right-click on it in the slide show folder and select the <b>Remove Linked Item</b> context menu option.</p> <p>The diagram items in the slide show folder are links to the diagrams in the Project Browser, not copies of the diagrams or the diagrams themselves; any actions you take in the slide show have no impact on the original diagrams.</p>	<a href="#">Model Views Toolbar</a> <sup>[688]</sup>
7	Close the folder.	

**Define how the slide show is to operate - automated or manual**

Step	Action	See also
1	Right-click on the slide show folder and select the <b>Properties</b> context menu option. The Slideshow Properties dialog displays.	
2	To automate the slide show, select the <b>Enable</b> checkbox. To run the slide show manually, deselect the checkbox.	
3	If you are automating the slide show, in the <b>Time</b> field type the number of seconds that each diagram is to remain on display.	
4	Click on the <b>OK</b> button.	

**Run a slide show of diagrams, in either Diagram View or full screen**

Step	Action	See also
1	Right-click on the slide show folder and select either the: <ul style="list-style-type: none"> <li>• <b>Run Slideshow</b> option, to run the slideshow in the Diagram View</li> <li>• <b>Run Slideshow Fullscreen</b> option to run the slideshow using the full screen</li> </ul> The first diagram in the slide show displays.	
2	If you have set up the slide show to run automatically, you can leave it to display the diagrams as defined. You can also moderate the slide show using manual commands.	
3	If you are controlling the slide show manually, right-click on a slide. The following toolbar displays: 	
4	Control the slide show using the toolbar icons and other aids, as follows: <ul style="list-style-type: none"> <li>• Display the next slide - , ( <b>Spacebar</b> ) or ( <b>↑</b> )</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• Display the previous slide - , ( ← )</li> <li>• Display the first slide - , ( ↑ )</li> <li>• Display the final slide - , ( ↓ )</li> <li>• Pause the slide show - </li> <li>• Resume the slide show - </li> <li>• Stop the slide show -  or, in Diagram View, right-click on the slide show folder and select the <b>Stop Slideshow</b> option</li> </ul>	

#### Delete a slide show

Step	Action	See also
1	Right-click on the slide show folder and select the <b>Remove Slideshow</b> context menu option. Enterprise Architect prompts you to confirm the deletion.	
2	Click on the <b>Yes</b> button. The folder and its list of links to diagrams in the model is removed.	

### 4.1.5 The Pan & Zoom Window

The Pan & Zoom window provides a 'birds-eye' view of diagrams. It enables you to navigate quickly around large diagrams.

**Access** **Diagram | Pan & Zoom** (Ctrl+Shift+N)

#### Reference

Topic	Detail	See also
<b>View</b>	<p>The window shows a reduced image of the whole diagram.</p> <p>The shaded box represents the viewed area, displayed on the open diagram.</p>	

Topic	Detail	See also
<b>Toolbar</b>	<p>The toolbar provides the following functions (in order):</p> <ul style="list-style-type: none"><li>• Zoom In</li><li>• Zoom Out</li><li>• Zoom to fit diagram</li><li>• Zoom to fit page</li><li>• Zoom to 100%</li><li>• Zoom Slider</li></ul>	
<b>Use</b>	<p>Open the required diagram.</p> <p>Move the cursor onto the shaded box inside the Pan &amp; Zoom window.</p> <p>Hold down the mouse button as you move the cursor to move the shaded box over the open diagram.</p> <p>To zoom, use either the Zoom Slider or the buttons located on the tool bar.</p>	

## 4.2 Search: Finding Information

Searching involves using ad hoc search terms and various search types to locate elements and information within your model, regardless of location or context.

The result sets can be used to manage elements, to create documentation or to find the location of elements within the complete model structure.

### Topics

Topic	Link

Create and Modify Searches - how to modify and work with search definitions	<a href="#">Create &amp; Modify Searches</a> <sup>[709]</sup>
Adding Filters - further modifications to searches	<a href="#">Add Filters</a> <sup>[716]</sup>
Diagram Filters- how to suppress or highlight information in a diagram using customizable filtering mechanisms based on element properties such as status and complexity	<a href="#">Diagram Filters</a> <sup>[718]</sup>

### 4.2.1 Model Search

The Model Search allows you to quickly navigate and find elements within your model. It lists each element that meets the search criteria you specify within the search terms and search type. Many different kinds of searches are already built into Enterprise Architect, and it is possible to create very detailed and specific searches of your own. It is even possible to export and share your favorite searches.

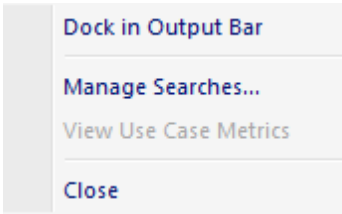

**Access** **Edit | Find in Project** ( **Ctrl+Alt+A** ) or ( **Ctrl+F** )

#### Use to

- Search for elements within your model based on various criteria
- Generate targeted reports based on your result set

- Manage result sets - for example set properties and delete elements

Field	Usage	See also
<b>Search Term</b>	Type in the word, phrase or characters to search on.  Search filters enable you to perform customized searches on a Search Term in order to locate model elements having specific characteristics.	
<b>Search</b>	The Model Search window provides a set of <i>built in</i> searches for your convenience; the Search drop-down list provides several pre-defined searches including. <ul style="list-style-type: none"> <li>• Simple</li> <li>• Extended</li> <li>• Find Orphans</li> <li>• Recently Modified Elements</li> </ul> <p>In the drop-down list, the built in searches are followed by searches that:</p> <ul style="list-style-type: none"> <li>• You have created yourself</li> <li>• Your organization has created for use within the project</li> <li>• Have been created as part of workflow script</li> <li>• Have been created in the Enterprise Architect Scripting facility</li> </ul>	<a href="#">Pre-defined searches</a> <sup>[706]</sup> <a href="#">Functions - Create a Search With User Tasks</a> <sup>[370]</sup> <a href="#">Workflow Data Structures You Fill</a> <sup>[372]</sup> <a href="#">Script Group Properties</a> <sup>[2794]</sup>
<b>Run</b>	Run the search using the entered text and selected Search.	
<b>Options</b>	<p>The <b>Options</b> button displays the <b>Search Options</b> submenu, which enables you to display the search results as a tab of the Output window rather than in the Model Search View.</p> <p>An advantage of moving the search results to the Output window is that you can select items from the search results and drag them onto a diagram, which you cannot do when the results are in the Model Search View.</p> <p>If you select the <b>Dock in Output Bar</b> menu option, when you next display the menu this option becomes <b>Dock in Main View</b>.</p> <p>The <b>Search Options</b> submenu also provides the means of performing advanced searches on your project, and displaying project metrics.</p>	<a href="#">The System Output Window</a> <sup>[169]</sup>  <a href="#">Advanced Search Options</a> <sup>[715]</sup> <a href="#">Estimating Project Size</a> <sup>[588]</sup>

		
<b>Builder</b>	Show or hide the Search Builder facility.	<a href="#">Create Search Definitions</a> 
<b>Result List</b>	Display the results of your search.	

**Keyboard Options:**

- Display the properties of an element (**Double Click or Enter**)
- Drag an item(s) onto a diagram (**Ctrl+drag a selected item**)
- Toggle between the Notes and the Model Search window (**Ctrl+Shift+Enter**)
- Open the Linked Document window for the selected Element (**Ctrl+Alt+D**)
- Select All Items (**Ctrl+Alt+A**)

**Notes**

- You can access the Model Search facilities and perform specific searches indirectly, from Add-Ins, from MDG Technologies, from a hyperlink and from a shortcut to access your model; this entails setting up a search profile either in the appropriate tool, or as an XML file accessed by the tool

Searching from	See
An MDG Technology Selection (MT ) File (using an exported search definition)	<a href="#">Working With MTS Files</a>  <a href="#">Create &amp; Modify Searches</a> 
A Login Shortcut	<a href="#">Project Shortcuts</a> 
An Add-In	<a href="#">Add-In Search</a> 
A Hyperlink	<a href="#">Hyperlinks</a> 

- Running a custom or diagram based search disables some context menu options

#### 4.2.1.1 Model Search Context Menu

You can select elements or diagrams in the Model Search and perform various operations on them, as well as simply dragging the item into a Team Review document or Linked Document. You can:

- Generate reports from search results
- Print search results
- Copy and work with search results
- Manage elements returned by a search

**Access**   **Edit | Find in Project ( Ctrl+Alt+A ) Results pane, right-click on an element**

##### Options

Menu Option	Action	Shortcut	See also
<b>Scripts</b>	<p>Displays a list of any Model Search scripts you have created, which can be executed on the selected item.</p> <p>This option displays only if:</p> <ul style="list-style-type: none"> <li>• You have created Model Search scripts in a Model Search Script Group folder, and</li> <li>• The item results from a successful Query search, or</li> <li>• The item results from a successful SQL search that includes CLASSGUID and CLASSTYPE</li> </ul>		<a href="#">Script Group Properties</a> <sup>[2794]</sup>
<b>Properties</b>	Display the Properties dialog for the element.		
<b>Copy Selected to Clipboard</b>	Copy the selected item to the MS Windows clipboard so that it can be pasted to a document, spreadsheet or email.		
<b>Documentation</b>	<p>Generate a document report; you have two options:</p> <ul style="list-style-type: none"> <li>• Generate a separate report on each selected object in the Model Search</li> <li>• Generate one report on all selected objects</li> </ul> <p>In either case, the Generate Documentation dialog displays.</p> <p>If you generate the report using a custom SQL search, the SQL must include <code>ea_guid AS CLASSGUID</code> and the object type.</p>		<a href="#">Generate Documentation</a> <sup>[2644]</sup>  <a href="#">Create Search Definitions</a> <sup>[711]</sup>

<b>Create Linked Document</b> <b>(Edit Linked Document)</b>	Create (or edit) a linked document (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions).	<b>Ctrl+Alt+D</b>	<a href="#">Create Linked Document on an Element</a> <sup>[1047]</sup> <a href="#">Edit Linked Documents</a> <sup>[1048]</sup> <a href="#">Linked Documents</a> <sup>[1044]</sup>
<b>Delete Linked Document</b>	Delete an existing linked document. (This option only displays if the element has a linked document.)		
<b>Print</b>	Print out the filtered results.		
<b>Clear Results</b>	Clear the search results from the Model Search.		
<b>Find in Diagrams</b>	Display the diagram that uses the element or, if the element is used in multiple diagrams, display a list of diagrams to choose from.	<b>Ctrl+U</b>	
<b>Find in Project Browser</b>	Highlight the element in the Project Browser.	<b>Alt+G</b>	
<b>Bookmark Selected</b>	Bookmark the element.		
<b>Delete Selected</b>	Delete the selected element from the Model Search.		
<b>Close</b>	Close the Model Search.		
<b>Help</b>	Display this Help topic on the Model Search.		

#### Add Items To Linked Document

A very useful feature of the Model Views facility is the ability to drag separate items from the Views into an existing **Linked Document**.

To do this you create your Linked Document, generate your Model View, and open the document and Model View as docked windows. You then drag the items - individually or as a multiple selection - from the View into the document, selecting one of two options:

- **Insert as Hyperlink(s)** and

- **Render as RTF**

If you select **Insert as Hyperlink(s)**, a hyperlink is embedded in the document for each dragged object, linking to the object in the Project Browser.

If you select **Render as RTF**, a prompt displays for you to select the RTF template (if any) from which to generate a small report on the dragged objects. You can select different templates for different objects. However, there needs to be compatibility between the selected object type (such as *Diagram*) and the RTF template used (such as *Diagram report*).

You can have hyperlinked objects and RTF-rendered objects in the same document.

- [Add a New Post](#)<sup>[353]</sup>

### 4.2.1.2 Model Search Toolbar

The Model Search toolbar displays at the top of the Model Search window, enabling you to operate on the results of your model search.

**Access** **Edit | Find in Project ( Ctrl+Alt+A )**

#### Use to

- Edit the text of notes for an item
- Delete selected items from the model
- Print the search results
- Generate and print a document report on selected items
- Hide or abbreviate notes text in the output
- Hide or show the filter bar under the column headings
- Display Help text

#### Reference

Option	Action	Shortcut	See also
<b>Edit Notes</b>	For the selected item, open the Notes window (if it is not already open) so that you can edit the text of the notes.	<b>Ctrl+Spacebar</b>	<a href="#">Notes</a> <sup>[1142]</sup>
<b>Delete</b>	For a selected item or group of items, delete them from the model; refresh the project to check that the items have been deleted.	<b>Ctrl+D</b>	
<b>Print</b>	Print the complete set of search results		

<b>Rich Text Report</b>	For a selected item or group of items, generate and print a document report.		<a href="#">Generate Documentation</a> [2644]
<b>View Notes</b>	Display a short menu that enables you to select whether, for all items, to: <ul style="list-style-type: none"> <li>• Hide any Notes text from display in the search results</li> <li>• Display the first few words of the Notes text in the search results</li> <li>• Display the full Notes text in the search results</li> </ul>		
<b>Toggle Filter Bar</b>	Hide or reveal the filter bar underneath the column headings.		<a href="#">Customizing the Search View</a> [708]
<b>Help</b>	Display the Enterprise Architect Help, starting with the Model Search Help topic.		

#### 4.2.1.3 Pre-defined Searches

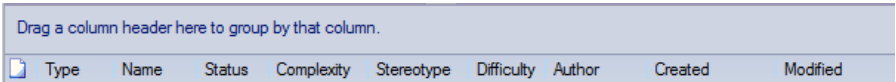

The following pre-defined searches are provided with Enterprise Architect, and are listed in the *Built-In* category in the **Search** drop-down list.

Search	Description	See also
<b>Simple</b>	Searches the <b>Name</b> , <b>Alias</b> and <b>Notes</b> fields of all elements for the given search term.	
<b>Extended</b>	Searches many additional fields relating to the element, including <b>Attributes</b> , <b>Operations</b> , <b>Tagged Values</b> and <b>Test Cases</b> .	
<b>Element Name</b>	Searches for an exact match against the element name, alias, method or operation; the default search in the <b>Search in Model</b> menu option in the Code Editor.	<a href="#">Code Editor Context Menu</a> [2152]
<b>Attribute Details</b>	Searches for elements with attributes relating to the search term, including Tagged Values, constraints, and common attribute data fields.	
<b>Find Orphans</b>	Searches for orphaned elements throughout the model, with the ability to filter on common element fields using a search term.  An 'orphaned' element is an element that does not appear on any diagram in the model.	

<b>Failed Internal Tests</b>	Searches for elements containing internal test cases where the search term is in any common Test Case field and the <b>Status</b> value is <i>Fail</i> .	
<b>Method Details</b>	Searches for elements with operations and methods relating to the search term, including Tagged Values, constraints and common operation and method data fields.	
<b>Responsibility</b>	Searches for elements with internal responsibilities/requirements where the search term relates to any common <b>Responsibility/Requirement</b> field.	
<b>Resources</b>	Searches for elements with assigned resources where the search term relates to any common <b>Resource</b> field.	
<b>Requirements</b>	Searches for Requirement element types where the search term relates to any common element field.	
<b>Find Bookmarked Elements</b>	Searches for elements that have been bookmarked, anywhere in the project.	
<b>Recently Modified Elements</b>	<p>Searches for elements that have been recently modified, anywhere in the project.</p> <p>The search term relates to any common element field.</p> <p>The default is to show elements modified in the last three days, but you can set an alternative interval by typing the appropriate number of days in the <b>Search Term</b> field.</p>	
<b>Recently Modified Diagrams</b>	<p>Searches for diagrams that have been recently modified, anywhere in the project.</p> <p>The search term relates to any common diagram properties field.</p> <p>The default is to show diagrams modified in the last three days, but you can set an alternative interval by typing the appropriate number of days in the <b>Search Term</b> field.</p>	
<b>My Checked Out Packages</b>	Searches for packages that are marked as checked out by the currently-logged in user.	

#### 4.2.1.4 Customizing the Search View

This topic explains how to customize the display of search results after they are generated.

Topic	Detail	See also
<b>Sort and Select</b>	<p>In the Model Search you can:</p> <ul style="list-style-type: none"> <li>Sort the items by any column value in ascending or descending order, by clicking on the column header</li> <li>Display element or diagram properties, by double-clicking on the item</li> <li>Select: <ul style="list-style-type: none"> <li>An element or diagram by clicking on it</li> <li>Several individual elements or diagrams by holding ( <b>Ctrl</b> ) as you click on them</li> <li>A range of elements or diagrams by holding ( <b>Shift</b> ) as you click on the first and last in the range</li> <li>All elements or diagrams in the list by pressing ( <b>Ctrl+A</b> )</li> </ul> </li> </ul>	
<b>The View Header</b>	 <p>The View Header defines the columns of information that are presented by the Model Search, and the order in which data items are presented.</p> <p>To review the column headings:</p> <ul style="list-style-type: none"> <li>Right-click on the header to display the <b>Field Chooser</b> context menu option; the Field Chooser dialog displays</li> </ul> <p>This enables you to add columns to or remove columns from the output; between them, the View Header and Field Chooser dialog show the full range of column headers available.</p> <p>To add a column heading to the View Header:</p> <ul style="list-style-type: none"> <li>Drag it from the Field Chooser dialog onto the header to the position you want the column of data to display</li> <li>When you have selected the column headings you require, click on the red cross in the top right corner of the Field Chooser dialog to close it</li> </ul> <p>To remove a column from the output:</p> <ul style="list-style-type: none"> <li>Drag the column heading downwards out of the View Header</li> </ul> <p>To change the sequence of columns:</p> <ul style="list-style-type: none"> <li>Drag the required column header left or right, as appropriate</li> </ul>	
<b>Value Grouping</b>	You can organize the reported data hierarchically according to the value of one or more of the column categories.	

Topic	Detail	See also
	<p>You might organize the data by <b>Type</b>, and within each Type by <b>Name</b>; if you then click on any of the other column headings, the data within this grouping is further sorted with the values of the selected column (for example, <b>Created</b>) in ascending or descending order.</p> <p>To set up the value grouping, drag the column heading representing the primary grouping (such as <b>Author</b>) onto the <b>Drag a column header here to group by that column</b> field.</p> <p>Now drag the column heading for the next level of grouping (such as <b>Status</b>) to the right of the first heading; the two heading titles display as connected blocks, as shown below:</p>  <p>You can, if required, add further levels of grouping by dragging other column headings onto the hierarchy (such as <b>Created</b>), and restructure the order by dragging existing or additional headings into the level you want them to hold.</p> <p>For example, you could make <b>Type</b> the secondary grouping by dragging it to the right of <b>Author</b>, or drop <b>Status</b> between <b>Author</b> and <b>Type</b>.</p> <p>To remove a grouping level, drag the appropriate column heading out of the sequence and below the View header; any subordinate groupings move up a level.</p>	
<b>Filter Bar</b>	<p>The Filter Bar displays underneath the column headings; you can hide or show it using the <b>Toggle Filter Bar</b> icon in the toolbar.</p> <p>The Filter Bar consists of a row of fields, one field per column; as you type a value into one of these fields, the Model Search results are automatically filtered to show entries with a value in the corresponding column that contain the value in the field.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>If you type the letter <b>F</b> in the Filter Bar field under the <b>Author</b> column, the results immediately reduce to entries for which the letter <b>F</b> occurs anywhere in the name (<b>F</b>red, <b>F</b>itzgibbon, <b>R</b>ufus, <b>W</b>olf)</li> <li>If you then go on to type <b>Fi</b>, the results immediately reduce again to entries for which the combination <b>fi</b> appears in the name (<b>F</b>itzgibbon, <b>A</b>mal<b>f</b>i)</li> </ul>	

#### 4.2.1.5 Create & Modify Searches

You provide search filters and create new search definitions using the Search Builder tab, displayed underneath the **Search Term** and **Search** fields on the Find in Model view.

**Access** **Edit | Find in Project (Ctrl+Alt+A): Builder**

##### Use to

- Create new search definitions and edit them

**Search Builder Toolbar:**

The search builder toolbar enables you to configure the system-provided searches, and to create and edit your own searches

The toolbar icons, from left to right, provide access to the following functions:

Option	Usage	See also
<b>New Search</b>	Create a new search definition, with new search criteria.	<a href="#">Create Search Definitions</a> 
<b>Save Search</b>	Save a modified or new search.	
<b>Copy Search</b>	Copy the existing search selected in the <b>Search</b> field, to modify. You can copy: <ul style="list-style-type: none"> <li>Searches you or other users have created</li> <li>Predefined searches and edit the copies, but you cannot edit the predefined searches themselves</li> </ul>	
<b>Restore Default</b>	Restore any changed parameters to the default settings and format.	
<b>Delete Search</b>	Delete the search definition from the <b>Search</b> drop-down list.	
<b>Add Filter</b>	Add a new set of parameters to filter the search on.	<a href="#">Add Filters</a> 
<b>Remove Filter</b>	Delete the selected filter from the search.	
<b>Export Search</b>	Display a selection box that enables you to select searches to export to an external directory as an XML Search file.	
<b>Import Search</b>	Display the Windows Directory Explorer Open dialog to enable you to import searches as XML Search files from an external directory.	
<b>Search Options</b>	Display the Advanced Options dialog, to define where a query-builder search should operate and how the search should match filters.	<a href="#">Advanced Search Options</a>  <a href="#">Create Search Definitions</a> 

**Search Builder**

You use the main body of the Search Builder tab to configure the element search filters that are contained in the selected search.

The Search Builder tab defaults to a **Simple** search, which changes as you select to create a new search or select the search to modify.

Column	Usage	See also
<b>Search In</b>	Select the type and name of each element feature (the element field name) to search on.	
<b>Condition</b>	Select the condition of the search parameter (the condition placed on the field value).  The available options are <b>Contains</b> , <b>Equal To</b> , <b>Not Equals</b> and <b>One Of</b> .	<a href="#">Fields and Conditions</a> <sup>718</sup>
<b>Look for</b>	Specify the search term (the actual value or delimiting value) to perform the conditional search on.  This value can pertain to the selected element type; for example, the value could be a date for <i>DateCreated</i> or a text value for other fields.  The search term can contain multiple values, separated by commas.	
<b>Required</b>	Indicate whether the field is mandatory - that is, whether the search results must include elements with your search term in that field.  The following provides example of using the <b>Required</b> checkbox, illustrated by the default <b>Simple</b> search, which checks the <b>Name</b> , <b>Alias</b> and <b>Notes</b> fields of all elements: <ul style="list-style-type: none"><li>• If the <b>Required</b> checkbox is not ticked for any field, then if the search term is found in the <b>Name</b>, <b>Alias</b> OR <b>Notes</b> field for an element, that element is listed in the results</li><li>• If the <b>Required</b> checkbox is ticked for all fields in the search, then the search term must be found in all of those fields before the element is listed in the results; that is: <b>Name AND Alias AND Notes</b></li><li>• If the <b>Required</b> checkbox is ticked for some fields but not others, the search term must be found in all fields for which the checkbox is ticked, and <i>at least one</i> of the fields in which the checkbox is not ticked; that is: <b>Name AND (Alias OR Notes)</b></li></ul> This checkbox helps you to define the filters on a specific <b>feature</b> (such as Element, Diagram or Attribute). You can also set up a filter to check for a defined value in <b>every feature</b> covered by a search (AND filter) or in <b>any feature</b> covered by the search (OR filter).	<a href="#">Advanced Search Options</a> <sup>719</sup>

#### 4.2.1.5.1 Create Search Definitions

If you want to define your own searches, you can do so using the SQL Editor, Query Builder or an Add-In, through the Search Builder tab. User-defined searches are stored in the user application data for the machine being used, and not in the project repository.

[Access](#) [Edit](#) | [Find in Project: Builder](#)

**Create a new search definition**

Step	Action	See also
1	Click on the <b>New Search</b> icon in the toolbar. The Create New Search Query dialog displays.	
2	In the <b>Search Name</b> field, type a name for the search.	
3	Select the radio button for the type of search you are creating: <ul style="list-style-type: none"> <li><b>Query Builder</b> - provides an interface through which you can design your own search</li> <li><b>SQL Editor</b> - for advanced users to directly write SQL <i>SELECT</i> statements</li> <li><b>Add-In Search</b> - where you supply the name of your Add-In and a method (for example <i>MyAddin.RunThisMethod</i>), which is called whenever the search is run; this search can be exported and distributed as a part of your Add-In</li> </ul>	<a href="#">Add-In Search</a> 
4	Click on the <b>OK</b> button, and refer to the next table.	

**Search Types**

Search	Description	See also
<b>Query Builder</b>	Your search name appears as being selected in the <b>Search</b> drop-down field.  Click on the <b>Add Filter</b> toolbar icon to add filters and construct the search.	<a href="#">Add Filters</a> 
<b>SQL Editor</b>	The SQL editor displays within the <b>Search Builder</b> tab, in which you input your <i>SELECT</i> statement.  The SQL editor is based on the common Code Editor, and provides an Intelli-sense autocompletion list populated with the Enterprise Architect repository structure; to display the autocompletion list, press <b>Ctrl+Spacebar</b> .  A simple search might be to locate an object from a table, given a search term that the user enters in the <b>Search Term</b> field  <i>SELECT * FROM t_object WHERE NAME='&lt;Search Term&gt;'</i>  In the <i>WHERE</i> statements you can also use <b>#xxx#</b> macros as string replacers, so that the same search can be used by different people in different environments; these macros include: <ul style="list-style-type: none"> <li><b>#WC#</b> - Gets the appropriate wild card for the current database, so the search can be performed on models on different databases</li> </ul> <i>t_object.Name LIKE '#WC#Test#WC#'</i>	<a href="#">Code Editor Functions</a> 

- **#Author#** - Takes the user name from the **Author** field in the Options dialog General page, so the defined search can be performed on objects created by that user (this value can be manually re-set in the Options dialog)
- **#DB=<DBNAME>#** where **<DBNAME>** can be one of the following:
  - MYSQL
  - JET
  - ORACLE
  - SQLSVR
  - ASA
  - OPENEDGE
  - POSTGRES

Only uses the section of code between two matching **#DB=<DBNAME>#** macros if the current database type matches the specified DBNAME. Can be used where a section of the SQL might require special handling depending upon the current database type.

For example:

```
#DB=ORACLE# t_object.ModifiedDate >= (SYSDATE - INTERVAL
'<Search Term>' DAY) #DB=ORACLE#
```

- **#UserName#** - Gets the name of the person logged into version control

```
t_package.PackageFlags LIKE
'#WC#VCCFG=#WC#CheckedOutTo=#UserName##WC#'
```

(this is from the built in search *My Checked Out Packages*)

- **#Now#** - Inserts the current date plus or minus a specified number of hours or days; the default is days (the date **format** is adjusted to suit the database in use)

```
t_object.ModifiedDate >=#Now <Search Term>#
```

For example:

```
t_object.ModifiedDate >= #Now -4d#    d is days
t_object.ModifiedDate >= #Now -5h#    h is hours
t_object.ModifiedDate >= #Now +3#
t_object.ModifiedDate >= #Now#
```

- **#Package#** - gets the currently-selected Package's package\_ID

```
t_object.Package_ID = #Package#
```

- **#Branch#** - gets the IDs of the child Packages of the currently-selected Package, working recursively down to the lowest level of sub-Package

	<p><i>t_object.Package_ID IN (#Branch#)</i></p> <p>For all functions in which you use a custom SQL statement (such as Document Reporting or Model Views) the statement must return the <b>guid</b> and <b>type</b> of the object found so that the system can search for the selected item in the Project Browser:</p> <pre>SELECT ea_guid AS CLASSGUID, Object_Type AS CLASSTYPE, Name FROM t_object</pre> <p>You can extend the usability of your SQL searches using the aliases <b>CLASSGUID</b> and <b>CLASSTYPE</b>, so that you can display the Properties dialog and icon for elements, connectors, attributes or operations, as well as selecting them in the Project Browser.</p> <p>Some simple examples for using these aliased fields are provided below:</p> <ul style="list-style-type: none"> <li>• <i>SELECT ea_guid AS CLASSGUID, Object_Type AS CLASSTYPE, Name FROM t_object</i></li> <li>• <i>SELECT ea_guid AS CLASSGUID, Connector_Type AS CLASSTYPE, Name FROM t_connector</i></li> <li>• <i>SELECT ea_guid AS CLASSGUID, 'Operation' AS CLASSTYPE, Name FROM t_operation</i></li> <li>• <i>SELECT ea_guid AS CLASSGUID, 'Attribute' AS CLASSTYPE, Name FROM t_attribute</i></li> </ul> <p>You can enable your search users to <b>drag and drop</b> elements from the <b>search results</b> onto a <b>diagram</b>, by including one or other of the following in your search's <i>SELECT</i> statement:</p> <ul style="list-style-type: none"> <li>• <i>(t_object.Object_ID and t_object.Object_Type)</i> or</li> <li>• <i>t_object.ea_guid AS CLASSGUID</i></li> </ul> <p>When you have defined the <b>SELECT</b> statement, click on the <b>Save</b> button to save this search; the search is then available from the <b>Search</b> drop-down list.</p>	
<b>Add-In Search</b>	<p>Type in:</p> <ul style="list-style-type: none"> <li>• The name of your Add-In</li> <li>• A period (full stop) and</li> <li>• The name of the method to be called (for example, <i>MyAddin.RunThisMethod</i>)</li> </ul> <p>Your search is automatically saved and available from the <b>Search</b> drop-down list.</p>	<p><a href="#">Add-In Search</a></p> <p>3019</p>

**Notes**

- When constructing an SQL search, do not switch to the **SQL tab**; this is for pasting in, modifying and running ad-hoc *SELECT* statements, and does not support the use of **#xxx#** macros

**Learn more**

- [Customizing the Search View](#)<sup>[708]</sup>
- [Create & Modify Searches](#)<sup>[709]</sup>

**4.2.1.5.2 Advanced Search Options**

The advanced search filter options help you to apply greater control over how your customized search operates on your model.

You can set values and checkboxes in your search definition to find specific criteria within a **feature**, for example, element properties. However, you can **also** set filters to run the search across the whole model or a specific package, and to locate objects that have a specified value in:

- All** features (for example, the value exists in an element's properties **and** one of its attributes' properties) or
- Any one** of its features (for example, the value exists in an element's properties **or** any of its attributes' properties)

The filters for each feature operate on a database table. In the default Enterprise Architect searches, for example, filters on element properties operate on the *t\_element* table, filters on attribute properties operate on *t\_attribute*, and filters on method parameters operate on *t\_operationparams*.

**Access**   **Edit | Find in Project ( Ctrl+Alt+A ):** **Builder: Search Options (toolbar icon)**

**Use to**

- Define whether your search should operate on the whole model, or on a specific package within the model
- Define whether your search should return items that match the search term in **every** feature or **any** feature defined for that search

**Reference**

Action	Usage	See also
<b>Return matching items for the entire model</b>	Run the search across the entire model (this is the default option). The search checks every package in the model, and returns items that match the search criteria from wherever they are located.	
<b>Return matching items for the selected Package</b>	Run the search on a specific package that you select from the Project Browser.  If you run a search and then select a different package in the Project Browser, the search results do not change until you click on the <b>Run</b>	

Action	Usage	See also
	<p>button again; that is, to search different areas of the project:</p> <ul style="list-style-type: none"> <li>• Click on the first required package in the Project Browser</li> <li>• Click on the <b>Run</b> button</li> <li>• Check the result</li> <li>• Click on another package in the Project Browser</li> <li>• Click on the <b>Run</b> button</li> </ul>	
<b>All Tables</b>	<p>List objects that have a match in <b>every</b> feature table checked in the search.</p> <p>For example, only list elements where both the element <b>and</b> one or more of its attributes have the same stereotype name.</p>	
<b>At Least One Table</b>	<p>List objects that have a match in at least one of the feature tables checked in the search (the default).</p> <p>For example, list elements that either have the specified stereotype name, <b>or</b> have attributes that have the specified stereotype name.</p>

#### 4.2.1.5.3 Add Filters

**Access** **Project | Documentation | Rich Text Format (RTF) Report: Add Filter**  
**Edit | Find in Project ( Ctrl+Alt+A ): Builder: Add Filter (toolbar icon)**

#### Use to

- Add filter criteria to a model search or a document report template

#### Reference

Option	Action	See also
<b>Search On</b>	<p>Select items to build up search filters on any information about an object.</p> <p>The following is a list of what is available, before you have defined a search:</p>	

Option	Action	See also
	<div> <p>                     Element                      Diagram                      Attribute                      Attribute.AttConstraint                      Attribute.AttTagValue                      Change                      Custom Property                      Constraint                      Method                      Method.MethodTagValue                      Method.Parameter                      Method.PostCondition                      Method.PreCondition                      Method.Parameter.ParamTagValue                      File                      Issue                      Defect                      Scenario                      TagValue                      Task                      Test                      Responsibility                      Resource                 </p> </div> <p>If you are adding filters to an existing search, the list contains only items appropriate to the initial filter.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>• If the initial filter is set to search on <b>Element</b>, the drop-down list for subsequent filters on the search will show a long list of element properties that you can filter more specifically on</li> <li>• If the initial filter is set to search on <b>Diagram</b>, the list for any subsequent filters for the search only contains the <b>Diagram</b> option, as there are no other filters that can be applied to a search on diagrams</li> </ul>	
<b>Include</b>	Select each field item to include in your search (select the checkbox).	
<b>Field</b>	Identify the name of the field to search. The list presents items specific to the filter <i>Search On</i> item.	<a href="#">Fields and Conditions</a> <sup>718</sup>
<b>Condition</b>	Specify the condition of the search parameter.	
<b>Value</b>	Type a value pertaining to the selected element field. For example, the value could be a date for <i>DateCreated</i> or a text value for other fields. The search term can contain multiple values separated by commas.	
<b>Required</b>	Select a particular field to generate a result set that <i>must</i> contain your search term in that field.	

Option	Action	See also
<b>Check All</b>	Select all the items to include them in the search definition.	
<b>Uncheck All</b>	Deselect all the items to omit them from the search definition.	
<b>OK</b>	Apply the filter. The fields selected are added to the search definition.	

### Notes

- You can add multiple search definitions as necessary; however, if you select the **Required** field in multiple definitions the search rapidly becomes impractical
- Multiple search definitions are better for 'and/or' searches

## 4.2.2 Diagram Filters

Using **Diagram Filters (Dynamic Visual filters)**, you can modify the display of diagram components so that the relevant items are immediately identified for the reader's attention, without damaging the structure and integrity of the model. The filters operate on elements and connectors, according to properties such as Author, Status, Date Created or Stereotype and, for connectors, whether the connector is hidden or visible.

You can use Diagram Filters singly, in sequence, or in combination to tailor the display of diagrams to show:

- Information for different users, so that - for example - technical staff and stakeholders each have a view that highlights the information pertinent to them
- What elements have been recently developed or changed
- Which part of a model was developed by a particular person
- Which parts of a diagram are at a particular phase, status or version

Examples of ways in which you might apply filtering include:

- Setting up a filter for immediate use on a diagram, and modifying that filter as you review the diagram so that you highlight elements with different values for the same properties - perhaps, by filtering on **Phase**, to compare 'as-is' and 'to-be' elements
- Setting up a filter and leaving it active so that all diagrams you display are automatically filtered the same way
- Setting up a series of filters to use:
  - in one or more sequences to progressively highlight a diminishing set of items, or
  - alternately to highlight contrasting views of the diagram

Filters for elements can also be applied to the Package Browser and Diagram List.

The Diagram Filters context menu (right-click on the body of the window) provides an option for toggling between the filters and simple context filtering of diagrams; if you select the **Context Filtering** option, the Diagram Filters are disabled and the contents of the diagram are grayed-out **except for** a selected element and those elements directly related to it.

#### Access **Diagram | Diagram Filters**

#### Facilities

Facility	Detail	See also
<b>Developing Filters</b>	<p>You create and define as many filters as you require, setting up each filter by defining which element or connector properties to specifically check for and (depending on how you set up the filter parameters, below) whether to include or exclude elements or connectors having particular property values.</p> <p>You cannot combine element and connector properties in one filter, but you can apply an element filter and a connector filter to a diagram at the same time.</p> <p>You can select to:</p> <ul style="list-style-type: none"> <li>• Mute the irrelevant items in <b>Gray Scale</b>, or <b>Fade</b> the display color</li> <li>• <b>Hide</b> the irrelevant items completely, or</li> <li>• <b>Select</b> and highlight (with a hashed line) the items that <b>are</b> relevant</li> </ul>	<a href="#">Work With Diagram Filters</a> [720]
<b>Filter Effect - Gray Scale, Fade or Hide</b>	<p>If you select <b>Gray Scale</b>, <b>Fade</b> or <b>Hide</b>, the action of the filters is to <i>exclude</i> items that <i>do not</i> match the parameters rather than <i>include</i> items that do.</p> <p>If, for example, you selected to filter on element name, looking for elements with the word <i>Class</i> in the name, the filter would apply the following logic:</p> <p style="padding-left: 40px;">Does <b>Name</b> contain string <i>Class</i>? If <b>No</b>, apply effect; if <b>Yes</b>, take <i>no</i> action.</p> <p>The elements you want are therefore what is left on the diagram, rather than what was operated on.</p>	

Facility	Detail	See also
	The filter effect remains in force while you do other work on the diagram, until such time as you disable the filter.	
<b>Filter Effect - Highlight</b>	<p>If you click on <b>Select</b>, the logic is reversed:</p> <p>Does <b>Name</b> contain string <i>Class</i>? If <b>No</b>, take <i>no</i> action. If <b>Yes</b>, apply effect.</p> <p>In this case, the filter effect is not permanent, and clicking off the items deselects them.</p> <p>This effect is excellent for selecting items having the same characteristics across a large diagram, to be processed in a single task; instead of having to locate the items and select them with ( <b>Shift</b> )+click individually, you can apply the filter.</p> <p>If you inadvertently lose the selection by clicking off the items, you can get it back again almost immediately by re-applying the filter.</p>

### 4.2.2.1 Work With Diagram Filters

You can modify the display of diagram components using diagram filters, which you create and use through the Diagram Filters window. This window is dockable, so you can move it around or 'fix' it next to the Diagram View while you activate, deactivate and edit the filters.

**Access**   **Diagram | Diagram Filters**

#### Create a filter to be applied to your diagrams

Step	Action	See also
<b>1</b>	<p>Perform one of the following actions:</p> <ul style="list-style-type: none"> <li>• On the Diagram Filter toolbar, click on the <b>New Filter</b> icon - the first on the left</li> <li>• Right-click on the list panel and select the <b>New Filter</b> context menu option</li> </ul> <p>The Create New Diagram Filter dialog displays.</p>	
<b>2</b>	In the <b>Enter Filter Name</b> field, type a name for the filter, then click on the <b>OK</b> button.	

Step	Action	See also
	The Diagram Filter dialog displays.	
3	<p>In the <b>Search On</b> field, either:</p> <ul style="list-style-type: none"> <li>• Use the default value of <b>Element</b> or</li> <li>• Click on the drop-down arrow and select <b>Connector</b></li> </ul> <p>If you select <b>Connector</b>, the dialog changes to offer a smaller set of properties. The <b>Visible</b> option enables you to filter out hidden or visible connectors that meet other filter conditions that you set.</p>	
4	Scroll through the properties to filter on, and select the checkbox against each property you require.	
5	<p>For each property, click on the <b>Condition</b> field and select, from the drop-down list, the comparison condition to be applied.</p> <p>Consider how the combination of <b>Condition - Equal To / Not Equal To</b> and <b>Filter Effect</b> might affect the results on the diagram.</p>	<a href="#">Diagram Filters</a> 
6	For each property, <b>double-click</b> on the <b>Value</b> field and type or select any specific value to filter on.	
7	Click on the <b>OK</b> button to save the filter and return to the Diagram Filters window.	

**Other Operations:**

Topic	Detail	See also
<b>Edit a Filter</b>	<p>To edit an existing filter on the Diagram Filters window, either:</p> <ul style="list-style-type: none"> <li>• Double-click on the filter name</li> <li>• Click on the filter name and select the <b>Properties</b> icon from the toolbar (the second icon from the left), or</li> <li>• Right-click on the name and select the <b>Properties</b> context menu option</li> </ul> <p>The Diagram Filter dialog displays; adjust the filtered fields as described above.</p>	
<b>Change the Name of the Filter</b>	<p>Right-click on the name and select the <b>Change Name</b> context menu option.</p> <p>The Create New Diagram Filter dialog displays.</p> <p>Type over the existing name with the new name, and click on the <b>OK</b> button.</p>	

Topic	Detail	See also
<b>Set Effect of Filters</b>	<p>To set how your filters identify selected items on your diagrams, click on the drop-down arrow of the toolbar <b>Filter Effect</b> field, and select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Fade</b> - display all items that do <i>not</i> match the filter criteria in a pale version of the diagram background color</li> <li>• <b>Gray Scale</b> - display all items that do <i>not</i> match the filter criteria in pale gray</li> <li>• <b>Hide</b> - conceal all items that do <i>not</i> match the filter criteria</li> <li>• <b>Select</b> - select and highlight (with a hashed line) all those items that <i>do</i> match the filter criteria</li> </ul> <p>If the filter is for elements in the Package Browser or Diagram List, note that the <i>Select</i> filter effect cannot show up in this context.</p>	
<b>Enable Filters</b>	<p>To enable a filter so that it takes immediate effect on your diagrams, select the check box against the filter name.</p> <p>You can select more than one filter at a time, to combine their effects.</p>	
<b>Disable/ Clear Filters</b>	<p>To disable a filter and clear the effect of the filter on the diagram so that it displays in full, clear the checkbox.</p> <p>To disable all filters, either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>Reload Filters</b> icon in the toolbar (third option from the left), or</li> <li>• Right-click on the list panel and select the <b>Reload Filters</b> context menu option</li> </ul>	
<b>Toggle between Diagram Filters and Context Filtering</b>	<p>To disable the filters you have defined and simply highlight a selected element and its immediate relatives, right-click on the Diagram Filters window background or the diagram background itself and select the <b>Context Filtering</b> option.</p> <p>To re-enable the Diagram Filter effects, display the Diagram Filters window or diagram context menus again and <b>deselect</b> the <b>Context Filtering</b> option.</p>	<a href="#">Context Filter a Diagram</a> <sup>789</sup>
<b>Delete a Filter</b>	<p>To remove a filter from the Diagram Filters window, either:</p> <ul style="list-style-type: none"> <li>• Click on the filter name and click on the <b>Delete</b> icon in the toolbar, or</li> <li>• Right-click on the filter name and select the <b>Delete Filter</b> context menu option</li> </ul>	

## 4.3 Trace: Tracking Dependencies

**Traceability** helps you to identify the way a given requirement or process has been implemented in a system, providing facilities to follow the path of dependencies from the initial request, through a modeled solution, to the deployed physical system or process. A well developed model provides full traceability in any direction, providing answers to questions such as "Why was that particular hardware used in the solution?", assuming there is traceability back to a requirement that specified particular response times or functional capability.

The result sets can be used to manage elements, to create documentation or to find the location of elements within the complete model structure.

### Traceability Tools

Enterprise Architect provides a number of tools for tracing the definition and implementation of a process, from initial requirement to generated code or technical deployment, or vice versa. Such tools include the:

- Traceability window
- Relationship Matrix
- Gap Analysis Matrix
- Relationships window
- Project Browser, and
- Traceability diagrams

The **Traceability window**, in particular, is designed to provide very detailed information on an element's relationships and dependencies, both immediate and distant.

### Tracing Transformations

If you have performed any **transformations** in developing your model and code, Enterprise Architect automatically creates **Transformation Dependency** connectors that you can trace - using the Traceability window - to establish what objects and code have been generated from each PSM element, or what the initial PSM element was for a generated object.

Whether you use transformations or develop the stages of the model in other ways, you can build up a range of **Traceability diagrams** (Custom diagrams) to identify the development pathway and the dependencies between entities such as Requirements, Use Cases, Classes, Packages, Test Cases and other model artifacts, or even between these entities and the overall business process model.

- [Model Transformation](#)<sup>[2013]</sup>
- [A Complete Business Process](#)<sup>[1813]</sup>

### 4.3.1 Traceability Tools

The **structure** of your model and a **Traceability diagram** act as the starting points for tracing the definition, design and implementation of a specific feature of a system or process. By applying tools such as the **Relationship Matrix** and **Traceability window**, you can follow threads through the model to determine how the feature is implemented and tested. You can also obtain information on what elements realize and are realized by the elements in a given package, using the **Dependency report** and **Implementation report**, respectively.

#### Principal Tools

Tool	Detail	See also
<b>Traceability window</b>	<p>The Traceability window is a very useful and versatile traceability tool; starting with a Traceability diagram or a package structure in the Project Browser, you can use the Traceability window to quickly explore the relationship chain of which any element is a component.</p> <ul style="list-style-type: none"> <li>• When you click on <b>an element</b>, it immediately becomes the top point in the Traceability window</li> <li>• When you click on the <b>background of a diagram</b>, <i>all</i> elements in the diagram are listed in the Traceability window, and you can follow the threads starting at each element through the diagram</li> </ul> <p>If you require a rapid, broad-brush view of <b>relationship flows</b> in the project structure, starting with a general list of - say - all functional Requirements, you can use a combination of Model Search, Project Browser and Traceability window; this is a powerful means of scanning your project, identifying how elements have been organized, and seeing how they interact. For example, the Model Search would list all the Requirements. You could rapidly click on each element and immediately see in the Project Browser where it has been grouped, and at the same time - in the Traceability window - how that element interacts with other elements in the model.</p> <p>By moving the cursor around a diagram or the Project Browser, and/or changing the relationship type combinations in the Traceability window, you can quickly see how elements are connected and how they influence each other. For example, you could see that - say - REQ017 is realized by two Use Cases, so you might then explore what else influences and is influenced by these two Use Cases. The Traceability window takes you well beyond what is likely to be depicted on any single diagram.</p> <p>If you have used <b>transformations</b> to develop your model, you can also follow the Transformation Dependencies that exist between an element in a PIM and elements in the PSMs.</p>	<p><a href="#">Example Traceability Diagram</a><sup>[743]</sup></p> <p><a href="#">The Traceability Window</a><sup>[723]</sup></p> <p><a href="#">Model Search</a><sup>[700]</sup></p> <p><a href="#">The Project Browser</a><sup>[646]</sup></p>
<b>Relationship Matrix</b>	<p>Using the Relationship Matrix, you can both create and study the relationships between, for example, the Requirements and Use Cases of a module.</p> <p>You might identify the 'theme' package (such as <i>Manage Users</i>) as the source package in the <b>Requirements</b> model and the target package in the <b>Use Case</b> model, and explore the likely element and connector types in the packages; this, like the Traceability diagram, identifies which</p>	<p><a href="#">Relationship Matrix</a><sup>[727]</sup></p>

Tool	Detail	See also
	<p>Requirements are (or should be) realized by which Use Cases.</p> <p>You can then perform similar checks with the <i>Manage Users</i> packages in, say, the <b>Use Case</b> and <b>Implementation</b> models.</p> <p>Using the <b>Source</b> and <b>Target</b> field browsers ( ... ) you can examine <b>child</b> packages within the 'theme' package, and obtain further detail on how the feature at this stage is defined.</p>	
<b>Relationships window</b>	<p>The Relationships window shows a single level of relationships from the currently selected element.</p> <p>Each line corresponds to a single relationship, providing information about that relationship and the element at the other end of the relationship.</p>	<a href="#">The Relationships Window</a> <sup>[742]</sup>
<b>Dependency report</b>	The Dependency report provides a list of dependencies for all elements in the model.	<a href="#">Dependency Report</a> <sup>[2738]</sup>
<b>Implementation report</b>	The Implementation report provides a list of all elements in the model that have to be implemented, and the elements that implement them.	<a href="#">Implementation Report</a> <sup>[2737]</sup>

### 4.3.2 The Traceability Window

Using the Traceability window you can quickly see how elements are connected and how they influence each other. You can:

- Locate related elements in the Project Browser
- View the properties of related elements
- Open the diagrams in which related elements are used
- Add related elements to the current diagram
- View the source code for related elements
- Change the display using the window toolbar options (see below)

When an **element** is selected, it immediately becomes the top point in the Traceability window. When a **diagram** is selected, all elements in the diagram are listed in the Traceability window, so you can use any of them as a starting point.

**Access** **View | Traceability** ( **Ctrl+Shift+4** )

#### Traceability window toolbar options

<b>Locate Element</b>	Click on this icon to make the selected element the focus of the Traceability window and to show all relationships and elements with which the selected element forms a	

	<p>relationship chain.</p> <p>Click on the diagram to list all elements in the diagram.</p>	
<b>Related Element Properties</b>	Click on this icon to display the element Properties dialog for the currently-selected element in the Traceability window.	
<b>Find Element Usage</b>	<p>Click on this icon to display the Element Usage dialog, listing all diagrams in which the currently-selected element is used.</p> <p>(Shortcut keys: <b>Ctrl+U</b>)</p>	<a href="#">Show Element Use</a> <sup>[910]</sup>
<b>(Relationship selector)</b>	<p>Click on the drop-down arrow and select the checkbox against each relationship type to include in the trace shown in the window:</p> <ul style="list-style-type: none"> <li>• Generalizations</li> <li>• Aggregations</li> <li>• Nesting</li> <li>• Realizations</li> <li>• Dependencies</li> <li>• Transitions</li> <li>• Other (unspecified) links such as: <ul style="list-style-type: none"> <li>• Associations</li> <li>• Use Cases</li> <li>• Delegates</li> <li>• Assemblies</li> <li>• Deployments</li> <li>• Information Flows</li> <li>• Manifests</li> </ul> </li> <li>• Classifiers - where an element is used as the classifier of another element</li> <li>• Embedded Element Re-uses - where a Port or Part is also represented in another part of the model</li> <li>• Transformations - where an element is created by running a Transformation from another element</li> <li>• Custom References that have been added between elements</li> <li>• Qualified Names - element names including the names of owning objects</li> </ul>	<a href="#">Generalization</a> <sup>[1408]</sup> <a href="#">Aggregation</a> <sup>[1392]</sup> <a href="#">Nesting</a> <sup>[1434]</sup> <a href="#">Realization</a> <sup>[1440]</sup> <a href="#">Dependency</a> <sup>[1404]</sup> <a href="#">Transition</a> <sup>[1446]</sup>  <a href="#">Classifiers and Instances</a> <sup>[1009]</sup> <a href="#">Inherited and Redefined Ports</a> <sup>[1385]</sup> <a href="#">Model Transformation</a> <sup>[2013]</sup>  <a href="#">Set Up Cross References</a> <sup>[916]</sup> <a href="#">Configure Diagram Display</a> <sup>[825]</sup>
<b>Help</b>	Click on this icon to display this Help topic.	

**Notes**

- To make it easier and faster to find the elements you are interested in, restrict the relationship types shown to the smallest set of relevant types
- As an alternative view, or to include the traceability information in documentation, you can develop a Traceability diagram using the Traceability window
- The Traceability window does not currently recognize **extended** relationship types defined by Technologies such as BPMN or Archimate; relationships defined by a Profile or Technology are identified using their base UML type, so, for example, Archimate 'Realization' and 'UsedBy' relationships are each reported as UML 'Dependency' relationships

**Learn more**

- [Example Traceability Diagram](#) 

**4.3.3 Relationship Matrix**

When you need to visualize or manage relationships quickly and definitively, you can use the **Relationship Matrix** - a convenient and simple tool for reporting and working on all the relationships in a selected structure. The Relationship Matrix is a spreadsheet display of relationships between model elements within a Package or between two different Packages. You can filter the selection of relationships shown, according to:

- The element type of the source and target elements in each relationship
- The relationship type and direction
- The Package(s) in which the source elements and target elements are held

The matrix shows all the relationships of a specified type between source and target elements by:

- Listing the source Package elements down the side of the matrix
- Listing the target Package elements across the top of the matrix, and
- If a relationship exists between a source and target element, changing the background color of the intersecting grid square and displaying an arrow indicating the direction of the relationship

The direction is a reflection of which element is the source element and which the target (it does not indicate the **Direction** property of the connector, as defined in the connector Properties dialog). The display might also show a 'bent arrow' icon, indicating that the same kind of connectors exist in **both** directions between the source and target elements. The colored squares are normally **green**, indicating that the **source** element is not locked (that is, the parent Package **has not** been checked in under version control); if the element **is** locked (the parent Package **has been** checked in) the color is **pink**.

If you click on any square in the matrix, the square, the row header and the column header are highlighted. Right-clicking on a square also gives you the options of creating, modifying and deleting relationships between elements with a single mouse click - a quick way to set up complex sets of element relationships with a minimum of effort.

You can also create additional **elements** in the source and target Packages, and quickly add relationships to and/or from them.

**Access** [View | Relationship Matrix](#) or [Project Browser Package Context Menu | Documentation | Open in Relationship Matrix | As Source](#) or [As Target](#)

Operations

Operation	Detail	See also
<b>Specify the element types</b>	<p>The Relationship Matrix defaults to show all element types. If you want to examine relationships between specific types of element, you can filter for those types.</p> <p>You define the element types - if necessary - as the first step in configuring the Relationship Matrix.</p> <p>Click on the drop-down arrow in the <b>Type</b> field in the <b>Source</b> row, and/or in the <b>Target</b> row, and in each case click on the required element type in the list.</p> <p>The Relationship Matrix display immediately refreshes.</p>	<a href="#">Set Element Type</a> <sup>[729]</sup>
<b>Specify the connector type and direction</b>	<p>The Relationship Matrix requires a relationship type and direction to operate on.</p> <p>In the <b>Link Type</b> field, click on the drop down arrow and on the type of relationship to show.</p> <p>In the <b>Direction</b> field, click on the drop-down arrow and on one of the connector directions to show, or on <b>Both</b> to show relationships in any direction.</p> <p>In each case, if any relationships of that type exist they are immediately shown on the Relationship Matrix.</p>	<a href="#">Set Connector Type and Direction</a> <sup>[730]</sup>
<b>Select the Source and Target Packages</b>	You need to set the source and target Packages in order to display relationships, but you do this <b>after</b> setting the connector and element types; as the Matrix automatically refreshes after each change, this is usually faster.	<a href="#">Set Source and Target Package</a> <sup>[731]</sup>
<b>Update, delete and create relationships</b>	Having seen what relationships currently exist between the selected elements, you can review the relationship and element properties, modify them, add more relationships or delete relationships that are no longer applicable.	<a href="#">Creating and Deleting Relationships</a> <sup>[737]</sup>
<b>Create new elements</b>	<p>If the source or target element <b>Type</b> field is set to a specific element type, you can add elements of that type to the matrix and the model.</p> <p>In the top left corner of the matrix itself, the <b>Target</b> and <b>Source</b> labels have a <b>+</b> button. When you click on this button, the element properties dialog displays, through which you can define a new element of the corresponding (target or source) type.</p> <p>If there are stereotyped elements of the type (such as Actors as defined in UML, TOGAF and Archimate) you are prompted to select the variant that you need.</p> <p>This option is not available for the target or source axis if the corresponding <b>Type</b> field is set to <b>&lt;All&gt;</b>.</p>	<a href="#">Set Element Type</a> <sup>[729]</sup>  <a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Modify the</b>	It is possible to tailor the display of information to, for example, list the	<a href="#">Relationship</a>

Operation	Detail	See also
<b>display of information</b>	Package elements in alphabetical order, show elements from the Package hierarchy, and hide or show additional element name components such as level numbering, aliases and parent Package names.	<a href="#">Matrix Options</a> [738]
<b>Toggle Between relationship direction and CRUD formats</b>	You can switch the display between the connector direction format and a CRUD matrix format. The CRUD (or other, customized) indicators are defined in an overlay that you create.	<a href="#">Matrix Overlays</a> [732]
<b>Export the contents of the Relationship Matrix</b>	After reviewing the Relationship Matrix, you can export the contents to a CSV file, or capture the image of the contents as a .png file or a .emf graphics file.	<a href="#">Relationship Matrix Options</a> [738]
<b>Print the contents of the Relationship Matrix</b>	You can also send the contents of the Relationship Matrix to a printer, after previewing the print format if necessary. The printout can be on as many pages as it takes, or you can scale the print format so that the file occupies a specific number of pages.	<a href="#">Relationship Matrix Options</a> [738]
<b>Capture the Matrix settings</b>	If you want to use the same Relationship Matrix settings repeatedly to, for example, monitor development of the same source and target Packages, it is possible to save the settings as a profile that can be called to reapply those settings.	<a href="#">Matrix Profiles</a> [735]
<b>Investigate Source and Target elements in relationships</b>	Having identified relationships that might be of significance to you, you can check details of the elements in those relationships. For example, you can look at: <ul style="list-style-type: none"> <li>• The diagrams that the elements are used in</li> <li>• The properties of the elements, or</li> <li>• What other elements might have relationships with the selected element</li> </ul>	<a href="#">Review Source and Target Elements</a> [741]

#### 4.3.3.1 Set Element Type

The Relationship Matrix defaults to show all element types in both Source and Target Packages. You can also select to list elements of one specific type in the Source Package or the Target Package or both. For example:

- Any (<All>) types of element in the Source Package linked to Use Cases in the Target Package
- Use Cases in the Source Package linked to any (<All>) types of element in the Target Package
- Requirements in the Source Package linked to Use Cases in the Target Package
- Classes in the Source Package linked to Classes in the Target Package

Having set the element type for an axis, you can create further elements of that type within the Relationship

Matrix,

#### Set the source and/or target element type

Step	Action	See also
1	Click on the drop-down arrow in the <b>Type</b> field for the Source Package, or for the Target Package.	
2	Find the required element type in the list and click on it. The Relationship Matrix content automatically refreshes.	
3	If necessary, repeat the process to select a specific element type in the other Package.	

