<b>Description</b>	<p>Record a textual description of how the user uses the current element.</p> <p>As for the Notes window, you can format the notes text using the Notes toolbar at the top of the field.</p> <p>As well as the Notes window facilities, you can also generate a structured specification from the text in this field; highlight the text, right-click on it and select the <b>Create Structure from Notes</b> context menu option.</p> <p>The text is copied to the Structured Specification tab for the current scenario, either as a new specification or as the continuation of an existing specification, with a new step created at each carriage return.</p> <p>Subsequent changes to the text on the Structured Specification tab are not reflected on the Description tab.</p>	<a href="#">Note Tab</a> <sup>[1142]</sup> <a href="#">Notes Toolbar</a> <sup>[1143]</sup> <a href="#">Structured Specification Tab</a> <sup>[967]</sup>
<b>New</b>	Clear the data fields so that you can enter data in them to create a new scenario.	

Field	Usage	See also
<b>Save</b>	Save a new scenario, or changes to an existing scenario.	
<b>Delete</b>	Delete a scenario selected from the Scenarios panel, below.	
<b>Scenarios</b>	Display a list of defined scenarios for this element.  You can change the order in which the scenarios are listed, using the  and  buttons.	

### Notes

- The Scenario page does not prevent you from creating more than one basic path, but it would be unusual to define more than one
- All the functions available on the Scenario page are also available through the Scenarios & Requirements window/view; use the **Browse Element** icon in the window toolbar to list and select the scenarios for the element

- [The Element Browser](#)<sup>[989]</sup>

#### 5.6.4.1.8.1 Structured Specification Tab

The Structured Specification tab offers a wide range of facilities for generating and modifying scenario specifications, enabling you to define the structure, actions and interactions of the scenarios defined for an element such as a Use Case. These scenarios can be the main (basic) path, alternate paths or exception paths.

When you open the Structured Specification tab it defaults to the basic path so that if it does not already exist, you can create it. You can create alternate paths and exception paths as part of the process of adding them to steps of the basic path.

You can also create all three types of scenario paths on the Description tab, or in the Scenarios & Requirements window.

### Learn more

- [Scenarios](#)<sup>[965]</sup>
- [Scenarios & Requirements](#)<sup>[992]</sup>
- [Structured Specification Toolbar](#)<sup>[970]</sup>
- [Item context menu](#)<sup>[972]</sup>
- [Selected Text context menu](#)<sup>[974]</sup>
- [Entry Points context menu](#)<sup>[976]</sup>
- [Floating Toolbar](#)<sup>[976]</sup>

You can create a specification for a scenario in one of several ways:

- Enter the specification yourself, as described below
- Generate a specification from an Activity diagram created under a Use Case element
- Generate a specification from the notes text of the scenario in the Description tab
- Generate a specification from text held on the clipboard

### How to

To enter the specification yourself, starting with the basic path

Step	Action	See also
1	In the <b>Scenario</b> field, click on the drop-down arrow and select the <i>Basic Path</i> scenario.	
2	In the <i>new step</i> field in the <b>Action</b> column, type the text of the first step or action.	
3	Tab to the <b>Uses</b> column and, if necessary, type the name of each element used in this step; any elements that are listed in the Context References tab are highlighted in blue and underlined.  You can also manage the list of elements as context references, and add to the list directly; see the Notes below.	
4	Tab to the <b>Results</b> column and, if necessary, type the outcome of completing this step.	
5	Tab to the <b>State</b> column and, if necessary, type the name of the state into which the step moves the action.	
6	When you move out of the <b>Action</b> column, the next <i>new step</i> field displays underneath. Repeat steps 2 to 5 as many times as is necessary. The Structured Specification tab should now resemble the following illustration:	

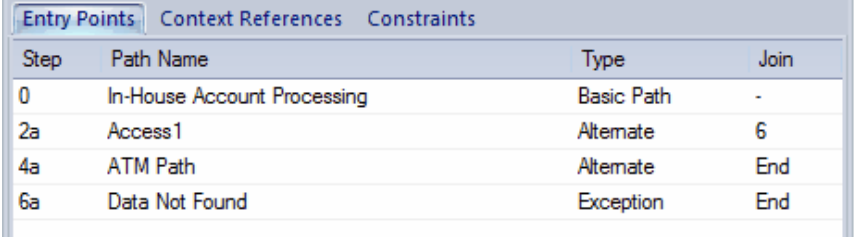

- Repeat the **Scenario Steps** procedure for each scenario you have created; you can now adapt, enhance and interrelate the scenario specifications using the facilities of the Structured Specification tab:
  - Structured Specification Toolbar
  - Item context menu
  - Selected Text context menu
  - Entry Points context menu
  - Floating Toolbar

Icon	Action	See also
	<p>the branch, any duplicates of that branch are updated to remain in synchrony with the join point</p> 	
	<p>(Only enabled when the basic path is displayed - you cannot add an exception path to another exception path or an alternate path.)</p> <p>Create a branch from the selected step to an exception path scenario - select the path from the displayed list. If the appropriate scenario does not yet exist, double-click on the <i>new path</i> line and type the scenario name, then click off the line and back on to it.</p> <p>Click on the <b>OK</b> button.</p> <ul style="list-style-type: none"> <li>An entry for this exception path displays in the Entry Points tab, as <b>Step a</b> of the basic path step it branches from; in the <b>Join</b> column, click on the drop-down arrow and select the number of the step at which action flows back to the basic path, or select <b>End</b> if the path terminates separately from the basic path</li> <li>You cannot add more than one branch - whether alternate or exception - to a step</li> <li>You cannot join the end of the branch - whether alternate or exception - to more than one step of the basic path. If you change the join point of the branch, any duplicates of that branch are updated to remain in synchrony with the join point</li> </ul>	
	Display the Manage Uses Context List dialog, which you use to set the <b>Uses</b> column entries to linked context reference lists.	<a href="#">Structured Specification Selected Text Context Menu</a> [974]
	Move the currently-selected step one place up (including any <i>new step ...</i> entry).	
	Move the currently-selected step one place down (including any <i>new step ...</i> entry).	
	Display a list of diagrams that you can generate from the scenario; select the type of diagram that you want to generate.	<a href="#">Generate Diagram</a> [976]

Icon	Action	See also
	Generate Test Cases based on this Use Case scenario; you can generate either internal Test Cases or External Test Cases.	<a href="#">Generate Test Cases</a> <sup>[986]</sup>
	Delete the selected step from the scenario.	
	Display the Help topic for this tab.	

To display the context menu for a structured specification item, right-click on a step or blank line on the Structured Specification tab. The following options are available:

Option	Action	Shortcut	See also
<b>Create Structure From Clipboard Text - New Line Delimited</b> <b>Create Structure From Clipboard Text - Sentence Delimited</b>	Generate a set of steps from a text description or list captured on the clipboard; a new step is generated: <ul style="list-style-type: none"> <li>• After each carriage return in the captured text (New Lines), or</li> <li>• For each sentence in the text; that is, after each full stop/space/capital letter combination (Sentences)</li> </ul> If a set of steps is already displayed, it is overwritten by the generated steps.		
<b>Create Structure From Generated Activity Diagram</b>	Generate a set of steps from an Activity Diagram created for a Use Case. If a set of steps is already displayed, it is overwritten by the generated steps.		<a href="#">Generate Scenario from Activity Diagram</a> <sup>[985]</sup>
<b>Add Alternate Path</b>	Create a branch from the selected basic path step to an alternate path.		<a href="#">Alternate path</a> <sup>[970]</sup>
<b>Add Exception Path</b>	Create a branch from the selected basic path step to an exception path.		<a href="#">Exception path</a> <sup>[971]</sup>
<b>Insert Step Above</b>	Insert a <i>new step...</i> line above the currently-selected step (press ( <b>Esc</b> ) to return this new line to the end of the scenario).	<b>Shift+Insert</b>	
<b>Insert Step Below</b>	Insert a <i>new step...</i> line below the currently-selected step (press ( <b>Esc</b> ) to return this new line to the end of the scenario).	<b>Insert</b>	

Option	Action	Shortcut	See also
<b>Insert End Step</b>	Insert a <i>new step...</i> line at the end of the scenario.	<b>Ctrl+N</b>	
<b>Set Step As 'User'</b> <b>Set Step As 'System'</b>	Switch the entity responsible for performing the action of the selected step between user and system.		
<b>Link Step to Use Case</b>	<p>Either include the actions of an existing Use Case element, extend an existing Use Case element, or invoke a Use Case as the action of the selected step.</p> <p>Selecting the appropriate sub-option displays the Select Use Case dialog, which you use to browse for and select the required Use Case element.</p> <p>The appropriate <i>includes</i>, <i>extends</i> or <i>invokes</i> stereotyped connector is created between the current element and the selected Use Case.</p> <p>For the <i>include</i> and <i>extend</i> actions, any text in the <b>Action</b> field is overwritten by the link to the Use Case; for the <i>invoke</i> action, the following link is added to the end of the <b>Action</b> text:</p> <p>( <i>Invokes: &lt;Use Case Name&gt;</i> )</p>		<a href="#">Select Use Case</a> 994
<b>Merge With Step</b>	<p>Merge the selected step with another.</p> <p>A list of the other steps in the scenario displays; click on the step to merge with the selected step.</p>		
<b>Move After Step</b>	<p>Move the selected step to another position in the scenario.</p> <p>A list of the other steps in the scenario displays; click on the step after which to position the selected step.</p>		
<b>Delete</b>	<p>Delete the selected step; any subsequent steps are moved up one place.</p> <p>A prompt displays to confirm the deletion.</p>		

To display this context menu, *highlight* the text in a user-editable field within a step on the **Structured Specification** tab. The following options are available:

Option	Action	Shortcut	See also
<b>Create</b>	Create a glossary definition or a new element based on the highlighted text.		<a href="#">Glossary definition</a> <sup>[1142]</sup> <a href="#">New element</a> <sup>[903]</sup>
<b>Link Step to Use Case</b>	<p>Either incorporate the actions of an existing Use Case element, extend an existing Use Case element or invoke a Use Case element, as the action of the selected step. Selecting the appropriate sub-option displays the Select Use Case dialog, which you use to browse for and select the required Use Case element.</p> <p>Any text in the Action field is overwritten by the link to the Use Case, except for the invoke action where the following link is added to the end of the Action text:</p> <p>( <i>Invokes: &lt;Use Case Name&gt;</i> )</p>		<a href="#">Select Use Case</a> <sup>[994]</sup>
<b>Link to existing Element</b>	<p>(Uses and Results fields only.) Create a Realization or Dependency relationship to a Requirement, Feature or other element elsewhere in the model.</p> <p>You select the element and connector types from submenu options, which then display the Select Element dialog, which you use to browse for and select the required element.</p>		<a href="#">Select Element</a> <sup>[994]</sup>
<b>Insert context reference</b>	<p>Add a reference to an element stored elsewhere in the model, and create an entry for the element in the Context References tab.</p> <p>Selecting this option displays the Select Element dialog, which you use to browse for and select the required reference element.</p>		<a href="#">Context References</a> <sup>[987]</sup> <a href="#">Select Element</a> <sup>[994]</sup> <a href="#">Structured Specification Floating Toolbar</a> <sup>[976]</sup>
<b>Insert glossary definition</b>	<p>Insert an existing glossary term at the cursor position. To select the term, double-click on it in the displayed list.</p> <p>When you select the term it is inserted into the field as highlighted and underlined text, which displays the definition when you move the cursor over it. If you highlighted part of the original text, the term overwrites that text.</p>		
<b>Manage Uses Context List</b>	(On highlighted text or a specific cursor position in the Uses column.)		<a href="#">Context References Tab</a> <sup>[987]</sup>

Option	Action	Shortcut	See also
	<p>Display the Manage Uses Context List dialog, which enables you to:</p> <ul style="list-style-type: none"> <li>• Browse to or type in a context reference item</li> <li>• Re-sort the list with up and down arrow keys</li> <li>• Remove an entry from the list</li> <li>• Enable or disable the Uses Context List facility across the model</li> </ul> <p>You can resize the dialog to show the full details of context reference items.</p> <p>If you enable the Uses Context List facility, you do not necessarily have to use the dialog to add context list items; you can type or insert an element name from the Context References tab in the Uses column, and that name is added to the Uses Context List.</p> <p>If you disable the Uses Context List facility, the context list items in the Uses column are hidden.</p>		
<b>Split Step</b>	<p>Splits the selected step into two consecutive steps.</p> <p>The option is available only if you highlight a <i>portion</i> of the text in the selected field. The new step takes the highlighted text as its <b>Action</b> text.</p>		
<b>Search for &lt;text&gt;</b>	Displays a sub-menu of options for locating the selected text in a number of locations.		<a href="#">Code editor context menu</a> <sup>[2152]</sup>
<b>Undo</b>	Undo any unsaved changes you have just made in the step.		
<b>Cut</b>	Perform simple editing operations on the highlighted text.		
<b>Copy</b>			
<b>Paste</b>			
<b>Delete</b>			
<b>Select All</b>			

Option	Action	Shortcut	See also

The Entry Points tab shows how the basic path, alternate path and exception path scenarios for the element are organized and interrelated. If an alternate path or exception path has been defined but has not yet been added to the basic path, it is not listed on this tab.

You can switch focus between the Entry Points tab and the Structured Specification tab by pressing ( **Alt+Q** ).

To display the context menu for this tab, highlight an entry and right-click on it. The following options are available:

Option	Action	Shortcut	See also
<b>Edit Path</b>	Display the steps of the scenario in the Structured Specification tab, with the first step highlighted.		
<b>Join with Step</b>	(Available only if the basic path scenario is displayed in the Structured Specification tab. Not available to edit the basic path scenario.)  Highlight the <b>Join</b> field and its drop-down arrow. Click on the drop-down to define or change the step number at which the alternate or exception path rejoins the basic path. Select <b>End</b> if the path does not rejoin the basic path steps.		
<b>Remove Entry Point</b>	(Available only if the basic path scenario is displayed in the Structured Specification tab. Not available to delete the basic path.)  Delete the relationship between the selected path and the basic path, and remove the entry from the Entry Points tab.		

Wherever a reference to another element exists on the Scenario tab (that is, where the text is highlighted and underlined), if you hover the cursor over the element name a short floating toolbar displays.

#### Use to

- Display the element Properties dialog
- Locate the element in its parent diagram
- Locate the element in the Project Browser

#### **5.6.4.1.8.2 Generate Diagrams**

If you have created a structured scenario, you can generate any of the following diagrams from that scenario:

- Activity
  - With ActivityParameter
  - With Action
  - With Action Pin

- Rule Flow
- State Machine
- Sequence
- Robustness

### How to

To generate the required diagram

Icon	Step	Action	See also
	1	Create the scenario structure on the Structured Specification tab.	<a href="#">Structured Specification Tab</a> <sup>[967]</sup>
	2	Click on the Generate Diagram icon in the toolbar on the tab.	
	3	<p>Click on the type of diagram to generate.</p> <p>Enterprise Architect generates the diagram and notifies you that generation is complete. Close the Properties dialog to review the diagram.</p> <p>If the diagram being generated already exists under the selected element, a prompt displays to overwrite or synchronize with that diagram.</p> <p>Select the appropriate radio button to:</p> <ul style="list-style-type: none"> <li>• Overwrite the existing diagram (delete the existing diagram and elements, and create a new diagram and elements) or</li> <li>• Synchronize the elements in the existing diagram with the scenario steps (however, Sequence and Robustness diagrams cannot be synchronized)</li> </ul>	

### Notes

- The **Synchronize elements in existing diagram** option enables the **Preserve Diagram Layout** checkbox, which you can select to preserve the existing arrangement of elements and connectors on the diagram; any new elements are added to the diagram in the default position, and you manually position them in the diagram as required; if you do not select the checkbox, the diagram is recast in the default layout

It is recommended that you uncheck the **Preserve Diagram Layout** checkbox if you are synchronizing elements with scenario steps:

- When new steps have been added or existing steps have been deleted or moved within the Use Case
- For the first time in a Use Case that has been imported from XML with the **Strip GUIDs** option selected
- For the first time in a Use Case that has been copied and pasted in the Project Browser, or
- For the first time in a Use Case whose containing package has been copied and pasted in the Project Browser

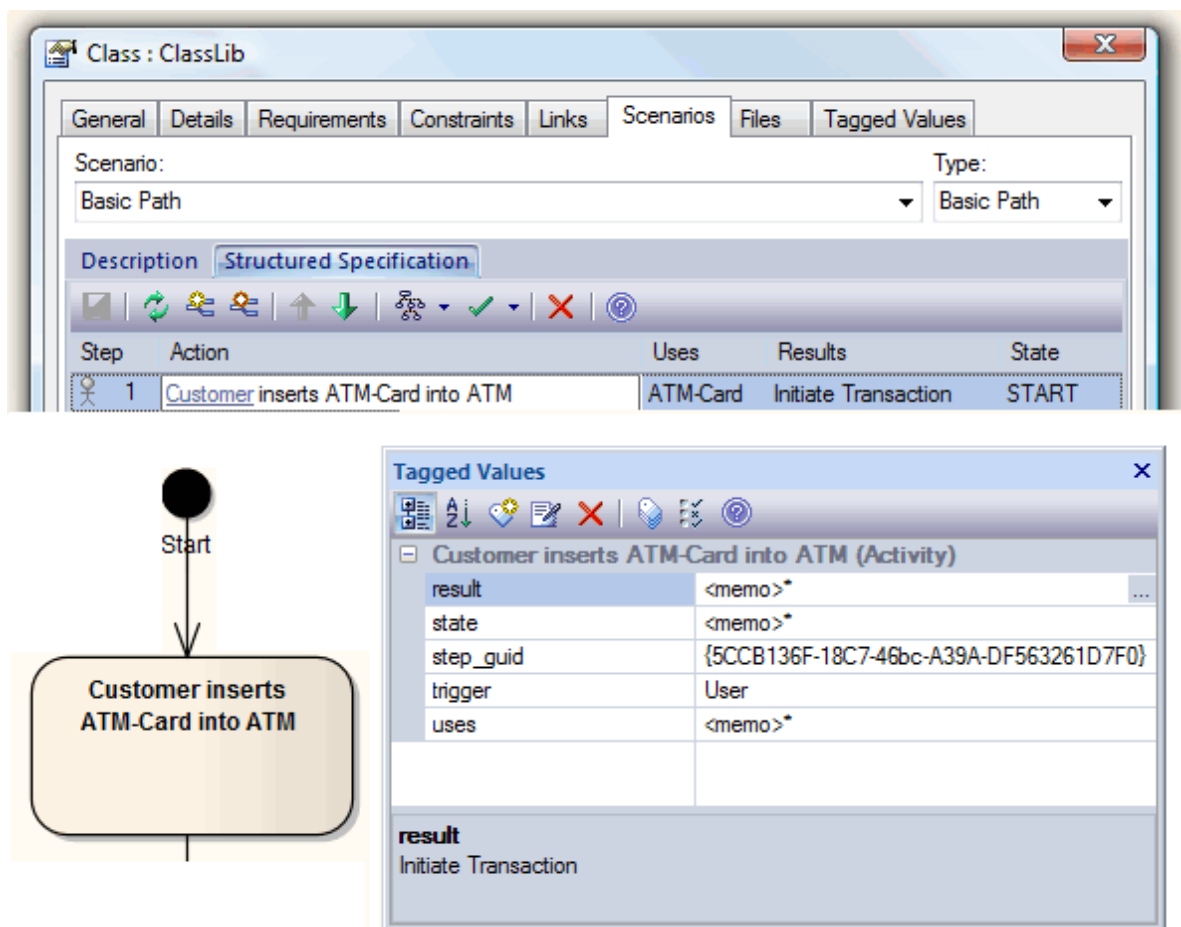

### Learn more

- [Import from XML](#) <sup>[478]</sup>
- [Copy Element Between Packages](#) <sup>[915]</sup>
- [Copy A Package](#) <sup>[775]</sup>

An Activity is generated as a child of the selected element, to act as a container for the diagram.

- The scenario steps are modeled as Activities
- The values of the **Uses**, **Results** and **State** columns for each step are added as Tagged Values of the corresponding Activity

### Example

### Topics

Topic	Detail	See also
<b>Activity with ActivityParameter</b>	<ul style="list-style-type: none"> <li>The values of the Uses and Results columns are modeled as ActivityParameters</li> <li>The value of the State column is added as a Tagged Value of the Activities</li> <li>ActivityParameters are added to the Project Browser and not to the diagram</li> </ul>	
<b>Activity with Action</b>	<ul style="list-style-type: none"> <li>The scenario steps are modeled as Actions</li> <li>The values of the Uses, Results and State columns are added as Tagged Values of the Actions</li> </ul>	
<b>Activity with ActionPin</b>	<ul style="list-style-type: none"> <li>The scenario steps are modeled as Actions</li> <li>The values of the Uses and Results columns are modeled as Input Pins and Output Pins respectively</li> <li>The value of the State column is added as a Tagged Value of the Actions</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"><li>ActionPins are added to the Project Browser and not to the diagram</li></ul>	

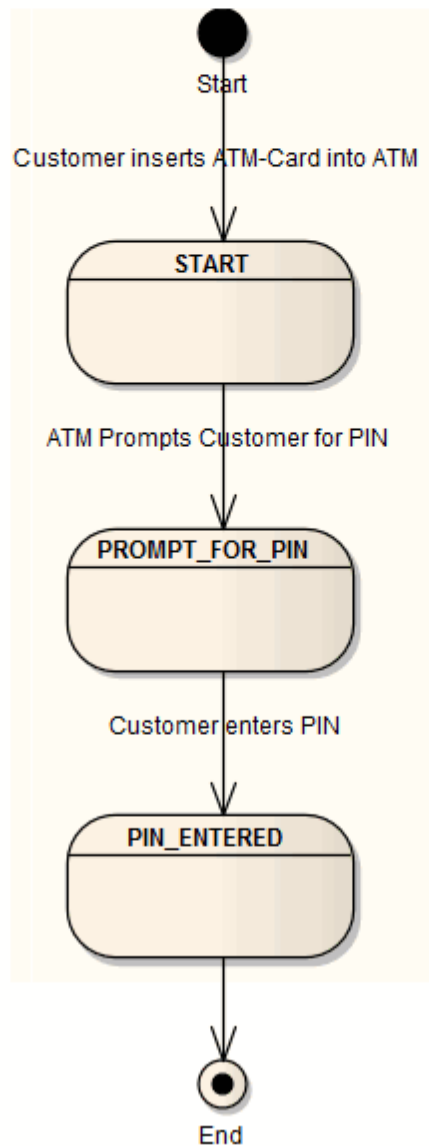

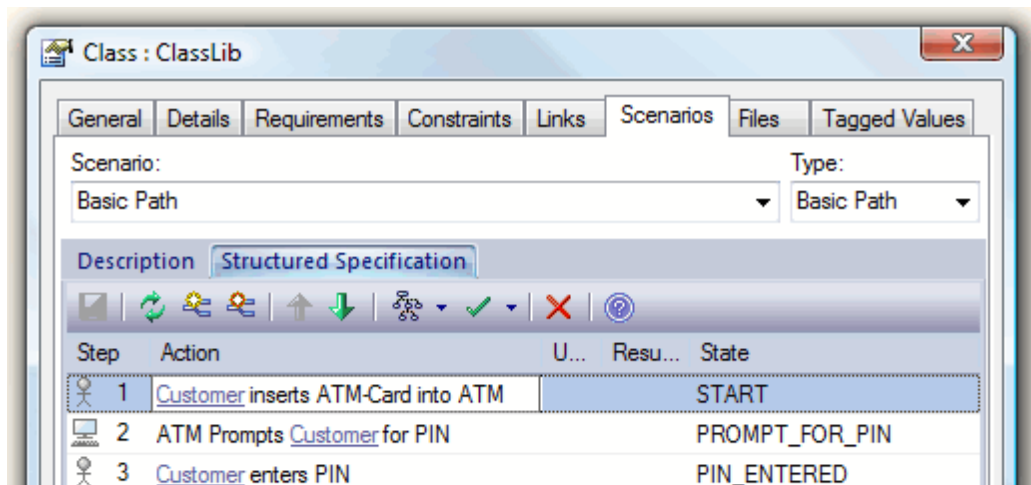

A Rule Flow Activity is created as a child of the selected element, to act as a container for the diagram.

- The scenario steps are modeled as RuleTasks.
- The values of the **Uses**, **Results** and **State** columns are added as Tagged Values of the RuleTasks

A StateMachine is created as a child of the selected element, to act as a container for the diagram.

- Each value in the *State* column is modeled as a State.
- The scenario steps become the Transition connectors between the States
- The values of the *Uses* and *Results* columns are added as Tagged Values of the Transitions

### Example

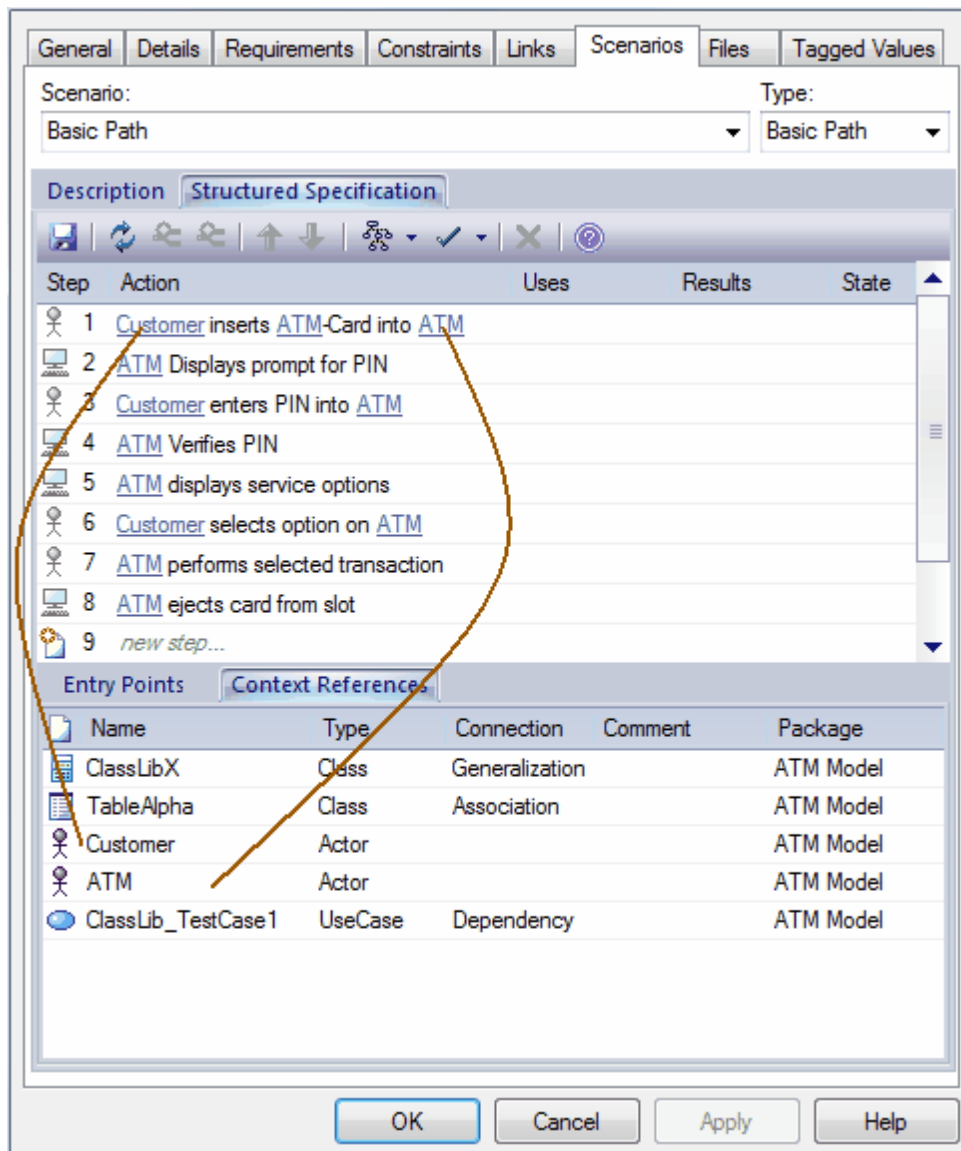

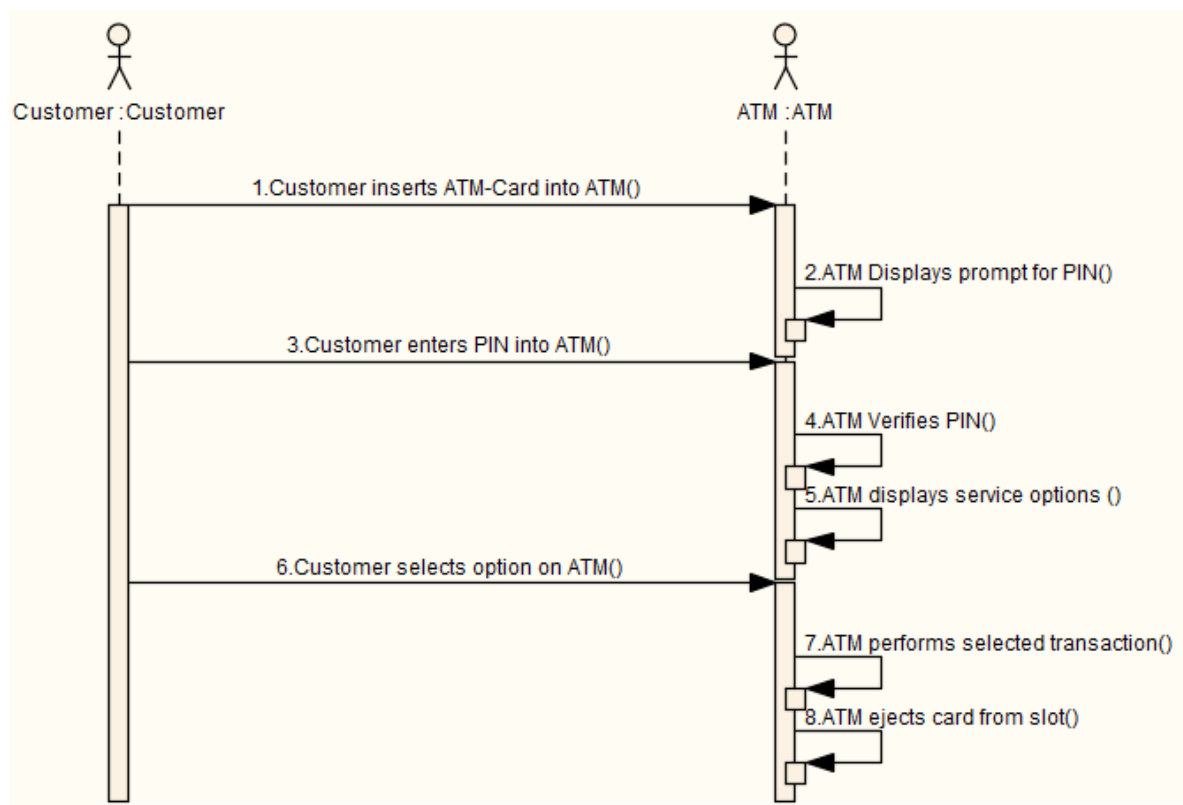

An Interaction is created as a child of the selected element, to act as a container for the diagrams - the Basic, Alternate and Exception paths are modeled as separate Sequence diagrams under the Interaction.

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>All the elements involved in the scenario should be identified in the Context Reference tab. That is, relationships must already exist between the scenario parent element and the other elements named in the scenario.</p> <ul style="list-style-type: none"> <li>Each Context Reference element named in a scenario step is modeled as a Lifeline</li> <li>The step itself becomes the Message between an originator and its destination(s)</li> <li>The first Context Reference element in a step is treated as the originator</li> <li>The subsequent Context Reference element(s) become the destination(s)</li> </ul> <p>Because the diagram generator acts on element names in the step, you should take care to avoid using the element names as normal text. For example, in step 1 in the dialog below, the term ATM-Card is interpreted as a reference to the ATM element, and two <i>Customer inserts ATM-Card into ATM</i> messages are generated for the step. (To avoid confusion, in the diagram the first Message has been deleted.)</p> <p>If the <b>Show Sequence Numbering</b> checkbox on the Diagram Sequence page of the Options dialog is not selected, the Message name on the Sequence diagram is prefixed by the step number, as shown in the diagram below. If the checkbox is selected, the message sequence number is shown instead of the step number.</p> <p>The values of the Uses, Results and State columns are added as Tagged Values of the Message.</p>	<a href="#">Context Reference Tab</a> <sup>[987]</sup> <a href="#">Sequence</a> <sup>[629]</sup>

### Example

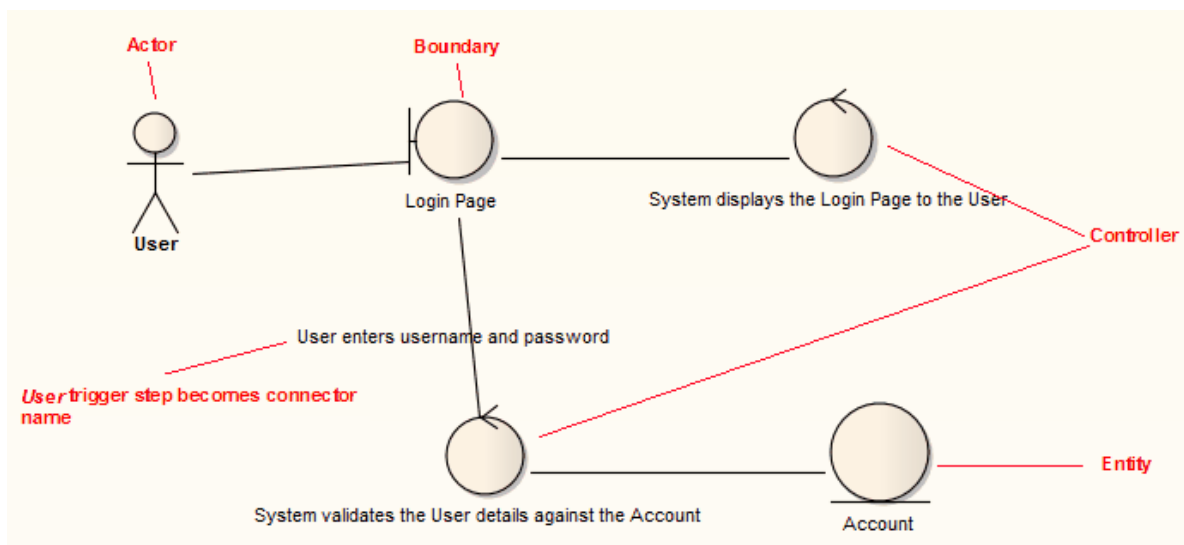

A Collaboration is created as a child of the selected element, to act as a container for the Robustness diagram.

### Example

Step	Action
 1	System displays the <a href="#">Login Page</a> to the <a href="#">User</a>
 2	<a href="#">User</a> enters username and password
 3	System validates the <a href="#">User</a> details against the <a href="#">Account</a>

### Notes

- All the elements involved in the scenario should be identified in the Context Reference tab; that is, relationships must already exist between the scenario parent element and the other elements named in the scenario
- Any values in the **Uses**, **Results** and **State** columns are ignored and not represented in the diagram
- Each UI element in a step becomes a Boundary element; a Dependency relationship is created from this Boundary element to the UI element (this connector is not shown on the diagram)
- Each Actor referenced in a step is dropped into the Robustness diagram as a simple link
- Each Class referenced in a step is dropped into the Robustness diagram as a simple link, and is given the stereotype *entity*
- Each step with a *System* trigger becomes a Controller; alternate/exception path Controllers are displayed with a red background color
- Each step with a *User* trigger becomes the name of the Association between Controllers

#### 5.6.4.1.8.3 Generate Scenario From Activity Diagram

You can generate a range of diagrams from a scenario in an element. Conversely, you can also generate a structured scenario within an element from an Activity diagram, reverse engineering the steps from the diagram elements (effectively either regenerating the scenario within the Use Case, or transferring a scenario into another Use Case).

**How to**

To generate the scenario from the Activity diagram

Step	Action	See also
1	Open the element Properties dialog, select the Scenarios tab, and select the Structured Specification tab.	
2	Right-click in the empty space within the tab, and select the <b>Create Structure From Generated Activity Diagram</b> context menu option.  The Select an Activity (generated from a UseCase Scenario) containing the Diagram dialog displays.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
3	Search for and select the Activity containing the required diagram.  Enterprise Architect validates the diagram (displaying the results in the Output window) and, if the diagram is valid, generates the scenario steps in the Structured Specification tab (replacing any existing scenario steps).	<a href="#">Output Window</a> <sup>[169]</sup>

**Notes**

- The source Activity diagram must be generated from another Use Case Scenario
- Any existing scenario steps are deleted and replaced by the generated scenario
- This facility does not operate on the enhanced Activity diagrams generated from a Use Case - those generated with ActivityParameters, Actions and Action Pins

**Learn more**

- [Generate Diagrams](#) <sup>[976]</sup>

**5.6.4.1.8.4 Generate Test Cases**

When you select a scenario and click on the **Test Case Generation** icon in the window toolbar, Enterprise Architect prompts you to select to generate either an Internal Test Case or an External Test Case.

**Topics**

Topic	Detail	See also
<b>Internal Test Case</b>	<p>A test is generated for the basic path and each alternate and exception path in the scenario, and added to the selected element.</p> <p>In addition, for each step in the basic, alternate and exception paths that has a value in the <b>Results</b> column, a test is generated and added to the selected element.</p> <p>A diagram is created under the selected element, to which the selected element and a Note (showing the element's Structured Specification) is added.</p>	<a href="#">Show Test Scripts compartment</a> <sup>[2618]</sup> <a href="#">Working on Test Records</a> <sup>[2605]</sup> <a href="#">Move Or Copy Tests Between Categories</a> <sup>[2610]</sup>

Topic	Detail	See also
	<p>The created tests are displayed in the <i>Test Scripts</i> compartment of the selected element on the diagram.</p> <p>Another way to view these tests is to click on the element and display the Testing window.</p> <p>These generated tests are written to the Scenario test tab of the Testing window; you can move the tests to another test-type tab if required.</p>	
<b>External Test Case</b>	<p>A Test Case element is created, linked to the selected element using the Trace connector.</p> <p>A diagram is created under this Test Case element, to which the selected element, the Test Case element and a Note (showing the element's Structured Specification) is added.</p> <p>The created tests are displayed in the <i>Test Scripts</i> compartment of the Test Case element on the diagram.</p> <p>A test case is generated and added to the Test Case element for the basic path, and for each alternate and exception path.</p> <p>In addition, for each step in the basic, alternate and exception paths that has a value in the <b>Results</b> column, a test is generated and added to the Test Case element.</p> <p>You can review the tests within the Test Case element using the Testing window, as for Internal Test Cases.</p>	<p><a href="#">Show Test Scripts compartment</a><sup>[2616]</sup></p> <p><a href="#">Test Case</a><sup>[2010]</sup></p> <p><a href="#">Trace</a><sup>[1446]</sup></p>

#### 5.6.4.1.8.5 Context References Tab

On the Scenarios page of the element Properties dialog, the Context References tab displays a list of all elements that are either:

- Connected to the current element by any connector, on the current diagram or another, or
- Defined as a cross reference (or custom reference) on the current element

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>This page enables you to add custom references; right-click anywhere in the list and select the <b>Add Reference</b> context menu option.</p> <p>The Select Element dialog displays, in which you can locate and select the required cross reference element or elements.</p> <p>For each cross reference you can also use context menu options to delete the entry in the list, or to open the <b>Comment</b> field so that you can add or edit comment text.</p> <p>For each element in the <b>Context References</b> list, wherever the name of that element appears in the structured specification, the name is</p>	<p><a href="#">Select &lt;Item&gt; Dialog</a><sup>[994]</sup></p>

Topic	Detail	See also
	highlighted and underlined; press ( <b>Ctrl</b> ) + <b>click</b> on the highlighted name to view the element Properties dialog.	

#### Learn more

- [Custom/Cross Reference](#)<sup>[916]</sup>

#### **5.6.4.1.8.6 Scenario Constraints Tab**

The Structured Specification Constraints tab is a simple link to the Constraints tab of the element overall. It lists existing constraints; if you select the toolbar icons to add or edit a constraint, control switches to the element Constraints tab.

#### Learn more

- [Constraints](#)<sup>[963]</sup>

#### **5.6.4.1.9 Associated Files**

An element can be linked to files external to the repository, using the Files page of the element's Properties dialog.

Field/Button	Usage	See also
<b>File Path</b>	Specifies the directory path and name of the file.	
<b>Type</b>	Display the local file or web address.	
<b>Last Write</b>	Display the date and time the file was last updated.	
<b>Size</b>	Display the size of the file.	
<b>Notes</b>	Indicates extra information about the file.	
<b>Files</b>	Display the list of linked files.	
<b>Launch</b>	Open the selected file.  Local files open with their default application and web files open in the default browser.	

#### Notes

- Linked files are a good way to link elements to additional documentation and/or source code
- You can also insert hyperlinks in diagrams to other files, and launch them directly from the diagram

- [The Element Browser](#)<sup>[989]</sup>

### 5.6.4.2 The Element Browser

As you develop an element in your model, you can define a range of added-on properties of that element through the appropriate dialogs, pages and tabs. It is possible to neatly summarize all of these properties for a selected element, using the Element Browser. The properties listed - where they exist in the element - are grouped by type and include:

- Operations
- Attributes
- Linked Features (Linked Operations and Attributes)
- Tagged Values
- Constraints
- Internal Requirements (Responsibilities)
- Attached Files
- Relationships
- Scenarios
- Maintenance Items (sub-grouped as Defects, Changes, Issues and Tasks)
- Testing Items (sub-grouped as Unit, Integration, System, Acceptance and Scenario tests)
- Project Management Items (sub-grouped as Resource Allocation, Effort, Risk and Metrics records)

Having listed these properties, you can also perform a number of operations on them, including dragging and dropping many of them onto other elements.

Access    **Element | Element Browser**    (Alt+9)

#### Options

Option	Action	See also
<b>Display element Properties dialog</b>	Double-click on the element name at the top of the dialog (the root node).	<a href="#">Properties Dialog</a> <sup>[956]</sup>
<b>Add items of a specific type</b>	<p>Right-click on the property type name and select the <b>Add New &lt;object&gt;</b> context menu option. (This option is not applicable to Relationships or Linked Features, which cannot be created without using information external to the selected element.)</p> <p>The appropriate window or dialog displays, or the element Properties dialog displays on the appropriate page. Add new or edit existing items</p>	

	<p>as necessary.</p> <p>For example, if you right-click on the <i>Attributes</i> folder and select the <b>Add New Attributes</b> context menu option, the &lt;element name&gt; Attributes dialog displays and you can add to or edit the attributes in the element.</p>	
<b>Edit specific items</b>	<p>Expand the appropriate folder and double-click on the required <b>item</b>.</p> <p>The Properties dialog, docked window or view displays with the focus on the selected item. You can also go on to select and edit other items within the window or dialog.</p>	
<b>Drag a relationship onto a diagram</b>	<p>Click on the relationship in the Element Browser and drag it onto the diagram.</p> <p>If the element at one or both ends of the relationship is not already on the diagram, those elements are also added to the diagram.</p> <p>If the relationship is already on the diagram, but hidden, it becomes visible again.</p> <p>Alternatively:</p> <ul style="list-style-type: none"> <li>• Right-click on the <i>Relationships</i> folder name and select the <b>Place All Related Elements in Diagram</b> context menu option, or</li> <li>• Right-click on the relationship and select the <b>Place Related Elements in Diagram</b> context menu option</li> </ul>	
<b>Hide/Show a Relationship in the current diagram</b>	<p>Right-click on the relationship in the Element Browser and select the <b>Hide Relationship</b> or <b>Show Relationship</b> context menu option as appropriate.</p>	
<b>Display the Properties dialog of the other element in the relationship</b>	<p>Right-click on the relationship in the Element Browser and select the <b>View Related Element Properties</b> context menu option.</p>	
<b>Locate the related element in the Project Browser</b>	<p>Right-click on the relationship in the Element Browser and select the <b>Locate Related Element</b> context menu option.</p>	
<b>Locate the related element in other diagrams</b>	<p>Right-click on the relationship in the Element Browser and select the <b>Find in all Diagrams</b> context menu option.</p>	
<b>Open an associated file</b>	<p>Double-click on the required file path within the <i>Files</i> folder.</p> <p>If the file can:</p>	<a href="#">Associated Files</a> 

	<ul style="list-style-type: none"> <li>• Be opened within Enterprise Architect, the file opens on a separate tab in the Diagram View workspace</li> <li>• Not be opened within Enterprise Architect, the file opens in the default Windows viewer/editor for the file type</li> </ul>	
<b>Display the source code for a feature</b>	<p>Right-click on an attribute or operation in the <i>Attributes</i> or <i>Operations</i> folder or in the <i>Linked Features</i> folder, then click on the <b>View Source Code</b> context menu option.</p> <p>Alternatively:</p> <ul style="list-style-type: none"> <li>• Click on the attribute or operation and press <b>Ctrl+E</b>, or</li> <li>• In the <i>Linked Features</i> folder, double-click on the attribute or operation</li> </ul> <p>If no code has been generated for the selected feature, nothing happens.</p> <p>If code has been generated for the feature, the code is displayed. The source code viewer in which the source code displays depends on which editor you select as the default, either for the project as a whole or for a specific programming language; if you select the Enterprise Architect internal editor, the code displays in the Source Code Viewer with the cursor positioned on the selected feature.</p>	<a href="#">Options - Code Editors</a> <sup>[2250]</sup> <a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>Add a property to another element</b>	<p>Click on the property in the Element Browser and drag it onto the other element in a diagram. The properties you can do this for are:</p> <ul style="list-style-type: none"> <li>• Attributes</li> <li>• Operations</li> <li>• Constraints</li> <li>• Requirements</li> <li>• Tagged Values</li> <li>• Maintenance Items</li> <li>• Test Items</li> </ul>	
<b>Attach a Recording Marker to an Operation</b>	<p>Right-click on the operation and select the <b>Visual Analyzer   Set Breakpoint</b> context menu option, and the option to set the required type of recording marker.</p>	<a href="#">Place Recording Markers</a> <sup>[2538]</sup>

### 5.6.4.3 Properties Window

The Properties window provides a convenient way to view (and in some cases edit) common properties of elements. When an element is selected, the Properties window shows the element's name, stereotype, version, author, dates and other pertinent information.

**Access**    **Element | Properties Window**    (Alt+1)

#### Topics

Topic	Detail	See also
<b>Properties Sections</b>	<p>The Properties window is divided into three expandable sections:</p> <ul style="list-style-type: none"> <li>• &lt;Element type&gt; Settings - for the basic element details</li> <li>• Project - for general housekeeping settings</li> <li>• Advanced - only active for generalizable elements</li> </ul>	

#### Notes

- When you click on a field name, a brief explanation of that field displays at the bottom of the Properties window, unless you have selected the **Hide Properties Info Section** checkbox on the General page of the Options dialog
- If you click on the field value for an editable field, a drop-down arrow displays that enables you to select a different value; one of the values offered might display a more advanced list or a dialog for adding new objects or selecting multiple objects, as the **Stereotype** field does

#### Learn more

- [General Options](#)<sup>[607]</sup>
- [Apply Stereotypes](#)<sup>[1453]</sup>

### 5.6.4.4 Element Scenarios & Requirements

The Scenarios & Requirements window provides a convenient way to quickly add, view, edit and delete rules applied to an element. The window shows details of the entities that impose such rules or restrictions on the element, namely:

- The element's internal responsibilities or requirements
- The element's internal constraints (not external Constraint notes)
- The element's scenarios

**Access** **Element | Scenarios & Rules** (Ctrl+Shift+3)

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The Scenarios &amp; Requirements window is typically used to examine Use Case and Test Case elements, and any other elements that realize an external Requirement.</p> <p>For convenience, you can display the window as either a dockable window around the edge of your workspace, or as a view in the center of your workspace (in which the Scenarios, Constraints and Requirements are shown on separate tabs).</p> <p>Use the  icon in the window toolbar to toggle between these display options.</p>	<a href="#">Notes</a> <sup>[1324]</sup>

### How to

To review an internal requirement, constraint or scenario for an element

Step	Action	See also
<b>1</b>	<p>Select the element in the Project Browser or diagram and select the <b>Scenarios &amp; Rules</b> menu option.</p> <p>The Scenarios &amp; Requirements window displays.</p>	
<b>2</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the required item in the list panel on the left of the window, or</li> <li>If the Element Browser is not already displayed, click on the  icon and select the required item from the <i>Constraints</i>, <i>Requirements</i> or <i>Scenarios</i> folder</li> </ul> <p>The appropriate screen displays, with the details of the selected item in the fields.</p>	<a href="#">Element Browser</a> <sup>[989]</sup>
<b>3</b>	<p>The toolbar icons, from left to right, enable you to:</p> <ul style="list-style-type: none"> <li>Add a new rule to the current screen (click on the appropriate folder to create an item of a different type)</li> <li>Save the new or edited item</li> <li>Save the current (edited) item as a new item</li> <li>Delete the current item</li> <li>Sort the contents of the selected folder into alphabetical order</li> </ul>	<a href="#">Notes Toolbar</a> <sup>[1143]</sup> <a href="#">Converting an Internal Responsibility Into an External Requirement</a> <sup>[1771]</sup> <a href="#">Scenarios</a> <sup>[965]</sup> <a href="#">Constraints</a> <sup>[963]</sup>

Step	Action	See also
	<ul style="list-style-type: none"> <li>• (Print icon unavailable)</li> <li>• Display the Element Browser window, or highlight the current item in the Element Browser window</li> <li>• Switch between a docked window display and a workspace view display</li> </ul> <p>You can also add or edit formatted notes in the <b>Notes</b> field, using the Notes toolbar at the top of the field.</p> <p>The list panel also provides a context menu that provides options for adding a new item to a folder, deleting the selected item or, for a requirement, converting an internal responsibility into an external Requirement element.</p>	<a href="#">Requirements</a> <sup>[96]</sup>

#### 5.6.4.5 Select <Item> Dialog

The Select <Item> dialog is a multi-purpose browser and search tool for locating model items such as Classifier elements, properties, attributes and behaviors. The <Item> in the dialog title changes to represent the type of item the original operation is working on.

##### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The dialog is called in a range of operations; for example, setting:</p> <ul style="list-style-type: none"> <li>• The base type or classifier for an Object, Swimlane or Lifeline</li> <li>• Classifiers for the return types for operations</li> <li>• Classifiers for generalization sets</li> <li>• The Information Item or classifier elements conveyed or realized on an Information Flow</li> <li>• The associated behavior for a behavior call</li> <li>• The type and return type for operation parameters</li> <li>• Activities for State transitions</li> <li>• Use Case Scenarios</li> <li>• Pattern element defaults</li> <li>• Activities from which to generate code</li> <li>• The values of Tagged Values</li> </ul>	<a href="#">Using Classifiers</a> <sup>[1010]</sup> <a href="#">Objects</a> <sup>[1379]</sup> <a href="#">Swimlanes</a> <sup>[852]</sup> <a href="#">Lifeline</a> <sup>[1321]</sup> <a href="#">Using Information Flows</a> <sup>[1411]</sup> <a href="#">General Properties of Operations</a> <sup>[1015]</sup> <a href="#">Generalization Sets</a> <sup>[1120]</sup> <a href="#">Associate with Different Behaviour</a> <sup>[1027]</sup> <a href="#">Insert Operation Parameters</a> <sup>[1041]</sup> <a href="#">Transitions</a> <sup>[1446]</sup> <a href="#">Generate Scenarios from Activity Diagram</a> <sup>[985]</sup> <a href="#">Use a Pattern</a> <sup>[1467]</sup> <a href="#">Assigning Tagged Values</a> <sup>[1137]</sup>

<b>Multiple Selection</b>	<p>Where an operation permits the selection of multiple items, the Select &lt;Item&gt; dialog is automatically enabled to support this; to select the items, press ( <b>Ctrl</b> ) as you click on each item.</p> <p>If you want to cancel a selected item, press ( <b>Ctrl</b> ) and click on the item.</p> <p>Having selected an item, you can continue to expand and browse the hierarchy, and/or search for items; the dialog retains the existing selections until you click on the <b>OK</b> button.</p>	
---------------------------	--	--

### Select a required item

Step	Action	See also
<b>1</b>	<p>During an operation, when it is necessary to locate an element or feature, click on the ( ... ) (browse) button.</p> <p>The Select &lt;Item&gt; dialog displays.</p>	
<b>2</b>	<p>If required, in the <b>Go To Namespace</b> field select a namespace to reduce the scope of the displayed hierarchy.</p> <p>The dialog opens the section of the hierarchy associated with that namespace, and closes all previously-open sections associated with other namespaces.</p>	
<b>3</b>	<p>You can either:</p> <ul style="list-style-type: none"> <li>Expand the selected area of the hierarchy on the Browse tab, or any other package, and locate the required item (go to step 5) or</li> <li>Click on the Search tab and, in the <b>Find</b> field, type a partial or complete text string to search for the item</li> </ul>	
<b>4</b>	<p>On the Search tab, you can filter the search further by selecting the <b>Whole Word</b> and <b>Match Case</b> checkboxes.</p> <p>Each list entry shows the name of the item, the type, any stereotype the item has, the immediate package in which the item is held, and any successive parent packages (the package path).</p> <p>You can either:</p> <ul style="list-style-type: none"> <li>Select the item immediately on the Search tab or</li> <li>Right-click on one item or a group of items and select the <b>Locate item(s) in tree</b> context menu option; this redisplay the Browse tab and highlights each selected item in the &lt;namespace&gt; hierarchy</li> </ul>	
<b>5</b>	Click on the required item.	
<b>6</b>	Click on the <b>OK</b> button.	

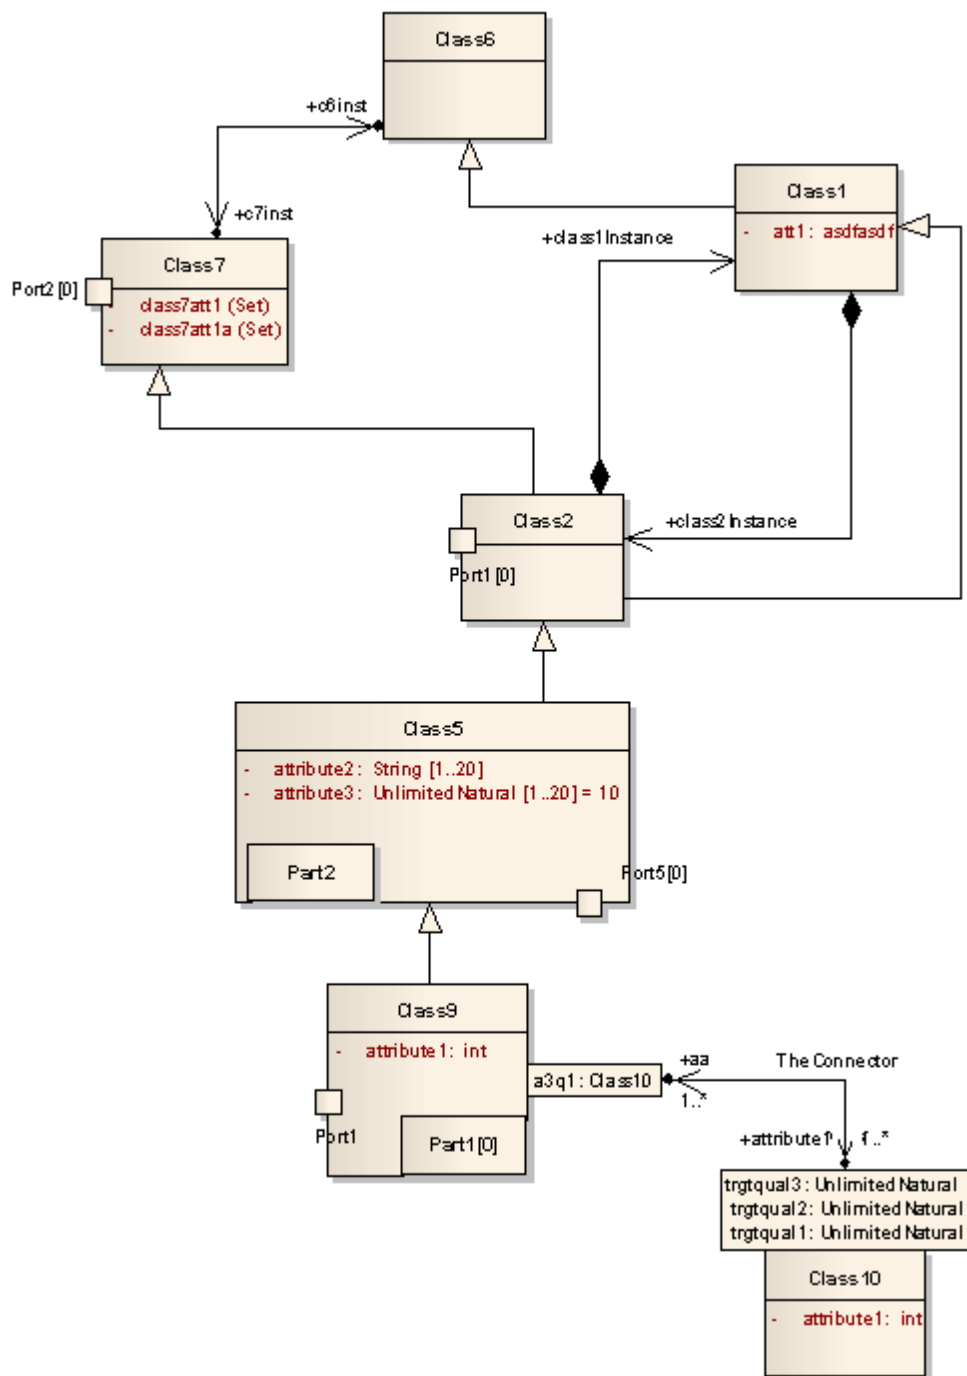

**Notes**

- When you have selected an item, the Select <Item> dialog retains the context and item; next time you display the dialog, if the context is similar the dialog opens to the same Namespace and item - for example, if you have selected an activity for a State transition and you start to do the same for another transition, the dialog opens to the activity you previously selected
- If the context is totally dissimilar, the dialog opens with the Namespace <any> and a collapsed model hierarchy
- If the available items do not meet your requirements, you can create a new item and define the appropriate properties - click on the **Add New** button; the appropriate Add <Item> dialog displays, on which you define the required item
- The **Add New** button is not always available, depending on the context and the type of item being searched for

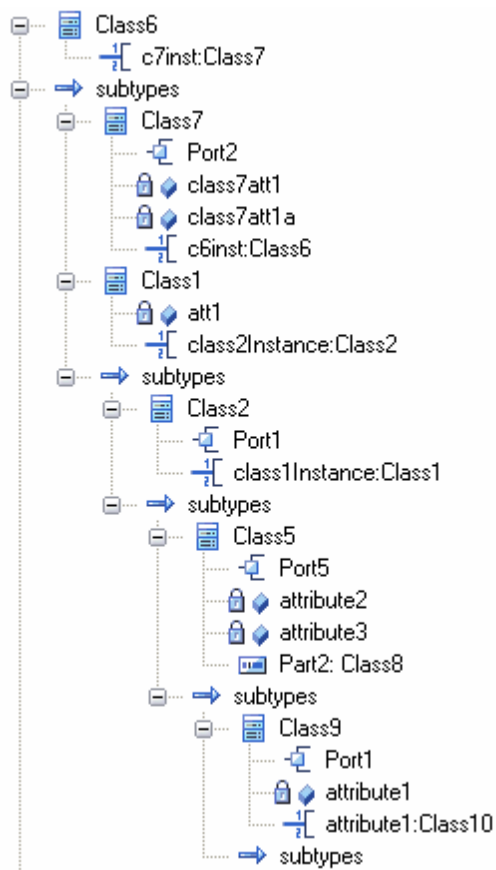

**5.6.4.5.1 Select Property Dialog**

The Select Property dialog is a specific instance of the Select <Item> dialog; it is used to select Ports, Parts, Attributes and Association Ends as *redefined* or *subsetting* properties, from a *hierarchical list* of Classes and their contained properties in the model. For example, consider the section of the model below:

**Example**

This would be represented in the dialog as follows:

Locate and click on the required object to select it, then click on the **OK** button (to select several objects at once, press and hold ( **Ctrl** ) while you click on each object).