#### Learn more

- [Relationship Matrix](#)<sup>[72]</sup>

### 4.3.3.2 Set Connector Type and Direction

The Relationship Matrix shows relationships of a specific type and direction, which you define after selecting the element type(s) to show, and before you specify the Source and Target packages to search in.

#### Set the connector type and direction

Step	Action	See also
1	Click on the drop-down arrow in the <b>Link Type</b> field.	
2	Locate and click on the required connector type in the list.	
3	Click on the drop-down arrow in the <b>Direction</b> field.	
4	Click on the required direction in the list. The Relationship Matrix content automatically refreshes.	

#### Notes

- If you set the **Direction** field to **Both**, each relationship is indicated by two arrows - a *From-To* arrow and a *To-From* arrow
- The direction is a reflection of which elements are the source elements and which are the target.; it

does not indicate the **Direction** property of the connector, as defined in the connector Properties dialog

#### Learn more

- [Relationship Matrix](#)

### 4.3.3.3 Set Source and Target Package

Before you display relationships on the Relationship Matrix, you set both the source and target packages containing the elements between which the relationships might exist. However, you set the source and target packages **after** setting the element and connector types/details; as the Relationship Matrix refreshes after each change, this is usually faster. You can set the same package as the source and target, to investigate relationships within a package, or different source and target packages to investigate relationships between packages.

When deciding on which packages to investigate and how to filter the matrix contents, consider that:

- The Relationship Matrix includes **all** child **elements** in each package, within the criteria you specify; in a large model, with less-specific filters, this can expand the matrix with a large number of elements
- On the other hand, if you want to examine relationships within the package structure, you can select options to include elements in **child packages** under either the source package or the target package, or both

**Access** [View | Relationship Matrix](#) or [Project Browser Package Context Menu | Documentation | Open in Relationship Matrix | As Source](#) or [As Target](#)

#### Set source and target packages

Step	Action	See also
<b>If you select the first access option</b>		
1	In the Project Browser, click on the required source package, then press and hold ( <b>Ctrl</b> ) and click on the required target package, to select the two packages together.	
2	Drag the selected packages over the <b>Source</b> and <b>Target</b> fields.  The first-selected package name displays in the <b>Source</b> field, and the second-selected package name displays in the <b>Target</b> field.	
<b>Or, if you use the second access option</b>		
1	Select and drag a single package name over the remaining <b>Source</b> OR <b>Target</b> field, to change just the source or the target package.  If you drop the package name anywhere else on the Relationship Matrix, the system prompts you to specify whether to add it to the <b>Source</b> or <b>Target</b> field, or both.	

Step	Action	See also
<b>Alternatively</b>		
1	<p>Click on the ( ... ) (Browse) button at the end of the <b>Source</b> or <b>Target</b> field.</p> <p>A short menu displays, with options to:</p> <ul style="list-style-type: none"> <li>• Locate a package using the Browse Project dialog or</li> <li>• Select a Model Search from a drop-down list and run the search on a search term; the name of the search is displayed in the <b>Source</b> or <b>Target</b> field</li> </ul> <p>The target of the search depends on whether the <b>Return matching items for the selected Package</b> option is selected in the Search definition; if it is selected, the search operates on the current package, otherwise the search operates on the whole model</p> <p>It is possible to browse for a package in one field and run a search in the other.</p>	<a href="#">Advanced Search Options</a> <sup>[715]</sup>
2	Select the required package, or the required Model Search and search term, and click on the <b>OK</b> button.	

In all cases, the Relationship Matrix immediately:

- Populates the axes with the elements identified in the Source and Target packages or searches that meet the selection criteria, and
- Shows any relationships between the sets of elements that also meet the selection criteria

#### **Notes**

- Custom SQL searches are supported if they are returning elements; the SQL must include `ea_guid AS CLASSGUID` (case sensitive)
- Using ORDER BY in a SQL search will not affect the order of the Relationship Matrix

#### **Learn more**

- [Relationship Matrix](#) <sup>[727]</sup>
- [Create Search Definitions](#) <sup>[717]</sup>

### **4.3.3.4 Matrix Overlays**

The Relationship Matrix indicates the existence of connectors between elements by displaying an **arrow** in the cell at the intersection of the source element row and target element column.

If you prefer, you can toggle the display to a **CRUD matrix overlay**, where the presence of a connector is indicated by the appropriate **value** or **combination** of CRUD values in the intersection cell. You define the actual values that are entered and displayed, so the characters can refer to whatever interpretation of CRUD your organization uses, or they can be another standard set of indicators such as **BREAD**, or your own custom set of indicators. The values can, therefore, be a selection of the following, or anything else you

might use:

- **Create**
- **Add**
- **Browse**
- **List**
- **Read, Retrieve**
- **Update**
- **Edit**
- **Modify**
- **Delete, Destroy**

#### Toggle between the two display formats

Click on the **Overlays** field drop-down arrow and select either:

- **<None>** to use the direction arrow Relationship Matrix format
- The name of your overlay, to use the Matrix overlay format, or
- **<New Overlay>** to create and use a new Matrix overlay

The overlay values display if they have been specifically **applied** to the relationship via the **intersection cell** on the Relationship Matrix.

#### Learn more

- [Relationship Matrix](#)<sup>[727]</sup>
- [Create a Matrix Overlay](#)<sup>[733]</sup>
- [Apply an Overlay to a Cell](#)<sup>[734]</sup>

#### **4.3.3.4.1 Create a Matrix Overlay**

When you create a Matrix Overlay to apply to the cells of the Relationship Matrix, you define the values that can be assigned under that overlay, and whether the values must be single or can be set in a combination. The overlay definition is actually created as a Tagged Value on the connector, of the predefined Tagged Value Type **MatrixOverlay**.

Access   **View | Relationship Matrix: Overlays drop-down arrow | <New Overlay>**

#### Create an Overlay

Field/Button	Action	See also
<b>Overlay Name</b>	Type an appropriate name for the overlay. This also becomes the <b>tag</b> name.	
<b>Allowable Values</b>	Type in the allowable values for the overlay/tag, <b>not</b> separated by any punctuation or spaces (for example, <b>CRUD</b> ); the matrix cell is case sensitive, so type the values exactly as they are to be entered.	

Field/Button	Action	See also
<b>Mutually Exclusive</b>	<p>If you want only <b>one</b> allowable value to be set in a matrix cell at a time, select this checkbox. (This makes the Tagged Value an <b>Enum</b> type.)</p> <p>If you want to allow any <b>combination</b> of values to be set in a matrix cell at a time, clear the checkbox. (This makes the Tagged Value a <b>Custom</b> type.)</p>	
<b>OK</b>	<p>Click on this button to save the new overlay/Tagged Value.</p> <p>You can now view the overlay on the Tagged Value Types tab of the UML Types dialog, in the format:</p> <pre>Type=Enum; Values=C, R, U, D; MatrixOverlay=true;</pre>	<a href="#">Tagged Value Types</a> <small>[1150]</small>

#### Notes

- You cannot change an existing overlay on the Relationship Matrix; because the overlay is defined by a Tagged Value of type **MatrixOverlay**, you can delete the overlay or edit the values and/or the **Mutually Exclusive** setting by deleting or editing the Tagged Value on the Tagged Value Types tab of the UML Types dialog

#### Learn more

- [Matrix Overlays](#) [732]
- [Apply an Overlay to a Cell](#) [734]
- [Predefined Tagged Value Types](#) [1622]

#### 4.3.3.4.2 Apply an Overlay to a Cell

You can apply overlays (one overlay at a time) to the cells of the Relationship Matrix. After you select the required overlay in the **Overlays** field, you can:

- Apply an overlay value or values to a cell that identifies an existing relationship
- Create a new relationship in a cell, and immediately apply overlay values to that relationship
- Change the overlay values currently applied, or
- Remove the overlay from the cell

**Access** [View | Relationship Matrix: right-click on cell](#)

#### Context Menu - Overlay Options

Option	Action	See also
<b>Apply overlay</b>	<p>(On a cell that has an arrow icon, or the value of a different type of overlay.)</p> <p>Displays the Allowable values &lt;values&gt; dialog. Type in the required value or values and click on the <b>OK</b> button.</p>	

Option	Action	See also
	<ul style="list-style-type: none"> <li>If you have entered more than one value and the overlay is set to mutually exclusive, only a single value is permitted and an error message displays; click on the <b>OK</b> button and type in a single character</li> <li>If the overlay is not set to mutually exclusive, you can type in any individual value, or any combination of values in any sequence</li> </ul>	
<b>Create new relationship with overlay</b>	<p>(On a cell that has no relationship indicated in it.)</p> <p>If necessary, change the <b>Link Type</b> field to show the type of connector to create.</p> <p>When you click on the menu option, a submenu of variations of the selected relationship type might display. Click on the variation to create.</p> <p>The Allowable values &lt;values&gt; dialog displays; type in the required value or values and click on the <b>OK</b> button.</p> <p>A relationship of the selected type is created between the source and target elements, and the selected overlay values are displayed in the cell.</p>	<a href="#">Relationship Matrix</a> <sup>[72]</sup>
<b>Edit overlay</b>	<p>(On a cell showing a value of the current overlay.)</p> <p>Displays the Allowable values &lt;values&gt; dialog, showing the current value. Overtyping this with the new value or values and click on the <b>OK</b> button.</p> <p>The new value(s) display in the selected cell.</p>	
<b>Remove overlay</b>	<p>(On a cell showing a value of the current overlay.)</p> <p>Clears the overlay value and restores the appropriate connector direction arrow symbol to the cell.</p>	

**Notes**

- You cannot apply different overlays to the matrix at the same time; if you select a different overlay in the **Overlays** field, any values in the cells revert to either the value set under that overlay, or the direction arrow if no value is set under that overlay

**Learn more**

- [Relationship Matrix](#)<sup>[72]</sup>
- [Matrix Overlays](#)<sup>[73]</sup>
- [Create a Matrix Overlay](#)<sup>[73]</sup>

**4.3.3.5 Matrix Profiles**

You can use the Relationship Matrix as a monitoring tool, to help in tracking the development of elements and relationships in particular packages or pairs of packages over time. In this case you would re-use the same combinations of field settings many times. It is very easy to store a combination of settings as a Matrix Profile, so that later you can recall it for use whenever you need it.

**Access** **View | Relationship Matrix****Save a Relationship Matrix configuration as a named Profile**

Step	Action	See also
1	Set up the Relationship Matrix with the required: <ul style="list-style-type: none"> <li>Source and target element types</li> <li>Connector type and direction</li> <li>Source and target packages or Model Searches, and</li> <li>Overlay name or <b>&lt;None&gt;</b> selected</li> </ul>	<a href="#">Relationship Matrix</a> <sup>[72]</sup> <a href="#">Set Source and Target Package</a> <sup>[73]</sup> <a href="#">Matrix Overlays</a> <sup>[73]</sup>
2	Click on the <b>Options</b> button on the Relationship Matrix and select the <b>Profiles   Save as New Profile</b> menu option.  The Enter name for new profile dialog displays.	
3	In the <b>Enter Value</b> field, type a profile name of up to 12 characters.  Click on the <b>OK</b> button.	
4	Once you have created a profile, you can select it by clicking on the <b>Profile</b> drop-down arrow at the top of the Relationship Matrix screen and selecting the profile name from the list.  Profiles are also listed in the <i>Matrix Profiles</i> folder of the Resources window; double-click on a profile in the folder to display the Relationship Matrix with that profile active.	<a href="#">Resources</a> <sup>[1173]</sup>

**Notes**

- You can modify an existing profile by:
  - Selecting the profile name from the **Profile** drop-down list
  - Changing the field values, then
  - Selecting the **Options: Profiles | Update Current Profile** menu option
- To delete an existing profile, select it in the **Profile** drop-down list and select the **Options: Profiles | Delete Current** menu option
- You can capture Relationship Matrix profiles in document reports

**Learn more**

- [Reporting Profiled Relationship Matrices](#) <sup>[2692]</sup>

#### 4.3.3.6 Creating and Deleting Relationships

Having reviewed existing relationships on the Relationship Matrix, you can use the Matrix to quickly modify or delete those relationships and create others between the elements. This is a very useful facility for maintaining a large number of relationships in a short space of time. As you can filter for specific types of connector and source and target element, you can create a logical set of relationships without having to specify the type of each object every time.

**Access** [View | Relationship Matrix](#)

##### Create a new relationship

Step	Action	See also
1	In the <b>Link Type</b> field, select the type of relationship you want to create, and in the <b>Type</b> fields select the types of source and target element between which to create the relationships.	
2	Right-click on the empty square at the intersection of the appropriate source row and target column.  You can select and operate on several squares (creating several relationships) at once. Either: <ul style="list-style-type: none"> <li>Press <b>Ctrl</b> as you click on each intersecting square, then right-click on one of the selected squares, or</li> <li>Click on the first square in the required row, column or block, then press <b>Shift</b> as you click on the final square in the required row, column or block; right-click on one of the selected squares</li> </ul>	
3	Select either the: <ul style="list-style-type: none"> <li><b>Create new relationship</b> option, if no overlay is to be applied</li> <li><b>Create new relationship with overlay</b> option, to apply an overlay as you create the relationship</li> </ul> <p>If the <b>Direction</b> field is set to <b>Both</b>, you are offered the choice of creating the relationship to the Source element or to the Target element.</p> <p>A further submenu might display, listing any variations on the type of relationship you can create; in this case, click on the required type of relationship.</p>	<a href="#">Apply an Overlay to a Cell</a> <sup>734</sup>
4	A connector of the selected type is created between the two elements, and the appropriate indicator displays in the matrix cell.	

##### Modify or delete a relationship on the Relationship Matrix

Step	Action	See also
1	<p>Right-click the required highlighted relationship cell on the matrix, and select the appropriate context menu option:</p> <ul style="list-style-type: none"> <li>• <b>Apply overlay</b> - apply the CRUD overlay, if one is selected</li> <li>• <b>Edit overlay</b> - change the overlay values assigned to the cell</li> <li>• <b>Remove overlay</b> - take the overlay off this cell only, and revert to the connector direction arrow icon</li> <li>• <b>View relationship</b> - opens the Properties dialog for the selected relationship</li> <li>• <b>Source element properties</b> - opens the Properties dialog for the source element</li> <li>• <b>Target element properties</b> - opens the Properties dialog for the target element</li> <li>• <b>Delete relationship</b> - removes the relationship from between the elements</li> </ul>	
2	<p>If you have selected <b>Delete relationship</b>, Enterprise Architect prompts you to confirm this action.</p> <p>Click on the <b>Yes</b> button.</p> <p>The <b>Delete relationship</b> option is not available if:</p> <ul style="list-style-type: none"> <li>• The source element (that is, the owner) is locked</li> <li>• You have selected <b>Both</b> in the <b>Direction</b> field - you are effectively trying to delete half a relationship</li> </ul>	
3	<p>If you have selected one of the other options, modify the properties in the dialog fields as required.</p> <p>Click on the <b>OK</b> button to save the changes.</p>	<p><a href="#">Apply an Overlay to a Cell</a> <sup>[734]</sup></p> <p><a href="#">Connector Properties</a> <sup>[1126]</sup></p> <p><a href="#">Properties Dialog</a> <sup>[956]</sup></p>

### 4.3.3.7 Relationship Matrix Options

When you have displayed information on the Relationship Matrix, you might want to capture the display in some way, or modify the output. There are a number of options that you can select to, for example:

- Output the information on the Relationship Matrix to the printer or to a metafile, .png file or .csv file
- Create and update profiles of the configurations of the matrix that you have designed
- Define local settings to control what the Relationship Matrix displays

**Access** **View | Relationship Matrix: Options**

Options

Option	Action	See also
<b>Print Relationship Matrix</b>	<p>Click on the <b>Matrix   Print</b> menu option.</p> <p>The Print dialog displays, on which you select the output printer and specify the printer properties, the range of pages to print, and the number of copies.</p> <p>The output is a WYSIWYG representation of the Relationship Matrix contents.</p>	
<b>Display a preview of the printout</b>	<p>Click on the <b>Matrix   Print Preview</b> menu option.</p> <p>The Print Preview screen displays, showing the Relationship Matrix printout.</p>	<a href="#">Print Preview</a> <sup>[783]</sup>
<b>Scale the printout</b>	<p>When you print the Relationship Matrix, by default it prints on as many pages wide and long as the Matrix requires.</p> <p>You can scale the printout into a fixed number of pages wide; the row height is automatically adjusted to maintain the proportions of the Matrix. This reduces the overall size of the printout and improves appearance, especially when used in conjunction with the <b>Landscape</b> option in the printer properties.</p> <p>For example, a 16-page printout without scaling can, with a scaling of 2 pages wide, be reduced to 6 pages.</p>	
	<p>To set the page scaling:</p> <ol style="list-style-type: none"> <li>1. Click on the <b>Matrix   Scale Setting</b> menu option. The Scale Matrix dialog displays.</li> <li>2. Select the <b>Scale Matrix Width Into Pages</b> checkbox, and type or select the number of pages in width to scale to.</li> <li>3. Click on the <b>OK</b> button to apply the setting.</li> </ol>	
<b>Save Relationship Matrix as graphic file</b>	<p>Click on the <b>Matrix   Save as Metafile</b> or <b>Matrix   Save as PNG</b> menu options.</p> <p>A Browser dialog displays on which you select the target file location and specify the filename of the .emf or .png file in which to save the output.</p> <p>You can incorporate these files in a document or web report, as either a hyperlinked file or an included file.</p>	<a href="#">Insert Images, Objects and Frames</a> <sup>[1085]</sup>  <a href="#">Insert Reference Links</a> <sup>[1083]</sup>
<b>Export output to CSV file</b>	<p>The contents of the Relationship Matrix can be exported to a CSV file, which provides a convenient mechanism for moving the matrix data to a spreadsheet environment such as Microsoft Excel.</p> <p>This option is also active in the 'Lite', read-only version of Enterprise Architect.</p> <p>To export the Matrix to CSV:</p>	<a href="#">The Read-only 'Lite' Edition</a> <sup>[23]</sup>

Option	Action	See also
	<ol style="list-style-type: none"> <li>1. Select the <b>Matrix   Export to CSV</b> menu option. The Windows Browser dialog displays.</li> <li>2. Browse to the required file location and type in a .CSV filename to export to.</li> <li>3. Click on the <b>Save</b> button to export the data.</li> </ol>	
<b>Create and manage matrix profiles</b>	<p>If you use a particular combination of field values often, you can save that combination as a profile to make it easier to recall them for use.</p> <p>You can also include a Relationship Matrix Profile in a document report, to pull in specific relationship details using the Matrix.</p>	<a href="#">Matrix Profiles</a> <sup>[735]</sup> <a href="#">Reporting Profiled Relationship Matrices</a> <sup>[2692]</sup>
<b>Manage display content</b>	<p>You can extend the information shown by the Relationship Matrix to include related elements and/or additional properties of each element. You can also re-organize the display to list the element names in alphabetical order.</p> <p>Select the <b>Options</b> menu option. The Matrix Options dialog displays. Select one or more of the following checkboxes to define the information you want to display:</p> <ul style="list-style-type: none"> <li>• <b>Include Source Children</b> - to recursively include child packages and contents under the Source</li> <li>• <b>Include Target Children</b> - to recursively include child packages and contents under the Target</li> <li>• <b>Include All Extended Meta Types</b> - to include elements that are extensions of a specified meta-type; for example, if there are Block elements (extending Class) in the package, selecting this option and specifying the type Class includes Class and Block elements, and any further derivatives of Class in the matrix</li> <li>• <b>Sort Axes</b> - to display the element names in alphabetical order</li> <li>• <b>Show Package Names</b> - to hide or show the elements' parent package names in the Relationship Matrix; this is useful for shortening the displayed texts, especially in circumstances where packages have long names</li> <li>• <b>Use Element Alias If Available</b> - to display an element's alias instead of the element name, if an alias has been defined</li> <li>• <b>Show Level Numbering If Available</b> - to reproduce level numbering in the Relationship Matrix, if it is turned on in the Project Browser</li> </ul>	<a href="#">General Settings</a> <sup>[958]</sup> <a href="#">Package Menu</a> <sup>[651]</sup>

#### Learn more

- [Relationship Matrix](#) <sup>[727]</sup>

#### 4.3.3.8 Review Source and Target Elements

As you review the information on **relationships** in the Relationship Matrix, you can also obtain information on the source and target **elements** in any of the relationships.

Access **View | Relationship Matrix**

##### Review the elements

Action	Detail	See also
<b>Identify other elements in relationships with a source or target element</b>	Click on the source or target element name in the row or column titles. The entire row or column is highlighted. Scroll across or down the highlighted row or column and quickly identify where the relationships are; this is very useful if the row or column is long.	
<b>Display the Properties dialog for the selected element</b>	Right-click on the element name and select the <b>Properties</b> context menu option.	<a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Identify diagrams in which the element is used</b>	Right-click on the element name and select the <b>Find in Diagrams</b> context menu option. Either: <ul style="list-style-type: none"> <li>The only diagram in which the element is used displays, with the element highlighted, or</li> <li>A list of the diagrams in which the element is used displays; you then double-click on the required diagram to open it</li> </ul>	<a href="#">Show Element Use</a> <sup>[910]</sup>
<b>Highlight the element name in the Project Browser</b>	Right-click on the element name and select the <b>Locate in Project Browser</b> option. The Project Browser expands to the location of the element, and the element name is highlighted.	
<b>Make the element the focus in any docked screens or windows that are open</b>	Right-click on the element name and select the <b>Set Context Item</b> option; the selected element becomes the subject of any other windows or screens that are open.	

##### Learn more

- [Relationship Matrix](#)<sup>[727]</sup>

### 4.3.4 The Relationships Window

If you want a **quick overview** of all the relationships of a single element, you can obtain this from the **Relationships window**. This window lists all the relationships of the element currently selected in a diagram or the Project Browser, showing:

- The relationship type
- Any stereotype on the relationship
- The source and target elements in the relationship (the selected element can be either one in the relationship)
- The direction of the relationship
- Any stereotype on the related element
- The related element type
- The roles, if defined, of the target and source elements in the relationship

The Relationships window also has a **Target in Diagram** column which, if the row contains the value **Yes**, indicates that the related element is visible in the currently open diagram. If the related element is **not** in the current diagram (the row has no value), you have the option of adding it.

**Access** **Element | Relationships** (Ctrl+Shift+2)

#### Facilities

Facility	Detail	See also
<b>Display Connector Properties</b>	Double-click on a connector in the list.  The <connector type> Properties dialog displays, on which you can view and edit the connector properties.	<a href="#">Connector Properties</a> [1128]
<b>Find Related Element</b>	Right-click on the item line and select the <b>Locate Related Element</b> context menu option.  The related element is highlighted in the Project Browser.	
<b>Display Related Element Properties</b>	Right-click on the item line and select the <b>View Related Element Properties</b> context menu option.  The element Properties dialog displays.	<a href="#">Properties Dialog</a> [956]
<b>Delete Relationship</b>	Right-click on the item line and select the <b>Delete Connection</b> context menu option.  A prompt displays to warn you that the selected items will be deleted from all diagrams and from the model, and that the action cannot be reversed. This message refers to the <b>relationship</b> only - the source and target elements remain in the diagram and in the model.  Click on the <b>Yes</b> button to proceed with the deletion.	

Facility	Detail	See also
<b>Hide/Show Connector</b>	<p>If the related element exists on the current diagram, and the connector is shown, you can hide it. Right-click on the item line and select the <b>Hide Relation</b> context menu option.</p> <p>If the related element exists on the diagram and the connector is hidden, you can re-display it. Select the <b>Show Relation</b> context menu option.</p>	
<b>Locate Related Elements in Diagrams</b>	<p>Right-click on the item line and select the <b>Find in all Diagrams</b> context menu option.</p> <p>If the related element exists only in one diagram, that diagram is displayed with the related element highlighted. The focus of the Relationship window switches to the related element.</p> <p>If the related element exists in more than one diagram, the Element Usage dialog displays, listing the diagrams. Click on one of the diagrams and on the <b>Open</b> button to display the selected diagram with the related element highlighted.</p>	<a href="#">Show Element Use</a> [910]
<b>Add Related element to current diagram</b>	<p>Right-click on the item line and select the <b>Place Related Element in Diagram</b> context menu option. The cursor changes to the 'drop element' symbols (small rectangle and arrow with a boxed plus sign); move the cursor to the point in the diagram at which to drop the related element, and click the mouse button.</p> <p>This facility is useful in building up a picture of how an element interacts with the rest of the model, especially when reverse engineering an existing code base.</p>	

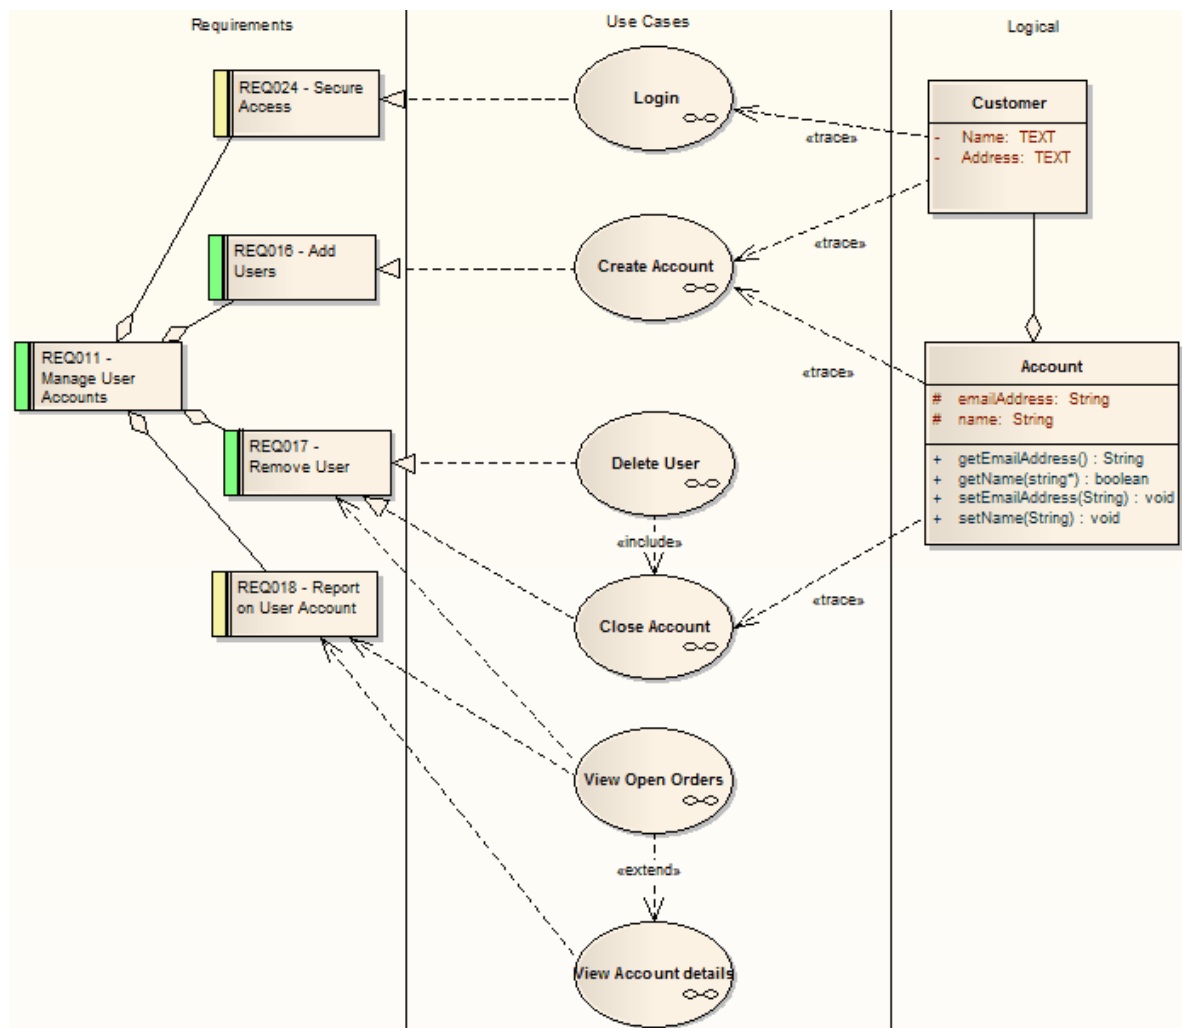

#### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, with security set ON, the diagram and the source and target elements must be free for editing before these options are available for use
- Adding a related element from the Relationships window to the diagram does not change the focus of the window to that related element; the originally-selected element (and the original subject of the Relationships window) remains in context, and you continue working with that element.

### 4.3.5 Example Traceability Diagram

You can create **Traceability diagrams** to show a wide variety of relationships, and you are not restricted to having either a single element type or elements from a single phase on a diagram. Therefore, you can create appropriate relationships (such as Realize or Trace) to elements where no relationship was previously defined.

Consider the following diagram, which shows how a series of requirements are traced to Use Cases and then Classes:

The diagram instantly shows:

- That two levels of Requirements are realized by Use Cases
- Which Requirement is realized by which Use Case(s)
- How some of the Use Cases are implemented by Class elements

You can drill down on each Use Case (or, in other Traceability diagrams, any other composite element) to display more detailed diagrams showing how the Use Case meets the Requirement; the *Close Account* Use Case, for example, is a composite element containing a Communication diagram and a Sequence diagram.

You can tailor your Traceability diagrams to depict any level of granularity and any stages of development that are appropriate; for example, you might:

- Narrow the above diagram to show development from just the *Remove User* Requirement, or
- Extend it to include Interfaces, Components, Test Case elements or any other facet of the system or process

### Building a diagram

A number of tools are available to for creating diagrams that show traceability:

- Select the diagram context menu option **Add | Related Elements** to automatically add elements linked to the selected element
- On the Relationships window, use the context menu option **Place Related Element in Diagram** to add elements to the diagram that are directly linked to the selected element
- On the Traceability window, add elements that are indirectly linked

#### Notes

- Whilst the Traceability diagram itself provides information on the definition, design and implementation of a business process feature, much more information can be obtained using the Traceability tools

### 4.3.6 Gap Analysis Matrix

The Gap Analysis Matrix is a tool to analyze model artifacts for potential gaps in solutions.

The idea is to highlight a shortfall between the Baseline Architecture and the Target Architecture; that is, items that have been deliberately omitted, accidentally left out, or not yet defined.

#### Access **View | Gap Analysis Matrix**

Topic	Detail	See also
<b>Overview</b>	<p>The Gap Analysis Matrix is a convenient method of identifying gaps between solution architectures.</p> <p>It enables you to model the gaps in the repository, which can later be addressed and assigned as tasks; the identified gaps can also be used to prioritize activities.</p> <p>On the Gap Analysis Matrix, you select the:</p> <ul style="list-style-type: none"> <li>• Target Architecture package</li> <li>• Baseline Architecture package</li> <li>• Type of Target Architecture artifact</li> <li>• Type of Baseline Architecture artifact</li> <li>• Type of element to model the gap</li> </ul>	<a href="#">Include Other Users' Packages</a> <sup>[436]</sup>
<b>Operations</b>	<p>Once you open the Gap Analysis Matrix, you can:</p> <ul style="list-style-type: none"> <li>• Create, update and delete Gap Matrix Profiles to monitor</li> </ul>	<a href="#">Edit Gap Notes</a> <sup>[748]</sup>

Topic	Detail	See also
	<p>development of the Baseline and Target packages</p> <ul style="list-style-type: none"> <li>• Edit Gap notes during a discussion session for Gap analysis</li> <li>• Create elements to address gaps</li> <li>• Add links to existing elements to address gaps</li> <li>• Remove links to existing elements modeled as gap</li> </ul>	
<b>Select Package</b>	<p>Click on the ( ... ) (Browse) button at the end of the <b>Target Architecture</b> or <b>Baseline Architecture</b> field.</p> <p>The Browse Project dialog displays.</p> <p>Select the required package and click on the <b>OK</b> button; by default all the elements under the package are displayed.</p>	
<b>Set Element Type</b>	<p>Click on the drop-down arrow in the <b>Filter</b> field for the Target Architecture package, and/or for the Baseline Architecture.</p> <p>Find the required element type in the list and click on it; Enterprise Architect refreshes the matrix content.</p>	
<b>Set Gap Type</b>	<p>Click on the drop-down arrow in the <b>Record Gap As</b> field.</p> <p>Find the required element type in the list and click on it.</p> <p>When you create a gap, the specified type of element is created; for example, if you want to address the gap with an issue element then select <b>Issue</b> for this field.</p>	
<b>Baseline Architecture</b>	<p>The Baseline Architecture artifacts are listed along the rows of the matrix.</p> <p>The last row is for capturing the new elements in the target architecture along the columns but not in the baseline architecture, hence the name <b>New</b>.</p>	
<b>Target Architecture</b>	<p>The Target Architecture artifacts are listed along the columns of the matrix.</p> <p>The last column is for capturing the missing or intentionally eliminated elements in the baseline architecture along the rows but not in the target architecture; hence the name <b>Missing / Eliminated</b>.</p>	
<b>Modeling Gap</b>	<p>Right-click on a cell in the <b>New</b> row or <b>Missing / Eliminated</b> column.</p> <p>The context menu displays options to:</p> <ul style="list-style-type: none"> <li>• Create a Gap element</li> <li>• Add a link to an existing Gap element</li> </ul> <p>If a link to Gap element already exists in the cell then the following options are displayed:</p> <ul style="list-style-type: none"> <li>• Edit Gap element</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>Find in Project Browser...</li> <li>Remove Gap element link</li> </ul>	
<b>Create Gap</b>	<p>Right-click on the cell and select the <b>Create Gap Element</b> context menu option.</p> <p>The Browse Project dialog displays.</p> <p>Select the package in which to create the Gap element and click on the <b>OK</b> button; a Gap element is created in the selected package and its Properties dialog displays to enable you to enter the element name and other required properties.</p>	
<b>Link to Existing Gap</b>	<p>If you intend to use a Gap element that is already available in the model, right-click on the appropriate cell in the <b>Missing / Eliminated</b> column or <b>New</b> row and select the <b>Link to Existing Gap Element</b> context menu option.</p> <p>The Select Classifier dialog displays, enabling you to select the existing Gap element.</p>	
<b>Remove Link to Gap</b>	<p>If you intend to remove a link to the Gap element in a cell, right-click on the appropriate cell in the <b>Missing / Eliminated</b> column or <b>New</b> row and select the <b>Remove Link to Gap Element</b> context menu option.</p> <p>The link is removed from the cell but the element still exists in the Project Browser.</p>	
<b>Review Gap Element</b>	<p>Right-click on the appropriate cell in the <b>Missing / Eliminated</b> column or <b>New</b> row and select the <b>Edit Gap Element</b> context menu option.</p> <p>The Properties dialog displays, enabling you to edit the selected Gap element.</p> <p>To locate the element in the Project Browser select the <b>Find in Project Browser...</b> context menu option, which highlights the element in the Project Browser.</p>	
<b>Gap Analysis Matrix Profiles</b>	<p>On the Gap Analysis Matrix, you can create and manage profiles to save commonly-used combinations of Target Architectures, Baseline Architectures and stereotypes.</p> <p>To work on Gap Analysis Matrix profiles, click on the <b>Options</b> button in the top right corner of the matrix; a submenu displays, listing options to:</p> <ul style="list-style-type: none"> <li>Create / Save the current matrix settings and content</li> <li>Update the currently selected profile in the <b>Profile</b> field</li> <li>Delete the currently selected profile in the <b>Profile</b> field</li> </ul>	
<b>Open a saved Profile</b>	<p>The <b>Profile</b> field drop-down list shows all the saved Gap Analysis Matrix profiles.</p>	

Topic	Detail	See also
	Click on the drop-down arrow in the <b>Profile</b> field, find the required Profile in the list and click on it to load the content of the selected profile in the matrix.	

### Notes

- The Gap Analysis Matrix is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- You can transport your Gap Analysis Matrix profiles between projects, using the **Export Reference Data** and **Import Reference Data** options

### Learn more

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

#### 4.3.6.1 Edit Gap Notes

The Gap Analysis Matrix provides a way to record notes during the initial phase or during a discussion session for Gap Analysis. These notes are saved in profiles, which can later be reviewed and the appropriate model elements created to address these gaps.

### How to

To edit gap notes

Step	Action	See also
1	Right click on the cell at the intersection of a Target and Baseline element and select the <b>Edit Gap Note</b> context menu option.  Alternatively, double click on the cell.  The Gap Note dialog displays.	<a href="#">Gap Analysis Matrix</a> <sup>[745]</sup>
2	Edit the notes as required and click on the <b>OK</b> button.	
3	The edited notes display in the selected cell in the matrix.	
4	Update or save the matrix to retrieve it when the Gap Matrix profile is loaded at a later stage.

## 5 Modeling Basics

Modeling can be described as graphically representing a business process or software system. The resulting model can be used to emphasize a certain aspect of the system being represented, and to record, document and communicate its detail. A study of such a model can enable insight or understanding of the system. Enterprise Architect's modeling platform is based on the Unified Modeling Language (UML), a standard that defines rules and notations for specifying business and software systems.

Using Enterprise Architect, you can quickly build a model using a hierarchy of *Packages* to represent the structure and organization of the model.

### Structural Components

Component	Link
<p>Models - a model is the highest conceptual level, representing a distinct and complete representation of all or some part of a modeled system.</p> <p>A Project can contain multiple models.</p>	<p><a href="#">Models</a> <sup>[753]</sup></p> <p><a href="#">Modeling</a> <sup>[752]</sup></p> <p><a href="#">Model Wizard</a> <sup>[753]</sup></p>
<p>Views are the second level within a model and define a specific viewpoint of the system being modeled - for example a Use Case view, a Requirements View or a Dynamic (behavioral) View.</p> <p>Views are simply Packages which have an additional conceptual meaning.</p>	<p><a href="#">Views</a> <sup>[769]</sup></p> <p><a href="#">Add Views</a> <sup>[770]</sup></p>
<p>Packages are the basic containers that create the overall model structure. Packages hold other Packages, elements, diagrams and similar model constructs.</p>	<p><a href="#">Packages</a> <sup>[772]</sup></p> <p><a href="#">Open Package in the Project Browser</a> <sup>[774]</sup></p>
<p>Diagrams are visual representations of how model elements are connected or behaviorally related. They can also display the characteristics of an element, such as attributes, methods, notes and Tagged Values in a convenient visual style.</p>	<p><a href="#">Diagrams</a> <sup>[778]</sup></p> <p><a href="#">Diagram Toolbox</a> <sup>[792]</sup></p> <p><a href="#">The Quick Linker</a> <sup>[896]</sup></p> <p><a href="#">Diagram Context Menu</a> <sup>[778]</sup></p> <p><a href="#">Diagram Tabs</a> <sup>[790]</sup></p> <p><a href="#">Diagram Tasks</a> <sup>[820]</sup></p> <p><a href="#">Layout Diagrams</a> <sup>[874]</sup></p>
<p>Elements are the basic building blocks of models. They represent both structural constructs such as Classes and Interfaces, as well as behavioral</p>	<p><a href="#">Elements</a> <sup>[900]</sup></p> <p><a href="#">Element Context Menu</a> <sup>[939]</sup></p>

constructs such as Activities, Actions and States.	<a href="#">Visual Representation</a> <sup>[953]</sup>
Connectors are the various kinds of relationships between elements within a model - including behavioral relationships, associations, taxonomic relations and similar.	<a href="#">Connectors</a> <sup>[1102]</sup> <a href="#">Connector Management Options</a> <sup>[1102]</sup> <a href="#">Connector Tasks</a> <sup>[1108]</sup> <a href="#">Connector Properties</a> <sup>[1126]</sup>
Tagged Values are customizable, profile or user defined properties which are generally related to a Stereotype and define additional attributes and characteristics of an element. They are one of the fundamental means of extending UML into more domain specific areas.	<a href="#">Tagged Values</a> <sup>[1134]</sup> <a href="#">Quick Start - Add Tagged Value To Elements</a> <sup>[1136]</sup> <a href="#">Modify Tagged Values</a> <sup>[1138]</sup>
Notes are the standard common language based descriptions of what an element, diagram, feature or relationship is for and how it is used within the model. Notes are often used as a first step to eliciting the meaning and use of an element - which is later refined into something more concrete and precisely specified.	<a href="#">Notes</a> <sup>[1142]</sup> <a href="#">Notes Toolbar</a> <sup>[1143]</sup>
Reference Information - a variety of basic types and information that is used across a particular model - for example, Stereotypes, Tagged Values and similar.	<a href="#">Reference Data</a> <sup>[1146]</sup> <a href="#">UML Types</a> <sup>[1146]</sup>

## 5.1 Modeling

Enterprise Architect is a comprehensive UML analysis and design tool. It provides a library of UML data structures that you can use and extend to develop your models.

You begin to create your projects and models using the **Start Page** or **File** menu, which provide templates on which to base your models. From these you create your Packages and diagrams using a range of toolbars and menus, and you then populate these structures with elements and connectors, using the **Diagram Toolbox**. You can also create new structures through the **Project Browser**, and re-use existing structures using the Project Browser, **Model Views**, **Package Browser** and **Model Search**.

Building models requires the use of various UML data structures and Enterprise Architect tools, as above, to graphically represent a business process or software system; the resulting model can be used to emphasize a certain aspect of the system being represented and to record and communicate its detail.

An extremely useful Enterprise Architect tool is the **Relationship Matrix**, through which you can select, visualize and amend the relationships in the organization of structures within the model. This provides particular support for:

- Requirements Management and
- Modeling the business process, an essential part of any software development process

You can extend the scope of your models using **UML Stereotypes**, **Profiles** and **Patterns**, and **MDG Technologies**.

## 5.2 Models

In Enterprise Architect a *model* is a special type of Package, being the top level entry point to a project file. You can develop a project with one model, or with several. Each model is a root node of a hierarchy of Model Packages and Views and, below them, Packages that contain the diagrams, elements, relationships and associated metadata that define the structure and function of a system or process. These components are organized through the Package hierarchy, which helps to group and manage related components; by iterating through all models, you can access all the elements within the project.

You can create the model or models when you first create the project, or you can add and develop new models later. When you first create a project, Enterprise Architect automatically displays the Model Wizard, which you use to generate the required models and subordinate structures from a wide selection of Model Patterns. However, you can also create a model as a single project root node with no content, and build up the model structure yourself, using the menu option:

**Project Browser context menu | Add | Add Model (root node)**

You can also delete a model, but be aware that everything contained in the model is deleted as well.

**Right-click | Delete Project Root**

### Learn more

- [Modeling Basics](#) <sup>750</sup>
- [Model Wizard](#) <sup>753</sup>

### 5.2.1 Model Wizard

The **Model Wizard** provides **Patterns** from a wide range of **technologies**, which you can use to quickly **generate new models** in your project both when you first create the project and over time.

The Model Wizard has three tabs:

- **Model Patterns** - from which you can create basic **models** that you can develop further as components of your project
- **Application Patterns** - from which you can generate starter **projects** including model information, code and build scripts for one of several basic application types
- **VEA Examples** - through which you can **import** complete sample models (Packages), including all necessary model information, code and build scripts, to explore and try out the **Visual Execution Analyzer**

This description covers the use of the **Model Patterns** tab. See *Learn more*, below, for links to information on the other two tabs.

**Access** **Automatically displays when creating a new project; otherwise**  
**Right-click on a Project Browser Package node | Add | Add a New Model using Wizard**

(Ctrl+Shift+M)

Project Browser toolbar | Generate a New Model

## 5.2.2 Model Templates

**Model templates** generated by Enterprise Architect are designed to assist in the creation of projects and models for both new and experienced users.

The templates are provided through the **Model Wizard**, for the model types available under the Basic UML 2 technology and Core Extensions technology.

Each template provides a **framework** of Packages, diagrams, representative elements and connectors on which to build a model appropriate to your purpose. These include overview diagrams that provide an introduction to the terminology and icons used in the model templates, and give a quick guide to the UML concepts important to the templates and how they are applied in Enterprise Architect. This information is provided either in Note elements or via hyperlinks to the Enterprise Architect Help and other Sparx Systems website resources.

### 5.2.2.1 Business Process Model Template

The **Business Process model** describes both the behavior and the information flows within an organization or system. As a model of business activity, it captures the significant events, inputs, resources, processing and outputs associated with relevant business processes.

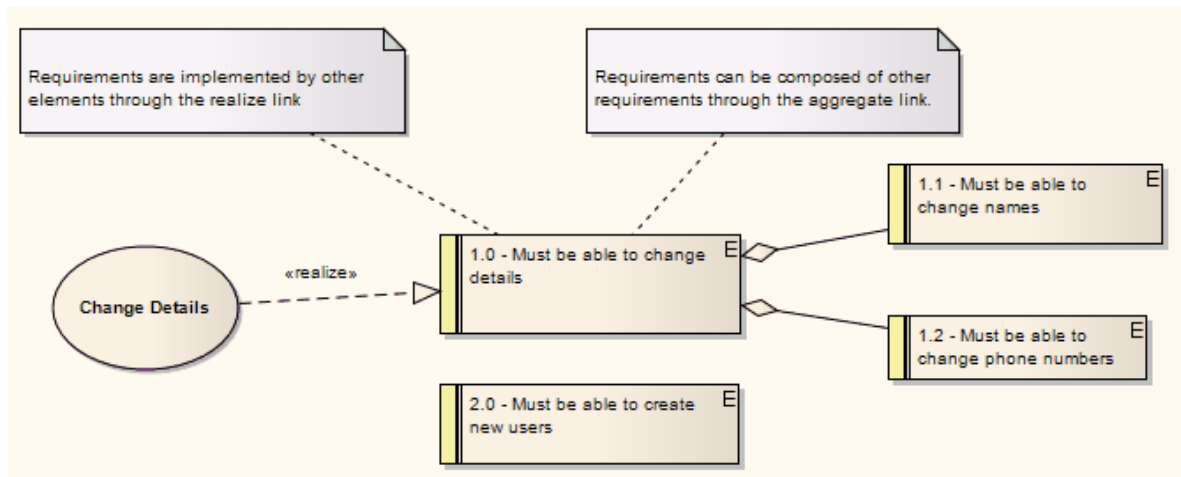

#### Learn more

- [The Business Process Model](#)
- [Business Models](#) <sup>[1804]</sup>
- [Analysis Diagram](#) <sup>[1801]</sup>
- [Business Modeling/Interaction](#) <sup>[1805]</sup>

### 5.2.2.2 Requirements Model Template

The **Requirements model** is a structured catalogue of end-user requirements and the relationships between them.

The **Requirements Management** facilities built into Enterprise Architect can be used to define Requirement elements, connect Requirements to other model elements, connect Requirements into a hierarchy and report on Requirements.

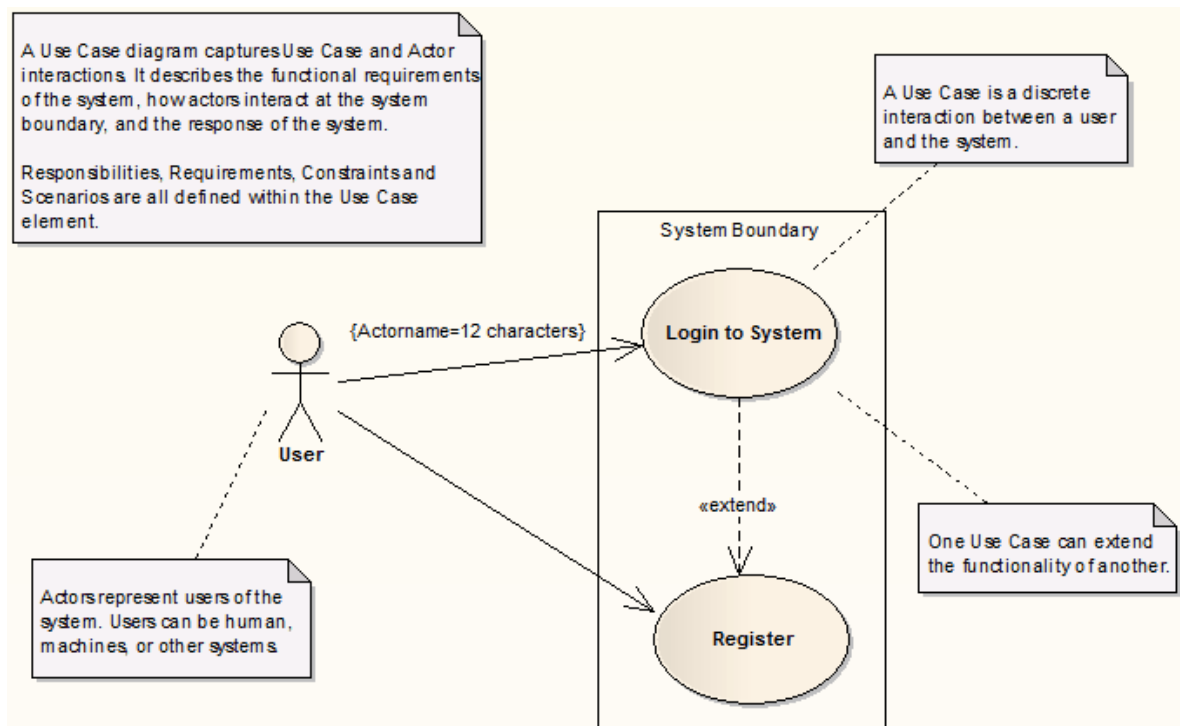

#### Learn more

- [Requirement Models](#) <sup>[1728]</sup>
- [Requirements Management in Enterprise Architect](#)
- [Packages](#) <sup>[772]</sup>

### 5.2.2.3 Use Case Model Template

The **Use Case model** describes a system's functionality in terms of **Use Cases**.

Each Use Case represents a single repeatable interaction that a user or 'actor' experiences when using the system, emphasizing the user's perspective of the system and interactions.

#### Learn more

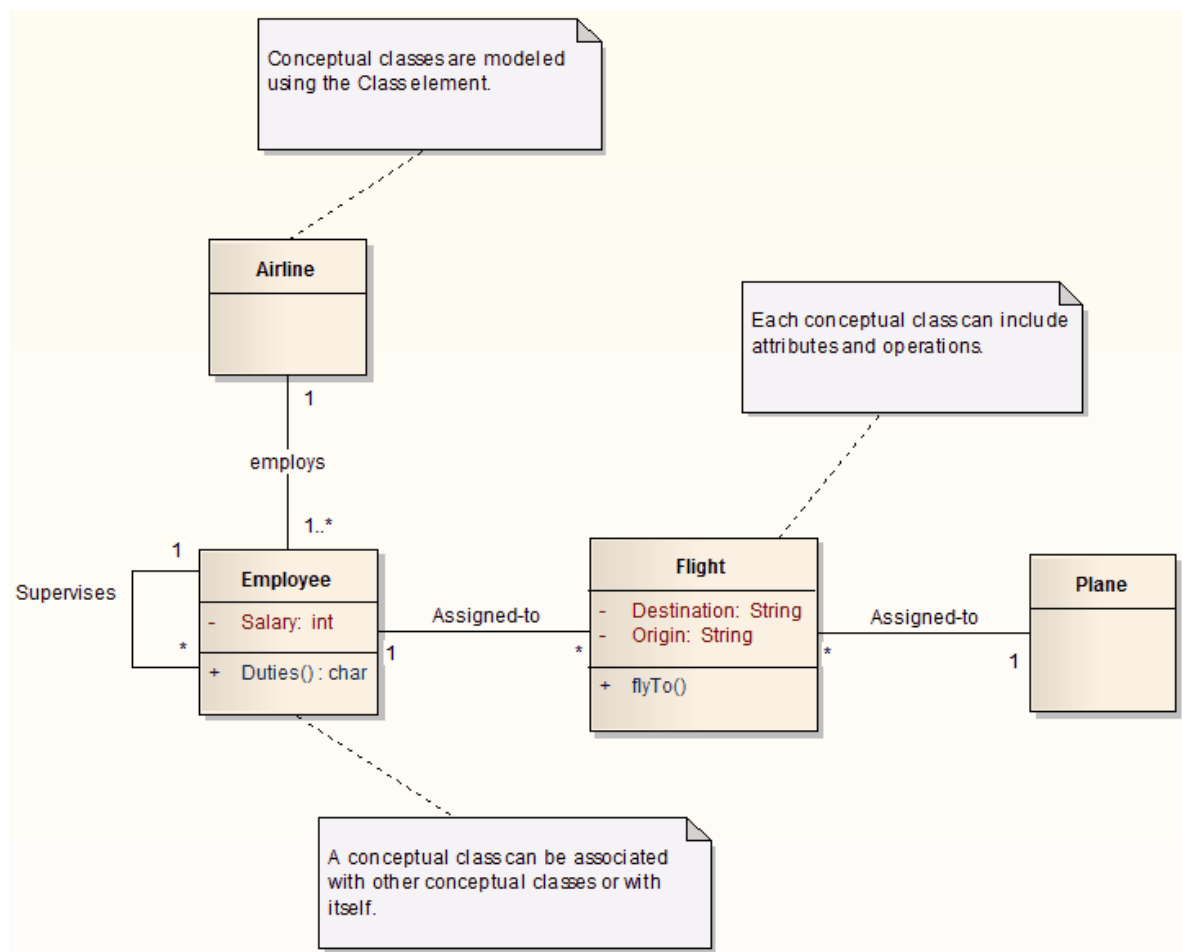

- [Use Case](#) <sup>[1352]</sup>
- [Use Case Diagram](#) <sup>[1201]</sup>
- [The Use Case Model](#)

#### 5.2.2.4 Domain Model Template

A **Domain model** is a high-level conceptual model, defining physical and abstract **objects** in an area of interest to the Project.

The Domain model can be used to document relationships between and responsibilities of conceptual classes (that is, classes that represent the concept of a group of things rather than Classes that define a programming object). It is also useful for defining the terms of a domain.

A Domain model shows:

- The physical and organizational units of the domain; for example, *Employee* and *Flight*
- The relationships between these units; for example, *Employee* is **assigned to** *Flight*
- The multiplicity of those relationships; for example, **one** employee can be assigned to **no** flights, **one** flight or **many** flights (represented by the 1 and the \* at the ends of that relationship)

#### Learn more

- [Multiplicity](#) 

### 5.2.2.5 Class Model Template

The **Class model** is a rigorous, logical model of the software system under construction.

**Classes** generally have a direct relationship to **source code** or other software artifacts that can be grouped together into executable components.

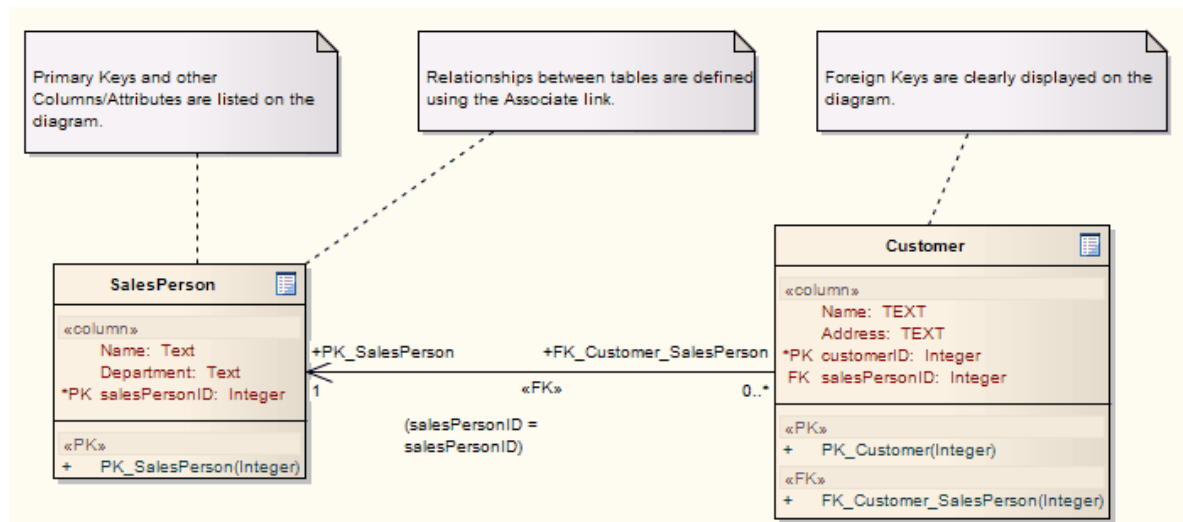

#### Learn more

- [Classes](#) <sup>[1363]</sup>
- [Class Diagram](#) <sup>[1184]</sup>
- [The Logical Model](#)

#### 5.2.2.6 Database Model Template

The **Database model** describes the data that must be stored and retrieved as part of the overall system design. Typically this means relational database models that describe the tables and data in detail and enable generation of DDL scripts to create and set up databases.

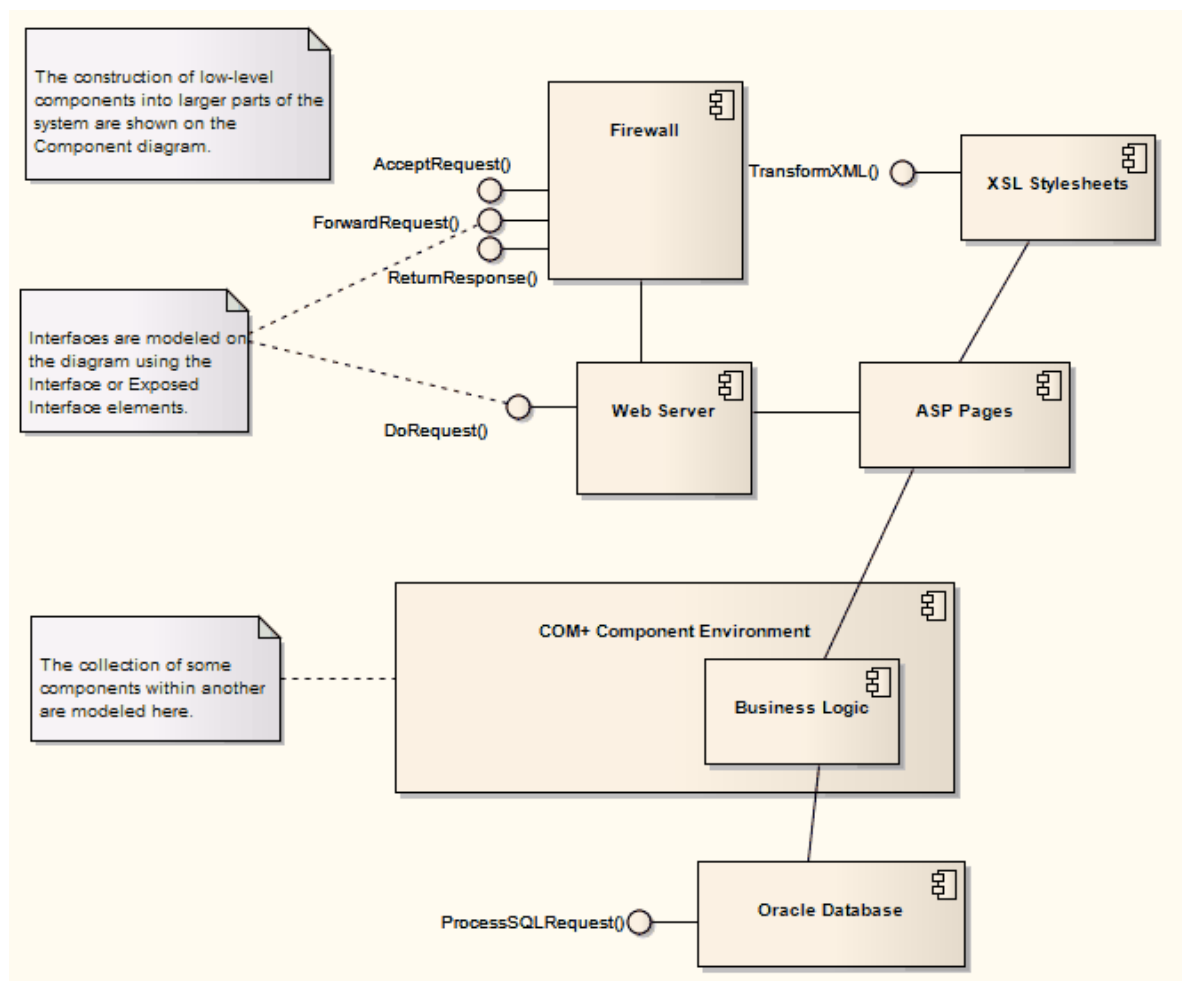

#### Learn more

- [Data Models](#) 1937
- [UML Database Modeling](#)

### 5.2.2.7 Component Model Template

The **Component model** defines how Classes, Artifacts and other low-level elements are collected into high-level components, and describes the interfaces and connections between them.

Components are compiled software artifacts that work together to provide the required behavior within the operating constraints defined in the Requirements model.

#### Learn more

- [Components](#) <sup>[1370]</sup>
- [Component Diagram](#) <sup>[1194]</sup>
- [The Component Model](#)

#### 5.2.2.8 Deployment Model Template

The **Deployment model** describes how and where a system is to be deployed. Physical machines and processors are represented by Nodes, and the internal construction can be depicted by embedding Nodes or Artifacts. As Artifacts are allocated to Nodes to model the system's deployment and roll out, the allocation is guided by the use of deployment specifications.

## 5.3 Views

The top-level Packages in a model (below the project root nodes) can be created as **Views**, which are used simply to structurally partition and extend the model according to specific requirements and modeling techniques, such as Component View or Dynamic View. These Views have the same concept as the Simple UML Views generated as Model Packages; however, unlike the Model Package views, basic Views:

- Do not have *any* automatically-generated components
- Can be created only under a root node
- Are top-level Packages with special Package icons
- Are not directly available for Requirements, Analysis or Testing, although you can develop these Views from Simple Views or within Use Case Views (see below)

### Types of View

There are **six** main types of View, each with their own Package icon:

- **Use Case View** - to contain, for example, Use Case diagrams and Analysis diagrams
- **Dynamic View** - to contain, for example, Activity diagrams, Communication diagrams, Sequence diagrams and State Machine diagrams
- **Class View** - to contain, for example, Class diagrams, Code Engineering and Data Models
- **Component View** - to contain, for example, Component diagrams
- **Deployment View** - to contain, for example, Deployment diagrams
- **Simple View** - to customize your own type of view

You can work within the first five standard View types, or devise your own type based on the Simple View. You can create Views, rename them, move them into a different order or delete them, by right-clicking on the selected View and choosing the appropriate context menu option.

### Learn more

- [Deployment Diagrams](#) <sup>[1191]</sup>
- [Add Views](#) <sup>[770]</sup>
- [Rename Views](#) <sup>[771]</sup>
- [Delete Views](#) <sup>[771]</sup>

### 5.3.1 Add Views

This example shows a customized view called *Java Code View*, which has been **added** to the end of the Views list.

**Access** [Project Browser root node context menu | Add | New View](#)

#### Create a View

Field/Option/Button	Action	See also
<b>Name</b>	Type the name of the View (in the example, this is <b>Java Code View</b> ).	
<b>Set View Icon Style</b>	Click on the appropriate radio button to set the icon to display next to the View name (the Java Code View has a <b>Class</b> icon).	
<b>Add to Version Control</b>	If the model root node is under version control, this checkbox displays, defaulted to selected.  If you do not want the new View to also be under version control, deselect the checkbox.	<a href="#">Version Control</a> <sup>[383]</sup>
<b>OK</b>	Click on this button to add the View to the Project Browser.	

#### Learn more

- [Views](#) <sup>[769]</sup>
- [Rename Views](#) <sup>[771]</sup>
- [Delete Views](#) <sup>[771]</sup>

### 5.3.2 Rename Views

If you decide to **change the name** of a View, you can do so very easily.

#### Rename a view

Step	Action	See also
1	Right-click on the View in the Project Browser, and select the <b>Properties</b> context menu option.  The Package Properties dialog displays.	
2	In the <b>Name</b> field, type the new name and click on the <b>OK</b> button.	

#### Learn more

- [Views](#) <sup>769</sup>

### 5.3.3 Delete Views

You can use Views as the main divisions of your project, or as temporary holding structures that you **delete** after you have redistributed any content you want to keep.

#### Delete a View

Step	Action	See also
1	In the Project Browser, right-click on the View to delete and select the <b>Delete &lt;viewname&gt;</b> context menu option.  A warning that child elements are to be deleted is displayed.	
2	To delete the View and its contents, click on the <b>Yes</b> button.  To cancel the deletion, click on the <b>No</b> button.	

#### Notes

- If you delete a View, its contents are deleted at the same time; they cannot be restored

#### Learn more

- [Views](#) <sup>769</sup>
- [Move Objects Between Packages](#) <sup>58</sup>

## 5.4 Packages

A **Package** is a container of model components, represented in the Project Browser by a 'folder' icon.

You can perform a number of tasks on Packages, including:

- Open a Package
- Add a Package
- Rename a Package
- Copy a Package
- Drag a Package onto a diagram
- Show or hide a Package
- Delete a Package
- List the elements in a Package, with their properties, in the Package Browser

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you need **Update Element** permission to update or delete a Package

### Learn more

- [Delete a Package](#)<sup>[777]</sup>
- [Package Browser](#)<sup>[673]</sup>
- [Update Element](#)<sup>[329]</sup>

### 5.4.1 Add a Package

Adding a Package to a model is a simple but versatile process. It is possible to add a new Package to a Root Package, View, Model Package, lower-level Package or element. In the process you can automatically:

- Create a child diagram for the Package
- Open the diagram as soon as it is created, and
- Add the Package to the version control system that its parent component is under

**Access** **Project Browser | Right-click on Package | Add a Package ( Ctrl+W )**

#### Add a Package to the model hierarchy

Field/Option/ Button	Instruction	See also
<b>Name</b>	Type in the name of the new Package.	
<b>Automatically add new diagram</b>	Select this checkbox if you want to immediately create a child diagram for the Package.  Otherwise, leave the checkbox unselected.	
<b>Open new diagram</b>	If you have selected to create a new diagram, select this checkbox if you want to open the diagram as soon as the Package and diagram are created.  Otherwise, leave the checkbox unselected.	
<b>Add to Version Control</b>	If you are adding a Package to a parent Package that is under version control, this option displays with the checkbox selected automatically.  If you want to exclude the new Package from version control, deselect it.	<a href="#">Version Control</a> [383]
<b>OK</b>	Click on this button to create the Package in the Project Browser.  The new Package is inserted into the tree at the current location and, if you selected to create a new diagram, the New Diagram dialog displays. Provide a name for the diagram.  If you have selected to put the Package under version control, the Package Control Options dialog displays. Set up the version control details for the Package	<a href="#">New Diagrams</a> [822]  <a href="#">Configure Packages</a> [488]

#### Notes

- You can also add a new Package element by dragging the **Package** icon from the Toolbox into a diagram; in this case the Package is created under the diagram's owning Package, and is created with a default diagram of the same type as that in which the Package is created
- In a multi-user environment, other users do not see the change until they reload their project

#### Learn more

- [Refresh View/Model](#) [308]

### 5.4.2 Open Package in the Project Browser

When you access a model in Enterprise Architect, you can explore the contents of any Package in the Project Browser by clicking on the **white** arrow to the left of the Package name, to expand the Package structure. If the model has a default diagram (which displays automatically when you access the model) the diagram's parent Package is already expanded.

To display the Package's properties, double-click on the Package name; the element's Properties dialog displays.

#### Notes

- Package contents are arranged alphabetically, and elements can be dragged from one Package to another using the computer mouse
- To collapse the Package structure again, click on the **black** arrow to the left of the Package name in the Project Browser

#### Learn more

- [The Project Browser](#)<sup>[646]</sup>
- [Set the Default Diagram](#)<sup>[844]</sup>
- [Properties Dialog](#)<sup>[956]</sup>

### 5.4.3 Rename a Package

If you want to correct or change a Package name, it is very simple to do so using the Properties dialog for the Package.

**Access**    **Project Browser | Right-click on Package | Properties**

#### Rename a Package

Step	Instruction	See also
1	In the <b>Name</b> field, type the new name.	
2	Click on the <b>OK</b> button.	

#### Notes

- Alternatively, highlight the Package to rename, and press **F2**
- In a multi-user environment, other users do not see the change until they reload their project

#### Learn more

- [Refresh View/Model](#)<sup>[308]</sup>

### 5.4.4 Copy a Package

In developing your model, you might want to duplicate the structure and organization of a section so that, for example, you can replicate that part of the model in another model, or make it easier to cross-refer the contents of duplicate sections. You can quickly do this by copying a complete Package, including its child Packages, elements and diagrams, and then pasting it under:

- The same parent Package
- One or more other Packages in the same model or project, or
- One or more other Packages in another model or project

You would tend to use this procedure for copying sections of a model within the project rather than reproducing an entire model or project, although copying these larger structures is equally feasible.

#### Duplicate a Package

Action	Detail	See also
<b>Copy the Package</b>	<p>In the Project Browser, right-click on the Package and select the <b>Copy / Paste   Copy Package to Clipboard</b> context menu option (or click on the Package and press <b>Ctrl+C</b>).</p> <p>The Copy Package to Clipboard dialog briefly displays until the copy operation completes.</p>	
<b>Paste the Package</b>	<p>In the Project Browser, right-click on the target Package into which to paste the copied Package, and select the <b>Copy / Paste   Paste Package from Clipboard</b> context menu option (or click on the Package and press <b>Ctrl+V</b>).</p> <p>The Paste Package from Clipboard dialog briefly displays until the paste operation completes.</p> <p>In the Project Browser, the target Package is expanded to show the pasted Package; if you are pasting the Package within the same model as the copied source, the source parent Package is also collapsed.</p> <p>If the target Package already contains:</p> <ul style="list-style-type: none"> <li>• A Package with the same name as the pasted Package, the pasted Package name has the suffix - <b>Copy</b></li> <li>• A Package with the same name as the pasted Package <b>including</b> the - <b>Copy</b> suffix, the suffix becomes - <b>Copy1</b> (or - <b>Copy2</b>, - <b>Copy3</b> and so on, as copies of the Package accumulate in the target parent Package)</li> </ul> <p>You can keep the same Package name as the source, or you can rename the Package by either:</p> <ul style="list-style-type: none"> <li>• Clicking twice on it and editing the name in the Project Browser, or</li> <li>• Double-clicking on it and editing the name in the Properties dialog</li> </ul>	

**Notes**

- A copy of a Package does not have the external cross references of the source Package; that is, the following connectors are discarded:
  - Connectors coming from Packages and elements outside the Package being copied, into the Package being copied
  - Connectors going to Packages and elements outside the Package being copied, from the Package being copied
- You cannot paste a Package into a parent Package that is locked by another user or that is checked in; the **Paste...** option is grayed out in the context menu
- This procedure is effectively the same as exporting and importing the Package XML file, with the **Strip GUIDs** checkbox selected
- The paste operation can be a single transaction or a series of transactions to paste each data item separately, depending on the setting of the **Import using single transaction** checkbox in the XML Specifications page of the Options dialog
- You can also **move** a Package to a **different part of the model**, in the same way as moving an element

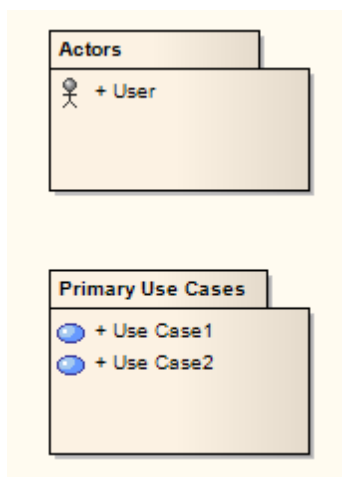

**Learn more**

- [Package XML files](#) <sup>[506]</sup>

- [Checking In/Checking Out Packages](#) <sup>[422]</sup>
- [Move Elements Between Packages](#) <sup>[913]</sup>

**5.4.5 Drag a Package Onto a Diagram**

You can drag a Package element from the Project Browser onto the current diagram, to show an icon of the Package containing a list of the Package contents. This is a useful feature to help organize the display and documentation of models.

In this illustration, note the child Actor and Use Case icons.

Learn more

- [Show or Hide Package Contents](#)<sup>[777]</sup>

### 5.4.5.1 Show or Hide Package Contents

If you have Package elements displayed in an open diagram, you can toggle between showing the Package contents within the elements, or leaving them clear.

**Access**    **Diagram | Properties > Elements**

Step	Instruction	See also
1	Select the <b>Package Contents</b> checkbox to list the content of each Package within its element.  Clear the <b>Package Contents</b> checkbox to hide the content of each Package within its element.	
2	Click on the <b>OK</b> button.	

### 5.4.6 Delete a Package

If you do not want to keep a particular Package in the model, it is very simple to remove it.

**Access**    **Project Browser | Right-click on Package | Delete '<package name>'**

A prompt displays to confirm the deletion; click on the **Yes** button.

Notes

- Alternatively, click on the Package name and press **Ctrl+Delete**
- Deleting a Package also deletes all contents of the Package, including sub-Packages and elements; make very sure that you really want to do this before proceeding
- In a multi-user environment, other users do not see the change until they reload their project

Learn more

- [Refresh View/Model](#)<sup>[308]</sup>

## 5.5 Diagrams

**Diagrams** are collections of project elements laid out and inter-connected to depict a structure or process.

Enterprise Architect supports all of the UML-defined diagrams, as well as several custom extensions. Together with the Enterprise Architect elements and connectors, these form the basis of the model. Diagrams are stored in Packages and can have a parent object (optional). Diagrams can be moved from Package to Package.

### Notes

- If the diagram display is too small to read comfortably, click on the diagram, press and hold ( **Ctrl** ) and use the mouse wheel to temporarily expand or reduce the display magnification

### Learn more

- [Diagram Tasks](#) <sup>[820]</sup>

### 5.5.1 Diagram Context Menu

You can perform a wide range of tasks and operations on a diagram and its contents. To access and initiate these operations, you can select options from the **diagram context menu**.

**Access**    **Open diagram | Right-click on diagram background**

### Options

Option	Action	Shortcut	See also
<b>Extensions</b>	<p>Select this option to access a submenu of enabled Technologies on the system (for example, ArcGIS or TOGAF), each of which provides options for performing technology-specific operations on the diagram.</p> <p>This option is available in the Professional, Corporate and Extended editions of Enterprise Architect.</p>		<a href="#">Domain Based Models</a> <sup>[1789]</sup>
<b>Scripts</b>	<p>Select this option to list the <b>scripts</b> available for execution directly from the diagram.</p> <p>The option is not listed if there are no diagram scripts available.</p>		<a href="#">Script Group Properties</a> <sup>[2794]</sup>

Option	Action	Shortcut	See also
<b>Properties</b>	Select this option to display and/or edit the diagram <b>properties</b> , using the Diagram Properties dialog.		<a href="#">Diagram Properties</a> <sup>[823]</sup>
<b>New Element or Connector</b>	Select this option to <b>add an element or connector</b> to the diagram, by selection from a context-sensitive list.		<a href="#">Insert Elements &amp; Connectors</a> <sup>[782]</sup>
<b>Insert Other Element</b>	Select this option to <b>locate an existing element</b> using the Select Element dialog, and insert it into the diagram as a linked element.		<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Synchronize Structural Elements</b>	Select this option to show, on a SysML <b>Internal Block diagram</b> , all structural elements (such as Ports and Parts) relating to the Block that owns this diagram.  This command will also generate Properties defined by existing Association connectors.		<a href="#">Generate Properties From Block Associations</a> <sup>[2304]</sup>
<b>Hide Diagram Frame</b> <b>Show Diagram Frame</b>	On a SysML <b>Internal Block diagram</b> , the elements are automatically enclosed in a <b>Diagram Frame</b> having the name of the Block element that owns the diagram.  Click on these options to hide and redisplay this Diagram Frame.		
<b>Advanced</b>	Select this option to access the options for more advanced operations, such as comparing the diagram to a baseline or creating a working set artifact.		<a href="#">Advanced Diagram Submenu</a> <sup>[783]</sup>
<b>Paste Element(s) as Link</b> <b>Paste Element(s) as New</b>	Select this option to <b>paste copied element(s)</b> into the diagram as a link or as new elements.		<a href="#">Paste copied element</a> <sup>[836]</sup>
<b>Paste Image from Clipboard</b>	Select this option to <b>paste an image</b> held on the clipboard into the diagram.	<b>Ctrl+Shift+ Insert</b>	<a href="#">Paste an image</a> <sup>[82]</sup>
<b>Switch to List View</b>	Select this option to display the diagram contents as a <b>Diagram List</b> instead of as a pictorial diagram.		<a href="#">Diagram List</a> <sup>[684]</sup>
<b>Switch to Gantt</b>	Select this option to display the diagram contents		<a href="#">The Gantt View</a> <sup>[594]</sup>

Option	Action	Shortcut	See also
<b>View</b>	as a <b>Gantt chart</b> instead of as a pictorial diagram.		
<b>Statechart Editor</b>	For a State Machine diagram, select this option to switch the current format of the diagram to: <ul style="list-style-type: none"> <li>• <b>Diagram</b></li> <li>• <b>Table (State-Next State)</b></li> <li>• <b>Table (State-Trigger)</b> or</li> <li>• <b>Table (Trigger-State)</b></li> </ul>		<a href="#">State Machine Table</a> <sup>[1212]</sup>
<b>Swimlanes, Matrix and Kanban</b>	Select this option to add or modify <b>Swimlanes</b> or a <b>Swimlanes Matrix</b> on the diagram, or apply the <b>Kanban</b> facilities.		<a href="#">Swimlanes</a> <sup>[852]</sup> <a href="#">Swimlanes Matrix</a> <sup>[854]</sup> <a href="#">Kanban Facilities</a> <sup>[857]</sup>
<b>Context Filtering</b>	Select this option to toggle <b>context filtering</b> within the diagram view. By default, this will highlight the currently selected element and related elements within the diagram while making all other elements appear faded into the background.  Context Filtering by name or alias can also be applied using the Format Toolbar.		<a href="#">Context Filter a Diagram</a> <sup>[789]</sup>  <a href="#">Format Toolbar</a> <sup>[785]</sup>
<b>Make all Elements Selectable</b>	Select this option to make all the elements on the diagram <b>selectable</b> .  If an element is: <ul style="list-style-type: none"> <li>• Selectable, you can move it around the diagram and perform right-click context-menu operations</li> <li>• Unselectable, you cannot move it around the diagram and the only right-click operation available is to make the element selectable</li> </ul> This option has no effect on double-click operations on the element, such as displaying child diagrams.		
<b>Modify Element Z Order</b>	Select this option to <b>re-sequence overlapping objects</b> in the diagram.  This option both: <ul style="list-style-type: none"> <li>• Numbers the objects in the diagram by Z-order, in red, and</li> </ul>		<a href="#">Z Order Elements</a> <sup>[844]</sup>

Option	Action	Shortcut	See also
	<ul style="list-style-type: none"> <li>Lists the objects by Z-order in the <b>Modify Z Order</b> dialog</li> </ul> <p>In the dialog, you select the required object and move it up or down in the Z-order using the <b>Up</b> and <b>Down</b> arrow keys, each click on an arrow key changes the Z-order by 1.</p> <p>When you select the object in the list, that object is also selected on the diagram and its Z-order number is shown in blue.</p> <p>Click on the <b>OK</b> button to save your changes.</p> <p>On the diagram, you can move the focus from element to element according to Z Order, by pressing <b>Shift+Tab</b>. Each time you press these keys, the element with the next-lowest Z Order number is selected.</p>		
<b>Lock Diagram</b>	<p>Select this option to lock the <b>diagram</b> to protect it from inadvertent changes.</p> <p>This does not apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions if security is enabled, in which case you lock the model <b>elements</b>.</p>		<a href="#">Lock a Diagram</a> <sup>[872]</sup>  <a href="#">Lock Model Elements</a> <sup>[336]</sup>
<b>Find in Project Browser</b>	Select this option to <b>locate</b> the current diagram in the <b>Project Browser</b> .	<b>Shift+Alt+G</b>	
<b>Import from source file(s)</b>	Select this option to import, or <b>reverse engineer, source code</b> (the option is not available in the Desktop edition).		<a href="#">Import, or reverse engineer, source code</a> <sup>[2138]</sup>
<b>Import DB schema from ODBC</b>	Select this option to import <b>database tables</b> from an ODBC data source (the option is not available in the Desktop edition).		<a href="#">Import database tables from an ODBC data source</a> <sup>[2376]</sup>
<b>Save Current Changes</b>	Select this option to <b>save any changes</b> to the current diagram.	<b>Ctrl+S</b>	
<b>Execute Simulation</b>	<p>Select this option to list and select from three further options for performing a model simulation on a behavioral diagram:</p> <ul style="list-style-type: none"> <li><b>Interpreted simulation</b> - Perform dynamic execution of a simulation (Corporate and Extended Editions)</li> <li><b>Manual simulation</b> - Step through a</li> </ul>		<a href="#">Model Simulation</a> <sup>[2463]</sup> <a href="#">How It Works</a> <sup>[2466]</sup>  <a href="#">Set Up Simulation</a>

Option	Action	Shortcut	See also
	simulation manually (the only option available in the Professional edition) <ul style="list-style-type: none"> <li>• <b>Using Script</b> - If simulation scripts exist for the diagram, list the scripts available; if no scripts exist, the option does not display</li> </ul>		<a href="#">Script</a> <sup>[2472]</sup>
<b>Help</b>	Select this option to view the Help on the this type of diagram.		

#### Notes

- Not all the menu options described appear on the context menu of every diagram

### 5.5.1.1 *Insert Elements and Connectors*

When you click on the **Diagram | New Element or Connector** context menu option, a list of elements and connectors displays. This is the **Toolbox Shortcut** menu.

#### Structure

The Toolbox Shortcut menu is divided into sections:

- **Other** - expands to offer options to select elements and connectors from diagram types other than either the current diagram type or pinned Toolbox pages
- The expanded list of elements and connectors for the current diagram type
- Collapsed lists of elements and connectors for pages that have been pinned in the Toolbox; if an MDG Technology:
  - is active
  - automatically pins Toolbox pages, and
  - has pages that redefine UML or Extended pages

The MDG Technology pages override the UML or Extended pages, which are not shown

- At the end:
  - **Common** - expands to display a list of the common elements and connectors, and
  - **Artifact** - Expands to display a list of the different types of Artifact element you can create

#### Notes

- The list of elements and connectors also displays on the diagram if you press **Ctrl** or **Shift** as you right-click the mouse, or if you press **Spacebar** or **Insert** while the cursor is on the diagram

#### Learn more

- [Toolbox Shortcut Menu](#)<sup>[799]</sup>

- [Common Page](#)<sup>[800]</sup>
- [Artifact](#)<sup>[1358]</sup>

### 5.5.1.2 Advanced Diagram Submenu

You can perform a number of advanced tasks and operations on a diagram and its contents. To access and initiate these operations, you can select options from the **Advanced diagram submenu**.

**Access**    **Open diagram | Right-click on diagram background | Advanced**

#### Options

Option	Action	Shortcut	See also
<b>Compare Diagram to Baseline</b>	Select this option to perform a comparison of the diagram <b>layout</b> against a version from a previously saved baseline.  This option can be used to roll back individual changes made to the diagram since the baseline was created.		<a href="#">Check Visual Changes to Diagrams</a> <sup>[466]</sup> <a href="#">Manage Baselines</a> <sup>[467]</sup>
<b>Save as Profile</b>	Select this option to save the current diagram <b>as a Profile</b> .		<a href="#">Export a Profile</a> <sup>[1523]</sup>
<b>Create Working Set Artifact</b>	Select this option to create a Working Set Artifact on the diagram, to define a Working Set that includes an instruction to open the diagram.		<a href="#">Artifact</a> <sup>[1358]</sup> <a href="#">Working Sets</a> <sup>[567]</sup>
<b>Set Theme</b>	Select this option to set the <b>Theme</b> to apply to all diagrams that you display in the model.  The Options dialog displays, at the <b>Diagram   Themes</b> page.		<a href="#">Diagram Theme Options</a> <sup>[617]</sup>

#### Learn more

- [Diagram Context Menu](#)<sup>[778]</sup>

### 5.5.2 Print Preview

Before you **print** an Enterprise Architect diagram or document, you can display a **preview** of its output appearance.

**Access**    **File | Print Preview**

#### Notes

- The display initially shows the first two pages on one screen, with no scroll bar

- To toggle between the two-page display and a single-page display, click on the  button in the preview screen toolbar; in either mode, you can use the  and  buttons in the toolbar to scroll through the pages of the diagram or document
- To display more than two pages on one screen, up to a maximum of ten pages, click on the  button in the Preview screen toolbar; the screen now includes the vertical scroll bar, which you can also use to scroll through the pages of the diagram
- Having checked the preview, you can immediately print the diagram or document by clicking on the  **Print** button; otherwise click on the **Close** button

### 5.5.3 Diagram View

If you have created diagrams in the Project Browser, you can select to open them and then add elements and connectors to them within the **Diagram View**. This is the main workspace for developing the structure of your model components, dragging new objects onto the diagram from the Diagram Toolbox and existing objects from the Project Browser. You can also add elements and connectors using the Quick Linker and other context menus within the Diagram View, and move, format and edit them.

Most work on elements and connectors is carried out in the Diagram View, so understanding how it works and how to manipulate elements is essential. You can use the **EAExample** project supplied with the system, or your own 'sandpit' models, to explore the capabilities and behavior of the Diagram View.

**Access**    **Project Browser | double-click diagram name**

#### Diagram sections

Section	Description	See also
<b>Caption Bar</b>	<p>Across the top of a diagram is the diagram caption bar, which includes the following:</p> <ul style="list-style-type: none"> <li>• Icon and text label for the diagram type</li> <li>• Diagram name</li> <li>• A 'chevron' icon to display or hide the Format Toolbar (see below)</li> <li>• A drop-down arrow that lists the currently-open diagrams; click on: <ul style="list-style-type: none"> <li>• A diagram name to switch to that diagram</li> <li>• Options to redisplay the hidden Start Page, Model Default diagram (if defined) or User Default diagram (if defined)</li> </ul> </li> <li>• The window 'close cross'; click on this to close the displayed diagram</li> </ul>	<p><a href="#">The Start Page</a><sup>[68]</sup></p> <p><a href="#">Diagram Advanced Menu</a><sup>[95]</sup></p>
<b>Format Toolbar</b>	<p>Underneath the Caption Bar is the Format Toolbar, which you can use to apply a wide range of functions to the format and appearance of the elements in your diagram.</p> <p>You can hide or reveal this toolbar by clicking on the 'chevron' icon in the Caption Bar (third icon from the right).</p>	<p><a href="#">Format Toolbar</a><sup>[785]</sup></p>

Section	Description	See also
<b>Diagram View</b>	<p>The larger area underneath the Caption bar is the work area within which you can create and view the diagram structures. The borders of the printable diagram page are represented by pale broken lines; structures created beyond these borders will print on separate pages.</p> <p>The Diagram View area is also where the diagram and object context menus operate, and where the representation of the model structure can be changed to a Gantt chart or diagram list format.</p>	<p><a href="#">The Gantt View</a><sup>[594]</sup></p> <p><a href="#">Diagram List</a><sup>[684]</sup></p>

### Notes

- Diagrams can contain hyperlinks to other diagrams, which are opened when you click on the links
- It is possible to open several diagrams at once, but **within the Diagram View** you can only **view** one at a time
- You **can** view and work on several diagrams at once, by making the tab containing a diagram into a **floating window**, using the **Window** menu
- You can also work on elements using the **Diagram List**
- Additional information on the diagram, or a selected element within the diagram, is displayed in the system **Status bar**

#### 5.5.3.1 Format Toolbar

As you add elements and connectors to a diagram, you might want to group or differentiate these objects by adjusting their appearance or position on the diagram, or by filtering the diagram to show only certain elements. You can make a number of changes to an element's appearance and then capture these changes as a named style, which you can then apply to other elements on the same diagram or on a different diagram. All of these options are available through the diagram **Format Toolbar**, which automatically displays at the top of every diagram.

You can hide or recover this toolbar by clicking on the or icons in the **Caption Bar** at the top of the Diagram View.

You can also temporarily display an abbreviated Format Toolbar beside an element or connector. For:

- Elements, select one or more elements on the diagram and click on the paintbrush icon beside the element (and, for multiple selected elements, the icon)
- Connectors, right-click on the connector; the Format Toolbar appears above the context menu

Options

Option	Action	Shortcut	See also
<b>Set Font</b>	Select this icon to set the text font, style, size and effects for the selected element(s) using the Font dialog.		<a href="#">Set Element Font</a> <sup>[949]</sup>
<b>Text Color</b>	Click on the drop-down arrow to set the text color for the selected element(s).  This option overrides the color setting of the <b>Set Font</b> option.		
<b>Fill Color</b>	Click on the drop-down arrow to set the fill color of the selected element(s).  This setting takes precedence over all other fill color settings, such as default appearance, Template element appearance, stereotype default color and Shape Script color.  If you set the fill color to <b>Default</b> and the element has a stereotype with a fill color defined, the element takes the stereotype default rather than the Standard Color default.		<a href="#">Stereotype Settings</a> <sup>[1147]</sup>  <a href="#">Standard Colors</a> <sup>[616]</sup>
<b>Line Color</b>	Click on the drop-down arrow to set the line color of the selected connector or the border of the selected element.  This setting overrides any line color set through the element Default Appearance or Connector Appearance dialogs.		
<b>Line Width</b>	Use the 'spinner' arrows to set the line width of the selected connector or the border of the selected element; choose a value between <b>1</b> (thinnest) and <b>5</b> (thickest).		
<b>Apply Style</b>	Click on this icon to apply a style to the selected elements or connector.  The style is either: <ul style="list-style-type: none"> <li>• Captured using the <b>Get Style</b> option (see below) or</li> <li>• The style currently displayed in the <b>Style List</b> field (see below)</li> </ul>		
<b>Get Style</b>	Select this icon to capture the current style of the selected element or connector.		
<b>Style List</b>	Click on the drop-down arrow and select a style from the list, to immediately apply to the selected elements or		

	connector.  To save a style to this list, use the <b>Save Style</b> option (below).		
<b>Save Style</b>	<p>Having selected an element or connector, click on the down arrow and select the appropriate option:</p> <ul style="list-style-type: none"> <li>• <b>Save as New Style</b> - save the style of the element or connector to the <b>Style List</b> as a new style; type the name of the style when prompted to do so</li> <li>• <b>Save Style</b> - save the (updated) style of the selected element or connector under its current style name in the <b>Style List</b></li> <li>• <b>Refresh List</b> - refresh the <b>Style List</b> with any changes to the existing styles</li> <li>• <b>Delete Current Style</b> - delete the defined style of the selected element or connector from the <b>Style List</b></li> </ul>		
<b>Align Left</b>	<p>(Activated when multiple elements are selected.)</p> <p>Click on this icon to align the selected elements on the left border of the last-selected element.</p>	<b>Ctrl+Alt+Left Arrow</b>	
<b>Align Right</b>	<p>(Activated when multiple elements are selected.)</p> <p>Click on this icon to align the selected elements on the right border border of the last-selected element.</p>	<b>Ctrl+Alt+Right Arrow</b>	
<b>Align Tops</b>	<p>(Activated when multiple elements are selected.)</p> <p>Click on this icon to align the selected elements on the top edge of the last-selected element.</p>	<b>Ctrl+Alt+Up Arrow</b>	
<b>Align Bottoms</b>	<p>(Activated when multiple elements are selected.)</p> <p>Click on this icon to align the selected elements on the bottom edge of the last-selected element.</p>	<b>Ctrl+Alt+Down Arrow</b>	
<b>Bring to Top</b>	Click on this icon to move the selected element(s) in front of other elements; that is, to the top of the Z order.		<a href="#">Diagram Context Menu</a> [778]
<b>Send To Back</b>	Click on this icon to move the selected element(s) behind other elements; that is, to the bottom of the Z order.		
<b>Layout Diagram</b>	<p>Click on the drop-down arrow and select a layout to auto-layout the diagram in that arrangement.</p> <p>You can also filter a standard layout to arrange the elements according to a selected characteristic. To do this, click on the <b>Configure Layouts</b> option in the drop-down list.</p>		<a href="#">Layout Diagrams</a> [874]

<b>Diagram Properties</b>	Click on this icon to display the Diagram Properties dialog for the diagram.	<b>F5</b>	<a href="#">Set Diagram Properties</a> [823]
<b>Delete Selected</b>	Click on this icon to delete the selected element(s).	<b>Ctrl+D</b>	
<b>Filter diagram elements by Name</b>  <b>Context Filter</b>	<p>Use this field and icon to filter the elements in the diagram simply according to name or alias. (A more comprehensive diagram filtering facility is also available, through the Diagram Filters window.)</p> <p>To activate the field, click on the <b>Context Filter</b> icon. If this icon is not selected, the field remains grayed out. If you:</p> <ul style="list-style-type: none"> <li>Do not type any text in the field, you can filter the diagram to show all elements related to a selected element</li> <li>Type text, the diagram is filtered according to the text and settings as described below</li> </ul> <p>Type the first few characters or all of the text string that forms the name of the elements to show normally. All elements that do not have names that match this string are grayed out.</p> <p>For example, if you type <b>REQ</b>, all elements with a name beginning with REQ are visible, whilst all other elements are grayed out.</p> <p>By typing in the full name of an element, you can mute everything on the diagram except that one element, thereby showing exactly where it is on the diagram.</p> <p>The filter <b>also</b> searches on aliases if the <b>Use Alias if Available</b> option is set on the diagram properties Diagram tab. If the <b>Alias only</b> option is set on the Options &gt; Diagram Behavior page, the filter is on the alias text <b>instead of</b> the name, and if the <b>Alias and Name</b> option is set, the filter shows elements that have the text string in <b>either</b> the alias <b>or</b> name.</p>		<a href="#">Diagram Filters</a> [718]  <a href="#">Context Filter a Diagram</a> [789]  <a href="#">Configure Diagram Display</a> [825]  <a href="#">(Diagram) Behavior</a> [625]
<b>Add or Remove Buttons</b>	<p>Click on the drop-down arrow at the far right of the toolbar to:</p> <ul style="list-style-type: none"> <li>Display or hide icons currently defined for the toolbar, or</li> <li>Customize the toolbar to include other icons, to initiate commands found on other toolbars or totally new commands</li> </ul> <p>(As an example, ten options on the Format toolbar are also found on the Diagram toolbar, which contains other options that could be duplicated here).</p>		<a href="#">The Customize Dialog</a> [152]  <a href="#">Diagram Toolbar</a> [138]

### Notes

- To set the global appearance of all elements throughout a model, use the Options dialog; select the **Tools | Options** menu option, then select **Standard Colors** and **Diagram | Appearance** from the options tree
- To override the global appearance and define a default appearance of a selected element (or several selected elements) on all diagrams on which it occurs, set the Default Appearance for that element; right-click the element and choose the **Appearance | Default Appearance** context menu option

### Learn more

- [Diagram Appearance Options](#)<sup>[622]</sup>
- [Set An Element's Default Appearance](#)<sup>[927]</sup>

## 5.5.3.2 Context Filter a Diagram

As you review a modeling diagram, it is possible to click on any element on the diagram and show only those elements that are directly related to the selected element. All other elements are grayed out until you click on the diagram background.

**Access** **Right-click diagram background | Context Filtering**  
**Diagram Filters window | right-click background | Context Filtering, or**  
**Diagram Format Toolbar | Context Filter icon**

### Notes

- When you set the option and click on an element, any elements on the diagram that are **not** directly related to the selected element are grayed out
- Setting the context filter applies to all diagrams that are open; you can select an element on each opened (floating) diagram and examine their relationships together
- To clear the filtering (but not turn Context Filtering off) press **Esc**
- To select the next element in a direct **chain** or **group** of relationships on a diagram, press the **Tab** key; the **Tab** key does not take you out of the element group
- To select the next element on the diagram, and display **that** element's related elements, use the **arrow** keys to move up, down, left or right to the next element in that direction; when moving left or right, the selection tends to be upwards rather than downwards
- When you enable the option on the diagram background or Diagram Filters window, it overrides the Diagram Filters settings; to use the Diagram Filters again, toggle the **Context Filter** menu option off
- When you enable the option using the diagram Format Toolbar, it activates the **Filter Diagram elements by Name** field; if you type text in that field the diagram is filtered according to the text value, but if you leave the field blank the diagram can be filtered according to the relationships of each selected element
- Context Filtering can be made even more useful by highlighting the incoming and outgoing relationships in different colors, by pressing and holding the **L** key on the selected element

- [Diagram Filters](#)<sup>[718]</sup>
- [Connect Elements](#)<sup>[1109]</sup>

### 5.5.4 Diagram Tabs

*Diagram tabs* indicate which diagrams and views (such as the Start Page, document reports, code editors, the Model Search and the Relationship Matrix) are currently open in the work area, by showing the view name and icon. The currently displayed view is indicated by the diagram name being in bold, and an asterisk against the tab name indicates that the diagram or view contains unsaved changes.

You open the view that you want by clicking on its tab, and you can select options for saving, reloading, moving and closing the views from the tab context menu. You can also review the tabs and select one using the View Tab Switcher window. The tabs are located, by default, at the bottom of the Diagram View; if you prefer, you can move them to the top of the Diagram View, above the Status Bar, using the General Settings page of the Options dialog.

**Access** Open a diagram or view

#### Diagram tabs context menu options

Option	Usage	See also
<b>Save Changes to '&lt;tab name&gt;'</b>	Save the changes made to the diagram or view.	
<b>Save All</b>	Save the model.	
<b>Reload '&lt;tab name&gt;'</b>	Reopen the diagram or view without the unsaved changes; that is, revert to the state before any changes were made.  Refresh the diagram or view from the repository, to show any changes made by other users in a shared model.	<a href="#">Refresh the diagram</a> <sup>[308]</sup>
<b>Float</b>	Converts the diagram or view into a floating window that you can move around your screen(s).  An alternative is to simply click on the selected tab and drag it off the Diagram Tabs row.  You could use this option to display and work on several diagrams at the same time.  To restore a floating view to a tab in the Diagram View, right-click on its Caption Bar and select the <b>Tabbed Document</b> option.	<a href="#">Window Menu</a> <sup>[121]</sup>
<b>Close '&lt;tab name&gt;'</b>	Close the selected diagram or view; Enterprise Architect prompts you to save any changes.  You can also close the tab by clicking the <i>middle</i> mouse button/ scroller.	
<b>Close All</b>	Close all open diagrams and views; Enterprise Architect prompts you to save any unsaved changes.	

Option	Usage	See also
<b>Close All Except '&lt;tab name&gt;'</b>	Close all diagrams and views except for '<tab name>'; Enterprise Architect prompts you to save any unsaved changes.	
<b>Close All &lt;view type&gt;</b>	(Where several views of the same type can be opened at the same time, such as diagrams, report documents, or text editors.)  Close all views of the same type as the selected tab, leaving views of other types still open.	
<b>Hide</b>	(Start Page only) Hide the Start Page.  To redisplay the Start Page, use the drop-down menu at the top right of the Diagram View, or select the <b>Window   Show Start Page</b> menu option.	

**Notes**

- The only context menu option available for the Start Page tab is the **Hide** option
- You can change the sequence of tabs by clicking on each tab and dragging it to a different position, as required; however, you cannot change the position of the Start Page tab - when displayed, it always sits at the left-hand end of the sequence

**Learn more**

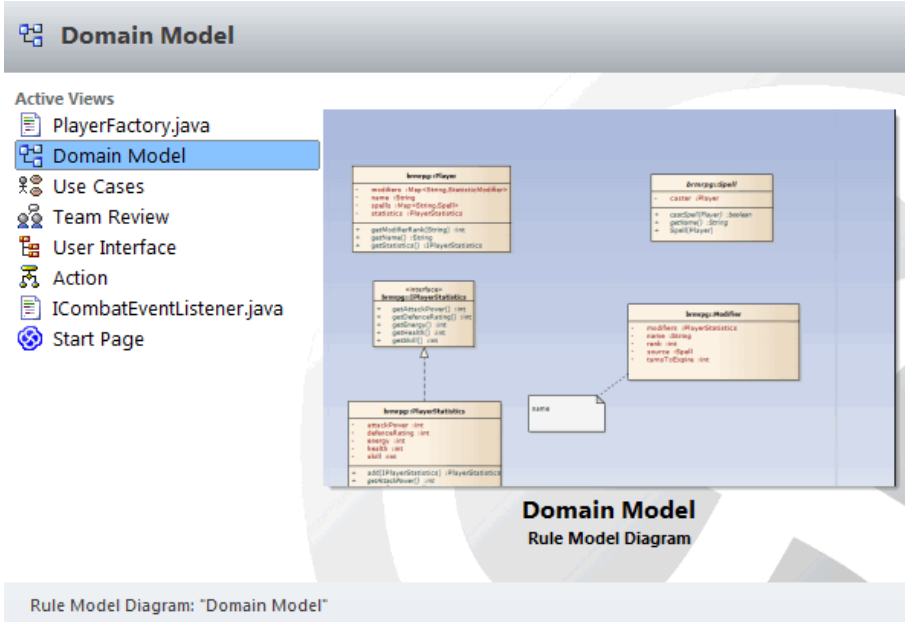

- [View Tab Switcher](#)<sup>[79]</sup>
- [General Options](#)<sup>[60]</sup>

**5.5.4.1 Switch Between Views**

When there are a number of open views available in the Diagram View (such as separate diagrams, editors and the Model Search screen), you can review them and switch between them using the **View Tab Switcher**.

**Access** Click on a view tab, press and hold ( **Ctrl** ) and press ( **Tab** )

**Switching between views**

Action	Detail	See also
<b>Selecting a different view</b>	 <p>The View Tab Switcher lists the currently open views, in order of most recently activated to least recently activated; the selection cursor is on the name of the view that was activated just before the currently active one.</p> <p>Details of the selected view are displayed on the right hand side of the screen, and include:</p> <ul style="list-style-type: none"> <li>• A preview thumbnail of the view, and</li> <li>• A description of the view and its contents</li> </ul> <p>Continue holding the ( <b>Ctrl</b> ) key to keep the window open; to move the selection cursor:</p> <ul style="list-style-type: none"> <li>• Down the list of views, press the ( <b>Tab</b> ) key</li> <li>• Up the list, press the ( <b>Shift+Tab</b> ) keys</li> </ul> <p>Alternatively, use the arrow keys.</p>	
<b>Activating a view</b>	<p>To activate a view in the Diagram View, either release the ( <b>Ctrl</b> ) key or press the ( <b>Enter</b> ) key; alternatively, click the left mouse button on the required view.</p> <p>Activating a view moves it to the top of the <b>Active Views</b> list, whereas closing a view removes it from the list completely.</p>	

### 5.5.5 Diagram Toolbox

The **Diagram Toolbox** is a panel of icons that you use to create elements and connectors on a diagram.

Within the Toolbox, related elements and connectors are organized into pages, each page containing the elements or connectors used for a particular type of diagram. The diagrams include standard UML diagrams, Enterprise Architect Extended diagrams, and diagrams customized for any MDG Technologies

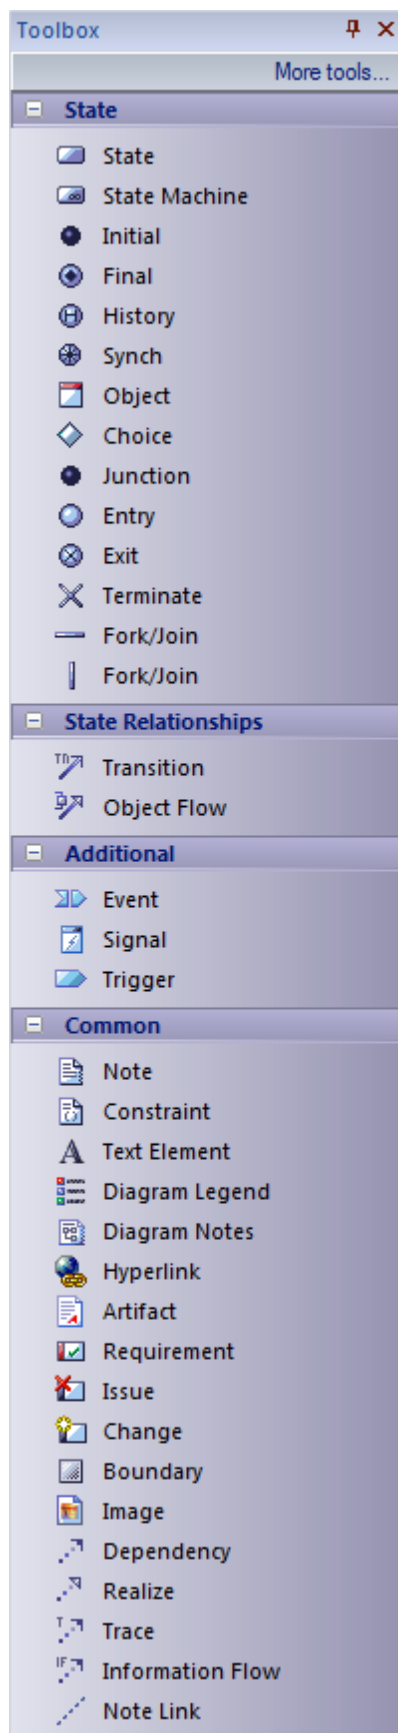

and Profiles that you have added to Enterprise Architect.

When you open a diagram, the Toolbox automatically provides the element and relationship pages corresponding to the diagram type. This does not prevent you using elements and connectors from other pages in a given diagram, though some combinations might not represent valid UML.

**Access** **Diagram | Diagram Toolbox ( Alt+5 )**

**Example**

Options

Option	Detail	See also
<b>Display specific pages</b>	<p>To display specific pages in the Toolbox, click on the <b>More Tools</b> button at the top of the Toolbox and select the appropriate UML, Extended or customized diagram type from the menu.</p> <p>In most cases, three pages display:</p> <ul style="list-style-type: none"> <li>• &lt;type&gt; elements</li> <li>• &lt;type&gt; Relationships and</li> <li>• Common</li> </ul> <p>If you select the &lt;default&gt; option, you display only the Common page.</p>	
<b>Customize the Toolbox</b>	You can customize the Toolbox display by pinning pages within the Toolbox, or by adding MDG Technologies and UML Profiles to the Toolbox.	<a href="#">Toolbox Appearance Options</a> <sup>[797]</sup> <a href="#">MDG Technologies</a> <sup>[1477]</sup> <a href="#">Using UML Profiles</a> <sup>[1472]</sup>

Create elements and connectors from the Toolbox

Step	Instruction	See also
<b>1</b>	<p>In the Project Browser, double-click on the icon against the required diagram.</p> <p>The diagram opens with the appropriate Toolbox pages for that diagram type.</p> <p>If you want a different set of elements and connectors, click on <b>More tools</b> and select the appropriate diagram type as explained above.</p>	
<b>2</b>	Click on the required item; for example, the Class element or Associate relationship.	
<b>3</b>	For element items, click anywhere on the diagram to place the new element.	
<b>4</b>	<p>For connector items, drag the cursor between the source and target elements on the diagram; the solid border of the elements changes to a hatched border as you pass the cursor over them, indicating the source and potential target elements.</p> <p>To add bends to the connector, press ( <b>Shift</b> ) as you change the drag direction of the cursor.</p>	<a href="#">Quick-linker</a> <sup>[897]</sup>

Step	Instruction	See also
	Alternatively, drag from the source element to an empty area of the diagram; the Quick-linker enables you to create the target element.	
5	Edit the element properties or connector properties, as required.	<a href="#">Properties Dialog</a> <sup>[956]</sup> <a href="#">Connector Properties</a> <sup>[1126]</sup>

### Notes

- Dropping a Package element from the Toolbox into a diagram creates a new Package in the Project Browser, and a default diagram of the same type as the current diagram
- If you are creating several elements of one type, after creating the first just press **(Shift+F3)** or **(Ctrl) + click** to create the next element of that type; for connectors, click on the source element and press **(F3)** to create another connector of the same type
- You can change an unstereotyped element to one of its stereotyped elements by dragging the stereotyped element from the Toolbox onto the unstereotyped element in the diagram; for example, you can stereotype a Class by dragging a Table element or a Profiled Class element onto it
- As you drag the stereotyped element, you can press **(Ctrl)** to apply the element stereotype to the unstereotyped element, or **(Shift)** to add the stereotyped element as a new element; otherwise a small context menu displays offering these actions as options
- If the diagram element already has the stereotype, you can also drag the Toolbox element onto it to synchronize the element's stereotype Tagged Values
- The Toolbox can be docked on either side of the diagram, or free floated on top of the diagram to expose more surface for editing
- You can also hide and show the whole Toolbox using the  **(Show Element Toolbox)** button on the Workspace Views toolbar
- Enterprise Architect provides Toolbox pages for a wide range of MDG Technologies, such as ArchiMate, BPEL, BPMN, Data Flow Diagrams, ICONIX and Mind Mapping, as part of the initial install

### Learn more

- [BPEL](#) <sup>[1870]</sup>
- [BPMN](#) <sup>[1845]</sup>
- [Data Flow Diagrams](#) <sup>[1797]</sup>
- [ICONIX](#) <sup>[2282]</sup>
- [Mind Mapping](#) <sup>[1794]</sup>

### 5.5.5.1 Toolbox Appearance Options

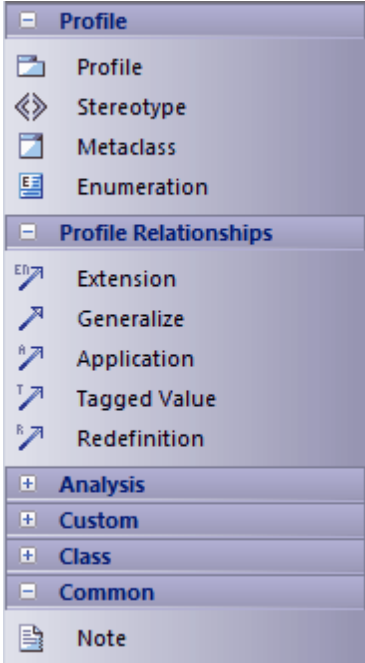

You can modify the appearance of the Diagram Toolbox pages in several ways, through the Toolbox context menu.