#### Notes

- AssociationEnds should be owned by the Class to be listed in the dialog

#### Learn more

- [Select <Item> Dialog](#)<sup>[994]</sup>

#### 5.6.4.5.2 Set Feature Dialog

The Set Feature dialog is the Set Operation dialog used to change the operation represented by an Action on a diagram.

As the Set Operation or Set Attribute dialog, it is also used to set the *Value* operation or attribute for Tagged Values of type RefGUID or for the target of a hyperlink in a diagram.

#### Locate and select a value operation or attribute

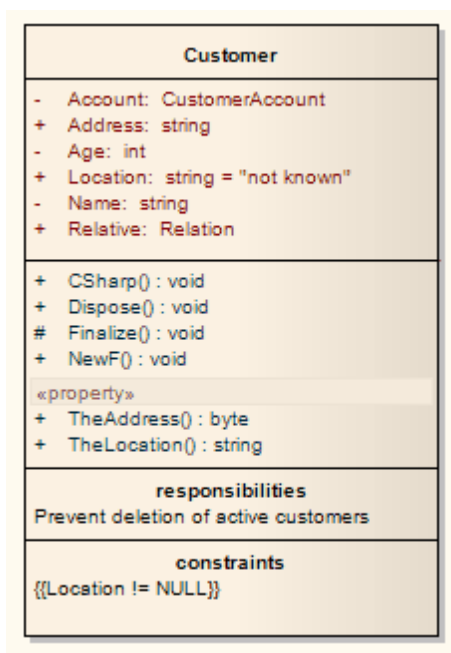

Step	Action	See also
1	The Set Operation (or Set Attribute) dialog displays, with the model hierarchy opened at the point at which you selected the original operation or attribute.	
2	If required, in the <b>In Namespace</b> field, click on the drop-down arrow and select another model that contains the required operation or attribute.  The package hierarchy for that model displays.	
3	Browse through the hierarchy, or use the Search tab to locate the required operation or attribute, then double-click on the item to select it.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>

#### Learn more

- [Class Operations In Diagrams](#)<sup>[1275]</sup>
- [Pre-defined Structure Types - RefGUID](#)<sup>[1624]</sup>
- [Hyperlinks](#)<sup>[2002]</sup>

### 5.6.5 Attributes

To represent the properties or internal data elements of an element, you create features of the element called **attributes**. Not all element types support attributes, and others have restrictions; for example, attributes of Interfaces must have **Public** scope. In the Project Browser, elements with attributes (typically Classes) have their attributes listed under the element name, each preceded by a blue box (◆). When depicted in diagrams, the attributes are listed in colored text in the first properties compartment of the element - the default color is red (for example, **Age : int**). In the following Customer Class example, the customer **Name** and **Address** are attributes.

Attributes have several important characteristics, such as **type**, **scope** (visibility), **derivation** and **notes**.

**Access** **Right-click element in diagram/Project Browser | Attributes (F9)**

### Maintain Attributes

Action	Detail	See also
<b>Create and Modify Attributes</b>	On the <Element name> Attributes dialog, you create and modify attributes on the four dialog pages.	<a href="#">General Properties of Attributes</a> <sup>[1001]</sup> <a href="#">Attributes Dialog - Detail</a> <sup>[1003]</sup> <a href="#">Attributes Dialog - Constraints</a> <sup>[1004]</sup> <a href="#">Attribute Tagged Values</a> <sup>[1005]</sup>
<b>Move and Copy Attributes</b>	You can copy or move existing attributes between elements, if the target element also supports attributes.	<a href="#">Copy Features Between Elements</a> <sup>[932]</sup> <a href="#">Move Features Between Elements</a> <sup>[933]</sup> <a href="#">The Element Browser</a> <sup>[989]</sup>
<b>Define Properties</b>	You can create property implementations specific to your coding languages for each attribute.	<a href="#">Create Properties</a> <sup>[1006]</sup>
<b>Identify Inherited Attributes</b>	The attributes of an element can be inherited from one or more successive <b>parent</b> elements in the model. On a diagram, you can show which attributes are inherited from which 'owning' element in the hierarchy.	<a href="#">Display Inherited Attributes</a> <sup>[1007]</sup>

### Notes

- If you make changes and do not save them, the **Cancel** button prompts you to save or cancel the changes, whilst the **Close** button closes the dialog immediately and does not save the changes
- If you are creating many attributes, go to the Attribute/Operations page of the Options dialog (**Tools | Options | Source Code Engineering | Attribute/Operations**) and **de-select** the **After save, re-select edited item** checkbox; now, when you create an attribute and click on the **Save** button, the dialog fields clear ready for you to enter the details of the next attribute - this helps you when you want to create attributes quickly and might not necessarily want to fully define each one as you create it
- If the parent element provides source or target roles for a connector, the connector can be attached to a specific attribute (feature)

- An alternative method of creating relationships between elements and attributes is to drag an attribute onto an Activity diagram, which generates an Object element named after the attribute; you then create relationships to and from this Object element

### 5.6.5.1 General Properties of Attributes

This topic describes the fields and options of the General page of the Attributes dialog.

#### Reference

Field	Usage	See also
<b>Name</b>	Display the name of the attribute; for a new attribute, type the name (with no spaces).	
<b>Type</b>	<p>Display the attribute's type; if necessary, either:</p> <ul style="list-style-type: none"> <li>• Click on the drop-down arrow and select a different type, or</li> <li>• Click on the ( ... ) button to open the Select &lt;Item&gt; dialog and select or define a different attribute classifier type that might not be in the <b>Type</b> drop-down list</li> </ul> <p>The type can be defined by the code language (data type) or by a classifier element; when you click on the drop-down arrow, the first set of values in the list provides the data types, and the second (longer) set provides the possible classifiers.</p> <p>To add new code language data types that can be displayed in this list, see the <i>Data Types</i> topic.</p>	<a href="#">Data Types</a> <sup>[1171]</sup> <a href="#">Instance Classifier</a> <sup>[994]</sup>
<b>Initial Value</b>	Display an optional initial value; if necessary, type in or browse for a new initial value.	
<b>Stereotype</b>	<p>Define the optional stereotype of the attribute; if necessary, either:</p> <ul style="list-style-type: none"> <li>• Type a different stereotype name</li> <li>• Click on the drop-down arrow and select a stereotype, or</li> <li>• Click on the ( ... ) button and browse for the stereotype</li> </ul>	
<b>Alias</b>	Display an optional alias for the attribute; if necessary, type in a new alias.	
<b>Scope</b>	Define the attribute as <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> ; if necessary, click on the drop-down arrow and select a different	

Field	Usage	See also
	scope.	
<b>Static</b>	Indicate that the attribute is a static member.	
<b>Const</b>	Indicate that the attribute is a constant.	
<b>Is Literal</b>	<p>(For Enumeration elements) Defaults to selected, to define the attribute as an enumeration literal.</p> <p>Deselect the checkbox to define the attribute as a normal element attribute.</p> <p>In the <i>Attributes</i> compartment on the diagram, the enumeration literals are listed separately, above the normal attributes (ensure that the <b>Stereotype</b> field for the normal attribute is not set to <b>enum</b>).</p>	
<b>Containment</b>	Define the containment type ( <b>By Reference</b> , <b>By Value</b> or <b>Not Specified</b> ); if necessary, click on the drop-down arrow and select a different containment type.	
<b>Property</b>	Indicate that the attribute has automatic property creation; when you select this checkbox, the Create Property Implementation dialog displays.	<a href="#">Create Properties</a> 
<b>Notes</b>	Enter any free text notes associated with the attribute; you can format the notes text using the Notes toolbar at the top of the field.	<a href="#">Notes Toolbar</a> 

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>To change the position of a selected attribute in the list at the bottom of the dialog, click on the <b>Scroll Up</b> or <b>Scroll Down</b> (hand) buttons.</p> <p>To review an existing attribute, click on the attribute name in the list.</p> <p>You can re-organize and filter the information shown for each attribute, using the List Header facilities for reported information.</p> <p>To delete an existing attribute, click on the attribute name in the list and click on the <b>Delete</b> button.</p> <p>To create a new attribute, either:</p> <ul style="list-style-type: none"> <li>Click on the <b>New</b> button to clear the fields for new information, or</li> <li>Click on an existing attribute name in the list, and click on the <b>Copy</b> button; a prompt displays for you to enter the name of the copy</li> </ul>	<a href="#">List Header</a> 

Topic	Detail	See also
	If you have changed the attribute details, click on the <b>Save</b> button to save the changes.	

#### Notes

- By default, the attributes are listed in alphabetical order; before changing this sequence, you must deselect the **Sort Features Alphabetically** checkbox on the Objects page of the Options dialog (**Tools | Options | Objects**)

### 5.6.5.2 Attributes Dialog - Detail

This topic describes the fields and options of the Detail page of the Attributes dialog.

#### Reference

Field	Action	See also
<b>Multiplicity</b>		
<b>Lower bound</b>	Define a lower limit to the number of elements allowed in the collection.	
<b>Upper bound</b>	Define an upper limit to the number of elements allowed in the collection.	
<b>Allow Duplicates</b>	Indicate that duplicates are allowed.  This field maps to the UML property <i>isUnique</i> , with a value <b>FALSE</b> .	
<b>Ordered Multiplicity</b>	Indicate that the collection is ordered.	
<b>Redefined Property</b>	Review the redefined properties for the attribute.  You can add redefined properties by clicking on the <b>Add</b> button to display the Select Property dialog.	<a href="#">Select Property dialog</a> <sup>[996]</sup>
<b>Subsetted Property</b>	Review the subsetted properties for the attribute.  You can add subsetted properties by clicking on the <b>Add</b> button to display the Select Property dialog.	

Field	Action	See also
<b>Collection</b>		
<b>Attribute is a Collection</b>	Indicate that the attribute is a collection (array), so that it can contain multiple concurrent values rather than a single value.	
<b>Container Type</b>	Enter the name of the container type.	
<b>Other</b>		
<b>Transient</b>	(For Java code) indicate that the attribute can change regardless of what the code is performing.	
<b>Derived</b>	Indicate that the attribute is derived from one or more other attributes; for example, full name can be derived from the <i>last name</i> and <i>first name</i> attributes.	
<b>isID</b>	When selected ( <b>true</b> ), enables the attribute to be used to uniquely identify an instance of the containing Class. Defaults to unselected ( <b>false</b> ).	
<b>Qualifiers</b>	Click on this button to add Qualifiers to the attribute. The Qualifiers dialog displays.	<a href="#">Qualifiers</a>  <a href="#">Qualifiers dialog</a> 
<b>Save</b>	Click on this button to save changes to this page.	

### 5.6.5.3 Attributes Dialog - Constraints

Attributes can have constraints associated with them; typically these indicate such things as maximum value, minimum value and length of field.

These constraints are managed on the Constraints page of the Attributes dialog.

#### Topics

Topic	Detail	See also
<b>Usage</b>	Select the Constraints page to define the constraints. <ul style="list-style-type: none"> <li>To review an existing constraint, click on the constraint name in the panel at the bottom of the dialog</li> <li>To delete an existing constraint, click on the constraint name in the panel and click on the <b>Delete</b> button</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"><li>To create a new constraint, click on the <b>New</b> button</li></ul> <p>Review, edit or complete the fields as indicated in the table below.</p> <p>If you have created or edited the data, click on the <b>Save</b> button to save the changes.</p>	

#### Reference

Field	Usage	See also
<b>Constraint</b>	Type in the constraint name.	
<b>Type</b>	Type in the constraint type.	
<b>(Notes)</b>	Type in any comments or notes concerning the constraint.	

#### 5.6.5.4 Attribute Tagged Values

You can define Tagged Values for an attribute. Tagged Values are a convenient means of extending the properties a model element supports. This in turn can be used by code generators and other utilities to transform UML models into other forms.

#### How to

To add a Tagged Value to an attribute

Step	Action	See also
1	Click on the Tagged Values tab of the Attribute Properties dialog.	
2	Click on the <b>New tag</b> button (  ). The Tagged Value dialog displays.	
3	In the <b>Tag</b> field, type the tag name or click on the drop-down arrow and select a defined tag.	
4	If appropriate, in the <b>Value</b> field type a specific value for the tag.	
5	Click on the <b>OK</b> button to confirm the operation.	

Step	Action	See also
	The tag name and value are displayed under the attribute in the Tagged Values tab.	

### Notes

- Tagged Values are supported for attributes, operations, objects and connectors
- You can define custom tags by creating a Custom Tagged Value Type

### Learn more

- [Creating a Custom Tagged Value Type](#) 

## 5.6.5.5 Create Properties

Enterprise Architect has capabilities for automatically creating properties in various languages. Property creation is controlled from the General page of the Attributes dialog.

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>On the General page, select the <b>Property</b> checkbox.</p> <p>The Create Property Implementation dialog immediately displays.</p> <p>The Language panel defaults to the Class language; however, you can change this and generate the properties for any language, including Action Script.</p> <p>Each language has slightly different syntax and generates slightly different results</p> <ul style="list-style-type: none"> <li>• Java and C++ generate get and set functions</li> <li>• C# and VB.Net create property functions</li> <li>• Delphi creates get and set functions as well as a specialized Delphi property Tagged Value</li> </ul> <p>Type in the required details and click on the <b>OK</b> button.</p> <p>Enterprise Architect generates the required operations and properties to comply with the selected language.</p> <p>Note that get and set functions are stereotypes with «<i>property get</i>» «<i>property set</i>» making it easy to recognize property functions; you can also hide these specialized functions by deselecting the <b>Property Methods</b> checkbox in the Features tab of the Diagram Properties dialog for a specific diagram (select the <b>Diagram   Properties</b> menu option). This makes it easier to view a Class, uncluttered by many <i>get</i> and <i>set</i> methods.</p> <p>Note that for Delphi you must enable the Tagged Values compartment to see the generated properties.</p>	<a href="#">Compartments</a> 

Topic	Detail	See also

### 5.6.5.6 Display Inherited Attributes

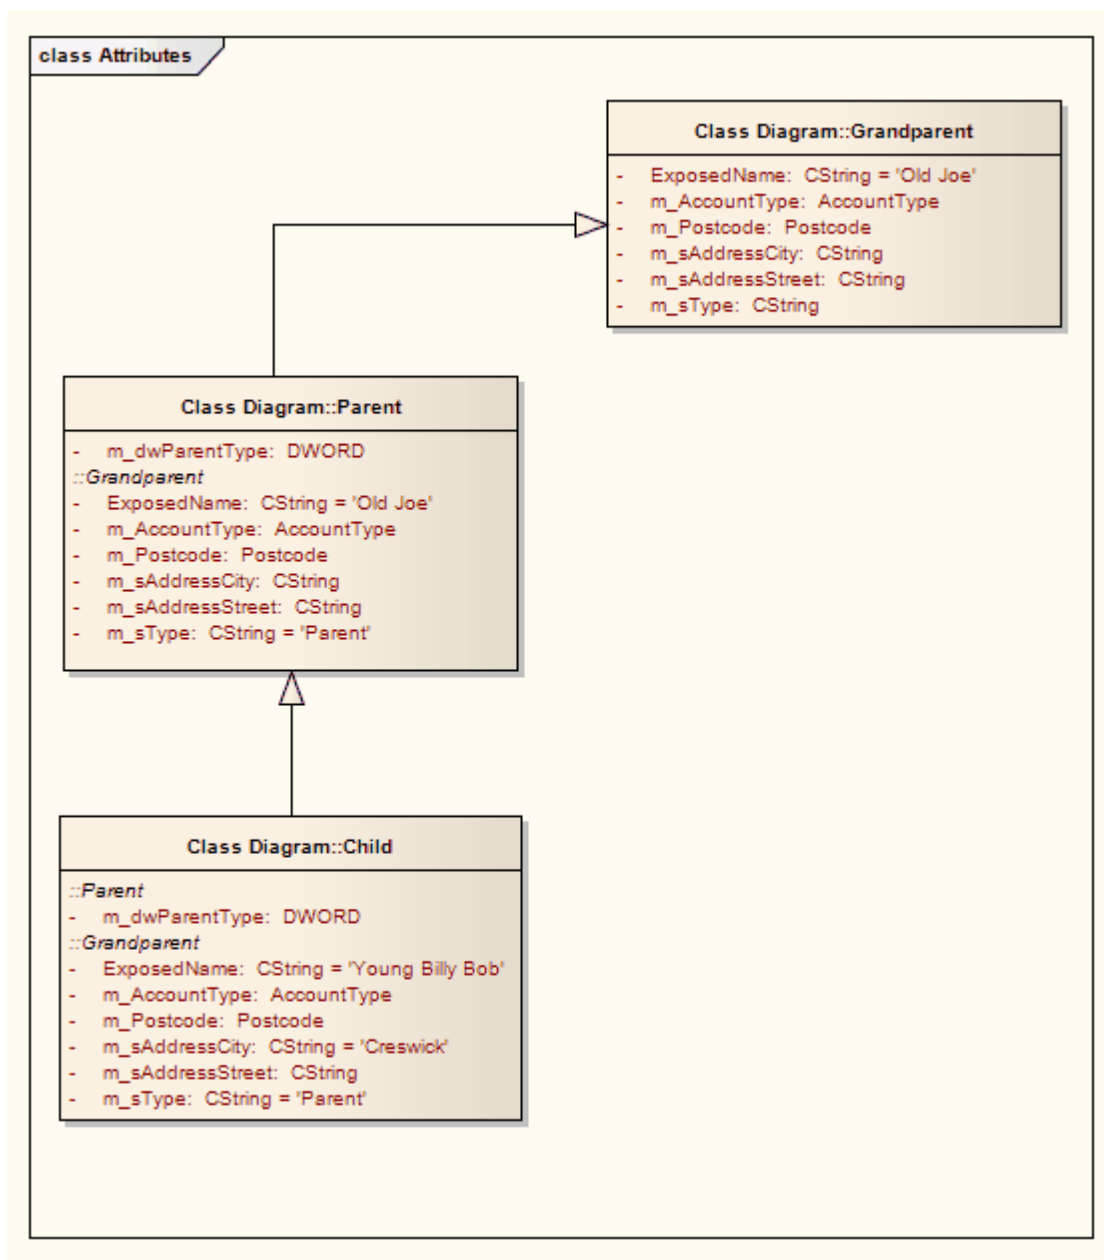

When displaying a Class with attributes in a diagram, you can also show the inherited attributes from all parents in the elements type hierarchy (ancestors).

**Access**    **Right-Click element (on diagram) context menu | Feature Visibility (Ctrl+Shift+Y)**

#### Topics

Topic	Detail	See also
<b>Override Attribute Initializers</b>	<p>Note that for elements that have attributes you can also override an inherited attribute's initial value, using the element context menu option <b>Advanced   Override Attribute Initializers</b> to display the Override Attribute Initializers dialog.</p> <p>In this dialog, select the variable name and enter a new initial value.</p> <p>If required, type a note in the <b>Note</b> field.</p> <p>When you display inherited attributes, Enterprise Architect merges the list of attributes from all ancestors and merges the attribute initializers, so that the final child Class displays the correct attribute set and initial values.</p>	

#### Example

#### Learn more

- [Feature Visibility](#)<sup>[845]</sup>

#### 5.6.5.7 Create Object From Attribute

If you drag an attribute from the Project Browser onto an *Activity* diagram, the attribute generates an Object element of the same name.

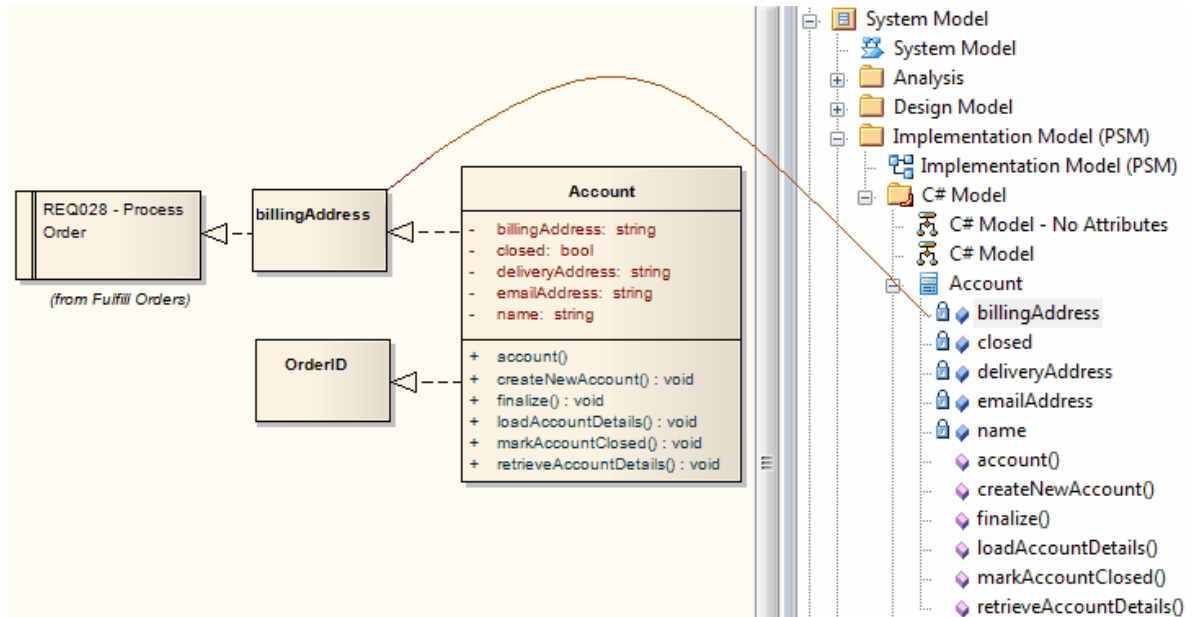

This is very useful for creating connectors between elements and specific attributes. For example, a Class element of stereotype *table* defines its fields as attributes; Requirement elements that define requirements for those fields can then be linked to the appropriate table fields via the attribute Object elements.

### Example

In the following diagram, the *billingAddress* Object was generated by dragging the *billingAddress* attribute from the Account Class in the Project Browser onto the diagram.

The user then created *Realize* relationships between the *Account* element and the *billingAddress* element, and between the *billingAddress* element and the *REQ028 Requirement* element.

### Notes

- You can also create this relationship more directly by linking an attribute in an element to another element, or linking two attributes in different elements

### Learn more

- [Connect to Element Feature](#) <sup>1110</sup>

## 5.6.6 Classifiers and Instances

Some types of element (such as Classes) model **classifications**, which provide a specification of an abstract concept. For example, the concept of a *Building* can be represented by a set of Classes that define types of building such as *Bungalow*, *Miner's Cottage*, *Office Block*, *Shop* and so on. Other types of element (such as Objects) model **instances** of such classifications, such as *23 High Street Shop* or *45 Village Green Cottage*. The instance elements represent actual objects in a run-time scenario, based on the specification of the classifier element. For example:

- An **Object element** represents a man called *Joe Smith*, as a specific instance of the concept of 'a person' defined by the **Class element** *Person*; the object is rendered as a rectangle showing the name of the classifier - if you name the object it becomes *<ObjectName> :<ClassifierName>* or, in this example, *Joe Smith :Person*

If you develop a *Person* Class with attributes such as *Age*, *Name*, *Address* and *Sex*, and functions such as *GetAge* and *GetName*, then when you derive an object from that Class the object takes on all the *Person* Class behavior and state (as well as inherited state and behavior from *Person's* **parent elements**, if any).

Associating an instance with a classifier greatly increases the descriptive power of the model in capturing the functionality and responsibility of objects and their associated state at run-time. This is a powerful means of moving your model from the analysis phase into detailed design.

### Notes

- An object is an instance of a classifier at runtime, so the object's **features** are actually those of the classifier; in the context menu for a classified object, if you select the **Attributes** or **Operations** menu options, the Attributes or Operations dialog displays for the **classifier**, not the **object**.
- Similarly, if you have set the classifier for an object in a **Sequence diagram**, when you add a **message** and display its Message Properties dialog, the **Message** drop-down list is drawn from the operations of the target object's **classifier**, not from the object itself

In this way you can associate Sequence diagram objects with Classes and use the defined behavior of the **Class** to model actual behavior at run time; the same concept applies to Messages for a **State Flow** connector

- In the Message dialog, you can also select to include messages defined in the **inheritance hierarchy** of the classifier for the target object

### Learn more

- [Classify an Object](#) <sup>[1010]</sup>
- [Message \(Sequence Diagram\)](#) <sup>[1418]</sup>

#### 5.6.6.1 Classify an Object

Objects can be created and classified in a number of ways. You can define a classifier first and then create instances of that classifier. Alternatively, you might develop several separate objects that turn out to have a similar specification, which you then formally define as a classifier. You would then classify the existing objects as instances of that new classifier.

#### Methods of Classifying an object

Method	Detail	See also
<b>Drop Classifier Onto Diagram</b>	<p>Drag an existing classifier element from the Project Browser onto a diagram. Depending on how you configure the Paste Element dialog, you can <b>create</b> an associated object as an instance, or the instance is <b>automatically generated</b>.</p> <p>If your classifier contains Property elements, you also have the option of adding some or all of these properties to the instance as 'slots'.</p>	<p><a href="#">Paste from Project Browser</a> <sup>[833]</sup></p> <p><a href="#">Add Property Slots to</a></p>

Method	Detail	See also
		<a href="#">Instance</a> <sup>[1011]</sup>
<b>Classify Existing Object</b>	<p>(Where both object and classifier already exist, separately.)</p> <p>On a diagram, right-click on the object and select the <b>Advanced   Instance Classifier</b> context menu option. (Or click on the object and press ( <b>Ctrl + L</b> ).)</p> <p>The Select Classifier dialog displays. Browse or search through the model for the classifier element to associate with the object, and double-click on it.</p> <p>The object is associated with the classifier and displays the naming convention described above.</p>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Classify new or existing object from classifier Associations</b>	<p>A classifier is usually a component of a model structure, and can have Associations with other classifiers.</p> <p>If an object is classified, any other objects related to that object can be classified by the related elements of the classifier. For example:</p> <ul style="list-style-type: none"> <li>• Class A is associated with Class B and Class C</li> <li>• Object 1 is classified by Class A</li> <li>• If you create an Association between Object 1 and Object 2, the Choose an Association Connector dialog offers the option of setting either Class B or Class C as the classifier of Object 2</li> </ul>	<a href="#">Classify Object Via Classifier Associations</a> <sup>[1012]</sup>

**Learn more**

- [Classifiers and Instances](#) <sup>[1009]</sup>

**5.6.6.1.1 Add Property Slots to Instance**

A classifier element can have a range of characteristics that are automatically applied to an instance based on that classifier. You can also, optionally, add any **Property elements** (Ports, Parts and Expose Interfaces) on the classifier to the instance, as 'slots' for the definition of each Property. This provides some flexibility in creating variations of the design defined in the classifier. For example, models of car might have doors of the same specification, but in a two-door or four-door configuration.

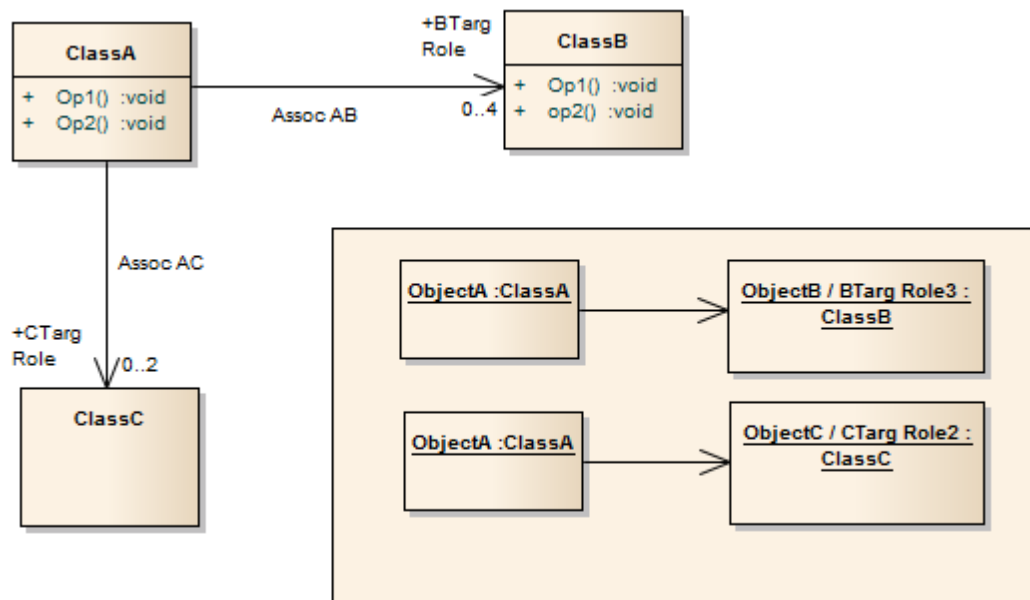

**Add classifier Property elements to an instance**

Step	Action	See also
<b>1</b>	Create and save the classifier element with the configuration of Property elements you need.	<a href="#">Part</a> <sup>[1383]</sup> <a href="#">Port</a> <sup>[1384]</sup> <a href="#">Expose Interface</a> <sup>[1375]</sup>
<b>2</b>	Create or assign an instance of the classifier on your work diagram.	<a href="#">Classifiers and Instances</a> <sup>[1009]</sup>

Step	Action	See also
3	<p>Right-click on the instance and select the <b>Structural Elements</b> context menu option.</p> <p>The Structural Elements dialog displays, listing the Property elements defined for the classifier.</p>	<a href="#">Manage Structural Elements</a> <sup>[93]</sup>
4	<p>Select the check box against each Property to reproduce in the instance element, and click on the <b>Close</b> button.</p> <p>Each Property element is shown in the top left of the instance; drag the elements into the arrangement you want. The Property element name within the instance is prefixed with a / character.</p>	

#### 5.6.6.1.2 Classify Object Via Classifier Associations

When building an instance model from a predefined Class model, Enterprise Architect can assist in setting classifiers and role names for objects involved in a relationship. For example, if ClassA has association relationships with ClassB and ClassC, you can create an instance of ClassA (ObjectA), then draw an association to a new unclassified object and have the choice of selecting ClassB or ClassC as the classifiers of the new object.

**Access** Click on the Classified object on a diagram and:

Drag an Association to an existing, unclassified object or  
 Use the Quick Linker arrow to create a Link to an existing or new unclassified object, or  
 Right-click on existing Association | Advanced | Instance Classifier (Ctrl+L)

**Choose an Association Connector dialog**

Field/Button	Detail	See also
<b>Classifier Name</b>	Displays the name (if defined) of each Association connector issuing from the source object's classifier.  If the connector has no name, the value <b>&lt;anonymous&gt;</b> displays.	
<b>Association</b>	Represents the source and target classifier elements in each Association connector issuing from the source object's classifier.  If you select one of these, the target classifier becomes the classifier for the target object element.  Select <b>&lt;none&gt;</b> if you want to create the Association, but not based on the classifier relationships.	
<b>&lt;Source Object Name&gt; Role</b>	Identifies any Roles defined in the Association for the source classifier element, according to the source role multiplicity setting; if you select one of these roles, this will become the specific Role for the source object, as shown on the name of the element on the diagram.  If the multiplicity is not set, or the upper bound is * (asterisk), just the role name displays in the list.	
<b>&lt;Target Object Name&gt; Role</b>	Identifies any Roles defined in the Association for the target classifier, according to the target role multiplicity setting; if you select one of these roles, it will become the specific Role for the target object as shown on the name of the element in the diagram (and on the Binding page of the Association connector Properties dialog).  If the multiplicity is not set, or the upper bound is * (asterisk), just the role name displays in the list.	
<b>OK</b>	Click on the Association and source and target roles, then click on this button to: <ul style="list-style-type: none"> <li>• Create the Association between the two objects based on the relationship between the two classifiers, and</li> <li>• Make the target classifier the classifier for the target object</li> </ul> If you selected the <b>&lt;none&gt;</b> entry, a simple Association is created and the target object is unclassified.	
<b>Cancel</b>	Cancel the dialog without changing any classifier settings.	

**Notes**

- When creating a new association or object, the **Properties** dialog might appear before the **Choose an Association Connector** dialog; complete any Properties fields as required, and click on the **OK** button

- [Behavior Parameters](#) <sup>[1028]</sup>
- [Behavior Call Arguments](#) <sup>[1027]</sup>

### 5.6.7.1 Operations

Operations are features of a Class or other element that represent the behavior or services an element supports. For a Customer Class, *UpdateCustomerName* and *GetCustomerAddress* can be operations. Operations have several important characteristics, such as type, scope (visibility), static, abstract and notes.

Topics

Images	Topic	Detail	See also
	<b>Create and Modify Element Operations</b>	<p>In the Diagram view or Project Browser, either:</p> <ul style="list-style-type: none"> <li>• Right-click on the element to be edited, and from the context menu select the <b>Operations</b> menu option, or</li> <li>• Click on the element and press ( <b>F10</b> )</li> </ul> <p>The &lt;Element name&gt; Operations dialog displays.</p> <p>You can also copy or move existing Operations between elements.</p> <p>These facilities are only available if the target element supports operations.</p>	<p><a href="#">General Properties of Operations</a> <sup>[1015]</sup></p> <p><a href="#">Copy Features Between Elements</a> <sup>[932]</sup></p> <p><a href="#">Move Features Between Elements</a> <sup>[933]</sup></p> <p><a href="#">The Element Browser</a> <sup>[989]</sup></p>

Images	Topic	Detail	See also
 <p>The diagram shows a class named <b>Customer</b>. It has several attributes: <code>- Account: CustomerAccount</code>, <code>+ Address: string</code>, <code>- Age: int</code>, <code>+ Location: string = "not known"</code>, <code>- Name: string</code>, and <code>+ Relative: Relation</code>. It also has several operations: <code>+ CSharp() : void</code>, <code>+ Dispose() : void</code>, <code># Finalize() : void</code>, and <code>+ NewF() : void</code>. There is a property section with <code>+ TheAddress() : byte</code> and <code>+ TheLocation() : string</code>. A responsibilities section states "Prevent deletion of active customers". A constraints section shows <code>{{[Location != NULL]}}</code>.</p>	<b>How Operations Appear in Diagrams</b>	<p>In diagrams, elements with operations (typically Classes) list the operations in the second properties compartment, in colored text, as shown on the left. The default color is dark green; for example:</p> <p><code>Finalize() : void</code></p> <p>Some characteristics display in shorthand form; for example, <i>static</i> displays as \$, <i>abstract</i> as *.</p>	
 <p>The Project Browser shows a tree structure. Under the <b>Order</b> class, there are several items: <code>date</code>, <code>deliveryinstructions</code>, <code>orderNumber</code>, <code>checkForOutstandingOrders()</code>, <code>Status()</code>, <code>LineItem()</code>, <code>Date()</code>, <code>DeliveryInstructions()</code>, and <code>OrderNumber()</code>. Each operation is preceded by a pink diamond icon.</p>	<b>Operations in the Project Browser</b>	<p>In the Project Browser, Classes with operations have the operations listed beneath the Class name, each preceded by a pink box (◆).</p> <p>Right-click on an operation and select the <b>Operation Properties</b> context menu option, to open the Operations dialog and edit details for the feature.</p> <p>From the Project Browser, you can drag operations onto new elements to give them the same operations.</p>	

### Notes

- If the parent element provides source or target roles for a connector, the connector can be attached to a specific operation

#### 5.6.7.1.1 General Properties of Operations

**Access** In diagram or Project Browser:

Click on element | Element | Operations (F10) or  
Right-click on element | Features & Properties | Operations

The Operations dialog has seven pages:

- General
- Parameters

- Behavior
- Advanced
- Tagged Values
- Pre-conditions and Post conditions (that is, Constraints)

The General page of the Operations dialog enables you to define new operations and set the most common properties, including name, access type and return.

Field/Button	Usage	See also
<b>Name</b>	Display the selected operation name.	
<b>Parameters</b>	Display the parameter list. See the <i>Parameters Dialog</i> topic for information regarding what this string can contain.	<a href="#">Define Parameters</a> <sup>[1028]</sup>
<b>Edit Parameters</b>	Open the Parameters dialog.	
<b>Return Type</b>	(This option is not shown for <i>State</i> or <i>State Machine</i> elements.) Display the data type returned by the operation.  The type can be defined by the code language (data type) or by a classifier element; when you click on the drop-down arrow, the set of values in the list provides the appropriate data types.  To select or define possible classifiers, either click on the <b>Select Type</b> option in the list, or click on the ( ... ) (Select) button to display the Select <Item> dialog.  To add new code language data types that can be displayed in this list, see the <i>Data Types</i> topic.	<a href="#">Instance Classifier</a> <sup>[994]</sup> <a href="#">Data Types</a> <sup>[1171]</sup>
( ... ) (Return Type Browse button)	Open the Select <Item> dialog to select the operation return type. (Not shown for <i>State</i> or <i>State Machine</i> elements.)	<a href="#">Instance Classifier</a> <sup>[994]</sup>
<b>Action</b>	Define the action of the operation: <b>do</b> , <b>exit</b> or <b>entry</b> . (Displayed for operations of <i>State</i> or <i>State Machine</i> elements.)	<a href="#">State</a> <sup>[1329]</sup> <a href="#">State Machine</a> <sup>[1338]</sup>
<b>Scope</b>	Click on the drop-down arrow and select one of: <ul style="list-style-type: none"> <li>• <b>Public</b></li> <li>• <b>Protected</b></li> <li>• <b>Private</b></li> <li>• <b>Package</b></li> </ul>	

Field/Button	Usage	See also
<b>Stereotype</b>	Specify an optional stereotype for this operation.	
<b>Alias</b>	Define an optional alias for the operation.	
<b>Notes</b>	Enter free text notes. You can format this text if necessary, using the Notes toolbar at the top of the field.	<a href="#">Notes toolbar</a> 
<b>Virtual</b>	If the operation's language is set to C++, map to the C++ <i>Virtual</i> keyword. Otherwise this option is <i>Abstract</i> , pertaining to an abstract function. (This option is not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Static</b>	Indicate that the operation is a static member. (This option is not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Up/Down Buttons</b>	Change the order of operations in the list.	
<b>New</b>	Create a new operation.	
<b>Copy</b>	Copy the currently selected operation.	
<b>Save</b>	Save a new operation, or save modified details for existing operation.	
<b>Delete</b>	Delete the currently selected operation.	
<b>Name/ Parameters/ Return Type</b>	List the existing operations for the selected element. You can re-organize and filter the information shown for each operation, using the List Header facilities for reported information.	<a href="#">List Header</a> 

### Notes

- The General page can vary according to the type of element you are adding an operation to; if defining operations for a data modeling table, see the *Indexes*, *Triggers* and *Check Constraints* topics
- If you make changes and do not save them, the **Cancel** button prompts you to confirm or cancel the changes, whilst the **Close** button closes the dialog immediately and does not save the changes
- If you are creating many operations, go to the Attribute/Operations page of the Options dialog (**Tools** |

**Options | Source Code Engineering | Attribute/Operations**) and **de-select** the **After save, re-select edited item** checkbox; now, when you create an operation and click on the **Save** button, the dialog fields clear ready for you to enter the details of the next operation - this helps you when you want to create operations quickly and might not necessarily want to fully define each one as you create it

**Access** Project Browser Operation context menu | Operation Properties | Behavior

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>On the Behavior page of the Operations dialog, use the <b>Initial Code</b> field to enter code to be inserted into an operation body when the operation is first generated to file.</p> <p>After this point, forward code generation and synchronization do not replace the existing operation code with the <b>Initial Code</b> field.</p> <p>By default, the <b>Initial Code</b> field also is not imported into the model during reverse engineering, but you can select to import the field by selecting the <b>Include method bodies in model when reverse engineering</b> checkbox on the Options dialog.</p> <p>This field is most useful when combined with Design Patterns; elements within a pattern often require the same stub code.</p> <p>Notice that the language-specific patterns available from <a href="http://www.sparxsystems.com/resources/developers/uml_patterns.html">www.sparxsystems.com/resources/developers/uml_patterns.html</a> include initial code for some of the defined operations; this helps speed up the process of applying patterns from model to implementation.</p> <p>The <b>Initial Code</b> section is also useful for ensuring that the generated code is directly compilable.</p>	<p><a href="#">Options - Attributes/Operations</a> <sup>2253</sup></p> <p><a href="#">Design Patterns</a> <sup>1464</sup></p> <p><a href="http://www.sparxsystems.com/resources/developers/uml_patterns.html">www.sparxsystems.com/resources/developers/uml_patterns.html</a></p>

#### 5.6.7.1.3 Advanced Properties of Operations

In defining the behaviors of the model elements you create, you can also define how the operations translate into methods in code. For this, you set options on the Advanced tab of the Operation Properties dialog.

**Access**    **In diagram or Project Browser:**

**Click on element | Element | Operations (F10) > General | select operation > Advanced, or Right-click on element | Features & Properties | Operations > General | select operation > Advanced**

#### Available Options

Field/Button	Usage	See also
<b>Concurrency</b>	Click on the drop-down arrow and select the concurrency of the operation - <b>Sequential</b> , <b>Guarded</b> or <b>Synchronous</b> .	
<b>Pure</b>	<p>For C++, select this checkbox to indicate that the method statement is pure virtual syntax. For example:</p> <pre>virtual void myFunction( ) = 0;</pre> <p>(This option is not shown for operations of <i>State</i> or <i>State Machine</i> elements.)</p>	
<b>Const</b>	Select this checkbox to indicate that the return type of the method is constant.	

Field/Button	Usage	See also
	(This option is not shown for operations of <i>State</i> or <i>State Machine</i> elements.)	
<b>Is Query</b>	Select this checkbox to indicate that the method does not modify the object.  (This option is not shown for operations of <i>State</i> or <i>State Machine</i> elements.)	
<b>Return Array</b>	Select this checkbox to indicate that the method's returned value is in the form of an array.  (This option is not shown for operations of <i>State</i> or <i>State Machine</i> elements.)	
<b>Synchronized</b>	For Java, select this checkbox to set a code engineering flag that relates to multi threading.  (This option is not shown for operations of <i>State</i> or <i>State Machine</i> elements.)	
<b>Advanced</b>	Select the checkbox for each coding convention to assign as a Tagged Value (corresponding to a coding keyword).	<a href="#">Modeling Conventions</a> [2080]
<b>Redefined Operation</b>	<p>If the parent element is the <b>source</b> of a <b>Generalize</b> connector, and you want the selected operation to redefine an operation in the <b>target</b> element, click on the <b>Add</b> button.</p> <p>The Select Operation dialog displays, showing the operations in the target element. Click on the appropriate operation; if you want to redefine more than one operation in the target element, press ( <b>Ctrl</b> ) as you click on each one.</p> <p>Click on the <b>OK</b> button.</p> <p>A statement displays in the <b>Redefined Operation</b> field of the format:</p> <pre>&lt;Package&gt;::&lt;Target Element&gt;.&lt;Operation&gt;</pre> <p>On the element in the diagram, the Operation compartment shows the complete statement, of the format:</p> <pre>&lt;Operation&gt;:{redefines &lt;Package&gt;::&lt;Target Element&gt;.&lt;Op</pre> <p>If you want to change the redefined operation(s) at any point, again click on the <b>Add</b> button and repeat the process; the original selection is replaced by the new selection.</p>	<a href="#">Generalization</a> [1409]  <a href="#">Select &lt;Item&gt; Dialog</a> [994]
<b>Raised Exception</b>	If you want the code to check for an exception and, if it occurs, skip to the code defined by a Classifier element, you can identify that element in this field.	

Field/Button	Usage	See also
	<p>Click on the <b>Add</b> button. The Select Classifier dialog displays; browse or search through the model hierarchy for the appropriate Classifier.</p> <p>Click on the <b>OK</b> button; the name of the Classifier displays under the <b>Exception</b> heading.</p> <p>If you want to change the Classifier at any point, again click on the <b>Add</b> button and repeat the process; the original selection is replaced by the new selection.</p>	<a href="#">Select &lt;Item&gt; Dialog</a> 
<b>Close</b>	Click on this button to save the field values and close the dialog.	
<b>Cancel</b>	Click on this button to close the dialog without saving the field values.	

#### Learn more

- [General Properties of Operations](#) 

#### 5.6.7.1.4 Operation Tagged Values

Operations can have Tagged Values associated with them. Tagged Values offer a convenient extension mechanism for UML elements, so you can define any tags you like and then assign values to them using this form.

Tagged Values are written to the XML output, and can be input to other third party tools for code generation or other activities.

**Access** [Project Browser Operation context menu](#) | [Operation Properties](#) | [Tagged Values](#)

#### Add a Tagged Value for an operation

Step	Action	See also
1	Click on the Tagged Values page of the operation Properties dialog.	
2	Click on the <b>New Tags</b> button. The Tagged Value dialog displays.	
3	In the <b>Tag</b> field, type the tag name (or select a defined tag from the drop-down list). In the <b>Value</b> field type the initial tag value.	
4	Click on the <b>OK</b> button to confirm the operation.	

Step	Action	See also

#### Notes

- Tagged Values are supported for attributes, operations, objects and connectors
- You can define custom tags using a predefined Tagged Value Type

#### Learn more

- [Create a Custom Tagged Value](#)<sup>[626]</sup>

#### 5.6.7.1.5 Operation Constraints

**Access** **Project Browser Operation context menu | Operation Properties | Constraints**

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>You can define pre- and post- conditions for an Operation; for each type, give the condition a name and a type, and enter notes.</p> <p>Constraints define the contractual behavior of an operation, what must be true before they are called and what is true after. In this respect they are related to the state model of a Class and can also relate to the guard conditions that apply to a transition.</p>	

#### 5.6.7.1.6 Override Parent Operations

In Enterprise Architect, you can automatically override methods from parent Classes and from realized Interfaces.

**Access** **Element | Advanced | Overrides & Implementations (Ctrl+Shift+O)**

Topic	Detail	See also
<b>Usage</b>	<p>In the Override Operations/Interfaces dialog, check the operations/interfaces to automatically override and click on the <b>OK</b> button.</p> <p>Enterprise Architect generates the equivalent function definitions in your child Class.</p> <p>You can configure Enterprise Architect to display this dialog each time you add</p>	

Topic	Detail	See also
	a Generalization or Realization connector between Classes, and review their possible operations/interfaces to override/implement; to do this, open the Links page of the Options dialog (select the <b>Tools   Options   Links</b> menu option).	

#### 5.6.7.1.7 *Display Inherited Operations*

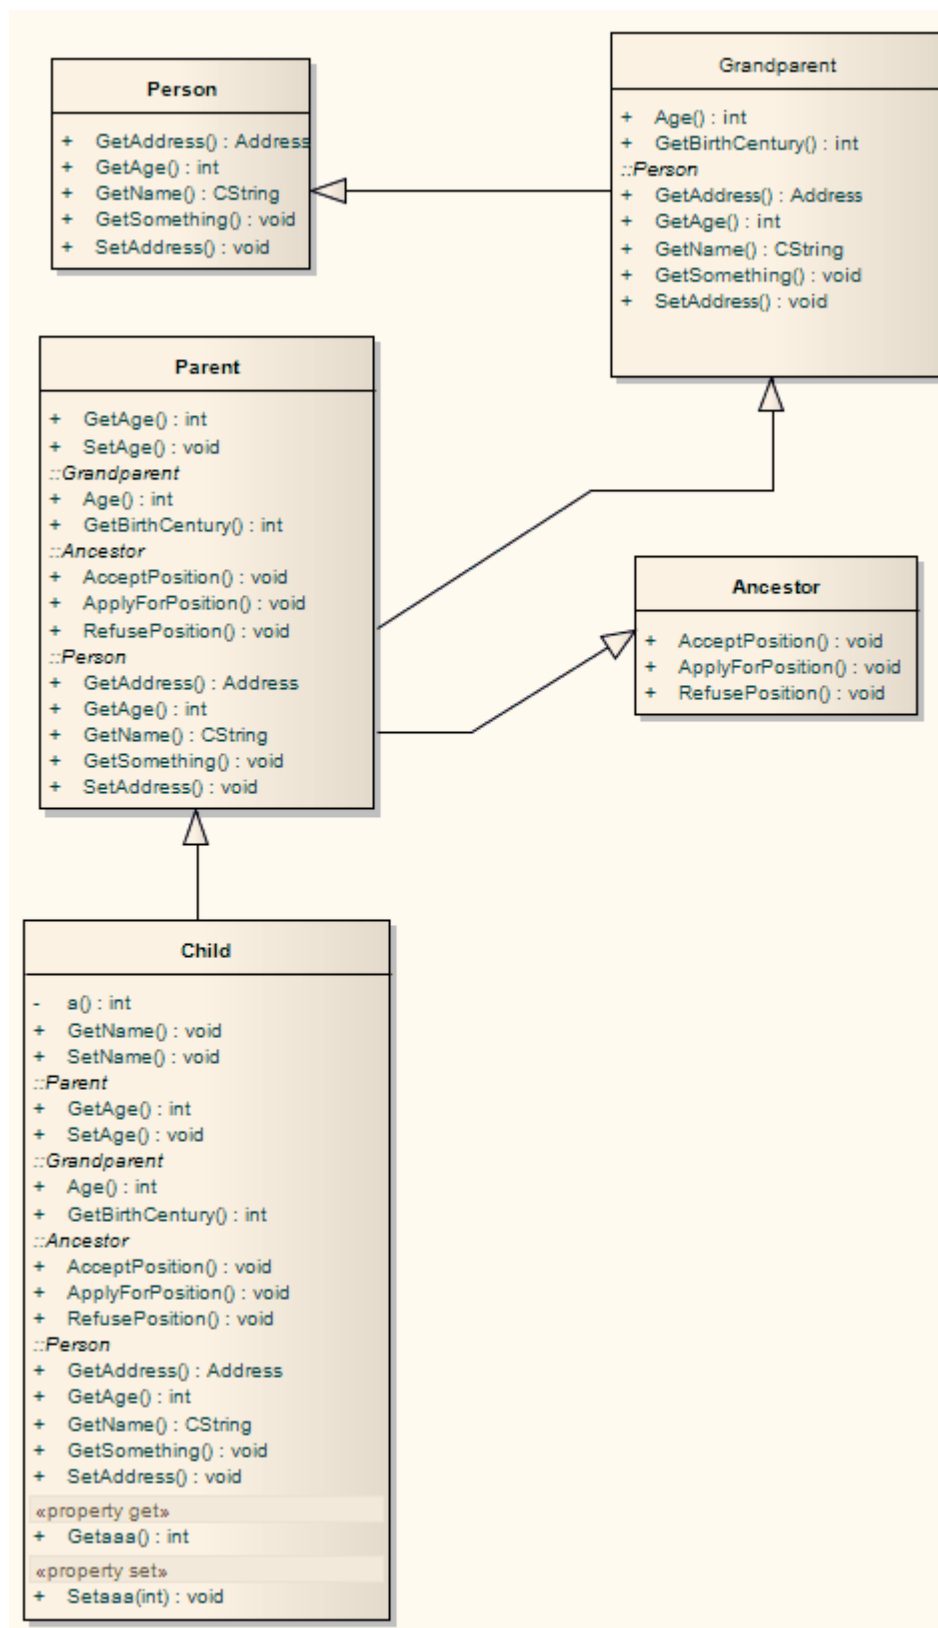

You can configure an element in a diagram to display the complete operation set obtained from all ancestors in the element's type hierarchy, as well as those directly owned.

Access   **Element | Feature Visibility**   ( **Ctrl+Shift+Y** )

#### Example

The following diagram illustrates this behavior when enabled for each element in a simple hierarchy.

### 5.6.7.2 Interactions and Activities

The behavioral aspects of Interactions and Activities are modeled using the Behavior page of the element Properties dialog, which enables you to assign parameters and return types to the elements.

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Use the <b>Edit Parameters</b> button to edit an element's parameters. When you create a new parameter using the dialog, it internally creates an Activity Parameter Node for an Activity or an Interaction Parameter for an Interaction. In the <b>Return</b> field, click on the drop-down arrow and select the return type of the element.</p> <p>The <b>Specification</b> field is populated automatically when an operation is associated with the activity as a behavior.</p>	<a href="#">Define Parameters</a>  <sup>[1028]</sup> <a href="#">Activity Parameter Nodes</a>  <sup>[1281]</sup> <a href="#">Operation Behaviour</a>  <sup>[1018]</sup>

### 5.6.7.3 Behavior Calls

A behavior call is the invocation of a behavior. You can represent an invocation with a CallOperation Action (Operation), CallBehavior Action (Activity) or Interaction Occurrence (Interaction) element. You model the properties of the behavior call using the Call tab of the element Properties dialog.

#### Use to

- Edit Arguments
- Re-associate the call with a different behavior
- Synchronize the arguments with the parameters in the associated behavior

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Click on the <b>Edit</b> button to create and delete arguments, and relate them to a corresponding parameter in the associated behavior.</p> <p>Click on the ( ... ) (<b>Select Behavior</b>) button to re-associate the invocation with a different behavior or to remove any association with the current behavior.</p> <p>The Interaction Occurrence panel is displayed only for Interaction Occurrence elements. It enables you to enter the return value and attribute of the behavior call.</p>	

#### Learn more

- [Action Types](#)  <sup>[1268]</sup>
- [Interaction Occurrence](#)  <sup>[1317]</sup>
- [Arguments](#)  <sup>[1027]</sup>

- [Synchronize Arguments](#) <sup>[1027]</sup>
- [Code Generation - Activity Diagrams](#) <sup>[2134]</sup>

#### 5.6.7.3.1 Associate with Different Behaviors

On the Call tab of the Behavior Call Properties dialog, when you click on the ( ... ) (Select Behavior) button the Select <Item> dialog displays, listing all available behaviors in the model.

##### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Select <b>&lt;none&gt;</b> to remove any existing association between an invocation and a behavior, or select another classifier to re-associate the invocation with a different behavior.</p> <p>The <b>Synchronize with Parameters</b> button is enabled only if a valid behavior is identified in the <b>Behavior</b> field.</p>	

##### Learn more

- [Select <Item> Dialog](#) <sup>[994]</sup>

#### 5.6.7.3.2 Synchronize Arguments

##### Topics

Topic	Detail	See also
<b>Usage</b>	<p>On the Call tab of the element Properties dialog, click on the <b>Synchronize with Parameters</b> button to synchronize the number of arguments in the invocation element with the number of parameters in the associated behavior.</p> <p>This automatically creates or deletes arguments based on the number of parameters in the behavior.</p> <p>If any arguments are to be deleted, Enterprise Architect prompts you to confirm the operation. Click on the <b>Yes</b> button to confirm.</p>	

##### Notes

- The **Synchronize with Parameters** button is enabled only if the invocation is associated with a valid behavior, as identified in the **Behavior** field

#### 5.6.7.4 Behavior Call Arguments

You define the arguments of a Behavior Call using the Arguments dialog, which you display by clicking on the **Edit** button on the Call tab of the element Properties dialog.

##### Define the arguments of a Behavior Call

Step	Action	See also
1	In the <b>Name</b> field, type the name of an argument to map to the behavior.	
2	In the <b>Parameters</b> field, click on the drop-down arrow and select a behaviors parameter from the list of parameters associated with the behavior.	
3	In the <b>Value</b> field, set any required value.	
4	If a diagram is displayed, and if required, select the <b>Show in current diagram</b> checkbox to add an Action Pin on the diagram.	<a href="#">Action Pin</a> [1277]
5	Click on the <b>Save</b> button.	
6	If appropriate, click on the <b>New</b> button and repeat steps 1 to 5 for another argument: parameter mapping.	

#### Notes

- If you attempt to map a newly created argument to a parameter that is already associated with a different argument, Enterprise Architect identifies the mapping and prompts you to confirm that you intend to change the association

#### Learn more

- [Behavior Calls](#) [1026]

### 5.6.7.5 Behavior Parameters

This topic area describes the facilities for defining, editing and extending the parameters of behavioral operations, Activities and Interactions.

#### Learn more

- [Define Parameters](#) [1028]
- [Parameter Tagged Values](#) [1030]
- [Operation Parameters By Reference](#) [1031]

#### 5.6.7.5.1 Define Parameters

Within the properties of an operation, Activity or Interaction, you can define parameters to control how that object and its subordinate objects behave.

The order or sequence of the parameters in the object properties is reproduced in code. You can set and manage the order using facilities available within the Parameter page of the object Properties dialog.

#### Reference

Field	Usage	See also
<b>Name</b>	Type the parameter name.	
<b>Type</b>	Select the data type of the parameter.  Alternatively, click on the ( ... ) button and select the element classifier to define the type.	
<b>Default</b>	Indicates an optional default value for the parameter.	
<b>Stereotype</b>	Indicates a stereotype name, specification of a Stereotype name can also be chosen via the drop-down list.	
<b>Kind</b>	Indicate the way a parameter is passed to a function: <ul style="list-style-type: none"><li>• <b>In</b> = By Value</li><li>• <b>InOut</b> = By Reference</li><li>• <b>Out</b> is passed by Reference, but only the return value is significant</li></ul>	
<b>Fixed</b>	Set the parameter to <i>const</i> , even if passed by reference.	
<b>Alias</b>	Indicate an optional alias for the parameter.	
<b>Add new to end</b>	Place new parameters at the end of the list instead of the start.	
<b>Multiplicity</b>	Display the Multiplicity dialog, to specify the multiplicity of the parameters.	
<b>Notes</b>	Indicate any additional notes on the parameter.	

Below is information regarding the Multiplicity dialog.

#### Reference

Field	Usage	See also
<b>Lower bound</b>	Define a lower limit to the number of elements allowed in the collection.	
<b>Upper bound</b>	Define an upper limit to the number of elements allowed in the collection.	

Field	Usage	See also
<b>Allow Duplicates</b>	Indicate that duplicates are allowed.  This maps to the UML property <i>isUnique</i> , value <b>FALSE</b> .	
<b>Multiplicity is Ordered</b>	Indicate that the collection is ordered.	

### Notes

- To organize parameters into the required sequence:
  - Use the **Up** and **Down** buttons above the parameter list
  - Select the **Add new to end** checkbox to force new parameters to appear at the end of the list instead of the top
  - Apply the List Header facilities from the column headings at the top of the parameter list
- Set the amount of parameter detail to display in a specific diagram using the **Show Parameter Detail** drop-down list on the Diagram Properties dialog; the setting applies only to the current diagram, and the default is to show the type only

### Learn more

- [Parameter Tagged Values](#)<sup>[1030]</sup>
- [Operation Parameters by Reference](#)<sup>[1031]</sup>
- [Visible Class Members](#)<sup>[831]</sup>
- [List Header](#)<sup>[677]</sup>

#### 5.6.7.5.1.1 Parameter Tagged Values

Behavioral parameters can have Tagged Values associated with them. Tagged Values offer a convenient extension mechanism for UML elements; you can define any tags you like and then assign values to them using this form.

Tagged Values are written to the XML output, and can be input to other third party tools for code generation or other activities.

### How to

To add a Tagged Value for a parameter

Step	Action	See also
<b>1</b>	Double-click on the operation, Activity or Interaction containing the parameter in a diagram or in the Project Browser.  The Properties dialog displays.	

Step	Action	See also
2	Click on the Tagged Values tab, which shows the Tagged Values for the selected object and its parameters.	
3	Click on the required parameter in the Parameters compartment of the Tagged Values tab, and click on the <b>New Tags</b> button.  The Tagged Value dialog displays.	
4	In the <b>Tag</b> field, type the tag name (or select a defined tag from the drop-down list).  In the <b>Value</b> field type the initial tag value.	
5	Click on the <b>OK</b> button to confirm the Tagged Value.	

### Notes

- Tagged Values are supported for attributes, operations, objects and connectors
- Custom tags can be created using a predefined Tagged Value Type

### Learn more

- [Create a Custom Tagged Value](#)<sup>[1628]</sup>

#### 5.6.7.5.2 Operation Parameters by Reference

**Access**   **Tools | Options | Objects:** Feature reference indicator

### Topics

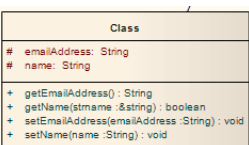

Image	Topic	Detail	See also
	<b>Usage</b>	<p>You can select to highlight parameters declared as 'Kind: <i>inout</i>' or 'Kind: <i>out</i>' with an additional user-defined prefix or suffix.</p> <p>If you select the <b>Highlight References</b> checkbox, you can also indicate whether a prefix or suffix should be used, and the actual reference character to use. In the example image, the <b>&amp;</b> character has been set as a prefix.</p> <p>When you declare a parameter of type <i>inout</i>, it is assumed you are passing the parameter by reference rather than by value. If you have elected to highlight references, then this is displayed in the Diagram View.</p> <p>The example to the left shows that, in the <i>getName</i></p>	<a href="#">Object Display Options</a> <sup>[631]</sup>

		operation, the parameter <i>strName</i> is a string reference, and is highlighted using the chosen character and position.	

### Notes

- This facility currently applies to operations only

## 5.6.8 In-place Editing Options

This topic explores the tasks that can be performed using in-place editing of elements on a diagram in Enterprise Architect. The tasks include:

- [View Properties](#) <sup>[1033]</sup>
- [Edit Element Item Name](#) <sup>[1034]</sup>
- [Edit Feature Stereotype](#) <sup>[1035]</sup>
- [Edit Feature Scope](#) <sup>[1036]</sup>
- [Edit Attribute Keyword](#) <sup>[1037]</sup>
- [Edit Operation Parameter Keyword](#) <sup>[1038]</sup>
- [Insert Operation Parameter](#) <sup>[1041]</sup>
- [Edit Parameter Kind](#) <sup>[1039]</sup>
- [Edit Custom Compartment](#) <sup>[1039]</sup>
- [Insert New Feature](#) <sup>[1040]</sup> (Attribute or Operation)
- [Insert Maintenance Feature](#) <sup>[1042]</sup>
- [Insert Testing Features](#) <sup>[1043]</sup>
- [Delete Selected from Model](#) <sup>[1033]</sup>

### 5.6.8.1 In-place Editing Tasks

#### How to

To use the in-place editing menu options

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element, and on the item to manipulate within the element.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Edit and manipulate the items in the element, either by pressing the appropriate keyboard keys or by right-clicking on the highlighted item and choosing a task from the	

Images	Step	Action	See also
		<b>Element Items</b> context menu. The available commands are listed in the table below.	

### Reference

Menu option...	Usage	Shortcut	See also
<b>Edit Selected</b>	Change the name, scope or stereotype of the element or element item.	<b>F2</b>	
<b>View Properties</b>	Display the dialog containing details of the element.	<b>Enter</b>	
<b>Insert New After Selected</b>	Insert a new item in the element.	<b>Insert</b>	
<b>Find in Project Browser</b>	Locate the item in the Project Browser.		
<b>Add Attribute</b>	Add an attribute to the element.	<b>Ctrl + Shift + F9</b>	
<b>Add Operation</b>	Add an operation to the element.	<b>Ctrl + Shift + F10</b>	
<b>Add Other</b>	Insert a feature on the specific element item, such as Maintenance features and Testing features.	<b>Ctrl + F11</b>	
<b>Delete Selected from Model</b>	Delete the selected item from the model.	<b>Delete</b>	
<b>View Source code</b>	Display the source code for the element, in the default external editor.	<b>F12</b>	<a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>Visual Analyzer</b>	Set a breakpoint on a highlighted operation (including a breakpoint, start recording marker, end recording marker or stack auto-capture marker.)		<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup> <a href="#">Marker Types</a> <sup>[2538]</sup>
<b>Set Type</b>	Set a classifier type for the selected item.	<b>Ctrl + L</b>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>

Menu option...	Usage	Shortcut	See also
	Navigate Diagram Selection, to navigate the diagram between elements without having to use the mouse.	<b>Ctrl + Shift + arrow key</b>	
	Toggle element highlight option on and off.	<b>Shift + Enter</b>	

Other options that are available while editing element attributes or operations in a diagram include:

Menu options	Usage	Shortcut	See also
	Accept current changes.	<b>Enter</b>	
	Accept current changes and open a new slot to add a new item.	<b>Ctrl + Enter</b>	
	Abort the edit, without save.	<b>Esc</b>	
	Move the cursor between segments of a feature definition.	<b>Tab</b> or <b>Shift+Tab</b>	
	Display the context menu for in-place editing.	<b>Shift + F10</b>	
	Invoke the Select <Item> dialog.	<b>Ctrl+Shift+Space</b>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
	Display an autocompletion list for a feature classifier.	<b>Ctrl+Space</b>	

#### Notes

- Most of the in-place editing menu commands have keyboard alternatives; for many of them, if the selected item happens to be off-screen when you press the appropriate keys, the diagram automatically scrolls to show the whole element, so that you can see what you are changing

### 5.6.8.2 Edit Element Item Name

#### How to

To change the name of the element, or the name of an operation or attribute, directly from the diagram, follow the steps below

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element and on the name to change within the element.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Right-click on the item.  The context menu displays.	
	4	Select the <b>Edit Selected</b> menu option, or press ( <b>F2</b> ) to enable you to edit the item directly from the diagram.  The name of the attribute or operation is highlighted.	
	5	Delete or type over the name.	
	6	Press ( <b>Enter</b> ) to accept the change, or ( <b>Esc</b> ) to cancel the change.	

### 5.6.8.3 Edit Feature Stereotype

#### How to

To change the stereotype of an operation or attribute directly from the diagram

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element, and on the item to edit within the element.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Right-click on the item.  The context menu displays.	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> ) ) to enable you to edit the attribute or operation directly from the diagram.  The name of the item is highlighted.	

Images	Step	Action	See also
	5	Move the cursor to the position before the name or within the existing attribute or operation stereotype (denoted by «stereotype name»).	
	6	Delete or type over the previous name to change the stereotype name of the attribute or operation.	
	7	Press ( <b>Enter</b> ) to accept the change or ( <b>Esc</b> ) to cancel the change.	

#### Notes

- You can assign multiple stereotypes by including a comma-separated list inside the stereotype markers

### 5.6.8.4 Edit Feature Scope

#### How to

To rapidly change the scope of an attribute or operation directly from the diagram

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element and on the item to edit within the element. The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Right-click on the item. The context menu displays.	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> ) ) to enable you to edit the attribute or operation directly from the diagram. The name of the item is highlighted.	
	5	Move the cursor to the scope of the item and delete the previous entry.	
	6	Reassign the entry by typing in one of the following symbols: <ul style="list-style-type: none"> <li>+ indicates that the scope is Public</li> <li>- indicates that the scope is Private</li> </ul>	

Images	Step	Action	See also
		<ul style="list-style-type: none"> <li>• ~ indicates that the scope is Package</li> <li>• # indicates that the scope is Protected</li> </ul>	
	7	<p>Press ( <b>Enter</b> ) to save the change, or ( <b>Esc</b> ) to cancel the change.</p> <p>The diagram is updated to reflect the changes (also see the <i>catalogNumber</i> attribute in the screen illustrations to the left).</p>	

### 5.6.8.5 Edit Attribute Keyword

You can add features such as attribute keywords and classifiers directly to an element, using the **Element Keywords and Classifiers** menu. This enables you to rapidly assign details element item by element item, directly from a diagram.

#### How to

To add features directly to an element

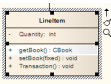

Images	Step	Action	See also
	1	In Enterprise Architect, open the diagram containing the element.	
	2	<p>Click on the element, and on the attribute to edit within the element.</p> <p>The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.</p>	
	3	<p>Right-click on the item.</p> <p>The context menu displays.</p>	
	4	<p>Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> ) ) to enable you to edit the attribute directly from the diagram.</p> <p>The name of the attribute is highlighted.</p>	
	5	Right-click on the attribute name to display the context menu.	
	6	<p>From the context menu, you can:</p> <ul style="list-style-type: none"> <li>• Change the attribute classifier to static or fixed - select the <b>static</b> or <b>fixed</b> menu options as appropriate; the diagram is updated to reflect the changes</li> <li>• Display the Class properties - click on the <b>Goto Definition</b> menu option; Enterprise Architect locates the Class in the Project Browser and opens its Properties dialog</li> </ul>	<a href="#">Properties Dialog</a> <sup>[95]</sup>

Images	Step	Action	See also
		If the data type is a raw data type, Enterprise Architect displays the message: <i>The data type is a raw data type</i>	

### 5.6.8.6 Edit Operation Parameter Keyword

You can directly edit operation classifiers by element, using the in-place editing menu. This enables you to rapidly assign parameter keywords.

#### Directly edit operation classifiers by element

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element, and on the operation to edit within the element.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Right-click on the item.  The context menu displays.	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> ) ) to enable you to edit the operation directly from the diagram.  The name of the operation is highlighted.	
	5	Right-click on the data type of a parameter to display the context menu.	
	6	From the context menu you can: <ul style="list-style-type: none"> <li>Change the operation classifier by clicking on the appropriate menu option - <b>static</b>, <b>isquery</b>, <b>abstract</b> or <b>fixed</b>; the diagram is updated to reflect the changes</li> <li>Display the Class properties - click on the <b>Goto Definition</b> menu option</li> </ul> <p>If the data type is Class, Enterprise Architect locates the Class in the Project Browser and opens its Properties dialog</p> <p>If the data type is a raw data type, Enterprise Architect displays the message <i>This data type is a raw data type</i></p> <p>If the data type is not defined in the model, the message is:</p>	<a href="#">Properties Dialog</a> 9561

Images	Step	Action	See also
		<i>The data type is not defined in the model</i>	

### 5.6.8.7 Edit Parameter Kind

You can edit operation parameter kinds such as ( *in* ), ( *inout* ) and ( *out* ) directly from a diagram element by element, using the **Element Keywords and Classifiers** menu. This enables you to rapidly assign the parameter directly from a diagram.

#### Edit operation parameter kinds directly from a diagram

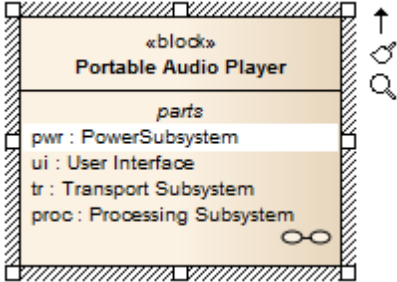

Images	Step	Action	See also
	1	In Enterprise Architect, open the diagram containing the element.	
	2	Click on the element, and on the operation to edit within the element.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Right-click on the item.  The context menu displays.	
	4	Select the <b>Edit Selected</b> menu option (or press <b>F2</b> ) to enable you to edit the item directly from the diagram.  The name of the item is highlighted.	
	5	Right-click on the item name to display the context menu.	
	6	Select the appropriate menu option for the parameter kind value: ( <b>in</b> ), ( <b>inout</b> ) and ( <b>out</b> ).  The diagram is updated to reflect the change.	

### 5.6.8.8 Edit Custom Compartment

Items listed within a Custom Compartment can also be in-place edited. They have a similar in-place editing menu as other compartment items such as Operations and Attributes within a Class.

For example: a SysML Block element can have a *parts* custom compartment. In-place editing can be performed upon the Parts listed within this compartment.

#### In-place edit an item in a Custom Compartment

Step	Action	See Also
1	Open the diagram containing the element.	
2	<p>Click on the element and on the item to change within the custom compartment.</p> <p>The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.</p> 	
3	<p>Right-click on the item.</p> <p>The context menu displays.</p>	
4	<p>Select the <b>Edit Selected</b> menu option, or press ( <b>F2</b> ) to enable you to edit the item directly from the diagram.</p> <p>The name of the item is highlighted.</p>	
5	Delete or type over the name.	
6	Press ( <b>Enter</b> ) to accept the change, or ( <b>Esc</b> ) to cancel the change.	

#### Notes

- Custom Compartments such as Parts and Ports within a SysML Block also provide a **Set Type** command on the right-click menu to set the classifier type of the selected item.

#### Learn more

- [In-place Editing Tasks](#)<sup>[1032]</sup>
- [Add Custom Compartments to Element](#)<sup>[1604]</sup>

### 5.6.8.9 Insert New Feature

#### How to

To add attributes and operations to a Class diagram element

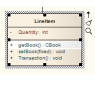

Images	Step	Action	See also
	1	Open the diagram containing the element to which you are adding an attribute or operation.	
	2	Click on the element and, within the element, on the item after which to insert the operation or attribute.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Either: <ul style="list-style-type: none"> <li>Press ( <b>Insert</b> ) or</li> <li>Right-click on the selected element item to display the context menu and select the <b>Insert New After Selected</b> menu option</li> </ul> Enterprise Architect inserts a new data line in the diagram, underneath the selected item.	
	4	Type in the relevant information for the attribute or operation.  Use the ( <b>Tab</b> ) and ( <b>Tab+Shift</b> ) keys to move the cursor through the segments of the attribute or operation, and select the classifier from either the: <ul style="list-style-type: none"> <li>Autocompletion list (press the ( <b>Ctrl+Space</b> ) keys) or</li> <li>Select &lt;Item&gt; dialog (press the ( <b>Ctrl+Shift+Space</b> ) keys)</li> </ul>	<a href="#">Autocompletion List</a> <sup>[2160]</sup> <a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
	5	Press ( <b>Enter</b> ) to accept the change or ( <b>Esc</b> ) to cancel the change.  The diagram is updated to reflect the changes.	

#### 5.6.8.10 Insert Operation Parameter

You can add operation parameters to an operation through the in-place editing options, using hotkey commands or menu shortcuts.

##### Add parameters to operations in a Class diagram element

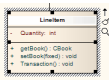

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element, and on the operation to update within the element.  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Press ( <b>F2</b> ), or right-click on the selected item to display the context menu and select the <b>Edit Selected</b> option.	

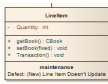

Images	Step	Action	See also
	4	Move the cursor inside the parameter brackets and type the parameter name, followed by a colon (for example, <b>bks:</b> for a vector containing books).	
	5	<p>Give the parameter a type.</p> <p>Place the cursor after the colon at the end of the name and add the classifier; either:</p> <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+Space</b> ) to invoke the classifier autocompletion list</li> <li>Press ( <b>Ctrl+Shift+Space</b> ) to select a classifier from the Select &lt;Item&gt; dialog or</li> <li>Right-click the mouse to display the inline editing options context menu and select the <b>Insert Classifier</b> option</li> </ul> <p>The Select &lt;Item&gt; dialog displays.</p>	<a href="#">Autocompletion List</a> <sup>[2160]</sup> <a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
	6	<p>Press ( <b>Enter</b> ) to accept the change or ( <b>Esc</b> ) to cancel the change.</p> <p>The diagram is updated to reflect the changes.</p>	

### 5.6.8.11 Insert Maintenance Feature

#### How to

To rapidly assign maintenance details such as Defects, Changes, Issues and Tasks directly to an element from a diagram

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	<p>Click on the element name.</p> <p>The name is highlighted in a lighter shade (the default is white), to indicate that it has been selected.</p>	
	3	<p>Either:</p> <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+F11</b> ) or</li> <li>Right-click on the highlighted name to display the context menu, and select the <b>Add Other</b> option</li> </ul> <p>The Insert Feature dialog displays.</p>	
	4	Click on the appropriate radio button option to associate the required	

Images	Step	Action	See also
		maintenance feature with the element item.	
	5	Click on the <b>OK</b> button. The <Maintenance Feature> details for <element> dialog displays.	
	6	Complete the fields to define the maintenance activity, and then click on the <b>Apply</b> button. To create a subsequent maintenance activity of this type, click on the <b>New</b> button.	
	7	When you have defined all of the maintenance activities of this type, click on the <b>OK</b> button. The maintenance details are added to the element.	

### Notes

- To ensure that the maintenance items are visible in the diagram element, as shown in step 7, select the **Maintenance** checkbox on the Elements tab of the Diagram Properties dialog

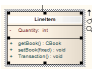

### Learn more

- [Show Maintenance Script in Diagram](#) 

## 5.6.8.12 Insert Testing Features

### How to

To rapidly add testing features such as Unit, Integration, System, Acceptance and Scenario tests to an element directly from a diagram

Images	Step	Action	See also
	1	Open the diagram containing the element.	
	2	Click on the element. The element name is highlighted in a lighter shade (the default is white), to indicate that it has been selected.	
	3	Either: <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+F11</b> ) or</li> <li>Right-click on the highlighted name to display the context menu and select the <b>Add Other</b> option</li> </ul>	

Images	Step	Action	See also
		The Insert Feature dialog displays.	
	4	Click on the appropriate radio button option to associate the required testing feature with the element.	
	5	Click on the <b>OK</b> button.  The Testing window opens, showing the appropriate panel for the type of test selected.	
	6	Complete the fields to define the test activity, and then click on the <b>Save</b> icon in the window toolbar.  The test is added to the element.	<a href="#">Working on Test Records</a> <sup>[2605]</sup>
	7	To create a subsequent test activity of this type, click on the <b>New</b> icon.  To add items for other types of test, click on the appropriate tab.	

### Notes

- To ensure that the test items are visible in the diagram element, as shown in step 7, select the **Testing** checkbox on the Elements tab of the Diagram Properties dialog

## 5.6.9 Linked Documents

When you are developing elements in your model, you might want to provide extensive documentation on an element, to provide more structured text than you can create in the element **Notes** field. In this case, you can create a formatted document that is linked to the element. You can create a linked document from scratch, or from one of a range of Linked Document Templates that you define with the Linked Document Template Editor. The linked documents are held within the model.

### Working with Linked Documents

Task	Detail	See also
<b>Create linked documents</b>	<p>You can create a linked document either:</p> <ul style="list-style-type: none"> <li>Within a Document Artifact element attached to your model element, or</li> <li>Directly on the UML element</li> </ul> <p>The advantages of using a Document Artifact to host the</p>	<p><a href="#">Create Document Artifact</a> <sup>[1046]</sup></p> <p><a href="#">Create Linked Document on an Element</a> <sup>[1047]</sup></p>

Task	Detail	See also
	<p>linked document include:</p> <ul style="list-style-type: none"> <li>• <b>Visibility</b> of the Document Artifact and hence linked document in the Project Browser</li> <li>• As you can only have one linked document in an element, hosting each of several documents in its own Document Artifact and connecting the <b>several</b> Document Artifacts to <b>one</b> model element means that you have <b>broader scope</b> for providing information</li> <li>• Similarly, associating <b>several</b> elements with <b>one</b> document by connecting them to the host Document Artifact element means that you can <b>share information</b> rather than duplicating it</li> </ul> <p>The advantages of using a linked document directly on an element include:</p> <ul style="list-style-type: none"> <li>• More tightly binding the content of the document to the element, so there is less ambiguity in what the information refers to</li> <li>• More tightly binding the document itself to the element, so there is less risk of the document being changed, moved or deleted without reference to the element it belongs to</li> </ul>	
<b>Create linked document templates</b>	<p>You can base your linked document on one of a range of system-provided templates, each of which represents a project document type.</p> <p>You can also create and use your own linked document templates in the Resources window, within the <i>Document Generation &gt; Linked Document Templates</i> folder.</p>	<a href="#">Create Linked Document Templates</a> 
<b>Edit linked documents</b>	<p>You can define the style, format and layout of your linked document both in the template from which you create the document and in the document itself.</p>	<a href="#">Edit Linked Document Templates</a>  <a href="#">Edit Linked Documents</a> 
<b>Create hyperlinks in linked documents</b>	<p>Linked documents are intimately associated with specific elements, but you can also create hyperlinks in the document directly to other elements in the model. Having followed the link, you can perform any normal operation on that element.</p> <p>Similarly, you can create <b>new</b> elements or diagrams to link to.</p> <p>You can also create hyperlinks to other forms of documentation.</p>	<a href="#">Hyperlink From Linked Document</a>  <a href="#">Create Element From Document</a> 
<b>Include linked documents in RTF reports</b>	<p>Linked documents, however they are created, are rendered into document reports when you select the <b>Linked Document</b> checkbox in the Document Template Designer.</p>	<a href="#">Reporting Linked Documents</a> 

Task	Detail	See also
<b>Delete linked documents</b>	You can completely remove a linked document from an element, or you can remove the <i>contents</i> of the document and replace them with the contents of an external file.	<a href="#">Replace or Delete Documents</a> <sup>[1097]</sup>

### Notes

- You can create a Document Artifact element to contain a linked document in **all** editions of Enterprise Architect
- You can create and link a document to any UML element in the model, in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- When you have saved the linked document on an element, an **A** symbol displays in the bottom right corner of the element in its diagrams
- You can work on linked documents through the Automation Interface, using the methods **GetLinkedDocument ()**, **DeleteLinkedDocument ()**, **SaveLinkedDocument (string Filename)** and **LoadLinkedDocument (string Filename)**

- [Element Class](#) <sup>[2887]</sup>

## 5.6.9.1 Create Document Artifact

You can create a Document Artifact element to host a linked document for another model element. You can either create an appropriate connector between the Document Artifact and the documented element (to indicate how the document impacts the element), or drag the Document Artifact over the model element on the diagram or in the Project Browser so that it becomes a child of the model element.

### Create a linked document in a Document Artifact

Step	Action	See also
<b>1</b>	Open the diagram containing the element for which to create the linked document.	
<b>2</b>	Open the Common page of the Diagram Toolbox. Drag and drop the Document Artifact element icon from the Toolbox into your diagram.	<a href="#">Diagram Toolbox</a> <sup>[792]</sup> <a href="#">Common Page</a> <sup>[800]</sup> <a href="#">Document Artifact</a> <sup>[1373]</sup>
<b>3</b>	Double-click on the Document Artifact element. A default blank-page document opens in the Linked Document Editor, based on the <i>Normal.rtf</i> style template.	<a href="#">The Normal.rtf Style Template</a> <sup>[1058]</sup>

Step	Action	See also
4	Apply a template and/or continue to develop the linked document as described in <i>Create Linked Document On UML Element</i> , from step 2 onwards.	<a href="#">Create Linked Document on an Element</a> <sup>[1047]</sup>

### Notes

- There is a limit of one linked document per Document Artifact element, but you can provide more than one linked document for a **model** element by linking it to more than one Document Artifact
- This operation is available in all editions of Enterprise Architect; it is the sole method of creating a linked document in the Desktop and Professional editions
- When you have saved the document, an **A** symbol displays in the bottom right corner of the element

### Learn more

- [Linked Documents](#)<sup>[1044]</sup>

## 5.6.9.2 Create Linked Document on an Element

If you need to provide more extensive and structured documentation on an element, you can develop this as a formatted document directly linked to the element. You can develop the document from a blank page or using a system template or user-defined template, at several different points in the work area.

**Access** Click on an element in the **Project Browser**, **Diagram List**, **Package Browser**, **Specification Manager**, **Model Search** or diagram, and either:

**Right-click | (Create) Linked Document**

**Ctrl+Alt+D**

**Element | Linked Document**

**View | Notes:**  in toolbar, OR

**Right-click | Properties > General:**  in Notes field toolbar

### Create a linked document

Step	Action	See also
1	A default blank-page document opens in the Linked Document Editor, based on the <i>Normal.rtf</i> style template.  The New Linked Document from Template dialog might display, depending on whether you have previously selected the <b>Show this dialog on document creation</b> checkbox. In this case, go to step 3.	<a href="#">The Normal.rtf Style Template</a> <sup>[1058]</sup>
2	If you do <b>not</b> want to apply a system template or user-defined template, go to step 6.  If you <b>do</b> want to base the document on a selected template, click on the  (	

Step	Action	See also
	<p><b>New</b>) icon in the editor toolbar. A prompt displays for you to confirm that you are clearing the current document; click on the <b>OK</b> button.</p> <p>The New Linked Document from Template dialog displays.</p>	
3	<p>In the <b>Template</b> field, click on the drop-down arrow and select the template from which to create the document.</p> <p>This can be either a system-supplied template or a template that you have previously created yourself.</p>	<a href="#">Create Linked Document Templates</a>  <sup>[1098]</sup>
4	<p>If you want to display the New Linked Document from Template dialog by default whenever you start to create a linked document, select the <b>Show this dialog on document creation</b> checkbox.</p> <p>If you no longer want to display the dialog by default, deselect the checkbox.</p>	
5	<p>Click on the <b>OK</b> button.</p> <p>The new linked document opens in the Linked Document Editor. If you have based the document on a selected template, the document shows the content applied by the template.</p>	
6	<p>Enter and format the text of the document, using the facilities of the Linked Document Editor.</p>	<a href="#">Edit Linked Documents</a>  <sup>[1048]</sup>

### Notes

- You can create only one linked document on an element; if you need to create more, develop each document within its own **Document Artifact element** and link these to the model element
- This operation is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- When you have saved the document, an **A** symbol displays in the bottom right corner of the element

### Learn more

- [Create Document Artifact](#)  <sup>[1046]</sup>

### 5.6.9.3 Edit Linked Documents

To develop the contents of a linked document, you use the Linked Document Editor. This is based on the common Document Editor, providing a wide range of convenient features for formatting and editing the document, and for adding links from and references to the content of the document. The editor facilities are provided from a context menu that you display by right-clicking in the body of the document.

**Access**    **Right-click on element | Edit Linked Document (Ctrl+Alt+D)**

Option Descriptions

The Linked Document Editor option descriptions are grouped according to the actions you are performing.

Actions	Link
<b>Creating and importing documents</b>	<a href="#">File Control</a> <sup>[1050]</sup>

- (Alt+F1) | **Enterprise Architect | Reporting | RTF Templates | Filter Connectors**

#### **5.6.9.3.2 Editor Tool Display Options**

Within the Document Editor, to help you edit the document contents you can configure the page display and the formatting tools visible, using the **View** context menu options.

**Access** Select **View** from the menu bar at the top of the Document Editor window, **or** right-click and select **View** within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Editing tools and options

Menu Option	Action	See also
<b>Page Layout Mode</b>	Toggles the text display between page layout and full window layout.	
<b>Horizontal Ruler</b>	Displays or hides the ruler at the top of the page.  The ruler shows tab stops and paragraph indentation marks; you can also use it to create or delete tab stops.	
<b>Vertical Ruler</b>	Displays or hides the ruler against the left edge of the page.  The ruler indicates the depth of the top and bottom margins of the page.	
<b>Tool Bar</b>	Displays or hides the two toolbars above the ruler.  The tool bars provide convenient icons for simple text formatting, copying and pasting, page layout, print management and file save functions.	
<b>Status Ribbon</b>	Displays or hides the status ribbon at the bottom of the editing panel.	

Menu Option	Action	See also
	The status ribbon displays the current page number, line number and column number; it also indicates the current insert/overtyping mode (at the left end of the ribbon).	
<b>Paragraph Marker</b>	<p>Displays or hides the various space markers in the text, such as:</p> <ul style="list-style-type: none"> <li>• The paragraph marker at the end of each paragraph</li> <li>• The Tab indicators between tabbed blocks of text, and</li> <li>• The blank character marker between words</li> </ul> <p>This option is useful when working with page-formatted text that is structured using both style definitions and key-strokes.</p>	
<b>Hidden Text</b>	<p>Shows or hides 'hidden' text.</p> <p>Text formatted with the <b>Font   Hidden</b> option is shown with a dotted underline; when the <b>Hidden Text</b> option is turned off, the hidden text is not visible and the normal text closes up to single character or line spacing.</p>	<a href="#">Format Text</a> 
<b>Field Names</b>	<p><b>Applicable to all document editing:</b></p> <p>If you have inserted any data fields and values, the <b>Field Names</b> option also toggles between displaying field names in the text and displaying the field values.</p> <p><b>Applicable to the Document Template Designer:</b></p> <p>As you develop your custom document template, you right-click on sections to insert field markers and select the <b>View   Insert Fields</b> option. The <b>Field Names</b> option makes the <b>Insert Fields</b> option available.</p>	<a href="#">Add Section Content</a>  <a href="#">Add Section Content</a> 
<b>Hyperlink Cursor</b>	<p><b>Applicable to the Document Template Designer and Linked Document Template Editor:</b></p> <p>Toggles the cursor icon when you 'mouse over' a hyperlink, between your default image (usually a line or arrow) and a 'pointing hand'.</p>	
<b>Page Header/Footer</b>	<p>Displays or hides the text of page headers and footers.</p> <p>To edit the header or footer text, select the <b>Edit   Edit Page Header/Footer</b> menu option.</p>	<a href="#">Insert Headers, Footers, Footnotes and Endnotes</a> 
<b>Zoom</b>	<p>Displays the Zoom Parameter dialog, on which you select the appropriate percentage of normal size by which to shrink or enlarge the display of the document content.</p> <p>The range of possible zoom percentages is from 10 to 200.</p>	

Menu Option	Action	See also

### 5.6.9.3.3 Styles, Special Text & Table of Contents

Using the Document Editor, you can define character-based styles and paragraph-based styles.

- A character style constitutes a set of character formatting attributes and is applied to a character string
- A paragraph style constitutes both a set of character formatting attributes and a set of paragraph formatting attributes, and is applied to one or more paragraphs

You can also include special, structured text in the document, such as **page number**, **date and time**, **table of contents** and **text input** fields.

Every custom template or document you create is automatically based on the **Normal.rtf** template file. This provides default styles, numbering and other base formats, which you can change using the Document Editor facilities and save either as a specific document, template or document report Stylesheet.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

### Editing Styles

To	Action	See also
<b>Use double-byte characters</b>	<p>Select the <b>Edit   Inline Ime</b> menu option.</p> <p>Double-byte characters are, broadly, complex characters used in languages such as Japanese, Chinese, and Cyrillic.</p> <p>With this menu option, you can use both single-byte characters and double-byte characters in your text, without having to switch to an external Input Method Editor (IME) application.</p>	
<b>Create and edit styles</b>	<p>Select the <b>Edit   Edit Style</b> menu option. The Edit Stylesheet dialog displays.</p> <p>Select the appropriate radio button to define a paragraph style or a character style.</p> <p>If you want to update an existing style, select that style from the list box. If you want to create a new style, select the <b>Create a new style</b> checkbox, and type a name in the <b>Style Name</b> field. Short style names are best, but you can type in long names if you wish to.</p> <p>To begin defining the style properties, click on the <b>OK</b> button.</p> <p>You can use the ruler, toolbar or context menu selections to modify the style properties; for an existing stylesheet item, these also reflect the currently-selected properties.</p> <p>After you have defined the required style, you set it by either selecting the <b>Edit   Edit Style</b> menu option again or clicking</p>	

To	Action	See also
	<p>anywhere in the document:</p> <ul style="list-style-type: none"> <li>If you modified an existing stylesheet item, the document automatically reflects the updated style</li> <li>If you created a new stylesheet item, you can apply the style to highlighted text by selecting the <b>Font   Style</b> or <b>Paragraph   Style</b> menu options.</li> </ul>	
<b>Edit the hyperlink style</b>	<p>This option operates specifically on the style of any hyperlinks you want to create.</p> <p>Select the <b>Font   Hyperlink</b> menu option, and select the font, font size and emphasis (bold, italic) you want to apply. You cannot remove the hyperlink underline or change the color from blue.</p> <p>Select the <b>Font   Hyperlink</b> menu option again to set the style.</p> <p>When you create a hyperlink from this point onwards, the link text will be in the style you have set. Links created before you changed the style remain in the earlier style.</p>	<a href="#">Insert Reference Links</a> <sup>[1083]</sup>
<b>Apply character styles</b>	<p>Highlight the text to be styled and select the <b>Font   Style</b> menu option; the Select a Style dialog displays, from which you select the character style to apply.</p>	
<b>Apply paragraph styles</b>	<p>Highlight the text to be styled and select the <b>Paragraph   Style</b> menu option; the Select a Style dialog displays, from which you select the paragraph style to apply.</p>	
<b>Insert a table of contents</b>	<p>Edit the Table of Contents level styles (<b>TOC 1 to TOC 9</b>) using the <b>Edit   Edit Style</b> menu option, as you wish. Add at least one <i>Heading n</i> style to the document.</p> <p>Move the cursor to the point at which to insert the table of contents and select the <b>Insert   Table of Contents</b> menu option. The heading '<u>Table of Contents</u>' displays to mark the presence of a table of contents; this heading is not replicated in any document generated from a template.</p> <p>To create a Table of Contents heading that displays in the generated document, type the appropriate text at least one line above the inserted list and define the style as you wish - use a Heading style to include the heading itself in the Table of Contents, otherwise use a non-heading style.</p> <p>The Table of Contents is automatically generated and updated whenever generation or repagination occurs.</p>	<a href="#">Define Document Sections</a> <sup>[1069]</sup>
<b>Insert date and time fields</b>	<p>At the point in the text at which to insert the current date and/or time field, select the <b>Insert   Date and Time</b> menu option.</p> <p>The Insert Current Date/Time dialog displays, from which you can select the required date and time format. You can insert the date or time fields separately, or as a combined field.</p>	

To	Action	See also
	The date and time are automatically updated whenever the page text is refreshed (that is, clicked on).	
<b>Insert your own data fields</b>	<p>Move the cursor to the point at which to insert the data field and select the <b>Insert   Data Field</b> menu option.</p> <p>The Data Field Parameters dialog displays, in which you enter the field name and the data value. Wherever you insert the data field, the values are automatically updated with the most recent data value you enter.</p>	
<b>Insert your own text entry field</b>	<p>You insert text entry fields so that anyone using the document can type in their own text in response to either a lead-in sentence or the field name itself.</p> <p>Move the cursor to the point at which to insert the text entry field and type in any lead-in text you want to use. Then select the <b>Insert   Text Input Field</b> menu option.</p> <p>The Input Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> <li>• The field name</li> <li>• The initial value to display as a default</li> <li>• The maximum length of the field</li> <li>• The text font in which to display the text</li> </ul> <p>You can also specify whether or not the field has a border.</p> <p>For example: <i>Hello</i> <input type="text" value="Type your name here"/></p> <p>If you insert a text entry field in a template, any document generated from the template shows the typed entry as normal text, not boxed.</p>	
<b>Insert a Project Constant</b>	<p>(For Document Report templates.)</p> <p>You can create <b>Project Constants</b> to insert a specific text string wherever you place the flag for that string. You can therefore design a report containing many instances of that string, but create and edit the actual value in one place - on the Project Constants tab of the Generate Report dialog.</p> <p>Right click at the point at which you want to insert the Constant (flag), and select the <b>Project Constants   &lt;flag name&gt;</b> context menu option. The Constant displays at that point in the template, and when the report is generated the flag is replaced by its defined value.</p> <p>You can insert a Project Constant anywhere in the template - in the text body, section headings, headers, footers, endnotes or footnotes. Project Constants are available to any template in the model.</p>	<a href="#">Project Constants</a> 

To	Action	See also
<b>Insert a Report Constant</b>	<p>(For Document Report templates.)</p> <p>The Document Editor provides a set of data fields that represent report data such as the report name, title, generation date, version, author and status. When the report is generated, each field is replaced by the current value of the data item.</p> <p>Right-click on the point in the template to insert the data field and select the <b>Report Constants   &lt;field name&gt;</b> context menu option.</p> <p>You can insert a report constant anywhere in your template - in text, in headers or footers, or in cover page material. They are particularly suited for cover pages.</p>	
<b>Insert a selectable checkbox</b>	<p>You insert checkboxes in a document so that the users of the document can mark the item represented by the box. The checkbox can be selected and deselected in a document, a template and a document generated from a template.</p> <p>Move the cursor to the point at which to insert the checkbox and select the <b>Insert   Checkbox Field</b> menu option.</p> <p>The Checkbox Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> <li>• The field name (which does not display in the text)</li> <li>• Whether the checkbox defaults to selected</li> <li>• The size of the checkbox</li> </ul> <p>Click on the <b>OK</b> button.</p>	
<b>Insert a selection (drop-down) field</b>	<p>You insert selection fields in a document so that the users of the document can select one of the items presented in a drop-down list.</p> <p>Move the cursor to the point at which to insert the selection field and select the <b>Insert   Selection Field</b> option.</p> <p>The Selection Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> <li>• The field name</li> <li>• The options to present in the drop-down list (separated by the   character)</li> <li>• The value from this list to display as a default</li> </ul> <p>Click on the <b>OK</b> button.</p>	
<b>Define level numbering in generated document</b>	<p>(Used in the Document Template Editor and Linked Document Template Editor.)</p> <p>Select the <b>Edit   List and Overrides</b> menu option.</p> <p>Set up the numbering list and the list overrides.</p> <p>Apply the numbering list to the headings set for packages and</p>	<a href="#">Apply User-Defined Section Numbering</a> 

To	Action	See also
	elements, using paragraph numbering.	

#### 5.6.9.3.4 The Normal.rtf Style Template

Every custom template or document you create is automatically based on the **Normal.rtf** template file. This is an external file that provides default styles, numbering and other base formats, such as the default list numbering, **MasterList**. You can edit the Normal.rtf file to apply your own default styles to the documents and templates you create. You also have the options of:

- Editing selected styles within a template, so that reports or documents created from that template always have those different styles
- Using the standard Stylesheets or creating custom Stylesheets, to optionally apply to any document report you generate independent of the template you are using

**Access** The Normal.rtf template is stored in %APPDATA%\Sparx Systems\EA\DocTemplates\Document Templates

#### Edit Normal.rtf

Step	Action	See also
1	Open the Document Template Designer and create a new template called, for example, <i>Normal</i> .	<a href="#">Design Custom Document Templates</a> 
2	Select the <b>File   Import</b> menu option to import the <i>Normal.rtf</i> file into the <i>Normal</i> template.	<a href="#">Import Template</a> 
3	Modify the <i>Normal</i> template style definitions as you want, and remove any text before you save the template.	<a href="#">Styles, Special Text &amp; Table of Contents</a> 
4	<b>Export</b> the modified template ( <b>File   Export</b> ) back into the Normal.rtf file in the <i>RTF Templates</i> folder. The modified styles will be applied to all documents and templates you create from now on.	<a href="#">File Control</a> 

#### Notes

- You must not edit the **SSbookmark** style; this defines the section styles and must be preserved
- A related feature in the Document Editor is the **File | Update Styles** menu option, which you select to update an **existing** template to reflect any changes to Normal.rtf, or to apply a standard Stylesheet to the template

**Learn more**

**5.6.9.3.5 Scroll, Search and Select Text**

In the Document Editor, you can move the cursor through the template or document using either the keyboard or the mouse. Alternatively, you could move the cursor to a position in the file by searching for a text string.

Having positioned the cursor on the required text, you can then highlight and manipulate it with various options, in addition to the standard 'mouse-click-and-drag' and the **Ctrl+C**, **Ctrl+X** and **Ctrl+P** keys.

**Access** In text, or select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

**Cursor Positioning**

Scroll Using	Options
<b>Keyboard Keys</b>	Press: <ul style="list-style-type: none"> <li>• <b>Ctrl+←</b> to move to the previous word</li> <li>• <b>Ctrl+→</b> to move to the next word</li> <li>• <b>Ctrl+↑</b> to move to the first column of the current line (if not already on the first column) or the first column of the previous line</li> <li>• <b>Ctrl+↓</b> to move to the first column of the next line</li> <li>• <b>F10</b> (or select the <b>Other   Jump</b> menu option), type in a line number to jump to, and click on the <b>OK</b> button</li> </ul>
<b>Mouse</b>	To perform various scrolling functions, click on the vertical or horizontal scroll bars. These functions are available when the scroll bars have been enabled by the startup parameters.  <b>Vertical Scroll Bar:</b> To scroll the screen up or down by one line, click on the arrows on either end.  To scroll the screen up by one page, click above the elevator (the block within the scroll bar); similarly, to scroll the screen down by one page, click below the elevator.  You can also scroll the screen up or down by dragging the elevator in the appropriate direction.

Scroll Using	Options
	<p><b>Horizontal Scroll Bar:</b> To scroll the screen left or right by one column, click on the arrow on the appropriate end of the bar; to scroll the screen left or right by half a screen, click on the bar on the appropriate side of the elevator.</p> <p>You can also scroll the screen left or right by dragging the elevator along the bar in the appropriate direction.</p>

### Text Search

When you **search for** a text string, the dialog for specifying the search details does not persist on the screen, so you can simply use keyboard keys or a menu option to continue the search without obscuring text behind a dialog.

To	Action	See also
<b>Find first instance of a text string</b>	<p>Select the <b>Other   Search</b> menu option, or press <b>F5</b>.</p> <p>The Search String Parameters dialog displays. Specify:</p> <ul style="list-style-type: none"> <li>• The term to search for</li> <li>• Whether to search from the start of the file or forwards or backwards from the current cursor position, and</li> <li>• Whether the search should exactly match the case of the search term</li> </ul> <p>The editor searches for the <b>first</b> instance of the specified character string as defined by the parameters.</p>	
<b>Find next instance of a text string</b>	<p>Select the <b>Other   Search Forward</b> menu option, or press <b>Ctrl+F</b>.</p> <p>The editor searches forwards for the next instance of the specified text string in the file, and highlights it.</p>	
<b>Find previous instance of a text string</b>	<p>Select the <b>Other   Search Backward</b> menu option, or press <b>Ctrl+Shift+F</b>.</p> <p>The editor searches backwards for the previous instance of the text string in the file, and highlights it.</p>	
<b>Replace a text string</b>	<p>Select the <b>Other   Replace</b> menu option, or press <b>F6</b>.</p> <p>The Replace String Parameters dialog displays, in which you specify:</p> <ul style="list-style-type: none"> <li>• The text string to locate</li> <li>• The text string to replace it with</li> <li>• Whether to search the whole document or just a highlighted block of text</li> <li>• Whether to confirm each replacement before making the change</li> </ul> <p>If you want to confirm replacement, a prompt displays for each</p>	

To	Action	See also
	occurrence of the search term to confirm or skip replacing that occurrence.	

### Text Selection

To	Action	See also
<b>Highlight a word</b>	Double-click on the word.	
<b>Highlight a line</b>	Move the cursor onto the line and press <b>F8</b> .	
<b>Delete a line</b>	Press <b>Shift+F9</b> to delete the current line; the remaining lines close up.	
<b>Paste special objects</b>	<p>Select the <b>Edit   Paste Special</b> menu option; the Paste Special dialog displays, listing the appropriate data type formats for inserting the copied object, as listed below:</p> <p>Click on the <b>Paste</b> button to embed the data into your application, or click on the <b>Paste Link</b> button to create a link to the original file.</p> <p><b><u>Native Object Format</u></b></p> <p>If available, this is the first format in the list box; you can edit data in this format using the original application, by double-clicking the object.</p> <p><b><u>Formatted Text</u></b></p> <p>A text format; this option offers the most suitable format if the data is pasted from another text output application, as the font and formatting attributes are reproduced accurately.</p> <p><b><u>Unformatted Text</u></b></p> <p>Another text format; this option pastes the text without retaining the formatting information.</p> <p><b><u>Picture Format</u></b></p> <p>The data is available in Picture format; you can later edit the object, by double-clicking on it and invoking the Microsoft MS Draw application.</p> <p>This format is preferable to the Bitmap and the Device Independent Bitmap formats.</p> <p><b><u>Device Independent Bitmap and Regular Bitmap formats</u></b></p> <p>The data is available in bitmap formats; you can later edit the object, by double-clicking on it and invoking the Microsoft MS Draw application.</p>	

To	Action	See also
	The editor converts these formats into the Picture format before calling the drawing application.	

#### 5.6.9.3.6 Format Text

When you create a document template or document, the default character or text styles are already defined, as they are derived directly from the Normal.rtf style template file. **Within** the document you can edit any of these character styles or apply individual formatting to text strings as you wish.

When you change the format of existing text, any new characters you type immediately after that text automatically assume the formatting characteristics you have applied.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Text formatting options

To	Action	See also
<b>Apply character format</b>	<p>Highlight the text to which to apply the format, and use one or more of these menu options or key combinations:</p> <ul style="list-style-type: none"> <li>• <b>Font   Normal</b>, or press <b>Alt+0</b></li> <li>• <b>Font   Bold</b>, or press <b>Ctrl+B</b></li> <li>• <b>Font   Underline</b>, or press <b>Ctrl+U</b></li> <li>• <b>Font   Double Underline</b>, or press <b>Ctrl+D</b></li> <li>• <b>Font   Italic</b>, or press <b>Ctrl+I</b></li> <li>• <b>Font   Superscript</b>, or press <b>Alt+4</b></li> <li>• <b>Font   Subscript</b>, or press <b>Alt+5</b></li> <li>• <b>Font   Strike</b>, or press <b>Alt+6</b> (puts a line through the text)</li> <li>• <b>Font   Double Strike</b></li> <li>• <b>Font   All Caps</b></li> <li>• <b>Font   Small Caps</b></li> </ul> <p>To <b>reset</b> any character format, highlight the text and select the <b>Font   Normal</b> menu option, or press <b>Alt+0</b>.</p>	
<b>Change font typeface and point size</b>	<p>Highlight the text to change and select the <b>Font   Fonts</b> menu option, or press <b>Alt+F10</b>.</p> <p>The Font Selection dialog displays, from which you select the</p>	

To	Action	See also
	<p>required typeface and point size.</p> <p>Click on the <b>OK</b> button.</p>	
<b>Change character style</b>	<p>Highlight the text to change and select the <b>Font   Style</b> menu option.</p> <p>The Select a Style dialog displays, listing the currently-defined character styles in the template stylesheet.</p> <p>Select the required style and click on the <b>OK</b> button.</p>	<a href="#">Styles. Special Text &amp; Table of Contents</a> <sup>[1054]</sup>
<b>Change the color of text, background (permanent highlight) or underline</b>	<p>Highlight the text to change and select one or more of the following options, as required:</p> <ul style="list-style-type: none"> <li>• <b>Font   Text Color</b></li> <li>• <b>Font   Background Color</b></li> <li>• <b>Font   Underline Color</b></li> </ul> <p>In each case, the Color dialog displays, through which you can select or define the required color.</p> <p>When you have selected a color, click on the <b>OK</b> button.</p>	
<b>Change character spacing</b>	<p>Normal character spacing (the space between characters) is 20 twips; if you want to change this (or return to it), highlight the text to adjust, and select the <b>Font   Spacing</b> menu option.</p> <p>The Character Spacing dialog displays.</p> <p>Select the radio button to expand or compress spacing, or to return to normal spacing; if you are changing <b>from</b> normal spacing, enter the number of twips to set the spacing to.</p> <p>Click on the <b>OK</b> button.</p>	
<b>Hide text</b>	<p>Hidden text is not displayed on the screen or printer, but remains in the document and is not deleted.</p> <p>Highlight the text to hide and select the <b>Font   Hidden</b> menu option, or press <b>Ctrl+H</b>.</p> <p>The highlighted text is not displayed and the rest of the text closes up.</p> <p>To view hidden text, select the <b>View   Hidden Text</b> menu option; you can then make the text normal again by highlighting it and deselecting the <b>Font   Hidden</b> menu option.</p>	<a href="#">Editor Tool Display Options</a> <sup>[1052]</sup>
<b>Create a box around text</b>	<p>Highlight the text to box and select the <b>Font   Boxed</b> menu option; this creates a broken-line border around the selected text.</p>	

To	Action	See also
<b>Insert a non-breaking space</b>	Move the cursor to the point at which to insert the non-breaking space and select the <b>Insert   Non-breaking Space</b> menu option.	
<b>Insert a non-breaking dash</b>	Move the cursor to the point at which to insert the non-breaking dash and select the <b>Insert   Non-breaking Dash</b> menu option.	
<b>Insert an optional hyphen</b>	Move the cursor to the point at which to insert the hyphen and select the <b>Insert   Optional Hyphen</b> menu option.	

#### 5.6.9.3.7 Format Paragraphs

When you create a document template or document the default paragraph styles are already defined, as they are derived directly from the Normal.rtf style template file. **Within** the document you can edit any of these paragraph styles or apply individual formatting to text blocks as you wish.

Each formatting option operates on the current paragraph, or on a **highlighted** block of text.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Paragraph formatting options

To	Action	See also
<b>Clear all paragraph formatting</b>	Select the <b>Paragraph   Normal</b> menu option.  All paragraph formatting applied whilst you have been <b>within</b> the file is removed.	
<b>Set text flow in document</b>	To set the text flow for: <ul style="list-style-type: none"> <li>• A highlighted block of text, select the <b>Paragraph   Text Flow</b> menu option; the Paragraph Text Flow dialog displays</li> <li>• The entire document, select the <b>Edit   Document Text Flow</b> menu option; the Document Text Flow dialog displays</li> </ul> <p>In either case, select the required text flow direction and click on the <b>OK</b> button. The options are:</p> <ul style="list-style-type: none"> <li>• <b>Left to right</b></li> <li>• <b>Right to left</b></li> <li>• <b>Default</b></li> </ul>	

To	Action	See also
	The <b>Default</b> action depends on the language setting of the system; for example, if the system language is Hebrew or Chinese, the default text flow is right to left.	
<b>Center text</b>	Select the <b>Paragraph   Center</b> menu option, or press <b>Alt+8</b> .	
<b>Right-justify text</b>	Select the <b>Paragraph   Right Justify</b> menu option, or press <b>Alt+9</b> .	
<b>Justify both sides of text</b>	Select the <b>Paragraph   Justify Both</b> menu option.	
<b>Indent paragraph left</b>	Select the <b>Paragraph   Indent Left</b> menu option, or press <b>Alt+L</b> . Select the option again to increase the indent. To reduce or cancel the indent, click on the <b>Indent Left icon</b> on the lower toolbar above the text area.	
<b>Indent paragraph right</b>	Select the <b>Paragraph   Indent Right</b> menu option or press <b>Alt+R</b> . Select the option again to increase the indent.	
<b>Create hanging indent</b>	Select the <b>Paragraph   Hanging Indent</b> menu option or press <b>Alt+T</b> . Select the option again to increase the indent of all lines below the first.	
<b>Keep paragraph lines together</b>	Select the <b>Paragraph   Keep Together</b> menu option. The editor attempts to keep all lines within the paragraph on the same page.	
<b>Keep paragraphs together</b>	Select the <b>Paragraph   Keep with Next</b> menu option. The editor attempts to keep the last line of the current paragraph and the first line of the next paragraph on the same page.	
<b>Prevent 'widow' and 'orphan' lines</b>	Select the <b>Paragraph   Widow/Orphan Control</b> menu option. The editor attempts to avoid having: <ul style="list-style-type: none"> <li>the first line of the paragraph on the previous page ('widow' line)</li> <li>the last line of the paragraph on the next page ('orphan' line)</li> </ul>	

To	Action	See also
<b>Start text on new page</b>	Move the cursor to the point at which to start the new page, and select the <b>Paragraph   Page Break Before</b> menu option.	
<b>Insert border and shading for text block</b>	<p>Select the <b>Paragraph   Border and Shading</b> menu option.</p> <p>The Paragraph Box Parameters dialog displays, on which you specify:</p> <ul style="list-style-type: none"> <li>• which sides of the box to display (including a line between text lines)</li> <li>• whether the lines are thick or doubled</li> <li>• the degree of gray shading behind the text</li> <li>• the color of the lines</li> </ul>	
<b>Define line spacing</b>	<p>Select the <b>Paragraph   Paragraph Spacing</b> menu option.</p> <p>The Paragraph Spacing Parameters dialog displays, on which you specify the line spacing and the point spacing before and after lines.</p> <p>Alternatively, to just set double line spacing, select the <b>Paragraph   Double Space</b> menu option.</p>	
<b>Set a background color for text space</b>	<p>Select the <b>Paragraph   Background Color</b> menu option.</p> <p>The Color dialog displays, on which you select the background color.</p> <p>The editor highlights the full width of the page in that color, for the selected lines.</p>	
<b>Create a bulleted list</b>	<p>Select the <b>Paragraph   Bullet</b> menu option.</p> <p>The editor formats the lines into a simple bullet list.</p> <p>If you want to indent the list (or a part of it) further, select the <b>Paragraph   Increase Level</b> menu option. If you have increased the indent but now want to decrease it, select the <b>Paragraph   Decrease Level</b> option.</p>	
<b>Create a numbered list</b>	<p>Highlight the required lines of text and select the <b>Paragraph   Numbering</b> menu option.</p> <p>The editor formats the lines into a simple numbered list.</p> <p>To create multiple-level numbered lists, see the entry below.</p>	
<b>Apply numbering to paragraphs</b>	<p>(Used in the Document Template Editor and Linked Document Template Editor.)</p> <ol style="list-style-type: none"> <li>1. Set up a numbering list and overrides (<b>Edit   List and Overrides</b>).</li> <li>2. Apply the numbering levels to the template sections (<b>Paragraph   List Numbering</b>).</li> </ol>	<a href="#">Apply User-Defined Section Numbering</a> <sup>[1081]</sup>

To	Action	See also
<b>Set the list characters</b>	<p>When you have set up your bulleted or numbered list elements, you can toggle between the list character options using the drop-down arrow icon just to the <b>left</b> of the bullet list icon on the lower toolbar of the document template editor.</p> <p>When you click on this icon, you are prompted to select between a <b>single-level</b> list format and a <b>multiple-level</b> list format. When you select one of these options, you then make a further selection between:</p> <ul style="list-style-type: none"> <li>Single-level: <b>Arabic numerals</b>, <b>Roman numerals</b>, <b>Upper-case letters</b> of the alphabet and <b>lower-case letters</b></li> <li>Multiple-level: <b>Arabic numerals</b>, <b>Roman numerals</b> and <b>bullet symbols</b></li> </ul>	
<b>Apply a paragraph style from the template stylesheet</b>	<p>Select the <b>Paragraph   Style</b> menu option.</p> <p>The Select a Style dialog displays, listing the currently-defined paragraph styles in the template stylesheet.</p> <p>Select the required style and click on the <b>OK</b> button.</p>	<a href="#">Styles, Special Text &amp; Table of Contents</a> <sup>[1054]</sup>

#### 5.6.9.3.8 Set Tabs

Using the Document Editor, you can define *left*, *right*, *center* and *decimal* tab points to define the positions of text strings and columns across the page. A paragraph or highlighted block of text can have as many as twenty tab points, which apply to every line of the selected text.