**Access** Right-click on the Toolbox page

#### Options

Option	Detail	See also
<b>Hide or Show element or relationship labels</b>	<p>Select the <b>Hide Labels</b> (or <b>Show Labels</b>) context menu option.</p> <p>The icons in the page then 'wrap' within the page, without text labels.</p>  <p>When you hide the labels, you can display the label of an individual element or relationship by moving the cursor over the icon.</p>	
<b>Pinning pages to display all the time</b>	<p>Select the <b>Pin in Toolbox</b> context menu option (not available on the Common page, which displays all the time anyway).</p> <p>For example, if you 'pinned' the Class elements page, and switched to the Communication pages, the Toolbox would include a collapsed Class elements page below the Communication pages.</p> <p>You can also pin a <b>SysML Common</b> page to the Toolbox, simply by making the SysML 1.3 Technology the <b>Active</b> technology for your work login.</p>	<a href="#">SysML Model Elements Toolbox</a> <sup>[2310]</sup>
<b>Unpinning pages</b>	<p>To unpin the page so that it displays only in its own Toolbox group, select the <b>Unpin from Toolbox</b> context menu option.</p>	
<b>Collapsing pages</b>	<p>To collapse a page to just show the heading (&lt;type&gt; elements, &lt;type&gt; Relationships or Common), click on the 'minus' box at the left of the page heading; alternatively, right-click on the page and select the <b>Collapse</b> context menu option.</p> <p>To expand the page again, click on the heading.</p>	

**Tailor Toolbox to list all required pages at once**

Step	Instruction	See also
1	Click on the <b>Set Toolbox Visibility</b> context menu option. The Visible Toolbox Pages dialog displays.	
2	By default, the dialog lists the element pages only, in the order: UML pages, Extended pages, MDG Technology pages.  To include the corresponding relationship pages, select the <b>Show Relationship Pages</b> checkbox at the bottom of the dialog.	
3	For each page to display on the Toolbox, select the <b>Visible</b> checkbox. Deselect the checkbox if you no longer require a page to be displayed.	
4	When you have defined the list of pages to display, click on the <b>OK</b> button. The pages you have selected are pinned to the Toolbox in a collapsed state, underneath the current diagram-type pages.  	
5	To expand a page, click on the heading.  To remove an individual page, expand it, right-click on it, and select the <b>Unpin from Toolbox</b> context menu option.	

#### Notes

- On a Toolbox page for an MDG Technology or UML Profile, if you right-click directly on a profile element

an additional option - **Synchronize Stereotype** - is available at the end of the context menu; this enables you to synchronize the Tagged Values and constraints for all elements created from the selected profile element

- MDG Technologies can impose their own Toolbox page visibility; for example, if ICONIX is the active technology, all six ICONIX pages are automatically exposed in the Toolbox
- If the active Technology pages duplicate UML or Extended pages (as the ICONIX pages do), the pinned Technology pages override and replace the pinned UML and Extended pages; for example, if ICONIX is active and you have pinned the Extended Analysis page, the Analysis page in the list is the *ICONIX-defined page*, not the Extended Analysis page

#### Learn more

- [Synchronize Tags and Constraints](#) 

### 5.5.5.2 Toolbox Shortcut Menu

When you add elements and connectors into a diagram, you can do so using the **Toolbox shortcut menu** instead of employing the full graphical Toolbox. The menu provides options to select:

- Elements specific to the current diagram type
- Relationships specific to the current diagram type
- Elements and relationships from any pages pinned in the Toolbox
- Common elements and relationships
- Elements and connectors for other diagram types

The advantage of using the shortcut menu is that it provides an increased amount of the workspace to be used for diagramming rather than displaying fixed (instead of pop-up) menus.

#### Use the Toolbox shortcut menu

Step	Action	See also
1	Open a diagram.	
2	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the diagram background and press <b>Insert</b> or <b>Spacebar</b></li> <li>• Press and hold <b>Ctrl</b> or <b>Shift</b> and right-click on the diagram background</li> <li>• Right-click on the diagram background and select the <b>New Element or Connector</b> context menu option</li> </ul> <p>The shortcut menu displays, listing the current diagram-type elements and connectors.</p>	
3	If necessary, select the <b>Other</b> option or a pinned Toolbox page option to list elements and connectors for a different diagram type.	
4	Select the element or connector to include in the diagram; the object is added to the diagram.	

Step	Action	See also
	If you select the <b>Other</b> context menu option, the final menu in the sequence offers the <b>Activate &lt;Type&gt; Toolbox</b> option at the top; this opens and activates the corresponding page in the Toolbox, if the Toolbox is visible.	

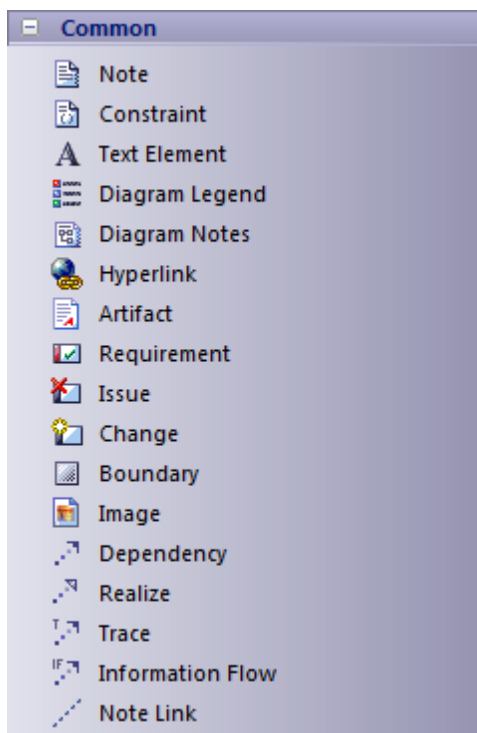

### Notes

- As with the Toolbox itself, if an MDG Technology:
  - Is active
  - Automatically pins Toolbox pages, and
  - Duplicates UML or Extended pages

The pinned Technology pages override and replace the pinned UML or Extended pages in the initial **Toolbox** shortcut menu

### 5.5.5.3 Common Page

The **Common** page of the Diagram Toolbox provides the elements and relationships that can be used on any diagram. It is displayed at the bottom of every other set of pages in the Toolbox.

### Common Elements and Connectors

Click on an icon below for more information on the corresponding element or connector.

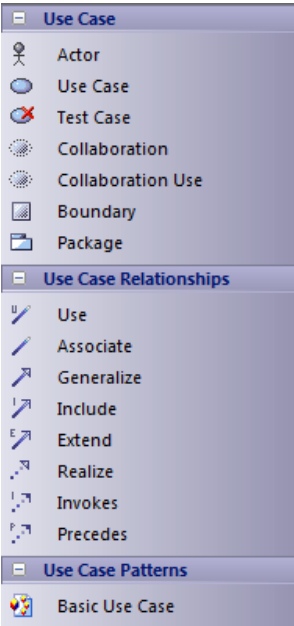

Elements	Connectors
 Note	 Dependency
 Constraint	 Realize

#### 5.5.5.4 Use Case Toolbox

The Use Case Toolbox is used to model the system functionality from the perspective of a **system user**; **Use Case** objects are used to build the Use Case models, which describe the **functionality** of the system to be built, the requirements, the constraints and how the user interacts with the system.

**Sequence diagrams** can be associated with Use Cases to capture work flow and system behavior.

**Use Case Toolbox pages**

Image	Detail	See also
	<p>A system user is called an <b>Actor</b> and is drawn as a stick figure, although this could represent another computer system or similar.</p> <p>A <b>Use Case</b> element defines a discrete piece of functionality the system provides for the user to either perform some piece of work or generate something of value using the system.</p> <p>Examples of Use Cases are: login, open account, transfer funds, check balance and logout; each of these implies some purposeful and discrete functionality the system is to provide to a user.</p> <p>A <b>Test Case</b> describes what must be set up in order to test a particular feature.</p> <p>The connectors available include:</p> <ul style="list-style-type: none"> <li>• <b>Associate</b> (an Actor uses a Use Case)</li> <li>• <b>Extend</b> (one Use Case can extend another)</li> <li>• <b>Include</b> (one Use Case can include another) and</li> <li>• <b>Realize</b> (the source Use Case might realize some business requirement)</li> <li>• <b>Invokes</b> (stereotyped <b>Dependency</b> relationship defined by the Open Modeling Language (OML), indicating that Use Case A, at some point, causes Use Case B to happen)</li> <li>• <b>Precedes</b> (stereotyped <b>Dependency</b> relationship defined by the Open Modeling Language (OML), indicating that Use Case C must complete before Use Case D can begin)</li> </ul> <p>The <b>Basic Use Case</b> icon adds the Basic Use Case Pattern to your diagram as a starting point for developing the diagram (drag the icon onto the diagram to open the Add Pattern &lt;name&gt; to Diagram dialog and click on the <b>OK</b> button).</p>	<p><a href="#">Actor</a> <sup>[1284]</sup></p> <p><a href="#">Use Case</a> <sup>[1352]</sup></p> <p><a href="#">Test Case</a> <sup>[2010]</sup></p> <p><a href="#">Add Pattern Dialog</a> <sup>[1469]</sup></p>

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

### Learn more

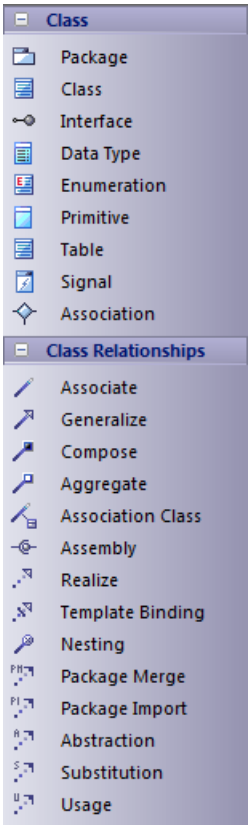

- [Use Case Diagram](#) <sup>[1201]</sup>

### 5.5.5.5 Class Toolbox

The **Class** Toolbox can be used for **Package** diagrams, **Class** diagrams and **Object** diagrams: those diagrams that usually display elements concerned with the **logical** structure of the system, such as Objects, Classes and Interfaces.

Logical models can include **domain** models (high level business driven object model) through to strict development **Class** models (define inheritance, attributes, operations).

#### Class Toolbox pages

Image	Detail	See also
 <p>The screenshot shows the Class Toolbox with two main sections: 'Class' and 'Class Relationships'. The 'Class' section includes icons for Package, Class, Interface, Data Type, Enumeration, Primitive, Table, Signal, and Association. The 'Class Relationships' section includes icons for Associate, Generalize, Compose, Aggregate, Association Class, Assembly, Realize, Template Binding, Nesting, Package Merge, Package Import, Abstraction, Substitution, and Usage.</p>	<p>The Class group is used for creating <b>Class models</b> and <b>Data models</b>.</p> <p>Class modeling uses the <b>Class</b> and <b>Interface</b> elements, with occasional use of the <b>Object</b> element to model Class instances; you can add <b>Association</b> or <b>Aggregation</b> relationships.</p> <p>Use the <b>Table</b> element to insert a stereotyped Class for use in data modeling.</p> <p>A <b>Primitive</b> element can be used to support the Meta-Object Facility (MOF) specification.</p>	<p><a href="#">Data Modeling</a> </p> <p><a href="#">MOF</a> </p>

#### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

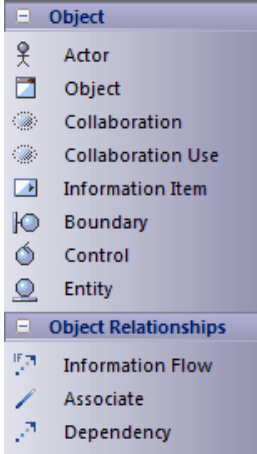

#### Learn more

- [Class Diagrams](#) 
- [Object Diagrams](#) 

### 5.5.5.6 Object Toolbox

The **Object** Toolbox is used to create Object diagrams, which reflect multiplicity and the roles that instantiated Classes could serve. They are useful in creating different cases in which relationships and Classes are applied.

#### Object Toolbox pages

Image	Detail	See also
	<p>The user is called an <b>Actor</b> and is drawn as a stick figure, although this could represent another computer system or similar.</p> <p>An <b>Object</b> is an instance of a <b>Class</b>.</p>	<p><a href="#">Actor</a> <small>[1284]</small></p> <p><a href="#">Object</a> <small>[1379]</small></p>

#### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

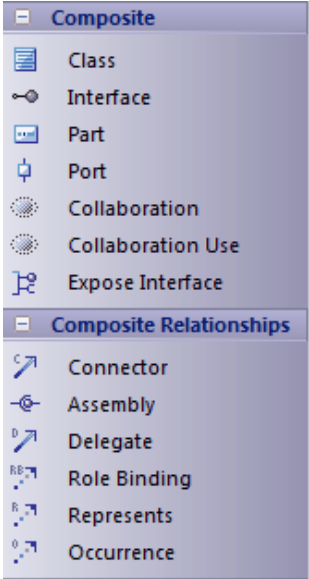

#### Learn more

- [Object Diagrams](#) [1188]

### 5.5.5.7 Composite Toolbox

The **Composite** Toolbox is used to create Composite Structure diagrams. These reflect the internal collaboration of Classes, Interfaces or Components to describe a functionality or to express run-time architectures, usage patterns and the participating elements' relationships, which static diagrams might not show.

#### Composite Toolbox pages

Image	Detail	See also
 <p>The <b>Composite</b> toolbox contains the following elements:</p> <ul style="list-style-type: none"> <li>Class</li> <li>Interface</li> <li>Part</li> <li>Port</li> <li>Collaboration</li> <li>Collaboration Use</li> <li>Expose Interface</li> <li>Composite Relationships</li> <li>Connector</li> <li>Assembly</li> <li>Delegate</li> <li>Role Binding</li> <li>Represents</li> <li>Occurrence</li> </ul>	<p>The <b>Class</b> elements form the basic structure of the diagram, with <b>Interface</b>, <b>Part</b>, <b>Port</b> and <b>Collaboration</b> elements defining the functionality or use of the Classes.</p>	<p><a href="#">Composite Structure Diagrams</a> <sup>[1168]</sup></p>

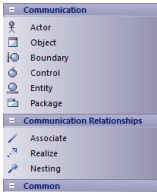

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

### 5.5.5.8 Communication Toolbox

The **Communication** Toolbox is used to model dynamic interactions between elements at run-time.

### Communication Toolbox pages

Image	Detail	See also
 <p>The <b>Communication</b> toolbox contains the following elements:</p> <ul style="list-style-type: none"> <li>Actor</li> <li>Object</li> <li>Boundary</li> <li>Control</li> <li>Entity</li> <li>Package</li> <li>Communication Relationships</li> <li>Associate</li> <li>Realize</li> <li>Nesting</li> <li>Common</li> </ul>	<p>Communication diagrams are used to model work flow and sequential passing of messages between elements in real time; they are often placed beneath <b>Use Case</b> elements to further expand on Use Case behavior over time.</p> <p>The <b>Actor</b> element models a user of the system, while the other elements model things within the system, including standard elements (<b>Object</b>), user interface component (<b>Boundary</b>), <b>Controller</b> and <b>Entity</b>.</p>	<p><a href="#">Communication Diagrams</a> <sup>[1259]</sup></p>

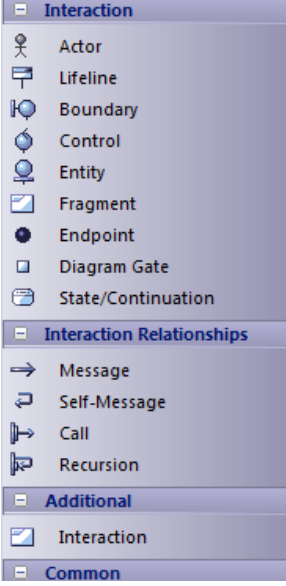

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

### 5.5.5.9 Interaction Toolbox

The **Interaction** Toolbox is used for Interaction diagrams (**Sequence**, **Timing**, **Communication** or **Interaction Overview**), which are used to model work flow and sequential passing of messages between elements in real time.

#### Interaction Toolbox pages

Image	Detail	See also
	<p>The Interaction group is used to model dynamic interactions between elements at run-time; Interaction diagrams are often placed beneath <b>Use Case</b> elements to further expand on Use Case behavior over time.</p> <p>The <b>Actor</b> element models a user of the system, while the other elements model things within the system, including standard elements (<b>Lifeline</b>), user interface components (<b>Boundary</b>), <b>Controller</b> and <b>Entity</b>.</p> <p>The <b>Message</b> (sequence) relationship is used to model the flow of information and processing between elements.</p>	<p><a href="#">Sequence diagram</a> [1249]</p>

#### Notes

- Messages can be simple or recursive calls
- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

#### Learn more

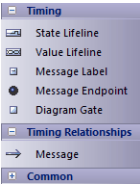

- [Timing](#) [1225]
- [Communication](#) [1259]
- [Interaction Overview](#) [1262]

### 5.5.5.10 Timing Toolbox

The **Timing** Toolbox is used solely for Timing diagrams, which use a time-scale to define the behavior of objects. The time-scale visualizes how the objects change state and interact over time.

Timing diagrams can be used for defining hardware-driven or embedded software components, and time-driven business processes.

Timing Toolbox pages

Image	Detail	See also
	<p>A <b>Lifeline</b> is the path an object takes across a measure of time, indicated by the x-axis.</p> <p>A <b>State Lifeline</b> follows discrete transitions between states, which are defined along the y-axis of the timeline; any transition has optional attributes of timing constraints, duration constraints and observations.</p> <p>A <b>Value Lifeline</b> shows the lifeline's state across the diagram, with parallel lines indicating a steady state; a cross between the lines indicates a transition or change in state.</p>	<p><a href="#">State Lifeline</a> <small>f1335</small></p> <p><a href="#">Value Lifeline</a> <small>f1355</small></p>

Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

- [Timing Diagrams](#) f1225

**5.5.5.11 State Toolbox**

The **State** Toolbox is used for State Machine diagrams to show the enableable states a Class or other element might be in and the transitions from one state to another. These diagrams are often placed under a Class element in the Project Browser to illustrate how a particular element changes over time.

State Toolbox pages

Image	Detail	See also
	<p>The State Toolbox provides elements common to State Machine diagrams; basically the <b>State</b>, <b>Entry</b> and <b>Exit</b> nodes and the <b>Object Flow</b> relationship.</p> <p>State Machine diagrams are used to model the states or conditions that elements might be in at runtime, such as active, inactive, idle, accelerating or braking.</p> <p>States can have substates; for example, <i>Accelerate</i> and <i>Brake</i> might be substates of <i>Active</i>.</p>	<p><a href="#">State Machine Diagrams</a> <small>f1203</small></p>

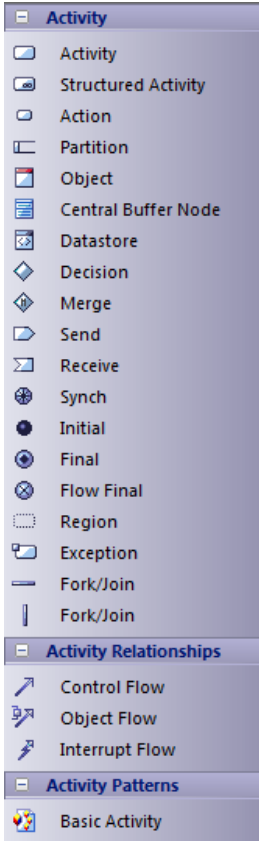

Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

### 5.5.5.12 Activity Toolbox

The **Activity** Toolbox is used to model system dynamics from a number of viewpoints in **Activity** diagrams and **Interaction Overview** diagrams.

#### Activity Toolbox pages

Image	Detail	See also
	<p><b>Activity</b> elements enable you to describe the dynamics of the system from the point of view of activities and flows between them.</p> <p>Activities can be stereotyped as a process to display a business process icon; an Activity is some work that is carried out, which might overlap several <b>Use Cases</b> or form only a part of one Use Case.</p> <p><b>Send</b> and <b>Receive</b> events are included as triggers.</p> <p>A <b>Decision</b> element marks a point where processing might split based on some outcome or value.</p> <p>The <b>Flow</b> relation models an active transition and <b>Synch</b> points are used to split and rejoin periods of parallel processing.</p> <p>The <b>Basic Activity</b> icon adds the Basic Activity Pattern to your diagram as a starting point for developing the diagram (drag the icon onto the diagram to open the Add Pattern &lt;name&gt; to Diagram dialog and click on the <b>OK</b> button).</p>	<p><a href="#">Add Pattern Dialog</a> <sup>[1469]</sup></p>

#### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

#### Learn more

- [Interaction Overview Diagrams](#) <sup>[1262]</sup>

### 5.5.5.13 Component Toolbox

The **Component** Toolbox provides model elements that you can use to model the physical components of your system in a **Component diagram**.

#### Component Toolbox pages

Image	Detail	See also
	<p>The Component pages contain elements and connectors related to the actual building of the system - the components that make up the system (such as ActiveX DLLs or Java beans), the Interfaces they expose and the dependencies between those elements.</p> <p>A component is a piece of hardware or software that makes up the system; for example, a DLL or a Web Server are components that might be deployed on a Windows 2000 Server (Node).</p>	<p><a href="#">Deployment Diagram</a> <sup>1191</sup></p>

#### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

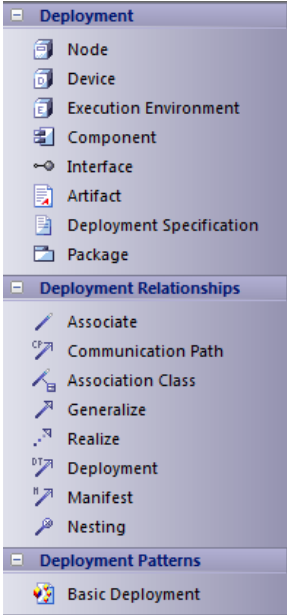

#### Learn more

- [Component Diagram](#) <sup>1194</sup>

### 5.5.5.14 Deployment Toolbox

The **Deployment** Toolbox provides model elements that you can use to model the physical components and deployment structure of your system in a **Deployment diagram**.

#### Deployment Toolbox pages

Image	Detail	See also
	<p>The Deployment group contains elements related to the actual building of the system - the components that make up the system (such as ActiveX DLLs or Java beans) and the nodes those components run on, including the physical connections between nodes.</p> <p>A Component is a piece of hardware or software that makes up the system, and a Node is a physical platform on which the component is to exist; for example, DLLs or Web Servers are Components that could be deployed on a Windows 2000 Server (Node).</p> <p>The <b>Basic Deployment</b> icon adds the Basic Deployment Pattern to your diagram as a starting point for developing the diagram (drag the icon onto the diagram to open the Add Pattern &lt;name&gt; to Diagram dialog and click on the <b>OK</b> button).</p>	<p><a href="#">Deployment Diagram</a> <sup>[119]</sup></p> <p><a href="#">Add Pattern Dialog</a> <sup>[1469]</sup></p>

### Notes

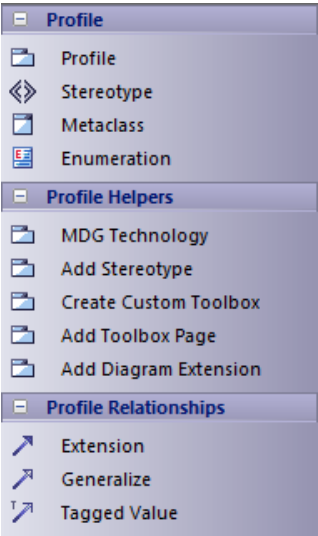

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

### 5.5.5.15 Profile Toolbox

The Profile Toolbox is used in creating **Profiles** for extending UML models. These Profiles can define custom **Stereotypes**, **Tagged Values**, **Diagram Types** and **Toolboxes**.

The Toolbox also contains a set of **Profile Helpers** that provide templates and dialogs to help you create UML Profiles, Toolbox Profiles and Diagram Profiles within an MDG Technology.

### Profile Toolbox pages

Image	Detail	See also
	<p>Profiles are used to provide a generic extension mechanism. The <b>Profile</b> Package element acts as the container for the diagrams, elements and connectors that define the Profile itself.</p> <p>A <b>Stereotype</b> provides a mechanism for varying the behavior and type of a model element.</p> <p>A <b>Metaclass</b> represents the base UML element or connector type that you are extending.</p> <p>An <b>Enumeration</b> is used to define an enumeration Tagged Value, which can be attached to one or more Stereotypes that have been defined in the Profile.</p> <p>Profile Helpers are templates and dialogs that help you create, respectively:</p> <ul style="list-style-type: none"> <li>• An MDG Technology Package to contain Profile definitions</li> <li>• Stereotypes and Metaclasses within a UML Profile</li> <li>• A customized Toolbox Profile</li> <li>• Toolbox pages within the customized Toolbox</li> <li>• A Diagram Profile to define an extended diagram type</li> </ul> <p>An <b>Extension</b> relationship shows that a Stereotype <b>extends</b> a Metaclass; all Stereotypes must extend either:</p> <ul style="list-style-type: none"> <li>• One or more Metaclasses, or</li> <li>• Another Stereotype that extends a Metaclass; you can create a <b>chain</b> of extending Stereotypes that ultimately extend the Metaclass</li> </ul> <p>A <b>Generalize</b> relationship shows that one Stereotype specializes a more general Stereotype; the more general Stereotype must still extend a Metaclass.</p> <p>A <b>Tagged Value</b> relationship is used to define a Tagged Value which is a reference (that is, RefGUID) to an element with a specific stereotype.</p>	<p><a href="#">Add Stereotypes and Metaclasses</a> <sup>[1488]</sup></p> <p><a href="#">Add an Enumeration to a Stereotype</a> <sup>[1493]</sup></p> <p><a href="#">Using the Profile Helpers</a> <sup>[1528]</sup></p> <p><a href="#">Use the Tagged Value Connector</a> <sup>[1498]</sup></p>

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted

### 5.5.5.16 Metamodel Toolbox

The **Metamodel** Toolbox provides model elements that you can use to create **Metamodel diagrams**, with support for **Meta-Object Facility (MOF)** diagrams.

#### Metamodel Toolbox pages

Image	Detail	See also
 <b>Metamodel</b>  Package  Class  Enumeration  Primitive  <b>Metamodel Relationships</b>  Generalize  Associate  Compose  Aggregate  Common	<p>A <b>Package</b> is a namespace as well as an element that can be contained in other Package's namespaces.</p> <p>A <b>Class</b> is a representation of objects, that reflects their structure and behavior within the system.</p> <p>An <b>Enumeration</b> is used to provide a list of named values as the range of a particular type.</p> <p>A <b>Primitive</b> supports the MOF specification (<b>deprecated</b> - use the <b>UML Primitive</b> in the <b>Class</b> group).</p>	<p><a href="#">Package</a> <sup>[1382]</sup></p> <p><a href="#">Class</a> <sup>[1363]</sup></p> <p><a href="#">Enumeration</a> <sup>[1374]</sup></p> <p><a href="#">Class</a> <a href="#">Toolbox</a> <sup>[803]</sup></p>

#### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the source element in the diagram and drag to the target element

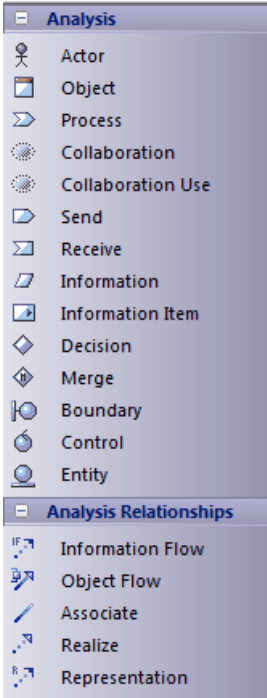

#### Learn more

- [MOF](#) <sup>[2456]</sup>

### 5.5.5.17 Analysis Toolbox

**Analysis-type elements** are used early in modeling to capture business processes, activities, collaborations and general domain information. They are generally used in **Analysis diagrams**.

#### Analysis Toolbox pages

Image	Detail	See also
	<p>You can use <b>stereotyped Activities</b> to model business processes, or stereotyped elements to capture standard UML business process modeling extensions such as worker, case worker, entity, and controller.</p>	

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

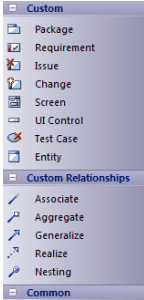

### Learn more

- [Analysis Diagrams](#) <sup>[1801]</sup>

#### 5.5.5.18 Custom Toolbox

The **Custom** Toolbox contains **extended** UML elements that can be of use in modeling or designing your system in a **Custom diagram**.

### Custom Toolbox pages

Image	Detail	See also
	<p>A <b>Package</b> is a namespace as well as an element that can be contained in other Package's namespaces.</p> <p>A <b>Requirement</b> is a custom element used to capture requirements external to standard UML elements; a Requirement expresses required system behavior that can cross several Use Cases.</p> <p>You can connect Requirements to other elements using the <b>Realize</b> connector to express the implementation of a requirement and hence the traceability from user requirements to what is being built.</p> <p>An <b>Issue</b> element is a structured comment that contains information about defects and issues relating to the system/model; affected elements are connected by <b>Trace</b> connectors.</p> <p>A <b>Change</b> element is a structured comment that contains information about changes requested to the system/model; affected elements are connected by <b>Trace</b> connectors.</p> <p>A <b>Screen</b> provides a stereotyped Class element that displays a GUI type screen; this can be used to express application GUI elements and flows between them.</p> <p>A <b>UI Control</b> likewise can be used to express GUI controls.</p> <p>A <b>Test Case</b> element defines what must be set up in order to test a particular feature; it enables you to define a set of tests once for a number of elements, and provides greater visibility for tests.</p> <p>An <b>Entity</b> is a stereotyped element that represents any general thing not captured by the element or Class type elements (for example a trading partner); use of this element is <b>deprecated</b> - it was originally intended to take the role now occupied by a <b>Table</b> element.</p>	<p><a href="#">Package</a> <sup>[1382]</sup></p> <p><a href="#">Requirements</a> <sup>[1763]</sup></p> <p><a href="#">Traceability</a> <sup>[723]</sup></p> <p><a href="#">Issues (Defects)</a> <sup>[2631]</sup></p> <p><a href="#">Trace</a> <sup>[1446]</sup></p> <p><a href="#">Changes and Issues</a> <sup>[2631]</sup></p> <p><a href="#">Screen</a> <sup>[1991]</sup></p> <p><a href="#">UI Control</a> <sup>[1992]</sup></p> <p><a href="#">Test Case</a> <sup>[2010]</sup></p> <p><a href="#">Working on Test Records</a> <sup>[2605]</sup></p> <p><a href="#">Table</a> <sup>[1942]</sup></p>

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

## 5.5.5.19 Requirements Toolbox

As an analysis step, often it is desirable to capture simple system **requirements**. These are eventually **realized** by **Use Cases**.

### Requirements Toolbox pages

Image	Detail	See also
	<p>A <b>Package</b> is a namespace as well as an element that can be contained in other Package's namespaces.</p> <p>A <b>Requirement</b> defines a requirement of a system. Note that there are several different requirement types, such as:</p> <ul style="list-style-type: none"> <li>• Display</li> <li>• Functional</li> <li>• Performance</li> <li>• Printing</li> <li>• Report</li> <li>• Testing</li> <li>• Validate</li> </ul> <p>A <b>Feature</b> is a small client-valued function expressed as a requirement. Features are the primary requirements-gathering artifact of the <b>Feature-Driven Design (FDD)</b> methodology.</p> <p>A <b>Risk</b> element represents an identified risk to the project.</p> <p>An <b>Object</b> is an instance of a <b>Class</b>.</p>	<p><a href="#">Package</a> <sup>[1382]</sup></p> <p><a href="#">Requirement</a> <sup>[1763]</sup></p> <p><a href="#">Feature</a> <sup>[1769]</sup></p> <p><a href="#">Risk</a> <sup>[2009]</sup></p> <p><a href="#">Object</a> <sup>[1379]</sup></p>

#### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

#### 5.5.5.20 Maintenance Toolbox

The **Maintenance** elements are Issues (Defects), Changes and Tasks.

#### Maintenance Toolbox pages

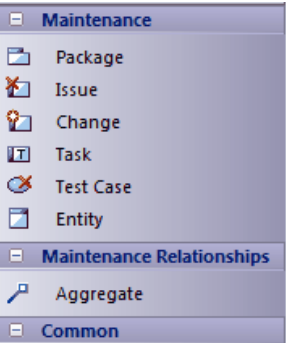

Image	Detail	See also
	<p>A <b>Package</b> is a namespace as well as an element that can be contained in other Package's namespaces.</p> <p>An <b>Issue</b> element is a structured comment that contains information about defects and issues relating to the system/model. Affected elements are connected by <b>Trace</b> connectors.</p> <p>A <b>Change</b> element is a structured comment that contains information about changes requested to the system/model. Affected elements are connected by <b>Trace</b> connectors.</p> <p>A <b>Task</b> element defines a task attached to an element, that enables resources to be assigned specifically to the task rather than just to the parent element. You can monitor these</p>	<p><a href="#">Package</a> <sup>[1382]</sup></p> <p><a href="#">Issues (Defects)</a> <sup>[2631]</sup></p> <p><a href="#">Trace</a> <sup>[1446]</sup></p> <p><a href="#">Changes and Issues</a> <sup>[2631]</sup></p> <p><a href="#">Task</a> <sup>[2010]</sup></p>

Image	Detail	See also
	<p>tasks on diagram Gantt charts.</p> <p>A <b>Test Case</b> describes what must be set up in order to test a particular feature.</p> <p>An <b>Entity</b> is a stereotyped element that represents any general thing not captured by the element or Class type elements (for example a trading partner). Use of this element is <b>deprecated</b>: it was originally intended to take the role now occupied by a <b>Table</b> element.</p>	<p><a href="#">Test Case</a> <sup>[2010]</sup></p> <p><a href="#">Table</a> <sup>[1942]</sup></p>

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

## 5.5.5.21 User Interface Toolbox

The **User Interface** Toolbox provides a wide range of icons that you can use to create graphical user interface diagrams.

### User Interface Toolbox pages

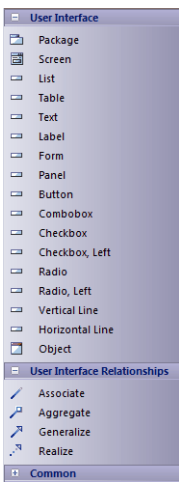

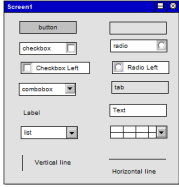

Image	Detail	See also
	<p>A <b>Package</b> is a namespace as well as an element that can be contained in other Packages' namespaces.</p> <p>A <b>Screen</b> element represents a graphical user interface. You can place GUI elements onto the screen element (see below).</p> <p><b>UI Control</b> elements are placed onto the screen element to build up a graphical user interface diagram. There are different stereotyped elements such as buttons and combo boxes.</p> <p>An <b>Object</b> is an instance of a Class.</p>	<p><a href="#">Package</a> <sup>[1382]</sup></p> <p><a href="#">Screen</a> <sup>[1991]</sup></p> <p><a href="#">UI Control</a> <sup>[1992]</sup></p> <p><a href="#">Object</a> <sup>[1379]</sup></p>

Image	Detail	See also
	<p>The diagram on the left illustrates all of the GUI elements from the Toolbox, within a <b>Screen</b> element.</p>	

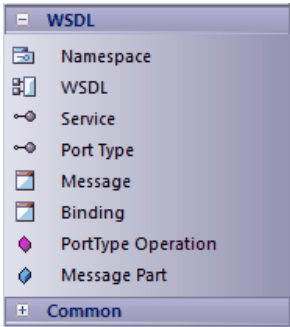

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

### 5.5.5.22 WSDL Toolbox

The **WSDL** Toolbox provides elements you can use to rapidly develop a W3C Web Service Definition Language (WSDL) model, from which you can automatically generate WSDL documents.

#### WSDL Toolbox page

Image	Detail	See also
	<p>A <b>Namespace</b> represents the top-level container for the WSDL model. Drag this element onto an open diagram to create the necessary model structure for WSDL documents.</p> <p>A physical <b>WSDL</b> document is represented as a UML <b>Component</b>. Its interfaces represent the WSDL <b>Services</b>.</p> <p>A WSDL <b>Port Type</b> is modeled as a UML <b>Interface</b>. Its <b>Port Type Operations</b> are realized by <b>Binding</b> elements.</p> <p>Each of the operation parameters is derived from the <b>Message</b> elements defined in the Messages Package.</p>	<p><a href="#">WSDL Namespace</a> <sup>[2426]</sup></p> <p><a href="#">WSDL document</a> <sup>[2443]</sup></p> <p><a href="#">WSDL Services</a> <sup>[2441]</sup></p> <p><a href="#">WSDL Port Type</a> <sup>[2433]</sup></p> <p><a href="#">Port Type Operations</a> <sup>[2434]</sup></p> <p><a href="#">WSDL Binding</a> <sup>[2437]</sup></p> <p><a href="#">WSDL Messages</a> <sup>[2430]</sup></p>

### Notes

- To add an **element** to the currently-open diagram, click on the appropriate icon and drag it into position on the diagram; set an element name and other properties as prompted
- To add a **relationship**, click on the appropriate icon, then click on the start element in the diagram and drag to the end element

## 5.5.6.1 Add New Diagrams

This topic explains how to add a UML diagram, Extended diagram or MDG Technology diagram to a model in Enterprise Architect.

### How to

Step	Action	See also
1	In the Project Browser, select the appropriate Package or element under which to place the diagram.	
2	<p>Do one of the following:</p> <ul style="list-style-type: none"> <li>In the Project Browser toolbar click on the <b>New Diagram</b> icon</li> <li>Right-click to open the context menu and select the <b>Add   Add Diagram</b> or <b>Add   Add &lt;type&gt; Diagram</b> menu option</li> <li>Press <b>Insert</b> and select the <b>Add   Add Diagram</b> or <b>Add   Add &lt;type&gt; Diagram</b> menu option, or</li> <li>Select the <b>Project   New Diagram</b> menu option</li> </ul> <p>The New Diagram dialog displays.</p>	
3	The <b>Name</b> field defaults to the name of the selected Package or element; if necessary, type a different name for the new diagram.	
4	<p>In the Select From panel, click on the appropriate diagram category for the diagram.</p> <p>The Diagram Types panel displays a list of the diagram types within the selected</p>	<a href="#">UML Diagrams</a> <sup>[1183]</sup>

Step	Action	See also
	category.	
5	In the Diagram Types panel, click on the type of diagram to create.	
6	Click on the <b>OK</b> button to create your new diagram.  Enterprise Architect checks whether there is a template diagram for this diagram type in the Templates Package and, if so, applies the display characteristics defined in that template.	<a href="#">Set Element Templates Package</a> <sup>[929]</sup>

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Diagrams** permission to create new diagrams
- The diagram type determines the default toolbar associated with the diagram and whether it can be set as a child of another element in the Project Browser (for example, a Sequence diagram under a Use Case)

### Learn more

- [Manage Diagrams](#)<sup>[329]</sup>

## 5.5.6.2 Set Diagram Properties

You can set several properties of a diagram using the diagram Properties dialog. Some properties influence the display and some are logical attributes that appear in the documentation.

There are several options for opening the diagram Properties dialog for a given diagram:

- Select the **Diagram | Properties** menu option to open the Properties dialog for the currently active diagram
- Right-click on the required diagram in the Project Browser and select the **Properties** context menu option
- Right-click on the background of the open diagram and select the **Properties** context menu option
- Double-click in the background of the open diagram

In the Diagram Properties dialog you can set properties including name, author and version information, zoom factor, paper size and layout, diagram notes and various appearance attributes.

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Update Diagrams** permission to change diagram properties
- You can also set the default diagram background color and color gradients for the diagram background on the Diagram Gradients and Backgrounds page of the Options dialog

- [Connectors Tab](#) <sup>[831]</sup>

**5.5.6.2.1 General Tab**

You use the General tab of the diagram Properties dialog to define characteristics of the overall diagram, such as its title, version and modification date.

**Access**    **Diagram | Properties > General**

Set Diagram Properties

Field	Action	See also
<b>Name</b>	Defaults to the name of the parent Package, as the name of the diagram.  If necessary, overwrite the field with a different diagram name.	
<b>Author</b>	Defaults to the name of the person who created the diagram.  If necessary, overwrite the field with a different author name, or click on the drop-down arrow and select a name from the list. You might do this if the diagram becomes the responsibility of another person.	
<b>Version</b>	Defaults to <b>1.0</b> as the version number of the diagram.  If necessary, overwrite with a different version number.	
<b>Stereotype</b>	Type in the name of a diagram stereotype to apply, or click on the drop-down arrow and select a stereotype from the list.  You can define stereotypes to select here using the <b>Settings   UML Types</b> menu option, selecting the Stereotypes <sup>[9006]</sup> tab and creating stereotypes with a <b>Base Class</b> of <b>Diagram</b> .	<a href="#">Stereotypes Tab</a> <sup>[1461]</sup>
<b>Created</b>	Automatically displays the date the diagram was created.  If necessary, overwrite with an amended creation data, or click on the drop-down arrow and select the date.	
<b>Modified</b>	Displays the date and time on which the diagram was last modified.	

Field	Action	See also
<b>Notes</b>	Type in any additional information on the diagram. You can format the notes using the Notes toolbar at the top of the field.	<a href="#">Notes Toolbar</a> <small>[1143]</small>
<b>OK</b>	If you have finished updating the diagram properties, click on this button to save the changes and close the Properties dialog.	
<b>Cancel</b>	If you do not want to save the changes you have made, click on this button to discard the changes and close the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Diagrams permission to update diagram properties

#### 5.5.6.2.2 *Configure Diagram Display*

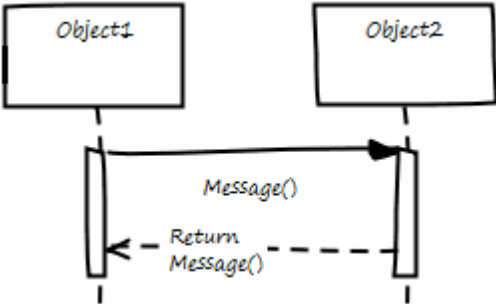

A diagram can show or hide information, and represent it in different ways depending on how you configure the display characteristics. You can perform this display configuration on the Diagram tab of the diagram Properties dialog.

**Access**    **Diagram | Properties > Diagram**

### Set the diagram display options

Field	Action	See also
<b>Use Alias if Available</b>	Display the element alias as the name, if the alias is specified.	
<b>Show Additional Parents</b>	Show the name of all parents not in the current diagram, for all Classes and interfaces.	
<b>Hide Page Border (All Diagrams)</b>	Disable the display of page borders on <b>all</b> diagrams in the model.	

Field	Action	See also
<b>Hide Page Border (Current Diagram)</b>	Disable the display of the page border on the <b>current</b> diagram.	
<b>Show Diagram Details</b>	Show diagram details in a note in the top left corner of the diagram. Deselect the option to hide the diagram details.	
<b>Show Sequence Notes</b>	Show the Sequence Notes on the current diagram.	
<b>Show Namespace</b>	Show the namespace of each element on the diagram, as part of the element name.  	
<b>Fully Qualified Namespace</b>	(If <b>Show Namespace</b> is selected) show the fully qualified namespace of each element on the diagram, under the element.  	
<b>Hand Drawn</b>	Display the diagram contents as if they had been roughly drawn by hand.  	
<b>Whiteboard Mode</b>	Displays the diagram as if it had been drawn on a whiteboard, with white fill and background.	

Field	Action	See also
	 <p>(This illustration also has Hand Drawn mode enabled.)</p>	
<b>Disable fully scoped object names</b>	Prevent the display of fully-qualified object names on the diagram.	
<b>Page Setup</b>	Adjust the scaling of the image according to the size of the page it is to be printed on.	<a href="#">Scale Image to Page Size</a> <sup>[87]</sup>
<b>Print Page Header and Page Footer</b>	Add page headers and footers to a print-out of the diagram; the headers and footers are generated from the diagram characteristics, such as the name of the creator and the date of modification.	
<b>Always Open as Element List</b>	Always display the diagram contents as a Diagram List rather than as a diagram.	<a href="#">Diagram List</a> <sup>[68]</sup>
<b>Always Open as Gantt</b>	Always display the diagram contents as a Gantt chart.	<a href="#">The Gantt View</a> <sup>[59]</sup>
<b>Set Layout Style</b>	Define the layout of the diagram, to be applied automatically when you select the Layout Diagram options.	<a href="#">Layout Diagram</a> <sup>[89]</sup>
<b>RTF Document Options</b>	Options for generating document reports for a particular diagram.	<a href="#">Document Options</a> <sup>[266]</sup>
<b>Exclude image from RTF documents</b>	Exclude this diagram image from any document report generated on the parent Package or element.	
<b>Document each contained element in RTF</b>	Include documentation on each element in this diagram, in any document report generated on the parent Package or element.	
<b>Divide Diagram into Multiple</b>	Divide each large diagram into separate pages in the document report.	<a href="#">Scaled to page</a> <sup>[87]</sup>

Field	Action	See also
<b>Pages</b>		
<b>Rotate Images</b>	Rotate each diagram image by 90 degrees in the document report.	
<b>OK</b>	If you have finished updating the diagram properties, click on this button to save the changes and close the Properties dialog.	
<b>Cancel</b>	If you do not want to save the changes you have made, click on this button to discard the changes and close the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

#### Notes

- The **Divide Diagrams into Multiple Pages** option is only effective when the **Scaled Printing** option on the Print Advanced dialog is set to **None**
- **Rotate Images** is only available for bitmap (.bmp) images

#### 5.5.6.2.3 Define Element Characteristics

It is possible to show a number of element characteristics on a selected diagram. You can define which of these characteristics to show, by selecting the corresponding check boxes on the diagram Properties dialog (and, conversely, which to hide by clearing their check boxes). You can also override the model default coding language and set a different language for the elements in the context of this diagram.

**Access**   **Diagram | Properties > Elements**

#### Set Component Display Options

Field	Action	See also
<b>Use Stereotype Icons</b>	For elements that have whole shapes drawn by Enterprise Architect (such as Analysis stereotypes), draw the alternative shape (if defined).  For elements that have an icon displayed in the top right corner, (such as an Artifact element) if <b>Show Element Stereotypes</b> is selected, display the stereotype icon instead of the stereotype text.	<a href="#">Analysis stereotypes</a>  <a href="#">Artifact</a> 
<b>Show Element Stereotypes</b>	For elements that have whole shapes drawn by Enterprise Architect, if <b>Use Stereotype Icons</b> is deselected, display any stereotype on the element.  For elements that have an icon displayed in the top right corner, indicate that a stereotype is present (icon if <b>Use Stereotype Icons</b>	

Field	Action	See also
	is selected, text if not).	
<b>Show Table Owner</b>	Display the Table Owner.	<a href="#">Set Table Owner</a> [2342]
<b>Show Element Property String</b>	Show the advanced property string for all elements; for example, {leaf}.	
<b>Show Compartments</b>	<p>Show or hide the named compartments for all elements using rectangle notation on the diagram:</p> <ul style="list-style-type: none"> <li>• Attributes</li> <li>• Operations</li> <li>• Tags (Tagged Values)</li> <li>• Requirements</li> <li>• Constraints</li> <li>• Testing (Testing Scripts)</li> <li>• Maintenance (Maintenance Scripts)</li> <li>• Package Contents</li> <li>• Notes</li> </ul> <p>If you have added custom compartments to your model display, such as Related Elements, Flow Ports or Parts, <b>Show Compartments</b> checkboxes are also listed for each of them. These checkboxes default to selected to show the compartments on the diagram; deselect the checkboxes to hide the compartments.</p> <p>If the checkboxes do not seem to operate for an element on a diagram, also check the Feature Visibility settings for that <b>element</b>.</p>	<p><a href="#">Show Test Scripts Compartment</a> [2616]</p> <p><a href="#">Show Maintenance Script in Diagram</a> [2630]</p> <p><a href="#">Add Custom Compartments to Element</a> [1604]</p> <p><a href="#">Feature Visibility</a> [845]</p>
<b>Language</b>	<p>Set the language that elements created on this diagram receive, overriding the model default language.</p> <p>If you do not want to override the model default, select the value <b>&lt;none&gt;</b> from the drop-down list.</p>	
<b>OK</b>	If you have finished updating the diagram properties, click on this button to save the changes and close the Properties dialog.	
<b>Cancel</b>	If you do not want to save the changes you have made, click on this button to discard the changes and close the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

#### 5.5.6.2.4 Features Tab

You use the Features tab of the diagram Properties dialog to define how features (attributes and operations) are displayed on the diagram.

**Access** [Diagram | Properties > Features](#)

#### Define how features are displayed on the diagram

Field	Action	See also
<b>Show Qualifiers and Visibility Indicators</b>	<p>Show or hide the qualifiers and visibility indicators on the diagram.</p> <p><i>Qualifiers</i> include such things as the 'derived' symbol (<i>/</i>) and the public key symbol (<b>PK</b>).</p> <p>Visibility indicators <sup>[2080]</sup> include such things as <b>+</b>, <b>-</b>, <b>#</b> and <b>~</b>, which indicate the scope of access of the item (such as an attribute, operation or role).</p>	<a href="#">Visibility indicators</a> <sup>[2080]</sup>
<b>Show Stereotypes</b>	Show the stereotypes on all features.	
<b>Show Property String</b>	Show the advanced property string for all element features, for example, {readOnly}.	
<b>Show Operation Return Type</b>	Display the return data type of operations.	
<b>Suppress Brackets for Operations Without Parameters</b>	Suppress brackets on operations that have no parameters; that is, <b>Opn</b> ; rather than <b>Opn()</b> .	
<b>Always Show Linked Features</b>	Force display of linked <sup>[1098]</sup> attributes and operations, regardless of the setting of any other option that might hide them.	<a href="#">Linked Attributes and Operations</a> <sup>[1110]</sup>
<b>Visible Class Members</b>	Hide Class members according to their scope and methods that specify properties.	<a href="#">Visible Class Members</a> <sup>[831]</sup>
<b>Show Attribute Detail</b>	Select whether to show both the attribute name and type, or the attribute name only.	
<b>Show Parameter Detail</b>	Control the display of method parameters.	<a href="#">Visible Class Members</a> <sup>[831]</sup>

Field	Action	See also
<b>OK</b>	If you have finished updating the diagram properties, click on this button to save the changes and close the Properties dialog.	
<b>Cancel</b>	If you do not want to save the changes you have made, click on this button to discard the changes and close the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

#### 5.5.6.2.4.1 Visible Class Members

On the Features tab of the diagram Properties dialog, you use the Visible Class Members panel to hide Class members by their scope and methods that specify properties. Use the check boxes to define the visibility of Class members.

**Access** [Diagram | Properties > Features : Visible Class Members](#)

#### Show Parameter Detail

Option	Effect
<b>None</b>	No details shown.
<b>Type Only</b>	Show the type of parameter only.
<b>Full Details</b>	Show all of the details for parameters.
<b>Name Only</b>	Show the name of the parameter only.

#### 5.5.6.2.5 Connectors Tab

To define the appearance of the connectors on a diagram, you use the Connectors tab of the diagram Properties dialog.

**Access** [Diagram | Properties > Connectors](#)

#### Define connector appearance

Field/Option/ Button	Action	See also
<b>Show Relationships</b>	Show relationships in the current diagram.	
<b>Show Collaboration Numbers</b>	Show numbering in Communication diagrams.	
<b>Show Non-Navigable Ends</b>	Indicate when an Association end is not navigable; a cross is presented at the Association connector.	
<b>Show Connector Property String</b>	Show the property string for connectors.	
<b>Suppress All Connector Labels</b>	Hide all connector labels.	
<b>Show Stereotype Labels</b>	Show (selected) or hide (deselected) any stereotype labels on the connectors on the diagram.	
<b>Connector Notation</b>	Display the required connector notation: <ul style="list-style-type: none"> <li>• <b>UML 2.1</b> - use the standard UML 2.1 notation for connectors</li> <li>• <b>Information Engineering</b> - use the Information Engineering (IE) connection style</li> <li>• <b>IDEFX1</b> - use the Integrated Definition Methods IDEFX1 connection style</li> </ul>	<a href="http://www.agiledata.org/essays/dataModeling101">http://www.agiledata.org/essays/dataModeling101</a>  <a href="http://www.idef.com/IDEF1X.html">http://www.idef.com/IDEF1X.html</a>
<b>OK</b>	If you have finished updating the diagram properties, click on this button to save the changes and close the Properties dialog.	
<b>Cancel</b>	If you do not want to save the changes you have made, click on this button to discard the changes and close the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

### 5.5.6.3 Paste from Project Browser

As well as creating new elements in the current diagram, you can drag **existing** elements (individually or as a group) from the **Project Browser** into the diagram. To select multiple elements, click on the element names in the Project Browser while pressing and holding:

- **Ctrl** to add single items to the selection of multiple elements, or
- **Shift** to select all the elements between the first and last selected items

When you drag an element onto a diagram from the Project Browser, the system response depends on whether you are dragging a **Package** element or **any other** type of element. For information on dragging a Package element onto a diagram, see the *Paste Packages* topic.

**Access**    **Drag existing element(s) onto the diagram**  
**(If the Paste Element dialog does not display, press ( Ctrl ) while dragging the elements)**

#### Select Paste options

Field/Button	Detail	See also
<b>Paste as</b>	<p>Click on the drop-down arrow and select one of the paste types:</p> <ul style="list-style-type: none"> <li>• <b>Link</b> - Paste the element as a simple link: in this case the <b>one</b> element is represented in the Project Browser and in any diagram to which it has been added; changes to the element are reflected in all diagrams in which it is shown</li> <li>• <b>Instance</b> - Paste a <b>copy</b> of the element as a separate instance of the original element, classified by the original element; this is useful when creating multiple instances of a Class in a Sequence diagram or Communication diagram</li> <li>• <b>Invocation</b> - Paste a copy of a State Machine or Activity element as an invocation of the source element; the resulting element is a State object or Action - respectively - with the source element as its classifier</li> <li>• <b>Property</b> - Paste a <b>copy</b> of the element as a separate Object instance</li> <li>• <b>Attribute</b> - (Available when dragging a classifier onto an element that supports attributes) Create a new attribute classified by the dragged classifier; the attribute is automatically selected in in-place editing so that you can add the attribute name</li> <li>• <b>Child</b> - Paste the element as a child of the copied element - that is, as a new element (which you are prompted to name) with a Generalization connector back to the copied element; this is very useful when you have a Class library or framework from which you inherit new forms - for example, you can paste a Hashtable as "MyHashtable" which automatically becomes a child of the original Hashtable</li> </ul> <p>Used with the Override Parent Operations feature, this is a quick</p>	<p><a href="#">Classifiers and Instances</a>  </p> <p><a href="#">Edit Element Item Name</a>  </p> <p><a href="#">Override Parent Operations</a>  </p>

Field/Button	Detail	See also
	<p>way to create new structures based on frameworks such as the Java SDK and the .NET SDK</p>	
<b>Structural Elements</b>	<p>If the original element has any child elements (for example, if it is a composite element or nested element, or contains embedded elements) this field contains the value <b>Select</b>. Either:</p> <ul style="list-style-type: none"> <li>• Leave this value as is, so that when you click on the <b>OK</b> button the Structural Elements dialog displays, from which you can <b>select</b> the child elements to reproduce with the pasted element, or</li> <li>• Click on the drop-down arrow and select: <ul style="list-style-type: none"> <li>• <b>None</b> to not reproduce any child elements</li> <li>• <b>All</b> to reproduce all child elements on the original element, or</li> <li>• <b>Based on Instance &lt;diagram names&gt;</b> to reproduce the configuration of child elements on an instance of the original element on another diagram, if there are any other instances</li> </ul> </li> </ul> <p>The resulting Object element is created large enough to display the selected child elements laid out neatly within the Object border.</p>	<a href="#">Manage Structural Elements</a> [935]
<b>Copy Connectors</b>	<p>This checkbox is enabled when you select to paste the copied element as an instance, property or invocation.</p> <p>Select the checkbox to reproduce on the diagram any connectors between the original element and any other elements that have also been pasted to this diagram, as connectors between the <b>instances</b>.</p>	
<b>Select for all</b>	<p>(If dragging multiple elements onto the diagram at once.)</p> <p>Select the checkbox to apply the dialog settings to all multiple-selected elements being dragged onto the diagram, and to add the elements together.</p> <p>Leave the checkbox unselected to add the elements to the diagram one at a time, with the opportunity to change the dialog settings for each element.,</p>	
<b>Options</b>	<p>Click on this button to display a short menu from which you can select to:</p> <ul style="list-style-type: none"> <li>• Make your settings on this dialog the default for all drag and drop operations from the Project Browser, and</li> <li>• Display this dialog for drag and drop operations only if you press and hold ( <b>Ctrl</b> ) as you drag the element onto the diagram</li> </ul> <p>If you select the <b>Autosave selection as default</b> option, this deselects the <b>Auto Instance</b> checkbox on the Diagram &gt; Behavior page of the Options dialog. The automatic paste operation becomes whatever you have set on the Paste dialog, and is not overridden by the paste-as-instance imposed by the <b>Auto Instance</b> checkbox.</p> <p>If you select the <b>Use Ctrl + Mouse drag to display this dialog</b> option, you can drag elements from the Project Browser without displaying the dialog;</p>	<a href="#">Diagram Behavior</a> [625]

Field/Button	Detail	See also
	the paste operation complies with whatever settings you used the last time you opened the dialog. To change these settings, hold <b>Ctrl</b> as you drag an element, and edit the field values on the dialog.	
<b>OK</b>	Click on this button to complete the paste operation and close the dialog.	
<b>Cancel</b>	Click on this button to cancel the paste operation and close the dialog. If you have selected multiple elements, the first-selected element is not pasted, but the remainder are.	
<b>Cancel All</b>	(If dragging multiple elements onto the diagram at once.) Click on this button to cancel the insertion of all the multiple-selected elements being dragged onto the diagram.	
<b>Help</b>	Click on this button to display this Help topic.	

### Notes

- Not all paste options apply to all element types; for many types, the only option available is a **Link**
- When an element dragged from the Project Browser is pasted into the diagram, its default style and size is applied rather than any alternative styles and sizes used for instances of the element in other diagrams

### Learn more

#### **5.5.6.3.1 Paste Packages**

When you drag a Package element from the Project Browser onto the current diagram, you can paste it into the diagram as one of a number of different objects, by simple selection from a menu.

**Access**    **Drag existing Package(s) onto the diagram**  
**(If the Place Package on Diagram menu does not display, press ( Ctrl ) while dragging the Package)**

### Select Paste options

Option	Detail	See also
<b>Package element</b>	Paste the Package as an element representing the Package in the Project Browser (a simple link): in this case any changes to the Package are reflected in all diagrams in which it is shown.	<a href="#">Package</a> <sup>[1382]</sup>
<b>Report Specification linked to package</b>	Paste the Package as a Report Specification linked to the Package; a Report Specification is a stereotyped Document Artifact element from which you can generate a report and view the report as a linked document of that element.	<a href="#">Generate Documentation</a> <sup>[2644]</sup> <a href="#">Generate Report to an Artifact Element</a> <sup>[2680]</sup>
<b>Graph based on package contents</b>	Paste the Package as a Pie Chart or Bar Chart that you can edit to graphically represent some aspect of the Package content.	<a href="#">Chart Elements</a> <sup>[2763]</sup>
<b>Matrix profile</b>	Paste the Package as a Matrix Specification object.	<a href="#">Create Matrix Profile</a> <sup>[1744]</sup>
<b>Package as List</b>	Paste the Package as a Model View chart element that lists the elements within the Package and shows the type (by icon), name, Scope, Status and Author of each element.	<a href="#">Define a Model View Chart</a> <sup>[2765]</sup>

#### Learn more

- [Paste from Project Browser](#) <sup>[833]</sup>

### 5.5.6.4 Copy And Paste Diagram Element

#### How to

To copy a diagram element

Step	Instruction	See also
<b>1</b>	Select the element(s) to copy.	
<b>2</b>	For multiple elements: <ul style="list-style-type: none"> <li>• Right-click to open the context menu and select the <b>Copy</b> menu option</li> <li>• Press <b>Ctrl+C</b></li> <li>• Click on the <b>Copy</b> button (  ) in the Default Tools toolbar, or</li> <li>• Click on the <b>Cut</b> button (  ) in the Default Tools toolbar</li> </ul>	
<b>3</b>	For single elements, select the <b>Edit   Copy</b> menu option or alternatively press ( <b>Ctrl+C</b> ).	

Step	Instruction	See also

To paste diagram elements

Step	Instruction	See also
1	Open the diagram to paste into.	
2	<ul style="list-style-type: none"> <li>Click on the <b>Paste</b> button (  ) in the Default Tools toolbar, or</li> <li>Right-click on the diagram background to open the diagram context menu</li> </ul>	
3	Select either the <b>Paste Object(s) as New</b> menu option (completely new element) or the <b>Paste Object(s) as Link</b> menu option (reference to the existing element).	

#### Notes

- The **Date Created** and **Time Created** parameters of a pasted-as-new element are set to the current date and time; the parameters for a linked element remain the same as the copied element

#### 5.5.6.5 Move/Copy Elements To & From Floating Diagrams

If you have converted a tabbed diagram in the Diagram View into a floating diagram, you have a number of context menu options to move or copy elements between that diagram and another. The other diagram can be either another floating diagram or a tabbed diagram.

**Access** Drag element(s) between two diagrams and release mouse button

#### Move or copy selected elements

Option	Function Keys	Description	See also
<b>Move to this diagram</b>	<b>Drag+Shift</b>	Cuts the selected element or elements from the source diagram and pastes them into the target diagram.  If the moved elements are held in a different Package, when the elements are pasted each has a label underneath identifying the parent Package.	
<b>Create link on this diagram</b>	<b>Drag+Alt</b>	Creates an element or elements on the target diagram, each as an instance of a selected element on the source diagram.	
<b>Copy as New</b>	<b>Drag+Ctrl</b>	Creates an element or elements on the target diagram, each	<a href="#">Copy</a>

Option	Function Keys	Description	See also
<b>Object(s)</b>		as a copy of a selected element on the source diagram.  The Paste Element(s) as New dialog displays, on which you enter a new name for each element to identify it as a new, separate element. Click on the <b>Paste</b> button to complete the create task.	<a href="#">Elements Between Diagrams</a> 
<b>Instance (Object)</b>		Creates an element or elements on the target diagram, each as an object instance or invocation of an element on the source diagram. The source element is the classifier for the new object element.	
<b>as New Child (Generalization)</b>		Creates a new child element on the target diagram, as a generalization of the element of the source diagram.  The Element Name dialog displays for each copied element, on which you enter a new name for the element to identify it as a new, separate element.  Click on the <b>OK</b> button to complete the create task.	

#### Notes

- Multiple elements are processed individually, so if one element is 'illegal' the other elements are still copied and/or transferred
- If you select multiple elements to copy as instances or generalizations, those elements must be of the same type and stereotype
- Embedded elements are moved or copied only if they are specifically selected with the parent element

#### Learn more

- [Diagram Tabs](#)  - for information on floating diagrams
- [Window Menu](#)  - for information on floating diagrams
- [Paste from Project Browser](#)  - for information on copying, pasting and moving elements using the Project Browser

### 5.5.6.6 Place Related Elements on Diagram

To find and place related elements on the current diagram, use the Relationships window.

**Access** **Element | Relationships** (Ctrl+Shift+2)

#### Topics

Topic	Detail	See also
<b>Usage</b>	Right-click on any connector in the list to open the context menu.	

Topic	Detail	See also
	<p>If an element is not present in the current diagram, the context menu contains the <b>Place Target Element in Diagram</b> option. This is useful when you are building up a picture of what an element interacts with, especially when reverse engineering an existing code base.</p> <p>Select the <b>Place Target Element in Diagram</b> option.</p> <p>Move the cursor to the required position in the diagram and click to place the element. Alternatively, press ( <b>Esc</b> ) to cancel the action.</p>	

### 5.5.6.7 Delete Diagram

#### Delete a diagram from your model

Step	Action	See also
1	In the Project Browser, right-click on the diagram to delete. The context menu displays.	
2	Select the <b>Delete '&lt;diagram name&gt;'</b> menu option. A confirmation prompt displays.	
3	Click on the <b>OK</b> button to confirm the delete.	

#### Notes

- In Enterprise Architect there is no Undo feature for deleting diagrams, so be certain that you want to delete a diagram before you do so
- When you delete a diagram, you do not delete the elements in the diagram from the model
- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Diagrams** permission to create new diagrams
- You can also delete multiple diagrams from the Project Browser, by holding ( **Ctrl** ) or ( **Shift** ) while you select them, then right-clicking on one of them and selecting the **Delete selected items** context menu option

#### Learn more

- [Permissions List](#)<sup>[329]</sup>

### 5.5.6.8 Rename Diagram

#### How to

To rename a diagram

Step	Action	See also
1	Open the Diagram Properties dialog by double-clicking on the diagram background, or by selecting the <b>Diagram   Properties</b> menu option.	
2	In the <b>Name</b> field on the General tab, type the new name for your diagram.	
3	Click on the <b>OK</b> button to save changes.	

### 5.5.6.9 Change Diagram Type

If necessary, you can change one type of diagram to another type. This is useful if you have either made a mistake in selecting the diagram type to begin with, or if the purpose and nature of a diagram changes during analysis.

**Access** **Diagram | Advanced | Change Type**

#### Change a diagram type

Step	Action	See also
1	Open the diagram to change.	
2	Select the <b>Change Type</b> menu option. The Change Diagram Type dialog displays.	
3	Select the required diagram type.	
4	Click on the <b>OK</b> button to save changes.	

#### Notes

- Some diagram types do not transfer to others; for example you cannot change a Class diagram into a Sequence diagram

### 5.5.6.10 Diagram Navigation Hotkeys

The diagram hotkeys enable you to quickly navigate to and select elements within a diagram. The following table details the key combinations and their functionality.

Hotkey Command	Action
<b>Shift+Arrow</b> , Element(s)selected	Move the selected element(s) by increments.
<b>Arrow</b> , No element selected	Scroll around the diagram.
<b>Esc</b>	Clear the current selection.
<b>Tab</b>	Select the first element in the diagram if none currently selected.
<b>Shift+Tab</b>	Select the element with the next-lowest Z Order number (the next furthest back in the diagram).
<b>Shift</b> +click	Add the clicked element to the current selection.
<b>Ctrl</b> +click	Add the clicked element to the current selection.
<b>Ctrl+Shift</b> +drag	Pan the diagram.
<b>Alt+G</b>	Select the item in the Project Browser and give it focus.

### 5.5.6.11 Copy Image to Disk

You can copy a diagram image to a disk file in the following formats:

- Windows bitmap (256 color bitmap)
- GIF image
- Windows Enhanced Metafile (standard metafile)
- Windows Placeable Metafile (older style metafile)
- PNG format
- JPG
- TGA

#### How to

To copy a diagram image to file

Step	Action	See also
1	Open the diagram to save.	
2	Select the <b>Diagram   Save as Image</b> menu option, or press ( <b>Ctrl+T</b> ).	
3	When prompted, enter a name for the file and select an image format.	
4	Click on the <b>OK</b> button.	

#### Notes

- Enterprise Architect clips the image size to the smallest bounding rectangle that encompasses all diagram elements

### 5.5.6.12 Copy Image to Clipboard

You can copy diagram images onto the MS Windows clipboard and paste them directly into MS Word or other applications.

#### Copy an image to the clipboard

Step	Action	See also
1	Open the diagram to copy.	
2	Select the <b>Diagram   Copy Image to Clipboard</b> menu option, or press ( <b>Ctrl+B</b> ).	
3	Click on the <b>OK</b> button.  The diagram has been copied to the clipboard and can now be pasted into compatible applications or into another diagram.  You can set the clipboard format on the Options dialog ( <b>Tools   Options   General</b> ). Enterprise Architect supports bitmap or metafile format.	<a href="#">General Options</a> 

### 5.5.6.13 Copy (Duplicate) Diagram

As you develop the diagrams in your model, you might find that some of the diagrams use many of the same elements and have a similar format. You can copy and replicate the complete diagrams for minor modification, resulting in a duplicate diagram with either:

- Links back to the original diagram elements, **unless** those elements are Text, Note, Hyperlink, Lifeline or Object elements that are specific to the diagram and that are copied (*shallow mode*) or
- Complete copies of all elements in the diagram, other than Packages (*deep mode*) or
- Complete copies of all elements in the diagram that have the **same parent** as that of the diagram, and

links back to the original diagram elements for all other elements on the diagram (*smart mode*)

**Access** **Project Browser | right-click on diagram | Copy Diagram** then  
**Project Browser | right-click on Package | Paste Diagram**

#### Duplicate a diagram

Step	Action	See also
1	In the Project Browser, select the diagram to copy and select the <b>Copy Diagram</b> context menu option.	
2	Select the Package to host the new diagram, and select the <b>Paste Diagram</b> context menu option. The Copy Diagram dialog displays.	
3	In the <b>Name</b> field, type the name for the new diagram.	
4	In the Type of copy panel, click on the radio button for the type of copy you require; either: <ul style="list-style-type: none"> <li>• <b>Shallow</b></li> <li>• <b>Deep</b>, or</li> <li>• <b>Smart</b></li> </ul>	
5	Click on the <b>OK</b> button. The new diagram is automatically created with linked or new elements arranged as in the original diagram. All connectors are also copied between diagram elements where appropriate.	

#### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Diagrams** permission to copy diagrams
- You can also paste a copied diagram as a child of a composite element
- For a diagram copied in *shallow mode*, any changes to the properties of the original elements are reflected only in those elements that are copied as simple links in the pasted diagram
- For a diagram copied in *deep mode*, any changes to the properties of the original elements are not reflected in the elements in the pasted diagram
- For a diagram copied in *deep mode*, Package elements are copied as simple links only; you cannot paste as new
- For a diagram copied in *smart mode*, any changes to the properties of the original elements are reflected only in those elements that are copied as simple links in the pasted diagram

- Element position and size are independent in all copy modes

#### Learn more

- [Permissions List](#)<sup>[329]</sup>
- [Composite Elements](#)<sup>[936]</sup>

### 5.5.6.14 Z Order Elements

Z Order refers to an element's depth in the diagram perspective, and thus influences which elements appear in front of others and which appear behind.

#### Set the Z Order of an element

Step	Action	See also
1	Right-click on the element in the diagram.	
2	Select the <b>Z-Order</b> menu option.	
3	The displayed commands enable you to move the selected element back, forward, to the front of all other elements or behind all other elements.	

#### Notes

- This option enables you to change the Z order of a single element approximately in relation to the rest of the diagram; you can also select the **Modify Z Order** option from the *diagram* context menu, to review and adjust the Z Order of each element on the diagram precisely relative to each other element
- On a diagram, you can move the focus from element to element according to Z Order, by pressing **Shift+Tab**; each time you press these keys, the element with the next-lowest Z Order number is selected

#### Learn more

- [Diagram Context Menu](#)<sup>[778]</sup>

### 5.5.6.15 Set the Default Diagram

A project might have a default diagram. If set, this diagram loads when Enterprise Architect first opens the model. It is often convenient to place hyperlinks to other diagrams and resources on the default diagram, thus creating a Home Page for your model.

**Access**   **Diagram | Advanced | Make Model Default**

#### Notes

- Once you have specified a default diagram, the **Home** icon on the Diagram toolbar takes you back to that diagram from your current location in the model
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of

Enterprise Architect, if security is enabled you must have **Manage Project Settings** permission to set the model default diagram

#### Learn more

- [Diagram Advanced Menu](#)<sup>[95]</sup>
- [Diagram Toolbar](#)<sup>[138]</sup>

### 5.5.6.16 Open Package From Diagram

#### How to

To open a Package from within a diagram follow the steps below:

Step	Action	See also
1	Open a diagram that shows the Package to open.	
2	Right-click on the Package element to open the context menu.	
3	Select the <b>Open Package</b> option. Alternatively, press ( <b>Ctrl+K</b> ).	

#### Notes

- Enterprise Architect finds the Package default diagram and opens it for you; this is the first available diagram in the Package, selected in alphabetical order - for example, a diagram called Alpha in a child Package or element several levels down opens before a diagram called Beta immediately under the selected Package

### 5.5.6.17 Feature Visibility

When you set up the characteristics and features of an element, you can set a collection of options to **display** or **hide the features** of that element on a specific diagram. You can also filter the attributes and operations that are shown by **scope** - such as hiding all protected attributes - or select to hide or show **specific** attributes and operations. The visibility you set applies only to the current diagram, so a Class can appear in one diagram with all features displayed, and in another with features hidden.

It is possible to hide or show inherited attributes, operations, responsibilities, constraints and Tagged Values for elements that support those features. When the system displays **inherited** features, it creates a merged list from all generalized parents and from all realized interfaces. If a child Class redefines something found in a parent, the parent feature is omitted from the list.

**Access** In diagram, right-click element | **Feature and Compartment Visibility**, or click element, then **Element | Feature Visibility** (**Ctrl+Shift+Y**)

#### Customize feature visibility

Field/Button	Action	See also
<b>Attribute Visibility</b>	Select the checkbox against each scope that should be visible, and clear the checkbox against each scope that should not be visible.	<a href="#">General Properties of Attributes</a> 
<b>Operation Visibility</b>	Select the checkbox against each scope that should be visible, and clear the checkbox against each scope that should not be visible.	<a href="#">General Properties of Operations</a> 
<b>Show and Custom</b>	<p>Use these to show or hide specific operations or attributes.</p> <p>If you <b>select</b> the <b>Show</b> checkbox, the <b>Custom</b> button displays the Show Features in Diagram dialog; if you <b>deselect</b> the checkbox, the button displays the Suppress Features in Diagram dialog.</p> <p>The two dialogs are identical. Select the checkboxes of specific features to <i>show</i> or <i>hide</i> on the element in the diagram.</p> <p>You can also use the:</p> <ul style="list-style-type: none"> <li>• <b>Filter by Scope</b> drop-down arrow to filter the list to show only features that have a specific scope</li> <li>• <b>All</b> button to select all operations or attributes in the list</li> <li>• <b>None</b> button to clear the checkboxes against all selected operations or attributes in the list</li> </ul> <p>The <b>Show</b> checkbox, if selected, overrides the selections to display attributes or operations in the element, other than those specifically selected in the Show Features in Diagram dialog.</p>	
<b>When Resizing Elements</b>	<p>Select the appropriate option for resizing the Class, object or table to manage very wide diagram objects.</p> <p>The <b>Resize to longest Feature</b> radio button defaults to selected, so that the minimum width for a diagram object is determined by its longest displayed attribute, operation or other compartment value.</p> <p>If necessary, you can select the <b>Wrap Features</b> radio button (so that any long features are wrapped onto multiple lines) or <b>Truncate Features</b> radio button (so that long features are not displayed in full).</p>	
<b>Inherited Features</b>	If you want to display inherited attributes and/or operations as well as directly owned ones, select one or both of the <b>Show Attributes</b> and <b>Show Operations</b> checkboxes.	<a href="#">Display Inherited Attributes</a>   <a href="#">Display Inherited Operations</a> 
<b>Hide Stereotyped Features</b>	<p>If you do not want to show an object having a particular stereotype, type that stereotype name - exactly as defined - in this field; the field is case-sensitive.</p> <p>If you want to specify more than one stereotype, separate the stereotype names with a comma.</p>	

Field/Button	Action	See also
<b>Show element compartments</b>	<p>Select the checkbox against each compartment to display in the element on the diagram.</p> <p>Some technologies such as SysML define additional compartments in the element, such as for Ports, Parts and Flow Ports. Visibility of these compartments will also be controlled by a checkbox matching the name of the compartment.</p> <p>If you select the <b>Fully Qualified Tags</b> checkbox, the <i>Tags</i> compartment will contain the full provenance of each Tagged Value (if created in Enterprise Architect release 7.1 or later) where the same Tagged Value is used several times in different contexts with different values. The description in the <i>Tags</i> compartment reads:</p> <pre>&lt;Profile&gt;::&lt;Stereotype&gt;::&lt;Tagged Value name&gt;=&lt;Value&gt;</pre> <p>For example:</p> <pre>BPMN::Activity::Activity Type = Task</pre> <p>You can display an <b>informal</b> internal or composite diagram of child elements such as Ports, Parts and Classes within a compartment of the parent element, by selecting the <b>Structured Compartment</b> checkbox. The Structured Compartment acts as a container for the child elements; Classes cannot be dragged out of the compartment, and Ports and Parts are confined to the borders of the compartment.</p> <p>If you want to apply a structure and formal relationships to the child elements, create a proper Composite Structure Diagram containing the elements and select the <b>Show Composite Diagram in Compartment</b> context menu option.</p>	<p><a href="#">Add Custom Compartments to Element</a> <sup>[1604]</sup></p> <p><a href="#">Composite Elements</a> <sup>[936]</sup></p>
<b>Element Notes</b>	<p>Select the <b>Show Notes</b> checkbox to display, in the <i>Notes</i> compartment on the element in the diagram, the text that has been typed into the <b>Notes</b> field of the element Properties dialog.</p> <p>This checkbox also enables the <b>maximum chars</b> field, which defaults to 1000 as the number of characters of notes text that can be displayed. Overtyping this value to display less text or more text, as you need.</p> <p>The setting applies only to the selected elements on the diagram, so you can display full notes for the selected element whilst the other elements on the diagram have no notes text.</p> <p>You can also select the <b>Render Formatted Notes</b> checkbox to display the text on the diagram as formatted using the Notes field toolbar.</p>	<a href="#">Notes Toolbar</a> <sup>[1143]</sup>
<b>Runstate</b>	Select the checkbox if you want to hide the object runstate of the element on the diagram.	<a href="#">Object State</a> <sup>[1381]</sup>
<b>Type</b>	(Available for Ports and Parts only.) Select the checkbox if you want to	

Field/Button	Action	See also
	display the element type.	
<b>OK</b>	Click on this button to save your settings. The diagram redisplay with the appropriate level of feature visibility.	

#### Notes

- To show features for element types that do not have visible compartments, such as Use Cases and Actors, right-click on the diagram object to display the context menu and select the **Advanced | Use Rectangle Notation** option

#### 5.5.6.18 Insert Diagram Properties Note

Properties of a diagram can be displayed on screen within a custom text box. You can move this text box around and change its appearance. You cannot change what the text box says.

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>To create the note, drag the <b>Diagram Notes</b> icon from the Common page of the Toolbox onto the diagram.</p> <p>Alternatively:</p> <ul style="list-style-type: none"> <li>Select the <b>Diagram   Add Diagram Property Note</b> menu option, or</li> <li>Click on the <b>Diagram Properties Note</b> button on the UML Elements toolbar and click on the diagram</li> </ul> 	

#### Notes

- This is not the same as the diagram details note, which displays in the top left corner of the diagram if the **Show Diagram Details** checkbox is selected on the Diagram Properties dialog; you cannot move the diagram details, nor change the appearance - to hide the diagram details, deselect the checkbox

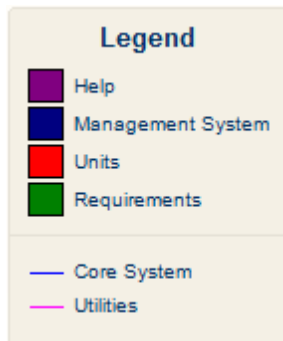

#### Learn more

- [Configure Default Appearance](#)<sup>[927]</sup>
- [Configure Diagram Display](#)<sup>[825]</sup>

### 5.5.6.19 Create Legends

A *Legend* shape identifies colors and styles you have used to group other elements on the diagram. You can use the Legend to assist in distinguishing different elements, connectors or systems on the diagram. For example, the Legend could show that all elements concerned with the management system are shaded in blue, and all outcomes connectors are shown in red. The Legend displays as a key to the diagram, with the filled shape styles first and the lines and connector styles underneath.

You add a Legend to the diagram, then edit it to add Legend elements, which define the colors and styles used in the diagram.

To add a Legend to a diagram, drag the *Diagram Legend* element from the Common page of the Toolbox onto the diagram (or click on the **New Diagram Legend** icon (  ) on the UML Elements toolbar, and click on the diagram).

To edit the Legend either double-click on the Legend or Right-click on the Legend and select the **Properties** context menu option.

#### 5.5.6.19.1 Legend Properties

**Access** Drag the Diagram Legend element from the Common page of the Toolbox onto the diagram

#### **Use to**

- Add a Legend to a diagram

#### **Reference**

Field	Usage	See also
<b>Name</b>	Indicates a name for an element displayed within a legend.	
<b>Fill Color</b>	Indicates a fill color for an element within a legend.	
<b>Line Color</b>	Indicates a line color for an element within a legend.	
<b>Line Thickness</b>	Denotes the line thickness of an element within a legend.	

<b>Style Options</b>	Allows further alteration options to the legend appearance.	<a href="#">Style Options</a> 
<b>Fill</b>	Indicates that a fill element is to be created/modified.	
<b>Line</b>	Indicates that a line element is to be created/modified.	
<b>Hand (Up)</b>	If more than one element is present within a legend, this button moves a highlighted element up one entry within the description list.	
<b>Hand (Down)</b>	If more than one element is present within a legend, this button moves the highlighted element down one entry within the description list.	
<b>New</b>	Add a new element to the legend.	
<b>Save</b>	Saves an element and adds it to the description list.	
<b>Delete</b>	Deletes an element from the description list.	
<b>Description List</b>	Specifies the current elements created within the legend.	

#### Notes

- The Legend dialog enables you to add, delete, modify or re-sequence Legend elements; use the Fill tab to define the Legend elements for shapes, then click on the Line tab to define Legend elements for lines and connectors

#### **5.5.6.19.2 Style Options**

Click on the **Style Options** button ( ... ) to display the Style Options dialog, on which you can modify a Legend title, font size, background color and border color. If you choose default options for the colors, the Legend automatically assumes colors based on the diagram background color.

Access    **Legend dialog > (...)**

#### Modify appearance of a Legend

Field	Action	See also
<b>Legend Title</b>	Indicates the title of the Legend.	

<b>Heading Size</b>	Indicates the size of the font for a Legend.	
<b>Font Color</b>	Indicates the font color the Legend is to use.	
<b>Background</b>	Indicates the background color the Legend is to use.	
<b>Border Color</b>	Indicates the border color the Legend is to use.	

### 5.5.6.20 Autosize Elements

You can autosize an element or group of elements in a diagram to the default size for the element type (for a Class, 90 x 70 pixels at 100% zoom). However, if the element contains more information than the default size can show (such as a long name, long attributes or additional compartments) the autosize option resizes the element to the minimum size for revealing the information.

The size change effectively operates around the mid point of each element, so the layout and size of the diagram do not change. Automatically changing the layout of a diagram is a different process.

#### Autosize elements

Step	Action	See also
<b>1</b>	Select the elements to resize; (press <b>Ctrl+A</b> to select all).	
<b>2</b>	Either: <ul style="list-style-type: none"> <li>Right-click on any of the elements and, on the context menu, select the Autosize menu option, or</li> <li>Press <b>Alt+Z</b></li> </ul>	

#### Notes

- Not all elements resize: elements such as Events remain the same; Timing and Sequence diagrams (where position is crucial) are unchanged; and elements added from a profile or Shape Script maintain any size definitions imposed by the profile
- With an element image created with a Shape Script that contains a defSize command, **Autosize** returns the element to the defSize value and not the element default size

#### Learn more

- [Lay Out a Diagram Automatically](#)<sup>[89]</sup>
- [defSize command](#)<sup>[159]</sup>

### 5.5.6.21 Swimlanes

**Swimlanes** are vertical or horizontal bands in a diagram, which divide the diagram into logical areas or **partitions**. You can apply them to all Enterprise Architect diagram types. Activities relating to particular entities within the model (such as the User, or the back end Repository) can be placed within the same Swimlane to indicate their association. You set up the Swimlanes using the Swimlanes, Matrix and Kanban dialog.

**Access** [Diagram | Swimlanes, Matrix and Kanban > Swimlanes](#)

#### Options

Field/Option/ Button	Action	See also
<b>Active</b>	Select this checkbox to make the Swimlane facilities active on the diagram, as opposed to the Matrix or Kanban facilities.	<a href="#">Swimlanes Matrix</a> <sup>[854]</sup> <a href="#">Kanban Facilities</a> <sup>[857]</sup>
<b>Orientation</b>	Click on the drop-down arrow and select the orientation of the Swimlanes: <b>Vertical</b> or <b>Horizontal</b> .	
<b>Line Color</b>	Click on the drop-down arrow and select the color in which to display all Swimlane borders.  If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.	<a href="#">Standard Colors</a> <sup>[616]</sup>
<b>Font Color</b>	Click on the drop-down arrow and select the color in which to display all Swimlane text.  If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.	
<b>Line Width</b>	Click on the drop-down arrow and select the line width of all Swimlane borders - either <b>1</b> (thinnest), <b>2</b> or <b>3</b> (thickest).	
<b>Locked</b>	Select this checkbox to prevent the Swimlanes in the diagram from being made narrower or wider.	
<b>Bold Font</b>	Select this checkbox to display all Swimlane text in bold.	
<b>Hide Classifier</b>	Select this checkbox to block all Swimlane classifier names from being shown on the diagram.	

<b>Hide Names</b>	Select this checkbox to block all Swimlanes names from being displayed on the diagram.	
<b>Show Names in Title Bar</b>	(If the <b>Orientation</b> field is set to <b>Vertical</b> .) Select this checkbox to display each Swimlane name in the title bar, above the Swimlane.	
<b>Swimlanes</b>	This panel lists the currently defined Swimlanes, in the sequence (top to bottom) in which they are displayed on the diagram (left to right, or top to bottom).	
<b>New</b>	Click on this button to begin defining a new Swimlane for the diagram.  The Swimlane Details dialog displays, on which you provide the name, classifier and background color of the Swimlane.	<a href="#">Swimlane Details</a> <small>853</small>
<b>Hand (Up)</b>	Click on this button to move a selected Swimlane one position up in the <b>Swimlanes</b> list.	
<b>Hand (Down)</b>	Click on this button to move a selected Swimlane one position down in the <b>Swimlanes</b> list.	
<b>Modify</b>	Click on this button to change the name, classifier or background color of a selected Swimlane.  The Swimlane Details dialog displays.	<a href="#">Swimlane Details</a> <small>853</small>
<b>Delete</b>	Click on this button to delete a selected Swimlane from the <b>Swimlanes</b> list and from the diagram. A prompt displays for you to confirm the deletion.	
<b>OK</b>	Click on this button to save and apply your changes, and close the dialog.	
<b>Cancel</b>	Click on this button to abort your changes, and close the dialog.	

**Notes**

- If you set a background color for a swimlane, it takes on the same shading profile as the main diagram background

**5.5.6.21.1 Swimlane Details**

You use the **Swimlane Details** dialog to define a Swimlane on a diagram.

**Access** **Diagram | Swimlanes, Matrix and Kanban > Swimlanes: New** or **Modify**

Options

Field/Options/ Button	Action	See also
<b>Name</b>	Type a name for the Swimlane.	
<b>Classifier</b>	(Optional) Click on the <b>Browse ( ... )</b> button to browse for and select a classifier for the Swimlane.  To delete a previously-assigned classifier, click on the <b>Browse</b> button and select the <b>&lt;none&gt;</b> option.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Back Color</b>	Click on the drop-down arrow and select the color in which to display the Swimlane background.  If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.	<a href="#">Standard Colors</a> <sup>[616]</sup>
<b>OK</b>	Click on this button to save and apply your changes, and close the dialog.	
<b>Cancel</b>	Click on this button to abort your changes, and close the dialog.

- [Swimlanes](#)<sup>[852]</sup>

**5.5.6.22 Swimlanes Matrix**

On any type of Enterprise Architect diagram, you can develop a **Swimlanes Matrix** to divide your diagram into cells at the intersections of columns and rows. This Matrix is based on the Zachman Framework. The top left cell of the Matrix contains the heading text, the cell at the top of each column contains the column title text and the cell at the left of each row contains the row title text.

You can define only one Matrix Heading cell, but you can create as many row and column headings as you need. You can also leave the column width and row height adjustable on the diagram, or fix the positions so that the cell borders cannot be moved.

**Access** [Diagram | Swimlanes, Matrix and Kanban > Matrix](#)

Options

Field/Option/ Button	Action	See also
<b>Active</b>	Click on this checkbox to set the diagram to use the defined Matrix facilities, as opposed to any Swimlanes or Kanban facilities that have also been defined.	<a href="#">Swimlanes</a> <sup>[852]</sup> <a href="#">Kanban</a>

		<a href="#">Facilities</a> <sup>857</sup>
<b>Type</b>	Click on the drop-down arrow and select <b>Heading</b> , <b>Column</b> or <b>Row</b> to apply your field settings to the Matrix heading cell, a column heading or a row title, respectively.	
<b>Title #</b>	<p>Type in a title name. You can provide one, two or three title names per heading to, for example, group a set of columns or rows.</p> <p>There is no effective limit on the length of the text string but it <b>does not wrap</b>, so to display the full text you might have to drag the cell borders out to create a wide cell. Alternatively, you can divide the text string between the <b>Title</b> fields to reduce the overall cell width.</p>	
<b>Color</b>	<p>Click on the drop-down arrow and select the color in which to display the text in the heading, row or column title.</p> <p>If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.</p>	<a href="#">Standard Colors</a> <sup>616</sup>
<b>Font</b>	<p>Click on this button to display the Font dialog, through which you define the font and style, size and effects of the text in the Matrix header, column and row titles.</p> <p>If you also change the text color here, it overrides the setting of the <b>Color</b> field (above).</p>	<a href="#">Set Element Font</a> <sup>949</sup>
<b>Hidden</b>	Select this checkbox to hide the corresponding Matrix header, row or column <b>Title</b> text on the diagram.	
<b>Back Color</b>	<p>Click on the drop-down arrow and select the color in which to display the heading cell, row or column background.</p> <p>If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.</p>	
<b>Hide Item</b>	Select this checkbox to hide the Matrix heading cell, row or column on the diagram.	
<b>Model Profiles</b>	<p>Click on the drop-down arrow and select:</p> <ul style="list-style-type: none"> <li>An existing Profile to override the current contents of the dialog</li> <li><b>Empty Profile</b> to clear the fields so that you can define a matrix to save as a new Profile (see <b>Model Profiles: Save</b>, below)</li> </ul>	
<b>Model Profiles : Save</b>	<p>Click on this button to save the current dialog contents as a new Profile.</p> <p>A prompt displays for you to assign a name to the Profile.</p>	

<b>Model Profiles : Delete</b>	Click on this button to delete the currently-displayed user-defined Matrix Profile from the drop-down list.	
<b>Lock</b>	Select this checkbox to prevent the Matrix rows and columns in the diagram from being resized.	
<b>Line Widths</b>	Click on the drop-down arrow and select the line width of all row and column borders - either <b>1</b> (thinnest), <b>2</b> or <b>3</b> (thickest).	
<b>Matrix list</b>	<p>Lists the components of the current Matrix Profile, starting with the Heading and followed by the columns and then the rows. For each item, the list shows the first title (<b>Title 1</b>) whether it is visible on the diagram, and what type it is.</p> <p>The columns are listed in the order in which they are displayed, left to right, on the diagram.</p> <p>The rows are listed in the order in which they are displayed, top to bottom, on the diagram.</p>	
<b>Hand (Up)</b>	<p>Click on this button to move a selected column or row one position up in the Matrix list. You cannot move a Column item above the Heading item, or a Row item above a Column item.</p> <p>When you save the changes, on the diagram the selected column or row is moved left or up one place.</p>	
<b>Hand (Down)</b>	<p>Click on this button to move a selected column or row one position down in the Matrix list. You cannot move the Heading item below a Column item, or a Column item below a Row item.</p> <p>When you save the changes, on the diagram the selected column or row is moved right or down one place.</p>	
<b>New</b>	Click on this button to clear the dialog fields so that you can add a new column or row item to the Matrix.	
<b>Copy</b>	<p>Click on this button to copy a selected item from the list so that you can give it a <b>new Title 1</b> and edit it as a new item.</p> <p>If you change the item, it is added to the list when you click on the <b>Save</b> button.</p>	
<b>Delete</b>	Click on this button to delete a selected item from the list. The column or row is removed from the list and diagram, which both close up.	
<b>OK</b>	Click on this button to save and apply your changes, and close the dialog.	

<b>Cancel</b>	Click on this button to abort your changes, and close the dialog.	

### Notes

- When you define columns and rows, you define the header or title cells; the properties of these cells do not reflect on the matrix cells themselves - for example, the intersection cell of a column and row has a transparent background and therefore takes the color and shading effect of the diagram background
- You can transport the Swimlanes Matrix Profiles between models (as Diagram Matrix Profiles), using the **Export Reference Data** and **Import Reference Data menu** options
- By applying a Matrix Profile to a diagram, you replace the current profile; save the current profile to avoid losing it
- To size the rows and columns, drag the row and column borders on the diagram - elements placed inside each cell are shifted when sizing; to prevent the elements shifting, press and hold ( **Ctrl** ) while sizing

### Learn more

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 5.5.6.23 Kanban Facilities

Using the **Kanban** project management methodology, you might work on tasks or the objects of tasks organized on a chart according to the value of a project management property, such as Phase, Version or Status. Your work on the task is represented by **moving** the corresponding element to a different position on the chart, which reflects the change in status of the selected project management property of that element.

In Enterprise Architect, you can apply a form of this methodology to your project administration diagrams to monitor and manage the flow of work in a particular area. You can develop the chart to divide your diagram into a series of vertical lanes that represent the status of the elements in the organization of work. Dragging the elements from one lane to another automatically applies the change in value of the selected status indicator property of the element, which can also be a Tagged Value (of type **Enumeration** or **String**).

**Access** **Diagram | Swimlanes, Matrix and Kanban > Kanban**

### Define the Kanban chart

Field/Option/ Button	Action	See also
<b>Active</b>	Click on this checkbox to set the diagram to use the defined Kanban chart, as opposed to any Swimlanes or Swimlane Matrix facilities that have also been defined.	<a href="#">Swimlanes</a> <sup>[852]</sup> <a href="#">Swimlanes Matrix</a> <sup>[854]</sup>
<b>Line Color</b>	Click on the drop-down arrow and select the color in which to display	

	<p>lane borders.</p> <p>If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.</p>	<a href="#">Standard Colors</a> 
<b>Font Color</b>	<p>Click on the drop-down arrow and select the color in which to display the text in the Kanban lane headings.</p> <p>If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.</p>	
<b>A</b>	<p>Click on this button to display the Font dialog, through which you define the font and style, size and effects of the text in the Kanban lane headings.</p> <p>If you also change the text color here, it overrides the setting of the <b>Font Color</b> field (above).</p>	<a href="#">Set Element Font</a> 
<b>Title Color</b>	<p>Click on the drop-down arrow and select the color with which to fill the lane heading cells.</p> <p>If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.</p>	<a href="#">Standard Colors</a> 
<b>Overfilled Color</b>	<p>Click on the drop-down arrow and select the color with which to fill a Kanban column if it contains more than the maximum number of elements. You set the maximum number of elements when you define the specific columns to work with, in the <b>Swimlanes</b> panel.</p> <p>If the color you require is not shown, click on the <b>Other</b> button and either select from a wider range of standard colors or define a custom color.</p>	
<b>Line Width</b>	Click on the drop-down arrow and select the line width of the Kanban lane borders - either <b>1</b> (thinnest), <b>2</b> or <b>3</b> (thickest).	
<b>Locked</b>	Select this checkbox to prevent the lanes in the diagram from being made narrower or wider. You cannot change the depth of the header cell even if this checkbox is clear.	
<b>Bold Font</b>	Select this checkbox to display the lane headings in bold (if their font definition does not already set them to bold).	
<b>Hide Names</b>	Select this checkbox to hide the names displayed in the lane heading cells (but not the heading cells themselves).	
<b>Hand Drawn</b>	Select this checkbox to display the Kanban lanes and the elements on	<a href="#">Configure</a>

	the diagram in Hand-drawn mode.	<a href="#">Diagram Display</a> <sup>825</sup>
<b>Show Names in Title Bar</b>	<p>Select this checkbox to display the Lane names in diagram title bar, above the lanes.</p> <p>This option is not available if the <b>Hide Names</b> checkbox is selected.</p>	
<b>Enable Overfill Highlight</b>	Select this checkbox to apply the overfilled color (above) to the lane if it contains more elements than the defined maximum number (see <b>New</b> , below).	
<b>Value</b>	<p>Click on the <b>Browse</b> button ( ... ) and select, firstly, the type of property to test for in assigning elements to lanes, either:</p> <ul style="list-style-type: none"> <li>• <b>Element</b> Properties</li> <li>• <b>Tagged Value</b> (Enumeration or String types only)</li> <li>• <b>None</b> (if you want to <b>manually</b> manage elements on the basis of some value that is not captured in the element properties or Tagged Values)</li> </ul> <p>If you select <b>Element</b>, also select one of the properties <b>Phase</b>, <b>Version</b>, <b>Priority</b> (for Requirement-type elements) and <b>Status</b>.</p> <p>If you select <b>Tagged Value</b>, also choose to either <b>Create</b> a new tag (and simply type in the name) or <b>select</b> an existing one. In the latter case, the Kanban tagged value selection dialog displays.</p> <p>On the dialog, click on the appropriate radio button to either select from a list of <b>Global Tagged Values</b>, or from a list of <b>Tagged Values from a selected element</b>; click on the <b>Select Element</b> button to browse for the element anywhere in the model.</p> <p>In the <b>Tagged Value</b> field, click on the drop-down arrow and select the reference Tagged Value from those listed. Click on the <b>OK</b> button.</p> <p>The <b>Value</b> field now displays either the element property or the Tagged Value you have selected.</p>	
<b>New</b>	<p>Click on this button to define a new lane on the Kanban chart. The Kanban Lane Details dialog displays:</p> <ul style="list-style-type: none"> <li>• In the <b>Name</b> field, click on the drop-down arrow and select the property value that the lane represents and that the lane title will reflect; the drop-down list generally provides a list of appropriate values, but you can type in <b>other values</b> if necessary</li> <li>• In the <b>Max Items</b> field, leave the value set to <b>0</b> if you do not want to limit the number of elements that can be placed in a lane, or type in the maximum number allowed; <b>if</b> this number is exceeded <b>AND</b> you have selected to highlight an overfill with a different lane color (see <b>Enable Overfill Highlight</b> above) the lane will change to that overfill color</li> <li>• Click on the <b>OK</b> button to add the lane definition to the Swimlanes list and the lane to the diagram; the lane name and fill limit display in the title cell at the top of the lane</li> </ul>	

<b>Modify</b>	Click on an entry in the Swimlanes list and click on this button to display the Kanban Lane Details dialog for that lane, and to change the details as necessary (see <b>New</b> , above).	
<b>Delete</b>	Click on an entry in the Swimlanes list and click on this button to delete the lane definition and clear the lane from the diagram. A prompt displays for you to confirm the deletion.	
<b>Swimlanes</b>	This panel lists the currently defined lanes, in the sequence (top to bottom) in which they are displayed on the diagram (left to right).	
<b>Hand (Up)</b>	Click on an entry in the Swimlanes list and click on this button to move the entry one line <b>up</b> in the list, and one lane to the <b>left</b> on the diagram.	
<b>Hand (Down)</b>	Click on an entry in the Swimlanes list and click on this button to move the entry one line <b>down</b> in the list, and one lane to the <b>right</b> on the diagram.	
<b>OK</b>	Click on this button to save and apply your changes, and close the dialog.	
<b>Cancel</b>	Click on this button to abort your changes, and close the dialog.	

### Notes

- The elements in a Kanban chart **individually** represent work in progress; you cannot **create** connectors between elements on the chart
- If you apply a Kanban chart to a current diagram, all connectors on the diagram are hidden; when you de-activate the chart, the connectors are shown again
- When you first set up a Kanban chart, any element that does not have a property value represented on the chart is moved to the right-hand side of the chart
- Moving an element into a lane **automatically sets** the appropriate property of that element to the value represented by the **lane**; for a Tagged Value, if the element does not have that tag, adding the element to the lane adds the tag and sets it to the lane value
- Elements on a Kanban chart are automatically adjusted to match the width of the lane they are in, both when the element is moved into a lane and when the lane width is changed
- All elements added to a Kanban chart initially have the same height and spacing, but the height can change as displayable information is added to an element

#### 5.5.6.24 Using the Image Manager

When you add an element to a diagram, it is rendered according to the standard UML notation. However, you can replace that representation with an image. For example, you could add a custom background image to a diagram, or display an image of a Router or PC on a UML element. You import, store and select these alternative images using the Image Manager.

**Access** Right-click on an element within a diagram | **Appearance** | **Select Alternate Image (Ctrl+Shift+W)**

To locate and display an image, click on individual image filenames, or press ( ↑ ) and ( ↓ ) to scroll through the list of images. As you highlight each image filename, the Preview panel changes to reflect the image. Double-click on the required image filename to display the image in full size.

### Image Manager Options

On the Image Manager dialog, the following buttons are available:

Button	Usage	Shortcut	See also
<b>View</b>	Display the selected image in full size.	<b>Alt+V</b>	
<b>Usage</b>	Display the Element Usage dialog, which lists the diagrams in which the selected image is used.		<a href="#">Element Usage</a> <sup>[910]</sup>
<b>Rename</b>	Change the filename of the selected image.  The option first warns you that the change would impact the other elements that use this image, and prompts you to confirm that you want to go ahead with the name change.  If you continue, a prompt displays for you to enter the new filename.		<a href="#">Changing Element Appearance</a> <sup>[948]</sup>
<b>Add New</b>	Browse appropriate directories to search for and import new images.  You can import images in .BMP, .PNG, .EMF, .WMF, .TGA, .PCX or .JPG format.  Internally, the images are stored in .PNG or metafile format to conserve space.  You can also add images by: <ul style="list-style-type: none"> <li>Importing a library of alternative images from the Sparx Systems website</li> <li>Copying the Image Library from another model using the Export and Import Reference Data facilities, and</li> <li>Capturing images from other sources into the clipboard and importing them into the Image Library (these are autonamed when they are added to the Image Library)</li> </ul> If necessary, you can change the file name using the <b>Rename</b> option (above).	<b>Alt+A</b>	<a href="#">Import Image Library</a> <sup>[864]</sup> <a href="#">Export Reference Data</a> <sup>[376]</sup> <a href="#">Import Reference Data</a> <sup>[380]</sup> <a href="#">Appearance Menu Section</a> <sup>[948]</sup>
<b>Update Selected</b>	Refresh the selected image; for example, after it has been modified.	<b>Alt+U</b>	
<b>Delete</b>	(Not available for an image from a deployed MDG	<b>Alt+D</b>	

Button	Usage	Shortcut	See also
	<p>technology.)</p> <p>Delete the selected image.</p> <p>A message displays to indicate how many elements use the image. Click on the <b>Continue</b> button to delete information about the image from those elements, which then revert to their previous appearance.</p>		
<b>Cancel</b>	Close the Image Manager dialog.		
<b>OK</b>	Confirm selection of the alternative image for the element selected in the diagram.	<b>Alt+O</b>	

### Notes

- For elements with lifelines, such as those used on Sequence diagrams, the Lifeline must remain intact to enable messages to be created between the elements; therefore such elements cannot have alternative images
- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Configure Images** permission to configure alternative element images
- There are two categories of image available through the Image Manager:
  - Images that have been imported into the model and are stored in the model
  - Images that are incorporated into a deployed MDG technology, which are not copied into the current model but are held in memory; the technology images can be identified by the technology name followed by the image file name, such as *MDGFrame::ovalshape.emf*, but can also be accessed by their short form (the name minus the technology name)
- If you are creating many elements of the same type that have a particular image, you should use a custom stereotype with an associated metafile
- If an element has an image, the element name is likely to be hidden; you can display the name **underneath** the image by right-clicking on the element and selecting **Appearance | Show Name Under Image**, and hide it again by selecting **Appearance | Hide Name Under Image**
- You can transport image files between models, using the **Export Reference Data** and **Import Reference Data** options

- [Custom Stereotype](#)<sup>[1452]</sup>

#### 5.5.6.24.1 Create Custom Diagram Background

Enterprise Architect diagrams have a single-color 'wash' background that you can set to a solid color or a fade gradient down the screen. You set the color and whether to have a fade gradient using the Diagram - Gradients and Backgrounds page of the Options dialog. You can also select a system-defined tile background for your diagrams.

Alternatively, using the Image Manager dialog, you can create a **customized** tiled or non-tiled background for your diagrams.

##### Create a customized background

Step	Action	See also
1	Create a Boundary object from the Use Case Elements page of the Toolbox; do not use the Boundary element from any other section of the Toolbox.	<a href="#">System Boundary</a> <a href="#">Toolbox</a>
2	Stretch the Boundary to a size that can contain all of the elements you intend to place on the diagram, and drag it to the edges of the diagram workspace.	
3	Right-click on the Boundary element and select the <b>Z-Order   Send to Bottom</b> context menu option.  This ensures that the Boundary is not displayed in front of any other element in the diagram.	
4	Either: <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+Shift+W</b> ), or</li> <li>Right-click on the Boundary to display the context menu, and select the <b>Appearance   Alternate Image</b> menu option</li> </ul>	
5	On the Image Manager dialog, select an appropriate image as the diagram background and ensure that the image size is large enough to span the required size of the diagram background.	<a href="#">Image Manager</a>
6	When you have selected the required image, click on the <b>OK</b> button.  Alternatively, you can copy an image from another source onto the Windows clipboard, right-click on the Boundary element in the Enterprise Architect diagram, and select the <b>Appearance   Apply Image From Clipboard</b> context menu option.

- [Diagram Gradients and Backgrounds](#)

#### 5.5.6.24.2 Import Image Library

Using the Image Library enables you to create attractive diagrams with custom images. A bundled clip art collection of UML-based images is available as an Imported Image Library, from the Sparx Systems website. Image libraries enable you to import a collection of images into the Image Manager in one process.

##### How to

To import the Image Library, follow the steps below (before starting, you must have a suitable Image Library file):

Step	Action	See also
1	Download the Image Library from the Sparx Systems website.	<a href="http://www.sparxsystems.com/resources/image_library.html">www.sparxsystems.com/resources/image_library.html</a>
2	Select the <b>Project   Model Import/Export   Import Reference Data</b> menu option. The Import Reference Data dialog displays.	
3	Locate the XML Image Library file to import using the <b>Select File</b> button. The file name is <i>ImageLibrary.xml</i> in the directory in which you saved the file.	
4	Select the data set containing the Image Library. Then click on the <b>Import</b> button.	

To use the images contained within the Image Library

Step	Action	See also
1	Create a diagram to associate with the images contained in the Image Library.	
2	Select the element to change from the default appearance to one of the images contained within the library.	
3	Either: <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+Shift+W</b> ), or</li> <li>Right-click on the selected element and select the <b>Appearance   Select Alternate Image</b> context menu option</li> </ul>	

Step	Action	See also
4	On the Image Manager dialog, in the <b>Name</b> field highlight the appropriate image name and click on the <b>OK</b> button.	

### Notes

- Images contained within the Image Library are copyright of Sparx Systems, are only available for use in conjunction with Enterprise Architect, and are supplied on the understanding that they are not used under any other circumstance

### 5.5.6.25 Show Realized Interfaces of Class

You can display each interface directly realized by a Class as a 'lollipop' style interface node, which protrudes from the left-hand side of the Class. Connectors can be directly attached to the node, indicating usage of the interface part of the Class or component. See the example below:

### Topics

Topic	Detail	See also
<b>Explanation</b>	<p>In this example, <i>Class2</i> realizes <i>Interface1</i> and <i>Interface2</i> as represented by the interface nodes protruding from the Class.</p> <p><i>Class1</i> is dependent on these two interfaces, which is shown by the Dependency connectors linking to the nodes.</p> <p>To show nodes for the interfaces a Class realizes, as in the above diagram, right-click on the Class and select the <b>Features &amp; Properties   Show Realized Interfaces</b> context menu option.</p> <p>This setting only applies to the selected Class, and can be changed at any time.</p>	

### 5.5.6.26 Manage Object Labels

When you create certain elements or connectors, some of the properties of the created object are displayed on the diagram as labels offset from the object. For example, the following display as labels:

- Embedded element name
- Run state, attributes and operations (if they exist) of an element that has an alternative image
- Connector name, stereotype, constraints and/or source and target role names

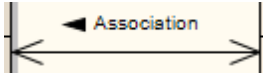

You can format and hide these labels using the **Labels** context menu.

**Access**    **Right-click on a label**

#### Options - For element labels

Option	Usage	Shortcut	See also
<b>Set Label Color</b>	Displays the Color dialog, from which you select a standard or custom color in which to display the label text.		
<b>Hide Label</b>	Hides the label on the diagram; to unhide the label, right-click on the element and select the <b>Appearance   Show labels</b> context menu option.		<a href="#">Changing Element Appearance</a> [948]
<b>Bold</b>	Displays the label text in bold.		
<b>Label Rotation</b>	(For embedded elements.) Orients the label in the horizontal (default) or vertical planes, with options to rotate the text in the vertical plane either clockwise or anti-clockwise.		
<b>Text Alignment</b>	Aligns the text to the left, center or right of the label text area. This is more apparent where there are several items of text in the label, of different lengths.		
<b>Default Position</b>	Moves the label to the position it was initially created in, relative to the parent element.		
<b>Default Color</b>	Sets the label color to the default color in which it was first created.		

#### Options - For connector labels

Option	Usage	Shortcut	See also
<b>Edit Label</b>	Displays the text within a small editing box, with the cursor within the text. Delete or add text as appropriate.	<b>F2</b>	
<b>Set Label Color</b>	Displays the Color dialog, from which you select a standard or custom color in which to display the label text.		
<b>Hide Label</b>	Hides the label on the diagram.  To unhide the label, right-click on the connector and select the <b>Visibility   Set Label Visibility</b> <sup>[1122]</sup> context menu option. Select the checkbox against each label to redisplay.		<a href="#">Hide/Show Labels</a> <sup>[1122]</sup>
<b>Bold</b>	Displays the label text in bold.		
<b>Label Rotation</b>	Orients the label in the horizontal (default) or vertical planes, with options to rotate the text in the vertical plane either clockwise or anti-clockwise.		
<b>Text Alignment</b>	Aligns the text to the left, center or right of the label text area. This is more apparent where there are several items of text in the label, of different lengths.		
<b>Direction</b>	Sets or clears a small arrow at the end of the label. You can choose to set the arrow pointing to the label source or destination.    This is part of the label, so if there is no label text (or if the label consists only of spaces) there is no direction indicator.		
<b>Default Position</b>	Moves the label to the position it was initially created in, relative to the parent connector.		
<b>Default Color</b>	Sets the label color to the default color in which it was first created.		