If you do not set tab points, the **Tab** key moves the cursor to default tab points at 0.5-inch intervals.

**Access** Select **Paragraph | Set Tab** from the menu bar at the top of the Document Editor window, **or** right-click and select **Paragraph | Set Tab** within either:

- The Content panel of the Document Template Designer or
- The text area of the document

Or click on the ruler at the top of the page.

#### Create and Clear Tab Points

Topic	Detail	See also
<b>Using the ruler</b>	<p>If the ruler is not visible, select the <b>View   Horizontal Ruler</b> context menu option.</p> <p>To create a:</p> <ul style="list-style-type: none"> <li><b>Left</b> tab, click on the required tab position on the ruler; the left tab is indicated on the ruler by an <b>L</b> shape</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <b>Right</b> tab, right-click on the required tab position on the ruler; the right tab is indicated on the ruler by a reversed <b>L</b> shape</li> <li>• <b>Center</b> tab, press (<b>Shift</b>) and click on the required tab position on the ruler; the center tab is indicated on the ruler by an inverted <b>T</b> shape</li> <li>• <b>Decimal</b> tab, press (<b>Shift</b>) and right-click on the required tab position on the ruler; the decimal tab stop is indicated on the ruler by an inverted <b>T</b> shape with a dot on the right hand side</li> </ul> <p>This tab is for numbers with a <b>decimal point</b>; numbers scroll left from the tab until you type the point, then numbers scroll right.</p> <p>To move a tab position, click on the tab symbol on the ruler and drag it to the new position.</p>	
<b>Using the Set Tab menu option</b>	<p>The <b>Paragraph   Set Tab</b> menu option displays the Set a Tab Position dialog, on which you select from a set of radio buttons to specify the tab type.</p> <p>The dialog provides two advantages over the ruler; you can:</p> <ul style="list-style-type: none"> <li>• Set the tab position with more precision and with a clear value (in inches) that you can duplicate</li> <li>• Select from a set of radio buttons to add or remove a dotted, broken or solid line preceding the tab point</li> </ul> <p>Click on the <b>OK</b> button to save the settings.</p>	
<b>Clear a single tab point</b>	<p>Highlight the block of text and select the <b>Paragraph   Clear Tab</b> menu option.</p> <p>The Clear a Tab Position dialog displays.</p> <p>Select the tab to clear and click on the <b>OK</b> button.</p>	
<b>Clear all tab points for a text block</b>	<p>Select the block of text and select the <b>Paragraph   Clear All Tabs</b> menu option.</p>	

#### Notes

- The **Other | Snap To Grid** menu option affects the movement of the tabs (and the paragraph indentation markers) on the ruler; when you select this option, the movements of the tab markers are locked on to an invisible grid at intervals of 1/16 inch (half a ruler division)

### 5.6.9.3.9 Define Document Sections

Using the Document Editor, you can partition your text into separate sections, present the text in a section in columnar format, and force page and column breaks to position text as you want. A multiple section document is useful to:

- Change the presentation and format of the text for different areas of information
- Change between portrait and landscape orientation for different parts of the document
- Vary the page margins from one page to another

As you change the section structure, you can insert page counts and insert and reset page numbers, and repaginate the document to update the page number, page count and Table of Contents.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer **or**
- The text area of the document

#### Manage sections

To	Action	See also
<b>Create a new section</b>	<p>Select the <b>Insert   Insert Break   Section Break</b> menu option. This creates a new section on a new page.</p> <p>The section break is represented by a dotted line; if this is not visible, click on the  icon in the toolbar above the text panel.</p> <p>This menu option is not effective when <b>Edit   Edit Page Header/Footer</b> is active, because editing control passes to the header and footer bands away from the body of the document.</p>	
<b>Set the section properties</b>	<p>Section properties apply to all the document content following the section break, up to the next section break line.</p> <p>Select the <b>Edit   Edit Section</b> menu option; the Section Parameters dialog displays.</p> <p>Complete each panel to set up the section as you prefer.</p>	
	<p>The <b>Number of Columns</b> field defaults to <b>1</b>, to present the text as a normal page of text (effectively a single column).</p> <p>If you want to structure the text in two or more columns on a page:</p> <ul style="list-style-type: none"> <li>• In the <b>Number of Columns</b> field, type the number of columns you want to divide the text into across the page</li> <li>• In the <b>Space Between the Columns</b> field, type the</li> </ul>	

To	Action	See also
	<p>separation of the columns, in inches</p> <ul style="list-style-type: none"> <li>If you want to separate the columns with a vertical line, select the <b>Line Between Columns</b> checkbox</li> </ul> <p>When you close the dialog, the text is displayed in the selected number of columns of equal width, across the page. The text wraps at the edge of the column and, when it reaches the foot of the page, continues at the top of the next column.</p>	
	<p>If you want to insert a page break before the new section, select the <b>Start Section on New Page</b> checkbox.</p> <p>If you also want to adjust the page numbering so that the new section starts at a specific page, select the <b>Restart Page Number at</b> checkbox and type the page number.</p> <p>The section start page will often be 1, but this facility is also useful for inserting another document of a constant number of pages between, for example, an introduction and a technical section.</p>	
	Set the direction of the <b>text flow</b> within the section by selecting the appropriate radio button.	<a href="#">Format Paragraphs</a> 1064
	Set the <b>page orientation</b> within the section by selecting the appropriate radio button.	
	<p>Select a standard <b>paper size</b> for printing the text of the section.</p> <p>Alternatively, you can scroll down the list and select the <b>User Defined</b> option, and then define your own page width and height, in inches.</p> <p>You can also define special page margins by selecting the <b>File   Page Layout</b> menu option.</p>	<a href="#">Print Documents</a> 1094
	<p>The <b>Paper Source</b> selections both default to <b>Auto Select</b>, so that the pages of the section print from whatever paper trays have paper available.</p> <p>If you are printing on paper from a specific tray, or are manually feeding paper to the printer for this section, select the appropriate option. You can select different options for the first page of the section and subsequent pages of the section.</p>	
<b>Force a page break</b>	Select the <b>Insert   Insert Break   Page Break</b> menu option, or press <b>Ctrl+Enter</b> .	

To	Action	See also
	The forced page break is indicated by a labeled solid line; if this is not visible, click on the  icon in the Toolbar above the text panel.	
<b>Create a column break</b>	<p>Move the cursor to the appropriate point in the column text and select the <b>Insert   Insert Break   Column Break</b> menu option. The break is indicated by a labeled 'dot and dash' line.</p> <p>Normally in a multiple column section, the text flows from the end of one column to the top of the next column; a column break forces the text to the next column before the current column is completely filled.</p>	
<b>Delete a break</b>	<p>A section break, page break or column break is indicated by a labeled line. To delete the break, move the cursor onto this line and press <b>Delete</b>.</p> <p>If you delete a section break, the section properties of the preceding section now apply to the document content following the deleted line.</p>	
<b>Insert the page number</b>	<p>Position the cursor at the point at which to display the page number, and select the <b>Insert   Page Number</b> menu option.</p> <p>The page number is displayed in gray.</p>	
<b>Insert the page count</b>	<p>Position the cursor at the point at which to display the total number of pages in the document, and select the <b>Insert   Page Count</b> menu option.</p> <p>The page count is displayed in gray.</p>	
<b>Repaginate the document</b>	<p>Select the <b>Edit   Repaginate</b> menu option.</p> <p>The <b>Page Number</b> and <b>Page Count</b> fields and the table of contents are all updated.</p>	

#### 5.6.9.3.10 Insert Headers, Footers, Footnotes and Endnotes

When creating a document report or template, you can include page headers, footers, endnotes and footnotes. You switch options on to create and edit these items, and then switch these options off again to protect the entries. While you are creating headers and footers, you can also continue to edit the body of the document. You can create headers and footers:

- To apply throughout the document
- Separately for each section that you might create in your document
- Separately for the first page of the document and for the subsequent pages (for example, to leave no header and footer text on the title page of the document)

- Separately for left-hand and right-hand pages

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Header and footer options

To	Action	See also
<b>Create the page header and footer</b>	<p>Select the <b>Edit   Edit Page Header/Footer</b> menu option.</p> <p>A dotted line marks off the header area at the top of the page and the footer area at the bottom of the page. This dotted line is at a position set using the Page Parameters dialog (<b>File   Page Layout</b>).</p> <p>Within each of these two areas, a paragraph marker displays to indicate where the text will sit relative to the top and bottom edges of the paper. This position is also defined on the Page Parameters dialog.</p> <p>You can type in any kind of free-form or formatted text and insert icons as you wish. You would normally work well within the defined areas for the header and footer, but if the text exceeds the area, the dotted lines simply move to accommodate the text.</p>	<a href="#">Print Documents</a> 
<b>Edit or delete the page header and footer text</b>	<p>Select the <b>Edit   Edit Page Header/Footer</b> menu option, move the cursor to the text and make any changes required. If you need to, delete the text altogether.</p>	
<b>Create separate header and footer for the initial page of the document</b>	<p>Select the <b>Edit   Edit Page Header/Footer</b> menu option to access the header and footer text spaces.</p> <p>Select the <b>Edit   First Page Header/Footer</b> option and either:</p> <ul style="list-style-type: none"> <li>• The <b>Create First Page Header</b> option, or</li> <li>• The <b>Create First Page Footer</b> option</li> </ul> <p>A paragraph marker displays at the top or bottom of the first page of the document. If you want specific text to display on the first page of the document, type it in and format it.</p> <p>Alternatively, leave the spaces blank so that the first page has no header or footer text.</p>	
<b>Display the common document header and footer on the initial page</b>	<p>If you have created a separate initial page header and/or footer and now want to display the same header and footer text on the initial page as is shown on subsequent pages of the document, you specifically delete the 'first page header/footer' assignment.</p> <p>Select the <b>Edit   Edit Page Header/Footer</b> menu option to access the header and footer text spaces.</p>	

To	Action	See also
	<p>Select the <b>Edit   First Page Header/Footer</b> menu option and either:</p> <ul style="list-style-type: none"> <li>• The <b>Delete First Page Header</b> option or</li> <li>• The <b>Delete First Page Footer</b> option</li> </ul> <p>The 'first page' assignment and text are removed from the first page header and/or footer spaces.</p>	
<b>Create separate header and footer for left-hand pages</b>	<p>Select the <b>Edit   Edit Page Header/Footer</b> menu option to access the header and footer text spaces.</p> <p>Select the <b>Edit   Left Page Header/Footer</b> option and either:</p> <ul style="list-style-type: none"> <li>• The <b>Create Left Page Header</b> option, or</li> <li>• The <b>Create Left Page Footer</b> option</li> </ul> <p>Scroll to the nearest left-hand page and in the header or footer space type in any kind of free-form or formatted text and insert icons as you wish.</p> <p>This text displays on every left-hand page in the section or, if there are no sections, in the document.</p> <p>Format your document to put left-hand page information on pages with left-hand headers and footers. For example, in English language documents, even-numbered pages are usually left-hand pages.</p>	
<b>Create separate header and footer for right-hand pages</b>	<p>Select the <b>Edit   Edit Page Header/Footer</b> menu option to access the header and footer text spaces.</p> <p>Select the <b>Edit   Right Page Header/Footer</b> option and either:</p> <ul style="list-style-type: none"> <li>• The <b>Create Right Page Header</b> option, or</li> <li>• The <b>Create Right Page Footer</b> option</li> </ul> <p>Scroll to the nearest right-hand page and in the header or footer space type in any kind of free-form or formatted text and insert icons as you wish.</p> <p>This text displays on every right-hand page in the section or, if there are no sections, in the document.</p> <p>Format your document to put right-hand page information on pages with right-hand headers and footers. For example, in English language documents, odd-numbered pages are usually right-hand pages, and sections such as Title, Introduction and Table of Contents start on right-hand pages.</p>	
<b>Delete left or right page headers and footers</b>	<p>Select the <b>Edit   Edit Page Header/Footer</b> menu option to access the header and footer text spaces.</p> <p>Select the <b>Edit   &lt;side&gt; Page Header/Footer</b> option (where <b>&lt;side&gt;</b> is</p>	

To	Action	See also
	<p>either <b>Left</b> or <b>Right</b>) and either:</p> <ul style="list-style-type: none"> <li>• The <b>Delete &lt;side&gt; Page Header</b> option, or</li> <li>• The <b>Delete &lt;side&gt; Page Footer</b> option</li> </ul> <p>You are prompted to confirm the deletion; click on the <b>Yes</b> button.</p> <p>Left and Right page headers or footers balance each other. If you create one, the system responds as if the other exists but is blank. If you delete one, the system responds as if the other is the 'common' header/footer for the section, and all page headers now contain that remaining text.</p>	
<b>Close and protect headers and footers</b>	Select the <b>Edit   Edit Page Header/Footer</b> menu option again, and check that you cannot move the cursor into the header and footer spaces.	
<b>Create a footnote</b>	<p>Move the cursor to the position at which to insert the footnote marker, and select the <b>Insert   Footnote/Endnote   Footnote</b> menu option.</p> <p>The Footnote Parameters dialog displays. In the:</p> <ul style="list-style-type: none"> <li>• <b>Footnote Marker</b> field type the marker you want to use, such as a number, asterisk, hash or letter of the alphabet, or any text string of up to 10 characters</li> <li>• <b>Footnote Text</b> field, type the text of the footnote</li> <li>• <b>Superscript Footnote Marker</b> field, leave the checkbox selected to display the marker as a superscript, or clear the checkbox to display the marker in the same format as the preceding text</li> </ul> <p>Click on the <b>OK</b> button; the editor inserts the footnote marker at the current cursor location and displays the marker and text at the bottom of the page, above the page footer space.</p>	
<b>Edit footnote text</b>	<p>Select the <b>Edit   Edit Footnote/Endnote   Edit Footnote Text</b> menu option.</p> <p>The marker and text of each footnote displays in the <b>document text</b> where the marker was originally inserted, highlighted by a broken underline.</p> <p>Locate the text and make the required changes. These changes are immediately reflected in the footnote text at the bottom of the page.</p> <p>When you have finished editing footnote text, click again on the <b>Edit   Edit Footnote/Endnote   Edit Footnote Text</b> menu option; the footnote text is no longer shown in the document text.</p>	
<b>Create an endnote</b>	Move the cursor to the position at which to insert the endnote marker, and select the <b>Insert   Footnote/Endnote   Endnote</b> menu option.	

To	Action	See also
	<p>The Endnote Parameters dialog displays. In the:</p> <ul style="list-style-type: none"> <li>• <b>Endnote Marker</b> field type the marker you want to use, such as a number or letter of the alphabet, or any text string of up to 10 characters</li> <li>• <b>Endnote Text</b> field, type the text of the endnote</li> <li>• <b>Superscript Endnote Marker</b> field, leave the checkbox selected to display the marker as a superscript, or clear the checkbox to display the marker in the same format as the preceding text</li> </ul> <p>Click on the <b>OK</b> button; the editor inserts the endnote marker at the current cursor location and displays the marker and text at the end of the section or, if there are no sections, at the end of the document.</p>	
<b>Edit endnote text</b>	<p>Select the <b>Edit   Edit Footnote/Endnote   Edit Endnote Text</b> menu option.</p> <p>The marker and text of each endnote displays in the <b>document text</b> where the marker was originally inserted, highlighted by a broken underline.</p> <p>Locate the text and make the required changes; these changes are immediately reflected in the endnotes at the end of the section or document.</p> <p>When you have finished editing endnote text, click again on the <b>Edit   Edit Footnote/Endnote   Edit Endnote Text</b> menu option; the endnote text is no longer shown in the document text.</p>	

### Notes

- You can create and edit headers and footers whether the **View | Page Layout Mode** option is switched on or switched off; this option makes no difference.

#### 5.6.9.3.11 Create Tables

Within any document report, you can present information using simple tables with any number of rows and columns. In a report template, it is also possible to render a **model section** as a table, defined with any number of columns but with only *two* rows. You can either add your own text to the tables, or populate the table cells with fields that extract information from your model.

**Access** Select **Table** from the menu bar at the top of the Document Editor window, **or** right-click and select the **Table** option within either:

- The Content panel of the Document Template Designer or
- The text area of the document

Create and format a table

To	Action	See also
<b>Insert a table in the document</b>	<p>Position the cursor on the point in the text to create the table, and select the <b>Table   Insert Table</b> menu option.</p> <p>The New Table Parameters dialog displays, in which you specify the number of table rows and columns. For a model section table in a report template you can accept the default values of two rows and three columns. Click on the <b>OK</b> button.</p> <p>Your table might be invisible; if so, select the <b>Table   Show Gridlines</b> menu option to reveal the table and cell borders in dotted lines. These lines are for guidance in creating the document, and do not display on the printed document. You can add printable borders if you wish, using other context menu options (below).</p> <p>The editor initially creates a table with cells of equal width across the page; you can change the cell width by dragging the cell borders using the mouse, or using other context menu options (below).</p>	<a href="#">Create Sections as Tables</a> <small>[2700]</small>
<b>Add a header row</b>	<p>Select the top row of the table, and then select the <b>Table   Header Row</b> menu option. Apply any heading text, settings and formatting to the highlighted row.</p> <p>In the document or compiled report, the heading row is repeated at the top of the columns each time the table flows on to a new page. In a report, if the heading row is populated with the values from field names, the heading rows on subsequent pages reflect the values from that first row.</p> <p>This option operates on the single row at the top of the table, and not on multiple rows. If you edit the table and add a row to the top of the table to act as a new header, selecting the menu option on the new row clears the previous setting.</p>	
<b>Insert a new row above the current row</b>	Click on a row and then select the <b>Table   Insert Row</b> menu option.	
<b>Insert a new column to the left of the current column</b>	Click on a column and then select the <b>Table   Insert Column</b> menu option.	
<b>Merge cells</b>	<p>Highlight the cells to merge and select the <b>Table   Merge Cells</b> menu option.</p> <p>The width and/or height of the resulting cell is the sum of the widths and/or the sum of the heights of the merged cells.</p> <p>You can merge cells across a row, down a column, and in a block spanning both rows and columns.</p>	

To	Action	See also
<b>Select a column</b>	<p>Click on a cell and select the <b>Table   Select Current Column</b> menu option.</p> <p>The whole column is highlighted and selected for further formatting.</p>	
<b>Split a cell</b>	<p>Select the cell to split and select the:</p> <ul style="list-style-type: none"> <li>• <b>Table   Split Cell Horizontally</b> menu option to split the selected cell into two cells of equal width within the column</li> <li>• <b>Table   Split Cell Vertically</b> menu option to split the cell into two cells of equal height, doubling the height of the whole row</li> </ul> <p>Any text in the original cell is assigned to the first cell, and the second cell is created empty.</p>	
<b>Delete cells</b>	<p>Select the cells to delete and select the <b>Table   Delete Cells</b> menu option.</p> <p>The Delete Table Cells dialog displays, on which you specify whether to delete:</p> <ul style="list-style-type: none"> <li>• <b>Cells</b> - deletes the highlighted cells; realign the column and/or row after doing this</li> <li>• <b>Columns</b> - deletes the column or columns containing the highlighted cells, or</li> <li>• <b>Rows</b> - deletes the row or rows containing the highlighted cells</li> </ul> <p>If you delete all cells in a table, the table itself is automatically deleted.</p>	
<b>Position the table on the page</b>	<p>Click on any part of the table and select the <b>Table   Row Position</b> menu option.</p> <p>The Table Row Alignment dialog displays, on which you select a radio button to left-justify, center or right-justify the table on the page.</p> <p>Leave the <b>All Rows in the Table</b> checkbox selected.</p> <p>This menu option has greater effect if the table is narrower than the page or text column.</p>	
<b>Set the height of a row, or all rows</b>	<p>Highlight the rows to adjust and select the <b>Table   Row Height</b> menu option.</p> <p>The Row Height Parameters dialog displays; you can select to:</p> <ul style="list-style-type: none"> <li>• Allow the row height to be determined automatically</li> <li>• Set a minimum row height, or</li> <li>• Set an exact row height</li> </ul> <p>If you are setting the height, type the value in twips.</p> <p>You can apply the setting to the selected rows only, or select the <b>Apply to all rows in the current table</b> checkbox to set the height of all rows in</p>	

To	Action	See also
	the table.	
<b>Keep row text together if it continues over a page</b>	<p>Select the rows to protect (preferably all rows in the table) and select the <b>Table   Keep Row Together</b> menu option.</p> <p>If the row continues over the end of the page, the whole row is moved to the top of the next page.</p>	
<b>Set the text flow in the table rows</b>	<p>Select the rows and select the <b>Table   Row Text Flow</b> menu option.</p> <p>The Table Text Flow dialog displays, on which you select a radio button to set the text flow in the rows to:</p> <ul style="list-style-type: none"> <li>• <b>Left to right</b></li> <li>• <b>Right to left</b></li> <li>• <b>Default</b></li> </ul> <p>You can apply the text flow to just the selected rows, or select the <b>Apply to all rows in the current table</b> checkbox to set the text flow for all rows in the table.</p> <p>This option also moves the selected rows over to the appropriate side of the page or column.</p>	<a href="#">Format Paragraphs</a> <small>[1064]</small>
<b>Set the width of selected cells</b>	<p>Select the cells to act on and select the <b>Table   Cell Width</b> menu option.</p> <p>The Set Cell Width dialog displays, on which you set the width of the cells and the margin between the text and the left and right sides of each cell, both in twips. You can apply the settings to:</p> <ul style="list-style-type: none"> <li>• All cells in the table</li> <li>• The selected cells only</li> <li>• The complete column or columns containing the selected cells, or</li> <li>• The complete row or rows containing the selected cells</li> </ul>	
<b>Define the width of the cell borders</b>	<p>Select the cells to act on and select the <b>Table   Cell Border Width</b> menu option.</p> <p>The Set Cell Border dialog displays, on which you set the width of the lines at any or all of the top, bottom, left and right of the selected cells. If you want the border to enclose:</p> <ul style="list-style-type: none"> <li>• The selected cells as a block, select the <b>Draw outline border around the selected cells</b> checkbox</li> <li>• Each selected cell separately, leave the checkbox unselected</li> </ul> <p>You can also set the margin between the text in each cell and the left and right borders, in twips, and apply all the settings to:</p> <ul style="list-style-type: none"> <li>• All cells in the table</li> </ul>	

To	Action	See also
	<ul style="list-style-type: none"> <li>The selected cells only</li> <li>The complete column or columns containing the selected cells, or</li> <li>The complete row or rows containing the selected cells</li> </ul>	
<b>Define the color of the cell borders</b>	<p>Select the cells to act on and select the <b>Table   Cell Border Color</b> menu option.</p> <p>The Set Cell Border Color dialog displays, on which you set the color of each of the lines at the top, bottom, left and right of a cell, or all of the cell borders at once.</p> <p>You can apply the settings to:</p> <ul style="list-style-type: none"> <li>All cells in the table</li> <li>The selected cells only</li> <li>The complete column or columns containing the selected cells, or</li> <li>The complete row or rows containing the selected cells</li> </ul>	
<b>Define the degree of shading on the cell color</b>	<p>Select the cells to act on and select the <b>Table   Cell Shading</b> menu option.</p> <p>The Cell Shading Parameters dialog displays, in which you type the shading percentage.</p> <p>Shading is the intensity of the cell background color, expressed as a percentage, and is uniform across the selected cells. If the cells have no colored background, a shading of <b>0%</b> is white. For colored backgrounds, <b>0%</b> is the color initially set. In all cases, a shading of <b>100%</b> is black.</p> <p>You can apply the setting to:</p> <ul style="list-style-type: none"> <li>All cells in the table</li> <li>The selected cells only</li> <li>The complete column or columns containing the selected cells, or</li> <li>The complete row or rows containing the selected cells</li> </ul>	
<b>Define the background color of the cell</b>	<p>Select the cells to act on and select the <b>Table   Cell Color</b> menu option.</p> <p>The Cell Color Parameters dialog displays. Click on the <b>Set Color</b> button to display the Color dialog, on which you select a basic color or define a more specific color.</p> <p>When you have selected the color, click on the <b>OK</b> button.</p> <p>You can apply the setting to:</p> <ul style="list-style-type: none"> <li>All cells in the table</li> <li>The selected cells only</li> <li>The complete column or columns containing the selected cells, or</li> </ul>	

To	Action	See also
	<ul style="list-style-type: none"> <li>The complete row or rows containing the selected cells</li> </ul>	
<b>Vertically align text in cells</b>	<p>Select the cells to act on and select the <b>Table   Cell Vertical Align</b> menu option.</p> <p>The Cell Vertical Alignment dialog displays, on which you select to align the text in the selected cells by the top, center or bottom of the cell or the baseline of the lowest top line of text.</p> <p>Text in a table defaults to being aligned with the top of the cell and, as you type it in, it scrolls downwards. You can change this alignment to the center or bottom of the cell so that text scrolls out from the center or up from the bottom of the cell.</p> <p>If you have special formatting - such as 'before-paragraph' spacing - you can align the text to the base of the lowest first line (the <b>baseline</b>), so that text in a row of cells is aligned with the special formatted text rather than with the top or bottom of the cell. If the special formatting is changed or removed, the text remains aligned.</p> <p>You can apply the setting to:</p> <ul style="list-style-type: none"> <li>All cells in the table</li> <li>The selected cells only</li> <li>The complete column or columns containing the selected cells, or</li> <li>The complete row or rows containing the selected cells</li> </ul>	<a href="#">Format Paragraphs</a> <small>110641</small>
<b>Rotate the text of a cell to display vertically</b>	<p>Select the cells to act on and select the <b>Table   Cell Rotate Text</b> menu option.</p> <p>The Cell Text Rotation dialog displays, on which you select to display text vertically up the cell, vertically down the cell or, if the text is already vertical, horizontally across the cell,</p> <p>Text in a table defaults to running horizontally across the cell from left to right, and scrolling down the cell from top to bottom. You can change the text position so that the text is rotated through 90 degrees to display:</p> <ul style="list-style-type: none"> <li>From top to bottom, scrolling across the cell from right to left, or</li> <li>From bottom to top, scrolling across the cell from left to right</li> </ul> <p>If the text is running horizontally, you can type as much as you need - the row height increases to accommodate the text. If the text is running vertically, you adjust the row height and column width manually to accommodate your text.</p> <p>You can apply the setting to:</p> <ul style="list-style-type: none"> <li>All cells in the table</li> <li>The selected cells only</li> <li>The complete column or columns containing the selected cells, or</li> <li>The complete row or rows containing the selected cells</li> </ul>	

To	Action	See also

### Notes

- Under some circumstances, a table in a generated report might repeat the header row rather than the output row; if this occurs, create another row in the table between the header row and the output row, and leave this blank

#### 5.6.9.3.12 Apply User-Defined Section Numbering

In your report template, you might want to number the section levels, with a numbering format of your own design. For example:

```

1. Package Level 1
  1.1 Package Level 2 (child package)
    1.1.1 Element Level 1
      1.1.1.1 Element (child element)

```

To define the numbering format you:

- First create a numbering list, then
- Create a set of list overrides for this list

In the overrides, you change the initial 1.0.0 setting to 1.1.1. You can then apply the numbering list to the headings set for packages and elements, using paragraph numbering.

**Access** Right-click in the Content panel of the Document Template Designer and select **Edit | List and Overrides**

### Define the numbering format

Step	Action	See also
1	<p>To create the numbering list, select the <b>Create List Item</b> menu option.</p> <p>The List Properties dialog displays:</p> <ul style="list-style-type: none"> <li>In the <b>List Name</b> field, type a name for the list</li> <li>Leave the <b>Multi-level list</b> checkbox selected</li> <li>If you have added sections to your document and want to restart numbering for each new section, select the <b>Restart at section break</b> checkbox</li> <li>Click on the <b>OK</b> button to close the dialog</li> </ul>	
2	<p>To create the list override, select the <b>Create List Override</b> menu option.</p> <p>The List Override Properties dialog displays:</p> <ul style="list-style-type: none"> <li>In the <b>List to Override</b> field, type or select the name of the list you have just created</li> <li>Leave the <b>Override Levels</b> checkbox selected</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Click on the <b>OK</b> button to close the dialog</li> </ul>	
<b>3</b>	<p>To set up the list level properties for a level, select the <b>Edit List Level</b> menu option. The List Level properties dialog displays.</p> <ul style="list-style-type: none"> <li>Select the <b>List item</b> radio button and type or select the list item you have just created</li> <li>Set the <b>List Level</b> field to <b>1</b> (for the <i>Package Section</i>) and the <b>Number text</b> field to <b>~1~</b></li> <li>Click on the <b>OK</b> button to save the values and close the dialog</li> </ul>	
<b>4</b>	<p>Select the <b>Edit List Level</b> menu option again to re-open the dialog:</p> <ul style="list-style-type: none"> <li>Select the <b>List item</b> radio button and type or select the list item you have just created</li> <li>Set <b>List Level</b> to <b>2</b> (for the <i>Element Section</i> or <i>Child Package Section</i>, for example)</li> <li>Set <b>Start at</b> to <b>1</b> (to ensure that numbering at this level begins at 1.1 rather than 1.0)</li> <li>Click on the <b>OK</b> button to close the dialog and save the changes</li> </ul>	
<b>5</b>	Repeat steps 3 and 4 for each additional list level to need, incrementing the <b>List Level</b> number and resetting <b>Start at</b> to <b>1</b> each time.	

#### Apply the numbering levels defined above

Step	Action	See also
<b>1</b>	<p>In the Content panel of the Document Editor, select the first item of text to be numbered (for example, <i>Package</i>).</p> <pre> package&gt;&gt;   Package: {Pkg.Name}    element&gt;&gt;   Element: {Element.Name}   child-elements&gt;&gt;   &lt;-child-elements   &lt;-element   child-packages&gt;&gt;   &lt;-child-packages   &lt;-package   </pre>	
<b>2</b>	Set the text style to one of the Heading styles ( <b>Heading 1</b> to <b>Heading 9</b> ), using the style drop-down field in the Document Editor toolbar.	

Step	Action	See also
	<p><b>package-&gt;</b>  <b>Package:-{Pkg.Name}</b> ¶</p>	
3	<p>Right-click on the text and select the <b>Paragraph   List Numbering</b> menu option.  The Apply paragraph numbering using Lists dialog displays.</p> <ul style="list-style-type: none"> <li>In the <b>List</b> panel, select the required List and Override combination</li> <li>Set the <b>Level</b> field to the required level (1, for the top level)</li> <li>Click on the <b>OK</b> button to close the dialog, and check that the required level has been applied to the selected text</li> </ul> <p><b>package-&gt;</b>  <b>1. Package:-{Pkg.Name}</b> ¶</p>	
4	<p>Repeat step 3 for the next level (Element), but change the <b>Level</b> field to 2.</p> <p><b>element-&gt;</b>  <b>1.1 Element:-{Element.Name}</b> ¶</p>	
5	<p>Continue applying the overrides for each lower section level as necessary, then generate your document.</p> <p>The output will be numbered and formatted, as illustrated by this example:</p> <p>1. <b>Package: Formal Requirements</b>  1.1 <b><i>Package: Manage Users</i></b>  1.1.1 <b>Element: REQ011 - Manage User Accounts</b>  1.1.2 <b>Element: REQ016 - Add Users</b>  1.2 <b><i>Package: Manage Inventory</i></b>  1.2.1 <b>Element: REQ019 - Manage Inventory</b>  1.2.2 <b>Element: REQ020 - Receive Books</b>  1.2.3 <b>Element: REQ021 - List Stock Levels</b></p>	

#### 5.6.9.3.13 Insert Reference Links

Within a document, you can insert two types of reference link:

- A **bookmark**, to locate material inside the document, either from within the same document or from a separate Word document
- A **hyperlink**, to display material held outside the document, namely an external document, Help topic or web page

**Access** Select **Insert** from the menu bar at the top of the Document Editor window, **or** right-click and select **Insert** within either:

- The Content panel of the Document Template Designer or
- The text area of the document

### Insert Bookmarks and Hyperlinks

To	Detail	See also
<b>Manage bookmarks</b>	<p>As your <b>report template</b> develops, the editor automatically assigns a unique bookmark to the start and end of each model section you select from the Sections panel.</p> <p>You can also create your own bookmarks in <b>any</b> document wherever you want to reference a specific point, and move these to other points in the text.</p> <p>(In the report template you can move the automatic bookmarks as well, but if you want to use these as reference points for a Word document to access, it is better to leave them as they are.)</p> <p>To insert a bookmark:</p> <ul style="list-style-type: none"> <li>• Move the cursor to the point in the text to mark, and select the <b>Insert   Bookmark</b> menu option; the Bookmark dialog displays</li> <li>• Either select an existing bookmark from the list (to switch it to the current location) or type a new bookmark name in the top field</li> <li>• Click on the <b>Insert</b> button</li> </ul> <p>To locate bookmarked text in the document:</p> <ul style="list-style-type: none"> <li>• Select the <b>Insert   Bookmark</b> menu option and, on the Bookmark dialog, click on the bookmark and on the <b>Go to</b> button; the editor displays the point at which the bookmark was set, in the top left corner of the display</li> </ul> <p>To delete an existing bookmark:</p> <ul style="list-style-type: none"> <li>• Select the <b>Insert   Bookmark</b> menu option and, on the Bookmark dialog, click on the bookmark and on the <b>Delete</b> button</li> </ul> <p>To insert a reference to a bookmark:</p> <ul style="list-style-type: none"> <li>• Move the cursor to the point at which to insert the reference and, if you want to, type some lead-in text such as "Go to page " or "See page "</li> <li>• Select the <b>Insert   Bookmark</b> menu option and, on the Bookmark dialog, click on the bookmark and on the <b>Set Page Reference</b> button</li> </ul> <p>The editor inserts the number of the page containing the bookmark, at the cursor position in the text; for a document, this acts as a hyperlink to the bookmark position</p>	<p><a href="#">Setting Sections for Reporting</a> [2688]</p> <p><a href="#">Document Bookmarks</a> [2730]</p>

To	Detail	See also
	If you set the reference in a template, the link is created in the document you generate from the template	
<b>Insert hyperlinks</b>	<p>To insert a hyperlink, right-click on the point in the text at which to create it and select the <b>Insert   Hyperlink</b> context menu option; the Insert Hyperlink dialog displays.</p> <p>In the <b>Link Text</b> field, type the text to be hyperlinked and, in the <b>Link Code</b> field, type or paste the:</p> <ul style="list-style-type: none"> <li>• Web page URL</li> <li>• Help topic file name (add the prefix <b>\$Help:/</b>) or</li> <li>• External file path and name</li> </ul> <p>To capture the help topic file name, right-click on the displayed topic, select the <b>Properties</b> context menu option, and copy the file name.</p> <p>Click on the <b>OK</b> button; the hyperlinked text displays in the document. Edit the sentence to accommodate the link text.</p> <p>To display the web page, help page or external document:</p> <ul style="list-style-type: none"> <li>• Linked in a document, double-click on the link</li> <li>• Linked in a report template, compile the report and click on the hyperlink in the report</li> </ul> <p>In a Team Review document, you can also insert hyperlinks to related objects in the model.</p>	<a href="#">Add Object Links</a> 

#### 5.6.9.3.14 Insert Images, Objects and Frames

In creating your document or template, you might want to embed or display images and other objects in the text, to insert external information and/or structure the text and graphics on a page. You could insert, for example:

- An image in the text or as background to the text
- A link to an image in the text
- An Object Linking and Embedding (OLE) object, which you create and edit in the document using an external application
- A frame - a rectangular border within the text that can contain separate text and pictures, and that the existing text flows **around**
- A drawing object - a rectangle, text box or line that can sit **over** the existing text
- Another document file

Having inserted an object, you can subsequently move, edit or delete it.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

Insert items

To	Action	See also
<b>Insert a picture in the document</b>	<p>You can insert a picture bitmap or Windows metafile in your document as either an embedded picture or a link to the external picture file.</p> <p>Position the cursor at the point at which to insert the picture, and select either:</p> <ul style="list-style-type: none"> <li>• <b>Insert   Embed Picture</b> ( F8 ) or</li> <li>• <b>Insert   Link Picture</b></li> </ul> <p>A browser dialog displays, through which you select the picture to insert in the document; the picture is shown at the current cursor location.</p> <p>The <b>embedded</b> picture is saved within the document; only the filename of the <b>linked</b> picture is saved with the document, which is a better option if you intend to edit the picture over time.</p>	
<b>Embed an OLE object in the text</b>	<p>Position the cursor at the point at which to embed the object, and select the <b>Insert   OLE Object</b> menu option.</p> <p>The Insert Object dialog displays, listing the applications that are available to create the object.</p> <p>When you select an application, the editor launches it and you create the object; when you save the application, the editor inserts an icon or view that represents the inserted object.</p> <p>You can also use the <b>Edit   Paste Special</b> menu option to import OLE objects, provided that the object is available in the clipboard.</p> <p>You can later edit the object using the application, by double-clicking on the object or by selecting the <b>Edit   Edit OLE Object</b> menu option.</p>	<a href="#">Scroll, Search and Select Text</a> <sup>[1059]</sup>
<b>Change the size and alignment of an embedded picture</b>	<p>Click on the picture and select the <b>Edit   Edit Picture</b> menu option; the Edit Current Picture Parameters dialog displays, through which you can change the height and width of the picture, in inches.</p> <p>You can also align the top, middle, or bottom of the picture with the baseline of any text on the same line as the picture, or offset the bottom of the picture from that baseline by any number of twips.</p>	
<b>Insert a background or watermark picture for the document pages (document report templates)</b>	<p>Select the <b>Other   Watermark Picture</b> menu option; a browser dialog displays, through which you select the graphic file to insert as a watermark. The picture occupies the entire text area, and is displayed as a washed-out image. If you choose an image that is already washed-out, no watermark is displayed at all.</p> <p>To remove the watermark image, deselect the <b>Watermark Picture</b> menu option.</p>	

To	Action	See also
<b>Insert a document File</b>	Position the cursor at the point at which to insert the file, and select the <b>Insert   Insert RTF File</b> menu option.	
<b>Embed a frame at the cursor position</b>	<p>Select the <b>Insert   Frame</b> menu option.</p> <p>The border of the frame displays, with the cursor at the top left corner. You can change the size of the frame by clicking on the border and dragging the small black 'handles'.</p>	
<b>Embed a drawing object at the cursor position</b>	<p>Select the <b>Insert   Drawing Object</b> menu option.</p> <p>The Select Drawing Object dialog displays, on which you select the radio button for either a:</p> <ul style="list-style-type: none"> <li>• Text Box</li> <li>• Rectangle or</li> <li>• Line</li> </ul> <p>Click on the <b>OK</b> button; the selected object displays, overlaid on the existing document content. If you wish, you can change the size of the object by clicking on the border and dragging the small black 'handles'.</p> <p>You can also change the appearance and the relationship of the object to the document text (see below).</p>	
<b>Move the frame or drawing object</b>	<p>Click inside the outline and then move the cursor just outside the outline so that the cursor changes to a plus-shape.</p> <p>Drag the plus shape (and hence the outline) to the new position.</p>	
<b>Edit the border, background and impact on document text of a drawing object</b>	<p>Select the <b>Edit   Edit Frame/Drawing Object   Edit Drawing Object</b> menu option.</p> <p>The Line and Fill Attributes dialog displays.</p> <p>Select the options to define:</p> <ul style="list-style-type: none"> <li>• Whether to display a border line and, if so, your preferred border thickness, type and color</li> <li>• Whether the object is transparent or filled and, if filled, the fill color</li> <li>• The wrapping behavior of the text outside the object: <ul style="list-style-type: none"> <li>• <b>Wrap Through</b> causes the document text to flow through the diagram object so that they overlap each other</li> <li>• <b>No Wrap</b> causes the document text to skip over the object, so that the text resumes below the object</li> <li>• <b>Wrap Around the Object</b> causes the document text to flow around the object, into a column on one side or the other of the object, or on both sides; if you move the object across the page, the editor tends to leave a wider</li> </ul> </li> </ul>	

To	Action	See also
	<p>margin before it starts to wrap text to the left of the object</p> <ul style="list-style-type: none"> <li>The Z Order of the object, so that if there is an overlap the object either lies in front of the document text (<b>Z-order = 1</b>) or behind the document text (<b>Z Order = &gt;1</b>)</li> </ul>	
<b>Insert text into the frame, text box or rectangle</b>	<p>Click inside the outline and type the text at the cursor position. The text wraps at the right hand side of the box and, for a:</p> <ul style="list-style-type: none"> <li>Frame, extends the bottom border of the box</li> <li>Text box and rectangle, overflows the bottom of the box but is still associated with the box and not with the 'normal' text of the document; to enclose all lines adjust the height manually to enclose the text</li> </ul> <p>If you change the <b>width</b> of the outline, any text inside the outline is automatically wrapped to adjust to the new width.</p>	
<b>Rotate text to display it vertically in the frame or text box</b>	<p>Select the <b>Edit   Edit Frame/Drawing Object   Rotate Text</b> menu option. The Text rotation dialog displays; select the radio button for the text direction you want to apply:</p> <ul style="list-style-type: none"> <li><b>Horizontal</b> (default) - the text flows from the top left corner of the box across the width of the box, wrapping at the right border and scrolling downwards</li> <li><b>Top to Bottom</b> - the characters are rotated through 90 degrees to flow from the top right corner of the box downward, wrapping at the bottom edge of the box and scrolling right to left</li> <li><b>Bottom to Top</b> - the characters are rotated through 90 degrees to flow from the bottom left corner of the box upward, wrapping at the top edge of the box and scrolling left to right</li> </ul> <p>If the text is running horizontally, you can type as much as you need - the box height increases to accommodate the text. If the text is running vertically, and it flows outside the box, you adjust the box height and width manually to accommodate your text.</p> <p>Click on the <b>OK</b> button to apply the change.</p>	
<b>Insert a picture into a frame or drawing object text box</b>	<p>Click inside the outline and either <b>Insert</b> the picture (see above) or copy and paste it at the cursor position.</p> <p>If the frame or text box contains only the picture, the picture size is automatically adjusted to as nearly fill the outline as possible without distorting the image.</p> <p>If you change the width or height of the box, the picture is adjusted to completely fill the outline; you continue manually adjusting the outline to reduce the distortion of the image.</p>	

To	Action	See also
<b>Lock a frame or drawing object to a point on the page</b>	<p>You can fix the position of the outline to a specific point so that as you enter and format the text the outline maintains its position relative to that point.</p> <p>The default position is relative to the <b>first character of the paragraph</b>, in which case the outline moves on the page with any change that affects the position of the paragraph.</p> <p>You can also fix the position relative to either the:</p> <ul style="list-style-type: none"> <li>• <b>Top edge of the page</b> or</li> <li>• <b>Top margin of the page</b></li> </ul> <p>In these cases, if the document text on the page is adjusted it flows <b>past</b> the outline.</p> <p>Click on the outline and select the <b>Edit   Edit Frame/Drawing Object   Vertical Base Position</b> menu option.</p> <p>The Object Position parameters dialog displays. Select the radio button for the locking point you prefer:</p> <ul style="list-style-type: none"> <li>• <b>Top of the Page</b></li> <li>• <b>Top Margin</b></li> <li>• <b>Current Paragraph</b></li> </ul> <p>Click on the <b>OK</b> button to apply the lock.</p>	
<b>Delete a frame or drawing object</b>	<p>Click on the outline and press ( <b>Delete</b> ).</p> <p>The editor prompts you to confirm the deletion; click on the <b>Yes</b> button.</p> <p>This deletion is <b>reversible</b> - press ( <b>Ctrl+Z</b> ) or select the <b>Edit   Undo</b> menu option.</p>	

#### 5.6.9.3.15 Checking Text

In developing a document or template, you would probably want to spell-check the text that you have entered; for example, to make sure that 'boiler-plate' text is correct, as it will be used many times in many reports. In the Document Editor you can both spot-correct a word from a context-sensitive list, or run a spell checker over the whole document. You can also check the use of a word against an online thesaurus, to see if there is a more precise term or to check the opposite meaning of the word.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Check Spelling

To	Action	See also
<b>Spot-correct a word</b>	<p>Select the <b>Other   Auto Spell</b> option.</p> <p>When the <b>Auto Spell</b> option is on, the Document Editor automatically checks the spelling of all <b>typed</b> or <b>pasted</b> text in the document (but not field names or generated text). Words that are apparently spelt incorrectly are underlined in red.</p> <p>Right-click on an underlined word; a short list displays, containing the correct spelling of the assumed word and a selection of other words that this word might have been intended to be. Click on:</p> <ul style="list-style-type: none"> <li>• One of the words, to use it in place of the mis-spelt word</li> <li>• The <b>Ignore All</b> option to use the word as it is in this context</li> <li>• The <b>Add</b> option to add the word to the suggested list of spellings/other words</li> </ul> <p>You might be using a language for which there is no spelling dictionary installed, or text that contains a high proportion of new terms, in which case you might not want to have the auto spell function underlining all the text. You can turn it off by selecting the <b>Other   Auto Spell</b> option again.</p>	
<b>Run the spell checker over the whole document</b>	<p>Select the <b>Other   Spell Check</b> menu option.</p> <p>The Check Spelling dialog displays, identifying the first apparent spelling mistake in the document.</p> <p>You might want to modify the things that the Spell Checker identifies as errors; click on the <b>Options</b> button to tailor the operation of the checker.</p> <p>Having tailored the spell checker, respond to each of the possible errors that it highlights in your document.</p> <p>When you have acted on all the words presented by the Spell Checker (or clicked on the <b>Cancel</b> button) a status message displays identifying the number of words picked up and the number of those words you have corrected. Click on the <b>OK</b> button.</p>	<p><a href="#">Select Spell Checker Options</a> <sup>[550]</sup></p> <p><a href="#">Correcting Words</a> <sup>[554]</sup></p>

### Run Thesaurus

To	Action	See also
<b>Access the Thesaurus</b>	<p>Right-click on a word in the text and select the <b>Other   Thesaurus</b> menu option.</p> <p>The Thesaurus dialog displays, showing the:</p> <ul style="list-style-type: none"> <li>• Selected word</li> <li>• Word-categories the word belongs to, in the Categories panel</li> <li>• List of <b>synonyms</b> for the word within the first category (words that have the same meaning as the selected word) in the Synonyms panel</li> </ul>	

To	Action	See also
	If there are several categories, click on each one to display the synonyms within each category.	
<b>Display antonyms</b>	<p>If you want to display the <b>antonyms</b> for the word (the opposite meanings of the word), select the <b>Antonyms</b> checkbox.</p> <p>The <i>Antonyms</i> title displays in the Categories panel, with the word-categories for the opposite of the selected word listed underneath.</p> <p>Click on a category name to list the antonyms in that category, in the Synonyms panel.</p>	
<b>Check for homonyms</b>	<p>A homonym is a word that sounds like another and can be confused with it. For example, <i>Sympathy</i> might be confused with <i>Empathy</i> or <i>Symphony</i>.</p> <p>If you want to check that you have not chosen a sound-alike word by mistake, click on the <b>Suggest</b> button.</p> <p>The Suggestions dialog displays, listing possible sound-alike words. If you want to use one of those words, or check for another with the same meaning, click on the <b>Look up</b> button.</p> <p>The Thesaurus dialog refreshes with the new word you have selected.</p>	
<b>Search for new terms</b>	<p>If you want to examine a totally different word, in the <b>Term</b> field type the new word and click on the <b>Look up</b> button.</p> <p>The display changes to show the synonyms (and antonyms) of the new word.</p>	
<b>Change to a synonym</b>	<p>Click on a synonym (or an antonym, if you wish) in the list, and click on the <b>OK</b> button.</p> <p>The word in the text changes to the selection.</p>

#### 5.6.9.3.16 Track Changes

In a team environment, two or more people might work on developing documents and/or templates. You might, therefore, need to review each other's work, or just be able to see what changes another person has made to the file. In the Document editor, you can turn on change tracking to highlight the changes you make to the text.

**Access** Select **Edit | Track Changes** from the menu bar at the top of the Document Editor window, **or** right-click and select **Edit | Track Changes** within either:

- The Content panel of the Document Template Designer or
- The text area of the document

### Tracking options

To	Action	See also
<b>Turn tracking on</b>	<p>Select the <b>Track Changes   Enable Tracking</b> menu option.</p> <p>Any changes made after Tracking is turned on are immediately highlighted:</p> <ul style="list-style-type: none"> <li>• Inserted text - printed in a different color</li> <li>• Deleted text - struck through with a single colored line</li> <li>• Formatting changes - indicated by a colored dotted underline</li> </ul> <p>A change bar is also inserted in the page or column margin to indicate the line on the page on which the change was made.</p> <p>If you mouse over a highlighted change, a tooltip displays the type of change, the name of the person who made the change, and the date and time the change was made.</p>	
<b>Turn tracking off</b>	<p>Select the <b>Track Changes   Enable Tracking</b> menu option again.</p> <p>Any changes made after Tracking was turned on remain highlighted, but changes made after tracking was turned off are not highlighted.</p>	
<b>Hide changes</b>	<p>If you want to review the document as it is, without the highlighted changes, but you do not want to lose the changes or highlighting, select <b>Track Changes   Hide Changes</b> menu option.</p> <p>The highlighted additions and deletions are hidden, and the remaining text closes up. Format changes are not hidden.</p> <p>To expose the hidden changes, click on the <b>Track Changes   Hide Changes</b> menu option again.</p>	
<b>Locate changes</b>	<p>Select the <b>Track Changes   Find Next Change</b> menu option or the <b>Track Changes   Find Previous Change</b> menu option to search the text and place the cursor on the next or previous change made, respectively.</p>	
<b>Respond to change</b>	<p>If you want to assess each change and act on your decision, select the:</p> <ul style="list-style-type: none"> <li>• <b>Track Changes   Accept Change</b> menu option to confirm the change, or</li> <li>• <b>Track Changes   Reject Change</b> menu option to reverse the change to the original text or format</li> </ul> <p>In either case, the change tracking markings are removed. You can</p>	

To	Action	See also
	make further changes if you wish.	
<b>Accept all changes</b>	<p>If you are not assessing each change, for example if you just want to see what a colleague has done before making your own changes, you can accept all changes across the document in one action.</p> <p>Select the <b>Track Changes   Accept All Changes</b> menu option.</p>	
<b>Reject all changes</b>	<p>If you are not assessing each change, but just want to reverse all changes across the document in one action, select the <b>Track Changes   Reject All Changes</b> menu option.</p> <p>A prompt displays for you to confirm the action; click on the <b>Yes</b> button.</p> <p>You might do this if, for example, you or a colleague have edited the wrong version of a document or acted on a technical change that was itself reversed.</p>	

#### 5.6.9.3.17 Protect Document Contents

When you have created a document, or some important text within a document, you might want to protect it from being edited or deleted so that it is safe from accidental change. The Document Editor defaults to locking **against** protection, so you first turn off the lock and then protect either the whole document or a selected block of text. Once protection is set, neither you nor any other user can change the text without specifically removing the protection.

**Access** Select options from the menu bar at the top of the Document Editor window, **or** right-click within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Protect text

To	Action	See also
<b>Enable protection</b>	<p><b>De</b>-select the <b>Other   Protection Lock</b> context menu option.</p> <p>A prompt displays for you to confirm the removal of the lock. Click on the <b>Yes</b> button.</p> <p>You can now set protection on your text.</p> <p>To reset the protection lock and block protection of <b>further</b> text, select the <b>Other   Protection Lock</b> context menu option again. The text that you have <b>already</b> protected, however, remains protected and cannot be edited until you or another user specifically removes the protection. You cannot remove protection from this text until you turn off the protection lock again.</p>	
<b>Protect text</b>	Highlight the line, block or section of text to be protected, and select	

To	Action	See also
	<p>the <b>Font   Protect</b> context menu option.</p> <p>The selected text is displayed in a grey font, and cannot be edited.</p> <p>If the menu option is unavailable, or the text is not faded, it means that you have not removed the protection lock (above).</p> <p>To release the text for editing again, highlight it and reselect the <b>Font   Protect</b> option. You can select and release a portion of the protected text; the remainder stays protected.</p>	
<b>Protect a document</b>	<p>Within the document or template, select the <b>Other   Protect Form</b> context menu option.</p> <p>The entire document is protected.</p> <p>An exception is protecting a template in the Document Template Designer. As you select checkboxes in the Sections panel, section markers are still added to the Content panel. You cannot, however, add fields or text between the markers.</p> <p>To release the document for editing again, reselect the <b>Other   Protect Form</b> context menu option.</p>	<a href="#">Setting Sections for Reporting</a> <span>[2688]</span>

#### 5.6.9.3.18 Print Report Documents

When you are editing a document or template, you can manage print jobs within the Document Editor. You can select from options to define the page layout, text to be printed and number of copies, and to check the appearance of the printing before actually submitting the print job.

**Access** Select **File** from the menu bar at the top of the Document Editor window, **or** right-click and select **File** within either:

- The Content panel of the Document Template Designer or
- The text area of the document

#### Print options

To	Action	See also
<b>Set the page margins for viewing and printing the document</b>	<p>Select the <b>File   Page Layout</b> menu option.</p> <p>The Page Parameters dialog displays, on which you can define the left, right, top and bottom page margins in inches.</p> <p>The <b>Top</b> and <b>Bottom</b> margins define how much space is set aside to contain header and footer text.</p> <p>In the <b>Header distance from the Page Top</b> and <b>Footer distance from the Page Bottom</b> fields, type the separation of the header and footer text from the edge of the paper.</p>	

To	Action	See also
<b>Set the parameters for the print run</b>	<p>Select the <b>File   Printer Setup</b> menu option, or press ( <b>Ctrl+Shift+P</b> ).</p> <p>The Print Setup dialog displays for the default printer, which you would have selected on the <b>Windows Control</b> panel.</p> <p>You can simply confirm or reselect the core parameters such as page size, paper source and page orientation, or click on the <b>Properties</b> button to define more advanced settings such as use of a watermark, duplex printing and print resolution.</p>	
<b>Preview document before printing</b>	<p>Select the <b>File   Print Preview</b> menu option to display the document as it would appear when printed.</p> <p>The editor displays either one page or two - toggle the display by clicking on the <b>One Page</b> or <b>Two Pages</b> buttons. Scroll to further pages using the scroll bar.</p> <p>By default the preview rectangle is sized to fit the current window; you can use the <b>Fitted</b> field to enlarge or shrink the size of the displayed pages as required.</p> <p>Click on the <b>Print</b> button to display and use the Print dialog, as described below.</p> <p>To return to editing mode click on the <b>Edit</b> button, or on the <b>File   Print Preview</b> menu option again.</p>	
<b>Print your document</b>	<p>Select the <b>File   Print</b> menu option, or press ( <b>Ctrl+P</b> ).</p> <p>The Print dialog displays, on which you can select the pages to print and the number of copies, and initiate the print task.</p> <p>You can also choose to print only a selected part of the file. To do this, highlight the required text before selecting the <b>Print</b> option. You can print a highlighted block of:</p> <ul style="list-style-type: none"> <li>• Lines, or</li> <li>• Characters</li> </ul>	

#### 5.6.9.3.19 Hyperlink From Linked Document

Within the text of your linked document, you can create hyperlinks to other elements in the model, and to web pages, Help files, Model Searches and Team Review Forums. When you next open the linked document, you can double-click on the hyperlink to open the linked files or to locate and highlight the object in the Project Browser. You can perform all normal operations on the object, including opening any linked document **that** element might have.