### Notes

- As labels can be concentrated on and around the element or connector, make sure that you click on a section of the required label that is clear of any other label or structure
- The Label Rotation option is not currently available for stereotyped elements and connectors

- [Connector Properties](#)<sup>[1126]</sup>

**5.5.6.27 Pan and Zoom a Diagram**Topics

Topic	Detail	See also
<b>Pan</b>	<p>Pan across the Diagram View in the following ways:</p> <ul style="list-style-type: none"> <li>• Use ( ← ), ( → ), ( ↑ ), ( ↓ ), ( <b>Page Up</b> ), ( <b>Page Down</b> ), ( <b>Home</b> ) and ( <b>End</b> ) when the Diagram View is selected</li> <li>• Use the scrollbars</li> <li>• Use the middle mouse button</li> <li>• Use the Pan &amp; Zoom window</li> </ul>	<a href="#">Pan &amp; Zoom Window</a> <sup>[698]</sup>
<b>Zoom</b>	<p>You can zoom into and out from a diagram using the zoom buttons on the diagram toolbar, or by using the <b>Diagram   Zoom</b> submenu.</p>  <p>Change the zoom level by 10% by clicking on either the <b>Zoom In (+)</b> or <b>Zoom Out (-)</b> buttons.</p> <p>Alternatively, select the <b>Zoom In</b> or <b>Zoom Out</b> options from the <b>Diagram   Zoom</b> submenu.</p> <p>There are three ways to return the diagram to 100%:</p> <ul style="list-style-type: none"> <li>• Click on the  button</li> <li>• Select <b>Zoom to 100%</b> from the <b>Diagram   Zoom</b> submenu</li> <li>• ( <b>Ctrl</b> ) + middle-click the mouse</li> </ul>	

Notes

- You can zoom in and out of the main window dynamically by holding ( **Ctrl** ) and rolling the mouse wheel
- Changes in diagram magnification through the zoom options can be saved as permanent changes to the diagram
- At high levels of zoom, element features cease to display. This is because of the difficulty the Windows font mapper has in choosing a font for extreme conditions, and the result can look odd

### 5.5.6.28 Move Elements In Diagram Sections

As you build up a diagram, you might find that you have to move part of the diagram up, down or to one side. You can do this in one of two ways:

#### Topics

Topic	Detail	See also
<b>Moving Elements</b>	<ul style="list-style-type: none"> <li>Hold the left mouse button down and drag over a group of elements to move (creating an outline around the elements), then click on an element in the outline and move the group as required</li> <li>Press ( <b>Alt</b> ) and click on the diagram, then drag the cursor to move everything beyond the cursor in the direction of the movement.</li> </ul> <p>The first method enables you to reposition groups of elements within the larger diagram. The second method enables you to create space within the diagram without pushing some elements into others, as might happen if you cannot see the whole diagram on one screen.</p> <p>When you press ( <b>Alt</b> ) and click on the diagram, as you move the cursor a line displays on the diagram just behind the cursor. If you are moving the cursor left, everything to the left of the line moves with the cursor. If you move the cursor up, everything above the line moves up.</p> <p>However, if you move the cursor diagonally, two lines display to create a quadrant, and everything within the quadrant moves. For example, if you move the cursor left and down, everything below and left of the cursor moves.</p>	
<b>Fine Movement</b>	To adjust (or 'nudge') the position of a single element or a selected group of elements, press ( <b>Shift</b> ) + ( <b>→</b> ), ( <b>←</b> ), ( <b>↑</b> ) or ( <b>↓</b> ).	

### 5.5.6.29 View Last and Next Diagram

Enterprise Architect enables you to step backwards and forwards through the currently-open diagrams, including the Start Page.

#### Topics

Topic	Detail	See also
<b>Usage</b>	 <p>To view the previous or next diagram use the <b>Previous</b> or <b>Next</b> buttons on the Diagram toolbar.</p> <p>Use the <b>Home</b> button to display the default project diagram (if one has been specified).</p>	<a href="#">Default Project Diagram</a> <sup>[844]</sup>

### 5.5.6.30 Set Up Diagram Page

You can change the size of the diagram area (or scrollable/printable area) using the Diagram Properties dialog.

#### How to

To set the page size

Step	Action	See also
1	Load a diagram.	
2	Double-click on the background to open the Diagram Properties dialog.	
3	Click on the Diagram tab and, in the Appearance panel ensure that the <b>Show Page Border</b> checkbox is selected.	
4	On the Page Setup panel, click on the <b>Advanced</b> button. The Print Advanced dialog displays.	
5	Click on the <b>Page Setup</b> button. The Page Setup dialog displays. As you adjust the settings on this dialog, the page icon at the top illustrates the effects of your changes.	
6	In the <b>Size</b> field, click on the drop-down arrow and select an appropriate page size.	
7	In the Orientation panel click on the radio button for the orientation of the page to print.	
8	In the <b>Margins</b> panel, type the required left, right, top and bottom page margins for the diagram, in inches.	
9	Click on the <b>OK</b> button on the Page Setup dialog, the Print Advanced dialog, and the Diagram Properties dialog, in turn.  The area within the page boundary lines on your diagram is expanded or reduced accordingly. When you print or print preview, the output is cropped to these boundary lines and the diagram divided between the necessary number of pages.	

#### Topics

Topic	Detail	See also
<b>Setting the Default Paper Size for New Diagrams</b>	<p>You can set the default paper size for new diagrams on the Diagram page of the Options dialog (select the <b>Tools   Options   Diagram</b> menu option).</p> <p>Once the paper size is set there, all new diagrams have that as the default size.</p>	<a href="#">Diagram Options</a> <sup>608</sup>

**Notes**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Update Diagrams** permission to change diagram page setup

**Learn more**

- [Permissions List](#) <sup>329</sup>

**5.5.6.31 Scale Image to Page Size**

When you print a diagram, the default setting is to scale the image to fit the size of the printer paper you have defined in the page set-up. The image is not scaled up to fill the page, but it is scaled down if it exceeds the current page boundary. The image retains its current proportions; that is, it is scaled down equally in the X and Y dimensions. For a large diagram, this can mean that the components of the diagram are small and hard to read.

Alternatively, you can print a multi-page image; that is:

- allow the diagram image to print on as many printer pages as it naturally occupies, (no scaling), or
- scale the diagram image to exactly fit a specified number of pages

In all three cases you also define the paper size and orientation.

**How to**

To turn off or customize image scaling options

Step	Action	See also
<b>1</b>	Select the diagram to scale.	
<b>2</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on the diagram background, or</li> <li>• Right-click on the background and select the <b>Properties</b> context menu option</li> </ul> <p>The &lt;type&gt; Diagram: &lt;name&gt; dialog displays.</p>	

Step	Action	See also
3	Click on the Diagram tab and, in the Page Setup panel click on the <b>Advanced</b> button.  The Print Advanced dialog displays.	<a href="#">Set Up Diagram Page</a> 
4	Select from the following options as required: <ul style="list-style-type: none"> <li>• <b>None</b>: select to print on as many pages as the diagram image covers</li> <li>• <b>Scale to 1 page</b>: select to scale the diagram image to fit on the currently selected page</li> <li>• <b>Custom</b>: select to specify the width and height of the diagram images across a specified number of pages</li> <li>• <b>Page Setup</b>: click to select the page size and alignment</li> </ul>	

#### Notes

- Before printing, make sure you have selected the required page layout using the **Page Setup** button

#### Learn more

- [File Menu](#) 

### 5.5.6.32 Lock Diagram

You can lock a diagram against inadvertent changes, such as moving or sizing elements.

#### How to

To lock a diagram

Step	Action	See also
1	Open the diagram to lock.	
2	Right-click on the background to open the diagram context menu.	
3	Click on the <b>Lock Diagram</b> option to prevent further changes.	
4	Click on the <b>OK</b> button.  If a user selects an item on a locked diagram, the object border or outline displays in red.	

### Notes

- This does not apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions if security is enabled; in that case, see the *Lock Model Elements* topic

### Learn more

- [Lock Model Elements](#) 

## 5.5.6.33 Undo Last Action

When editing diagrams, Enterprise Architect supports multiple undo levels for moving, re-sizing and deleting elements, and for deleting connectors.

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>There are three ways to undo the last action:</p> <ul style="list-style-type: none"><li>• Press ( <b>Ctrl+Z</b> )</li><li>• Select the <b>Edit   Undo</b> menu option</li><li>• Click on the <b>Undo</b> button in the Default Tools toolbar - </li></ul>	

### Notes

- Currently you cannot undo element additions or connector moves

## 5.5.6.34 Redo Last Action

When editing diagrams, Enterprise Architect supports multiple undo levels for moving, re-sizing and deleting elements, and for deleting connectors. If an Undo action is in error, you can redo the action to reverse the Undo.

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>There are three ways to redo the last action:</p> <ul style="list-style-type: none"><li>• Press ( <b>Ctrl+Y</b> )</li><li>• Select the <b>Edit   Redo</b> menu option</li><li>• Click on the <b>Redo</b> button in the Default Tools toolbar - </li></ul>	

### 5.5.7 Layout Diagrams

As you develop a model diagram and add more elements and connectors to it, you can apply one of a number of formats to automatically lay out specific **areas** or **sets of elements** in the diagram in a structured arrangement. If the diagram is very simple, you could even use this facility to lay out the **entire** diagram.

Additionally, you can provide filters and parameters for two or three types of layout and then 'chain' the layouts so that they are executed in sequence to result in a more refined layout. You can select a system-defined chain, or one that you have created yourself.

**Access**    **Diagram | Diagram Layout or**  
**Right-click on main toolbar | Diagram Layout**

#### Lay out elements on a diagram

Step	Action	See also
1	<p>Select the elements to lay out on the currently-active diagram - hold <b>Shift</b> or <b>Control</b> while you click on each required element, or hold the mouse button down while you sweep over the area containing the required elements.</p> <p>If no elements are selected on the active diagram, then all elements on the diagram are laid out (except where otherwise documented).</p>	
2	<p>Click on the drop-down arrow on the top left field of the Layout Tools window, and select the required layout type:</p> <ul style="list-style-type: none"> <li>• Circle/Ellipse</li> <li>• Box</li> <li>• Per Page</li> <li>• Digraph</li> <li>• Spring</li> <li>• Neaten</li> <li>• Converge/Diverge</li> <li>• Fan Relations</li> <li>• Auto Route</li> </ul> <p>The layout type determines the fields presented in the window, therefore the appropriate fields are described separately for each layout type.</p> <p>If you want to apply a sequence or <b>chain</b> of diagram layouts to a diagram, select either:</p> <ul style="list-style-type: none"> <li>• The appropriate system-defined chain name, or</li> <li>• The name of a chain you have created yourself</li> </ul> <p>You can create and modify a 'Layout Chain' by clicking on the  <b>Edit Layout Chains</b> button in the dialog toolbar.</p>	<p><a href="#">Circle/Ellipse</a> [875]</p> <p><a href="#">Box</a> [879]</p> <p><a href="#">Per Page</a> [881]</p> <p><a href="#">Digraph</a> [883]</p> <p><a href="#">Spring</a> [883]</p> <p><a href="#">Neaten</a> [885]</p> <p><a href="#">Converge/Diverge</a> [886]</p> <p><a href="#">Fan Relations</a> [888]</p> <p><a href="#">Auto Route</a> [890]</p> <p><a href="#">Chain diagram layouts</a> [894]</p>

Step	Action	See also
3	When you have completed the fields, click on the  button.  The selected elements are reorganized into the pattern format you have selected and according to the options you have chosen.	
4	If you do not want to work with the new layout, click on the <b>Undo</b> button in the toolbar (  ).	

### Notes

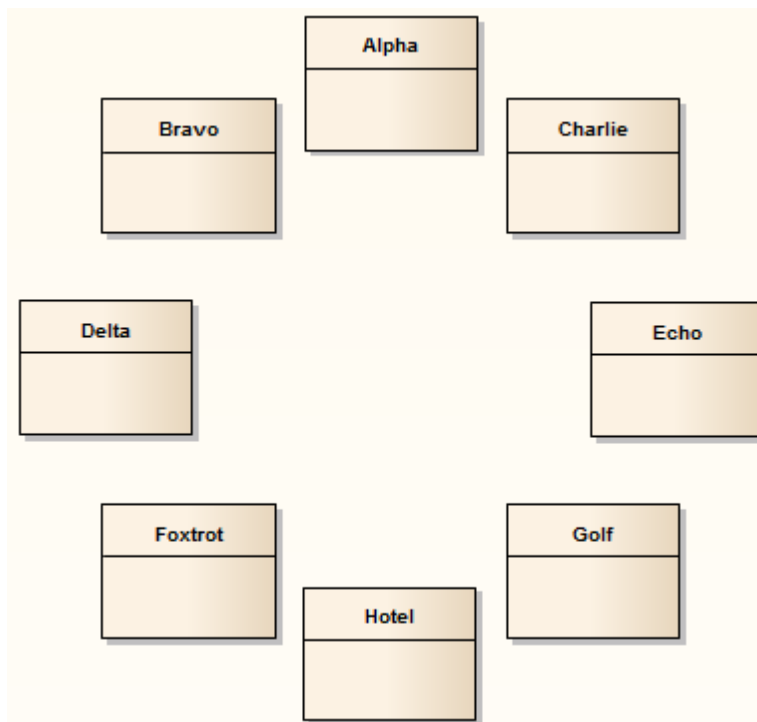

- You can also automatically lay out an entire diagram, without specifying any format or filters, using the alternative *Layout Diagram* facility

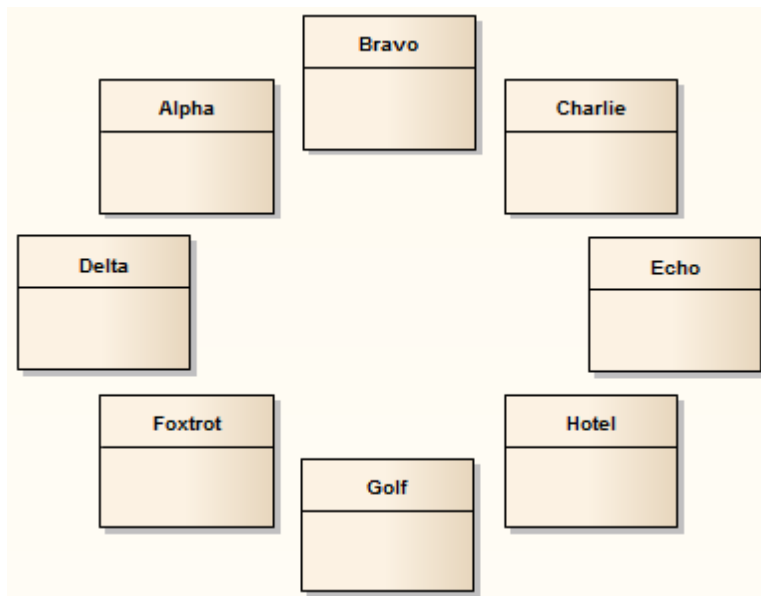

### Learn more

- [Lay Out a Diagram Automatically](#)<sup>[89]</sup>

#### 5.5.7.1 Circular/Elliptical Layout

The **Circle** and **Ellipse** layouts arrange the selected elements in a circle or elliptical pattern, using the largest horizontal and vertical element edge in the set of elements when calculating the radius of the layout arc.

#### Invoke the Circular or Ellipse layout

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select either <b>Circle</b> or <b>Ellipse</b> as required.	<a href="#">Layout Diagrams</a> <sup>874</sup>
2	<p>Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter:</p> <ul style="list-style-type: none"> <li>• <b>None</b> - elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li>• <b>Name (Ascending)</b> - elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li>• <b>Element Type</b> - elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
3	<p>Under the <b>Placement</b> option, select either:</p> <ul style="list-style-type: none"> <li>• <b>Top to Bottom</b> - the elements are positioned in the required order, zig-zagged across the perimeter of the circle or ellipse, as in Diagram A</li> <li>• <b>Circular</b> - the elements are placed in the required order, clockwise around the perimeter of the circle or ellipse, as in Diagram B</li> </ul>	

Step	Action	See also
4	Select the <b>Center focused element</b> checkbox to put the last-selected element (the one with the hashed border) in the <b>center</b> of the circle or ellipse, as in Diagram C.	

Diagram A - Top To Bottom Layout

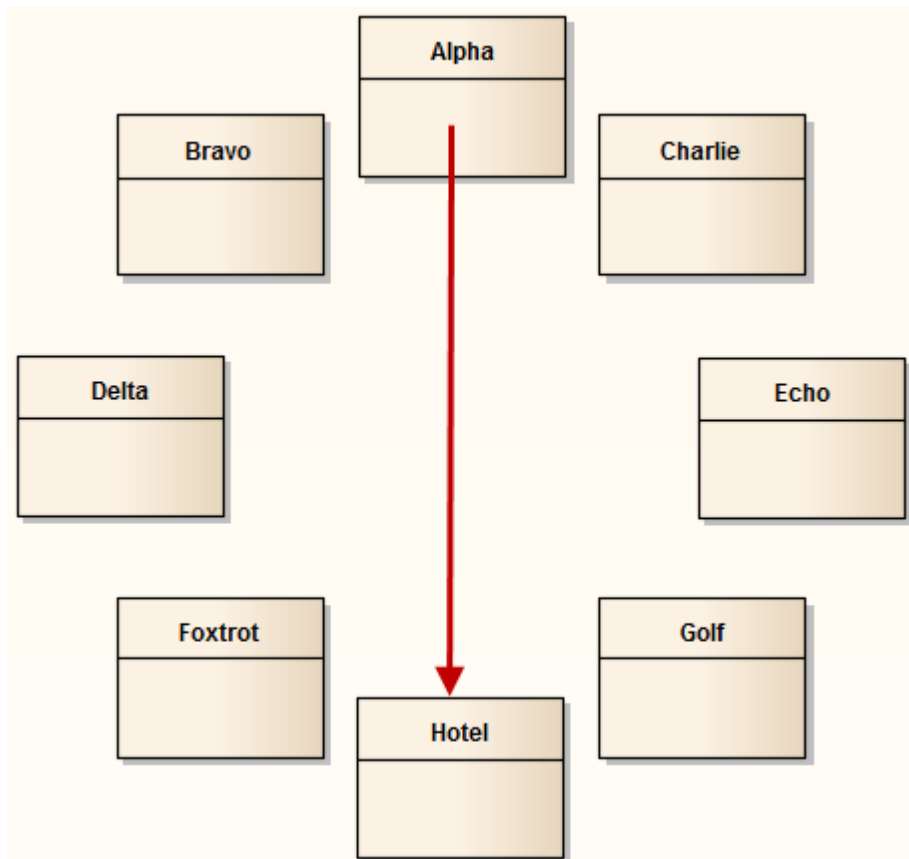

Diagram B - Circular Layout

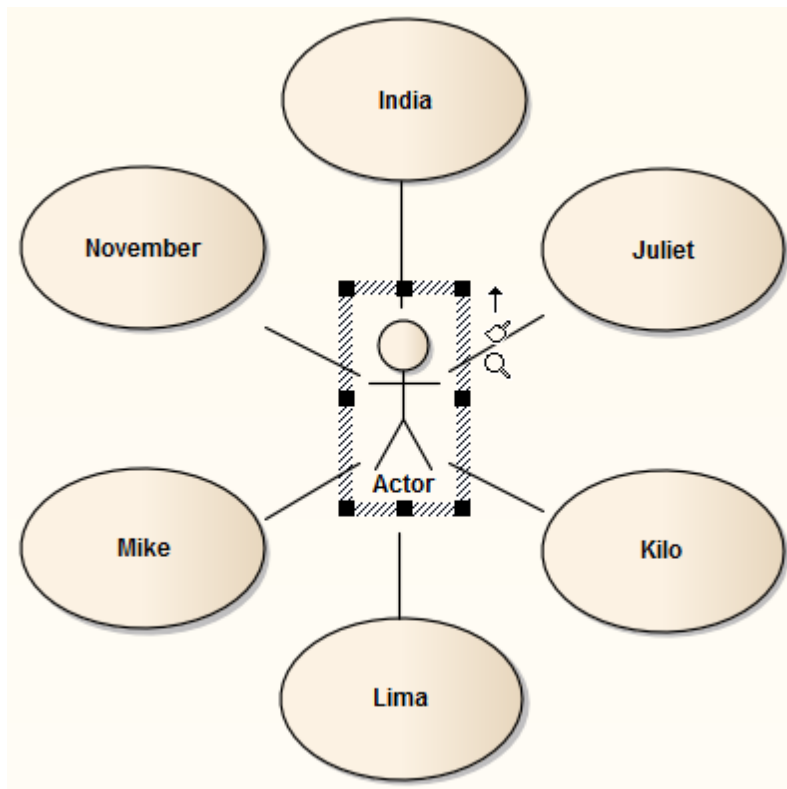

Diagram C - Center Focused Element

### 5.5.7.2 Box Layout

The **Box** layout arranges the set of selected elements into a square grid.

The dimensions of the box are determined by the number of columns that either:

- You set manually or
- The system automatically sets to a value that results in the same number of columns and rows (for example, 5, 6, 7, 8 or 9 elements would all be arranged in a three-column rectangle).

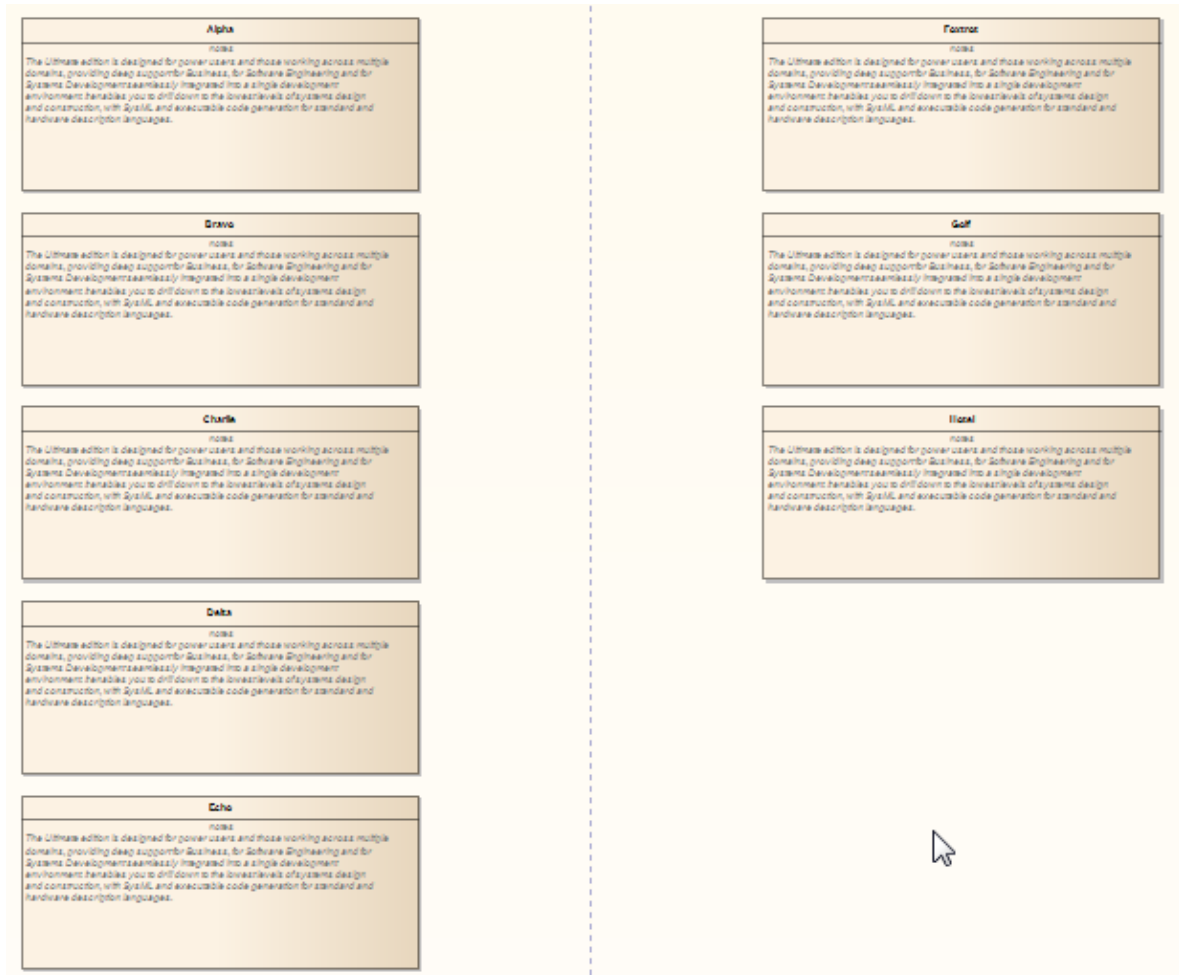

**Invoke the Box layout**

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select <b>Box</b> .	<a href="#">Layout Diagrams</a> <sup>[874]</sup>
2	Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter: <ul style="list-style-type: none"> <li>• <b>None</b> - elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li>• <b>Name (Ascending)</b> - elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li>• <b>Element Type</b> - elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
3	In the <b>Padding (px)</b> field, type the vertical and horizontal distance between elements, in pixels.	
4	Select the appropriate element distribution option: <ul style="list-style-type: none"> <li>• <b>Automatically distribute:</b> Automatically calculate the dimensions of the box (the square root of the number of selected elements; for example, 16 elements create a 4x4 box)</li> <li>• <b>Specify distribution:</b> Manually define the width of the box, in columns</li> </ul>	
5	If you selected <b>Specify Distribution</b> , in the <b>Columns</b> field type the required number of columns.	

### 5.5.7.3 Per Page Layout

The **Per Page** layout divides each diagram page into a number of cells, which house the selected elements. The number of cells per page is determined by the page distribution parameter.

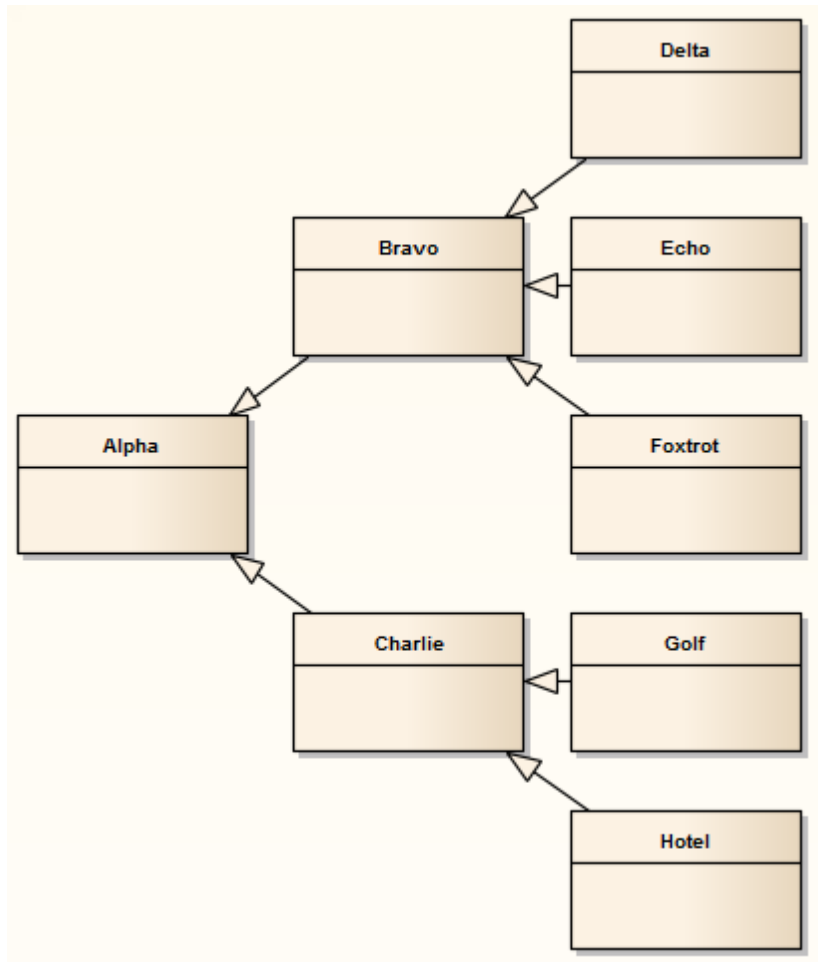

#### Invoke the Per Page layout

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select <b>Per Page</b> .	<a href="#">Layout Diagrams</a> [874]
2	<p>Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter:</p> <ul style="list-style-type: none"> <li>• <b>None</b> - elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Name (Ascending)</b> - elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li>• <b>Element Type</b> - elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
3	In the <b>Padding (px)</b> field, type the vertical and horizontal distance between cells, in pixels.	
4	Select the appropriate page distribution option: <ul style="list-style-type: none"> <li>• <b>Automatically distribute</b>: automatically calculate the optimum number of cells, taking into consideration the largest horizontal and vertical element edges</li> <li>• <b>Specify distribution</b>: manually enter the per page grid dimensions</li> </ul>	
5	If you selected <b>Specify Distribution</b> , in the <b>Rows</b> and <b>Columns</b> fields type the required number of rows and columns.	
6	Select the <b>Center Elements</b> checkbox to place each element in the center of its cell; otherwise the element placement defaults to the top left corner of the cell.	
7	In the <b>Start Page</b> field, type the number from which to start page numbering; pages begin at the top left and continue horizontally to the right.	

#### 5.5.7.4 Digraph Layout

The **Digraph** layout arranges the selected elements into a directed graph ('digraph' for short). The Digraph attempts to highlight the hierarchy of the elements while keeping the direction of all connectors pointing to the same edge of the diagram.

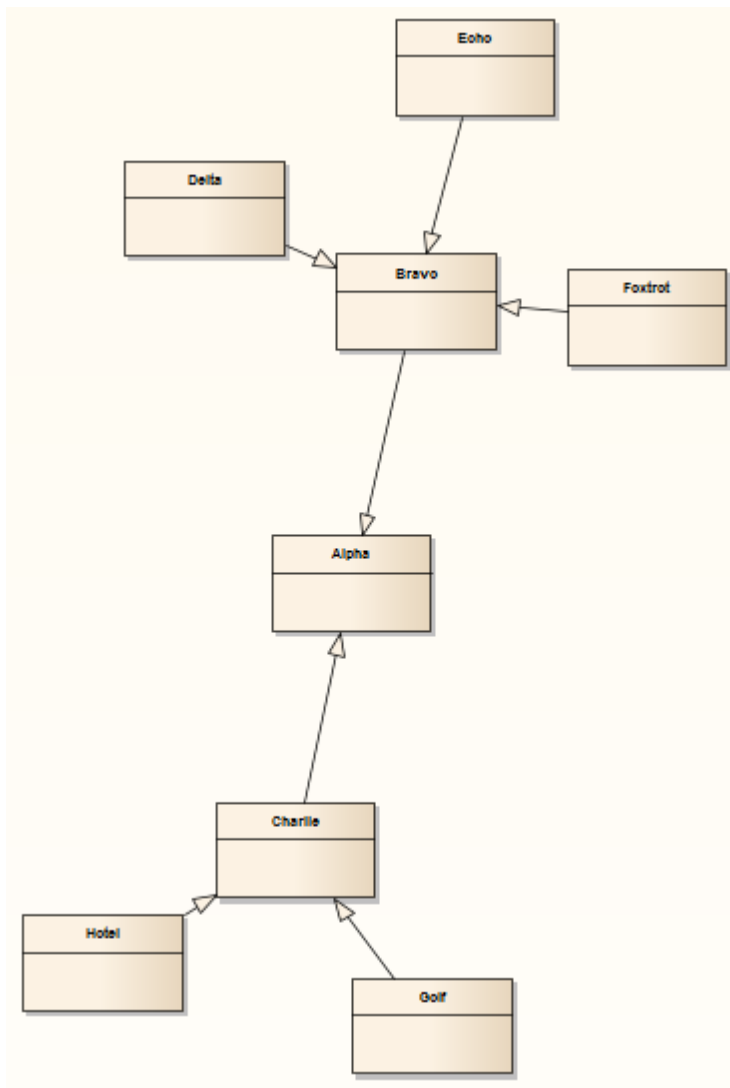

The Digraph layout provides the same behaviour as the Automatic Diagram layout.

##### Learn more

- [Layout Diagrams](#)<sup>[874]</sup>
- [Layout a Diagram Automatically](#)<sup>[891]</sup>

#### 5.5.7.5 Spring Layout

The **Spring** layout uses a force-directed approach to arrange the selected elements organically. It employs a physical analogy to lay out elements; each element is treated as a particle with a like electrical charge that repels other elements. Connectors act as springs (hence the name Spring layout) that draw connected elements back together. The layout is good for highlighting clusters of related objects and identifying symmetry in the graph.

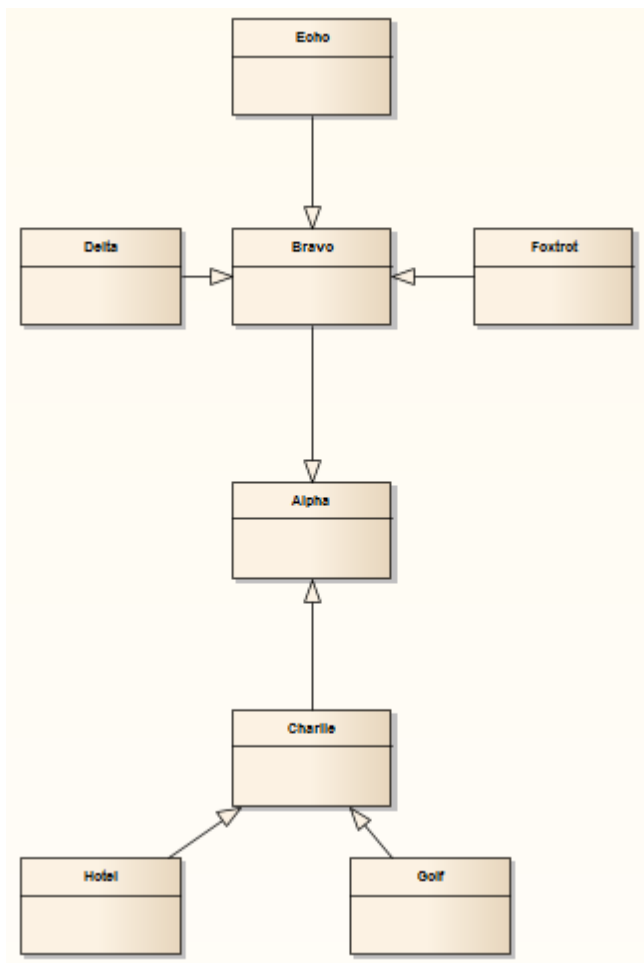

### Invoke the Spring layout

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select <b>Spring</b> .	<a href="#">Layout Diagrams</a> <sup>[874]</sup>
2	In the <b>Iterations</b> field, type the number of iterations, or rounds, to perform to reach the final layout.  The layout is developed over several iterations; depending on the complexity of the graph, increasing the number of iterations produces a better result but takes longer to calculate.	
3	If the diagram contains elements that significantly vary in size, and that might overlap in the final layout, select the <b>Scale to prevent overlap</b> checkbox to scale up	

Step	Action	See also
	the positions of the selected elements (preserving size) until no elements overlap.	

### 5.5.7.6 Neaten Layout

The **Neaten** layout attempts to pull the selected elements into a grid based on their horizontal and vertical proximity to each other. That is, the layout pulls elements that are roughly aligned into a neater arrangement. Elements that share the same row or column are aligned based on the **Column** and **Row Snap** parameters. The arrangement shown for the **Spring** layout, when the Neaten layout is applied, might look like this:

#### Invoke the Neaten layout

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select <b>Neaten</b> .	<a href="#">Layout Diagrams</a> <sup>874</sup>

Step	Action	See also
2	<p>In the <b>Threshold (px)</b> field type the separation, in pixels, up to which elements are considered to be in the same row or column.</p> <p>A higher threshold value produces a tighter result, pulling elements that are far distant into the same row or column. A lower threshold value provides for a larger number of rows and columns</p>	
3	<p>In the <b>Column Snap</b> field, click on the drop-down arrow and select the appropriate alignment for elements in the same column:</p> <ul style="list-style-type: none"> <li>• <b>Left</b> - elements are aligned with the left edge of the left-most element in the column</li> <li>• <b>Center</b> - elements are aligned with the vertical center of the center-most element in the column</li> <li>• <b>Right</b> - elements are aligned with the right edge of the right-most element in the column</li> </ul>	
4	<p>In the <b>Row Snap</b> field, click on the drop-down arrow and select the appropriate alignment for elements in the same row:</p> <ul style="list-style-type: none"> <li>• <b>Top</b> - elements are aligned with the top edge of the highest element in the row</li> <li>• <b>Center</b> - elements are aligned with the horizontal center of the center-most element in the row</li> <li>• <b>Bottom</b> - elements are aligned with the bottom edge of the lowest element in the column</li> </ul>	

#### Learn more

- [Spring Layout](#)<sup>883</sup>

### 5.5.7.7 Converge/Diverge Layout

The **Converge** layout attracts the set of selected elements towards the center of their bounding rectangle. Conversely, the **Diverge** layout repels the set of selected elements away from the center of their bounding rectangle. The Converge/Diverge layout also tries to maintain connector angles if an element in the set contains a connector with waypoints.

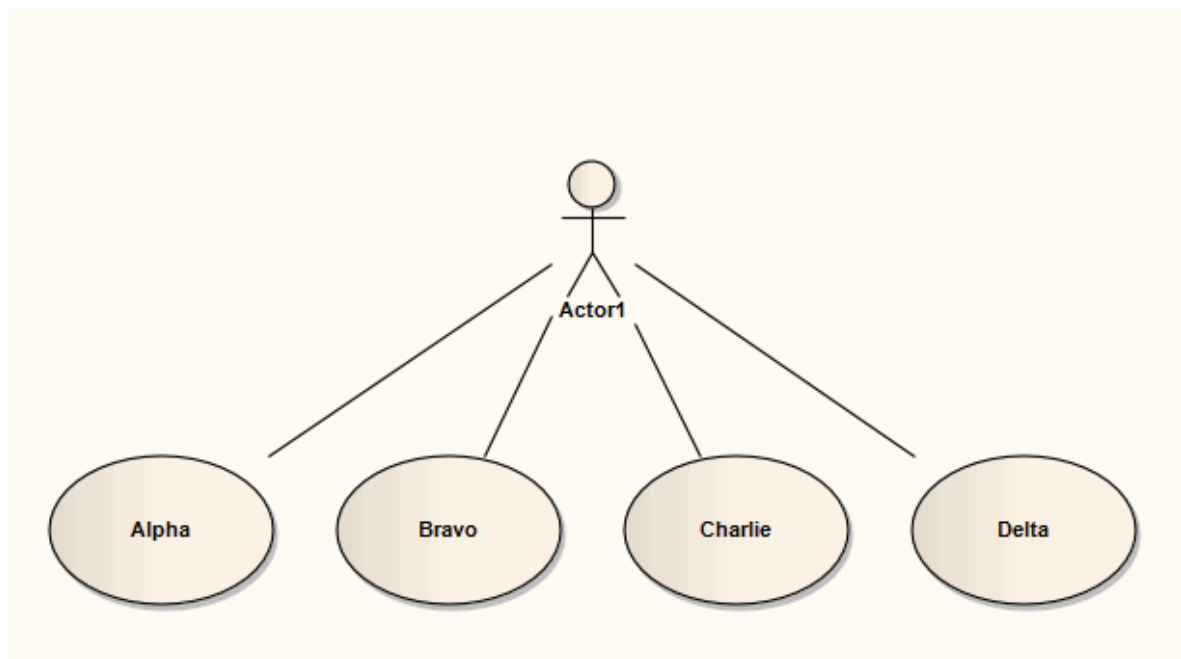

#### Invoke the Converge/Diverge layout

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select <b>Converge/Diverge</b> .	<a href="#">Layout Diagrams</a> [874]
2	Select the radio button for the required direction of the layout: <ul style="list-style-type: none"> <li>• <b>Converge</b> - attracts the set of selected elements to the center point</li> <li>• <b>Diverge</b> - repels the set of selected elements from the center point</li> </ul>	
3	Set the <b>Amount (%)</b> slider to the required percentage. A smaller percentage provides finer control of the change in layout.  The slider determines how far the elements are moved towards or away from the center point; the movement is the element's current distance from the center point multiplied by the percentage value set on the slider.  In the <b>Converge</b> layout, the element moves <b>towards</b> the center point; in the <b>Diverge</b> layout the element moves further <b>away</b> from the center point.	

Step	Action	See also

### 5.5.7.8 Fan Relations Layout

The **Fan Relations** layout arranges the immediate relations of an element around a specified edge. This layout requires a single element to be selected on the diagram, to be used as the context for the layout.

#### Invoke the Fan Relations layout

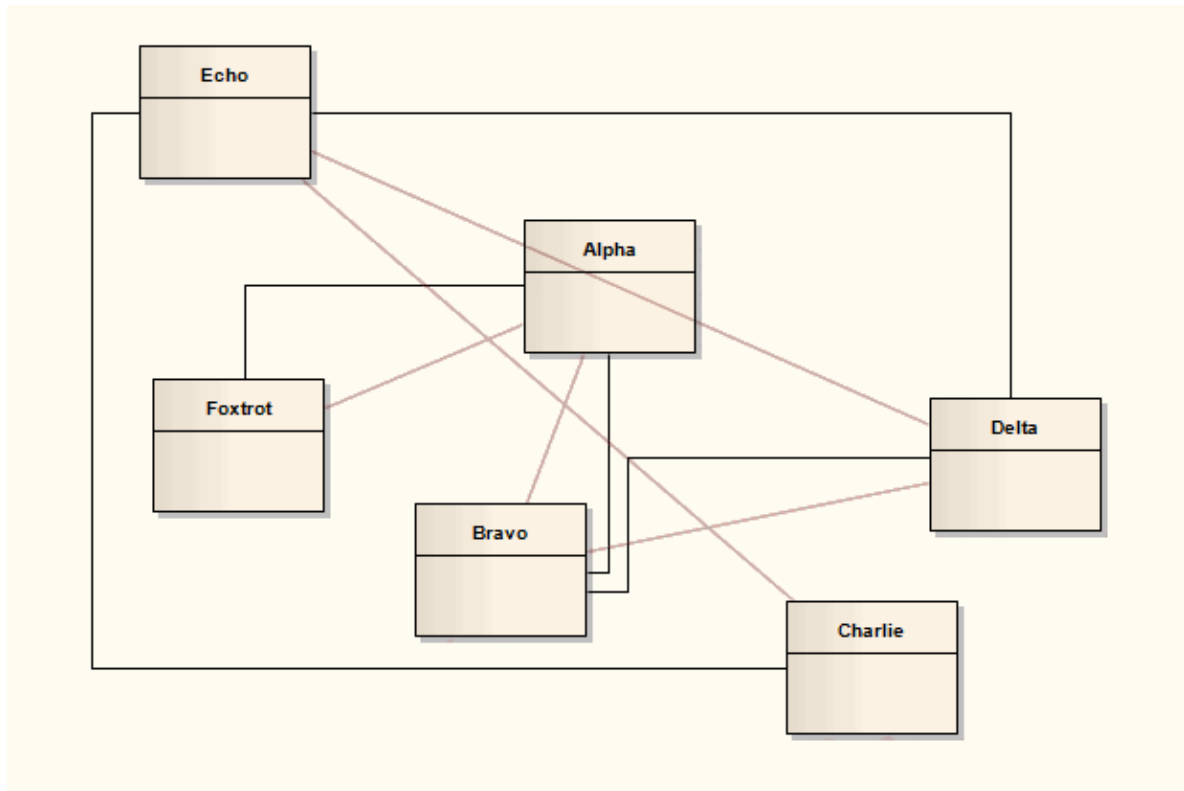

Step	Action	See also
1	Open the Layout Tools window; either: <ul style="list-style-type: none"> <li>Select the <b>Diagram   Diagram Layout</b> menu option, or</li> <li>Right-click on the main toolbar and select the <b>Layout Tools</b> context menu option</li> </ul>	<a href="#">Layout Diagrams</a> <sup>[874]</sup>
2	Select the single element around which to lay out related elements on the currently-active diagram.	
3	Click on the drop-down arrow on the top left button of the Layout Tools window, and select <b>Fan Relations</b> .	
4	Click on the drop-down arrow in the <b>Sort By</b> field and select the required sort parameter.	

Step	Action	See also
	<p>The options are:</p> <ul style="list-style-type: none"> <li>• <b>None</b> - elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li>• <b>Name (Ascending)</b> - elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li>• <b>Element Type</b> - elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
5	In the <b>Padding (px)</b> field, type the separation required between the selected element and its related elements, in pixels.	
6	<p>Select the connector direction to use in determining the related elements to lay out; either:</p> <ul style="list-style-type: none"> <li>• <b>Incoming Nodes</b> - to lay out related elements that have the selected element as the target</li> <li>• <b>Outgoing Nodes</b> - to lay out related elements that have the selected element as the source</li> </ul>	
7	<p>In the <b>Fan Edge</b> field, click on the drop-down arrow and specify the edge of the selected element from which to lay out the related elements:</p> <ul style="list-style-type: none"> <li>• <b>Left</b> - to arrange related elements to the left of the selected element</li> <li>• <b>Right</b> - to arrange related elements to the right of the selected element</li> <li>• <b>Top</b> - to arrange related elements from the top of the selected element</li> <li>• <b>Bottom</b> - to arrange related elements from the bottom of the selected element</li> </ul>	

### 5.5.7.9 Auto Route Layout

The **Auto Route** layout orthogonally routes connectors between the selected elements. The layout attempts to find the shortest path between the two connected elements while minimizing crossings. In this illustration, the original connectors are shown in red.

#### Invoke the Autoroute layout

Step	Action	See also
1	Follow the general <i>Layout Diagrams</i> procedure, and at step 2 select <b>Auto Route</b> .	<a href="#">Layout Diagrams</a> [874]
2	In the <b>Cell Size (px)</b> field, type the effective connector separation in pixels.  When calculating connector routes, the algorithm divides the diagram into cells of a size determined by this field value; a smaller cell size results in connectors being placed closer together.	
3	In the <b>Element Margin</b> field, type the separation between connector segments and element borders, in pixels.	

### 5.5.7.10 Lay Out a Diagram Automatically

As you develop a diagram, it can become difficult to position the elements and connectors so that the layout and organization remain clear. Rather than continually moving structures around manually, you can simply select a **Layout Diagram** option to **automatically** reposition all the structures on the diagram in a logical, tree-based structure. If your diagram is complex, you can then do some manual 'tweaking' to draw out particular elements and relationships.

Generally the default layout parameters provide adequate layouts for a wide range of diagrams, but for a fine degree of control you can also set layout parameters using the Diagram Layout Options dialog.

**Access**    <open diagram> | **Diagram** | **Layout Diagram**  
               <open diagram> | **diagram toolbar: Auto Layout**  
               **Double-click background** > **Diagram: Set Layout Style**

#### Apply Layout Configurations

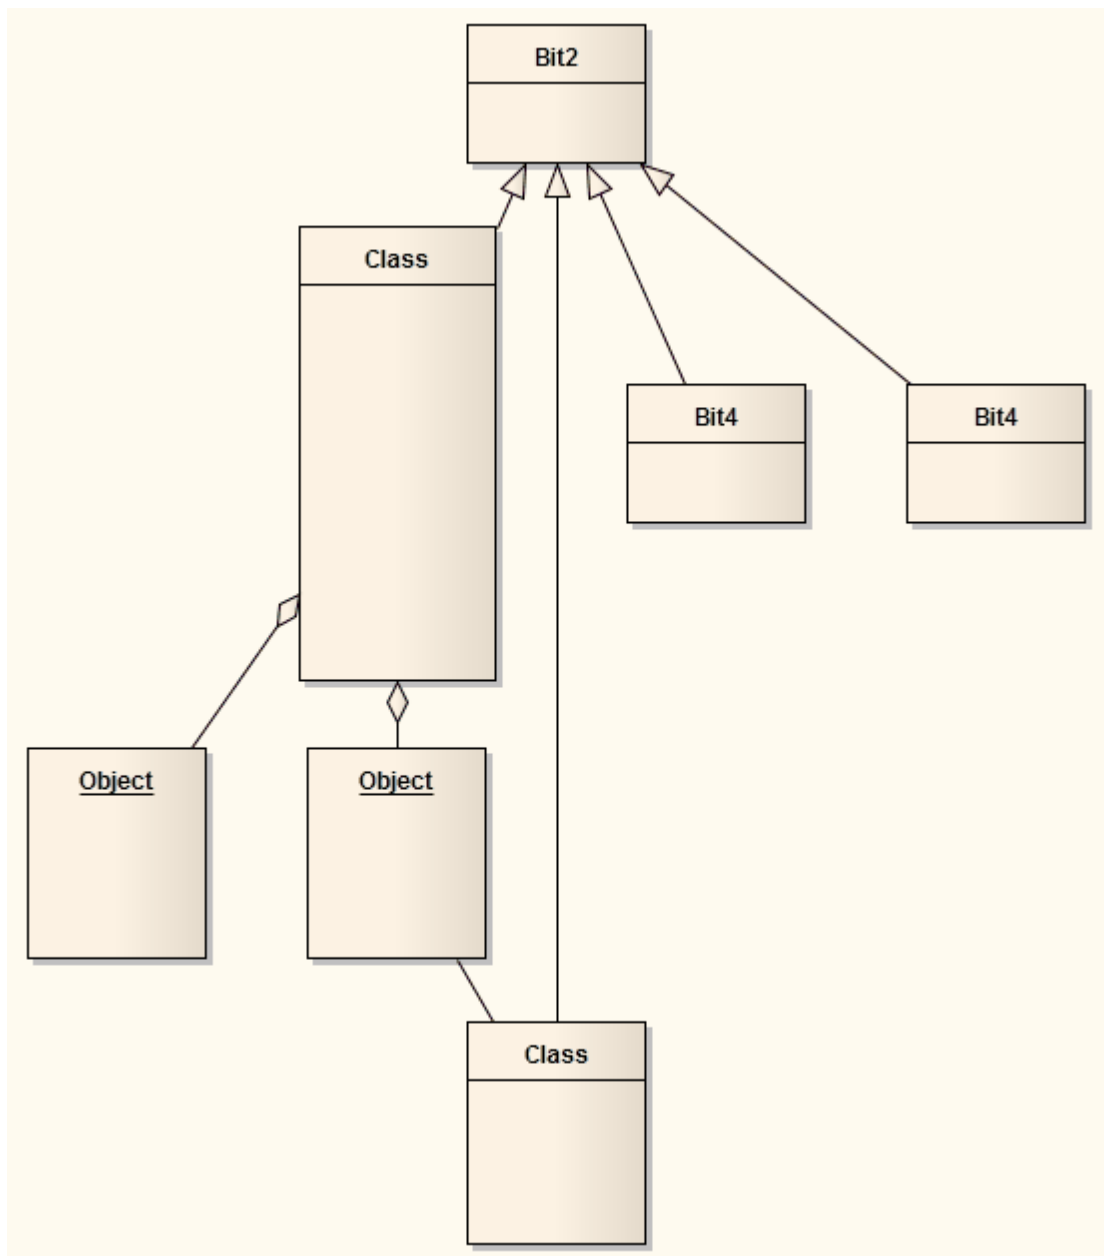

Options/Buttons	Action	See also
<b>Cycle Remove Options</b>	<p>These settings remove cycles in the element organization (where element <b>X</b> is the <b>source</b> of a path but also becomes the <b>target</b> of a branch of the path), by reversing the connectors that impose the cycling and then reorganizing the diagram and reinstating the reversed relationships; this identifies the primary source element in the diagram. Select</p> <ul style="list-style-type: none"> <li>• <b>Greedy</b> - to use the <b>Greedy Cycle Removal</b> algorithm, which minimizes the number of connectors reversed</li> <li>• <b>Depth First Search</b> - to use the <b>Depth First Search Cycle Removal</b> algorithm, which establishes the longest linear sequence possible before establishing parallel sequences and branches; this algorithm is less effective in large and/or complex diagrams, but produces a more natural layout than the Greedy algorithm</li> </ul>	
<b>Crossing Reduction Options</b>	<p>These options determine the length of time the routine searches for ways of reorganizing the layout to avoid crossed relationships:</p> <ul style="list-style-type: none"> <li>• <b>Iterations</b> - Type the number of iterations to be used during cycle removal (more than 8 does not usually provide any improvement)</li> <li>• <b>Aggressive</b> - Select this checkbox to use an aggressive (detailed and time-consuming) crossing reduction step</li> </ul>	
<b>Layering Options</b>	<p>These settings determine how elements are organized in layers during layout. Select:</p> <ul style="list-style-type: none"> <li>• <b>Longest Path Sink</b> - to use the <b>Longest Path Sink Layering</b> algorithm, where the final target elements (<b>sinks</b>, which have no relationships <b>issuing</b> from them) are arranged in a layer at the top of the diagram, and the relationship paths built downwards from there in as many layers as there are nodes in the longest path</li> <li>• <b>Longest Path Source</b> - to use the <b>Longest Path Source Layering</b> algorithm, where the original <b>source</b> elements (those with no relationships <b>entering</b> them) are arranged in a layer at the bottom of the diagram and the relationship paths built up from there in as many layers as there are nodes in the longest path</li> <li>• <b>Optimal Link Length</b> - to use the <b>Optimal Link Length Layering</b></li> </ul>	

Options/Buttons	Action	See also
	algorithm, which organizes the elements into the number of layers that minimizes the total source-to-sink relationship chain; in this layout you can have both source elements and sink elements at various levels of the diagram	
<b>Layout Options</b>	<p>These settings define how far apart the element layers and columns are in the layout.</p> <ul style="list-style-type: none"> <li>• <b>Layer Spacing</b> - Type the default number of logical units <b>between layers</b> of elements (vertical spacing)</li> <li>• <b>Column Spacing</b> - Type the default number of logical units between elements <b>within</b> a layer (horizontal spacing)</li> </ul>	
<b>Initialize Options</b>	<p>The autolayout routine inserts line waypoints and connectors into relationship paths to help plot the direction of the relationships; the routine then assigns an index number to every node, such that nodes in the same layer are numbered left to right. These settings determine how those index numbers are assigned. Select:</p> <ul style="list-style-type: none"> <li>• <b>Naive</b> - to use the <b>Naive Initialize Indices</b> algorithm, which assigns index numbers to nodes as they are encountered in a sweep and tends to place all waypoints to the right of real nodes (and therefore long relationships between a small number of elements to the right of chains of short relationships between several elements)</li> <li>• <b>Depth First Search Outward</b> - to use the <b>Depth First Out Initialize Indices</b> algorithm, which assigns index numbers to nodes as they are encountered in a depth first search from source nodes outwards (and would therefore place longer relationship chains to the left of shorter chains, with the primary <b>source</b> node at the <b>start</b> of the diagram flow)</li> <li>• <b>Depth First Search Inward</b> - to use the <b>Depth First In Initialize Indices</b> algorithm, which also assigns index numbers to nodes as they are encountered in a depth first search, but from sink nodes inwards (and would therefore place longer relationship chains to the left of shorter chains, with the ultimate <b>target</b> node at the <b>end</b> of the diagram flow)</li> </ul>	
<b>Direction</b>	Select the direction in which all directed connectors should point, to set the position of the primary source element and the overall flow of the diagram. That is, <b>Up</b> , <b>Down</b> , <b>Left</b> , or <b>Right</b>	
<b>Set as Project Default</b>	<p>Select this checkbox to apply the diagram layout settings to <b>all diagrams in the project</b>.</p> <p>If you later define different settings and select this checkbox, the new settings override all those saved previously.</p>	
<b>OK</b>	Click on this button to save your settings.	