#### Create hyperlinks

Task	Action	See also
<b>Create Hyperlinks to elements</b>	<p>Click on the element in the Project Browser and drag it into the linked document to the position at which to create the hyperlink. The Linked Document Editor automatically creates the hyperlink, using the object name as the hyperlink text. You can edit this text if you prefer.</p>	

Task	Action	See also
	<p><b>Alternatively:</b></p> <p>Highlight the link text in the linked document, right-click on it and select the <b>Create   Link to Existing Element</b> context menu option. The Select Classifier dialog displays, through which you browse for and select the element to link to.</p>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Create hyperlinks to other documents</b>	<p>Highlight the appropriate text and select the <b>Create   Hyperlink</b> context menu option.</p> <p>The Hyperlink Details dialog displays, through which you specify the type of document to link to, and its location. When specifying the object location, you can use full paths or local (path substitution) paths.</p> <p>In some cases you might not want to have normal text as the hyperlink, but the text of the link itself. In this case, do not highlight any text or, in Hyperlink Details dialog, type any link text in. The system then inserts the <b>Address</b> path as the link text.</p> <p>In this context you do not need to provide an Alias or Notes.</p>	<a href="#">Hyperlinks</a> <sup>[2002]</sup>

- [The Web Browser](#)<sup>[170]</sup>

#### **5.6.9.3.20 Create Element From Document**

Whilst you can set up hyperlinks from the linked document to **existing** elements and diagrams in the Project Browser, you can also **create new** elements to illustrate and support information written in the linked document. You can create and link to any type of element or diagram, but the facility has specific options for the following element types:

- Class
- Requirement
- Issue

The element or diagram is created in the same package as the element for which the linked document was created. A hyperlink is automatically created in the document to the new object. When you click on the hyperlink, the element or diagram is highlighted in the Project Browser.

#### Create element or diagram

Step	Action	See also
1	Open the linked document in the model element or Document Artifact element.	<a href="#">Document Artifacts</a> <sup>[1046]</sup> <a href="#">Create Linked Document on an Element</a> <sup>[1047]</sup>
2	Enter or select the appropriate text to act as the hyperlink text (such as the element or diagram name).  Highlight this text and right-click on it; the Editor context menu displays.	
3	Select the <b>Create   New</b> menu option, and one of the submenu options. If you select the: <ul style="list-style-type: none"> <li>• <b>Class, Requirement or Issue</b> option, the corresponding element is immediately created in the Project Browser</li> <li>• <b>Other</b> option, the New Element dialog displays; specify the element type and - if appropriate - stereotype, and click on the <b>Create</b> button</li> <li>• <b>Diagram</b> option, the New Diagram dialog displays; specify the diagram type and click on the <b>OK</b> button</li> </ul>	<a href="#">New Elements</a> <sup>[903]</sup> <a href="#">New Diagrams</a> <sup>[822]</sup>
4	The highlighted text is now a hyperlink to the new object in the Project Browser. Click on the link to highlight the object.  You can now edit or expand the element or diagram as required.

#### 5.6.9.4 Replace or Delete Documents

If a linked document is out of date you can edit the text, or you can:

- Delete the content and replace it from another file, or
- Delete the document altogether

#### Replace the document content

Step	Action	See also
1	Either:	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Right-click on the element and select the <b>Edit Linked Document</b> menu option, or</li> <li>Click on the element and press <b>Ctrl+Alt+D</b></li> </ul> <p>The linked document opens in the Linked Document Editor.</p>	
2	Click in the body of the document and press <b>Ctrl+A</b> to select all the document text.	
3	Press <b>Delete</b> .	
4	<p>Right-click and select the <b>File   Import</b> context menu option.</p> <p>The Windows Open dialog displays, in which you can browse for the file to import into the document.</p>	
5	Click on the <b>Save</b> icon in the Linked Document Editor toolbar.	

#### Delete the linked document

Step	Action	See also
1	Right-click on the element in the Project Browser or diagram, and select the <b>Delete Linked Document</b> context menu option.	
2	A prompt displays for you to confirm the deletion; click on the <b>Yes</b> button.

### 5.6.9.5 Create Linked Document Templates

To create a linked document, you can open an empty file and add the text and contents as you want. You can **also** base your linked document on a linked document **template** that you either:

- Select from a drop-down list of (initially) system-provided templates in the New Linked Document from Template dialog or
- Create in the *Document Generation > Linked Document Templates* folder of the Project Resources window

Linked document templates that you create are added to the drop-down list on the New Linked Document from Template dialog.

**Access** **Project | Resources** (Alt+6)

### Create a template

Step	Detail	See also
1	In the Resources window: 1. Expand the <i>Document Generation</i> folder. 2. Right-click on the <i>Linked Document Templates</i> folder. 3. Select the <b>Create Template</b> context menu option. The New Document Template dialog displays.	
2	In the <b>New template</b> field, type a name for your template.	
3	In the <b>Copy template</b> field, if you want to base the new template on an existing template, click on the drop-down arrow and select the name of the source template.  Otherwise leave the field set to <b>None</b> .	
4	Click on the <b>OK</b> button.  The template opens in the Linked Document Template Editor in the Diagram View. Create and edit the template contents as you need.	<a href="#">Edit Linked Document Templates</a> 
5	Save the template ( <b>File   Save</b> ) and close the editor ( <b>File   Close</b> ). The template is immediately available for use.	
6	If you want to assign your template to a group, right-click on the template name in the Resources window and select the <b>Assign Template to Group</b> context menu option.  The Enter the Model Document Template Group Name dialog displays. In the <b>Enter Value</b> field type a category name and click on the <b>OK</b> button.  The template is immediately transferred to the named group.	

### Notes

- You can transport customized linked document templates between models, using the **Export Reference Data** and **Import Reference Data** options

### Learn more

- [Resources](#) 
- [Export Reference Data](#) 

- [Import Reference Data](#)<sup>[380]</sup>

### 5.6.9.6 Edit Linked Document Templates

To develop the contents of a linked document template, held in the Resources window, you use the Linked Document Template Editor. This is based on the Document Editor, providing a wide range of convenient features for formatting and editing the template, and for adding links from and references to the content of the document. The editor facilities are provided from a menu displayed at the top of the editor.

**Access** **Project | Resources > Document Generation > Linked Document Templates ( > template group) > template name | Modify Template**

#### Option Descriptions

The Document Template Editor menu option descriptions are grouped according to the actions you are performing.

Actions	Link
Creating and importing documents	<a href="#">File Control</a> <sup>[1050]</sup>
Configuring the editor page display and formatting tools shown	<a href="#">Editor Tool Display Options</a> <sup>[1052]</sup>
Incorporating stylesheets, special texts and Tables of Contents Managing the base styles in the Normal.rtf style template file	<a href="#">Styles, Special Texts &amp; Table of Contents</a> <sup>[1054]</sup> <a href="#">The Normal.rtf Style Template</a> <sup>[1058]</sup>
Moving through, searching and selecting text	<a href="#">Scroll, Search and Select Text</a> <sup>[1059]</sup>
Formatting characters and text strings	<a href="#">Format Text</a> <sup>[1062]</sup>
Formatting paragraphs and text blocks	<a href="#">Format Paragraphs</a> <sup>[1064]</sup>
Inserting tab points	<a href="#">Set Tabs</a> <sup>[1067]</sup>
Inserting sections, columns and page breaks, and repaginating	<a href="#">Define Document Sections</a> <sup>[1069]</sup>
Inserting and editing page headers and footers, and footnotes and endnotes	<a href="#">Insert Headers, Footers, Footnotes and Endnotes</a> <sup>[1071]</sup>
Inserting tables	<a href="#">Create Tables</a> <sup>[1075]</sup>

Actions	Link
Inserting hyperlinks and bookmarks	<a href="#">Insert Reference Links</a> 
Checking spelling and use of terms	<a href="#">Checking Text</a> 
Tracking, accepting and rejecting changes to text	<a href="#">Track Changes</a> 
Protecting template text from accidental change	<a href="#">Protect Document Contents</a> 
Inserting images, OLE objects, frames and drawing objects	<a href="#">Insert Images, Objects and Frames</a> 
Printer setup and printing documents	<a href="#">Print Report Documents</a> 

### Notes

- Throughout your template editing:
  - To undo one or more immediately previous edits, press **(Ctrl+Z)**, or select the **Edit | Undo** menu option; you can still undo a change even after you have saved the change
  - To redo one or more immediately previous undone edits, press **(Ctrl+Y)**, or select the **Edit | Redo** menu option

## 5.7 Connectors

UML connectors, along with elements, form the basis of a UML model. Connectors link elements together to denote some kind of logical or functional relationship between them. UML supports a wide range of connectors, each having its own purpose, meaning and notation, and each used in specific kinds of UML diagrams.

- [BPMN](#) <sup>[1862]</sup>
- [Connector Style Options](#) <sup>[1106]</sup>

### 5.7.1 Connector Management Options

If you right-click on a connector in a diagram, the connector context menu displays. This provides quick access to some important functions.

### Topics

Topic	Detail	See also
<b>Context Menu</b>	<p>The menu is split into up to seven distinct sections:</p> <ul style="list-style-type: none"> <li>• <b>Extensions</b> - displays in the first section only if you have Add-Ins installed and registered, such as Eclipse</li> <li>• <b>Properties</b></li> <li>• <b>Type Specific</b></li> <li>• <b>Advanced</b></li> <li>• <b>Style</b></li> <li>• <b>Appearance</b></li> <li>• <b>UML Help</b> - Displays the Enterprise Architect Help topic for this connector type</li> <li>• <b>Delete</b> - delete the connector with this option</li> </ul>	<p><a href="#">Manage Connector Properties</a> <sup>[1103]</sup></p> <p><a href="#">Connector Type-Specific Options</a> <sup>[1103]</sup></p> <p><a href="#">Advanced Connector Management Options</a> <sup>[1105]</sup></p> <p><a href="#">Connector Style Options</a> <sup>[1106]</sup></p> <p><a href="#">Connector Appearance Options</a> <sup>[1107]</sup></p>
<b>Connector Role Context Menu</b>	<p>For connectors with Roles, right-clicking a connector within up to 60 pixels of an end point displays a role-specific context menu.</p> <p>The Role context menu has three additional menu options:</p> <ul style="list-style-type: none"> <li>• A <b>Source/Target Role...</b> menu option that opens the</li> </ul>	<p><a href="#">Source Role</a> <sup>[1130]</sup></p> <p><a href="#">Connect To Element Feature</a> <sup>[1110]</sup></p>

Topic	Detail	See also
	<p>connector specification dialog with the respective role page selected</p> <ul style="list-style-type: none"> <li>• A <i>Multiplicity</i> submenu that enables you to set the multiplicity for the role</li> <li>• A <b>Link to Element Feature</b> menu option that displays a dialog through which you can attach the end of the connector to a specific attribute or operation</li> </ul>	

#### Notes

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

### 5.7.1.1 Manage Connector Properties

The *Properties* section of the connector context menu contains the following options:

Menu Option	Action	Shortcut	See also
<b>&lt;Connector type&gt; Properties</b>	Open the Properties window for the selected connector.		<a href="#">Properties Window</a> <sup>[1126]</sup>
<b>Advanced</b>	Display the <b>Advanced</b> menu.		<a href="#">Advanced Connector Management Options</a> <sup>[1105]</sup>
<b>Attach Note or Constraint</b>	Attach a note or constraint to the connector.		<a href="#">Attach a Note or Constraint</a> <sup>[1111]</sup>

#### Notes

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

### 5.7.1.2 Connector Type-Specific Options

The *Type-Specific* section of the connector context menu is specific to the object, and only appears for a few different connectors. Some examples are shown below:

Connector	Menu Option	Action	See also
Transition	<b>Locate in State Table</b>	Switch a State Machine diagram to a State Table, with the selected Transition cell highlighted on the table.	
Transition	<b>Message</b>	Set the value of the Message.	

Connector	Menu Option	Action	See also
Transition	<b>Find Triggers Associated</b>	Identify hidden triggers, and locate a trigger in the Project Browser; if there: <ul style="list-style-type: none"> <li>Is one trigger, it is immediately highlighted in the Project Browser</li> <li>Are two or more triggers the Element Usage dialog displays, listing the triggers; double-click on the required trigger to highlight it in the Project Browser</li> </ul>	
Transition	<b>Queue Triggers in Simulation</b>	(Available when a simulation is being executed.)  Adds the Trigger to the <b>end</b> of the list in the Simulation Events tab of the Breakpoints & Events window, without signalling it.	<a href="#">Simulation Events</a> <sup>[2504]</sup>
Transition	<b>Signal Triggers in Simulation</b>	(Available when a simulation is being executed.)  Adds the Trigger to the Simulation Events tab of the Breakpoints & Events window and signals it at the <b>current step</b> of the simulation, leaving it with the status <i>signalled</i> .	<a href="#">Waiting Triggers</a> <sup>[2508]</sup>
Association	<b>Find Association Class</b>	Locate and highlight the Association Class element in the Project Browser.	
Aggregation	<b>Set Aggregation to Composite</b>	Change the Aggregation to Composite.	
Aggregation	<b>Set Aggregation to Shared</b>	Set the Aggregation to shared; this appears after <b>Set Aggregation to Composite</b> has been selected.	
Information Flow	<b>Find Items Conveyed</b>	(Listed only if there are Information Items on the connector.)  Locate the Information Item in the Project Browser; if there: <ul style="list-style-type: none"> <li>Is one item, it is immediately highlighted in the Project Browser</li> <li>Are two or more items the Element Usage dialog displays, listing the items; double-click on the required item to highlight it in the Project Browser</li> </ul>	

**Notes**

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

**5.7.1.3 Advanced Connector Management Options**

The *Advanced* section of the connector context menu contains the following options:

Menu Option	Action	Shortcut	See also
<b>Set Source and Target</b>	Change the source and/or target of the connector.		<a href="#">Change the source and/or target</a>  <sup>[1113]</sup>
<b>Change Type</b>	Change the connector type.		<a href="#">Change the connector type</a>  <sup>[1113]</sup>
<b>Change Direction</b>	Keep the <b>ends</b> of the connector the same but change the <b>direction</b> setting. There are four options: <ul style="list-style-type: none"> <li><b>Unspecified</b></li> <li><b>Source -&gt; Destination</b></li> <li><b>Destination -&gt; Source</b></li> <li><b>Bi-Directional</b></li> </ul>		
<b>Reverse Direction</b>	Reverse the <b>ends</b> of the connector; for example, if the connector is an arrow, the arrowhead swaps to the other end.  This command maintains the <b>direction</b> of the connector (such as <i>Source -&gt; Destination</i> ).		
<b>Specialize Associations</b>	Specify how the properties of this Association specialize the properties of other Associations.		
<b>Information Items Conveyed</b>	Add information items to an Information Flow connector.		<a href="#">Information Item Conveyed</a>  <sup>[1413]</sup>  <a href="#">Information Flow</a>  <sup>[1410]</sup>
<b>Information Flows Realized</b>	Realize any information items conveyed on an Information Flow connector between two elements.		<a href="#">Information Item Realized</a>  <sup>[1414]</sup>
<b>Dependency Stereotypes</b>	Select a stereotype for the Dependency (or Trace, Role Binding, Occurrence or Represents connector).		

Menu Option	Action	Shortcut	See also
<b>Extension Points</b>	<p>On an Extend connector between two Use Cases, provides options to:</p> <ul style="list-style-type: none"> <li>Specify which Extension Point (if any) in the target Use Case the connector and its source Use Case relate to</li> <li>Show or hide the Note element that identifies the defined Extension Point</li> </ul>		<a href="#">Extend</a> 

### Notes

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

#### 5.7.1.4 Connector Style Options

The *Style* section of the connector context menu provides the following options:

Action	Usage	Shortcut	See also
<b>Line Style</b>	<p>Set the connector line style; the options are:</p> <ul style="list-style-type: none"> <li>Direct</li> <li>Auto Routing</li> <li>Custom</li> <li>Bezier</li> <li>Tree (Horizontal, Vertical, Lateral Horizontal or Lateral Vertical)</li> <li>Orthogonal (with Square or Rounded corners)</li> </ul>		<a href="#">Set the connector line style</a> 
<b>Pin End(s)</b>	<p>Pin the connector start and/or end to the current position on the target element; a sub-menu displays to offer the options of pinning the start point only, the end point only, or both.</p> <p>Once one or both ends are pinned, a fourth option is available to unpin both ends.</p>		
<b>Bend Line at Cursor</b>	Insert an anchor point on the line at the point of the cursor so you can change the shape of the line.	<b>Ctrl+Q</b>	<a href="#">Insert an anchor point</a> 
<b>Suppress Line Segment</b>	<p>Hide a segment of a connector so that you can view a part of the diagram that it crosses.</p> <p>To reverse the change, right-click on the connector and select the <b>Show All Line Segments</b> context menu option.</p>		

Action	Usage	Shortcut	See also
<b>Straighten Line at Cursor</b>	Remove an anchor point on the line at the point of the cursor.  (This is the exact opposite of <b>Bend Line at Cursor</b> , and ( <b>Ctrl+Q</b> ) toggles the connector point between the options).	<b>Ctrl+Q</b>	<a href="#">Connector Styles</a> 

#### Notes

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included
- If two connectors cross, the later connector has a 'hoop' at the intersection, indicating that the connectors are crossing

### 5.7.1.5 Connector Appearance Options

The *Appearance* section of the connector context menu provides the following options:

Menu Option	Action	Shortcut	See also
<b>Appearance</b>	Set the line color and line thickness of the connector.		
<b>Visibility</b>	Set connector visibility; see the table below for sub-menu options.		
<b>Tidy Line Angles</b>	Tidy the line angles of a custom connector.		<a href="#">Tidy the line angles</a> 

#### Visibility Sub-Menu:

Menu Option	Action	Shortcut	See also
<b>Hide Connector</b>	Hide the connector.  To show the connector again, follow the steps in the <i>Hide/Show Connectors</i> topic.		<a href="#">Hide/Show Connectors</a> 
<b>Hide Connector in Other Diagrams</b>	Hide or show the connector in other diagrams.		<a href="#">Hide/Show Connectors</a> 
<b>Hide All Labels</b>	Hide or show all labels attached to the connector.		

Menu Option	Action	Shortcut	See also
<b>Set Label Visibility</b>	Hide or show labels attached to the connector, individually.		<a href="#">Hide or show labels</a> <sup>[1122]</sup>

### Notes

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

## 5.7.2 Connector Tasks

This topic details some of the tasks associated with managing model connectors, such as:

- [Connect Elements](#) <sup>[1109]</sup>
- [Connect to an Element Feature](#) <sup>[1110]</sup>
- [Change Connector Styles](#) <sup>[1114]</sup>
- [Arrange Connectors](#) <sup>[1112]</sup>
- [Change Connector Type](#) <sup>[1113]</sup>
- [Create Connector in Project Browser](#) <sup>[1118]</sup>
- [Reverse Connector](#) <sup>[1123]</sup>
- [Delete Connectors](#) <sup>[1119]</sup>
- [Hide/Show Connectors](#) <sup>[1127]</sup>
- [Hide/Show Labels](#) <sup>[1122]</sup>
- [Create Generalization Set](#) <sup>[1120]</sup>
- [Change the Source or Target Element](#) <sup>[1113]</sup>
- [Set Relation Visibility](#) <sup>[1119]</sup>
- [Add a Note to a Connector](#) <sup>[1111]</sup>
- [Use Tree Style Hierarchy](#) <sup>[1125]</sup>
- [Create Connector in Project Browser](#) <sup>[1118]</sup>
- [Show Uses Arrow Head](#) <sup>[1125]</sup>
- [Set Association Specializations](#) <sup>[1123]</sup>
- [Change Sequence Message Scope](#) <sup>[1124]</sup>

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions, if security is enabled, you must have **Update Element** permission to update or delete a connector

### Learn more

- [List of Available Permissions](#) <sup>[329]</sup>

### 5.7.2.1 Connect Elements

#### Topics

Topic	Detail	See also
<b>Connect Elements on a Diagram</b>	<p>The fastest and simplest ways to create connectors are using the Quick Linker and using the Toolbox.</p> <p>To create another connector of the same type as the last connector you used, click on the appropriate source element and press ( <b>F3</b> ).</p>	<a href="#">Create Connectors In Place Using the Quick Linker</a> <sup>[898]</sup> <a href="#">Create Connectors Using the Toolbox</a> <sup>[792]</sup> <a href="#">Design Patterns</a> <sup>[1464]</sup> <a href="#">Using UML Profiles</a> <sup>[1472]</sup>
<b>Selecting Connectors</b>	<p>To select a connector, simply click on it; drag handles display, indicating that the connector is selected.</p> <p>This gives the connector focus for keyboard commands such as ( <b>Delete</b> ), and displays connector properties in docked windows such as the Tagged Values window.</p> <p>If there is more than one connector on a diagram, you can cycle through them using the arrow keys.</p>	
<b>Drag Connectors</b>	<p>You can drag a connector to position it; click on the connector and drag it to where it is to appear - note that there are some limitations on how far or to where you can drag a connector.</p> <p>You can also reattach the end of a connector to a different source or target element.</p>	<a href="#">Change the Source or Target Element</a> <sup>[1113]</sup> <a href="#">The Element Browser</a> <sup>[989]</sup>
<b>Connector Properties and Commands</b>	<p>You can double-click on a connector to change properties, or right-click to display the context menu containing commands to change connector type and direction.</p> <p>You can also highlight the connectors on a specific element; select the element and press and hold ( <b>L</b> ) - all the connectors issuing from or terminating at that element are highlighted in separate colors. This is a useful feature to apply in conjunction with the context filtering facility on an element on a diagram.</p>	<a href="#">Connector Properties</a> <sup>[1126]</sup> <a href="#">Change Connector Type</a> <sup>[1113]</sup> <a href="#">Reverse Connector</a> <sup>[1123]</sup> <a href="#">Context Filter a Diagram</a> <sup>[789]</sup>
<b>Create Connectors Without a Diagram</b>	<p>Sometimes it is useful to create relationships between elements without a diagrammatic representation; you can do this using the Project Browser and the Relationship Matrix.</p>	<a href="#">Add Connectors With the Project Browser</a> <sup>[1118]</sup> <a href="#">Add Connectors With the Relationship Matrix</a> <sup>[737]</sup>

#### Notes

- You can reposition a connector by selecting and dragging the connectors as required
- If a connector has source and target roles, you can attach either end of the connector to a specific attribute or operation in the source or target element

#### Learn more

- [Connect to Element Feature](#) 

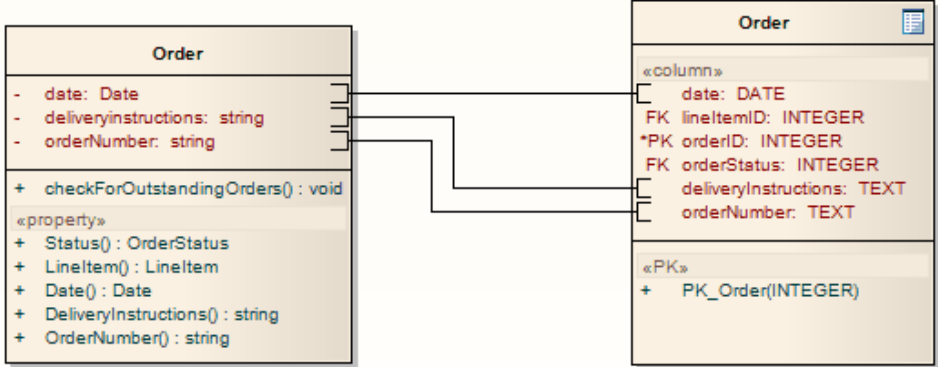

### 5.7.2.2 Connect to Element Feature

If a connector has source and target roles, you can connect either end of the connector to a specific operation or attribute in the source or target element. This is entirely a visual aid, to indicate which features are significant in the relationship. In code generation or transformation, the link is interpreted as a normal source-element to target-element relationship.

#### How to

To connect the end of the connector to a specific operation or attribute

Step	Action	See also
1	Right-click on the end of the connector joined to the element containing the required feature.	
2	Select the <b>Link to Element Feature</b> context menu option. The Link to Element Feature dialog displays.	
3	In the <b>Feature Type</b> field, click on the drop-down arrow and select the required feature type - <b>Attribute</b> or <b>Operation</b> . The attributes or operations from the element are listed in the <b>Feature</b> field.	
4	Click on the required attribute or operation, and click on the <b>OK</b> button. The end of the connector changes to a bracket next to the selected feature.  You might create a number of feature-to-feature relationships between two elements (such as a Class and a Table that represents the Class data) to produce a diagram similar to the following:	

Step	Action	See also
	 <p>You can change the feature to which the connector is attached by following the above procedure and selecting the new feature.</p> <p>You can break the link to the selected feature in the following ways:</p> <ul style="list-style-type: none"> <li>• Follow the above procedure, setting the <b>Feature Type</b> to <b>None</b></li> <li>• Delete the attribute or operation from the element</li> <li>• Change the connector type to a type that does not have source and target roles</li> <li>• Change the connector to a different source or target element that does not contain the feature</li> </ul> <p>Note that reversing the direction of the connector does not break the connector's attachment to the feature.</p>	

### 5.7.2.3 Add a Note to a Connector

This topic describes how you can connect notes and constraints to graphical relationships.

Notes enable you to provide explanations and further detail for one or more connectors on a diagram, with a visible Note element.

#### How to

To add a note or constraint to a connector

Step	Action	See also
1	Right-click on one of the connectors to attach a note to. The context menu displays.	
2	Select the <b>Attach Note or Constraint</b> menu option. The Link Relations dialog displays.	

Step	Action	See also
3	Select the appropriate radio button in the Link Type panel.	
4	Check all the connectors that participate in the set.	
5	Click on the <b>OK</b> button to complete the note or constraint creation.	
6	Use the normal Note dialog to enter the appropriate text for the note or constraint.	

### Notes

- The constraint note is drawn slightly differently to a regular note, and has { and } automatically added to visually indicate the constraint form
- As an alternative to the procedure above, you can drag the Quick Linker arrow on an existing Note or Constraint, and drag it to the required connector; a Notelink is automatically created to attach the Note or Constraint to the connector

### Learn more

- [Quick Linker](#) 

## 5.7.2.4 Arrange Connectors

Connectors between two elements can be moved around the element borders to create a good layout. There is a limit to how much a connector can be moved around, but generally it is very easy to find an acceptable layout. For the best layouts, use the *custom* line style; this enables you to add as many line points and bends as you require to create a clean and readable diagram.

### Move and arrange connectors on a diagram

Step	Action	See also
1	Click once on the connector to select it.	
2	Holding the mouse button down, move the connector in the required direction.	
3	To refine the movement, click and hold very near to one end of the connector; this enables a slightly different movement range.	
4	To further refine the movement and range, select either a routed, direct or custom line style; each behaves slightly differently.	<a href="#">Connector Styles</a> 

### 5.7.2.5 Change Connector Type

#### How to

To change a connector type

Step	Action	See also
1	In the Diagram View, right-click on the connector to change. The context menu displays.	
2	Select the <b>Connection Detail   Change Type</b> menu option.	
3	In the <b>Connector Type</b> field, click on the drop-down arrow and select the required connector type.	
4	Click on the <b>OK</b> button to apply changes.	

### 5.7.2.6 Change the Source or Target Element

After you have created a connector between two elements, you might later want to change either the source or target. Instead of deleting and re-creating the connector, Enterprise Architect enables you to change the source or target. There are two ways of doing this: using the Set Source and Target dialog or using the mouse.

#### How to

To change the source or target element of a connector using the Set Source and Target dialog

Step	Action	See also
1	Right-click on the connector to open the context menu.	
2	Select the <b>Advanced   Set Source and Target</b> menu option. The Set Source and Target dialog displays.	
3	Click on the drop-down arrows on the <b>From Element</b> and <b>To Element</b> fields, and select the source and target elements.	
4	Click on the <b>OK</b> button to apply changes.	

To change the source or target element of a connector using the mouse

Step	Action	See also
1	Click on the connector and position the cursor over the 'handle' at one end.	
2	When the cursor changes, click the mouse and drag the handle to the new element.	

#### Notes

- The connector does not actually move until you release the mouse button over the new source or target element; however:
  - A dotted line shows where the connector would be during the move
  - The solid outline of the nearest element or extension changes to a hatched outline as you move the cursor onto it; this helps you identify where the connector should connect to, if there are many closely-arranged elements, Parts, Ports and other extensions

#### 5.7.2.7 Connector Styles

Connectors come in seven different routing styles. Additionally, if one solid-line connector crosses another, the second one 'jumps' over the first (unless the **Enable Connector line jumps** option is deselected on the Options dialog).

#### Reference

Style	Description	See also
<b>Direct</b>	A straight line from element A to element B.  You can move the line (back and forward, up and down) to a limited degree.	
<b>Auto Routing</b>	A vertical and horizontal route from A to B with 90-degree bends.  You can move the line to improve the route, but the location and number of bends are not configurable.	
<b>Bezier</b>	A smooth curved line from A to B.  Bezier style is directly available for Data Flow diagram connectors, Mind Mapping connectors, State Flows, State Transitions, Object Flows, and Control Flows. <ul style="list-style-type: none"> <li>You can convert other types of relationship to Bezier style by assigning the Tagged Value <code>_Bezier</code>, with an integer value other than <b>0</b>; however, some relationship types (such as Aggregate) do not accommodate this style very well</li> <li>This Tagged Value over-rides the value of the <b>Style</b> field in the connector Properties dialog</li> </ul>	<a href="#">Connector Properties</a> <small>[1128]</small>

Style	Description	See also
<b>Custom Line</b>	The most flexible option; you can add one or more line points and bend and push the line into virtually any shape, using the <b>Toggle Line Point at Cursor</b> option.	
<b>Tree Style - Vertical</b> <b>Tree Style - Horizontal</b>	A line from element A to B with two right-angle bends, and the end points fixed to selected locations on the elements (Vertical or Horizontal). <ul style="list-style-type: none"> <li>You can convert relationships to Tree Style by assigning the Tagged Value <code>_TreeStyle</code>, with a value of <b>H</b> (Horizontal) or <b>V</b> (Vertical)</li> <li>This Tagged Value over-rides the value of the <b>Style</b> field in the connector Properties dialog</li> </ul>	
<b>Lateral - Vertical</b> <b>Lateral - Horizontal</b>	A line from element A to B with a single right-angle bend, and the end points fixed to selected locations on the elements (Vertical or Horizontal). <ul style="list-style-type: none"> <li>You can convert relationships to Lateral style by assigning the Tagged Value <code>_TreeStyle</code>, with a value of <b>LH</b> (lateral-horizontal) or <b>LV</b> (lateral vertical)</li> <li>This Tagged Value over-rides the value of the <b>Style</b> field in the connector Properties dialog</li> </ul>	
<b>Orthogonal - Square</b> <b>Orthogonal - Rounded</b>	You can add one or more line points and bend and push the line into a variety of shapes, using the <b>Toggle Line Point at Cursor</b> option.  All line segments thus created are either vertical or horizontal.	

### How to

To set the connector style

Step	Action	See also
<b>1</b>	Right-click on the connector to change. The context menu displays.	
<b>2</b>	Select the <b>Line Style</b> option.	
<b>3</b>	From the submenu, select the required style: <ul style="list-style-type: none"> <li><b>Direct</b></li> <li><b>Auto Routing</b></li> <li><b>Custom</b></li> <li><b>Tree</b></li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Lateral</b></li> <li>• <b>Orthogonal</b></li> <li>• (or <b>Bezier</b>, where appropriate)</li> </ul>	

*Alternatively:*

Step	Action	See also
<b>1</b>	Select the connector to change.	
<b>2</b>	Press the following keys to change the style: <ul style="list-style-type: none"> <li>• ( <b>Ctrl+Shift+D</b> ) for Direct</li> <li>• ( <b>Ctrl+Shift+A</b> ) for Auto Routing</li> <li>• ( <b>Ctrl+Shift+C</b> ) for Custom</li> <li>• ( <b>Ctrl+Shift+Z</b> ) for Bezier (where appropriate)</li> </ul>	

To bend a connector to quickly and easily route connectors in the required layout

Step	Action	See also
<b>1</b>	Right-click on the connector. The context menu displays.	
<b>2</b>	Set the line style to Custom Line ( <b>Ctrl+Shift+C</b> ); this enables the <b>Bend Line at Cursor</b> option in the context menu.	
<b>3</b>	Click on the <b>Bend Line at Cursor</b> option to add a line point. Right-clicking a line point displays the <b>Straighten Line at Cursor</b> context menu option, which you can use to remove the line point.	
<b>4</b>	Using the mouse, drag the line point to the required position.	

*Alternatively:*

Step	Action	See also
1	Hold down ( <b>Ctrl</b> ) or ( <b>Shift</b> ) and click on a point on the connector to create a line point.  ( <b>Ctrl</b> )+click also removes a line point.	
2	Using the mouse, drag the line point to the required position.	

To tidy line angles (custom connector)

Step	Action	See also
1	Right-click on the connector.  The context menu displays.	
2	Click on the <b>Tidy Line Angles</b> menu option; this nudges the custom line in horizontal and vertical increments, saving you the time of trying to get a good layout manually.  You can set the <b>Tidy Line Angles</b> option to operate by default; click on the <b>Tools   Options</b> menu option to display the Options dialog, and select the Diagram Behavior page.	

To suppress individual line segments

Step	Action	See also
1	Right-click on the connector.  The context menu displays.	
2	Set the line style to Custom Line ( <b>Ctrl+Shift+C</b> ).  This enables the <b>Suppress Line Segment</b> option in the context menu.	
3	Click on the <b>Suppress Line Segment</b> option to suppress a line between two bend points.  The segment you right-clicked on is suppressed.	
4	To show the segment again, right-click on the line and click on the <b>Show All Line Segments</b> context menu option.	

Step	Action	See also
	<p>One application for this is to represent the continuation of flow when your diagram crosses the page boundary marker in the Diagram View.</p> <p>When you suppress the line segment that crosses the boundary, the link name (connector properties) displays at both ends of the hidden segment; when you print the diagram on multiple pages, the link name identifies the connection apparently broken by the page boundary.</p>	

### 5.7.2.8 Create Connector in Project Browser

You can create a connector from one element to another directly in the Project Browser.

#### How to

To connect elements from the Project Browser

Step	Action	See also
1	<p>In the Project Browser, either:</p> <ul style="list-style-type: none"> <li>Right-click on the element to create a connector for, and select the <b>Add   Create Link</b> context menu option, or</li> <li>Select the element, press ( <b>Insert</b> ) and select the <b>Create Link</b> context menu option</li> </ul> <p>The Create Link dialog displays.</p>	
2	In the <b>Direction</b> field, click on the drop-down arrow and select the direction of the new connector ( <b>Outgoing</b> means this element is the source).	
3	In the <b>Link Type</b> field, click on the drop-down arrow and select the type of connector.	
4	<p>In the <b>Choose target(s)</b> list, click on the name of the target.</p> <p>(If necessary, in the <b>Select Target Type</b> field click on the drop-down arrow and select a feature to list only elements having that feature).</p>	
5	Click on the <b>OK</b> button to create the connector.	

#### Notes

- You can also reproduce an existing connector between two elements when you paste those elements from the Project Browser into a diagram as instances; an option enables you to copy just the elements, or the relationship as well

Learn more

- [Pasting From the Tree](#)<sup>[833]</sup>

**5.7.2.9 Relationship Visibility**

You can change the visibility of individual connectors or relationships, diagram by diagram.

Access **Diagram | Advanced | Visible Relations ( Ctrl+Shift+I )**

How to

To set relationship visibility

Step	Action	See also
1	Open the diagram to change.	
2	Select the <b>Visible Relations</b> menu option. The Set Visible Relations dialog displays.	
3	Select the checkbox against each list item to show, and clear the checkbox against each item to hide. If you want to display the information in a more readable layout, you can resize the dialog.	
4	Click on the <b>OK</b> button to apply the changes.	

**5.7.2.10 Delete Connectors**How to

To delete a connector

Step	Action	See also
1	Right-click on the connector and select the <b>Delete Connector</b> context menu option. The Remove Connector dialog displays; this dialog provides the options to hide the connector so that it remains functional, or remove the connector completely.	
2	Click on the appropriate radio button and click on the <b>OK</b> button. If you select the <b>Hide</b> option, it has the same effect as hiding the connector on the Links tab of the source element Properties dialog, or using the <b>Visibility   Hide Connector</b> context menu option.	<a href="#">Hiding the Connector</a> <sup>[1121]</sup> <a href="#">Relationships</a> <sup>[742]</sup>

Step	Action	See also
	It also hides the connector on the Relationships window.	

#### Notes

- The dialog does not display if:
  - You have previously selected the **Don't ask again** checkbox or
  - On the Links page of the Options dialog (**Tools | Options | Links**) the **Prompt on connector deletes** checkbox is not selected
- Selecting the **Don't ask again** checkbox also deselects the **Prompt on connector deletes** checkbox
- Selecting the **Prompt on connector deletes** checkbox restores the dialog if you have used the **Don't ask again** checkbox
- If you hide the dialog, the **Delete Connector** context menu option defaults to the setting you last used on the dialog; make sure that you have selected the right option to default to

#### 5.7.2.11 Generalization Sets

A Generalization Set enables you to specify the relationship of a group of Generalizations. Each Generalization is a binary relationship that relates a specific Classifier to a more general Classifier (e.g. from a class to its superclasses). Each Generalization Set defines a particular set of Generalization relationships that describe the way in which a general Classifier (or superclass) can be divided using specific subtypes.

**Access** **connector context menu | Advanced | Generalization Set | New**

#### How to

To create a generalization set

Step	Action	See also
1	Select the <b>New</b> menu option. The Generalization Set dialog displays.	
2	In the <b>Name</b> field, type the name of the Generalization set; for example, <b>Gender</b> .	
3	In the <b>Power Type</b> field, either: <ul style="list-style-type: none"> <li>Type a new power type, or</li> <li>Click on the drop-down arrow or browser button ( ... ) and select an existing one from the Select &lt;Item&gt; dialog</li> </ul>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
4	Check the <b>IsMember</b> column for the child subtypes that are part of this Generalization set.	

--	--	--

### 5.7.2.12 Hide/Show Connectors

Connectors/relations that appear in multiple diagrams can be selectively shown or hidden. This makes it easier to read diagrams where elements might have many connectors, but not all are relevant in the context of the current diagram.

#### Hide or show a connector in the current diagram

Step	Action	See also
1	Double-click on the required diagram element in the Diagram view. The element Properties dialog displays.	
2	Select the Links tab. This lists the connectors linked to the element, whether or not they are hidden on the diagram.	
3	Right-click on the connector to hide or show. The context menu displays.	
4	Select the <b>Show Relation</b> option to show the hidden connector on the diagram, or the <b>Hide Relation</b> option to hide the visible connector.  Alternatively, hide a connector by right-clicking on it on the diagram and selecting the <b>Visibility   Hide Connector</b> context menu option; however, you must use the Links tab of the element Properties dialog to show the relationship again.	

#### Hide or show a connector in other diagrams

Step	Action	See also
1	Right-click on the connector in the diagram. The context menu displays.	
2	Select the <b>Visibility   Hide Connector in Other Diagrams</b> menu option. The Set Connector Visibility dialog displays.	
3	If the two connected elements have been included in other diagrams, these diagrams are	

Step	Action	See also
	<p>listed here.</p> <p>In the list, all diagrams for which the checkbox is selected show the connector; deselect the checkbox for any diagrams in which to hide the connector.</p> <p>If you want to display the information in a more readable layout, you can resize the dialog.</p> <p>To hide the connector in all of the diagrams listed, click on the <b>Suppress All</b> button.</p>	
4	Click on the <b>OK</b> button to save the changes.	

### Notes

- Certain elements, such as Requirements, do not have a Links tab in the Properties dialog

In these cases, open the Relationships window (**Element | Relationships**) for the element, right-click on the relationship in the list and select the context menu option to hide or show that relationship in the diagram

Be aware that, in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions with security on, locks on the diagram and elements can make the required option unavailable

### Learn more

- [Relationships](#) <sup>742</sup>

## 5.7.2.13 Hide/Show Labels

### How to

To hide or display one or more labels on a connector

Step	Action	See also
1	<p>Right-click on the connector.</p> <p>The context menu displays.</p>	
2	<p>Select the <b>Visibility   Set Label Visibility</b> menu option.</p> <p>The Label Visibility dialog displays; if you have several long labels, you can resize this dialog for greater clarity.</p>	
3	Select the checkbox against each label to display, and clear the checkbox against each label to hide.	

Step	Action	See also
4	Click on the <b>OK</b> button.	

#### 5.7.2.14 Connector In-place Editing Options

You can edit many of the Enterprise Architect connector labels directly on the diagram. Each label can be bound to a single connector field.

Topic	Detail	See also
<b>Putting a label in Edit Mode</b>	<p>To put a label into Edit mode, either:</p> <ul style="list-style-type: none"><li>• Select the <b>Edit Label</b> option from the context menu, or</li><li>• Select a label and press ( <b>F2</b> )</li></ul> <p>To save the current text to the field, either press ( <b>Return</b> ) or deactivate the Edit window</p> <p>To cancel edit mode without saving any changes, press ( <b>Esc</b> ).</p>	

#### 5.7.2.15 Reverse Connector

You can reverse the direction of a connector without having to delete and re-create it. This is helpful if your design changes or you add the connector wrongly to begin with.

##### How to

Step	Action	See also
1	Right-click on the incorrect connector.	
2	Select the <b>Connection Detail   Reverse Direction</b> context menu option.	

#### 5.7.2.16 Set Association Specializations

UML enables specialization of properties defined by Associations. Enterprise Architect enables this through the **Specialize Associations** option in the advanced section of the context menu for an Association.

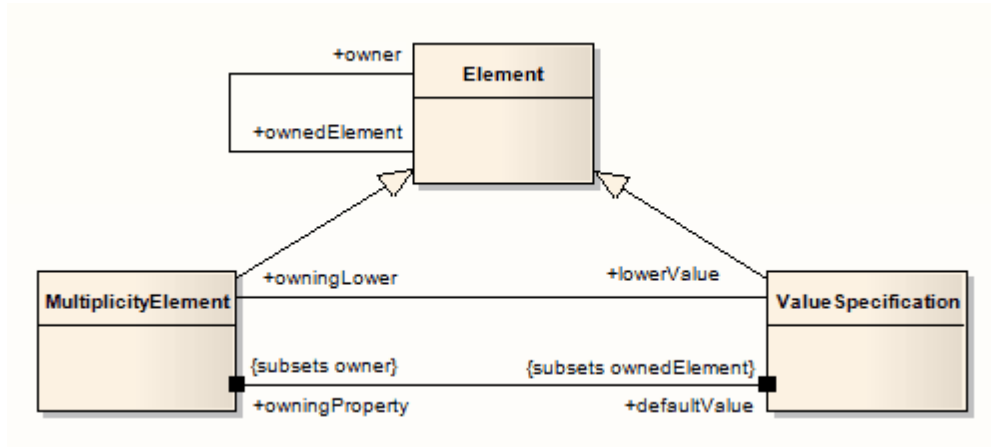

A dialog displays, showing all Associations between the two Classes connected by the current Association and their parents.

The left two columns define the source role of the current Association, while the right two define the target role. With this you are able to select the relationships of each end of the properties listed. When a relationship is set then this is drawn at the corresponding end of the connector on any diagram it appears on.

The dialog displays when you select the **Advanced | Specialize Associations** context menu option on the

lowest Association connector in the following diagram.

#### Example

#### 5.7.2.17 Change Sequence Message Scope

A message in a Sequence diagram represents a dynamic interaction from one element to another. Sometimes when you are designing your model you might have to change either the start or end point of a message as the responsibilities of elements change during design. For this reason, Enterprise Architect enables you to change the message scope by setting a new start or end element.

#### How to

Step	Action	See also
1	Select the message in the Sequence diagram.	
2	Right-click on the message to open the context menu.	
3	Select <b>Advanced   Set Source and Target</b> .	
4	In the pop up dialog, in the <b>From Element</b> and <b>To Element</b> fields, click on the drop-down arrows and select the required elements.	
5	Click on the <b>OK</b> button to save changes. The message is re-routed to meet your changed requirements.	

### 5.7.2.18 Show Uses Arrow Head

By default the *Use* connector in Use Cases has no arrow head.

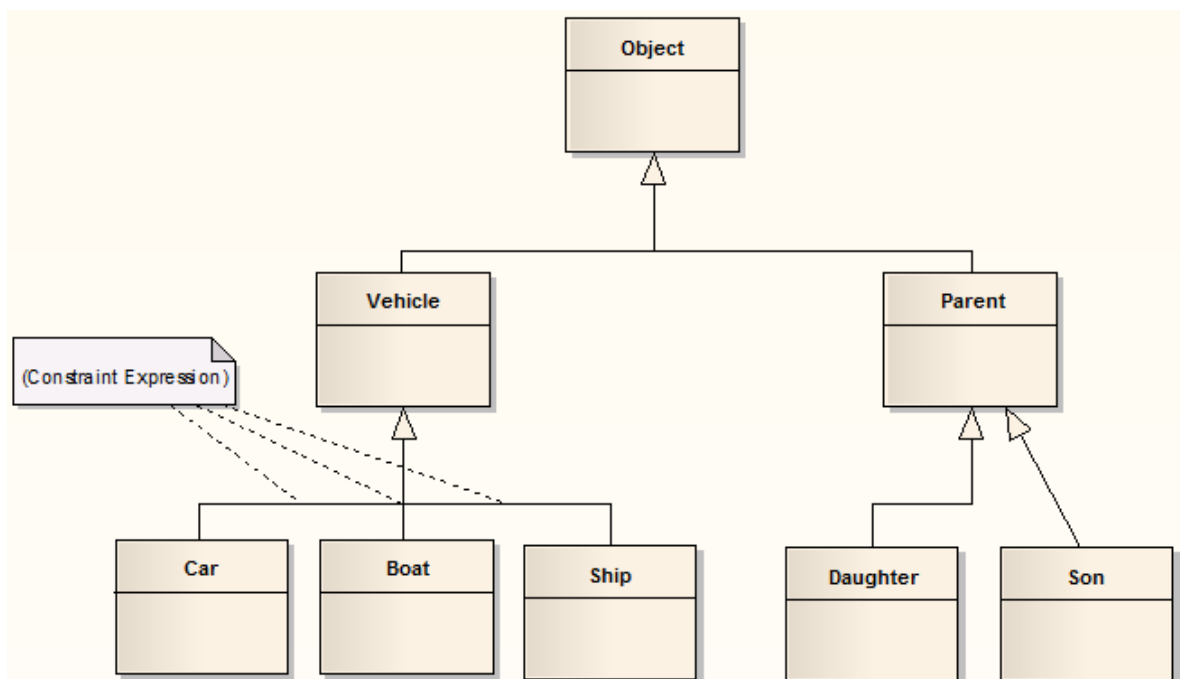

#### How to

To generate arrow heads on Use connectors

Step	Action	See also
1	Select the <b>Tools   Options   Links</b> menu option. The Links page of the Options dialog displays.	
2	In the General panel, select the <b>Show Uses arrowheads</b> checkbox.	
3	Click on the <b>Close</b> button. When you save the Use Case diagram, the Use connectors change to display arrowheads.	

### 5.7.2.19 Tree Style Hierarchy

In Enterprise Architect you can create a tree style inheritance diagram using a special form of the *Generalization* connector, as shown below.

**How to**

To create a tree style connector

Step	Action	See also
1	Create a normal Generalization between two elements.	
2	Right-click on the connector to open the context menu.	
3	Select the <b>Line Style   Tree Style - Vertical</b> or the <b>Line Style   Tree Style - Horizontal</b> menu option.	
4	Enterprise Architect automatically makes the Generalization layout conform to a specific shape.  By adding more Generalization connectors, and checking their Tree Style options, you can achieve the appearance of the diagram above.  You can slide the root and child Classes left and right to achieve the required result; Enterprise Architect maintains the conformity of the branch connectors.	

To set this style of connector as default

Step	Action	See also
1	Select the <b>Tools   Options   Links</b> menu option.  The Links page of the Options dialog displays.	
2	Select the <b>Generalization link style Default = Tree</b> checkbox to make this branching style the default style for inheritance connectors.	

**Notes**

- In the example diagram, the *Son ->Parent* connector has not yet been put in **Tree Style - Vertical** style
- This style of diagram provides a clearer layout for inheritance hierarchies and is easy to work with

**5.7.3 Connector Properties**

To access the connector Properties dialog, double-click on a connector in a diagram. You can change several characteristics of connectors from this dialog. Many of these characteristics generate text labels on or around the connector. You can change these labels using the **Label** context menu.

The connector Properties dialog has the following pages:

- General (see below)
- Constraints
- Binding
- Source Role
- Target Role
- Tagged Values
- Advanced properties.

**Access**    **Double-click on a connector in the diagram, or**  
**Right-click a connector in a diagram and, from the context menu, select Properties**

The General page enables you to configure the name of the connector, the direction, the line style, the stereotype (optional) and a comment.

#### General Page Options

Field/Option/ Button	Action	See also
<b>Source</b>	Indicates the name of the source element for the connector.	
<b>Target</b>	Indicates the name of the target element for the connector.	
<b>Name</b>	(Optional) Indicates a name for the connector; if entered, the name displays on the diagram.	
<b>Alias</b>	(Optional) Indicates an alternative name or alias for the connector.	
<b>Direction</b>	Select the appropriate direction details: from source to destination, destination to source, or bi-directional.  Some connectors have arrow heads that depend on this setting; some connectors are logically dependent on this (such as Inheritance).	
<b>Style</b>	Select the appropriate connection style; choose from: <ul style="list-style-type: none"> <li>• Direct</li> <li>• Auto-Routing</li> <li>• Bezier</li> <li>• Custom</li> <li>• Tree (Vertical, Horizontal, Lateral Vertical or Lateral Horizontal), or</li> <li>• Orthogonal (Square Corners or Rounded Corners)</li> </ul>	
<b>Stereotype</b>	(Optional) Indicate the name of a stereotype for the connector, or	<a href="#">Stereotype Selector</a>

Field/Option/ Button	Action	See also
	<p>click on the drop-down arrow and select one.</p> <p>Alternatively, click on the ( ... ) button and select the stereotype from the Stereotype Selector dialog.</p> <p>If entered, the stereotype is displayed on the diagram and overrides the connector type in the report documentation.</p>	
<b>Virtual Inheritance</b>	Indicates that inheritance is virtual; available only for <i>Generalization</i> connectors.	
<b>Scope</b>	Select the appropriate value for the scope (used for inheritance); available only for <i>Generalization</i> connectors where the child Class is C++.	
<b>Notes</b>	<p>(Optional) Specifies any notes on the connector; the notes are displayed in documentation, if required.</p> <p>As for the Notes window, you can format the text using the Notes toolbar at the top of the field.</p>	<a href="#">Notes Window</a>  <a href="#">Notes Toolbar</a> 

### Notes

- Generalize, Realize, Associate and Template Binding connectors also have a Binding page, which enables you to define binding expressions and parameter substitutions for the connector

### Learn more

- [Message Scope](#) 
- [Constraints](#) 
- [Binding](#) 
- [Source Role](#) 
- [Target Role](#) 
- [Connector Advanced](#) 
- [Tagged Values](#) 
- [Template Binding](#) 
- [Manage Object Labels](#) 

### 5.7.3.1 Connector Constraints

A UML connector can also have associated constraints placed on it. Constraints tell us something about the rules and conditions under which a relation operates. For example, it might be a pre-condition that a customer is of a certain type before an Association connector to an Account is allowed.

### How to

To set constraints on a connector

Step	Action	See also
1	Double-click on a connector to open the Connector Properties dialog.	
2	Select the Constraints tab.	
3	Fill in details of the constraint(s) that apply and click on the <b>Save</b> button.	

### Reference

Field	Usage	See also
<b>Constraint</b>	The name of the constraint.	
<b>Type</b>	Specifies the type of constraint (such as pre-condition).	
<b>Notes</b>	Indicates notes on the connector.	
<b>Defined Constraints</b>	Displays the list of constraints for this connector.	

### Notes

- Constraints about an Association (connector) can be added to further refine the model; constraints detail the business and operational rules for the model

### 5.7.3.2 Binding

Generalize, Realize, Associate and Template Binding connectors have a Binding tab on their Properties dialog. This enables you to define binding expressions and parameter substitutions for the connector.

### Learn more

- [Template Binding](#)<sup>[1444]</sup>
- [Parameter Substitution](#)<sup>[1445]</sup>
- [Parameterized Classes \(Templates\)](#)<sup>[1365]</sup>
- [Class Details](#)<sup>[959]</sup>

### 5.7.3.3 Source Role

A connector can have certain properties assigned to one end, and be associated with the particular role that element plays in the relationship. You can enter details about this role to further develop your model.

This description refers to the role of the *Source* element in a relationship, but applies equally to the role of the *Target* element.

#### Set the source role details

Step	Action	See also
1	Double-click on a connector to open the Connector Properties dialog.	
2	Select the Source Role page.	
3	Enter the required details and click on the <b>OK</b> button.	

#### Field Details

Field	Action	See also
<b>&lt;Type&gt; Role</b>	Enter the name of the role to be played.	
<b>Alias</b>	Enter an alias for the role, if required.	
<b>Role Notes</b>	Enter notes about the role.	
<b>Derived</b>	Indicate that the role value or values can be computed from other information.	
<b>Owned</b>	Indicate that the role is owned by the opposite Class rather than the Association.  Selecting this checkbox adds a 'dot' to the appropriate end of the connector (  ).	
<b>Derived Union</b>	Indicate that the role is derived from the properties that subset it.	
<b>Multiplicity</b>	Specify the role multiplicity (you can define the values of this field on the Cardinality tab of the UML Types dialog).  This is the range of instances of the role that can be active in the relationship - for example, <i>one</i> employee can be assigned to tasks; for the target role you define the range of instances (such as tasks) the	<a href="#">Cardinality</a>  <a href="#">Attribute properties</a> 

Field	Action	See also
	<p>employee could be assigned to.</p> <p>The values have the following formats:</p> <ul style="list-style-type: none"> <li>• *, or <b>0..*</b> - zero, one or many instances</li> <li>• <b>0..n</b> - zero or up to n instances, but no more than n</li> <li>• <b>n</b> - exactly n instances</li> <li>• <b>n..*</b> - n, or more than n instances</li> </ul> <p>You can also define source and target element multiplicity in the element Attribute properties.</p>	
<b>Ordered</b>	Indicate that the role is a list and the list is ordered.	
<b>Allow Duplicates</b>	<p>Indicate that the role can contain duplicate elements (relevant only if multiplicity is &gt; 1).</p> <p>This field maps to the UML property <i>isUnique</i> (selecting the checkbox maps to the <i>isUnique</i> value of <i>FALSE</i>).</p>	
<b>Containment</b>	Indicate the nature of the containment at the Destination (reference, value...).	
<b>Access</b>	Indicate the access level for the role.	
<b>Aggregation</b>	Indicate the type of aggregation that this role uses.	
<b>Target Scope</b>	Indicate the level at which this role applies (instance or classifier).	
<b>Navigability</b>	Indicate whether or not this role is navigable (non-navigable ends are shown depending on diagram properties).	
<b>Changeable</b>	Indicate whether this role is subject to change.	
<b>Constraint(s)</b>	Indicate a constraint on the role.	
<b>Qualifier(s)</b>	<p>Indicate any qualifiers or restrictions on the role; separate multiple qualifiers with a semi-colon.</p> <p>Alternatively, click on the ( ... ) button at the end of the field, and define a new qualifier on the Qualifiers dialog (qualifiers typed into the <b>Qualifier (s)</b> field are also automatically added to this dialog).</p>	<a href="#">Qualifiers Dialog</a> <sup>[1396]</sup>
<b>Stereotype</b>	(Optional) Indicate the name of a stereotype that applies to this end of	<a href="#">Stereotype</a>

Field	Action	See also
	the Association, or click on the ( ... ) button at the end of the field and select a stereotype from the Stereotype Selector dialog.	<a href="#">Selector</a> 
<b>Member Type</b>	Indicate a role type that can be used when generating collection Classes for multiplicity > 1.	

#### Notes

- Source role details are displayed at the start end of a connector; if you have drawn the connector the wrong way, you can always use the **Reverse Direction** menu option from the connector context menu

### 5.7.3.4 Target Role

A connector can have certain properties assigned to one end, and be associated with the particular role that element can play in the relationship.

You can enter details about this role to further develop your model.

#### Set the destination role details

Step	Action	See also
<b>1</b>	Double-click on a connector to open the Connector Properties dialog.	
<b>2</b>	Select the Target Role tab.	
<b>3</b>	The details and appearance of this tab are identical to the Source Role tab.	<a href="#">Source Role</a> 

#### Notes

- Destination role details are displayed at the terminating end of a connector on the diagram

### 5.7.3.5 Connector Tagged Values

The Tagged Values tab of the connector Properties dialog simply provides the Tagged Values window within the frame of the Properties dialog.

You can define Tagged Values for the connector and, on Association and Aggregation connector types, you can set additional Tagged Values for the source and/or target role.

#### How to

To set Tagged Values for the connector

Step	Action	See also
1	On the Properties dialog for the connector, click on the Tagged Values tab.	
2	Select the connector type, <b>Connector Source</b> or <b>Connector Target</b> as required.	
3	Either click on the <b>New Tags</b> button or press ( <b>Ctrl+N</b> ). The Tagged Value dialog displays.	
4	In the <b>Tag</b> field type the tag name and value, or click on the drop-down arrow and select a predefined Tagged Value type.	
5	Click on the <b>OK</b> button to save the changes.	

#### Learn more

- [Tagged Values](#)  f1134

### 5.7.3.6 Connector Advanced

The Advanced page displays the advanced properties of the connector (where they exist) and enables you to reset the values of these properties.

#### How to

To set a value for an advanced (or custom) property

Step	Action	See also
1	Click on the data field to the right of the property name.	
2	Depending on the property, either: <ul style="list-style-type: none"> <li>• Type the value in free text</li> <li>• Click on the drop-down arrow and select the value from the list</li> <li>• Click on the ( ... ) Browse button and search for the required value</li> </ul>	
3	Click on the <b>OK</b> button.	

## 5.8 Tagged Values

### Topics

Topic	Detail	See also
<b>What is a Tagged Value</b>	<p>Tagged Values are a convenient way of adding additional information to an element, beyond what is directly supported by UML. The UML specification provides the Tagged Value element for just this purpose.</p> <p>Often Tagged Values are used during code generation or by other tools to pass information or operate on elements in particular ways. Tagged Values are the preferred method of extending the code generation capabilities of the modeling tool per element / per language.</p> <p>A Tagged Value, strictly, is the value of a property of a modeling item, the property being called a tag. For example, a Class element called <i>Person</i> might have a tag called <i>Age</i> with the Tagged Value of <b>42</b>. The combination of tag and value, however, is often referred to as a Tagged Value.</p> <p>Enterprise Architect defines a Tagged Value Type, which constrains the possible values of a tag and can specify how a value is assigned to the tag. For example, the tag <i>Age</i> might have a Tagged Value Type of <i>Integer</i>, so the user simply types in a numeric value. Alternatively, the type could be <i>Spin</i>, with lower and upper limits of, say, <b>20</b> and <b>120</b>, so the user sets a value by clicking on arrows in the field to increment or decrement the value within the limits of 20 and 120.</p> <p>To quickly add Tagged Values to one of more elements, see the <i>Quick Start - Add Tagged Value to Elements</i> topic.</p>	<p><a href="#">Tagged Value Type</a> <sup>[1150]</sup></p> <p><a href="#">Quick Start - Add Tagged Value to Elements</a> <sup>[1136]</sup></p>
<b>The Tagged Values Window</b>	<p>The Tagged Values window is used to view and modify Tagged Values for the currently selected modeling item, either in the current diagram or in the Project Browser.</p> <p>The Tagged Values window is a dockable window. You can use it to perform the following actions:</p> <ul style="list-style-type: none"> <li>• Assign a Tagged Value to an Item</li> <li>• Modify Tagged Values</li> <li>• Assign Notes to a Tagged Value</li> <li>• Perform advanced tag management</li> </ul> <p>A Technology Developer can also create new structured Tagged Values, reference data Tagged Values and custom Tagged Values from predefined Tagged Value Types.</p>	<p><a href="#">Assign a Tagged Value to an Item</a> <sup>[1137]</sup></p> <p><a href="#">Modify Tagged Values</a> <sup>[1138]</sup></p> <p><a href="#">Assign Notes to a Tagged Value</a> <sup>[1138]</sup></p> <p><a href="#">Perform Advanced Tag Management</a> <sup>[1140]</sup></p> <p><a href="#">Custom Tagged Values</a> <sup>[1626]</sup></p> <p><a href="#">Tagged Value Types</a> <sup>[1627]</sup></p>

Topic	Detail	See also														
<b>Model Elements and Features with Tagged Values</b>	The following model components can use the Tagged Values window as a convenient way to quickly view and modify Tagged Values:															
	<table><tr><th>Component</th><th>Description</th></tr><tr><td><b>Elements</b></td><td>Elements display their own Tagged Values and inherited values.</td></tr><tr><td><b>Object Instances</b></td><td>Object Instances display owned tags and those inherited from their classifier.</td></tr><tr><td><b>Ports and Parts</b></td><td>Ports and parts display information similar to Port/Part 'Type' instead of a classifier. #### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Getting Started** | **Basic Tasks** | **Add A Tagged Value**

### 5.8.1 Quick Start - Add Tagged Value To Elements

You can add a Tagged Value to one or more elements with a special shortcut. You can also use the Current Element toolbar, on which the last button is a shortcut to the **Add Tagged Value** function.

To delete this property you must open the element Properties dialog, go to the Tagged Values tab and manually delete the item. There is currently no shortcut to delete tags from multiple elements simultaneously.

To add notes to the Tagged Value, go to the Tagged Values tab, click on the Tagged Value name, and click on the **Edit Notes** button in the tab toolbar. The Notes dialog displays.

Any Notes text you enter also displays in the **Info** section at the bottom of the Tagged Values window.

#### Access    **Add | Tagged Value**

#### Add a Tagged Value

Step	Action	See also
1	<p>From an element context menu (or the context menu of a multi-selection) choose the <b>Advanced   Tagged Value</b> menu option.</p> <p>Alternatively, in a diagram, select one or more elements and press <b>Ctrl+Shift+T</b>. The Tagged Values dialog displays, in which you enter a Name and Value for the tag.</p>	<a href="#">Tagged Values</a> <sup>[1134]</sup>
2	Click on the <b>OK</b> button to add your new Tagged Value to all the currently selected elements.	

Learn more

- [The Element Browser](#)<sup>[989]</sup>

**5.8.2 Assign a Tagged Value to an Item**

You can assign Tagged Values to a range of model objects, including elements, object instances, connectors, attributes and operations, using the Tagged Values window. You would probably have the window open already as a docked window, and any object you select becomes the focus of the window; you can then review and add or delete Tagged Values for that object.

**Access**    **View | Tagged Values** (Ctrl+Shift+6 )

Assign a Tagged Value to an item

Step	Action	See also
1	Select the model feature to which to assign a Tagged Value. This feature becomes the focus of the window.	
2	In the Tagged Value window, either click on the <b>New Tags</b> button  or press ( <b>Ctrl+N</b> ). The Tagged Value dialog displays.	
3	In the <b>Tag</b> field type the tag name, or click on the drop-down arrow and select the appropriate tag to assign to the item.	
4	If appropriate, type a specific value for the tag in the <b>Value</b> field.	
5	To confirm selection of the Tagged Value, click on the <b>OK</b> button.	

Notes

- You can also assign a Tagged Value directly to an element by clicking on the element and either selecting the **Element | Advanced | Add Tagged Value** menu option or pressing ( **Ctrl+Shift+T** ), and completing the Tagged Value dialog as described above

- [Predefined Tagged Value Types](#)<sup>[1621]</sup>
- [Assign Notes to a Tagged Value](#)<sup>[1138]</sup>
- [Modify Tagged Values](#)<sup>[1138]</sup>
- [Model Elements and Features with Tagged Values](#)<sup>[1135]</sup>

### 5.8.3 Assign Notes to a Tagged Value

Once a Tagged Value has been assigned to a model feature, you can add information and **notes** describing the Tagged Value to the information property of the Tagged Value.

**Access** **View | Tagged Values (Ctrl+Shift+6)**

#### Assign a note to a Tagged Value

Step	Action	See also
1	Select the <b>Tagged Values</b> menu option. The Tagged Values window displays.	
2	Click on the model feature for which to edit the Tagged Values. Its Tagged Values display in the Tagged Values window.	
3	Click on the Tagged Value to add information to.	
4	Click on the <b>Edit Tagged Value Notes</b> button or press <b>Ctrl+E</b> . The Tagged Value Note dialog displays.	
5	In the <b>Note</b> field, type the information relating to the Tagged Value. Click on the <b>OK</b> button. The information is displayed in the lower portion of the Tagged Values window whenever the Tagged Value is selected.	

#### Learn more

- [Model Features](#) 

### 5.8.4 Modify Tagged Values

Once a Tagged Value has been assigned to a model feature (such as an element or connector), it is possible to edit the values in the Tagged Values window.

**Access** **View | Tagged Values ( Ctrl+Shift+6 )**

#### Edit Tagged Values

Step	Action	See also
1	<p>Click on the model feature for which to edit the Tagged Values.</p> <p>The Tagged Values window shows all of the tags for the selected feature, each with their current value.</p>	
2	<p>Edit the fields as appropriate; the information entered can only reflect the value types that have been defined by the tag's Tagged Value Type.</p> <p>There are six types of value field for a Tagged Value:</p> <ul style="list-style-type: none"> <li>• 'Open' fields, in which you can type any appropriate value</li> <li>• Structured Tags, where you do not directly edit the composite value but expand the tag to show the component tags and edit the component values in 'open' fields; the composite value updates as you click off the component field</li> <li>• 'Drop-down list' fields, where you click on the drop-down arrow to select from a discrete list of possible values such as <b>M</b> or <b>F</b>, or <b>Win</b>, <b>Lose</b> or <b>Draw</b></li> <li>• 'Spin' fields, where you click on up or down arrows in the field to increase or decrease the value within certain limits</li> <li>• Checklist fields, where you click on an ellipsis ( ... ) in the field to display the Check List dialog, which lists a set of items that can be selected by ticking the checkbox against each item; if any checkboxes are <b>not</b> selected the value of the tag is <b>Incomplete</b>, and when <b>all</b> checkboxes are selected the tag value is <b>Complete</b></li> <li>• 'Further detail' fields, where you click on an ellipsis ( ... ) in the field to display a dialog in which you enter information (such as notes) or indicate a source of further information (such as a classifier)</li> </ul>	<p><a href="#">Predefined Structured Types</a> <sup>[1622]</sup></p> <p><a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup></p>

### Notes

- To override a Tagged Value defined in a parent element, edit the value in the *from <parentname>* compartment of the Tagged Values window

Once this has been done the tag is moved into the selected element's Tagged Values; this does not affect the Tagged Values defined in the parent element

- [Tagged Values](#) <sup>[1134]</sup>
- [Assign a Tagged Value to an Item](#) <sup>[1137]</sup>

## 5.8.5 Show Duplicate Tags

Tagged Values are by default set to hide duplicate values. This setting is used to facilitate inherited and overridden tag names.

### How to

To set the Tagged Values window to show duplicate values

Step	Action	See also
1	On the Tagged Values window toolbar, click on the <b>Options</b> icon.	
2	Select the <b>Show Duplicate Tags</b> context menu option.	

**Alternatively:**

Step	Action	See also
1	Select the <b>Tools   Options</b> menu option. The Options dialog displays.	
2	From the hierarchical tree, select the <b>Objects</b> item.	
3	Select the <b>Show Duplicate Tags</b> checkbox.	

**Notes**

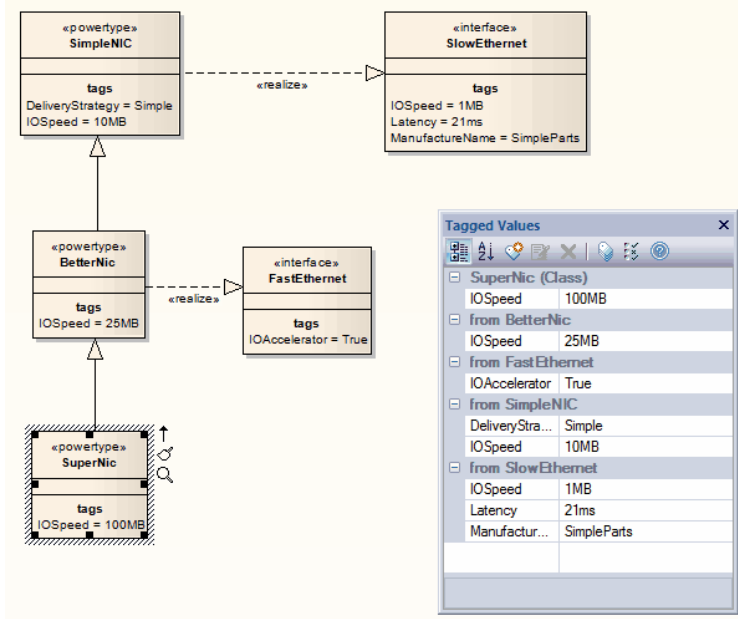

- In either procedure, to hide duplicate values again deselect the option or check box

**5.8.6 Advanced Tag Management**

Tagged Values can also be managed within a type hierarchy and with respect to element instances, using the Tagged Values window.

**Topics**

Topic	Detail	See also
<b>Usage</b>	Using the Tagged Values window it is possible to: <ul style="list-style-type: none"> <li>• View Tagged Values inherited from parent Classes or realized interfaces or applied stereotypes</li> <li>• Override Tagged Values derived from parents or applied stereotypes with a unique value for the current element</li> <li>• Delete Tagged Values from the current element (if a parent version of the Tagged Value exists, it re-appears in the list after the override is deleted)</li> </ul>	
<b>Tag Hierarchy</b>	The diagram below illustrates a complex tag hierarchy and the way Tagged Values can be either inherited or overridden in specialized Classes to create the final tagged property set for an element.  Note also that a similar concept applies to instances, in which case the full tag set is created from the directly owned tags, plus all of

## 5.9 Notes

Notes are the main documentation feature you use to describe an element, diagram, feature or connector; in the documentation that Enterprise Architect generates, notes feature prominently. You can record and view notes on a modeling object using the Notes window.

**Access** **View | Notes** (Ctrl+Shift+1)

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>You use the Notes window to view and edit the documentation (notes) associated with elements, diagrams, attributes, operations and connectors, either from a diagram or from the Project Browser.</p> <p>When you select an element, the note displayed changes to reflect the current selection; if you make changes to notes in this window, they are saved.</p> <p>If you want to display the Notes information in a more readable layout, you can resize the window.</p> <p>You can also format the notes text using the Notes toolbar at the top of the Notes window.</p> <p>You can cut, copy, paste and delete text in the Notes window, or in any <b>Notes</b> or <b>Description</b> field that shows the Notes toolbar, using a right-click context menu; from the context menu, you can also select an option to spell-check a highlighted word.</p> <p>You can also edit notes by double-clicking on an element or connector in a diagram or in the Project Browser, to open the Properties dialog and edit the <b>Notes</b> field; any formatting changes made in one display are reflected in the other.</p> <p>On the Testing, Maintenance and Project Management windows, any descriptive, history, input or results text for a selected item is also displayed in the Notes window; you cannot edit this text in the Notes window.</p>	<p><a href="#">Notes Toolbar</a> <sup>1143</sup></p>
<b>Glossary Entries</b>	<p>The Notes window or field also enables you to create a Project Glossary entry from text you have highlighted in the window or field.</p> <p>To create the Glossary entry</p> <ul style="list-style-type: none"> <li>• Highlight the notes text to use as the Glossary definition (if suitable text is available), and press ( <b>Ctrl+C</b> ) to copy it</li> <li>• Highlight the text to use as the Glossary term, and right-click on it to display the context menu</li> <li>• Select the <b>Create   Glossary Definition</b> menu option; the Glossary Detail dialog displays, with the selected term in the <b>Term</b> field</li> <li>• If you have copied some definition text, paste it into the <b>Meaning</b> field; otherwise type a suitable definition of the term in this field</li> </ul>	<p><a href="#">Project Glossary</a> <sup>533</sup></p> <p><a href="#">Glossary Detail</a> <sup>534</sup></p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>In the <b>Type</b> field, select the appropriate term type</li> <li>Click on the <b>Apply</b> button to save the new Glossary definition</li> </ul> <p>The term displays in the Notes text as a roll-over hyperlink which, when you move the cursor over it, displays the Glossary definition of the term.</p> <p>Having created a glossary definition anywhere else in the model, you can insert the glossary term in the text of the Notes window (or Notes panel of a dialog) as a rollover hyperlink to the definition.</p>	
<b>Inserting a Glossary term in a Notes Window</b>	<ul style="list-style-type: none"> <li>In the <b>Notes</b> window, move the cursor to the point in the text at which to insert the glossary term</li> <li>Press ( <b>Ctrl+Space</b> ); the glossary term selection list displays</li> <li>Double-click on the term to insert in the Notes text; the term is inserted as a rollover hyperlink to the definition</li> </ul>	
<b>Additional keyboard shortcuts</b>	<ul style="list-style-type: none"> <li>Insert Date and Time ( <b>F5</b> )</li> <li>Select line of text ( <b>F8</b> )</li> <li>Spell check Notes text only ( <b>F7</b> )</li> <li>Undo changes ( <b>Ctrl+Z</b> )</li> <li>Redo changes ( <b>Ctrl+Y</b> ) or ( <b>Ctrl+Shift+Z</b> )</li> <li>Copy ( <b>Ctrl+C</b> )</li> <li>Paste ( <b>Ctrl+V</b> )</li> <li>Cut ( <b>Ctrl+X</b> )</li> </ul> <p>Any Note text appearing in the element Note compartments in diagrams is not formatted.</p>	

### 5.9.1 Notes Toolbar

Although it is not an independent toolbar that you can pin to the screen top or sides, or float in your work area, the Notes toolbar appears in many places across Enterprise Architect in the **Notes**, **Description** and **History** fields.

#### Topics

Topic	Detail	See also
<b>Where the Toolbar Appears</b>	<p>Throughout Enterprise Architect on various tabs and pages of, for example, the:</p> <ul style="list-style-type: none"> <li>Element and Connector Properties dialogs</li> </ul>	

	<ul style="list-style-type: none"> <li>• Operations and Attributes Properties dialogs</li> <li>• Diagram Properties dialog</li> <li>• Hyperlink Details dialog</li> <li>• Testing window descriptions</li> <li>• Notes window</li> <li>• Glossary Detail dialog</li> <li>• Assigned Resources dialog</li> <li>• Project Management window</li> <li>• Scenarios &amp; Requirements window</li> </ul>	
Options	 <p>The options of this toolbar operate on selected text and any new text continuing from the formatting.</p> <p>The options (with some keyboard shortcuts) are, from left to right:</p> <ul style="list-style-type: none"> <li>• Make text bold ( <b>Ctrl+B</b> )</li> <li>• Make text italic ( <b>Ctrl+I</b> )</li> <li>• Underline text ( <b>Ctrl+U</b> )</li> <li>• Change the font color of the text</li> <li>• Insert list bullet points ( <b>Ctrl+.</b> ) (full stop)</li> <li>• Insert list numbering ( <b>Ctrl+1</b> )</li> <li>• Make text superscript</li> <li>• Make text subscript</li> <li>• Insert a hyperlink - this displays the Hyperlink Details dialog, on which you specify the type of hyperlink and type in or browse for the location of the target of the hyperlink; you can use full paths or local (path substitution) paths, and you can either select or type the link text or leave the text blank to use the link address as the text</li> <li>• Create a new linked document for the element, or edit an existing one</li> </ul>	<p><a href="#">Hyperlinks</a> [2002]</p> <p><a href="#">Create Linked Document on an Element</a> [1047]</p>

### Notes

- If the toolbar is displayed but grayed out, the text field is read-only and cannot be edited; other long text fields in Enterprise Architect might not have the toolbar, in which case the Notes facility is not available for those fields
- For any Notes text that is displayed on a diagram, you must select the **Render Formatted Notes** checkbox on the Feature Visibility dialog in order to reproduce the formatting
- You can create a Project Glossary term and definition from text in any field that has the Notes toolbar

## 5.10 Reference Data

Reference data is used in many places to provide content for drop-down list boxes. Setting up a project often involves setting up the base set of reference types to use. Reference data options can be set up from the **Settings** menu, including:

- People
- General Types
- Maintenance
- Metrics and Estimation
- UML
- Data Types

Having set up the reference data in a project, you can also export and import it between projects.

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Manage Reference Data - Update permission to update and delete reference items.

### Learn more

- [People](#) <sup>[1152]</sup>
- [General Types](#) <sup>[1158]</sup>
- [Maintenance](#) <sup>[1169]</sup>
- [Metrics and Estimation](#) <sup>[1169]</sup>
- [UML](#) <sup>[1146]</sup>
- [Data Types](#) <sup>[1171]</sup>
- [Export and Import](#) <sup>[374]</sup>
- [Manage Reference Data - Update](#) <sup>[329]</sup>
- [Applying Stereotypes](#) <sup>[1453]</sup>
- [Custom Stereotypes](#) <sup>[1461]</sup>

### 5.10.1 UML Types

The UML Types dialog enables you to configure stereotypes, Tagged Value types and the cardinality list for your project.

Access   **Settings | UML Types**

Use to

- Add, modify and delete stereotypes
- Customize stereotypes appearance
- Updating shape scripts and metafiles associated with Stereotypes
- Create/modify tagged values
- Define cardinality rules

#### Learn more

- [Stereotypes](#) <sup>[1147]</sup>
- [Tagged Value Types](#) <sup>[1150]</sup>
- [Cardinality](#) <sup>[1151]</sup>

### 5.10.1.1 Stereotype Settings

Enterprise Architect has an extensive set of Standard Element Stereotypes that you can apply to any UML construct. Using the Stereotypes tab of the UML Types dialog, a Technical Developer can also customize the stereotypes for your project by adding, modifying and deleting them. For information on customizing stereotypes, see *Custom Stereotypes*.

Stereotypes can be modified to make use of metafiles (image files) or customized colors, or to make use of the Enterprise Architect Shape Scripts to make new element shapes to determine the shape and dimensions of the element.

**Access**    **Settings | UML Types > Stereotypes**

#### Use to

- Add, modify and delete stereotypes
- Customize stereotypes' appearance
- Update shape scripts and metafiles associated with stereotypes

#### Reference

Field	Usage	See also
<b>Stereotype</b>	Specify the name of the stereotype.	
<b>Group name</b>	Enable grouping of stereotype features by a plural name, for attributes and operations, which is shown on diagrams in the attribute and operations compartments.	
<b>Base Class</b>	Enable the stereotyped element to inherit the base characteristics from a pre-existing element type.	
<b>Notes</b>	Indicates any notes concerning the stereotype (not the elements to which the stereotype is to be applied).	

Field	Usage	See also
<b>None</b>	Switch to the default element appearance.	
<b>Metafile</b>	Enable an image file to be used for the appearance of the stereotype.	
<b>Shape Script</b>	Specify custom shapes for the stereotype using the Enterprise Architect Shape Scripting language.	<a href="#">Shape Scripts</a> [1582]
<b>Assign</b>	Add the associated metafile or Shape Script from the stereotyped element.	
<b>Remove</b>	Remove the associated metafile or Shape Script from the stereotyped element.	
<b>Fill</b>	<p>Set the default background color of the element.</p> <p>This color will be applied to all occurrences of any element to which the stereotype has been applied; if the color is subsequently changed, the change is immediately applied to all occurrences of any element to which the stereotype was applied (as for changes to any other property of the stereotype).</p> <p>However, on elements created with the stereotype, the default color might be overridden by other color definitions of a higher priority that have been applied to the element, such as the Format Toolbar fill definition or the Alternative Appearance dialog (<b>F4</b>) definition.</p>	<a href="#">Format Toolbar</a> [785] <a href="#">Set an Element's Default Appearance</a> [927]
<b>Border</b>	Control the border color.	
<b>Font</b>	Control the color of the stereotype font.	
<b>Reset</b>	Reset the appearance of the element to the default element appearance.	
<b>Preview</b>	Provides a visual representation of the currently active Stereotype.	
<b>New</b>	Enables a new stereotype to be created.	
<b>Save</b>	Saves the Stereotype details and adds the Stereotype to the Defined Stereotypes list.	

Field	Usage	See also
<b>Delete</b>	Removes a Stereotype from the Defined Stereotypes list.	

#### Learn more

- [Standard Element Stereotypes](#) <sup>[1457]</sup>
- [Applying Stereotypes](#) <sup>[1453]</sup>
- [Custom Stereotypes](#) <sup>[1461]</sup>

#### 5.10.1.1.1 Shape Editor

The Shape Editor enables a Technology Developer to specify custom shapes via a scripting language; that is, to create *Shape Scripts*. These custom shapes are drawn instead of the standard UML notation. Each script is associated with a particular Stereotype, and is drawn for every element of that stereotype.

**Access**    **Settings | UML Types > Stereotypes : Assign**

#### Reference

Field	Usage	See also
<b>Format</b>	The format in which the script is written.	
<b>Import</b>	Opens a Windows browser dialog, allowing for a script file to be loaded.	
<b>Export</b>	Opens a Windows browser dialog, allowing for a script file to be saved.	
<b>Edit window</b>	The area in which a script can be written.	<a href="#">Writing Scripts</a> <sup>[1585]</sup>
<b>Preview of main</b>	A visual representation of the compiled script. Nothing displays until the <b>Refresh</b> button is clicked.	
<b>Next Shape</b>	If a composite shape is defined within the Edit Window, clicking on the <b>Next Shape</b> button pages through the components of the shape.	
<b>Refresh</b>	Parses your script and produces a visual example of the shape in the Preview of main window.	
<b>OK</b>	Exit from the Shape Editor; don't forget to save your scripts from the	

	Stereotype tab.	
--	-----------------	--

### Notes

- Shape Scripts adopt the same color gradient settings as normal elements, as defined in the Standard Colors page of the Options dialog
- If an element's appearance is modified by a Shape Script, many of the **Advanced** context menu options for that element are disabled
- Once you have finishing writing your Shape Script, click on the **OK** button; to save the Shape Script you must click on the Stereotypes tab

### Learn more

- [Getting Started With Shape Scripts](#) <sup>[1583]</sup>
- [Advanced Settings](#) <sup>[944]</sup>

## 5.10.1.2 Tagged Value Types

Tagged Values are used in a variety of places within Enterprise Architect to specify additional information about an element or connector. The Tagged Value Types tab of the UML Types dialog enables a Technology Developer to rapidly create Tagged Values, using a range of predefined structured Tagged Values to create structured tags that adhere to a specific format. For example, for model features that use the predefined tag Boolean you can use the Tagged Values window to assign a value of *True* or *False* and no other value.

You can also add default Tagged Value names and create predefined reference data Tagged Value types and custom masked Tagged Value types.

Any Tagged Value names created display in the drop-down lists of Tagged Value names in the Tagged Value dialogs for elements, operations and attributes.

**Access**    **Settings | UML Types > Tagged Value Types**

### Reference

Field	Usage	See also
<b>Tag Name</b>	Type the new name of the Tagged Value.	
<b>Description</b>	Type a description of the Tagged Value.	
<b>Detail</b>	Type any additional information necessary.	
<b>New</b>	Click to begin creating a new Tagged Value.	
<b>Save</b>	Click to save the details of a Tagged Value.	

Field	Usage	See also
<b>Delete</b>	Click to delete a Tagged Value from the <b>Defined Tag Types</b> list.	
<b>Defined Tag Types</b>	A list of previously defined Tagged Values.	

### Notes

- You can transport these Tagged Value Type definitions between models, using the Export Reference Data and Import Reference Data options; Tagged Value Types are exported as *Property Types*

### Learn more

- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

### 5.10.1.3 Cardinality

The Cardinality Values tab of the UML Types dialog enables you to add, modify and delete values in the default cardinality list.

The cardinality values are used to define the multiplicity of source and target elements in relationships. This is the range of instances of the role that can be active in the relationship; for example, one employee can be assigned to tasks; for the target role you define the range of instances (such as tasks) the employee could be assigned to.

The cardinality values are also used to define the multiplicity of a Classifying element; that is, the number of instances of the element that can exist. For example, the Class element *Building Walls* might have a multiplicity of 2..n, meaning that at least two walls must exist (to support the roof) but there can be many walls if the building design required it.

The values have the following formats:

- \***, or **0..\*** - zero, one or many instances
- 0..n** - zero or up to n instances, but no more than n
- n** - exactly n instances
- n..\*** - n, or more than n instances.

**Access**    **Settings | UML Types > Cardinality Values**

### Reference

Field	Usage	See also
<b>Cardinality</b>	Type the new name of the Cardinality Value.	
<b>New</b>	Type a description of the Cardinality Value.	
<b>Save</b>	Saves the Cardinality value and adds it to the Cardinality List.	
<b>Delete</b>	Deletes a Cardinality value from the Cardinality List.	
<b>Cardinality List</b>	A list of already defined Cardinality values.	

#### Notes

- You can transport these cardinality values between models, using the **Export Reference Data** and **Import Reference Data** options

#### Learn more

- [Project Clients](#) <sup>[1157]</sup>

### 5.10.2.1 Project Authors

You can define the people who are working on a project, such as the authors of specific elements.

**Access**    **Settings | Project Types | People > Project Author(s)**

#### Use to

- Maintain Authors involved within a project

#### Reference

Field	Usage	See also
<b>Name(s)</b>	<p>Type the name of the person registered as a Project Author.</p> <p>If you are using a Windows Active Directory, you can select names from the directory; click on the ( ... ) (Browse) button to display the Select Users dialog.</p> <p>You can also type a list of names separated by semi-colons; this enables you to define a group of people sharing a role, such as a team of Developers, Testers or Analysts.</p> <p>Do not leave any spaces between the names and the semicolons.</p>	<a href="#">Select Users</a>  <sup>[1154]</sup>
<b>Role</b>	<p>(Mandatory) Enter the role the Project Author plays in the project (such as Designer, Analyst, or Architect).</p> <p>You can type a role name or click on the drop-down arrow and select a role defined through the Project Roles tab.</p>	<a href="#">Project Roles</a>  <sup>[1155]</sup>
<b>Notes</b>	Type any additional notes concerning the Project Author.	
<b>New</b>	Add further Authors.	
<b>Save</b>	Add the new Author to the Defined Authors list.	
<b>Delete</b>	Removes an Author from the Defined Authors list.	
<b>Defined Authors</b>	Review the Project Authors already defined.	

#### Notes

- If you enter multiple names, Enterprise Architect adds them separately and in alphabetical order to the

**Defined Authors** list; if you then click on one of these names, Enterprise Architect displays that name only in the **Name(s)** field

- If you type in a role, this is not added to the roles on the Project Roles tab
- You can transport these author definitions between models, using the Export Reference Data and Import Reference Data options

#### Learn more

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

#### 5.10.2.1.1 *Select Users*

If your company is using a Windows Active Directory, you can select the Project Author names from the local or corporate-wide directory.

**Access**    **Settings | Project Types | People > Project Author(s) : (...)**

#### Use to

- Select Project Authors from Windows Active Directory

#### Reference

Field	Usage	See also
<b>Object Types...</b>	Opens the Object Types dialog, which provides a choice of object types that can be used.	
<b>Locations...</b>	Defines the root location from which to begin a search.	
<b>Check Names</b>	Matches object names listed in the <b>Enter the object names to select</b> section.	
<b>Enter the object names to select</b>	Specify object names to search for.	
<b>Advanced...</b>	Opens the Advanced dialog to provide further search options. For more information on this dialog, please refer to Windows Help and Support.	

#### Notes

- Multiple Entries can be typed into the **Enter the object names to select** section; ensure that objects are separated by semicolons (for example: Name01; Name02)

### 5.10.2.2 Project Roles

People associated with a project play a *role* in analysis, design or implementation, such as Application Analyst, Architect, Developer and Project Manager. Project roles define the activities that resources can undertake.

**Access**    **Settings | Project Types | People > Project Roles**

#### Use to

- Define role types that are captured within Enterprise Architect

#### Reference

Field	Usage	See also
<b>Role</b>	Type or select the name of the role.	
<b>Description</b>	Type a description of the role .	
<b>Notes</b>	Type any additional information related to the role.	
<b>New</b>	Add further Roles.	
<b>Save</b>	Add the new role to the Defined Roles list.	
<b>Delete</b>	Removes a role from the Defined Role list.	
<b>Defined Roles</b>	<p>Review the Project Roles already defined.</p> <p>The Defined Roles list is available for selection for any element in the model; for example, you can select roles on the Project Authors tab of the People dialog, and the Resource Allocation tab of the Project Management window.</p> <p>You can also specify other roles on these dialogs, but such roles are not added to the Defined Roles list.</p>	<a href="#">Project Authors</a> <sup>1153</sup> <a href="#">Resource Allocation</a> <sup>512</sup>

#### Notes

- Deleting a role has no effect on any Project Author definition having this role; the deleted role becomes a simple text entry in the Project Author definition
- You can transport these role definitions between models, using the **Export Reference Data** and **Import Reference Data** options

Learn more

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

**5.10.2.3 Project Resources**

*Resources* are, for example, project authors, analysts, programmers and architects. That is, anyone who might work on the system over time, either adding to the model or programming and designing elements of the system outside Enterprise Architect.

**Access**    **Settings | Project Types | People > Project Resources**

Use to

- Record information on project resources

Reference

Field	Usage	See also
<b>Name</b>	Type or select the name of the person listed as a resource. The resource name is available for use in Resource Management.	<a href="#">Resource Management</a> <sup>[512]</sup>
<b>Organization</b>	Type the name of the organization employing the resource.	
<b>Role(s)</b>	Type or select the role the resource plays in the project (for example, Designer, Analyst, Architect).	
<b>Phone 1, Phone 2, Mobile, Fax</b>	Type the contact telephone numbers for the resource.	
<b>Email</b>	Type the email address for the resource.	
<b>Notes</b>	Type any additional notes on the resource.	
<b>Available Resources</b>	Review resources that have already been defined.	
<b>New</b>	Add further resources.	
<b>Save</b>	Add a new resource to the Available Resource list.	

<b>Delete</b>	Delete a resource from the Available Resources list.	

#### Notes

- You can transport these resource definitions between models, using the Export Reference Data and Import Reference Data options

#### Learn more

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 5.10.2.4 Project Clients

*Project clients* are the eventual owners of the software system.

**Access**    **Settings | Project Types | People > Project Clients**

#### Use to

- Capture client details associated with the current model

#### Reference

Field	Usage	See also
<b>Name</b>	Type or select the name of the client.	
<b>Organization</b>	Type the name of the organization that employs the client.	
<b>Role(s)</b>	Type the role the client plays in the project (for example, Manager, Sponsor).	
<b>Phone 1, Phone 2, Mobile, Fax</b>	Type the contact telephone numbers for the client.	
<b>Email</b>	Type the email address of the client.	
<b>Notes</b>	Type any additional notes on the client.	
<b>Defined Clients</b>	Review clients that have already been defined.	

<b>New</b>	Add details of further clients.	
<b>Save</b>	Add a new client to the Defined Client list.	
<b>Delete</b>	Delete a client record from the Defined Client list.	

### Notes

- You can transport these client definitions between models, using the Export Reference Data and Import Reference Data options

### Learn more

- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

## 5.10.3 General Types

When you create or edit the properties of an element, you define the **type** or **status** of the property by selecting from a drop-down list that initially contains system-provided values. You can **add to or replace** any of these system values with your own **customized** values. The properties you can customize are:

- Status
- Constraint
- Constraint Status
- Difficulty
- Priority
- Test Status
- Requirement
- Scenario

Each of these can be separately managed through the General Types dialog.

**Access**   **Settings | Project Types | General Types**

### Learn more

- [Status Types](#) <sup>[1159]</sup>
- [Constraint Types](#) <sup>[1160]</sup>
- [Constraint Status Types](#) <sup>[1161]</sup>
- [Difficulty Types](#) <sup>[1163]</sup>
- [Priority Types](#) <sup>[1164]</sup>

- [Test Status Types](#) <sup>[1165]</sup>
- [Requirement Types](#) <sup>[1166]</sup>
- [Scenario Types](#) <sup>[1167]</sup>

### 5.10.3.1 Status Types

In an element Properties definition, the status of the element in the development management process is defined in the element **Status** field. You can select the appropriate value from a drop-down list, which initially contains the system values:

- **Approved**
- **Implemented**
- **Mandatory**
- **Proposed** and
- **Validated**

You can add to or replace any of these values with your own custom values. You can also assign a color band to each status type, and define the types of element that can display those colors.

**Access**    **Settings | Project Types | General Types > Status**

#### Customize Element Status Types

Field	Usage	See also
<b>Status</b>	Type the name of the status.	
<b>Description</b>	Type a short description of the status.	
<b>Status Type Color</b>	Using the drop-down arrow, select a color to be applied to the current status type.	
<b>Preview</b>	Displays a visual representation of an element with the selected status type color.	
<b>Restore Default</b>	Restore the status type color to its default setting.	
<b>Applies to...</b>	By default, status colors only apply to Requirement, Issue and Change elements. You might decide to also apply these colors to other UML elements, such as Use Cases or Classes.  To do this, click on the <b>Applies to...</b> button and, in the <b>Applied Status Colors</b> list, select the checkbox against each element type to which to apply the status colors.	<a href="#">Requirement</a> <sup>[1763]</sup> <a href="#">Issues (Defects)</a> <sup>[2631]</sup> <a href="#">Change</a> <sup>[2633]</sup>

<b>New</b>	Clear the dialog fields to create a new status.	
<b>Save</b>	Save the status, and add it to the <b>Type</b> list.	
<b>Delete</b>	Remove the currently selected status from the <b>Type</b> list.	
<b>Type</b>	Lists the current status types and descriptions for each status.	

### Notes

- To display status colors on your diagrams, you must select the **Show status colors on diagrams** checkbox on the Objects page of the Options dialog
- You can transport the status types (and the colors assigned to status types) between models, using the **Export Reference Data** and **Import Reference Data** menu options
- Requirement, Feature, Issue and Change elements have a status color **compartment**, whereas the status color for other elements is applied to the element **shadow**; to show the element shadows (and hence the status colors), select the **Element Shadows on** checkbox on the Diagram Appearance page of the Options dialog

### Learn more

- [Import Reference Data](#) <sup>[380]</sup>
- [Object Display Options](#) <sup>[631]</sup>
- [Diagram Appearance Options](#) <sup>[622]</sup>

### 5.10.3.2 Constraint Types

In an element Properties definition, each constraint on the element is defined by type in the **Constraint** field. You can select the appropriate value from a drop-down list, which initially contains the system values:

- **Invariant**
- **Post-condition**
- **Pre-condition**
- **Process** and
- **OCL**

You can add to or replace any of these values with your own custom values.

Access    **Settings | Project Types | General Types > Constraint**

### Customize Constraint Types

Field/Button	Usage	See also
<b>Constraint</b>	Type the name of the constraint to define.	
<b>Description</b>	Type a brief description of the constraint.	
<b>Note</b>	Type any further details concerning the constraint.	
<b>New</b>	Clear the fields to define a new constraint.	
<b>Save</b>	Save the constraint definition and add it to the <b>Defined Constraint Types</b> list.	
<b>Delete</b>	Remove the currently selected constraint from the <b>Defined Constraint Types</b> list.	
<b>Defined Constraint Types</b>	Lists the currently-defined constraint types and their descriptions.	

#### Notes

- You can transport customized constraint types between models, using the **Export Reference Data** and **Import Reference Data** menu options

#### Learn more

- [Constraints](#)<sup>[963]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 5.10.3.3 Constraint Status Types

In an element Properties definition, each constraint's status in the development process is defined in the constraint **Status** field. You can select the appropriate value from a drop-down list, which initially contains the system values:

- Implemented**
- Build**
- Validated**
- Approved**
- Mandatory** and
- Proposed**

You can add to or replace any of these values with your own custom values.

**Access**   **Settings | Project Types | General Types > Constraint Status Types**

### Customize Constraint Status Types

Field/Button	Usage	See also
<b>Status</b>	Type the name of the constraint status to define.	
<b>Make Default</b>	To make the selected constraint status the default for all constraint <b>Status</b> fields, select the checkbox.	
<b>New</b>	Clear the fields to define a new constraint status.	
<b>Save</b>	Save the constraint status definition and add it to the <b>Type</b> list.	
<b>Delete</b>	Remove the currently selected constraint status from the <b>Type</b> list.	
<b>Type</b>	Lists the currently available constraint status types.	
 	Move the selected constraint type higher or lower in the <b>Type</b> list.  This defines the ordering used in the <b>Status</b> drop down combo boxes, and in sorting any report or list when the Constraint Status Type is used as the sort-by property.	
<b>Sort Alphabetically</b>	Reorganize the entries in the <b>Type</b> list into alphabetical order.	
<b>Restore Defaults</b>	Remove all customized constraint status values and restore the system defaults.	

### Notes

- You can transport customized constraint status types between models, using the **Export Reference Data** and **Import Reference Data** menu options

### Learn more

- [Constraints](#) <sup>[963]</sup>
- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

### 5.10.3.4 Difficulty Types

Developing a particular element might be a simple task or more complex. In the element Properties definition, the level of difficult of developing that element is defined in the **Difficulty** field. You can select the appropriate value from a drop-down list, which initially contains the system values **High**, **Medium** and **Low**. You can add to or replace any of these values with your own custom values.

**Access**    **Settings | Project Types | General Types > Difficulty**

#### Customize Difficulty Types

Field/Button	Usage	See also
<b>Difficulty</b>	Type the name of the Difficulty to define.	
<b>Make Default</b>	To make the selected Difficulty the default for all <b>Difficulty</b> fields, select the checkbox.	
<b>New</b>	Clear the fields to define a new Difficulty type.	
<b>Save</b>	Save the Difficulty definition and add it to the <b>Type</b> list.	
<b>Delete</b>	Remove the currently selected Difficulty from the <b>Type</b> list.	
<b>Type</b>	Lists the currently available Difficulty types.	
 	<p>Move the selected type higher or lower in the <b>Type</b> list.</p> <p>This defines the ordering used in the <b>Difficulty</b> drop down combo boxes, and in sorting any report or list when the Difficulty type is used as the sort-by property.</p> <p>For example: you have several Change elements on a diagram, and you select Diagram View; then you sort on the Difficulty column. The Diagram View entries are grouped by difficulty, in the order you defined in this <b>Type</b> field.</p>	
<b>Sort Alphabetically</b>	Reorganize the entries in the <b>Type</b> list into alphabetical order.	
<b>Restore Defaults</b>	Remove all customized Difficulty values and restore <b>High</b> , <b>Medium</b> and <b>Low</b> .	

#### Notes

- You can transport customized Difficulty types between models, using the **Export Reference Data** and **Import Reference Data** menu options

#### Learn more

- [Requirement Properties](#)<sup>[1774]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 5.10.3.5 Priority Types

In an element Properties definition, the priority of developing that element is defined in the **Priority** field. You can select the appropriate value from a drop-down list, which initially contains the system values **High**, **Medium** and **Low**. You can add to or replace any of these values with your own custom values.

Access    **Settings | Project Types | General Types > Priority**

#### Customize Priority Types

Field/Button	Usage	See also
<b>Priority</b>	Type the name of the Priority to define.	
<b>Make Default</b>	To make the selected Priority the default for all <b>Priority</b> fields, select the checkbox.	
<b>New</b>	Clear the fields to define a new Priority.	
<b>Save</b>	Save the Priority definition and add it to the <b>Type</b> list.	
<b>Delete</b>	Remove the currently selected Priority from the <b>Type</b> list.	
<b>Type</b>	Lists the currently available Priority types.	
 	<p>Move the selected type higher or lower in the <b>Type</b> list.</p> <p>This defines the ordering used in the <b>Priority</b> drop down combo boxes, and in sorting any report or list when the Priority type is used as the sort-by property.</p> <p>For example: you have several Change elements on a diagram, and you select Diagram View; then you sort on the Priority column. The Diagram View entries are grouped by priority, in the order you defined in this <b>Type</b> field.</p>	
<b>Sort Alphabetically</b>	Reorganize the entries in the <b>Type</b> list into alphabetical order.	

<b>Restore Defaults</b>	Remove all customized Priority values and restore <b>High, Medium</b> and <b>Low</b> .	
-------------------------	--	--

**Notes**

- You can transport customized Priority types between models, using the **Export Reference Data** and **Import Reference Data** menu options

**Learn more**

- [Requirement Properties](#)<sup>[1774]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

**5.10.3.6 Test Status Types**

All tests defined in the Testing window and Test Details dialog have a status value to show what point in the testing cycle the test has reached. The system values you can select from the test **Status** field are:

- Not Run**
- Pass**
- Fail**
- Deferred** and
- Canceled**

You can add to or replace any of these values with your own custom values.

**Access** **Settings | Project Types | General Types > Test Status**

**Customize Test Status Types**

Field/Button	Usage	See also
<b>Status</b>	Type the name of the Test status to define.	
<b>Make Default</b>	To make the selected Test status the default for all test <b>Status</b> fields, select the checkbox.	
<b>New</b>	Clear the fields to define a new Test status.	
<b>Save</b>	Save the Test status definition and add it to the <b>Type</b> list.	
<b>Delete</b>	Remove the currently selected Test status from the <b>Type</b> list.	

<b>Type</b>	Lists the currently available Test status types.	
 	<p>Move the selected type higher or lower in the <b>Type</b> list.</p> <p>This defines the ordering used in the test <b>Status</b> drop down combo boxes, and in sorting any report or list when the Test Status Type is used as the sort-by property.</p> <p>For example: you have run several tests on a package, and you run a Test Details report; then you sort on the Status column. The report entries are grouped by test status, in the order you defined in this <b>Type</b> field.</p>	
<b>Sort Alphabetically</b>	Reorganize the entries in the <b>Type</b> list into alphabetical order.	
<b>Restore Defaults</b>	Remove all customized Test status values and restore the system defaults.	

#### Notes

- You can transport customized Test status types between models, using the **Export Reference Data** and **Import Reference Data** menu options

#### Learn more

- [Working on Test Records](#) <sup>[2605]</sup>

### 5.10.3.7 Requirement Types

In a Requirement definition, the requirement is categorized according to type or function, in the **Type** field of the Requirement properties dialog. This helps to maintain a single set of typed requirements. You can select the appropriate **Type** value from a drop-down list, which initially contains the system values:

- **Display**
- **Functional**
- **Performance**
- **Printing**
- **Report**
- **Testing** and
- **Validate**

You can add to or replace any of these types with your own customized values.

**Access**   **Settings | Project Types | General Types > Requirement**

#### Customize Requirement Types

Field	Usage	See also
<b>Requirement</b>	Type the name of the requirement.	
<b>Description</b>	Type a short description of the requirement.	
<b>Weight</b>	Type a weighting to apply to the requirement type.	
<b>New</b>	Clears the dialog fields so that you can define a new requirement type.	
<b>Save</b>	Saves the requirement type details and adds it to the Defined Requirement Types list.	
<b>Delete</b>	Deletes a selected requirement type from the Defined Requirement Types list.	
<b>Defined Requirement Types</b>	Lists the currently available requirement types.	

#### Notes

- You can transport these requirement types between models, using the **Export Reference Data** and **Import Reference Data** menu options

#### Learn more

- [Requirement Properties](#)<sup>[1774]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### **5.10.3.8 Scenario Types**

In the Scenario definitions for an element each scenario is of a specific type, which you define in the **Type** field on the Scenario page of the Properties dialog. You can select the appropriate value from a drop-down list, which initially contains the system values:

- **Exception**
- **Alternate** and
- **Basic Path**

You can add to or replace any of these system types with your own customized values.

**Access**   **Settings | Project Types | General Types > Scenario**

### Customize Scenario Types

Field	Usage	See also
<b>Scenario Type</b>	Type the name of the scenario type.	
<b>Description</b>	Type a short description of the scenario type.	
<b>Weight</b>	Type a value for the weighting to apply to the scenario type.	
<b>Notes</b>	Type any additional information to describe the scenario type.	
<b>New</b>	Clears the dialog fields so that you can define a new Scenario type.	
<b>Save</b>	Saves the scenario type and adds it to the <b>Defined Scenario Types</b> list.	
<b>Delete</b>	Deletes a selected scenario type from the <b>Defined Scenario Types</b> list.	
<b>Defined Scenario Types</b>	Lists the currently available scenario types to offer in the drop-down list of a <b>Scenario Type</b> field.	

### Notes

- You can transport customized scenario types between models, using the **Export Reference Data** and **Import Reference Data** menu options

### Learn more

- [Scenarios](#)<sup>[965]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 5.10.4 Metrics and Estimation

TCF values, EFC values and Default Hour Rate for a project are controlled from the Estimation Factors dialog.

Risk, metric and effort types for a project are controlled from the Project Indicators dialog.

For further information on these see the [Project Management](#)<sup>[509]</sup> and [Resource Management](#)<sup>[512]</sup> topics, or specifically:

- [Technical Complexity Factors](#)<sup>[585]</sup>
- [Environment Complexity Factors](#)<sup>[586]</sup>
- [Default Hours](#)<sup>[588]</sup>
- [Effort Types](#)<sup>[522]</sup>
- [Metric Types](#)<sup>[523]</sup>
- [Risk Types](#)<sup>[524]</sup>

### 5.10.5 Maintenance

**Access**    **Settings | Project Types | Maintenance**

**Use to**

- Set the base Problem Types that are handled

**Learn more**

- [Testing Types](#)<sup>[1170]</sup>

#### 5.10.5.1 Problem Types

**NOT CURRENTLY USED**

For the maintenance and change control screens, you can use the Maintenance dialog to set the base Problem Types that are handled. Examples are hardware-related issues, performance problems, software bugs and network problems.

**Access**    **Settings | Project Types | Maintenance > Problem Types**

**Use to**

- Set the base Problem Types that are handled

**Reference**

Field	Usage	See also
<b>Problem Type</b>	Indicates the name of the problem type.	

<b>Description</b>	Indicates a short description of the problem type.	
<b>Weight</b>	Indicates a weighting to apply to the problem type.	
<b>Note</b>	Indicates any additional information on the problem type.	
<b>Defined Types</b>	Displays all of the pre-defined and saved problem types.	
<b>New</b>	Add a new problem type.	
<b>Save</b>	Saves the scenario details and adds it to the Defined Types list.	
<b>Delete</b>	Deletes a scenario from the Defined Types list.	

#### Notes

- You can transport these problem types between models, using the Export Reference Data and Import Reference Data options
- You transport the problem types together with test types as a *Maintenance Types* file

#### Learn more

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

### 5.10.5.2 Testing Types

Use the Test Types tab of the Maintenance dialog to add testing types to the basic set that comes with Enterprise Architect. Typical test types are load tests, performance tests and function tests.

**Access**    **Settings | Project Types | Maintenance > Test Types**

#### Use to

- Add Testing Types

#### Reference

Field	Usage	See also
<b>Test Type</b>	Type the name of the test type.	

<b>Description</b>	Type a short description of the test type.	
<b>Weight</b>	Type a weighting to apply to the test type.	
<b>Note</b>	Type any additional information on the test type.	
<b>Defined Types</b>	Displays all of the pre-defined and saved test types.	
<b>New</b>	Add a new test type.	
<b>Save</b>	Saves the scenario details and adds it to the Defined Types list.	
<b>Delete</b>	Deletes a scenario from the Defined Types list.	

**Notes**

- You can transport these test types between models, using the Export Reference Data and Import Reference Data options
- You can either export the test types together with the default problem types, as a *Maintenance Types* file, or separately as a *Test Types* file

**Learn more**

- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>

**5.10.6 Data Types**

Different programming languages support different inbuilt data types. It is possible for you to manage and extend this set of inbuilt data types for a standard programming language, as well as define new programming languages for use within Enterprise Architect.

**Access**    **Settings > Code Engineering Datatypes**

**Programming Language Datatype Options**

Field	Usage	See also
<b>Product Name</b>	Click on the drop-down arrow and select the name of the programming language.	
<b>Add Product</b>	Click on this button to display a prompt for the name of a new programming	

Field	Usage	See also
	language. Type the name and click on the <b>OK</b> button.	
<b>Datatype</b>	Type the language-specific name of the datatype.	
<b>Common Type</b>	Type the common (or generic) name of the datatype; for example, the Java <i>boolean</i> datatype has a common datatype <i>Boolean</i> .	
<b>New</b>	Click on this button to clear the fields to create a new datatype.	
<b>Save</b>	Click on this button to save the newly created or updated datatype.	
<b>Delete</b>	Click on this button to delete the selected datatype.  You can delete your own custom data types, but you cannot delete any of the predefined data types.	
<b>Defined Datatypes for Programming Languages</b>	Review the list of datatypes for the selected language, and click on any that you want to edit or delete. The details for the selected datatype display in the dialog fields.	

### Notes

- You do not need to set the options in the Size panel
- Once you have defined at least **one** datatype for a new language, that language name is added to the drop-down list for the **Language** fields in the Programming Languages Datatypes dialog, in the Code Template Editor, and in the Properties dialog for each Class element within the model
- You can transport these data types between models, using the **Export Reference Data** and **Import Reference Data** menu options
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Configure Datatypes** permission to update and delete data types

### Learn more

- [Code Template Editor](#)<sup>[1641]</sup>
- [Export Reference Data](#)<sup>[376]</sup>
- [Import Reference Data](#)<sup>[380]</sup>
- [Permission List](#)<sup>[1130]</sup>

### 5.10.7 Resources

The Resources window is a repository of project-standard and re-usable document generation templates, MDG Technologies, Relationship Matrix profiles, commonly-used model elements, stylesheets, UML Profiles and UML Patterns. The window provides facilities for creating and modifying these structures and facilities and, in some cases, for applying the facility to the current model directly from the window.