### Example

This illustration shows an automatically laid out diagram with the following options set:

- Depth First Search
- Optimal Link Length
- Depth First Search Outward
- Direction - Up

#### Notes

- This facility is available for all types of diagram other than Timing and Interaction Overview diagrams
- If you decide that the autolayout is not appropriate, you can **reverse** it before saving the diagram; click **Ctrl+Z**

#### 5.5.7.11 Chain Diagram Layouts

Each of the diagram layout formats has a specific effect on the layout and appearance of a diagram. These effects can be combined by chaining certain layouts in a sequence, to further improve the final appearance of the diagram. Enterprise Architect provides a selection of standard 'chains' for your use, and you can quickly and easily set up chains of your own.

The system does not restrict the way in which you combine the layouts, but in practice some layouts complement each other better than others, or are more logically executed in a certain order. You therefore need to consider the effect of each layout on the diagram - or part of the diagram - as you develop the chain. You also provide parameters for each layout, so you would set the parameters for each format to complement those for the other formats in the chain, using the Layout Chains dialog.

The available formats could be grouped by impact on the diagram:

- **Circle, Ellipse, Box, Per Page, Digraph** and **Spring** each adjust element positions completely, so would destroy the effects of any other layout if used after it in a chain; one of these would therefore be the first layout to apply in the chain
- **Fan Relations** operates on a specific element, so you might not want to further adjust the diagram layout; if you did, you would only use these next layouts
- **Converge/Diverge** could be used after some of the above layouts, to broaden or narrow the final layout
- **Neaten** is a logical successor to the previous types, adjusting positions to provide more uniform separation
- **Auto-route** is the best final layout, to adjust connectors to the clearest routes without changing element positions

In creating a chain of layouts, you might consider these suggestions in selecting which layouts to use and in which sequence.

**Access** **Diagram | Diagram Layout:**   
**Right-click on main toolbar | Diagram Layout**

### Set up a chain

On the Layout Chains dialog:

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>New Chain</b> button and type in a new chain name (and click on the <b>OK</b> button) or</li> <li>• Click on the drop-down arrow and select the name of an existing chain to edit</li> </ul> <p>If you want to delete the existing chain you have selected, click on the <b>Delete Chain</b> button.</p>	

Step	Action	See also
	If you want to rename the existing chain, click on the  button and overwrite the existing name with the new name (and click on the <b>OK</b> button).	
2	In the <b>Existing Layouts</b> field, click on the first layout to execute in the chain, then click on the  button to add it to the chain. Repeat this step to add further layouts to the chain.	
3	If you do not want to include a layout that is currently in the chain, click on it and click on the  button. If you want to move a layout in the chain to a different point in the sequence, click on it and click on the  or  button as appropriate.	
4	If you want to change the name of a <b>layout</b> , click once on the name in the chain list and overwrite it.  To set the parameters of each layout, double-click on the layout name in the chain list. The appropriate parameter dialog for the layout displays; complete the fields as appropriate and click on the <b>OK</b> button.  These are the parameters that will be applied whenever you execute this layout chain, regardless of the settings in any other use of the layout.	<a href="#">Circular/Elliptical Layout</a> <sup>[87]</sup> <a href="#">Box Layout</a> <sup>[87]</sup> <a href="#">Per Page Layout</a> <sup>[88]</sup> <a href="#">Digraph Layout</a> <sup>[88]</sup> <a href="#">Spring Layout</a> <sup>[88]</sup> <a href="#">Neaten Layout</a> <sup>[88]</sup> <a href="#">Converge/Diverge Layout</a> <sup>[88]</sup> <a href="#">Fan Relations Layout</a> <sup>[88]</sup> <a href="#">Auto Route Layout</a> <sup>[89]</sup>
5	Click on the <b>Save Chains</b> button to save your changes, then click on the <b>OK</b> button. (If you have not saved your changes, an error message displays; click on the <b>Yes</b> button.)

### 5.5.8 The Quick Linker

If you want to create new elements and connectors quickly on a diagram, use the **Quick Linker** on your initial element to guide you in creating a related element and connector of the appropriate types, without having to weigh up the full range of options from the Diagram Toolbox. The Quick Linker consists of paired menus that list the commonest objects appropriate to the context of the selected element. You simply select the type of element you need from the first menu, which displays the second menu offering a choice of appropriate types of connector. When you select the connector, you create a new element connected to your initial element, complete with any subordinate objects such as Object Nodes and Action Pins.

If the connectors and elements suggested by the Quick Linker do not include the types you need, you can create them from the Diagram Toolbox pages. Also, a Technology Developer can edit the lists of elements and connectors, and create new combinations.

There are two methods of accessing the Quick Linker menus.

#### Access Method

Action	Detail	See also
<b>Click on Quick Linker Arrow</b>	<p>When you click on an element in a diagram, the Quick Linker arrow is displayed at the upper right corner of the element:</p>  <p>Click on this arrow and drag it in the direction in which you want to create the new connector and element. When you release the mouse button, the element menu displays. When you select an element type, the connector menu displays.</p>  <p>When you select the connector type, the element and connector are</p>	

Action	Detail	See also
	added to the diagram in the location in which you displayed the menus.	
<b>Press ( Ctrl+Shift+ &lt;arrow key&gt; )</b>	<p>After selecting the element, press ( <b>Ctrl+Shift</b> ) and the keyboard arrow key for the direction in which you want to create the new connector and element (<b>Up, Down, Left</b> or <b>Right</b>).</p> <p>The element and connector menus display as above. When you select the type of connector, the new element and connector are created off the edge of the element appropriate to the arrow key you pressed. For example, if you press the <b>Left</b> arrow key, the new element is created to the left of the original element.</p>	

### Notes

- When using the **Ctrl+Shift+<arrow key>** method on a **Sequence** diagram, you cannot use the **Up** or **Down** keys; the **Left** and **Right** arrow keys create a connector to a Lifeline element
- When using the **Ctrl+Shift+<arrow key>** method on a **Timing** diagram, you cannot use the **Left** or **Right** keys

<b>Usage</b>	<ul style="list-style-type: none"> <li>Press and hold ( <b>Shift</b> ) while selecting the type of connector to select an existing classifier as the target</li> <li>For rapid modeling, you can suppress the Properties dialog when creating new elements; see the option <b>Tools   Options   Objects: Edit Object on New</b></li> </ul> <p>The available Quick Linker options depend on the type of element selected; for example, the Quick Linker options for a Class differ from those of an Actor.</p> <p>These are the most appropriate, commonly used elements and connectors for the source element; you can create other target elements and connectors by selecting them from the appropriate Toolbox page.</p>	

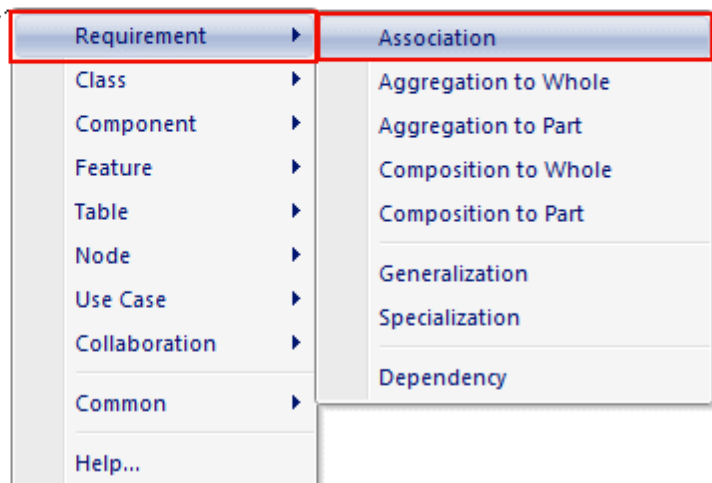

#### 5.5.8.2 Create Connectors

*Click, drag and release*

*Choose element and connector type*

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The list of connectors provides the most appropriate, commonly-used connectors for the source and target element types.</p> <p>If you want to use a different connector, select the appropriate Toolbox page, click on the required connector and then on the source element, and drag across to the target element.</p> <p>The connector does not actually establish until you release the mouse button over the target element; however, a dotted line shows where the connector would be at any point, and the solid outline of the nearest element or extension changes to a hatched outline as you move the cursor onto it - this helps you identify where the connector should connect to, if there are many closely-arranged elements, Parts, Ports and other extensions.</p> <p>You can also bend the connector, pressing ( <b>Shift</b> ) as you drag the cursor in a new direction.</p> <p>You can create a Notelink to attach a Note or Constraint to a connector, simply by dragging the Quick Linker arrow on the Note to the connector.</p>	

## 5.6 Elements

Models are constructed from elements, each of which has its own meaning, rules and notation. Elements can be used at different stages of the design process for different purposes.

The properties and features of an element can be defined and displayed through a set of windows and dialogs.

### Notes

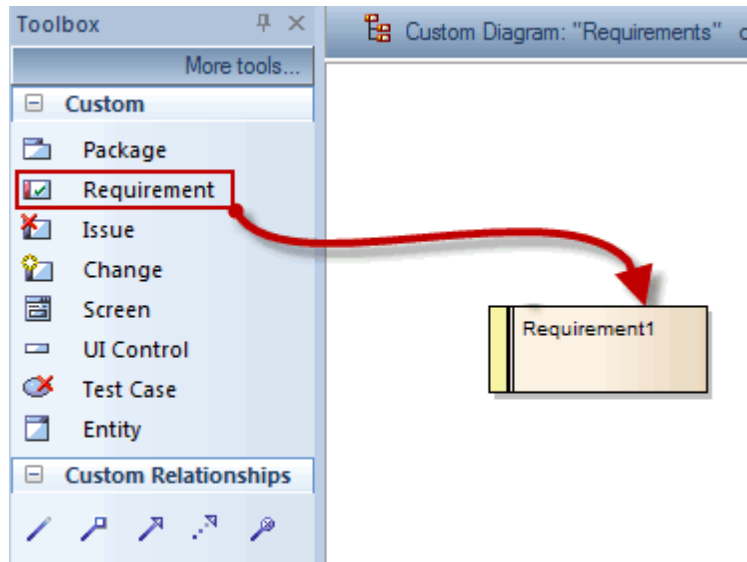

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Element permission to update element properties or delete an element

### Learn more

- [Permissions List](#)<sup>[329]</sup>

### 5.6.1.1 Create Elements

#### Example

#### Notes

- If you have defined a template element in the Templates Package, Enterprise Architect applies the characteristics of that template to each new element you create of that type
- If you are creating several elements of one type, after creating the first just press **(Shift+F3)** or **(Ctrl) + click** to create the next element of that type
- Once you have created elements, you can re-use them by dragging them from the Project Browser and dropping them onto your diagrams
- Sometimes it is useful to add elements to a Package, without a diagrammatic representation; this can be accomplished via the Project Browser and is explained in the topic - *Add Elements Directly to a Package*

### 5.6.1.2 Add Elements Directly To Packages

You can quickly add new elements to a Package without the necessity of adding a diagram element at the same time. This is particularly useful in defining a group of Requirements, Changes, Issues, base Classes or other element types that might not require diagrammatic representation in the model.

**Access** **Project Browser | Right-click on Package | Add Element** (Ctrl+M)

#### Add an element to a Package

Field/Option/ Button	Action	See also
<b>Active Toolset</b>	Shows the UML Diagram Type, profile, Add-In or MDG Technology within which you are creating the element.	
<b>Select Toolset</b>	<p>If the Active Toolset is not appropriate for the type of element you want to create, click on this button and select the required diagram type or technology.</p> <p>The <b>&lt;default&gt;</b> group in the list provides a basic set of elements drawn from across the UML Behavioral and Structural groups, and the Enterprise Architect Extended groups.</p> <p>The selected technology is displayed in the <b>Active Toolset</b> field.</p>	
<b>Name</b>	Type the name of the element.	
<b>Auto</b>	<p>As an alternative to typing in the name, click on this button to insert predefined auto-counter text.</p> <p>If you already have some text in the <b>Name</b> field, it is over-written by the auto-counter text.</p>	<a href="#">Set Auto Naming and Auto Counters</a> 
<b>Type</b>	<p>Click on the drop-down arrow and select the element type from the list.</p> <p>The list of elements is derived from the diagram or technology shown in the <b>Active Toolset</b> field.</p>	
<b>Stereotype</b>	If required, either type the stereotype name or click on the drop-down arrow and select the stereotype.	
<b>Open Properties Dialog on Creation</b>	Select the checkbox if the Properties dialog is to open immediately after the element is created.	
<b>Close Dialog on OK</b>	<i>Deselect</i> the checkbox to add multiple elements in one session.	
<b>Add to current</b>	Available if you have a diagram open.	

Field/Option/ Button	Action	See also
<b>diagram</b>	The checkbox is defaulted to selected to add the new element to the diagram; if you do not want the element in that diagram, deselect the checkbox.	
<b>Create</b>	Click on the <b>OK</b> button to create the element.	

### Notes

- The New Element dialog also displays when you create an element in the **Specification Manager**, if the Specification Type is **<Any>**

### Learn more

- [Adding Elements](#)  (Specification Manager)

## 5.6.1.3 Set Auto Naming and Auto Counters

When you create a new element in your model, you have different options for **naming** the element depending on how you are creating it. If you create the element:

- On a diagram, the system applies a default naming convention of the element **type** plus the increment of the **number** of elements of that type in the same **Package** - for example, *Actor4*; you can change this to any other name by editing the **Name** field on the element's Properties dialog
- Within the Project Browser, the system prompts you to type the element name into the New Element dialog

You can also set up your **own, automatic**, naming and numbering convention for elements of the same type, so that:

- On a diagram, it is **your** naming/numbering convention that is automatically applied to the new element (which you can still change if you need to, as before)
- Within the Project Browser, the New Element dialog **Auto** button applies the naming convention to your new element

If you have **existing** elements in a Package, and you want to apply the new naming convention to them, you can make this change very easily to **all** elements of the same type in the Package at once (see *Learn more*, below).

You define a naming convention for the element type as a model setting. At the same time, you can also optionally define a naming/numbering convention for the **Alias** field for elements of that type.

**Access** [Settings | Auto Names and Counters](#)

**Set up auto naming for an element type**

Field/Option	Action	See also
<b>Type</b>	Click on the drop-down arrow and select the element type to which to apply auto naming/auto numbering.	
<b>Name</b>		
<b>Prefix</b>	Type a prefix for the new name (optional).	
<b>Counter</b>	Type the counter value; use as many 0's as required to pad the number.	
<b>Suffix</b>	Type a suffix for the new name (optional).	
<b>Apply on creation</b>	<p>Select the checkbox to apply auto naming to each new element of the specified type, on creation.</p> <p>If you do not select the checkbox, the autonaming details for the specified element type remain defined in the dialog, but are not applied to new elements of that type. The default element naming convention takes effect (<b>&lt;element type&gt;&lt;n&gt;</b>).</p>	
<b>Alias</b>		
<b>Prefix</b>	Type a prefix for the new Alias (optional).	
<b>Counter</b>	Type the counter value; use as many 0's as required to pad the number.	
<b>Suffix</b>	Type a suffix for the new Alias (optional).	
<b>Apply on creation</b>	<p>Select the checkbox to apply Alias auto naming to each new element of the specified type, on creation.</p> <p>If you do not select the checkbox, the Alias autonaming details for the specified element type remain defined in the dialog, but are not applied to new elements of that type. The default element naming convention takes effect (<b>&lt;element type&gt;&lt;n&gt;</b>).</p>	
<b>Save</b>	<p>Click on the <b>Save</b> button.</p> <p>New elements of this type now have an automatically-generated name and/or Alias with an incrementing counter value.</p> <ul style="list-style-type: none"> <li>• If the user creates an element on a diagram, such as from the Diagram Toolbox or Quicklinker, the element is automatically assigned the defined name and/or Alias</li> <li>• If the user creates an element outside a diagram (such as in the</li> </ul>	<a href="#">Add Elements</a>

Field/Option	Action	See also
	<p>Project Browser) using the New Element dialog, they can click on the <b>Auto</b> button next to the <b>Name</b> and/or <b>Alias</b> field on the appropriate dialog to apply the auto-generated text</p> <ul style="list-style-type: none"> <li>If the user already has some text in the <b>Name</b> or <b>Alias</b> field, it is over-written by the auto-counter text</li> </ul> <p>If an Alias is active, to view the Alias in a diagram requires that the option <b>Use Alias if Available</b> is selected in Diagram Properties.</p>	<p><a href="#">Directly To Packages</a><sup>[903]</sup></p> <p><a href="#">Configure Diagram Display</a><sup>[825]</sup></p>

#### Notes

- Automatic numbering - whether system default or user-defined - does not increment across Package levels; if you have an element called *Actor1* in Package A, and you create an Actor element in a **child** Package of Package A, that Actor will **also** be *Actor1*

#### Learn more

- [Apply Auto Naming to Existing Elements](#)<sup>[906]</sup>

### 5.6.1.4 Apply Auto Naming to Existing Elements

If you have set up **auto-naming** conventions for the names and/or Aliases of specific types of element, you can apply those conventions to all of the **existing** elements of those types in a selected Package, in **one** operation.

You apply auto-naming through the Apply Auto Naming to Elements dialog. This groups the elements that have auto-naming conventions by type, and shows the effects of applying the conventions to the element names and/or Aliases. You can change all the element names in the Package, or select only certain elements to update.

**Access**    **Project Browser | Right-click on Package | Advanced | Apply Auto Naming to Elements**

#### Apply Auto-naming to elements

Field/Option	Action	See also
<b>Current Name</b>	<p>Initially displays the name of each element <b>type</b> that has auto-naming conventions, and the number of elements of that type in the Package.</p> <p>Click on the '+' symbol to expand the type group and list the elements of that type by their current name, with the most recently created element first.</p> <p>Select the checkbox against each element to be renamed, or against the element type name to select all elements in the group. Deselect the checkbox to leave the element name and Alias at their current values.</p>	
<b>Name Preview</b>	Initially shows the elements' current names.	

Field/Option	Action	See also
	When you select the element checkboxes, the names change to show the effect of applying the auto-naming conventions to each element name.	
<b>Alias Preview</b>	Initially shows the elements' current Aliases.  When you select the element checkboxes, the Aliases change to show the effect of applying the auto-naming conventions to each element Alias.	
<b>All</b>	Click on this button to select all elements listed on the dialog.	
<b>Clear</b>	Click on this button to clear the selection of all selected elements.	
<b>Update Name</b>		
<b>Prefix Auto Name to Current Name</b>	Set the change to the auto-name text followed by the current name.	
<b>Overwrite current Name with Auto Name</b>	Replace the current name with the auto-name text.	
<b>Move current Name to Notes Apply Auto Name</b>	Show the current name in the <b>Notes</b> field in the element Properties dialog (in front of any existing notes) and overwrite the element <b>Name</b> field with the auto-name.	
<b>No change</b>	Leave the current names unchanged.	
<b>Update Alias</b>		
<b>Prefix Auto Alias to Current Alias</b>	Set the change to the auto-Alias text followed by the current Alias.	
<b>Overwrite current Alias with Auto Alias</b>	Replace the current Alias with the auto-Alias text.	
<b>Move current Alias to Notes Apply Auto Alias</b>	Show the current Alias in the <b>Notes</b> field in the element Properties dialog (after any replaced element name text, but in front of any existing notes) and overwrite the <b>Alias</b> field with the auto-Alias.	

Field/Option	Action	See also
<b>No change</b>	Leave the current Aliases unchanged.	
<b>Include sub packages</b>	Select this checkbox to include elements in sub-Packages in this run of applying auto-naming (the checkbox reverts to deselected when the dialog is closed).	
<b>Configure Auto Naming</b>	<p>Click on this button to immediately define automatic naming conventions for an element type if:</p> <ul style="list-style-type: none"> <li>You want to change the conventions for an element type, or</li> <li>The element type that you want to apply auto-naming to has no conventions (and is therefore not listed on the dialog)</li> </ul> <p>The Auto Name Counters dialog displays, on which you define your automatic element and/or Alias naming convention. When you click on the <b>Save</b> button on that dialog, any elements of that type in the Package are listed on the Apply Auto Naming to Elements dialog.</p>	<a href="#">Set Auto Naming and Auto Counters</a> 
<b>OK</b>	Click on this button to close the dialog and put the naming changes into effect.	
<b>Cancel</b>	Click on this button to close the dialog and cancel any naming changes you have defined.	

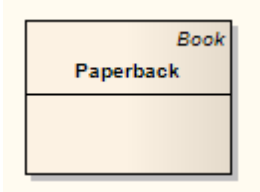

#### Notes

- If you select this facility and there have **never been** any auto-naming conventions defined in the model, the **Current Name** column displays the message *Configure Auto Naming*; click on the **Configure Auto Naming** button to define any conventions for any element type you need
- The contents of Packages that are locked under version control will not be auto-named
- Because you are applying auto-naming to **existing** elements, the auto-naming set up **Apply on Creation** setting has no impact on this operation
- The Apply Auto Naming to Elements dialog is resizable; if you want to expand or reduce the dialog, drag its edges to the size you want

#### 5.6.1.5 Set Element Parent

You can manually set an element's parent or parents, or an interface it realizes (implements), using the Set Parents and Interfaces dialog.

##### Set an element parent

Step	Action	See also
1	Select a generalizable element in a diagram.	
2	<p>Select the <b>Element   Advanced   Set Parents and Interfaces</b> menu option. Alternatively:</p> <ul style="list-style-type: none"> <li>• Press (<b>Ctrl+I</b>) or</li> <li>• Right-click and select the <b>Advanced   Parent</b> context menu option.</li> </ul> <p>The Set Parents and Interfaces dialog displays.</p>	
3	You can elect to enter a parent or interface name by either manually typing it in, or clicking on the <b>Choose</b> button to locate the element within the current model.	
4	Set the <b>Type</b> of relationship ( <b>Implements</b> or <b>Generalizes</b> ) from the drop-down list.	
5	<p>Click on the <b>Add</b> button to add the relationship to the <b>Type Details</b> list, and to the selected child element.</p>  <p>The diagram shows a rectangular box representing a 'Book' element. Inside this box, there is a smaller rectangular box labeled 'Paperback', indicating a generalization relationship where 'Paperback' is a specific type of 'Book'.</p>	
6	Repeat this process to add further parent elements, or click on the <b>Delete Selected</b> button to remove a selected relationship.	

If the parent name is shown in the element on the diagram, you can select it and perform further operations, as follows:

Step	Action	See also
1	Click on the element.	
2	Click on the parent name to highlight it.	
3	Right-click to display the context menu, which provides options enabling you to:	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Redisplay the Set Parents and Interfaces dialog to, for example, delete the parent or add further parents</li> <li>Display the parent element Properties dialog</li> <li>Find the parent element in the Project Browser</li> </ul> <p>Find the parent element in the diagram.</p> <p>If the parent element does not currently exist in the model, and is listed on the element in the diagram, you can highlight it and click on it to redisplay the Set Parents and Interfaces dialog to, for example, delete it or add further parents.</p>	

#### Notes

- You can specify parent elements that exist in the model, or that you intend to create later; if the parent element does not currently exist in the model, select the **Accept classifier even if not in model** checkbox to ensure that the reference to a non-existent element is accepted
- If Parents are not in the same diagram as their corresponding related element, the parentage is shown in the top right corner of the child element

#### 5.6.1.6 Show Element Use

You can display the use of an element using the Element Usage dialog. This lists all occurrences of the element throughout the model, and enables you to easily navigate to any occurrence.

#### How to

To show element usage

Step	Action	See also
1	Select an element in a diagram.	
2	<p>Select the <b>Element   Find in Diagrams</b> menu option (or, for a Package element, the Find in all Diagrams option).</p> <p>Alternatively, press ( <b>Ctrl+U</b> ).</p> <p>If the element exists in other diagrams, the Element Usage dialog displays, listing all occurrences of the current element in diagrams in the model.</p>	
3	<p>If you want to display the usage information in a more readable layout, you can resize the dialog and its columns</p> <p>Either:</p> <ul style="list-style-type: none"> <li>Double-click on a line item to open the relevant diagram and display the selected element (the Element Usage dialog remains open), or</li> <li>Click on the <b>Open</b> button to display the selected diagram and close the Element Usage dialog</li> </ul>	

Step	Action	See also

### Notes

- You can also access this feature from the Project Browser; select an element in the tree and select the **Element | Find in Diagrams** menu option

If there is only one instance of the element in any diagram, that diagram displays instead

### 5.6.1.7 Move Elements Within Diagrams

As you add new elements to a diagram, you might want to move the **existing** elements to create more space, make a structure more apparent, or create a child-parent relationship between two elements. There are several ways in which you can move the elements within the diagram.

#### Move Elements

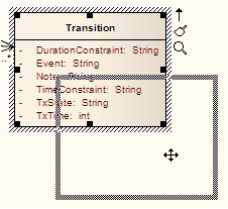

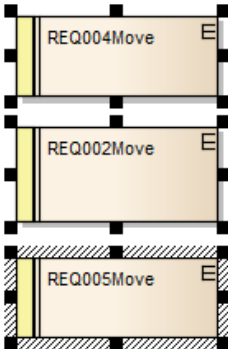

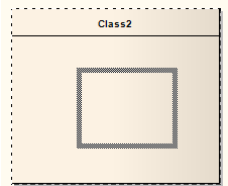

Image	Action	Detail	See also
	<b>Change Position</b>	<p>Select an element or group of elements in the diagram, then:</p> <ul style="list-style-type: none"> <li>Use the mouse to drag the element or group of elements to the required position (the cursor switches to the four-arrow icon as shown)</li> <li>Hold down ( <b>Shift</b> ) and use the arrow keys to move the element or group of elements by small increments to the required position</li> </ul>	
	<b>Align Elements</b>	<p>Select a group of elements in the diagram and align them on the last-selected element using:</p> <ul style="list-style-type: none"> <li>The <b>Align...</b> options in the right-click context menu or</li> <li>The <b>Alignment</b> buttons on the Diagram toolbar</li> </ul> 	<p><a href="#">Operations on Multiple Elements</a> <sup>[95]</sup></p> <p><a href="#">Diagram Toolbar</a> <sup>[138]</sup></p>
	<b>Confirm Possible Parent Elements</b>	<p>If you want to make one element the child of another, you can drag the child onto the parent; the child is then always encapsulated by the parent and moved within the parent.</p> <p>Not all parent/child element combinations are valid. For example:</p> <ul style="list-style-type: none"> <li>Drag a Signal element over a Class; because a Class element <b>can</b> be a</li> </ul>	

Image	Action	Detail	See also
		<p>parent to a Signal, the Signal element is encapsulated</p> <ul style="list-style-type: none"> <li>• Drag a Class element over a Signal element; because a Signal <b>cannot</b> be a parent to a Class, the Class element is not encapsulated</li> </ul> <p>To confirm that the proposed parent element is able to accept the selected child element, observe the parent element border as you drag the child element over it. If the parent can accept the selected element as a child, the element border changes to a dashed line. If the border does not change, the selected element cannot be a child to the parent element.</p>	

#### Notes (on Adding child element to parent)

- The **Support for Composite Objects** checkbox must be selected on the Objects page of the Options dialog (select **Tools | Options | Objects**); if this option is not selected, the dashed border does not show and the child element cannot be embedded on the parent in the diagram
- Both elements must already exist **on the diagram**; the parent element border does not change if you drag a potential child element over it from the **Toolbox** or **Project Browser**
- The child element must be dragged right over the parent, so that its borders are completely within the parent element borders
- The Z-order of the child element is automatically adjusted so that the child is not hidden by the parent
- When you embed a child element on its parent, the child element becomes part of the parent element hierarchy in the Project Browser; if you drag the child element **out of** the parent, the child element becomes independent and is no longer embedded in the parent element hierarchy
- If you have selected the **Structured Compartment** checkbox on the Feature and Compartment Visibility dialog, the child element is confined to the Structured Compartment and cannot be dragged out until the checkbox is deselected again

#### Learn more

- [Object Display Options](#)<sup>[63]</sup>
- [Feature Visibility](#)<sup>[84]</sup>

### 5.6.1.8 Copy Elements Between Diagrams

On a diagram, if you have created a structure of elements such as a State Machine, you might want to copy that structure onto another diagram as a new set of elements without losing the organization of the structure. In doing this, you can change any of the element names within the structure and still preserve the relative nesting of the elements.

**Access** **Source diagram > Right-click selected elements | Copy (Ctrl+C)** then  
**Target diagram > Right-click diagram background | Paste Element(s) as New (Ctrl+Shift+V)**

**Complete the Paste Element(s) as New Dialog**

Field/Option	Action	See also
<b>Original Element Name</b>	Each element name defaults to selected, to be inserted in the target diagram.  If you want to omit an element from the copied structure, clear the checkbox against it.	
<b>New Element Name</b>	If you want to give a copied element a new name, delete the current name and type in the new name.	
<b>Include Connectors</b>	This checkbox defaults to selected, to make copies of the original connectors where both source and target elements in the relationship have been copied. This maintains the relationships between and organization of the copied elements.  If you do not want to copy the connectors, clear the checkbox.	
<b>Paste</b>	Click on this button to add the copied elements and connectors to the target diagram as new elements.	

**Notes**

- Package elements cannot be copied as structured elements
- Elements - including **special** embedded elements such as SysML Properties - do not need to have a parent when pasting as new, although **normal** embedded elements such as Ports must have a parent
- Elements in State regions cannot be pasted as new outside the parent element
- Parenting is still applied when copying and pasting as new using **Ctrl+click-and-drag** between (floating) diagrams

**Learn more**

- [Copy Elements Between Packages](#) <sup>[915]</sup>
- [Paste from Project Browser](#) <sup>[833]</sup>

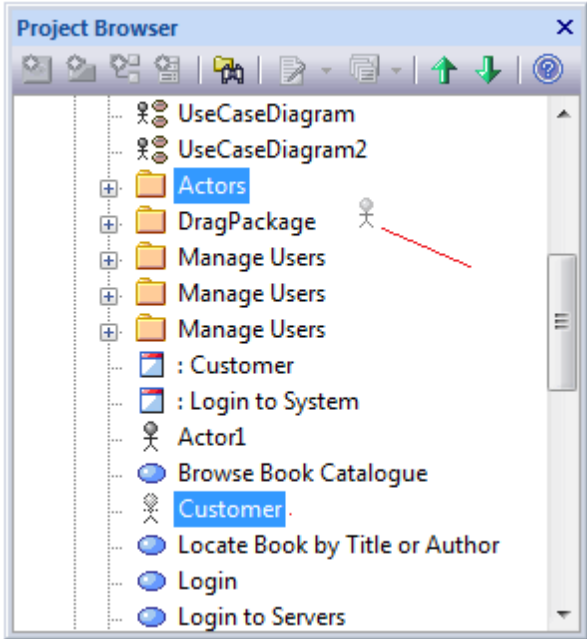

**5.6.1.9 Move Elements Between Packages**

If an element or Package is not in the most appropriate part of the model structure, you can move it to a different location in the Project Browser, either by:

- Dragging and dropping the element to a target destination, or
- Cutting and pasting the element or Package

If you move a Package, ALL the child Packages and their contents are moved to the new location also.

**Drag an element between Packages**

Step	Action	See also
1	Click on the element in the Project Browser. See <i>Customer</i> in the diagram below.	
2	Drag the element so that the cursor is over the target Package icon. The element symbol (and, in some operating systems, the element name) displays at the moving cursor position.  	
3	Release the mouse button. The element is moved into the target Package.	

#### Cut and Paste the Element

Step	Action	See also
1	In the Project Browser, right-click on the element to be moved and select the <b>Copy / Paste   Cut</b> context menu option. The selected element is highlighted.	
2	Right-click on the Package or element under which to move the cut element, and select the <b>Copy / Paste   Paste</b> context menu option. The cut element is listed as a child of the selected element or Package, in the Project Browser.	

Step	Action	See also

### Notes

- You can also drag the element under a host element in the new Package; for example, drag an element under a Class
- Moving an element has no effect on any relationships that the element might have
- Moving an element in the Project Browser has no effect on the use of that element in any diagram
- Moving a diagram generally does not affect the location of elements in Packages - if you move a diagram out of one Package into another, all the elements in the diagram remain in the original Package; however, certain elements (such as Decision, Initial and Final elements) are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram, therefore, if you move a diagram containing these elements they **are** moved to the new parent Package with the diagram
- In a multi-user environment, if one person moves or updates the Project Browser structure, other users must reload their project to see the latest changes in the Project Browser; although this is true of any addition or modification to the tree, it is most important when big changes are made, such as dragging a Package to a different location

### Learn more

- [Refresh View of Shared Project](#)<sup>[30]</sup>

#### 5.6.1.10 Copy Elements Between Packages

You can quickly and easily duplicate one or more elements, including their child elements and diagrams, across packages. You can insert a copy of an element under one or more other packages, in the same project file or any other project file.

### Topics

Topic	Detail	See also
<b>Copying Elements</b>	<p>In the Project Browser, select each required element, right-click on one of them and select the <b>Copy Element(s) to Clipboard</b> context menu option.</p> <p>Alternatively, click on a selected element and press ( <b>Ctrl+C</b> ).</p> <p>The Copy Element(s) to Clipboard dialog briefly displays until the copy operation completes.</p>	
<b>Pasting Elements</b>	<p>In the Project Browser, right-click on the package into which to paste the copied elements, and select the <b>Paste Element(s) from Clipboard</b> context menu option.</p> <p>Alternatively, click on the package and press ( <b>Ctrl+V</b> ).</p> <p>The Paste Element(s) from Clipboard dialog briefly displays until the paste operation completes.</p>	

Topic	Detail	See also
	<p>The target package is expanded and the pasted elements are exposed in the Project Browser. If you are pasting the elements within the same model as the copied source, the source parent package is also collapsed.</p> <p>If the target package already contains:</p> <ul style="list-style-type: none"> <li>• An element of the same type with the same name as a pasted element, the pasted element name has the suffix - <i>Copy</i></li> <li>• An element with the same name as the pasted element including the - <i>Copy</i> suffix, the suffix becomes - <i>Copy1</i> (or - <i>Copy 2</i>, - <i>Copy3</i> and so on, as copies of the element accumulate in the target package)</li> </ul> <p>You can keep the same element names as the source, or you can rename each element either by clicking twice on it and editing the name in the Project Browser, or by double-clicking on it and editing the name in the Properties dialog.</p>	

#### Notes

- A copy of an element does not have the external cross references of the source element; that is:
  - if one element is copied it has no connectors
  - if more than one element is copied, only the connectors between the copied elements are retained
  - however, if those elements come from a Sequence or Communication diagram and the diagram itself is not copied, the message connectors between the copied elements are not retained
- You cannot paste an element into a package that is locked by another user or that is checked in; the **Paste...** option is grayed out in the context menu

#### Learn more

- [Checking In/Checking Out Packages](#) <sup>422</sup>

#### 5.6.1.10.1 Set Up Cross References

It is possible to set up a cross reference (or Custom Reference) from one element in Enterprise Architect to another. You can also view existing cross references on an element, using the Context References tab on the element's Properties dialog, or the Traceability window.

#### Set up a cross reference

Step	Action	See also
1	In the Project Browser, locate the target element or diagram (that is, the object of the cross reference).	

Step	Action	See also
2	Open a diagram that contains the elements that are to have the currently selected element as a reference.	
3	Right-click on the element in the Project Browser. The context menu displays.	
4	Select the <b>Add custom reference</b> menu option.	
5	In the <b>Set up references</b> dialog, select the checkbox against each element to that is to have the target element as a reference.	
6	Optionally, in the <b>Comment</b> field, type some text to describe the purpose of the reference.	
7	Click on the <b>OK</b> button.	

#### Use the cross reference

Step	Action	See also
1	Select an element in a diagram.	
2	Select the <b>Element   Advanced   Custom References</b> menu option. Alternatively, either press ( <b>Ctrl+J</b> ), or right-click on the element and select the <b>Find   Custom References</b> context menu option.	
3	The Custom References dialog displays, showing a list of elements that have been set as cross references for the selected element.	
4	You can open the Properties dialog for an element by highlighting it and clicking on the <b>Open</b> button.	
5	If you have a diagram cross reference, you can open that diagram.	
6	If you have a string of diagram links, click on the <b>Home</b> button to return to the original diagram.	

**Notes**

- You can delete a cross reference by selecting it on the Custom References dialog and clicking on the **Delete** button; cross references are also automatically deleted if the source or target element in the reference is deleted

**Learn more**

- [Context References Tab](#)<sup>[987]</sup>
- [The Traceability Window](#)<sup>[725]</sup>

**5.6.1.11 Change Element Type**

**Access** **Element | Advanced | Change Type**

Select the new element type from the list and click on the **OK** button.

The target element is transformed into the required type.

**5.6.1.12 Align Elements**

When you have created a number of elements on a diagram, you might want to organize them in groups so that they form a column or row with a uniform edge. You can do this quickly and easily by selecting the group of elements and aligning them all against the left, right, top or bottom edge or center of one element in the group. You can also space three or more elements evenly in a row or column, at an average of their previous separations.

**Access** **On diagram | select elements | right-click 'master' element |**  
**Align Left**  
**Align Right**  
**Align Top**  
**Align Bottom**  
**Align Centers (Align Vertically or Align Horizontally)**  
**Space Evenly (Across or Down the page)**

**Align multiple elements**

Step	Action	See also
1	Select a group of elements by drawing a selection box around them all (or select them one by one by holding down ( <b>Ctrl</b> ) and clicking on each element).	
2	Right-click on the element in the group to align others to. The context menu displays.	
3	Select the alignment function you require. All selected elements are aligned to the one beneath the cursor.	

**Notes**

- You can also use the first four buttons of the Diagram toolbar to align elements; these are made available when more than one element is selected in a diagram

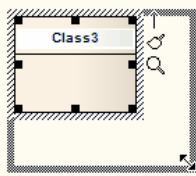

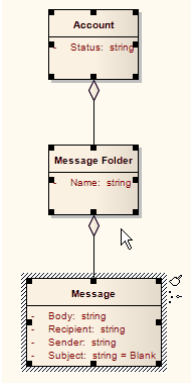

**Learn more**

- [Operations on Multiple Elements](#) <sup>951</sup>
- [Diagram Toolbar](#) <sup>138</sup>

### 5.6.1.14 Delete Elements from Diagram and Model

#### Delete an element from a diagram

Step	Action	See also
1	In the active diagram, click on the element to delete.	
2	Either: <ul style="list-style-type: none"> <li>Press <b>Delete</b> or</li> <li>Right-click to display the context menu and select the <b>Delete &lt;element name&gt;</b> option</li> </ul> <p>This does not delete the element from the model, only from the current diagram.</p>	

#### Delete an element from the model

Step	Action	See also
1	In the Project Browser, right-click on the element to delete and select the <b>Delete &lt;element name&gt;</b> context menu option. A confirmation prompt displays.	
2	Click on the <b>Yes</b> button.	

Alternatively, click on the element in the Project Browser and press **Ctrl+Delete**. The element is completely removed from the model.

#### Delete multiple elements from a diagram

Step	Action	See also
1	In the active diagram, press <b>Ctrl</b> and click on each element to delete.	
2	Either: <ul style="list-style-type: none"> <li>Press <b>Delete</b>, or</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Right-click to display the context menu and select the <b>Delete selected elements</b> option</li> </ul>	

#### Delete multiple elements from a diagram and model

Step	Action	See also
1	Open the diagram containing the elements to remove from the model.	
2	Press <b>Ctrl+A</b> to select all of the elements in the diagram, or press <b>Ctrl</b> and click to select specific elements.	
3	Press <b>Ctrl+Delete</b> to completely remove the elements from the model.	

#### Delete multiple elements from the Project Browser and model

Step	Action	See also
1	In the Project Browser, press and hold either <b>Shift</b> or <b>Ctrl</b> and click on the required items.	
2	<p>To completely remove the elements from the model, either:</p> <ul style="list-style-type: none"> <li>Press <b>Ctrl+Delete</b>, or</li> <li>Right-click on the selected items and select the <b>Delete selected item(s)</b> context menu option</li> </ul> <p>If you delete an element in this way, you delete all its properties and connectors as well.</p>	

#### **5.6.1.15 Customize Visibility of Elements**

Some elements are hidden from view in Packages and in report documents by default. These include Events, Decisions, Sequence elements and Associations. You have the option of turning these elements back on.

For example, some Events and Decisions contained in a Package do not appear in the Package view, as

shown.

Images	Step	Action	See also
	1	Select the <b>Tools   Options   Objects</b> menu option. The Objects page of the Options dialog displays.	
	2	Click on the <b>Advanced</b> button. The Advanced Settings dialog displays.	
	3	Select the checkbox for each type of element to show in packages and in report documents.	
	4	Click on the <b>Close</b> button on each dialog.	
	5	<b>Reload</b> the current diagram if required. The package from the example shows the Event and Decision elements it now contains (see left image).	<a href="#">Refreshing the view of a shared project</a> <sup>[308]</sup>

### 5.6.1.16 Create Notes and Text

You can create both notes and text on a diagram; the two are slightly different.

#### How to

To create a Note

Step	Action	See also
1	Drag the <b>Note</b> icon from the Common page of the Toolbox onto the diagram. <ul style="list-style-type: none"> <li>If you have the <b>Edit Object On New</b> checkbox deselected on the Objects page of the Options dialog, the Note element displays on your diagram; type your note text directly within the Note element</li> <li>If you have the checkbox selected, the Notes <i>window</i> displays; type your text in that window</li> </ul>	<a href="#">Object Display Options</a> <sup>[631]</sup> <a href="#">Notes</a> <sup>[1142]</sup> <a href="#">Notes Toolbar</a> <sup>[1143]</sup>

Step	Action	See also
	<p>If you want to display the Notes information in a more readable layout, you can resize the window</p> <p>You can format the text if necessary, using the Notes toolbar at the top of the window; when you have completed the text, click on the <b>OK</b> button to save it</p>	

To create a Text element

Step	Action	See also
1	<p>Drag the <b>Text Element</b> icon from the Common page of the Toolbox onto the diagram.</p> <p>The Notes window displays.</p>	<a href="#">Notes</a> 
2	<p>Type your text in the window.</p> <p>If you want to display the Notes information in more readable layout, you can resize the window.</p> <p>You can format the text if necessary, using the Notes toolbar at the top of the window; when you have completed the text, click on the <b>OK</b> button to save it.</p>	<a href="#">Notes Toolbar</a> 

### Notes

- You can also create a note by clicking on the **New Note** icon (the text page) on the UML Elements toolbar and clicking on the diagram

### Learn more

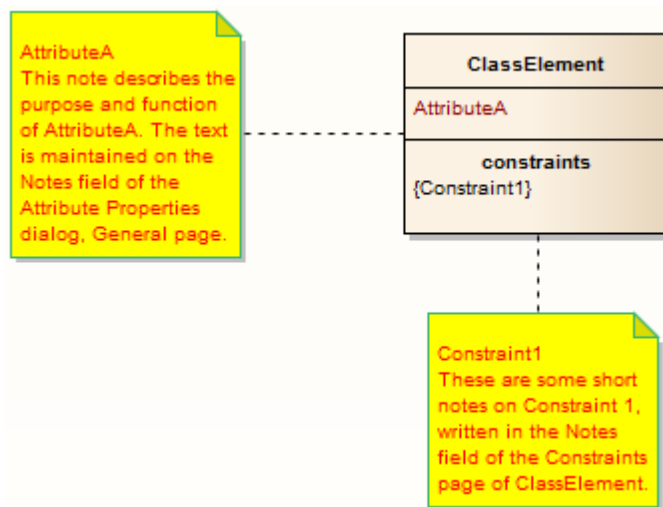

- [UML Elements Toolbar](#) 

#### 5.6.1.17 Link Note to Internal Documentation

It is possible to connect a *Note* element to another element's internal documentation. This enables you to externalize model documentation to the diagram level, and as Enterprise Architect keeps the Note and the internal structure in synch, you do not have to update the Note; in fact, you are blocked from editing the Note text, because it is maintained automatically.

In a similar way, it is also possible to connect a *Note* element to the notes property of the diagram which it is displayed on.

In the example below, two notes are connected into an element's internal structures. One is connected to an attribute, and displays the attribute name and notes. The other is connected to a constraint, showing the constraint name and documentation.

### How to

To connect a Note element to another element's documentation

Step	Action	See also
1	Click on the element and then click on the feature so that it is highlighted for inline editing.	<a href="#">Inline Features Submenu</a> 
2	Select the <b>Element   Inline Features   Create Linked Note</b> menu option. This creates a Note element linked to the selected feature, reflecting the content of that feature.	

Alternatively:

Step	Action	See also
1	Insert the target element into a diagram.	
2	Drag the <b>Note</b> icon from the Common page of the Toolbox onto the diagram, next to the target element. The Notes dialog displays.	
3	Do not type any text, just click on the <b>OK</b> button.	

Step	Action	See also
4	Click on the <b>Note Link</b> icon from the Common page of the Toolbox.	
5	Click on the Note, and drag across to the target element to create the connector.	
6	Right-click on the Note Link to display the context menu.	
7	Select the <b>Link this Note to an Element Feature</b> context menu option. The Link note to element feature dialog displays.	
8	In the <b>Feature Type</b> field, click on the drop-down arrow and select the type of feature to link to.	
9	In the <b>Feature</b> list, click on the specific feature to link to.	
10	Click on the <b>OK</b> button. The note now automatically derives its contents from the target element.	

To connect a Note element to the diagram notes property

Step	Action	See also
1	Open the diagram.	
2	Select the <b>Diagram   Properties</b> menu option, enter an appropriate description in the <b>Notes</b> field, then click on the <b>OK</b> button.	<a href="#">General Tab</a> [824]
3	Drag the <b>Note</b> icon from the Common page of the Toolbox onto the diagram. The Notes dialog displays.	
4	Do not type any text, just click on the <b>OK</b> button.	
5	Right click the Note element and select the <b>Advanced   Link to Diagram Note</b> option. The note now automatically derives its contents from the diagram's notes property.	

**Notes**

- You can unlink a Note linked to an element feature, leaving the Note text, which can be edited manually and directly as normal; to unlink the Note from an element feature, either:
  - Right-click on the Note and select the **Advanced | Unlink from Element Feature** context menu option, or
  - Right-click on the Notelink connector, select the **Link this Note to an Element Feature** context menu option and, on the Link note to element feature dialog, set the **Feature Type** field to **None**

**5.6.1.18 Set an Element's Default Appearance**

To override the **global** element appearance settings and define a default appearance for a **specific element** on all diagrams on which it is found, you use the Default Appearance dialog. You can alter:

- The background, border and font colors
- Font styles, including font face and size
- The border thickness for an element

An alternative option for changing the element's appearance is to define a stereotype that has different fill, border and font settings, or either a Shape Script or an image file associated with it. You can then assign the stereotype to the element to change the element's appearance to that defined by the stereotype.

**Access** Click on the element, **Element | Appearance | Default Appearance** (Ctrl+Shift+E)

**Options**

Field/Option/ Button	Action	See also
<b>Background Color</b>	<p>Click on the drop-down arrow and select the background - or fill - color of the element.</p> <p>This setting overrides all other fill color definitions in the model, <b>except</b> for an element-specific definition from the Format Toolbar, or a color defined in a Shape Script and applied through a stereotype.</p> <p>If you want to use a color that is not available, click on the <b>Other</b> button and define the required color.</p>	<a href="#">Create Custom Colors</a> 
<b>Border Color</b>	<p>Click on the drop-down arrow and select the border color for the element.</p> <p>If you want to use a color that is not available, click on the <b>Other</b> button and define the required color.</p>	
<b>Border Width</b>	<p>Type in the width of the border surrounding the element, or use the increment/decrement arrows to the right of the field.</p> <p>The minimum width setting is <b>1</b>, the maximum is <b>5</b>.</p>	
<b>Font Style</b>	<p>Display the current font typeface for the element text. To change this, click on the (...) button.</p>	

Field/Option/ Button	Action	See also
	<p>The Font dialog displays, on which you can select a different typeface, style (such as bold/italic) and font size.</p> <p>You can also select from a limited number of font colors and effects on this dialog.</p>	<a href="#">Font Dialog</a> <sup>[94]</sup>
<b>Font Color</b>	<p>Click on the drop-down arrow and select the font color to apply to the text of the element.</p> <p>If you want to use a color that is not available, click on the <b>Other</b> button and define the required color.</p>	Notes, below <a href="#">Create Custom Colors</a> <sup>[619]</sup>
<b>Reset to defaults</b>	(Optional) Click on this button to reset all appearance settings to the system default values.	
<b>Preview</b>	Displays a representation of the colors, border width and font styles, which updates as you choose the new settings.	
<b>OK</b>	Click on this button to close the dialog and <b>apply</b> the appearance settings you have defined.	
<b>Cancel</b>	Click on this button to close the dialog and <b>abort</b> all the changes you have made within the dialog.	

### Notes

- You can adjust several elements at the same time; select all of the required elements, right-click on one of them and select the **Appearance | Default Appearance** context menu option, or use the Format toolbar
- If the **Show Project Custom Colors in Color Combo Boxes** checkbox is selected on the Options dialog, Standard Colors page, the last 16 color squares in the color selection palettes contain the project colors set on that dialog
- The **Font Color** field affects only the element name text; it does not override the feature text colors as defined on the Options dialog, Standard Colors page
- When it has been called directly on one or more selected elements (**Appearance | Set Font**), the Font dialog overrides the Default Appearance dialog
- When called from the Default Appearance dialog, the **Color** field on the Font dialog is overridden by the **Font Color** field on the Default Appearance dialog
- The **Font** and **Font Style** fields on the Font dialog affect all text except for the Note compartment text
- The **Size** field on the Font dialog affects all text

### 5.6.1.19 Set Element Templates Package

In building up a model, you might want to represent or emphasize certain characteristics of elements in the appearance of those elements, or select particular display options as standard. For example, you could make new Interface elements a different default color to new Class elements, ensure all new Activity Partitions are vertical rather than horizontal, or set a specific group of display options for new diagrams; you could also define a set of characteristics to use for each development stage of a project.

To do this, you create a diagram with all the characteristics you require, and store the diagram in an Element Templates package; the system then checks this package:

- Whenever you start to create an element in a diagram or
- Whenever you create a new diagram

If it finds a template for that diagram type, the system applies the settings in that template to the new element or to the display options of the diagram. For example, you could save a diagram under the name *ClassTemplate*, to apply a set of display characteristics to all new Class elements and Class diagrams.

You can create the Templates package anywhere in your model; however, it is better to create it in a location that is not likely to be accidentally changed or lost in any project development work.

#### Set up the element Templates package

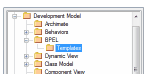

Image	Step	Action	See also
	1	Create a new package. You can give this package any name; <i>Templates</i> is an unambiguous option.	
	2	Within the Templates package create new diagrams, one for each type of diagram to template.  Give them easily recognized names; for example <i>ClassTemplate</i> for the template for Class diagrams.	
	3	Add new elements to the template diagrams from the Toolbox, and configure the size, appearance, notes, version and other properties.	
	4	Select the <b>Settings   Project Template Package</b> menu option to set the templates as the default element templates.  The Browse Project window displays.	
	5	Locate and click on the Templates package, and click on the <b>OK</b> button to set the package as the default element template.  Now each new element or diagram you add to your project is created with the settings from the appropriate Template diagram.	

Image	Step	Action	See also

### Notes

- The **Fill color** for a type of element defined in the element template can be overridden by the element fill color defined from the Format Toolbar, a Shape Script applied to the element, or the Default Appearance dialog
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Reference Data - Update** permission to set up or access the element Templates package
- If you decide not to use the default element template, set the default element template to **<none>** in the Browse Project window; the **<none>** package is at the bottom of the hierarchy shown in the Browse Project window
- There are two other ways in which you can modify the standard appearance of elements in diagrams:
  - Define the default appearance of elements (and other structures) grouped in a diagram using UML Profiles, which provide a means of extending the UML to build UML models in particular domains; Profiles are based on additional stereotypes and Tagged Values that are applied to elements, attributes, methods, connectors and connector ends
  - Modify the appearance of elements or connectors of a specific type using **stereotypes, which take precedence over templates**; if you drop a **stereotyped** Class onto a diagram, the stereotype immediately defines the Class appearance so the template is not accessed

Stereotypes are much more flexible for defining the appearance of an element under different scenarios

## 5.6.1.20 Highlight Context Element

**Access** **Tools | Options | Diagram | Behavior**

You can show a hatched border around a selected element by selecting the **Always Highlight Context Element** checkbox on the Diagram Behavior page. If you have selected this checkbox, the selected element displays similarly to the following example:

If you have not selected the **Always Highlight Context Element** checkbox, the selected element does not have a hatched border around it.

### Topics

Images	Topic	Detail	See also
	<b>Multiple Selections</b>	<p>Whether you have selected the <b>Always Highlight Context Element</b> checkbox or not, if you select multiple elements one of the elements you select always has a hatched border.</p> <p>If you align the elements, this element is the one used to align the other elements against.</p> <p>For example, if the elements in the diagram are aligned, the top element aligns to the bottom element (the element showing a hatched border).</p>	
	<b>Change the Element to Align Against</b>	To change which element has a hatched border in a selected group (and thus the element that is aligned with) click on the element that the other elements are to align with.	

### 5.6.1.21 Make Linked Element a Local Copy

#### How to

To convert a linked element to a local copy

Step	Action	See also
1	Open the diagram with the linked element.	
2	Select the linked element and right-click on it to display its context menu.	
3	<p>Select the <b>Convert Linked Element to Local Copy</b> menu option.</p> <p>The element changes to a local copy and is placed in the appropriate package.</p>	

Step	Action	See also

### 5.6.1.22 Copy Features Between Elements

Using drag and drop, you can copy attributes and/or operations from an element in the Project Browser or Element Browser on to another element in a diagram.

#### How to

To copy an element feature

Images	Step	Action	See also
	1	Open a diagram that contains the target element.  In the example to the left, the <i>AccountItem</i> Class is the target and the <i>Customer</i> element is the donor - this is depicted for the Project Browser but is almost identical for the Element Browser.	
	2	Click on the attribute or operation and drag it to the target element.	
	3	Release the mouse button.	

The image below shows *AccountItem* after the attribute *Account* has been dropped from the browser on to it.

To copy multiple element features from the Project Browser (not the Element Browser)

Images	Step	Action	See also
	1	Open a diagram that contains the target element (as in the example above, the <i>AccountItem</i> Class is the target and <i>Customer</i> is the donor).	
	2	Hold down ( <b>Ctrl</b> ) (separate features) or ( <b>Shift</b> ) (select a range) and click on the attributes and/or operations to copy, then drag the selected features to the target element.	
	3	Release the mouse button.	

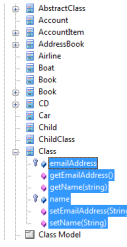

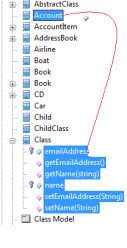

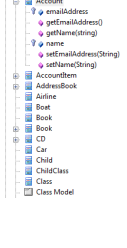

#### Learn more

- [Attributes](#) <sup>999</sup>
- [Operations](#) <sup>1014</sup>
- [The Project Browser](#) <sup>646</sup>
- [The Element Browser](#) <sup>989</sup>
- [Move Features Between Elements](#) <sup>933</sup>

### 5.6.1.23 Move Features Between Elements

Using drag and drop, you can move attributes and/or operations from an element in the Project Browser on to another element within the Project Browser.

#### Move element features

Images	Step	Action	See also
	1	In the Project Browser, locate the attributes and/or operations to move from the target element and select them while holding down: <ul style="list-style-type: none"> <li>• <b>(Ctrl)</b> (single item select) or</li> <li>• <b>(Shift)</b> (multiple item select)</li> </ul>	
	2	Holding down the mouse button, drag the attributes and/or operations to the target element.  A single feature symbol (and, under some operating systems, the feature name) displays during the move; however all of the selected features are moved.	
	3	Release the mouse button.  The image to the left shows the final stage of the attribute and operations move between the <i>Class</i> element and the <i>Account</i> element.