**Access** **Project | Resources** (Alt+6)

#### Resources available through the Resources window

Resource	Description	See also
<b>Document Generation</b>	<p>The <b>Document Generation</b> folder holds a number of sub-folders, each of which provides the facilities for generating a particular type of document or report from your model.</p> <ul style="list-style-type: none"> <li> <b>System Templates</b> - this sub-folder itself has sub-folders containing system-defined report <b>templates</b>, <b>Fragments</b>, <b>Cover Pages</b>, <b>Style Sheets</b> and <b>Table of Contents definitions</b> <p>You can right-click on these template names and select options to display the template contents or to copy the template as the basis of a user-defined template that you work on in the <b>Document Template Editor</b>, under a <b>different name</b>; you can also select the <b>Override</b> option to create a copy of the system template as a user template with the <b>same</b> name</p> </li> <li> <b>User Templates</b> - this sub-folder also has sub-folders for report templates, Fragments, Cover Pages, Style Sheets and Tables of Contents, but these are the templates that you have created yourself using the Document Template Editor, either as new or by copying and editing another template <p>You can right-click on these template names and select options to create, delete, rename, modify, move or copy a user-defined template; you have additional options to <b>Mark</b> a report template as a Fragment, or a Fragment as a report template, if they are suitable for this reclassification</p> <p>You can also 'drag and drop' user-defined templates between user-defined groups, and between these groups and the appropriate standard 'type' folders; for example, from <i>DavidCover</i> to <i>Cover Pages</i></p> </li> <li> <b>Technology Templates</b> - If you have loaded an MDG Technology containing document templates, those are also listed under the Technology name </li> <li> <b>Web Style Templates</b> - this sub-folder contains the <b>HTML style templates</b> that you have created as alternatives to the system-supplied <b>&lt;default&gt;</b> template </li> </ul>	<p><a href="#">Document Templates</a>  <sup>[2681]</sup></p> <p><a href="#">Template Fragments</a>  <sup>[2708]</sup></p> <p><a href="#">Design Custom Document Templates</a>  <sup>[2684]</sup></p> <p><a href="#">Create Web Style Templates</a>  <sup>[2747]</sup></p> <p><a href="#">Resource Documents</a>  <sup>[2668]</sup></p>

Resource	Description	See also
	<p>To create a new template, right-click on the folder name and select the <b>Create HTML template</b> option, and provide a template name; this opens the <b>HTML and CSS Style Editor</b>, in which you create the template from HTML fragments</p> <p>You can right-click on the template names and select options to delete the template or modify the template contents</p> <ul style="list-style-type: none"> <li>• <b>Defined Documents</b> - this folder holds the <b>Resource documents</b> (report specifications) you have created in the Document Report Generator; you can right-click on the document name to generate documents individually or as a batch, open the generated document, or delete the report specification</li> <li>• <b>Linked Document Templates</b> - this folder holds the <b>non-standard</b> Linked Document templates, either user-defined or supplied with each MDG Technology enabled on the system; you can edit or delete any of these existing templates, or create new ones from scratch or by copying an existing template, including the system-provided linked document templates</li> </ul> <p>You can also re-assign the templates to different template groups, either another of the existing groups or a new one that you create as part of the assignment</p> <ul style="list-style-type: none"> <li>• <b>Legacy Templates</b> - if you are, or have been, using the original (legacy) Enterprise Architect report generator, this sub-folder contains the report templates that you use to generate the documents</li> </ul> <p>You can continue to create, modify, use and delete legacy style templates, but it is recommended that you switch to the later report generator</p>	<p><a href="#">Linked Documents</a> <small>[1044]</small></p> <p><a href="#">Create Linked Document Templates</a> <small>[1098]</small></p> <p><a href="#">The Legacy Report Generator</a> <small>[2720]</small></p> <p><a href="#">Legacy Report Style Templates</a> <small>[2726]</small></p>
<b>MDG Technologies</b>	<p>The MDG Technologies folder lists the MDG Technologies that have been imported directly into the Resources window. Each technology extends the modeling capabilities and facilities of Enterprise Architect.</p> <p>You can import Technologies into your project by right-clicking on the MDG Technologies folder and selecting the <b>Import Technology</b> menu option. The Copy Technology to Application Data dialog then gives you the option to import the Technology to:</p> <ul style="list-style-type: none"> <li>• <b>User</b>, for your individual use; the Technology is imported into the %APPDATA% folder and is not listed in the Resources window</li> <li>• <b>Model</b>, for all project users to access; the Technology is imported into the Resources window</li> </ul> <p>If you have any MDG Technologies in the folder, each has its own subfolder containing the Profiles, Patterns and code modules</p>	<p><a href="#">MDG Technologies</a> <small>[1475]</small></p> <p><a href="#">Import MDG Technologies to Model</a> <small>[1480]</small></p>

Resource	Description	See also
	<p>used in the technology. You can right-click on these and select options to delete the technology, review the Patterns or Profiles, or invoke the code modules.</p> <p>If you remove the technology, it is removed from the Resources window, the MDG Technologies dialog, and the model.</p> <p>Consider the fact that some MDG Technologies can be large and might impose some delays on the workstation as they load each time a user connects to the model.</p>	<a href="#">Manage MDG Technologies</a>  <sup>[1477]</sup>
<b>Matrix Profiles</b>	<p>The Matrix Profiles folder contains a list of Relationship Matrix Profiles that you or your team members have created using the Relationship Matrix or Specification Manager. You simply double-click on a Matrix Profile name to quickly open the Relationship Matrix under the settings defined in the Profile.</p>	<a href="#">Matrix Profiles</a>  <sup>[735]</sup> <a href="#">Create Matrix Profile</a>  <sup>[1744]</sup>
<b>Favorites</b>	<p>The Favorites folder provides a shortcut to each commonly-used element that you have added to the folder, so that you can quickly and easily locate the elements and add them to diagrams.</p>	<a href="#">Favorites</a>  <sup>[1176]</sup>
<b>Stylesheets</b>	<p>The Stylesheets folder contains <b>XSL stylesheets</b> that you or your team members have imported into the model. These XSL stylesheets support the optional step of converting XML files exported from the model into alternative formats such as HTML, XSL or source code. Stylesheets imported here are then available in the drop-down lists on the XML Export dialog and the Generate GML Application Schema dialog.</p> <p>Combined with UML Profiles, this is a powerful means of extending Enterprise Architect to generate almost any content required.</p> <p>To import a stylesheet:</p> <ol style="list-style-type: none"> <li>1. Right-click on the folder name and select the <b>Import Stylesheet</b> option.</li> <li>2. Locate and select the stylesheet file in the browser, and click on the <b>Open</b> button.</li> <li>3. Provide a reference name for the file, and click on the <b>OK</b> button.</li> </ol> <p>Once the stylesheet is in the folder, you can select context menu options to reload it (if it has been changed at the source) or delete it.</p>	<a href="#">Publish Model Package</a>  <sup>[476]</sup> <a href="#">Generate GML Application Schema</a>  <sup>[1987]</sup>
<b>UML Profiles</b>	<p>A Profile is a source of modified or extended element and connector types that you have developed from the UML base types. You can import each new Profile into this folder, and then create elements and connectors of the new types by dragging the icons from the Profile onto a diagram.</p> <p>Once you have Profiles in the folder, you can select options for arranging them in order of name or type, viewing a Profile</p>	<a href="#">UML Profiles in the Resources Window</a>  <sup>[1526]</sup> <a href="#">Import UML Profiles Into the Resources Window</a>  <sup>[1526]</sup>

Resource	Description	See also
	<p>description, or deleting a Profile.</p> <p>It is possible to synchronize the Tagged Values and constraints for any elements created from a Profile element in the Resources window.</p> <p>Importing and applying Profiles through the Resources window is <b>no longer recommended</b>; from Enterprise Architect release 7.0. it is recommended that you load and apply Profiles as components of MDG Technologies.</p>	<p><a href="#">Synchronize Tagged Values and Constraints</a>  <sup>1473</sup></p> <p><a href="#">Developing Profiles</a>  <sup>1485</sup></p>
<b>UML Patterns</b>	<p>The UML Patterns folder is a folder of UML Design Patterns that you or your team members have imported into the model. A Pattern captures complex new elements and features that you can drag into a diagram without having to retype or reconfigure each element.</p> <p>Within the folder, the Patterns are grouped by type. Once you have Patterns within a group, you can select options to delete all Patterns in the group or just the selected Pattern, view a Pattern's details, or apply a Pattern to an empty diagram.</p>	<p><a href="#">Design Patterns</a>  <sup>1464</sup></p> <p><a href="#">Create a Pattern</a>  <sup>1464</sup></p> <p><a href="#">Import a Pattern</a>  <sup>1466</sup></p> <p><a href="#">Use a Pattern</a>  <sup>1467</sup></p>

### Notes

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Configure Resources** permission to maintain Resources window items
- For a number of folders in the Resources window, the right-click context menu also offers a **Help** option that, when you select it, displays a brief description of the folder

### Learn more

- [Permission List](#)  <sup>329</sup>

#### 5.10.7.1 Favorites

If you have any elements that you or your team use frequently - such as the list of Actors in a system - you can add them to the **Favorites** folder in the Resources window, and use that as the source for conveniently dragging and dropping instances of or links to these elements into other diagrams. This makes it much easier to locate and use the elements as you create and manage your model.

**Access**   **Project | Resources | Favorites**

#### Actions on the Favorites Folder

Action	Detail	See also
<b>Add an element to the Favorites Folder</b>	<ul style="list-style-type: none"> <li>In a diagram, right-click on the element to add</li> <li>From the context menu select the <b>Find   Add to Favorites</b> option</li> <li>Switch to the Resources window and expand the <i>Favorites</i> folder; the added element is listed within its element-type category (such as <b>Class</b>)</li> </ul> <p>You add elements to the Favorites folder individually.</p>	<a href="#">Finding Elements</a> 
<b>Delete an element from the Favorites Folder</b>	<ul style="list-style-type: none"> <li>Right-click on the element within the <i>Favorites</i> folder in the Resources window</li> <li>From the context menu select the <b>Delete Favorite</b> option</li> <li>A confirmation prompt displays; click on the <b>Yes</b> button</li> </ul>	
<b>View Properties of an element in the Favorites Folder</b>	<ul style="list-style-type: none"> <li>Select and right-click on the element in the folder</li> <li>From the context menu, select the <b>Element Properties</b> option; the element Properties dialog displays</li> </ul>	

**Notes**

- When you have had the Favorites folder open for some time and other users might have been adding to it, right-click on the folder name and select the **Refresh Favorites** option to update your view of the folder with the new contents

## 6 Standard UML Models

This topic provides an introduction to Enterprise Architect's diagrams, elements and connectors, and its modeling process.

It also illustrates its alignment to the Unified Modeling Language (UML) 2.4.1, an open modeling standard, defined and maintained by the Object Management Group.

Topic	Detail	See also
<b>The Unified Modeling Language (UML)</b>	<p>The UML standard defines notations and rules for specifying business and software systems; the notation supplies a rich set of graphic elements for modeling object oriented systems, and the rules state how those elements can be connected and used.</p> <p>UML is not a tool for creating software systems; instead, it is a visual language for communicating, modeling, specifying and defining systems.</p> <p>UML is not a prescriptive process for modeling software systems; it does not supply a method or process, simply the language. You can therefore use UML in a variety of ways to specify and develop your software engineering project.</p> <p>This language is designed to be flexible, extendable and comprehensive, yet generic enough to serve as a foundation for all system modeling requirements. With its specification, there is a wide range of elements characterized by the kinds of diagrams they serve, and the attributes they provide. All can be further specified by using stereotypes, Tagged Values and profiles.</p> <p>Enterprise Architect supports many different kinds of UML elements (as well as some custom extensions); together with the connectors between elements, these form the basis of the model.</p>	<a href="#">UML Diagrams</a> <small>[1181]</small> <a href="#">UML Elements</a> <small>[1265]</small> <a href="#">UML Connectors</a> <small>[1389]</small> <a href="#">UML Stereotypes</a> <small>[1452]</small> <a href="#">Tagged Values</a> <small>[1134]</small>
<b>Wide Range of Applications</b>	<p>Although initially conceived as a language for software development, UML can be used to model a wide range of real world domains and processes (in business, science, industry, education and elsewhere), organizational hierarchies, deployment maps and much more.</p> <p>Enterprise Architect also provides additional custom diagrams and elements, to address further modeling interests.</p>	<a href="#">Modeling Basics</a> <small>[750]</small>
<b>Extending UML for New Domains</b>	<p>Using UML Profiles, UML Patterns, Grammars, Data Types, Constraints, MDG Technologies and other extensions, UML and Enterprise Architect can be tailored to address a particular modeling domain not explicitly covered in the original UML specification</p> <p>Enterprise Architect makes extending UML simple and</p>	<a href="#">Using UML Profiles</a> <small>[1472]</small> <a href="#">Design Patterns</a> <small>[1464]</small> <a href="#">MDG</a>

Topic	Detail	See also
	straightforward and, best of all, the extension mechanism is still part of the UML Specification.	<a href="#">Technologies</a> <small>[1475]</small>
<b>Recommended Reading</b>	<p>In addition to the UML Specification available from the OMG, two books that provide excellent introductions to UML are:</p> <ul style="list-style-type: none"> <li>• <i>Schaum's Outlines: UML</i> by Bennet, Skelton and Lunn Published by McGraw Hill. ISBN 0-07-709673-8</li> <li>• <i>Developing Software with UML</i> by Bern Oestereich Published by Addison Wesley. ISBN 0-201-36826-5</li> </ul>

## 6.1 UML Diagrams

A **UML diagram** is a representation of the components or elements of a system or process model and, depending on the type of diagram, how those elements are connected or how they interact from a particular perspective. For example, how and why an object changes state, or how requirements are realized by the process or a system.

Diagrams are developed in the main workspace (Diagram View), in which you create and connect model elements. You create diagrams by right-clicking a Package and selecting the **New Diagram** context menu option, or load them by double-clicking on their diagram icon in the Project Browser.

### Diagram Grouping

Group	Detail	See also
<b>Structural Diagrams</b>	Structural Diagrams depict the structural elements composing a system or function, reflecting the static relationships of a structure, or run-time architectures.	<a href="#">Structural Diagrams</a> <small>[1182]</small>
<b>Behavioral Diagrams</b>	Behavioral Diagrams show a dynamic view of the model, depicting the behavioral features of a system or business process.	<a href="#">Behavioral Diagrams</a> <small>[1198]</small>
<b>Extended Diagrams</b>	Enterprise Architect provides a set of additional diagram types that extend the core UML diagrams for domain-specific models.	<a href="#">Extended Diagrams</a> <small>[1793]</small>
<b>Custom Diagrams</b>	Enterprise Architect also supports diagram types specific to MDG Technologies, including integrated technologies.	<a href="#">Specialized UML Models</a> <small>[1789]</small>

### Learn more

- [Diagram Tasks](#) [820]

## 6.2 UML Structural Models

**UML Structural diagrams** depict the structural elements composing a system or function. These diagrams reflect the **static relationships** of a **structure** (Class or Package diagrams) or **run-time architecture** (Object or Composite Structure diagrams).

### Structural Diagram types

Diagram Type	Detail	See also
<b>Class</b>	Class diagrams capture the logical structure of the system, the Classes and objects that make up the model, describing what exists and what attributes and behavior it has.	<a href="#">Class diagrams</a> <sup>[1184]</sup>
<b>Composite Structure</b>	Composite Structure diagrams reflect the internal collaboration of Classes, Interfaces and Components (and their properties) to describe a functionality.	<a href="#">Composite Structure diagrams</a> <sup>[1188]</sup>
<b>Component</b>	Component diagrams illustrate the pieces of software, embedded controllers and such that make up a system, and their organization and dependencies.	<a href="#">Component diagrams</a> <sup>[1194]</sup>
<b>Deployment</b>	Deployment diagrams show how and where the system is to be deployed; that is, its execution architecture.	<a href="#">Deployment diagrams</a> <sup>[1191]</sup>
<b>Object</b>	Object diagrams depict object instances of Classes and their relationships at a point in time.	<a href="#">Object diagrams</a> <sup>[1186]</sup>
<b>Package</b>	Package diagrams depict the organization of model elements into Packages and the dependencies amongst them.	<a href="#">Package diagrams</a> <sup>[1182]</sup>
<b>Profile</b>	Profile Diagrams are those created in a «profile» Package, to extend UML elements, connectors and components.	<a href="#">Profile Diagrams</a> <sup>[1196]</sup>

### 6.2.1 Package Diagram

**Package diagrams** depict the organization of model elements into Packages and the dependencies amongst them, including Package imports and Package extensions. They also provide a visualization of the corresponding namespaces. You can use them to:

**Example Diagram** [Example Package Diagram](#) <sup>[1183]</sup>

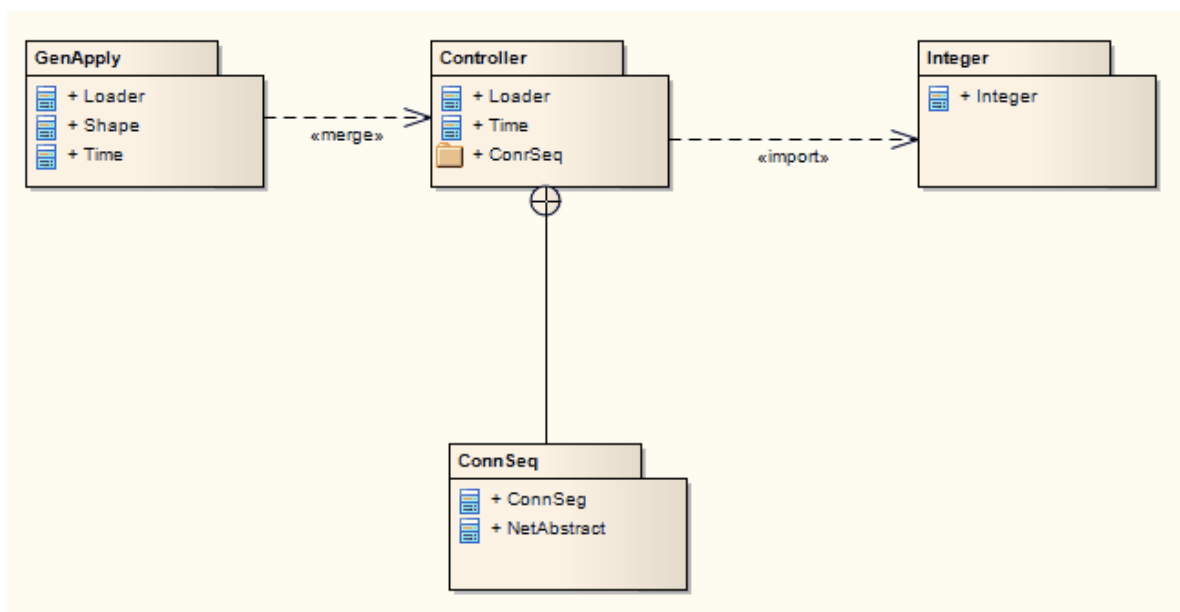

#### Tools

Select Package diagram elements and connectors from the Class pages of the Toolbox.

Package Diagram Elements	Package Diagram Connectors
 Package	 Associate
 Class	 Generalize
 Interface	 Compose
 Data Type	 Aggregate
 Enumeration	 Association Class
 Primitive	 Assembly
 Table	 Realize
 Signal	 Nesting
 Association	 Package Merge
	 Package Import

### 6.2.1.1 Example Package Diagram

The following example demonstrates a basic Package diagram.

Item	Description	See also
Nesting connector between <i>ConnSeq</i> and <i>Controller</i>	<p>The nesting connector between <i>ConnSeq</i> and <i>Controller</i> reflects what the Package contents reveal.</p> <p>Package contents can be listed by clicking on the diagram background to display the diagram's Properties dialog, selecting the Elements tab and selecting the <b>Package Contents</b> checkbox.</p>	<a href="#">Properties</a> <sup>[823]</sup> dialog
«import» connector	<p>The «import» connector indicates that the elements within the target Integer Package, which in this example is the single Class <i>Integer</i>, are imported into the Package <i>Controller</i>.</p> <p>The <i>Controller</i>'s namespace gains access to the <i>Integer</i> Class; the <i>Integer</i> namespace is not affected.</p>	
«merge» connector	<p>The «merge» connector indicates that the package <i>Controller</i>'s elements are imported into <i>GenApply</i>, including <i>Controller</i>'s nested and imported contents.</p> <p>If an element already exists within <i>GenApply</i>, such as <i>Loader</i> and <i>Time</i>, these elements' definitions are expanded by those included in the package <i>Controller</i>. All elements added or updated by the merge are noted by a generalization relationship back to that package.</p>	

## 6.2.2 Class Diagram

The **Class diagram** captures the logical structure of the system - the Classes - and things that make up the model. It is a static model, describing what exists and what attributes and behavior it has, rather than how something is done. On a Class diagram you can illustrate relationships between Classes and Interfaces using Generalizations, Aggregations and Associations, which are valuable in reflecting inheritance, composition or usage, and connections respectively.

**Example Diagram** [Example Class Diagram](#) <sup>[1185]</sup>

### Tools

Select Class diagram elements and connectors from the Class pages of the Toolbox.

Class Diagram Elements	Class Diagram Connectors
 Package	 Associate
 Class	 Generalize
 Interface	 Compose
 Data Type	 Aggregate
 Enumeration	 Association Class

Class Diagram Elements	Class Diagram Connectors
 Primitive	 Assembly
 Table	 Realize
 Signal	 Template Binding
 Association	 Nesting
	 Package Merge
	 Package Import
	 Abstraction
	 Substitution
	 Usage

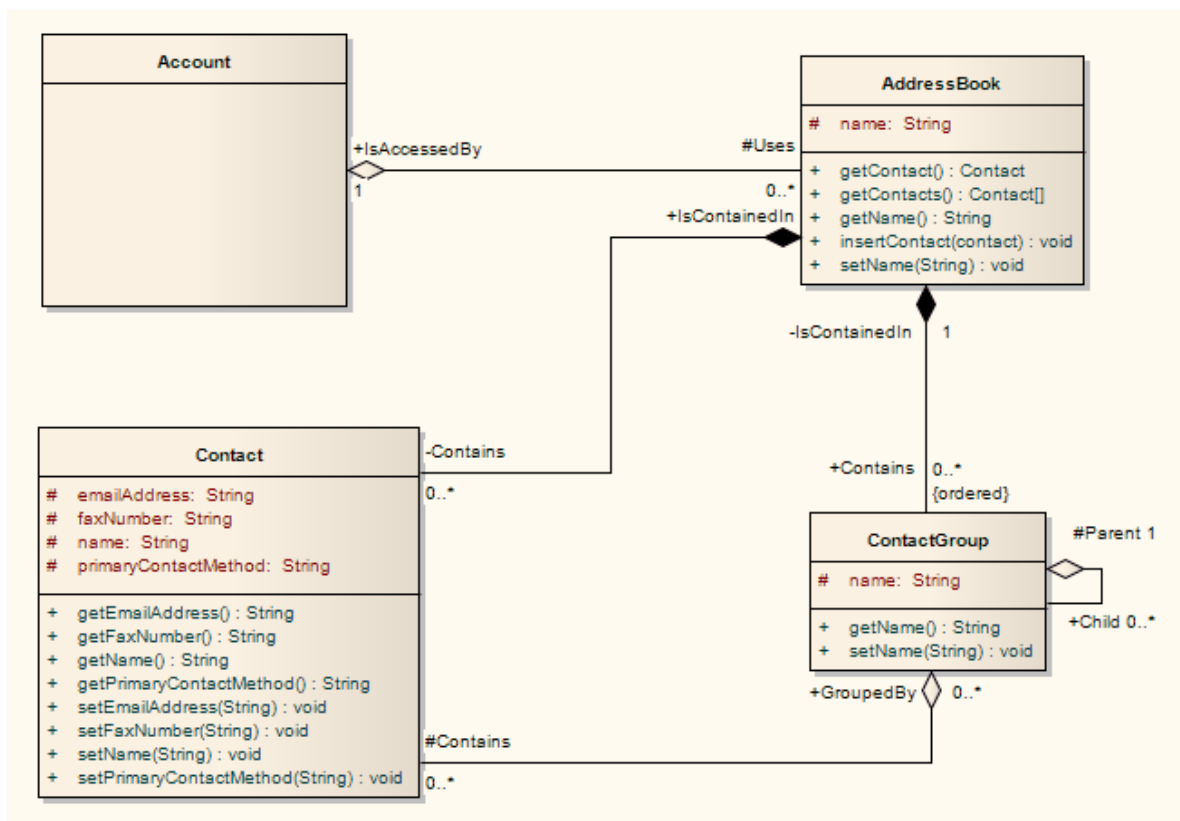

### Learn more

- [Active Classes](#) <sup>[1365]</sup>
- [Parameterized \(template\) Classes](#) <sup>[1365]</sup>
- [Stereotyped Business Interaction Elements](#) <sup>[1805]</sup>

### 6.2.2.1 Example Class Diagram

In this example Class diagram, there are two forms of the [Aggregation](#) <sup>[1392]</sup> relationship:

- The pale form indicates that the Class *Account* uses *AddressBook*, but does not necessarily contain *AddressBook*
- The dark *Composite* Aggregation form indicates ownership or containment by the target Classes (at the diamond end) of the source Classes

### 6.2.3 Object Diagram

An **Object diagram** is closely related to a Class diagram, with the distinction that it depicts **object instances** of Classes and their relationships at a point in time. Object diagrams do not reveal architectures varying from their corresponding Class diagrams, but reflect multiplicity and the roles instantiated Classes could serve. They are useful in understanding a complex Class diagram, by creating different cases in which the relationships and Classes are applied.

This might appear similar to a Composite Structure diagram, which also models run-time behavior; the difference is that Object diagrams exemplify the **static** Class diagrams, whereas Composite Structure diagrams reflect **run-time** architectures different from their static counterparts. An Object diagram can also be a kind of Communication diagram (which also models the connections between objects, but additionally sequences events along each path).

**Example Diagram** [Example Object Diagram](#) 1187

#### Tools

Select Object diagram elements and connectors from the Object pages of the Toolbox.

Object Diagram Elements	Object Diagram Connectors
 <b>Actor</b>	 <b>Information Flow</b>
 <b>Object</b>	 <b>Associate</b>

Object Diagram Elements	Object Diagram Connectors
 Collaboration	 Dependency
 Collaboration Use	
 Information Item	
 Boundary	
 Control	
 Entity	

#### Learn more

- [Business Modeling Objects](#) <sup>[1805]</sup>
- [Communication diagram](#) <sup>[1259]</sup>

### 6.2.3.1 Example Object Diagram

This example shows a simple Class diagram, with two Class elements connected.

These Classes are instantiated as Objects in an Object diagram. There are two instances of *Computer* in this model, demonstrating the usefulness of Object diagrams in considering the relationships and interactions Classes might have in practice.

## 6.2.4 Composite Structure Diagram

A **Composite Structure diagram** reflects the **internal collaboration** of Classes, Interfaces or Components (and their properties) to describe a functionality. Composite Structure diagrams are similar to Class diagrams, but whilst Class diagrams model a static view of Class structures, including their attributes and behaviors, Composite Structure diagrams model a **specific usage** of the structure. You can use them to express run-time architectures, usage patterns and the participating elements' relationships, which might not be reflected by static diagrams.

In a Composite Structure diagram, Classes are accessed as Parts or run-time instances fulfilling a particular role. These Parts can have multiplicity, if the role filled by the Class requires multiple instances. Ports defined by a Part's Class should be represented in the composite structure, so that all connecting Parts provide the required interfaces specified by the Port. There is extensive flexibility, and a consequent complexity, that come with modeling composite structures. To optimize your modeling, consider building Collaborations to represent reusable patterns responding to your design issues.

**Example Diagram** [Example Composite Structure Diagram](#) 

### Tools

Select Composite Structure diagram elements and connectors from the Composite pages of the Toolbox.

Composite Structure Diagram Elements	Composite Structure Diagram Connectors
 Class	 Connector
 Interface	 Assembly
 Part	 Role Binding
 Port	 Represents
 Collaboration	 Occurrence
 Collaboration Use	 Delegate
 Expose Interface	

Learn more

- [Business Use Case Realization](#) <sup>[1805]</sup>

**6.2.4.1 Example Composite Structure Diagram**

This diagram shows a Collaboration, used in Composite Structure diagrams to model common patterns. This particular example shows a relationship for performing an installation.

The next diagram uses this *Install* Collaboration in a Collaboration Use, and applies it to the *UtilLoad* Class via a «represents» relationship. This indicates that the classifier *UtilLoad* uses the Collaboration pattern within its implementation.

Learn more

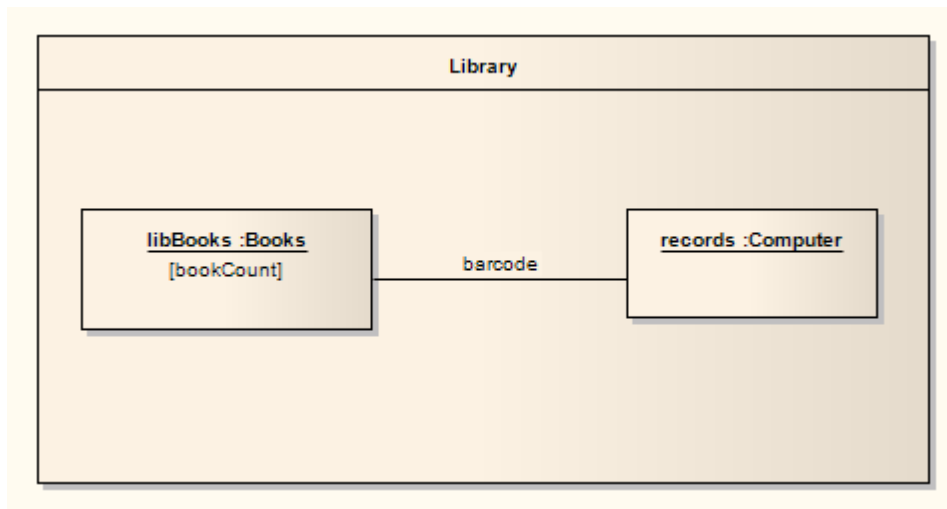

- [Collaboration Use](#) <sup>[1368]</sup>

**6.2.4.2 Properties**

A **property** is a nested structure within a classifier, usually a Class or an Interface, on a Composite Structure diagram. The contained structure reflects instances and relationships reflected within the containing classifier. Properties can have multiplicity, and can be displayed as:

- Parts (preferred) or
- Association Roles

### Parts

In this diagram there are two Parts, *libBooks* and *records*, which are instances corresponding to the Classes *Books* and *Computer* respectively. The relationship between the two Parts is indicated by the connector, reflecting that communication between the Parts is via the *barcode*. This contained structure and its Parts are properties owned by the *Library* Class.

After dragging Parts from the Diagram Toolbox onto the Class, right-click on a Part and select **Advanced | Set Property Type** to connect to a classifier. If Parts disappear when dragged onto the Class, adjust the Z-order of the Class to move it behind the Parts (right-click on the Class and select the **Z-Order** context menu option).

To indicate a property that is **not** owned by composition to the containing classifier, use a box symbol with a dashed outline, indicating association; to do this:

1. Right-click on the Part and select the **Properties** context menu option.
2. Select the Advanced page of the Properties dialog.
3. Set the **IsReference** option to **true**.

### Association Roles

Properties can also be reflected using a normal composite structure (**without** containing it in a Class), with the appropriate connectors, Parts and relationships indicated through connections to the Class.

The alternative representation is shown here; however, this representation fails to express the ownership immediately reflected by containing properties within a classifier.

### 6.2.5 Deployment Diagram

A **Deployment diagram** shows how and where the system is to be deployed; that is, its execution architecture.

Hardware devices, processors and software execution environments (system **Artifacts**) are reflected as **Nodes**, and the internal construction can be depicted by embedding or nesting Nodes. **Deployment** relationships indicate the deployment of Artifacts, and **Manifest** relationships reveal the physical implementation of **Components**. As Artifacts are allocated to Nodes to model the system's deployment, the allocation is guided by the use of **Deployment Specifications**.

**Example Diagram** [Example Deployment Diagram](#) 

#### Tools

Select Deployment diagram elements and connectors from the Deployment pages of the Toolbox.

Deployment Diagram Elements	Deployment Diagram Connectors
 Node	 Associate
 Device	 Communication Path
 Execution Environment	 Association Class
 Component	 Generalize
 Interface	 Realize
 Artifact	 Deployment
 Document Artifact	 Manifest

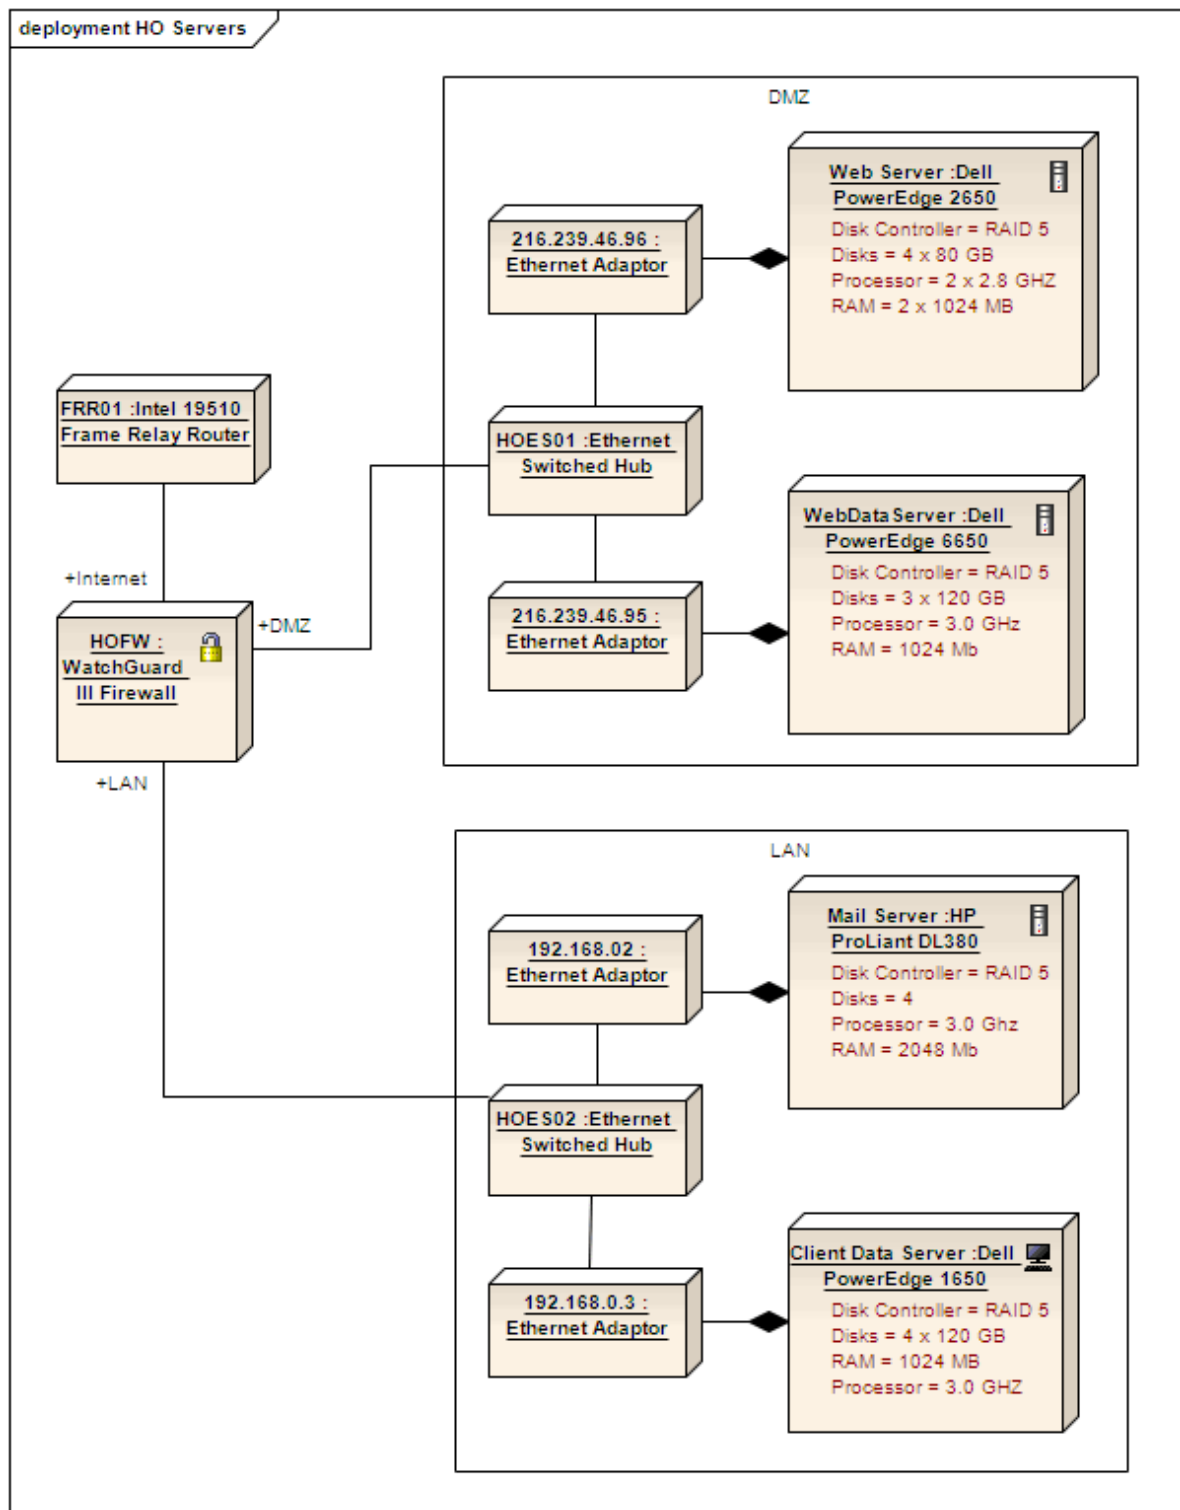

Deployment Diagram Elements	Deployment Diagram Connectors
 Deployment Specification	 Nesting
 Package	

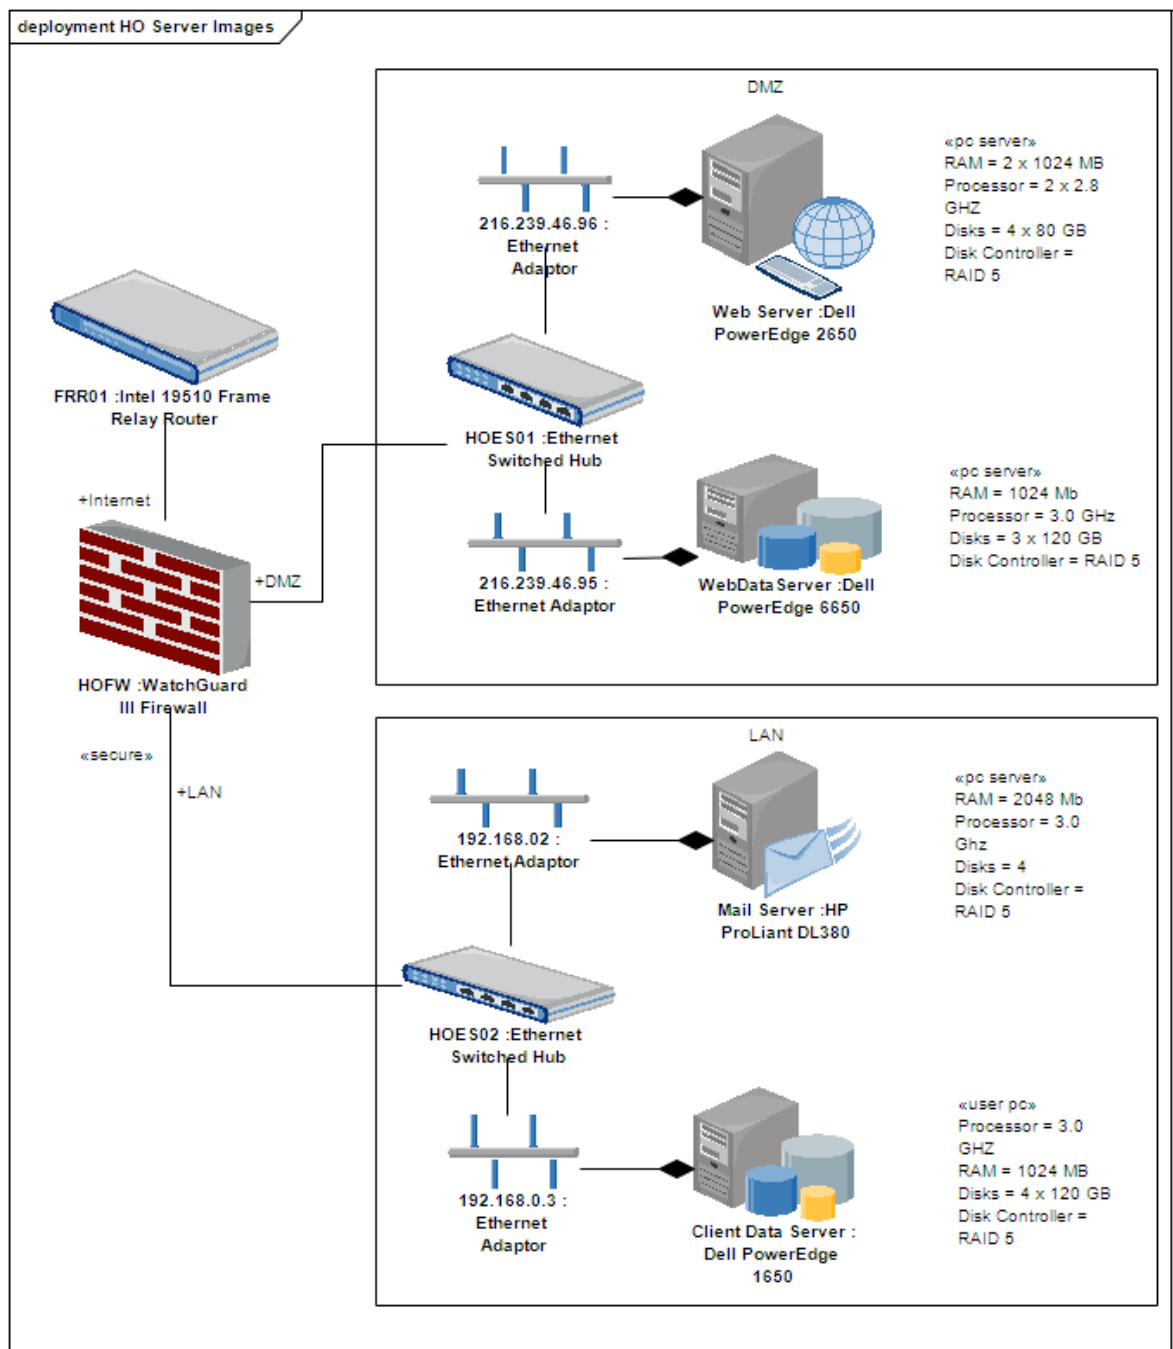

### 6.2.5.1 Example Deployment Diagram

This is a simple Deployment diagram, representing the arrangement of servers at a head office.

The servers are represented by Nodes linked by either simple or aggregate **Association** relationships.

Deployment diagrams are ideal for using alternative images for the objects that the elements represent. Such images can be substituted for the elements in the diagram, as shown below:

#### Learn more

- [Using the Image Manager](#) <sup>860</sup>

## 6.2.6 Component Diagram

A **Component diagram** illustrates the pieces of software, embedded controllers and such that make up a system, and their organization and dependencies.

A Component diagram has a higher level of abstraction than a Class diagram; usually a component is

implemented by one or more Classes (or Objects) at runtime. They are building blocks, built up so that eventually a component can encompass a large portion of a system.

**Example Diagram** [Example Component Diagram](#) 

### Tools

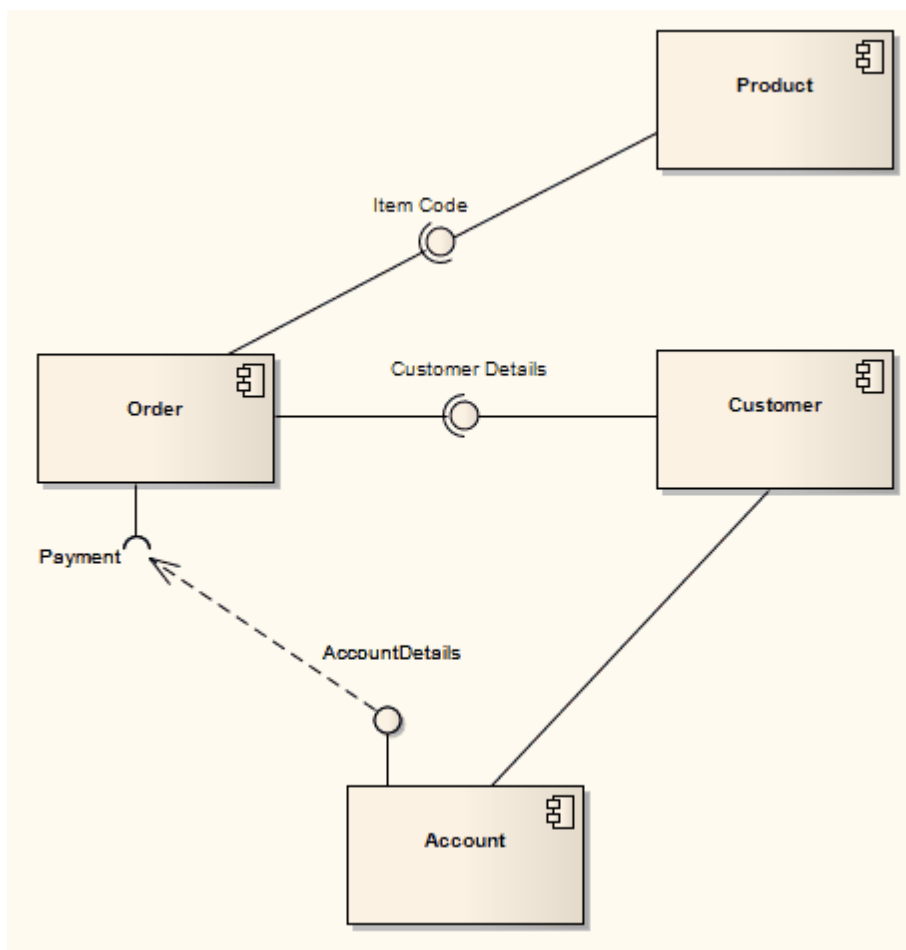

Select Component diagram elements and connectors from the Component pages of the Toolbox.

Component Diagram Elements	Component Diagram Connectors
 Package	 Assembly
 Packaging Component	 Delegate
 Component	 Associate
 Class	 Realize
 Interface	 Generalize
 Object	
 Port	
 Expose Interface	
 Artifact	
 Document Artifact	

#### 6.2.6.1 Example Component Diagram

This diagram demonstrates a number of components and their inter-relationships.

**Assembly** connectors connect the **provided interfaces** supplied by *Product* and *Customer* to the **required interfaces** specified by *Order*. A **Dependency** relationship maps a customer's associated *account details* to the required interface *Payment*, also specified by *Order*.

#### Learn more

- [Assembly](#)<sup>[1393]</sup>
- [Dependency](#)<sup>[1404]</sup>

### 6.2.7 Profile Diagram

A **Profile** diagram is any diagram created in a «*profile*» Package.

Profiles provide a means of extending the UML. They are based on additional stereotypes and Tagged Values that are applied to UML elements, connectors and their components. A Profile is a collection of such extensions that together describe some particular modeling problem and facilitate modeling constructs in that domain.

**Example Diagram** [Example Profile Diagram](#)<sup>[1197]</sup>

#### Tools

Select the following Profile diagram elements and connectors from the Profile pages of the Toolbox.

Profile Diagram Elements	Profile Diagram Connectors
 Profile	 Extension
 Stereotype	 Generalize
 Metaclass	 Tagged Value
 Enumeration	

#### Learn more

- [Create UML Profiles](#)  1485

### 6.2.7.1 Example Profile Diagram

A typical unit on a Profile diagram resembles this:

## 6.3 UML Behavioral Models

UML Behavioral diagrams depict the behavioral features of a system or business process. Behavioral diagrams include the following diagram types:

Diagram Type	Detail	See also
<b>Activity Diagrams</b>	Activity diagrams model the behaviors of a system, and the way in which these behaviors are related in an overall flow of the system.	<a href="#">Activity diagrams</a> <sup>[1199]</sup>
<b>Use Case Diagrams</b>	Use Case diagrams capture Use Cases and relationships among Actors and the system; they describes the functional requirements of the system, the manner in which external operators interact at the system boundary, and the response of the system.	<a href="#">Use Case diagrams</a> <sup>[1201]</sup>
<b>State Machine Diagrams</b>	State Machine diagrams illustrate how an element can move between states, classifying its behavior according to transition triggers and constraining guards.	<a href="#">State Machine diagrams</a> <sup>[1203]</sup>
<b>Timing Diagrams</b>	Timing diagrams define the behavior of different objects within a time-scale, providing a visual representation of objects changing state and interacting over time.	<a href="#">Timing diagrams</a> <sup>[1225]</sup>
<b>Sequence Diagrams</b>	Sequence diagrams are structured representations of behavior as a series of sequential steps over time. They are used to depict work flow, message passing and how elements in general cooperate over time to achieve a result.	<a href="#">Sequence diagrams</a> <sup>[1249]</sup>
<b>Communication Diagrams</b>	Communication diagrams show the interactions between elements at run-time, visualizing inter-object relationships.	<a href="#">Communication diagrams</a> <sup>[1259]</sup>
<b>Interaction Overview Diagrams</b>	Interaction Overview diagrams visualize the cooperation between interaction diagrams (Timing, Sequence, Communication and other Interaction Overview diagrams) to illustrate a control flow serving an encompassing purpose.	<a href="#">Interaction Overview diagrams</a> <sup>[1262]</sup>

- [Behavioral Modeling](#) <sup>[1014]</sup>
- [Code Generation from Behavioral Models](#) <sup>[2121]</sup>

### 6.3.1 Activity Diagram

Activity diagrams are used to model system behaviors, and the way in which these behaviors are related in an overall flow of the system (that is, dynamic element interactions). The logical paths a process follows, based on various conditions, concurrent processing, data access, interruptions and other logical path distinctions, are all used to construct a process, system or procedure.

**Example Diagram** [Example Activity Diagram](#) 

#### Tools

Select Activity diagram elements and connectors from the Activity pages of the Toolbox.

Click on the following elements and connectors for more information.

Activity Diagram Elements	Activity Diagram Connectors
 Activity	 Control Flow
 Structured Activity	 Object Flow
 Action	 Interrupt Flow
 Partition	
 Object	
 Central Buffer Node	
 Datastore	
 Decision	
 Merge	
 Send	
 Receive	
 Synch	
 Initial	
 Final	
 Flow Final	
 Region	
 Exception	

Activity Diagram Elements	Activity Diagram Connectors
 Fork/Join	
 Fork/Join	

#### Notes

- You can create Analysis diagrams (Simplified Activity diagrams) containing the elements most useful for business process modeling, using the New Diagram dialog

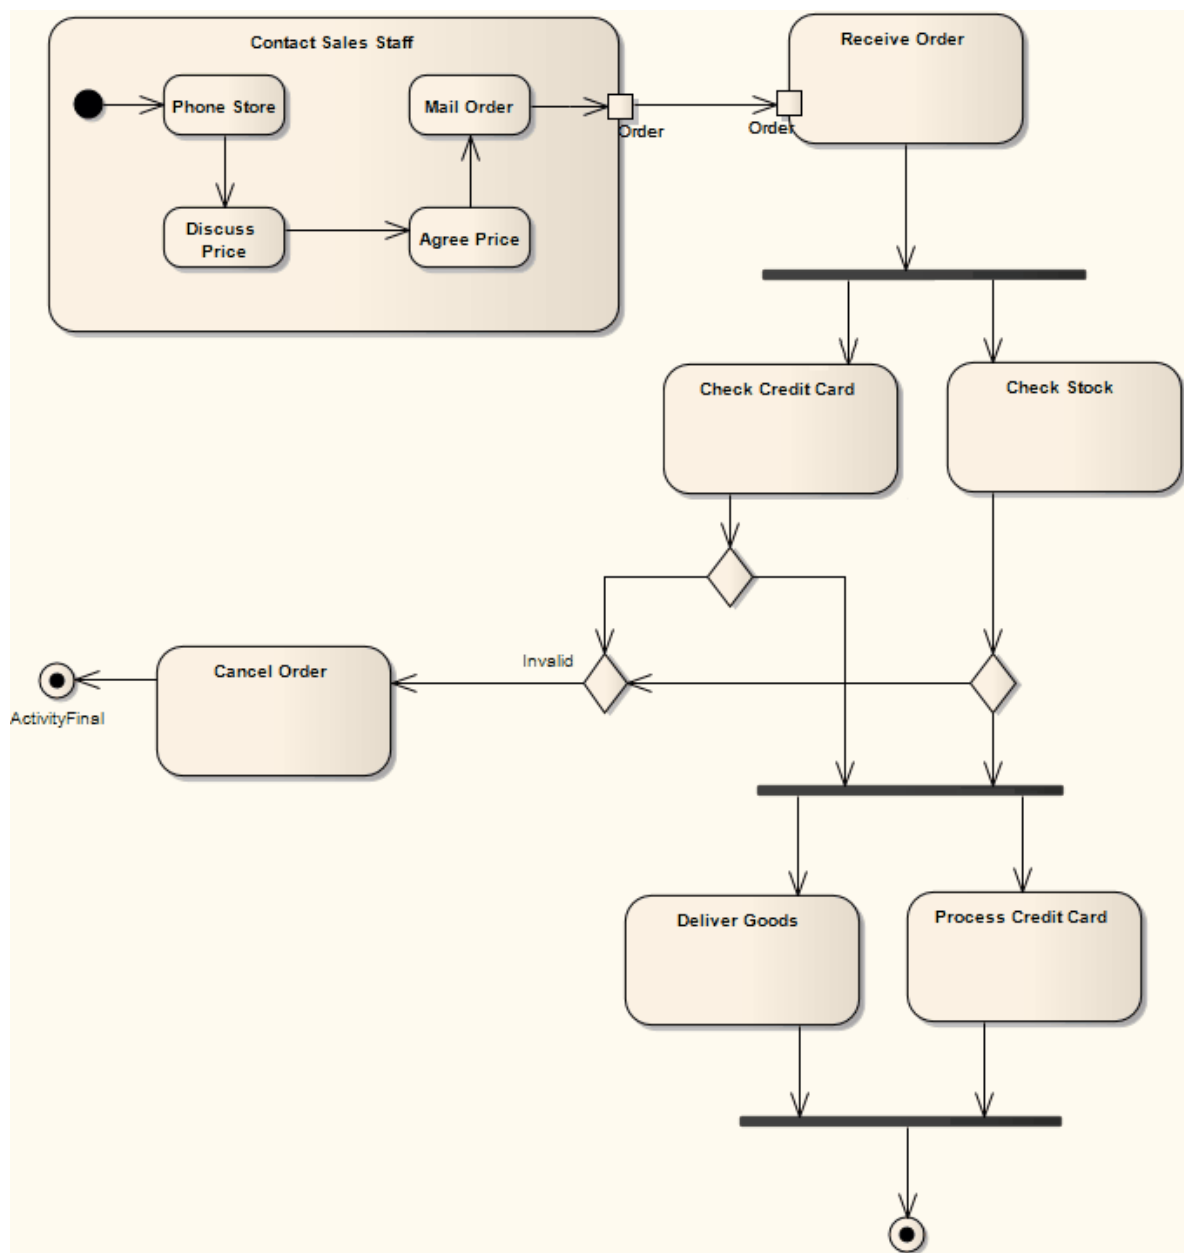

#### Learn more

- [Analysis Diagram](#)<sup>[1801]</sup>
- [New Diagram](#)<sup>[822]</sup>
- [Activity Toolbox](#)<sup>[808]</sup>

#### 6.3.1.1 Example Activity Diagram

The following diagram illustrates some of the features of Activity diagrams, including Activities, Actions, Start Nodes, End Nodes and Decision points.

### 6.3.2 Use Case Diagram

Use Case diagrams capture Use Cases and the relationships between Actors and the subject (system). You can use them to:

- Describe the functional requirements of the system
- Describe the manner in which outside things (Actors) interact at the system boundary
- Describe the response of the system.

**Example Diagram** [Example Use Case Diagram](#) <sup>1203</sup>

#### Tools

Select Use Case diagram elements and connectors from the Use Case pages of the Toolbox. Click on the

following elements and connectors for more information.

Use Case Diagram Elements	Use Case Diagram Connectors
 Actor	 Use
 Use Case	 Associate
 Test Case	 Generalize
 Collaboration	 Include
 Collaboration Use	 Extend
 Boundary	 Realize
 Package	 Invokes
	 Precedes

### Notes

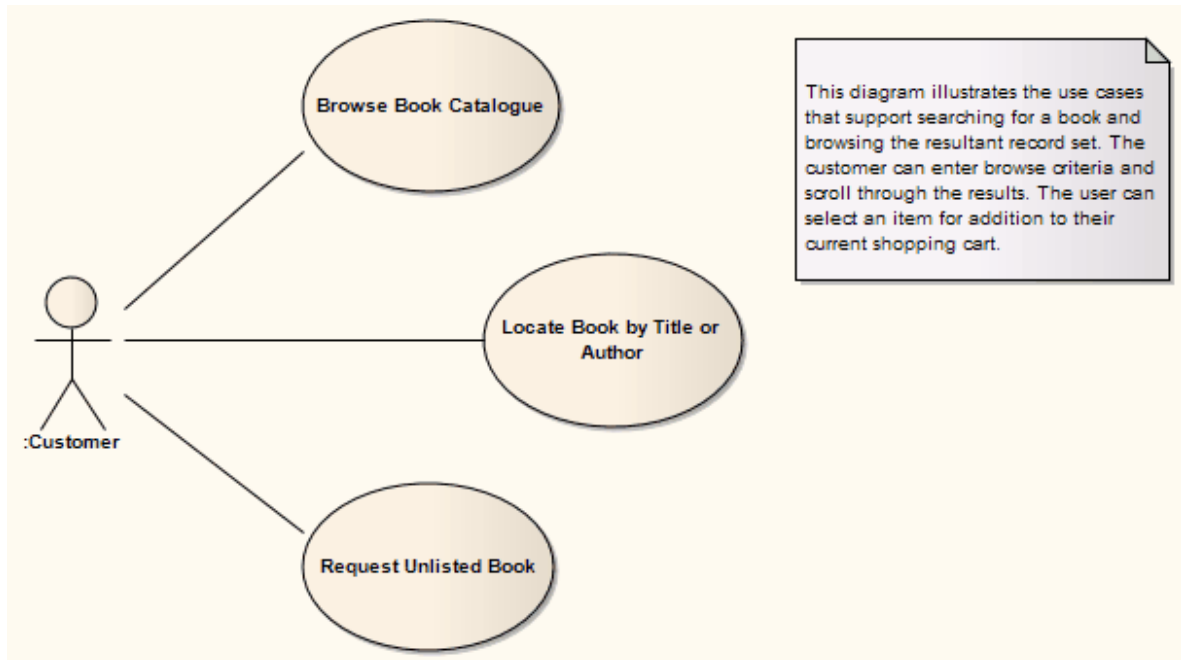

- Invokes and Precedes relationships are defined by the Open Modeling Language (OML); they are stereotyped Dependency relationships
- Invokes indicates that Use Case A, at some point, causes Use Case B to happen
- Precedes indicates that Use Case C must complete before Use Case D can begin

### 6.3.2.1 Example Use Case Diagram

The following diagram illustrates some features of Use Case diagrams:

### 6.3.3 State Machines

State Machines illustrate how an element (often a Class) can move between states, classifying its behavior according to transition triggers and constraining guards.

#### Naming

- State Machines were formerly known as State diagrams
- State Machine representations in UML are based on the Harel State Chart Notation and therefore are sometimes referred to as State Charts

#### State Tables

You can display a State Machine as a diagram, or as a table in one of three relationship formats.

#### Select the display format

Step	Action	See also
1	Right-click on the diagram background and select the <b>Statechart Editor</b> context menu option.	
2	Select the appropriate display option: <ul style="list-style-type: none"> <li>• <b>Diagram</b></li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Table (State-Next State)</b></li> <li>• <b>Table (State-Trigger)</b></li> <li>• <b>Table (Trigger-State)</b></li> </ul>	<a href="#">State Machine Table</a> <sup>[1212]</sup>

**Example Diagram** [Example State Machine Diagram](#) <sup>[1205]</sup>

### Toolbox Icons

Select State Machine elements and connectors from the State pages of the Toolbox; click on the element and connector icons below for more information.