- [Operations](#) <sup>1014</sup>
- [Copy Features Between Elements](#) <sup>932</sup>

### 5.6.1.24 Insert Related Elements

Elements can be used more than once in a model, either individually or as a group. If you want to reproduce an existing set of elements that have one element as the focus, without copying and linking the elements individually in the new diagram, you can use the **Insert Related Elements** facility. With this facility, you drag the focus element from the Project Browser onto your diagram, right-click on it and select to add related elements. The Insert Related Elements dialog displays, on which you can specify:

- Which types of relationship to filter on, and what direction these relationships have
- Which types of element to filter on
- Which package the related elements exist in

- How many levels of relationship to bring in; that is, just the elements immediately related to the focus element, or also elements related through those elements
- Whether to add all elements that satisfy the criteria you have specified, or just those you select
- Whether or not to automatically re-organize the diagram when the related elements have been added

**Access** **Right-click on element | Insert Related Elements**

**Define selection criteria to insert related elements**

Field/Button	Action	See also
<b>Connector types</b>	<p>Displays the <b>types</b> of <b>relationship</b> in which the selected element and, if more than one level of relationship is selected, its related elements are currently involved.</p> <p>To limit the inserted elements to those connected by specific relationship types, select the checkbox against each of those types of connector.</p> <p>To deselect a selected checkbox, click on it again.</p>	
<b>Element types</b>	<p>Display the <b>types</b> of <b>element</b> to which the selected element and, if more than one level of relationship is selected, its related elements are connected.</p> <p>To limit the inserted elements to those of specific types, select the checkbox against each of those types.</p> <p>To deselect a selected checkbox, click on it again.</p>	
<b>Link Direction</b>	<p>Limit the inserted elements to those in incoming or outgoing relationships with the selected element; click on the drop-down arrow and select the appropriate direction, or <b>&lt;All&gt;</b> for either direction.</p>	
<b>Limit to Namespace</b>	<p>Restrict the inserted elements to those from a specific package; select the namespace from which the elements are to come. Select <b>&lt;None&gt;</b> for elements in any namespace.</p>	
<b>Find relationships to: levels</b>	<p>Click on the drop-down arrow and select the level down to which to insert connected elements, between levels <b>1</b> (immediately related elements) and <b>5</b> (elements 5th in a chain from the focus element).</p> <p>You can select levels <b>4</b> or <b>5</b> to see how far the element/relationship hierarchy extends, but as this can produce a complicated and tangled diagram, it is better to use level <b>1</b> or <b>2</b> on selected elements in turn.</p>	
<b>Refresh</b>	<p>Click on this button to locate and list all elements that satisfy the criteria you have specified.</p> <p>Each list item shows the depth at which the related element exists in relation to the focus element, the name of the element, its parent package, and whether it is currently in the diagram.</p>	<a href="#">Customizing the Search</a>

Field/Button	Action	See also
	<p>If there are many entries, you can re-organize them for clarity using the <b>Drag a column header...</b> panel.</p> <p>If you want to add an element to your diagram, select the checkbox against that element. Alternatively, to select all elements, click on the <b>All</b> button.</p> <p>To deselect all selected checkboxes, click on the small <b>Clear</b> button.</p> <p>To empty the list panel altogether, click on the large <b>Clear</b> button.</p>	<a href="#">View</a> <sup>[709]</sup>
<b>Layout Diagram when complete</b>	<p>Select the checkbox if you want the system to layout the diagram after the elements have been inserted; the layout applied is the Digraph<sup>[883]</sup> layout.</p> <p>If no elements have been added, this option has no effect; elements have to be added for the system to adjust the layout.</p>	<a href="#">Digraph Layout</a> <sup>[883]</sup>
<b>OK</b>	Click on this button to add the selected elements to the diagram and close the dialog.	

#### Notes

- If the selected element has a relationship to an edge-mounted structural element such as a **Port** or **Exposed Interface**, adding the Port or Interface to the diagram using the Insert Related Elements dialog will also add the associated parent elements onto the diagram, if they are not already shown.

#### 5.6.1.25 Manage Structural Elements

You can add a number of structural - or embedded - elements to a modeling element. For example, you can add Ports to a Class, Action Pins to an Action, or Activity Parameter to an Activity. These structural elements cannot exist by themselves, they must be attached to a parent element.

**Access** **Diagram | right-click on element | Structural Elements**

#### Create and manage Structural Elements

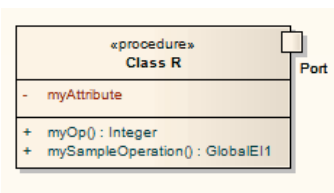

Image	Detail	See also
	<p>On the Structural Elements dialog, click on the <b>New</b> button to create a new embedded element. The Insert New Embedded Element dialog displays.</p> <p>The <b>Type</b> field defaults to the first in the list of types of structural element you can create for the selected element. If this is not the type you need, click on the drop-down arrow and select another type.</p> <p>Enter details such as type, name and stereotype, and click on the <b>OK</b> button.</p> <p>The embedded element now shows on the primary</p>	

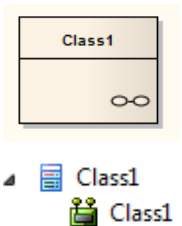

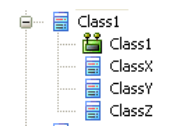

Image	Detail	See also
	<p>element as shown on the left.</p> <p>You can add as many embedded elements as you need; modify or delete embedded elements using the Structural Elements dialog.</p> <p>To incorporate inherited or owner properties, select the <b>Show Owned/Inherited</b> checkbox.</p> <p>The name of the embedded element is a label, which you can edit using the <b>Labels</b> context menu.</p>	<p><a href="#">Manage Object Labels</a> [866]</p>

### 5.6.1.26 Composite Elements

You might want to make one element represent a structure composed of other elements; for example, a general Use Case representing a collection of more specific Use Cases. To achieve this, you can make the 'general' element a **composite** element, as a pointer to a child diagram containing the 'detail' elements. The elements that you can turn into composites include Classes, Objects, Activities and Use Cases.

**Access** [Right-click element in diagram | New Diagram | Composite Structure Diagram](#)  
[Right-click element in Project Browser | Add | Composite Structure Diagram](#)

#### Make an element composite

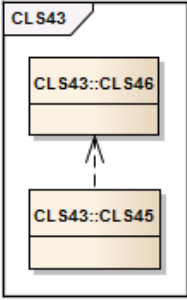

Images	Step	Action	See also
	1	<p>When you select to make an element composite, it displays in the diagram and in the Project Browser as illustrated on the left.</p> <p>Note:</p> <ul style="list-style-type: none"> <li>The small icon in the bottom right hand corner of the element shape, indicating that this is now a Composite element</li> <li>The icon against the child diagram name in the Project Browser, indicating that this diagram was created as a child of the composite element</li> </ul>	
	2	<p>Double-click on the Composite element to access the child diagram that it points to. You can populate the child diagram with elements and connectors to represent the internal structure of the (parent) composite element.</p> <p>At this point, embedded elements cannot be added to the child composite diagram. A modified procedure enables you to include them.</p> <p>The Composite element and its child diagram are now represented in the Project Browser as shown. <i>ClassX</i>, <i>ClassY</i> and <i>ClassZ</i> are elements added to the child diagram.</p>	<p><a href="#">Show Embedded Elements In Composite</a> [938]</p>

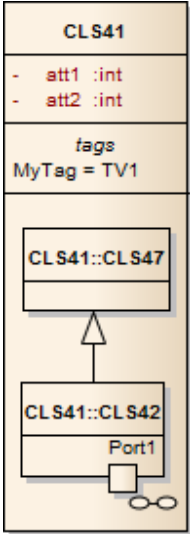

Images	Step	Action	See also
	3	<p>If you already have, or subsequently create, another diagram that better represents the content of your composite element, you can select <b>that</b> diagram as the child of the composite.</p> <p>Right-click on the composite element and select the <b>New Diagram   Select Composite Diagram</b> context menu option. The Select a Diagram browser displays, through which you can browse the entire project to locate the alternative diagram. Click on the diagram and on the <b>OK</b> key to apply it as the child of the composite element.</p> <p>Neither the original nor the alternative child diagram move location or change icons in the Project Browser (unless you specifically make these changes as a separate operation).</p>	

### Alternative Notation

You can display the contents (the child diagram) of a Composite element within the element, in two ways.

Display Format	Detail	See also
<p><b>Display Composite Element as Frame</b></p> 	<p>Composite elements can show their contents <b>in place of</b> their usual notation.</p> <ol style="list-style-type: none"> <li>1. Right-click on the element to open the context menu.</li> <li>2. Select the <b>New Diagram   Show Composite Diagram in Frame</b> option.</li> </ol> <p>The element is replaced by a frame containing the child diagram. The frame label shows the composite element name. The element is resized to contain the diagram; whilst it can be enlarged, it cannot be reduced to less than the diagram size.</p> <p>Some technologies, such as SysML, qualify the frame label to show the diagram type, element type, element name and child diagram name. If you design custom diagram profiles, you can also qualify the frame label as required.</p>	<p><a href="#">Create Custom Diagram Profiles</a> <sup>[1570]</sup></p>
<p><b>Display Composite Element Content In Compartment</b></p>	<p>Composite elements can also show their contents <b>in addition to</b> their usual notation, in an additional compartment of the element.</p> <ol style="list-style-type: none"> <li>1. Right-click on the element to open the context menu.</li> <li>2. Select the <b>New Diagram   Show Composite Diagram in Compartment</b> option.</li> </ol> <p>A compartment is added to the element, containing the child diagram. The element is resized to contain the diagram; whilst it can be enlarged, it cannot be reduced to less than the diagram size.</p> <p>You can also display a Composite Diagram inside its parent element,</p>	<p><a href="#">Show Composite</a></p>

Display Format	Detail	See also
	<p>using a Shape Script. The diagram is displayed in a <b>custom</b> compartment in the <b>center</b> of the element and not necessarily with the standard compartments (such as attributes, tags).</p>	<p><a href="#">Diagram</a> <sup>[1608]</sup></p>

### Notes

- If the **Composite Structure Diagram** option is not listed in the context menu, the option is not available for the type of element you have selected
- If you select either of the alternative notation options to display the child diagram **on** the composite element, and then you select a **different** child diagram, the display settings are cleared; reselect the appropriate option to display the new diagram on the composite element
- Automation support is available for Composite elements; *Element* has an *Elements* collection and a *Diagrams* collection. Additionally you can set the Composite diagram with *SetCompositeDiagram*.

- [Element Class](#) <sup>[2881]</sup>

#### 5.6.1.26.1 Show Embedded Elements In Composite

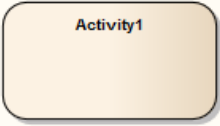

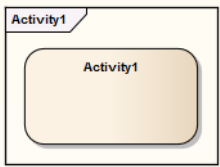

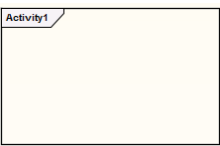

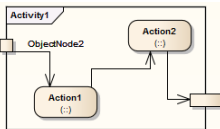

A Composite element shows the external relationships of the element with other components of the model and, via a child diagram, its own internal structure. You cannot add embedded elements to the initial representation of this *internal* structure; this procedure explains how to add embedded elements to the child diagram.

Embedded elements include:

- ActivityParameter
- RequiredInterface
- ActionPin
- Port
- EntryPoint
- ExpansionNode
- ObjectNode
- ProvidedInterface
- ExitPoint

- Part

#### Include embedded elements in a child composite diagram

Images	Step	Action	See also
	1	Create the element to set as a Composite element. For example, a Class, Activity, or SysML Block.	
	2	Right-click on the element in the diagram and select the <b>New Diagram   Composite Structure Diagram</b> context menu option. The element redisplay with a small icon in the bottom right hand corner, indicating that this is now a Composite element.	<a href="#">Composite Elements</a> [936]
	3	Double-click on the Composite element to access the child diagram that it points to.	
	4	From the Project Browser, drag the Composite element itself onto the child Composite diagram, and paste it in as a Simple Link.	
	5	Right-click on the element in the diagram, and select the <b>New Diagram   Show Composite Diagram in Frame</b> context menu option. The element redisplay with a labeled frame around it.	
	6	Press <b>(Ctrl+S)</b> to save the diagram. Right-click on the diagram tab and select the <b>Reload &lt;diagram name&gt;</b> context menu option. The diagram redisplay with just the frame showing. This frame represents the original composite element.	
	7	Populate the frame with the appropriate internal elements, including the embedded elements that attach to the frame itself.	

## 5.6.2 Operations on Elements

You can perform a wide range of operations on element objects on a diagram, such as displaying an element's structural components, displaying or hiding its features on the diagram, and changing the element's appearance. You access these operations through the **element context menu**. If you are working under a technology such as SysML or BPMN, the menu can also provide options that are specific to that technology.

**Element Context Menu Options on Diagrams**

Option	Action	Shortcut	See also
<b>&lt;Technology Options&gt;</b>	For some technologies the context menu begins with technology-specific options. Refer to the topics on elements specific to the technology you are working in, such as BPEL, BPMN and SysML.		
<b>Properties</b>	Open the Properties dialog for the selected element.  For <b>State Lifeline</b> and <b>Value Lifeline</b> elements, display the Configure Timeline dialog. For a <b>Required Interface</b> element, display the Exposed Interface dialog.	<b>Alt+Enter</b>	<a href="#">Properties dialog</a> [956] <a href="#">Configure Timeline - States</a> [1237] <a href="#">Expose Interface</a> [1375]
<b>Lock Element</b>	Lock the element so it can't be edited; to unlock the element, select <b>Lock Element</b> again.  This does not apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions <b>when security is enabled</b> ; in that situation, use the <b>Lock</b> option for model elements.		<a href="#">Lock model elements</a> [336]
<b>Other Properties</b>	For State Lifeline, Value Lifeline and Required Interface elements, display the Properties dialog for the selected element.	<b>Ctrl+Shift+G</b>	<a href="#">Properties dialog</a> [956]
<b>Feature and Compartment Visibility</b>	Open the Feature and Compartment Visibility dialog to define which features and feature properties to display on the element, and which element compartments.	<b>Ctrl+Shift+Y</b>	<a href="#">Feature Visibility</a> [845]
<b>Rule Composer</b>	For a Rule Task element, invoke the Rule Composer in Business Rule Modeling.		<a href="#">Compose Business Rules</a> [1833]
<b>Create (or Edit) Linked Document</b>	(Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions) Create a document linked to the element.	<b>Ctrl+Alt+D</b>	<a href="#">Create Linked Document on an Element</a> [1047]
<b>Delete Linked Document</b>	Delete an existing linked document for the element.		<a href="#">Replace or Delete Documents</a> [1097]
<b>Create Document to Artifact</b>	(On an Artifact element linked to a Master Document or Model Document element). Generate a virtual document as the linked document of the Artifact element.		<a href="#">Generate Report to an Artifact Element</a> [2680]

Option	Action	Shortcut	See also
<b>New Element</b>	<p>Attach:</p> <ul style="list-style-type: none"> <li>One of a number of types of structural element, such as a Port, Part or Activity Parameter, to the selected element, or</li> <li>A text element to the selected element, documenting a Note, Constraint, Rationale or Problem.</li> </ul>		<a href="#">Create Notes and Text</a> <sup>[923]</sup> <a href="#">Note</a> <sup>[1324]</sup>
<b>New Diagram</b>	<p>Display a submenu, listing - in order:</p> <ul style="list-style-type: none"> <li>Individual types of child diagram (often technology-specific) that you might <b>usually</b> create for this type of element</li> <li>For classifier elements, options to create Activity, Interaction, State Machine or Rule Flow elements that encompass the appropriate type of child diagram</li> <li>Options for creating and displaying the child diagram for a <b>Composite</b> element</li> <li>An option to display the New Diagram dialog to add any <b>other</b> type of diagram as the child diagram of this element</li> </ul>		<a href="#">Classifiers and Instances</a> <sup>[1009]</sup> <a href="#">Composite Elements</a> <sup>[936]</sup> <a href="#">Show Composite Diagram</a> <sup>[1608]</sup> <a href="#">Add New Diagrams</a> <sup>[822]</sup>
<b>Features and Properties</b>	<p>Select to add Attributes and/or Operations to the element, through the Attribute Properties dialog or Operation Properties dialog.</p> <p>For elements that can have interfaces, you can also select to show realized and/or dependent interfaces.</p>		<a href="#">Attributes</a> <sup>[999]</sup> <a href="#">Operations</a> <sup>[1014]</sup> <a href="#">Show Realized interfaces of Class</a> <sup>[865]</sup>
<b>Structural Elements</b>	Display the Structural Elements dialog, for <b>managing</b> the structural elements (such as Provided Interfaces, Ports and Activity Parameters) attached to the selected element.	<b>Ctrl+Shift+B</b>	<a href="#">Manage Structural Elements</a> <sup>[935]</sup>
<b>Find</b>	Display the <b>Find</b> submenu, which provides options for locating the selected element in other diagrams and in the Project Browser, and for setting up cross references (Custom References) to other elements.		<a href="#">Finding Elements</a> <sup>[944]</sup>
<b>Insert Related Elements</b>	Displays the Insert Related Elements dialog, to add elements related to the selected element to the current diagram.		<a href="#">Insert Related Elements</a> <sup>[933]</sup>
<b>Advanced</b>	Open the Advanced sub-menu, which provides options for performing more complex or specialized operations on the element.		<a href="#">Advanced Operations on Elements</a> <sup>[944]</sup>

Option	Action	Shortcut	See also
<b>Transform</b>	Transform the selected element from one domain to another.	<b>Ctrl+H</b>	<a href="#">Transform Elements</a> <sup>[2017]</sup>
<b>Generate DDL</b>	Generate DDL for a Table, Procedure or View Class.		<a href="#">Generate DDL</a> <sup>[2380]</sup>
<b>Generate Code</b>	Generate source code for the selected element (forward engineer).	<b>F11</b>	<a href="#">Generate a Single Class</a> <sup>[2113]</sup>
<b>Synchronize with Code</b>	Reverse engineer source code for the selected element.  You can also synchronize Class elements from the source code via the Project Browser, and reverse engineer or forward engineer model packages and code to synchronize them and incorporate changes made in one but not in the other.	<b>F7</b>	<a href="#">Importing Source Code</a> <sup>[2136]</sup>  <a href="#">Element Options in the Project Browser</a> <sup>[660]</sup>  <a href="#">Operation Menu - Project Browser</a> <sup>[667]</sup>  <a href="#">Update Package Contents</a> <sup>[2117]</sup>
<b>View Source Code</b>	Open the source editor if a source code file exists for that selected element.	<b>F12</b>	<a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>Execution Analyzer</b>	(If the selected Class element has generated code.) Display the Execution Analyzer submenu, to prepare the Class for Execution Analysis by: <ul style="list-style-type: none"> <li>• Creating workbench variables from the selected Class (<b>Ctrl+Shift+J</b>)</li> <li>• Marking up a process for the Class or</li> <li>• Marking up the Class for recording</li> </ul>		<a href="#">Create Workbench Variables</a> <sup>[2568]</sup>  <a href="#">Recording Activity For a Class</a> <sup>[2542]</sup>
<b>Selectable</b>	Toggle whether the element is selectable or not <ul style="list-style-type: none"> <li>• If an element is selectable, you can move it around the diagram and perform right-click context menu operations</li> <li>• If an element is unselectable, you cannot move it around the diagram and the only right-click operation available is to make the element selectable</li> </ul> <p>This option has no effect on double-click operations on the element, such as displaying child diagrams or Properties dialogs.</p> <p>An element on a locked diagram is also unselectable - if you click on it, the element outline displays in red.</p>		<a href="#">Diagram Filters</a> <sup>[718]</sup>

Option	Action	Shortcut	See also
	In a diagram, you can filter the display to show selectable or non-selectable elements only.		
<b>Dockable</b>	<p>Align and join two elements either vertically or horizontally, on the current diagram only.</p> <p>Both elements must have the <b>Dockable</b> option selected, and must have the joining edges parallel.</p> <p>As the distance between the elements narrows, the moving element snaps to the edge of the other element.</p> <p>For Activity Partitions, the option is selected by default.</p> <p>Deselecting the <b>Dockable</b> option does not separate the elements; if necessary, you can simply move the elements apart again.</p>		<a href="#">Partition</a> <sup>1325</sup>
<b>Appearance</b>	Display a short menu of options to change and reproduce the appearance of the element.		<a href="#">Changing Element Appearance</a> <sup>948</sup>
<b>Z-Order</b>	<p>Display a short submenu providing options to:</p> <ul style="list-style-type: none"> <li>• Move the element further back in the diagram</li> <li>• Move the element further forward in the diagram</li> <li>• Put the element at the back of the diagram</li> <li>• Put the element at the front of the diagram</li> </ul>		<a href="#">Z Order Elements</a> <sup>844</sup>
<b>UML Help</b>	Display the Help topic describing the type of element you have selected.		
<b>Delete &lt;element name&gt;</b>	Delete the element from the diagram. The element still exists within the model and can be accessed from the Project Browser.	<b>Ctrl+D</b>	

### Notes

- Context menus vary between element types; for example, the **Generate Code**, **Synchronize with Code** and **View Source Code** options won't display for a Use Case element
- If you select two or more elements at the same time, you can perform an operation on all of the selected elements at once; the operations available for multiple selection are provided on a separate context menu

### Learn more

### 5.6.2.1 Finding Elements

When you have selected an element on a diagram, you might want to find out where it is held in the model structure, where else it is used in the model, and how to locate it easily in the future. For these operations, you can select the **Find** submenu.

**Access**    **Right-click on element | Find**

#### Find Options

Option	Action	Shortcut	See also
<b>Locate in State Table</b> <b>Locate in State Chart</b>	For a State element, switch to the alternative diagram display format and highlight the element.		
<b>In Project Browser</b>	Highlight the currently selected element in the Project Browser.	<b>Alt+G</b>	
<b>Locate Classifier In Project Browser</b>	For an <b>instance</b> or <b>Object</b> , highlight the <b>classifier</b> for that element in the Project Browser.	<b>Ctrl+Alt+G</b>	
<b>Locate Operation in Project Browser</b>	For an <b>Action</b> element, highlight the <b>call operation</b> for that element in the Project Browser.	<b>Ctrl+Alt+G</b>	<a href="#">Class Operations in Diagrams</a> <sup>[1275]</sup>
<b>Find in all Diagrams</b>	List the other diagrams in which the element is also used, on the Element Usage dialog.	<b>Ctrl+U</b>	<a href="#">Show Element Use</a> <sup>[910]</sup>
<b>Custom References</b>	Identify and, if necessary, open the Properties dialog for, any elements that are the target of a cross reference from the selected element.	<b>Ctrl+J</b>	<a href="#">Set Up Cross References</a> <sup>[917]</sup>
<b>Add to Favorites</b>	Add the selected element to the <i>Favorites</i> folder in the Resources window.		<a href="#">Favorites</a> <sup>[1176]</sup>

### 5.6.2.2 Advanced Operations on Elements

You can perform a wide range of more specialized functions on an element, specific to the element type and relationship to other modeling objects.

**Access**    **Right-click on element | Advanced**

**Advanced Options**

Option	Action	Shortcut	See also
<b>Parent</b>	(For a classifier element that can be generalized) Set the element parent.	<b>Ctrl+I</b>	<a href="#">Set Element Parent</a> <sup>[908]</sup>
<b>Instance Classifier</b>	(For an instance or Object element) Set the instance classifier for the element, on the Select <Item> dialog.	<b>Ctrl+L</b>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Classifier Properties</b>	(For an instance or Object element) Open the Properties dialog for the <i>classifier</i> of the selected element.	<b>Ctrl+Alt+Enter</b>	<a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Change to State (Value) Lifeline</b>	(For a State Lifeline or Value Lifeline element) Switch one type of Lifeline element to the other.		<a href="#">Value Lifeline</a> <sup>[1355]</sup> <a href="#">State Lifeline</a> <sup>[1335]</sup>
<b>Set Property Type</b>	(For a Part element) Browse for and select the element that defines the Part type, using the Select <Item> dialog.		<a href="#">Part</a> <sup>[1383]</sup>
<b>Multiplicity</b>	Define the multiplicity for the element, using the format defined on the Cardinality Values tab of the UML Types dialog ( <b>Settings   UML Types</b> ).  This is the number of instances of the element that can exist in a set; the value displays on the element in a diagram, in the <i>Name</i> compartment.		<a href="#">Cardinality</a> <sup>[1151]</sup>
<b>Port Size Customizable</b>	(For a Port element) Allow the Port to be re-sized from the default size. If the option is not set, the element size cannot be changed.		<a href="#">Port</a> <sup>[1384]</sup>
<b>Show Element Type</b>	(For a Port or Part element) Toggles between displaying and hiding the element type, as set using the <b>Set Property Type</b> option (above) or on the Property page of the element's Properties dialog.		<a href="#">Part</a> <sup>[1383]</sup> <a href="#">Port</a> <sup>[1384]</sup> <a href="#">The Property Page</a> <sup>[1386]</sup>
<b>Set Property Values</b>	(For a Part element) Set the property value for the Part, using the Set Property Values dialog.	<b>Ctrl+Shift+R</b>	<a href="#">Add Property Values</a> <sup>[1383]</sup>
<b>Edit Extension Points</b>	(For a Use Case element) Display the Use Case Extension Points dialog, which you use to insert the point at which the behavior should be inserted.		<a href="#">Use Case Extension Points</a> <sup>[1354]</sup>

Option	Action	Shortcut	See also
<b>Association Class</b>	(For a Class element) Connect the Class to a new Association.		<a href="#">Connect New Class to Association</a> 
<b>Use Rectangle (Circle, Actor) Notation</b>	(For an element that uses non-rectangular notation) Apply rectangle notation to the element (and switch back again).		<a href="#">Rectangle Notation</a> 
<b>Partition Activity</b>	(For an Activity element) Define an Activity Partition in the element.		<a href="#">Activity Partition</a> 
<b>Set Run State</b>	(For an Object or State element) Add a new instance variable to the element using the Define Run State dialog.	<b>Ctrl+Shift+R</b>	<a href="#">Define A Run-Time Variable</a> 
<b>Set Object State</b>	(For an Object or instance element) Set the state of the element based on the child states of its classifier.	<b>Ctrl+Shift+S</b>	<a href="#">Object State</a> 
<b>Override Attribute Initializers</b>	(For a Class element with attributes) Pre-define initial values for attributes that can be used to override existing defaults.	<b>Ctrl+Shift+R</b>	<a href="#">Display Inherited Attributes</a> 
<b>Convert to Instance (Property/Invocation)</b>	Convert this classifier to an instance, property or invocation, depending on the type of classifier selected (for example, SysML classifiers are always converted to properties).		<a href="#">Classifiers and Instances</a> 
<b>Convert Linked Element To Local Copy</b>	Convert the occurrence of the element on this diagram from a <b>link to the original element</b> to a <b>local copy</b> of the element. A copy of the element is also added to the diagram's parent package in the Project Browser.		
<b>Make Sender/Receiver</b>	(For Send and Receive Event elements) Toggle the element from a sender to a receiver and vice versa.		<a href="#">Receive</a>  <a href="#">Send</a> 
<b>Accept Time Event</b>	(For a Receive element) Change the notation from an Accept Event action to an Accept Time Event action.		<a href="#">Receive</a> 
<b>Define Concurrent Substates</b>	(For a State element) Define a set of substates that can be held simultaneously within that composite State.		<a href="#">Regions</a> 

Option	Action	Shortcut	See also
<b>Use State Label Notation</b>	Display State Label Notation for a State object (the element name is displayed on a box on top of the element rather than inside it).		
<b>Deep History</b>	(For a History pseudo-State) Change the type of a <b>shallow</b> History pseudo-state to a <b>deep</b> History pseudo-state.		<a href="#">History</a> 
<b>Set Attached Links</b>	(For a Note element) Attach the element to a connector, or several connectors.		<a href="#">Add a Note to a Connector</a> 
<b>Link to Diagram Note</b>	(For a Note element) Display the <b>diagram</b> notes as the text of the Note element.  The option simply deletes any current text and blocks the Note from being edited other than through the <b>Notes</b> field in the diagram Properties dialog.		<a href="#">Link Note to Internal Documentation</a> 
<b>Link to Connector Tagged Value</b>	(For a Note element) Display the Tagged Values assigned to the connector as the Note text, or hide the text.		
<b>Vertical Partition</b>	(For an Activity Partition element) Switch a horizontal Partition to a vertical Partition.		<a href="#">Partition</a> 
<b>Tagged Value</b>	Add a Tagged Value to the selected element.		<a href="#">Quick Start - Add Tagged Value To Elements</a> 

### Notes

- Context menus vary between element types, and few of the menu options shown here are present on all element context menus; **Tagged Value** is often the only option available
- If an element appearance is overridden by a Shape Script, several of the appearance options are disabled; for example, **Use Rectangle (Circle) Notation**

### Learn more

- [Shape Scripts](#) 

### 5.6.2.3 Changing Element Appearance

If you want to modify the appearance of a specific element on a diagram, you can use a range of facilities available through the element context menu on the diagram.

**Access**    **Right-click on element on diagram | Appearance**

#### Element Appearance Options

Option	Action	Shortcut	See also
<b>Align Text</b>	(Hyperlink elements) Select an option to justify the text of the hyperlink on the left, middle or right of the element space.		
<b>Default Appearance</b>	Override the <i>global</i> default appearance of all elements (which you set on the Standard Colors and Diagram Appearance pages of the Options dialog) with a different default for just the selected element on all diagrams in which it is found.  To change the appearance of the selected element on the <i>current diagram only</i> , use the Format toolbar.	<b>F4</b>	<a href="#">Standard Colors</a> <sup>[616]</sup> <a href="#">Diagram Appearance Options</a> <sup>[622]</sup> <a href="#">Set an Element's Default Appearance</a> <sup>[927]</sup> <a href="#">Format Toolbar</a> <sup>[785]</sup>
<b>Apply Image From Clipboard</b>	Paste the image held on the <b>clipboard</b> onto the selected element, as an alternative image.  This image is added to the <b>Image Library</b> under an automatically-assigned name. The image can be accessed from and renamed in the Image Manager.		<a href="#">Using the Image Manager</a> <sup>[860]</sup>
<b>Select Alternate Image</b>	Select an alternative image using the <b>Image Manager</b> .	<b>Ctrl+Shift+W</b>	<a href="#">Using the Image Manager</a> <sup>[860]</sup>
<b>Hide/Show Name Under Image</b>	Hide or redisplay the name label under an element with an alternative image.		
<b>Set Font</b>	Change the font type, size, color and effects for the text in an element.		<a href="#">Set Element Font</a> <sup>[949]</sup>
<b>Diagram Frame Appearance</b>	(Diagram Frame elements) Select from a number of options to set the appearance of a Diagram Frame dragged onto the diagram from the Project Browser.		<a href="#">Diagram Frame</a> <sup>[1296]</sup>

Option	Action	Shortcut	See also
<b>Show Labels</b>	Reveal any hidden labels on the element.		
<b>Copy Appearance to Painter</b>	Copy the default element appearance (set using the <b>Default Appearance</b> option, above) to the painter.  You then paste the default appearance using the <b>Paste Appearance</b> option on the Diagram toolbar.		<a href="#">Diagram Toolbar</a> [138]
<b>Copy Image to Clipboard</b>	Copy the element image to the clipboard. You can use the <b>Apply Image from Clipboard</b> option (above) to recover and use the image elsewhere.		

**Notes**

- You can also change the appearance (and other aspects) of several selected elements at once
- Context menus vary slightly between element types, and not all menu options shown here are present on all element context menus; for example, the **Alternate Image** option won't display for a Lifeline element

**Learn more**

- [Operations on Multiple Elements](#) [95]

**5.6.2.3.1 Set Element Font**

When you display an element on a diagram, the text font defaults to a global setting defined from the Diagram Appearance page of the Options dialog. You can change this global default setting if you need to. On the diagram, however, you might want to change the font only on a specific element or group of elements, to distinguish them from other elements. You have several options for doing this.

**Access** **Right-click on element | Appearance | Set Font**  
**Click on element | Format Toolbar | Font**  
**Click on element | F4 | Font Style [ ... ]**

**Font Dialog Options**

Field/Button	Action	See also
<b>Font</b>	Scroll through the list of font types and click on the name of the appropriate font, which is then displayed in the field at the top of the list.  This setting affects all text in the selected element except for the Note compartment text.	
<b>Font Style</b>	In the list of font styles click on the name of the appropriate style, which is then displayed in the field at the top of the list.	

Field/Button	Action	See also
	This setting affects all text in the selected element except for the Note compartment text.	
<b>Size</b>	<p>Scroll through the list of font sizes and click on the appropriate size, which is displayed in the field at the top of the list.</p> <p>Alternatively, type the font size directly into the field.</p> <p>This setting affects all text in the selected element.</p>	
<b>Strikeout</b>	Select this checkbox to show the element text with a line through it. (This checkbox is not currently available.)	
<b>Underline</b>	Select this checkbox to show the element text with an underline.	
<b>Color</b>	<p>Click on the drop-down arrow and click on a color in the list.</p> <p>(If you access the Font dialog through the Default Appearance dialog, the color you select will be overridden by the color in the <b>Font Color</b> field of the Default Appearance dialog, if different.)</p>	
<b>Script</b>	If Western script is not appropriate for the element text, click on the drop down arrow and select a different script type.	
<b>Sample</b>	Review the combined effects of the settings you have selected.	
<b>OK</b>	Click on this button to save your changes.	

### Notes

- If you set the element font through the Default Appearance dialog (**F4**) the changes can be overridden by any different values set through the other two access paths
- When it has been called directly on one or more selected elements (**Appearance | Set Font**), the Font dialog overrides the Default Appearance dialog

### 5.6.2.4 Operations on Multiple Elements

It is possible to perform various operations on two or more elements on a diagram at once, either to add the same feature or to standardize the size or orientation of the selected elements. This makes it much faster to update the diagram than if you had to modify each element separately.

To select the required elements, either click and drag the cursor over the group to highlight them, or press **Shift** and click on each element separately.

**Access** Right-click on one of the selected elements (for format/layout operations, right-click on the element to standardize the others against)

#### Options

Option	Detail	Shortcut	See also
<b>Align</b>	<p>Align elements against the 'master' element's:</p> <ul style="list-style-type: none"> <li>• left edge</li> <li>• right edge</li> <li>• top edge</li> <li>• bottom edge</li> <li>• center, vertically or</li> <li>• center, horizontally</li> </ul> <p>You can also edge-align groups of elements using the Diagram Toolbar; the four alignment buttons are made available when more than one element is selected in a diagram.</p>	<b>Ctrl+Alt+←</b> <b>Ctrl+Alt+→</b> <b>Ctrl+Alt+↑</b> <b>Ctrl+Alt+↓</b>	<a href="#">Operations on Elements</a> <sup>[939]</sup>  <a href="#">Diagram Toolbar</a> <sup>[138]</sup>
<b>Space Evenly</b>	(For three or more selected elements.) Automatically even out the spacing between the selected elements, either horizontally or vertically.	<b>Alt+-</b> <b>Alt+=</b>	
<b>Height/Width</b>	<p>Make all the selected elements match the 'master' element's height or width, or both.</p> <p>In Use Case diagrams, these options are blocked if the <b>Allow Elongated Use Cases</b> option is turned off on the Options dialog Objects page.</p>		<a href="#">Object Display Options</a> <sup>[637]</sup>
<b>Feature and Compartment Visibility</b>	Define the visibility of features and compartments on all selected elements.	<b>Ctrl+Shift+Y</b>	<a href="#">Feature Visibility</a> <sup>[845]</sup>
<b>Add Tagged Value</b>	Add the same Tagged Value to all selected elements.		<a href="#">Assign a Tagged Value to an Item</a> <sup>[1137]</sup>

Option	Detail	Shortcut	See also
<b>Autosize</b>	Automatically resize the selected elements to their default minimum size (element content permitting).	<b>Alt+Z</b>	<a href="#">Autosize Elements</a> <sup>[85]</sup>
<b>Appearance</b>	Set the same default appearance and font for all of the selected elements at once.	<b>F4</b>	<a href="#">Set an Element's Default Appearance</a> <sup>[92]</sup> <a href="#">Set Element Font</a> <sup>[94]</sup>
<b>Make Non-Selectable</b>	Make the selected elements on the diagram <b>non-selectable</b> .  To make the elements selectable again, either: <ul style="list-style-type: none"> <li>Right-click on <b>individual elements</b> and click on the <b>Selectable</b> menu option, or</li> <li>Right-click on the <b>diagram</b> and select the <b>Make All Elements Selectable</b> context menu option</li> </ul>		<a href="#">Operations on Elements</a> <sup>[94]</sup>
<b>Dockable</b>	Turn the <b>Docking</b> feature on or off for the selected elements. When two elements are dockable, they can be moved together to automatically join along their common edge.		<a href="#">Operations on Elements</a> <sup>[94]</sup>
<b>Code Generation</b>	Either: <ul style="list-style-type: none"> <li>Generate code for the selected elements together, or</li> <li>Synchronize code and model for each of the selected elements</li> </ul>	<b>Shift+F11</b> <b>Ctrl+R</b>	<a href="#">Generate a Group of Classes</a> <sup>[211]</sup>
<b>Transform</b>	Transform the selected elements using a transformation template in a single operation.	<b>Ctrl+H</b>	<a href="#">Transform Elements</a> <sup>[201]</sup>
<b>Copy</b>	Copy the selected elements to the clipboard.		
<b>Layout Selected Elements</b>	Automatically adjust the layout of the selected elements on the diagram.		<a href="#">Layout a Diagram Automatically</a> <sup>[89]</sup>
<b>Delete Selected Elements</b>	Delete the selected elements from the <b>diagram</b> only.	<b>Ctrl+D</b>	

#### 5.6.2.4.1 Position Elements

Use these sections of the Multiple Selection menu to size and position elements on the diagram, relative to each other.

##### Size

Use these options to make the selected element(s) wider, narrower, taller or shorter by one increment.

Option	Action	Shortcut	See also
<b>Wider</b>	Make all selected elements wider.	<b>Ctrl+→</b>	
<b>Narrower</b>	Make all selected elements narrower.	<b>Ctrl+←</b>	
<b>Shorter</b>	Make all selected elements shorter.	<b>Ctrl+↑</b>	
<b>Taller</b>	Make all selected elements taller.	<b>Ctrl+↓</b>	

##### Move

Use these options to move the selected element(s) left, right, up or down by one increment.

Option	Action	Shortcut	See also
<b>Right</b>	Move all selected elements to the right.	<b>Shift+→</b>	
<b>Left</b>	Move all selected elements to the left.	<b>Shift+←</b>	
<b>Up</b>	Move all selected elements upwards.	<b>Shift+↑</b>	
<b>Down</b>	Move all selected elements downwards.	<b>Shift+↓</b>	

### 5.6.3 Visual Representation

Each UML element has a default representation. However, you can:

- Change the appearance, features, position and - for some elements - orientation through a number of toolbars
- Display or hide various types of information held in the element, in compartments

##### Learn more

- [Element Icons](#) <sup>954</sup>

- [Compartment](#)<sup>[955]</sup>

### 5.6.3.1 Element Icons

When you add an element to a diagram, or select an existing element, a number of small icons display off the right hand side of the element underneath the Quicklinker arrow.

These icons display small versions of the diagram toolbars or perform specific actions, to enable you to quickly edit the element you have highlighted.

You can prevent the display of these icons by deselecting the **Show buttons for selected Object on diagram** checkbox on the Objects page of the Options dialog.

#### Icon explanations

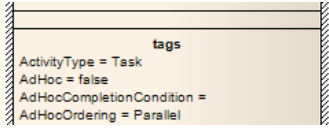

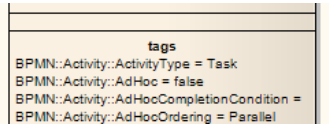

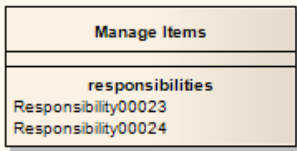

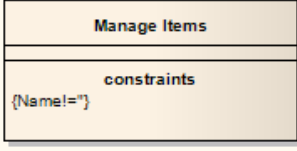

Icon	Description	See also
	Rotates a Fork/Join element from vertical to horizontal and vice-versa.	
	Displays the Format toolbar, for changing element appearance.	<a href="#">Format Toolbar</a> <sup>[785]</sup>
	Displays the Current Element toolbar, to edit the element's properties and features.	<a href="#">Current Element Toolbar</a> <sup>[141]</sup>
	When multiple elements are selected, displays the Diagram Toolbar for changing or aligning the elements together.	<a href="#">Diagram Toolbar</a> <sup>[138]</sup>
	Toggles an Activity Partition between vertical and horizontal.	<a href="#">Activity Partition</a> <sup>[1283]</sup>
	<p>Indicates that the Interaction Fragment currently contains messages; in this state you can:</p> <ul style="list-style-type: none"> <li>• Move the fragment vertically, but not horizontally; all elements and messages <b>below</b> the fragment move up or down by the same amount</li> <li>• Resize the fragment larger than the contained messages/elements, but not smaller</li> </ul> <p>This is the default condition when you open or reload a diagram containing a fragment. You can click on the icon to toggle to <b>'move freely'</b> mode (below).</p>	<a href="#">Combined Fragment</a> <sup>[1267]</sup>

Icon	Description	See also
	<p>Indicates that the Interaction Fragment can be moved independently of the Messages or other elements contained within the fragment.</p> <p>This is the default condition when you first create the fragment. You can click on the icon to toggle to '<b>contains messages</b>' mode (above).</p>	

### 5.6.3.2 Compartments

When you place an element on a diagram, you can display it with a number of compartments that reveal, not only the attributes and operations of the element, but also several other properties such as tags, constraints and tests, as described here.

#### Compartment Types

Images	Type	Detail	See also
 <ul style="list-style-type: none"> <li>Or, fully qualified, expanded format:</li> </ul> 	<b>Tags Compartment</b>	<p>The <b>tags</b> compartment lists all Tagged Values for an element as entered in the Tagged Values window.</p> <p>The <b>fully-qualified</b> option operates only on those Tagged Values that were created in Enterprise Architect release 7.1 or later; it does not expand Tagged Values created in earlier releases.</p>	<a href="#">Tagged Values</a> <sup>[1134]</sup>
	<b>Responsibilities Compartment</b>	The <b>responsibilities</b> compartment shows a list of responsibilities as entered on the Requirements page of the element Properties dialog.	<a href="#">Requirements</a> <sup>[961]</sup>
	<b>Constraints Compartment</b>	The <b>constraints</b> compartment shows a list of element constraints as entered in the Constraints page of the element Properties dialog.	<a href="#">Constraints</a> <sup>[963]</sup>
	<b>Testing Compartment</b>	The <b>testing</b> compartment lists all of the tests associated with an element as listed in the Testing window.	<a href="#">Working on Test Records</a> <sup>[2605]</sup>

Images	Type	Detail	See also
	<b>Maintenance Compartment</b>	The <b>maintenance</b> compartment lists all of the defects, changes, issues and tasks associated with an element, as listed in the Maintenance window.	<a href="#">Working on Maintenance Items</a> <sup>[2623]</sup>

#### Notes

- To set the visibility of the various compartments, see the *Feature Visibility* topic

### 5.6.4 Element Property Displays

To define, assign and review the properties and features of elements, you can use the following:

Topic	Link
Properties Dialog	<a href="#">Properties Dialog</a> <sup>[956]</sup>
Properties Docked Window	<a href="#">Properties Window</a> <sup>[992]</sup>
Element Browser	<a href="#">The Element Browser</a> <sup>[989]</sup>
Scenarios & Requirements Window	<a href="#">The Scenarios &amp; Requirements Window</a> <sup>[992]</sup>
Select <Item> Dialog	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>

#### 5.6.4.1 Properties Dialog

This topic area covers element properties and their settings, responsibilities, constraints, connectors, scenarios, Tagged Values, associated files, object files and classifiers, and boundary element settings.

#### Topics

Topic	Detail	See also
<b>Displaying the</b>	To display the element Properties dialog, use any of the following methods:	

Topic	Detail	See also
<b>Properties dialog</b>	<ul style="list-style-type: none"> <li>Select an element in the Diagram View and select the <b>Element   Properties</b> menu option</li> <li>Right-click on an element in the Diagram View, and select the <b>Properties</b> context menu option</li> <li>Select an element in the Diagram View, and press ( <b>Alt+Enter</b> )</li> <li>Double-click on an element in the Diagram View</li> <li>Right-click on an element in the Project Browser, and select the <b>Properties</b> context menu option</li> </ul> <p>To suppress display of the Properties dialogue when placing a new element, uncheck the <b>Edit Object on New</b> option on the Objects page of the Options dialog.</p>	<a href="#">Object Display Options</a> <sup>[631]</sup>
<b>Properties dialog pages</b>	<p>The Class Properties dialog consists of the following pages:</p> <ul style="list-style-type: none"> <li>General</li> <li>Details</li> <li>Advanced Properties</li> <li>Templates</li> <li>Tagged Values</li> <li>Requirements</li> <li>Constraints</li> <li>Scenarios</li> <li>Files</li> <li>Links</li> </ul> <p>Properties also include Object files and classifiers, and the System Boundary element appearance.</p>	<a href="#">General Settings</a> <sup>[958]</sup> <a href="#">Details</a> <sup>[959]</sup> <a href="#">Advanced Properties</a> <sup>[961]</sup> <a href="#">Templates</a> <sup>[961]</sup> <a href="#">Tagged Values</a> <sup>[1134]</sup> <a href="#">Requirements</a> <sup>[961]</sup> <a href="#">Constraints</a> <sup>[963]</sup> <a href="#">Scenarios</a> <sup>[965]</sup> <a href="#">Associated Files</a> <sup>[988]</sup> <a href="#">Links</a> <sup>[964]</sup> <a href="#">Classifiers and Instances</a> <sup>[1009]</sup> <a href="#">System Boundary Properties</a> <sup>[1348]</sup>

### Notes

- There are several variations of the Properties dialog:
  - The dialog for a Table or Stored Procedure element has slight differences on the General page, and a Table (Stored Procedure) Details page instead of a Details page
  - The dialog for a Class element of a stereotype other than Table is as shown in General Settings
  - The dialog for an element of any other type does not have a Details page
  - Port and Part elements have a Property page
  - Activity elements have a Behavior page, and Action and Invocation elements (depending on their type) have other pages such as Effect, Trigger and Call pages
  - Action Pins have a Pin page
- In all cases, the Properties dialog is an expandable window, which you can stretch to enable longer entry and clearer inspection of the text field values
- The Tagged Values page of the element Properties dialog simply provides the Tagged Values window

within the frame of the Properties dialog

- If Tagged Values have been derived from a stereotyped element in a Profile, they are listed on a separate **page** having the Profile name; they are still listed on the Tagged Values window, in a separate **compartment**

- [Action Pin](#) <sup>[1277]</sup>

#### 5.6.4.1.1 General Settings

The General page of the element Properties dialog contains the following fields:

Field	Usage	See also
<b>Name</b>	Change the element's name.	
<b>Stereotype</b>	(Optional) Type the name of a stereotype for the element, or click on the drop-down arrow and select one.	
<b>Role</b>	Type the role played by the object represented by the element.	
<b>Alias</b>	Type an alias (alternative display name) for the object.	
<b>Keywords</b>	Enter free-text items such as keywords or context information; this can be filtered in Use Case Metrics and Search dialogs.	
<b>Author</b>	Enter or select the name of the original author.	
<b>Language</b>	Select the programming language for the object.	
<b>Status</b>	Indicate the current status of the element (such as Approved or Proposed).	
<b>Complexity</b>	Indicate the complexity of the element (used for project estimation). You normally select from three levels:	<a href="#">Object Display Options</a> <sup>[631]</sup>

Field	Usage	See also
	<ul style="list-style-type: none"> <li>• <b>Easy</b></li> <li>• <b>Medium</b></li> <li>• <b>Difficult</b></li> </ul> <p>You can change your user defaults to add <b>Extreme</b> and <b>Unknown</b> to this list of options.</p>	
<b>Version</b>	Enter the version of the current element.	
<b>Phase</b>	Indicate the phase this element is to be implemented in (for example, 1, 1.1, 2.0, ...).	
<b>Notes</b>	<p>Enter any notes text associated with the element, as described for the Notes window,</p> <p>You can format the notes text using the Notes toolbar at the top of the field,</p>	<a href="#">Notes</a>  <sup>[142]</sup> <a href="#">Notes Toolbar</a>  <sup>[143]</sup>

Further facilities are made available by clicking on the Advanced page.

#### Learn more

- [Advanced Settings](#)  <sup>[96]</sup>

#### **5.6.4.1.2 Details**

The Details page of the element Properties dialog enables you to define the structural and processing details for the selected Class element.

#### Reference

Field/Button	Usage	See also
<b>Scope</b>	Click on the drop-down arrow and select the element's scope (public, private, protected, package).	
<b>Persistence</b>	Click on the drop-down arrow and select the appropriate value (blank, persistent or transient).	
<b>Cardinality</b>	<p>The number of instances of the element that can exist - the value displays on the element in a diagram, in the <i>Name</i> compartment.</p> <p>Use the format defined in the Cardinality tab.</p>	<a href="#">Cardinality</a>  <sup>[15]</sup>

Field/Button	Usage	See also
<b>Abstract</b>	Select if the element is abstract.	
<b>Is Root</b>	Select if the element is a root element and cannot be descended from another.	
<b>Is Leaf</b>	Select if the element is final and cannot be a parent for other elements.	
<b>Is Specification</b>	Select if the element is a specification.	
<b>Is Active</b>	Select if the element is active; for example, an Active Class.	<a href="#">Active Classes</a> <sup>[1365]</sup>
<b>Attributes</b>	Define attributes for the Class. The Attributes Properties dialog displays.	<a href="#">Attributes</a> <sup>[999]</sup>
<b>Operations</b>	Define operations for the Class. The Operations Properties dialog displays.	<a href="#">General Properties of Operations</a> <sup>[1015]</sup>
<b>Concurrency</b>	Specify how concurrent activities should be processed.	
<b>Collection Classes</b>	Define Collection Classes (for generating code from Association connectors) that apply to this Class. The Collection Classes for Association Roles dialog displays.	<a href="#">Set Collection Classes</a> <sup>[2259]</sup>
<b>Template Parameters</b>	List the <i>Parameterized Class</i> template parameters. Click on the <b>Edit</b> button to edit a selected parameter, or click on the <b>Add</b> button to add a new parameter.	<a href="#">Parameterized Classes</a> <sup>[1365]</sup>
<b>Binding(s)</b>	List the binding expressions on a <i>binding</i> Class. Click on the <b>Edit</b> button to edit a selected binding expression, or click on the <b>Add</b> button to add a new binding expression.	<a href="#">Template Binding</a> <sup>[1444]</sup>

#### Notes

- When launched from MDG Integration, the **Attributes** and **Operations** buttons are not available

#### 5.6.4.1.3 Advanced Properties

The Advanced page displays the advanced properties of the element (where they exist) and enables you to reset the values of these properties.

##### How to

To set a value for an advanced (or custom) property

Step	Action	See also
1	Click on the data field to the right of the property name.	
2	Depending on the property, either: <ul style="list-style-type: none"><li>• Type the value in free text</li><li>• Click on the drop-down arrow and select the value from the list</li><li>• Click on the ( ... ) Browse button and search for the required value</li></ul>	
3	Click on the <b>Apply</b> button.	

#### 5.6.4.1.4 Templates

Use the Templates page to define

- Parameterized Class template parameters
- Binding expressions on a binding Class

In the Template Parameter(s) panel, click on the **Add** button to add a new parameter, or click on the **Edit** button to edit a selected existing parameter; in either case, the Template Parameter dialog displays.

In the Binding(s) panel, click on the **Add** button to add a new binding expression or click on the **Edit** button to edit a selected binding expression. When you click on the **Add** button, a short context menu displays from which you select the type of relationship to generate, and then you define the binding expressions.

If either a template parameter or a binding expression is no longer required, click on it and then click on the corresponding **Delete** button.

##### Learn more

- [Parameterized Classes \(Templates\)](#)<sup>[1365]</sup>
- [Template Binding](#)<sup>[1444]</sup>

#### 5.6.4.1.5 Requirements

You use the Requirements page of the element Properties dialog to create requirements that this element is designed to meet. Requirements are of two types:

- Internal requirements (responsibilities) and
- External requirements (system requirements, elements connected to the element by a Realize

connector)

Enterprise Architect shows both types, but you can only edit the internal type from the Requirements page.

You can show the requirements for an element on the diagram directly, using the Feature Visibility function; it is also possible to show inherited requirements in this way.

Field/Button	Usage	See also
<b>Requirement</b>	Enter the name and high level detail of the requirement.	
<b>Type</b>	Specify the type; for example, Functional or Non-functional: <ul style="list-style-type: none"> <li>• <b>Functional</b> requirements are things that the system must do, such as identify franked, unfranked and total credit for a dividend</li> <li>• <b>Non-functional</b> requirements are things that the system must be, such as reliable or cost effective</li> </ul>	
<b>Last update</b>	Specify the date of the last requirement update.	
<b>Status</b>	Specify the current status of the requirement.	
<b>Difficulty</b>	Identify the difficulty of implementing the current requirement.	
<b>Priority</b>	Specify how urgent the requirement is.	
<b>Stability</b>	Specify the estimated stability of the requirement.  This is an indication of the probability of the requirement - or understanding of the requirement - changing; high stability indicates a low probability of the requirement changing.	
<b>Notes</b>	Record details of the requirement.  You can format the notes text using the Notes toolbar at the top of the field.	<a href="#">Notes Toolbar</a> 
<b>Move External</b>	Make an internal responsibility into an external requirement.	<a href="#">Make Internal Requirement External</a> 
<b>New</b>	Create a new requirement.	

Field/Button	Usage	See also
<b>Save</b>	Save changes to requirements.	
<b>Delete</b>	Delete a selected requirement.	
<b>Defined</b>	List the defined requirements associated with this element.	

#### Learn more

- [Internal Requirements](#) 
- [External Requirements](#) 
- [Feature Visibility](#) 
- [The Element Browser](#) 

#### **5.6.4.1.5.1 External Requirements**

External requirements are those Requirement elements that have been connected to the current element using a *Realization* connector. By creating the connector from the element to the requirement, you create an expectation that the element must implement the requirement as part of the system solution.

In Enterprise Architect, linked requirements are shown in the Requirements page of the element Properties dialog, but they are marked external and cannot be directly edited (on selection, the page fields are grayed out).

Double-click an external requirement in the list to activate the Properties dialog for the associated requirement, where you can view and modify the requirement details and check the requirement hierarchy details.

#### Learn more

- [Create Requirements](#) 
- [Requirement Properties](#) 
- [Make Internal Requirement External](#) 

#### **5.6.4.1.6 Constraints**

If you need to define the conditions and rules under which an element operates and exists, you can do this by setting Constraints on the element, in conjunction with responsibilities (internal requirements). Typical constraints are pre- and post- conditions, which indicate things that must be true before the element is created or accessed and things that must be true after the element is destroyed or its action is complete.

You can show the constraints for an element directly on the diagram, using the Feature Visibility function; this also reveals any constraints inherited from parent elements.

**Access**    **Double-click element > Constraints**

#### Define constraints for an element

Field/Button	Description	See also
<b>New</b>	Click on this button to clear the fields ready to create a new constraint.	
<b>Constraint</b>	Type the value of the constraint.	
<b>Type</b>	Click on the drop-down arrow and select the appropriate type ( <b>Pre-condition</b> , <b>Post-condition</b> or <b>Invariant</b> ).	
<b>Status</b>	Click on the drop-down arrow and select the appropriate status.	
Notes	Type any additional information required.	
<b>Save</b>	Click on this button to save the constraint data.	
<b>OK</b>	Click on this button to close the dialog.	

#### Learn more

- [Feature Visibility](#)<sup>[845]</sup>