State Machine Diagram Elements	State Machine Diagram Connectors
 <b>State</b>	 <b>Transition</b>
 <b>State Machine</b>	 <b>Object Flow</b>
 <b>Initial</b>	
 <b>Final</b>	
 <b>History</b>	
 <b>Synch</b>	
 <b>Object</b>	
 <b>Choice</b>

### 6.3.3.1 Example State Machine

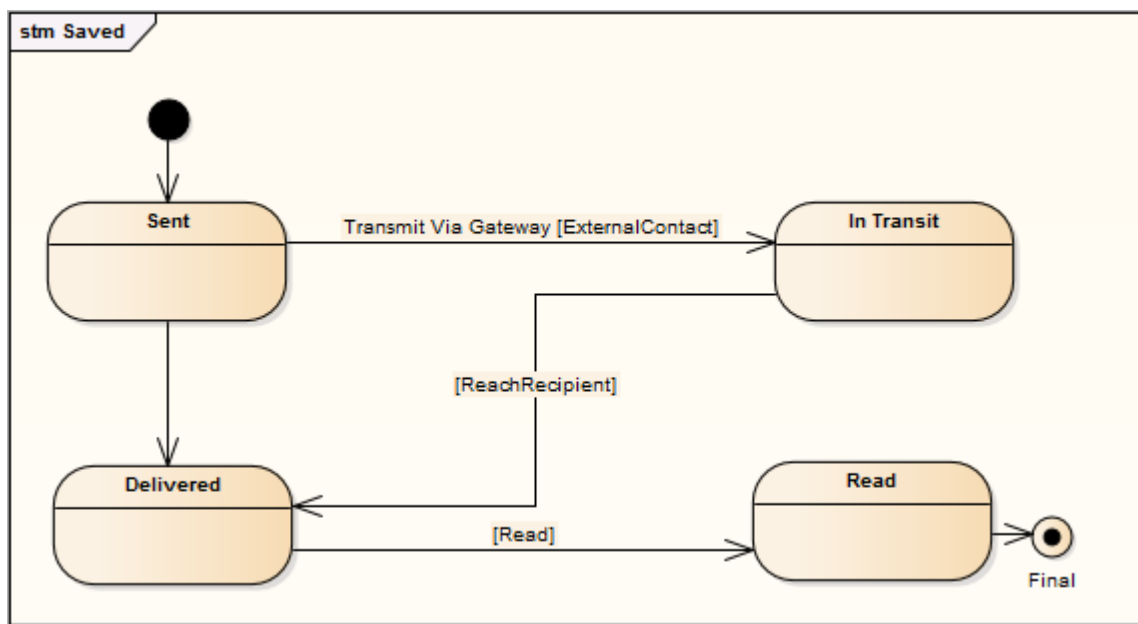

This diagram illustrates some features of State Machines:

#### Composite Diagram States

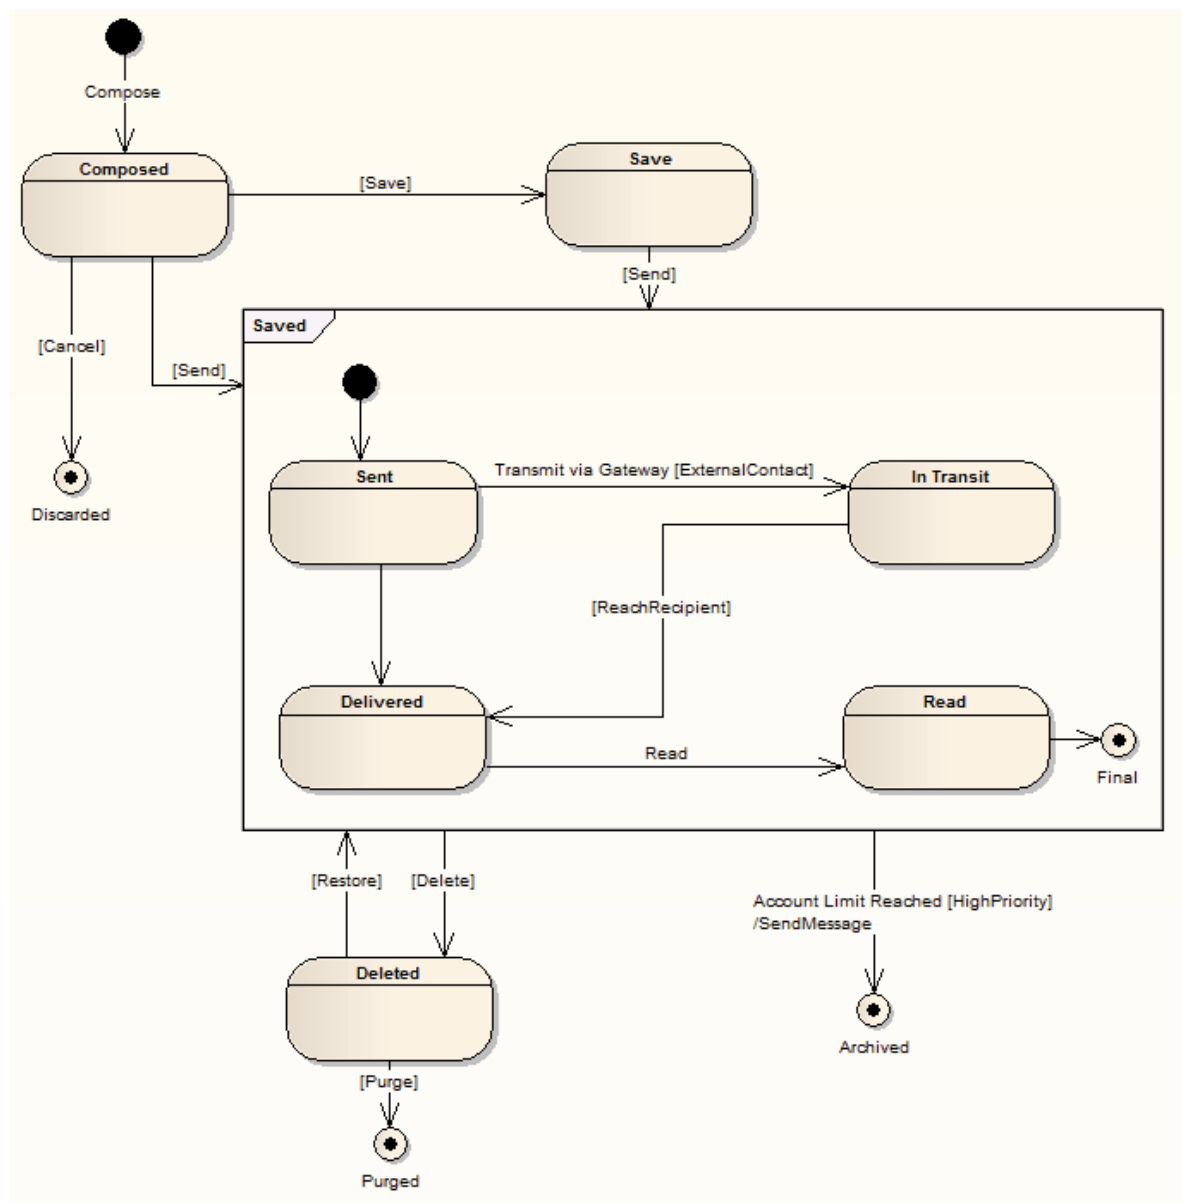

The chain-link symbol in the bottom right corner of the **Saved** State indicates that it is a State with a Composite diagram.

You have two options for displaying the contents of a State's Composite diagram. Firstly, you can **double-click on the parent element** to display its child diagram separately, as shown below:

By default, the child diagram displays within a labeled frame that represents the parent object in the context of the child diagram. You can right-click on the background and select the **Hide Diagram Frame** option to hide the frame, and on the **Show Diagram Frame** option to show the frame again.

Alternatively, you can right-click on the composite element on the main diagram and select the **Advanced | Show Composite Diagram** context menu option, which again displays the child diagram in a labeled frame, but this time within the context of the parent diagram.

### Notes

- State elements can display either with or without a line across them; the line - as shown above - displays when the element has features such as attributes (which could be hidden) or when the **Show State Compartment** checkbox is selected in the Objects page of the Options dialog
- It is possible to add **Entry Point** and **Exit Point** elements to the border of a State or State Machine element - right-click on the element and select the **New Element | Entry Point** or **Exit Point** option; if the element is a composite element and represented by a frame, you can also right-click on the selected **frame** and add the Entry Point or Exit Point elements
- If you have Entry Point and/or Exit Points on a State Machine that is a classifier for another State, you can create **ConnectionPointReferences** to the classifier from the other State
- It is also possible to add **Regions** to a State element or State Machine element **frame**; right-click on the selected frame and select the **Define Concurrent Substates** option

**Learn more**

- [Object Display Options](#)  <sup>63</sup>
- [Composite States](#)  <sup>1330</sup>
- [Pseudo-states](#)  <sup>1208</sup>
- [State Elements](#)  <sup>1329</sup>
- [Regions](#)  <sup>1209</sup>
- [Entry Point](#)  <sup>1300</sup>
- [Exit Point](#)  <sup>1304</sup>
- [Create a Connection Point Reference](#)  <sup>1210</sup>

**6.3.3.2 Pseudo-States**

Pseudo-states are a UML abstraction for various types of transient vertices used in State Machine diagrams. Pseudo-states are used to express complex transition paths.

The following types of pseudo-state are available:

Type	See
 Initial	<a href="#">Initial</a>  <sup>1313</sup>
 Entry	<a href="#">Entry Point</a>  <sup>1300</sup>
 Exit	<a href="#">Exit Point</a>  <sup>1304</sup>
 Choice	<a href="#">Choice</a>  <sup>1286</sup>
 Junction	<a href="#">Junction</a>  <sup>1319</sup>
 History	<a href="#">History</a>  <sup>1311</sup>
 Terminate	<a href="#">Terminate</a>  <sup>1350</sup>
 Final	<a href="#">Final</a>  <sup>1305</sup>
 Fork/Join	 Fork/Join <a href="#">Fork</a>  <sup>1309</sup>
 Fork/Join	 Fork/Join <a href="#">Join</a>  <sup>1310</sup>

**Notes**

- All the listed types of pseudo state can be represented in code, and can generate code under the State Machine code generation templates from Enterprise Architect release 11 onwards

**Learn more**

- [State Machines](#)  <sup>1203</sup>

### 6.3.3.3 Regions

If you are modeling an active State configuration on a State Machine diagram, and you need to represent several States as being active concurrently, you can achieve this by firstly creating a State Machine element or Composite State element and secondly subdividing that element with Regions. You set out the State configuration such that there is only ever one of the concurrently active States per Region. Multiple transitions can occur from a single event dispatch, so long as the similarly-triggered transitions are divided by Regions.

Regions display on an element on a diagram as subdivisions of a structured compartment, underneath other compartments such as tags, responsibilities, attributes and operations.

**Access**   **Right-click on element | Advanced | Define Concurrent Substates**

#### Create a Region in a Composite State or State Machine element

Step	Action
1	On the State Regions dialog, the <b>Name</b> field defaults to <b>&lt;anonymous&gt;</b> .
2	If you want to create Regions that have no title, simply click on the <b>Save</b> button once for each Region to create.  If you want to create named Regions, type the name and click on the <b>Save</b> button for each Region.
3	When you have created as many Regions as you need, click on the <b>Close</b> button.  You can now populate the Regions with elements from the State Diagram Toolbox.

#### Notes

- Changes to the elements in a Region are committed when the diagram is saved; if you want to undo the changes, reload the diagram without saving
- Any States, State Nodes (Pseudo-States) or Synch elements added to a Region are owned by that Region and, ordinarily, cannot be dragged into another Region; however, if you attempt to drag a **State** between Regions, the **move embedded element to region** menu option displays which - if you select it - allows the transfer to complete

### 6.3.3.4 Create a Connection Point Reference

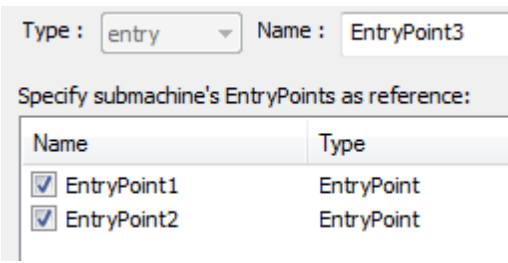

A Connection Point Reference represents the use, by a Submachine State, of an Entry Point or Exit Point pseudostate defined in the State element's classifier State Machine. You initially create the Connection Point Reference elements themselves as Entry Points or Exit Points.

#### Create Entry Points and/or Exit Points

Step	Action	See also
1	<p>Create or open the classifier State Machine (as a child diagram of a Class element).</p> <p>The State Machine is represented by a labeled frame.</p>	<a href="#">State Machine</a> <sup>[1338]</sup> <a href="#">Example State Machine</a> <sup>[1205]</sup>
2	<p>If the Entry Points and/or Exit Points do not already exist, right-click on the inside edge of the frame and select the <b>New Element   Entry Point</b> or <b>New Element   Exit Point</b> option, as necessary.</p> <p>The corresponding pseudostate element is immediately created on the edge of the frame. If you prefer, you can double-click on the element and give it a specific name.</p>	<a href="#">Entry Point</a> <sup>[1300]</sup> <a href="#">Exit Point</a> <sup>[1304]</sup>
3	Create as many additional Entry Point and/or Exit Point elements as you need.	
4	<p>If the corresponding State element does not already exist, drag a <b>State</b> icon from the Diagram Toolbox into the frame.</p> <p>Create the appropriate connectors between the State element and the Entry Point and Exit Point elements.</p>	<a href="#">State</a> <sup>[1329]</sup>
	 <p>The diagram shows a rectangular frame labeled 'stm SubMachine'. Inside the frame, there is a central rounded rectangle labeled 'State1'. On the left side of the frame, there are two small circles labeled 'EntryPoint1' (top) and 'EntryPoint2' (bottom). On the right side, there are two small circles with an 'X' inside, labeled 'ExitPoint1' (top) and 'ExitPoint2' (bottom). Arrows point from 'EntryPoint1' and 'EntryPoint2' to 'State1'. Arrows point from 'State1' to 'ExitPoint1' and 'ExitPoint2'.</p>	
5	Save the diagram.	

**Create Connection Point References**

Step	Action	See also
1	Create or open the calling State Machine (as a child diagram of a Class element).	<a href="#">State Machine</a> <sup>[1338]</sup>
2	If the elements do not already exist, create the appropriate State and pseudostate elements and connectors in the diagram.	<a href="#">Example State Machine</a> <sup>[1205]</sup>
3	Click on the calling State element and press <b>Ctrl+L</b> to display the Select Element dialog.  Browse for and select the classifier State Machine from the <i>Create Entry Points and/or Exit Points</i> stage.	<a href="#">Select &lt;item&gt; Dialog</a> <sup>[994]</sup>
4	Right-click on the State element, and select the <b>New Element   Entry Point</b> or <b>New Element   Exit Point</b> option, as you need.  The corresponding pseudostate element is immediately created on the border of the element.   <p>The diagram shows a state machine with an initial state (solid black circle) labeled 'Initial'. A transition arrow points from 'Initial' to an entry point (open circle) labeled 'EntryPoint3'. This entry point leads into a submachine state (rounded rectangle) labeled 'State2: SubMachine'. An exit point (circle with an 'X') labeled 'ExitPoint3' is on the right side of the submachine state. A transition arrow points from 'ExitPoint3' to a final state (bullseye circle) labeled 'Final'.</p>	<a href="#">Entry Point</a> <sup>[1300]</sup> <a href="#">Exit Point</a> <sup>[1304]</sup>
5	Double-click on the Entry Point element.  The Edit ConnectionPointReference dialog displays.	
6	If you prefer, in the <b>Name</b> field type a new name for the selected Entry Point.  In the <b>Specify submachine's EntryPoints as reference</b> panel, select the check box against <b>each</b> of the classifier's Entry Points you want to create a reference to. You can select more than one checkbox.	

Step	Action	See also
		
7	Click on the <b>OK</b> button.	
8	If necessary, repeat steps 4 to 7 for the State element's Exit Point.	

### 6.3.4 State Machine Table

A State Machine table is one of two variants of a State Machine (the other is the State Machine diagram). It displays the information of the State Machine in table form, and is a method of specifying the discrete behavior of a finite state-transition system; that is, what state the State Machine moves to and the conditions under which the transition takes place.

You can display the state transition in the table as one of two different relationships:

Display Type	Description	See also
<b>State - Trigger</b>	<p>The rows indicate the current states and the columns indicate trigger events.</p> <p>The cell at the intersection of a row and column identifies the target state in the transition if the trigger occurs, and the condition (or guard) of the transition, or the other way around if you prefer, in a <i>Trigger - State</i> format.</p>	<a href="#">Example State-Trigger Table</a> <sup>[1222]</sup>
<b>State - Next State</b>	<p>The rows and columns both indicate states, and the cell at the intersection of a row and column indicates:</p> <ul style="list-style-type: none"> <li>• The event that triggers a transition from the current (row) state to the next (column) state</li> <li>• The condition (or guard) of the event, and</li> <li>• The effect of the transition</li> </ul>	<a href="#">Example State-Next State Table</a> <sup>[1223]</sup>

#### Select the display format

Step	Action
1	Right-click on the diagram background and select the <b>Statechart Editor</b> context menu option.

2	Select the appropriate display option: <ul style="list-style-type: none"> <li>• <b>Diagram</b></li> <li>• <b>Table (State-Next State)</b></li> <li>• <b>Table (State-Trigger)</b></li> <li>• <b>Table (Trigger-State)</b></li> </ul>
---	--

#### Learn more

- [State Machine Table Simulation](#) <sup>[1224]</sup>

### 6.3.4.1 State Machine Table Options

You can choose the State Machine table layout and set other options from the State Machine Diagram: Options dialog, which you display by either:

- Double-clicking on the State Machine table background or
- Right-clicking on the background and selecting the **State Table Options** context menu option

Field	Usage	See also
<b>Table Format</b>	Select the required table format: <ul style="list-style-type: none"> <li>• <b>State - Trigger:</b> <ul style="list-style-type: none"> <li>• Rows represent States, each State name in a left edge cell</li> <li>• Columns represent Triggers, each Trigger name in a column header cell</li> <li>• The intersection of a row and column identifies the Transition (if there is one)</li> <li>• The Transition cell displays information about the next State and the condition (guard) of the Transition</li> </ul> </li> <li>• <b>Trigger - State:</b> as above, except that rows represent Triggers and columns represent States</li> <li>• <b>State - Next State:</b> <ul style="list-style-type: none"> <li>• Both rows and columns represent States</li> <li>• The intersection of row and column defines the transition (if there is one) from the row State to the column State</li> </ul> </li> </ul>	
<b>Cell Size</b>		
<b>Transition Cell Width</b>	Specify the width of the transition cells (that is, the column width).	
<b>Transition Cell</b>	Specify the height of the transition cells (that is, the row height).	

Field	Usage	See also
<b>Height</b>		
<b>Left Edge Cell Width</b>	Specify the width of the left edge (row title) cells.	
<b>Top Edge Cell Height</b>	Specify the height of the top edge (column title) cells.	
<b>Cell Color</b>		
<b>State/Trigger Cell</b>	Select the color of the row and column title cells.	
<b>State/Trigger Enumeration</b>	Select the color of the enumeration (row/column numbering) cells. You must select at least one of the <b>Enable State Enumeration</b> and <b>Enable Event Enumeration</b> checkboxes to set this color.	
<b>Transition Cell</b>	Select the color of the transition cells (in the main body of the table).	
<b>Highlight Options</b>		
<b>Highlight Zones Related to Selected Transition</b>	Highlight the cells for all elements involved in a selected transition - the initial state, the target state, and the trigger.	
<b>Highlight Color</b>	Select the color of the highlight.	
<b>Use Different Color for Target State</b>	Highlight the cell for the target element in a transition in a different color to the cell for the source element.	
<b>Target Zone Color</b>	Select the color of the highlight.	
<b>Display Options</b>		
<b>Always Display an Empty State Zone</b>	Add an empty row (and, on a <i>State - Next State</i> table, an empty column) to the end of the table.  The title cell contains an ellipsis (...). You can click twice (not double-click) on the ellipsis to edit it and identify a new state. In this case, another empty state zone is automatically added.	
<b>Enable State Enumeration</b>	Add a cell to each state title cell, to number the state. Numbering starts at 0.	

Field	Usage	See also
<b>Prefix</b>	If required, type a prefix for the state number or delete the default <b>S</b> to have no prefix.	
<b>Enable Event Enumeration</b>	Add a cell to each event or trigger title cell, to number the event. Numbering starts at <b>0</b> .	
<b>Prefix</b>	If required, type a prefix for the event number or delete the default <b>E</b> to have no prefix.	
<b>Sample State Table</b>	Display a preview of the table format as you define it.	
<b>Advanced</b>	Define diagram options. The State Machine Diagram Properties dialog displays.	<a href="#">Set Appearance Options</a> [823]
<b>Restore Defaults</b>	Reapply the State Table diagram default values.	
<b>Apply</b>	Apply the changed options to the State Table diagram.	

### 6.3.4.2 State Machine Table Operations

As a State Machine table is a variant of a State Machine diagram, most of the operations for manipulating the data are the same as for State Machine diagrams. The operations specific to State Machine tables are described in the following topics:

Operation	See also
Change State Machine Table Position	<a href="#">Change Position of State Machine Table</a> [1216]
Change State Machine Table Size	<a href="#">Change Size of State Machine Table</a> [1216]
Insert New State	<a href="#">Insert New State (and Substate)</a> [1217]
Insert Trigger	<a href="#">Insert Trigger</a> [1218]
Insert/Change Transition	<a href="#">Insert/Change Transition</a> [1218]
Reposition State or Trigger Cells	<a href="#">Reposition State/Trigger Cells</a> [1219]

Add Legend	<a href="#">Add Legend</a> <sup>[1219]</sup>
Locate Cell in State Machine Diagram	<a href="#">Find Cell in State Machine Diagram</a> <sup>[1220]</sup>
State Machine Table Conventions	<a href="#">State Machine Table Conventions</a> <sup>[1221]</sup>
Export State Table To CSV File	<a href="#">Export State Table To CSV File</a> <sup>[1222]</sup>

#### Learn more

- [State Machines](#) <sup>[1203]</sup>
- [State Machine Table](#) <sup>[1212]</sup>

#### **6.3.4.2.1 Change State Machine Table Position**

If necessary, you can move the State Machine table around in the Diagram View.

##### **Change the position of the State Machine table**

Step	Action
<b>1</b>	Press ( <b>Ctrl+A</b> ) or double click on the top left cell to select the whole State Machine table.
<b>2</b>	Drag and drop the State Machine table to the required position. Alternatively, use ( <b>Shift</b> ) + ( <b>←</b> ) , ( <b>↑</b> ) , ( <b>→</b> ) or ( <b>↓</b> ) to move the State Machine table.

#### **6.3.4.2.2 Change State Machine Table Size**

There are three ways to change the size of the State Machine table:

Action	See also
Change the cell size on the State Machine Diagram: Options dialog.	<a href="#">State Machine Table Options</a> <sup>[1213]</sup>
Press ( <b>Ctrl+A</b> ) or double click on the top left cell to select the whole State Machine table, then press ( <b>Ctrl</b> ) + ( <b>←</b> ) , ( <b>→</b> ) , ( <b>↑</b> ) or ( <b>↓</b> ) to change the size.	
Select the State Machine table, then drag the shape handles to change the size.	

### 6.3.4.2.3 Insert New State

#### Topics

Action	Description
<b>Insert a new State in the State Machine table</b>	<p>You can insert a new State in the State Machine table, using one of following methods:</p> <ul style="list-style-type: none"> <li>• In the top left cell in the State Machine table, move the cursor to the word <b>State</b> to display a + at the end of the word; click on the + to create a new State</li> <li>• Right-click in the top left cell in the State Machine table and select the <b>Add State</b> context menu option</li> <li>• Right-click on an existing State cell in the State Machine table and select the: <ul style="list-style-type: none"> <li>• <b>Insert New State Before</b> context menu option to insert a new State before the current State, or</li> <li>• <b>Insert New State After</b> context menu option to insert a new State after the current State</li> </ul> </li> <li>• Click on an existing State cell in the State Machine table, and press ( <b>Insert</b> ) to create and insert a new State above the selected State</li> <li>• In the Toolbox, on the State Elements page, click on an element and then click on: <ul style="list-style-type: none"> <li>• The diagram background to add a new State to the end of the table, or</li> <li>• An existing State cell to add the new State just above it</li> </ul> </li> </ul> <p>From the State Elements page of the Toolbox you can insert State, Initial, Final, Entry, Exit and Terminate elements.</p>
<b>Add a Substate to a selected State</b>	<p>To add a Substate to a selected State, right-click on the required State cell in the State Machine table, and select the <b>Add Substate</b> context menu option; Enterprise Architect adds the Substate to the State.</p> <p>If the selected State does not allow a Substate, the <b>Add Substate</b> menu option is grayed out.</p> <p>You can also drag one existing State over another; if the second State allows Substates, the dragged State then becomes its Substate.</p> <p>Similarly, you can change the parent State of a Substate by dragging the Substate from the original parent State to a different State.</p>
<b>Remove the parent relation of a Substate and make it a separate State</b>	<p>To remove the parent relation of a Substate and make it a separate State, right-click on the Substate in the State Machine table and select the <b>Remove Parent Relation</b> context menu option; the Substate cell becomes a State cell.</p> <p>You can also drag and drop the Substate onto the top left cell of the State Machine table; the dragged Substate again becomes a State cell.</p>

#### 6.3.4.2.4 Insert Trigger

If the State Machine table format is either *State-Trigger* or *Trigger-State*, you can use **any** of the following methods to insert a new Trigger:

Method	Action
1	In the top left cell in the State Machine table, move the cursor to the word <b>Event</b> to display a <b>+</b> at the end of the word; click on the <b>+</b> to create a new Trigger.
2	In the top left cell in the State Machine table, right-click and select the <b>Add Trigger</b> context menu option to create a new Trigger.
3	Select an existing Trigger in the State Machine table, then press ( <b>Insert</b> ) to insert a new Trigger before the existing Trigger.
4	Click on an existing Trigger in the State Machine table, right-click and select either the: <ul style="list-style-type: none"> <li>• <b>Insert New Trigger Before</b> context menu option to insert a new Trigger before the current Trigger, or</li> <li>• <b>Insert New Trigger After</b> context menu option to insert a new Trigger after the current Trigger</li> </ul>

#### 6.3.4.2.5 Insert/Change Transition

Action	Description	See also
<b>Insert a new Transition</b>	<p>You can insert a new Transition using one of the following methods:</p> <ul style="list-style-type: none"> <li>• Right-click on the cell in which to create a Transition: <ul style="list-style-type: none"> <li>• If the State Machine table format is <i>State-Trigger</i> or <i>Trigger-State</i>, the context menu lists the States you can choose as the target of the Transition; click on the required State name to create the Transition</li> <li>• If the State Machine table format is <i>State-Next State</i>, click on the <b>Insert Transition</b> context menu option to create the Transition</li> </ul> </li> <li>• In the State Relationships page of the Toolbox, select the Transition element, then click on the cell in the State Machine table in which to create the Transition; double-click on the Transition to define it in the Transition Properties dialog</li> </ul>	
<b>Change the Transition</b>	As for the State Chart diagram, to change the properties of a Transition double-click the Transition cell and edit the details on the Transition Properties dialog.	<a href="#">State Machine Diagrams</a> <sup>[1203]</sup>
<b>Change Transition</b>	You can change the source and target of the Transition by right-clicking the Transition and selecting the <b>Advanced   Set Source and</b>	

<b>States</b>	<p><b>Target</b> context menu option.</p> <p>Alternatively, you can change the Transition source, target or Trigger by clicking on the Transition and dragging it to a different cell.</p> <p>If the State Machine table format is either <i>State-Trigger</i> or <i>Trigger-State</i>, you can change the target state of a Transition by:</p> <ol style="list-style-type: none"> <li>1. Highlighting the target state name in the Transition cell and clicking on it to display a list of the states in the table.</li> <li>2. Clicking on the preferred target state name.</li> </ol>	
<b>Highlight States and Trigger Related to Transition</b>	<p>You can select options to highlight the source State, target State and Trigger cells associated with a Transition, using the Highlight Options panel on the State Machine Diagram: Options dialog.</p> <p>When you click on the Transition cell its associated State and Trigger cells are highlighted.</p> <p>Alternatively, click on the Transition cell and press and hold ( <b>L</b> ).</p>	<a href="#">State Machine Diagram: Options</a> 

#### 6.3.4.2.6 Reposition State or Trigger Cells

You can change the position of a selected State or Trigger cell in one of the following ways:

- Right-click on the State or Trigger title cell and select the appropriate **Order | Move xxx** context menu option
- Click on the cell and press ( **Shift** ) + ( **→** ), ( **←** ), ( **↑** ) or ( **↓** )

#### 6.3.4.2.7 Add Legend

You can add a simple legend to any State Machine Table cell that has no transition. The two legend symbols are:

- **I** - Ignore
- **N** - Never Happen

#### Assign a legend symbol to a State Machine Table cell

Step	Action
<b>1</b>	<p>Click on the cell to which to assign the legend and press:</p> <ul style="list-style-type: none"> <li>• ( <b>I</b> ) to insert the Ignore legend, or</li> <li>• ( <b>N</b> ) to insert the Never Happen legend</li> </ul> <p>The required symbol displays in the center of the cell.</p>

#### Alternatively

Step	Action
1	Right-click on the cell to which to assign the legend.
2	<p>Select the appropriate context menu option:</p> <ul style="list-style-type: none"> <li>• <b>Legend   Ignore</b></li> <li>• <b>Legend   Never Happen</b></li> </ul> <p>The required symbol displays in the center of the cell.</p>

#### Notes

- To remove a legend symbol from a cell, either:
  - Click on the cell and press ( **Delete** ), or
  - Right-click on the cell and select the **Legend | Remove Legend** context menu option

#### 6.3.4.2.8 Find Cell in State Machine Diagram

#### Topics

Locate	Description
<b>In State Chart</b>	<p>On the State Machine table, to locate a selected State or Trigger element in a State Machine diagram:</p> <ul style="list-style-type: none"> <li>• Select the <b>Find   Locate in State Chart</b> context menu option</li> </ul> <p>Enterprise Architect switches to the State Machine diagram and highlights the selected element.</p> <p>You can locate a Transition relationship in a similar way, by selecting the <b>Locate in State Chart</b> context menu option.</p> <p>A Trigger on a State Machine table might or might not exist on the corresponding State Machine diagram; if the Trigger does not exist on the State Machine diagram, the <b>Locate in State Chart</b> option is disabled.</p>
<b>In State Table</b>	<p>Conversely, on the State Machine diagram, to locate a selected State or Trigger element in the corresponding State Machine table:</p> <ul style="list-style-type: none"> <li>• Select the <b>Find   Locate in State Table</b> context menu option</li> </ul> <p>Enterprise Architect switches to the State Machine table and highlights the selected element.</p> <p>You can locate a Transition relationship in a similar way, by selecting the <b>Locate in State Table</b> context menu option.</p>

#### 6.3.4.2.9 State Machine Table Conventions

##### Trigger

- Deleting a Trigger removes it completely from the model, therefore you cannot UNDO a Trigger deletion
- There is a <None> column at the end of the **Event** heading row; this is for Transitions that have no Trigger information

##### State

From the Toolbox you can insert the following *State* element types only (although the State Machine table might pick up and display other types, such as *Submachine State*):

- State
- Initial
- Final
- Entry
- Exit
- Terminate

##### Transition

The Transition cell displays its properties in one of two ways, depending on the State Machine table format.; if the State Machine table format is *State - Trigger* or *Trigger - State*, the Transition cell displays the *Guard* and *Target* as shown below:

If the State Machine table format is *State - Next State*, then the Transition cell displays the *Trigger*, *Guard* and *Effect* as shown below:

In the State Machine table, you can edit the *Guard* and *Effect* in place. If the *Guard* or *Effect* is empty for your selected Transition cell, the cell displays an ellipsis ( ... ) instead; click twice (not double-click) on the ellipsis to type in the *Guard* and *Effect* names.

#### 6.3.4.2.10 Export State Table To CSV File

##### Export a State Machine Table to a CSV file

Step	Action
1	Open the required State Machine Table.
2	Right-click on the diagram background and select the <b>Export Statechart to CSV file</b> context menu option. The Save As browser dialog displays.
3	Select the appropriate directory location and type in the .CSV filename.
4	Click on the <b>Save</b> button.

#### 6.3.4.3 Example State-Trigger Table

##### State - Trigger:

The rows indicate the current states and the columns indicate trigger events (or the other way around if you prefer, in a **Trigger - State** format).

The cell at the intersection of a row and column identifies the target state in the transition if the trigger occurs, and the condition (or guard) of the transition.

State \ Trigger		Event1	Event2	Event3	Event4	<None>
		E0	E1	E2	E3	E4
Initial	S0					S1
State1	S1				S2	
State2	S2	S6	<u>[Guard]</u> S4			
	SubState1	S3	S4			
	SubState2	S4		<u>[Cond]</u> S2		
	SubState3	S5				
State3	S6					S7
Final	S7					

#### 6.3.4.4 Example State-Next State Table

##### State - Next State:

The rows and columns both indicate states, and the cell at the intersection of a row and column indicates:

- The event that triggers a transition from the current (row) state to the next (column) state
- The condition (or guard) of the event, and
- The effect of the transition

Next State State		Initial	State 1	State2				State3	Final
					SubState1	SubState2	SubState3		
		S0	S1	S2	S3	S4	S5	S6	S7
Initial		S0							
State1		S1		Event4					
State2		S2				Event2 [Guard]		Event1	
	SubState1	S3				Event2			
	SubState2	S4		Event3 [Cond]					
	SubState3	S5							
State3		S6							
Final		S7							

#### 6.3.4.5 State Machine Table Simulation

A State Machine Table is a representation of a State Machine, and can be simulated in exactly the same way as a State Machine diagram.

**Access** Select State Machine diagram in Project Browser and  
(If necessary) **Right-click diagram background | Statechart Editor | Table** (any of the three options) then  
**Analyzer | Simulator**

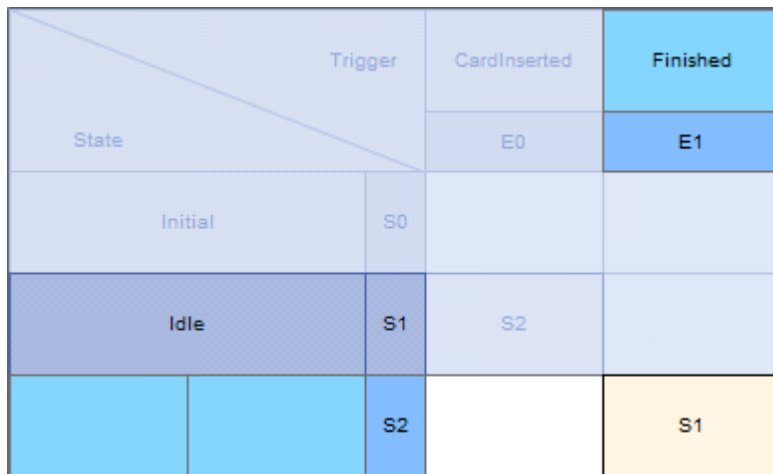

##### Highlight active cells

As the simulation executes, the table cells change color to indicate the:

- Currently active State(s) - the color set in the **Highlight Color** field of the State Machine Options: Dialog, and a dark border
- Potential next States(s) - A variant of the color in the **Highlight Color** field or, if the **Use Different Color for Target State** checkbox is selected on the State Machine Options: Dialog, the color set in the **Target Zone Color** field
- Active Transition(s) - the color set in the **Transition Cell** field of the State Machine Options: Dialog
- Trigger(s) - the color set in the **Highlight Color** field of the State Machine Options: Dialog
- Non-active States - gray

For example:

### Signal Triggers

As when running a simulation as a Diagram, the simulation will automatically traverse transitions with no guards or validated guards. Transitions with a Trigger will not be followed unless that Trigger has been fired. They may be fired automatically from the Simulation Events window or you can fire a Trigger manually by right-clicking on the Transition or Trigger cell and select the **Signal Trigger in Simulation** context menu option.

## 6.3.5 Timing Diagram

A Timing diagram defines the behavior of different objects within a time-scale. It provides a visual representation of objects changing state and interacting over time. You can use it to:

- Define hardware-driven or embedded software components; for example, those used in a fuel injection system or a microwave controller
- Specify time-driven business processes

**Example Diagram** [Example Timing Diagram](#) <sup>1227</sup>

### Tools

Select Timing diagram elements and connectors from the Timing pages of the Toolbox. Click on the elements and connectors below for more information.

Timing Diagram Elements	Timing Diagram Message
State Lifeline	Message

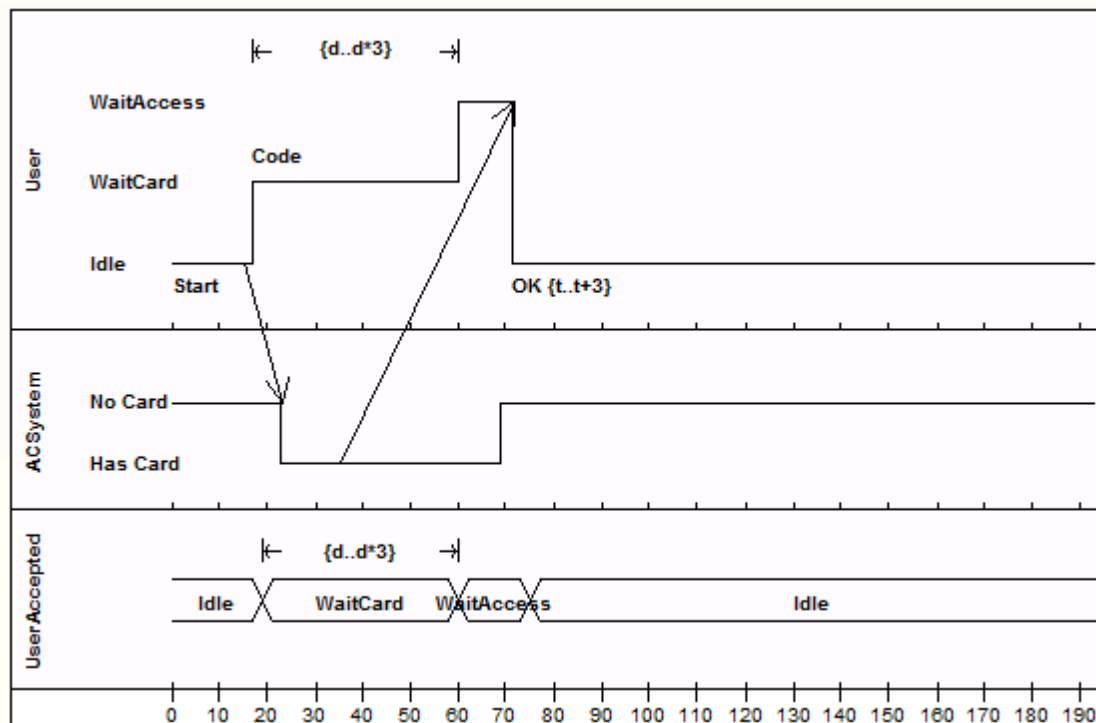

Timing Diagram Elements	Timing Diagram Message
 Value Lifeline	
 Message Label	
 Message Endpoint	
 Diagram Gate	

### Learn more

- [Time Intervals](#) <sup>f1241</sup>
- [Message \(Timing Diagram\)](#) <sup>f1431</sup>
- [Timing Toolbox](#) <sup>f806</sup>

### 6.3.5.1 Example Timing Diagram

An example of a Timing diagram is shown below:

### 6.3.5.2 Create a Timing Diagram

#### Create a Timing diagram

Step	Action
1	Right-click on a package in the Project Browser and select the <b>Add   Add Diagram</b> context menu option. The New Diagram dialog displays.
2	In the Select From panel, select <b>UML Behavioral</b> .
3	In the Diagram Types panel, select <b>Timing</b> .
4	Click on the <b>OK</b> button. The Diagram View displays, on which you create the Timing elements for the diagram.

[Learn more](#)

- [Set a Time Range](#)<sup>[1228]</sup>
- [Edit a Timing Diagram](#)<sup>[1228]</sup>

### 6.3.5.3 Set a Time Range

**Set a time range before adding Lifeline elements to your Timing diagram**

Step	Action
1	Right-click on the diagram and select the <b>Set Timeline Range</b> context menu option. The Set Timeline Range dialog displays.
2	In the <b>Start Time</b> and <b>End Time</b> fields, type the numeric values for the start and end points of the timeline; for example, set the range <b>0</b> to <b>100</b> . The start time must be less than the end time.
3	In the <b>Time Units</b> field, type the unit in which the time is measured; for example, seconds or minutes.
4	If it is not necessary to show the time range on the diagram, select the <b>Suppress In Diagram</b> checkbox.
5	Click on the <b>OK</b> button. If you have not suppressed it, the time range displays underneath the Lifeline elements that you create on the diagram.

### 6.3.5.4 Edit a Timing Diagram

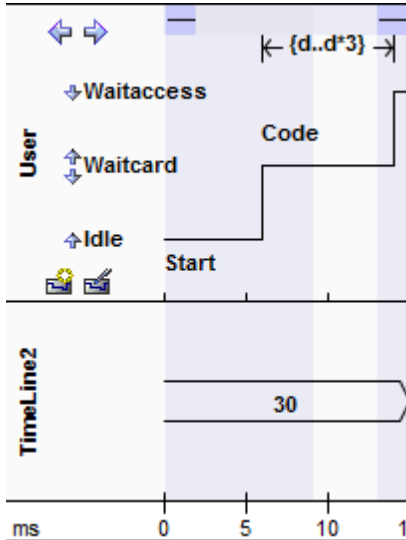

On a Timing Diagram, you can add State Lifeline elements and Value Lifeline elements. You can maintain the states and transitions on these Lifeline elements either on the diagram itself or via the Configure Timeline dialog.

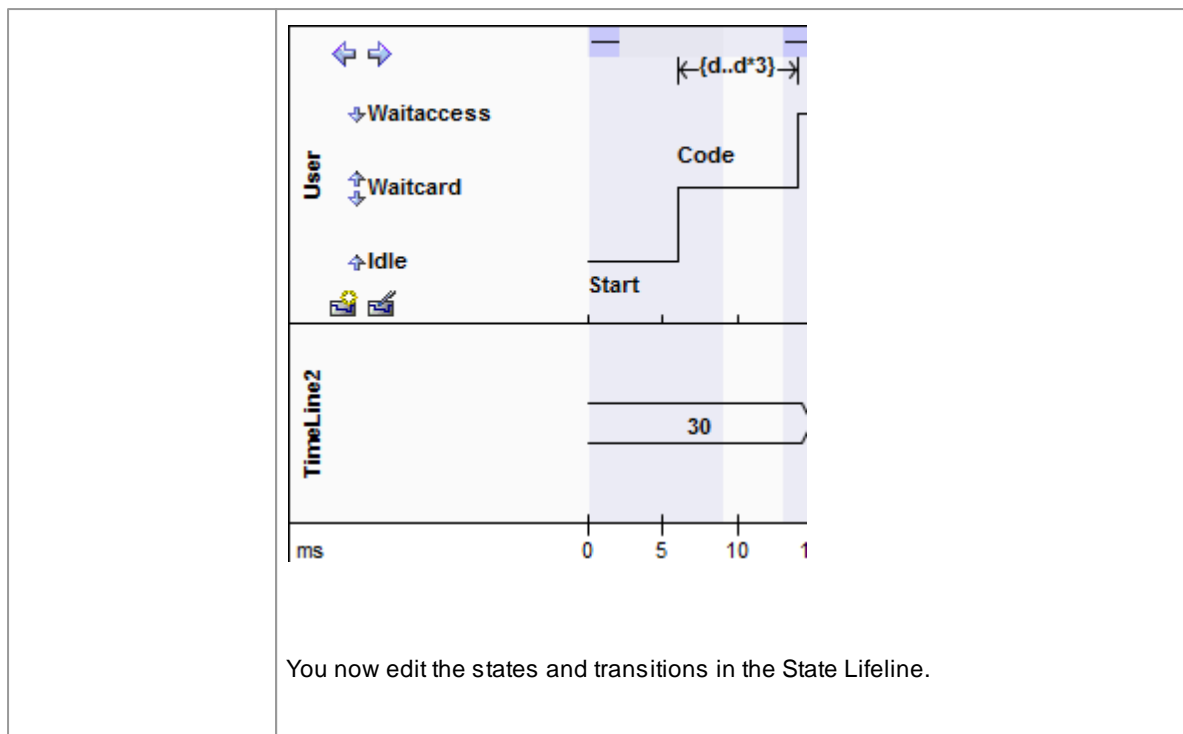

#### **Learn more**

- [Add and Edit a State Lifeline Element](#)<sup>[1229]</sup>

- [Add States in a Value Lifeline Element](#)<sup>[1235]</sup>
- [Edit Transitions in a Value Lifeline Element](#)<sup>[1235]</sup>
- [Configure Timeline dialog - States Tab](#)<sup>[1237]</sup>
- [Configure Timeline dialog - Transitions Tab](#)<sup>[1239]</sup>

#### 6.3.5.4.1 Add and Edit State Lifeline

From the Timing elements page of the Toolbox drag a State Lifeline icon onto your diagram. The element displays on the diagram.

Task	Action
<b>Define the name of the State Lifeline</b>	<ol style="list-style-type: none"> <li>1. Right-click on the element and select the <b>Other Properties</b> context menu option; the Timeline &lt;name&gt; dialog displays, showing the General tab.</li> <li>2. Overtyp the <b>Name</b> field.</li> <li>3. Click on the <b>Apply</b> button and the <b>OK</b> button.</li> </ol>
<b>Sizing and Scale</b>	<p>In the top left corner of a selected Lifeline element are the left and right quick sizing buttons (↔).</p> <p>These buttons increase or decrease the width of the Lifeline element, which in turn controls the scale width of each time unit; by increasing the width of the element you increase the resolution when adding transitions, which makes them easier to edit.</p> <p>In order to edit the State Lifeline element, you must click on it to select it.</p>
<b>Set Timeline Start Position</b>	<p>You might require more space at the start of your timelines; for example, to use long state names.</p> <p>To insert more space in all the timelines on a diagram</p> <ol style="list-style-type: none"> <li>1. Right-click on the diagram background and select the <b>Set Timeline Start Position</b> menu option; the Set Timeline Start Position dialog displays.</li> <li>2. The <b>Value 80 to 300</b> field defaults to <b>80</b> as the minimum distance in pixels between the start of the timeline element and the start of the timeline itself; type a new value up to 300 pixels and click on the <b>OK</b> button to increase the space at the start of the timeline. The two diagrams below have start positions of 80 pixels and 150 pixels respectively.</li> </ol> 

#### Learn more

- [Edit States in a State Lifeline](#) <sup>1231</sup>
- [Delete States in a State Lifeline](#) <sup>1231</sup>
- [Edit Transitions In State Lifeline](#) <sup>1232</sup>

#### 6.3.5.4.2 Add States to a State Lifeline

##### Add States to a State Lifeline

Step	Description	See also
1	Click on the <i>State Lifeline</i> element.  The <b>New State</b> button (  ) and <b>Edit States</b> button (  ) display at the bottom left of the element.	
2	Click on the <b>New State</b> button.  The New State dialog displays.	
3	In the <b>State</b> field, type the name of the state.	
4	Click on the <b>OK</b> button.  You must add at least two states; for example, <b>On</b> and <b>Off</b> .	

5	<p>As you add states, increase the height of the element by dragging a handle-box (  ) on the edge of the element.</p> <p>You can also add states using the States tab of the Configure Timeline dialog.</p> <p>Add either:</p> <ul style="list-style-type: none"> <li>• Discrete states to the Timeline, or</li> <li>• A continuous range of numeric states</li> </ul>	<a href="#">Add a New State</a>  <a href="#">Numeric Range Generator</a> 
---	--	--

#### 6.3.5.4.3 Edit States in a State Lifeline

##### Edit States in a State Lifeline

Step	Description	See also
1	Click on the State Lifeline element and click on the required state. The Edit State dialog displays.	
2	In the <b>State</b> field, change the name as required.	
3	Click on the <b>OK</b> button.	
4	<p>If necessary, change the order of the states by either:</p> <ul style="list-style-type: none"> <li>• Clicking on the up or down arrows (  ) beside each state name, or</li> <li>• Right-clicking on the state name and selecting the <b>Move Up</b> or <b>Move Down</b> context menu options</li> </ul> <p>You can also edit the states using the States tab of the Configure Timeline dialog.</p>	<a href="#">States</a> 

#### 6.3.5.4.4 Delete States in a State Lifeline

##### Delete States in a State Lifeline

Step	Description
1	Right-click on the state name and select the <b>Delete</b> context menu option.

##### Alternatively

Step	Description
1	Click on the State Lifeline element.
2	Hold down ( <b>Ctrl</b> ) and move the cursor over the state name. The cursor changes form (  ).
3	Click the mouse button. The state name is deleted.

#### 6.3.5.4.5 Edit Transitions In State Lifeline

A Timing diagram allows you to show the transitions (changes of state) that occur within a State Machine over a fixed time period and at certain timing points. This is similar in many respects to an Interaction lifeline with State changes highlighted. As events and changes occur within the instance this Timing diagram represents, state changes occur and are mapped onto this Timeline. In that respect it is a record of how a particular aspect of the system behaves over time.

When building a Timeline it is necessary to define the States first - and then to add the explicit transitions between those states at particular timing points.

Task	Action	See also
<b>Add and Move Transitions</b>	After you have added states, you can add transitions between states directly on the timeline using the mouse.	<a href="#">Add and Move Transitions</a> <sup>[1233]</sup>
<b>Change the Transition Time</b>	Move the cursor over one or other of the vertical transition lines and drag the line left or right to change the time of the transition.  While on the line, the cursor shape changes to the horizontal movement cursor (  ).	
<b>Merge Transitions</b>	If necessary, you can 'push' a transition to merge it with the next or previous transition point on any Lifeline element on the diagram.  Position the cursor off the appropriate side of the transition line; the cursor changes form (  or  ).  Click the mouse button; the system locates the nearest transition in the required direction, on any element on the diagram, and merges the current transition with that transition.	
<b>Delete Transitions</b>	Transitions are automatically deleted when you move the transition to the same state as the previous transition state, and release the cursor.  Alternatively, right-click on the transition line and select the <b>Delete</b> context menu option.	

--	--	--

#### 6.3.5.4.5.1 Add and Move Transitions

After you have added states, you can configure state changes (transitions) directly on the Timeline using the mouse. This is a fast and effective means of building a detailed model of state changes over time.

In order to modify the Timeline, place the mouse over the existing Timeline. As you move the cursor over the Timeline, the cursor changes to one of three shapes, described below.

Task	Action	See also
<b>The move cursor</b> (  )	Displays when it is directly over the timeline.  Hold down the mouse button and drag the line to move the timeline to a state above or below the current position; you can move the transition more than one state up or down, if necessary.	
<b>The new transition up cursor</b> (  )	Displays when it is just below the timeline, and there is another state above the line.  Press and hold ( <b>Alt</b> ); the cursor changes (  ).  Click to create a new transition to the state above the line.  To push the transition up more than one state, move the cursor onto the line and drag it up.  The transition is for one interval unit; you can make it longer by changing the transition time.  If you do not hold ( <b>Alt</b> ), the cursor does not change and the whole timeline from the transition onwards moves up.	<a href="#">Edit Transitions In State Lifeline</a>  <sup>[1232]</sup>
<b>The new transition down cursor</b> (  )	Displays when it is just above the transition line, and there is another state below the line.  Press and hold ( <b>Alt</b> ); the cursor changes (  ).  Click to create a new transition to the state below the line.  To push the transition down more than one state, move the cursor onto the line and drag it down.  The transition is for one interval unit; you can make it longer by changing the transition time.  If you do not hold ( <b>Alt</b> ), the cursor does not change and the whole timeline from the transition onwards moves down.	<a href="#">Edit Transitions In State Lifeline</a>  <sup>[1232]</sup>

As you move the cursor over the vertical line of a transition, the time at which the transition occurs displays

next to the line.

**Access** Click directly on the appropriate transition line, after the transition begins, or Right-click on the transition line and select the **Edit** context menu option

Edit the transitions as required, on the Edit Transition dialog.

Field/ Option	Action
<b>At Time</b>	Type the point on the timescale at which the transition occurs.
<b>Transition To</b>	Type the name of the state to which the transition occurs.
<b>Event</b>	Type the name of the event that the transition represents. This displays on the Timeline element just above the transition line.
<b>Duration Constraint</b>	Type any constraint on the duration of the transition. This displays on the Timeline element, along the top of the element over the transition.
<b>Time Constraint</b>	Type any constraint on the start of the transition. This displays on the Timeline element at the start of the transition.
<b>OK</b>	Click on this button to save the changes.

#### Notes

- Once Event, Duration Constraint or Time Constraint are displayed on the diagram, you can edit them directly by clicking on them to display their specific dialog
- You can delete them by pressing and holding ( **Ctrl** ) as you click on them; the cursor changes form when you press ( **Ctrl** )
- You can also edit transitions using the Transitions tab of the Configure Timeline dialog

#### Learn more

- [Transitions](#) 

#### **6.3.5.4.6 Add and Edit Value Lifeline**

From the Toolbox drag a Value Lifeline element onto your diagram. The element displays on the diagram.

#### Edit the Value Lifeline name

Step	Action
1	Right-click on the element and select the <b>Other Properties</b> context menu option. The Timeline <name> dialog displays, showing the General tab.
2	Overtyping the <b>Name</b> field.
3	Click on the <b>Apply</b> button and the <b>OK</b> button.

### Sizing and Scale

In the top left corner of a selected Lifeline element are the left and right *quick sizing* buttons (   ). These buttons increase or decrease the width of the Lifeline element, which in turn controls the scale width of each time unit. By increasing the width of the element you increase the resolution when adding transitions, which makes them easier to edit.

### Learn more

- [Value Lifeline](#)<sup>[1355]</sup>
- [Add States in a Value Lifeline](#)<sup>[1235]</sup>
- [Edit Transitions in a Value Lifeline](#)<sup>[1235]</sup>

#### 6.3.5.4.7 Add States In Value Lifeline

Adding States to a Value Lifeline is similar to adding states to a State Lifeline element.

For a Value Lifeline, only the first state displays on the diagram. The other states are added to a list to access when creating transitions; they only display on the Lifeline element as you create transitions to those states.

You can only edit or delete states in a Value Lifeline element using the States tab of the Configure Timeline dialog.

### Learn more

- [Add States to a State Lifeline](#)<sup>[1230]</sup>

#### 6.3.5.4.8 Edit Transitions In Value Lifeline

##### Add Transitions to the states on a Value Lifeline element, via the diagram

Step	Action
1	Move the cursor above the transition line. The cursor changes form (  ).

2	Click the mouse button. The New Transition Event dialog displays.
3	In the <b>Transition To</b> field, click on the drop-down arrow and select a state from the list of available states; this displays on the Lifeline element within the transition box. The remaining fields on the dialog are optional.
4	In the <b>Event</b> field, type the name of the event that the transition represents; this displays on the Lifeline element just below and at the start of the transition line.
5	In the <b>Duration Constraint</b> field, type any constraint on the duration of the transition; this displays on the Lifeline element, along the top of the element over the transition.
6	In the <b>Time Constraint</b> field, type any constraint on the start of the transition. This displays on the Lifeline element at the start of the transition, just after the Event name.
7	Click on the <b>OK</b> button to create the new transition.

#### Edit a Transition

Step	Action
1	Click on the state name in the transition. Alternatively, right-click on the state name and select the <b>Edit</b> context menu option. The Edit Transition dialog displays, which is the same as the New Transition Event dialog, except that the <b>At Time</b> field is enabled.
2	If necessary, overwrite the <b>At Time</b> field to define a different start point. You cannot change the <b>At Time</b> field for the first state in the timeline; this is always <b>0</b> .
3	Edit the remaining fields as necessary.
4	Click on the <b>OK</b> button to save the changes.

#### Change the transition time

Step	Action
1	<p>To change the start or end time of a transition, click on the start or end point of the transition and drag it to the new position.</p> <p>While on the line, the cursor shape changes to the horizontal movement cursor (.</p>

### Delete Transitions

Step	Action
1	<p>To delete a transition, press and hold ( <b>Ctrl</b> ) and click on the transition state name.</p> <p>While you hold ( <b>Ctrl</b> ) on the transition state name, the cursor changes form ( .</p> <p>Alternatively, right-click on the state name and select the <b>Delete</b> context menu option.</p>

#### 6.3.5.4.9 Configure Timeline - States

You can manage states using the States tab of the Configure Timeline dialog. To display this, either:

- Double-click on the Lifeline element
- Right click on the Lifeline element and select the **Properties** context menu option, or
- On a Value Lifeline, click on the **Edit States** button (  )

The Configure Timeline dialog defaults to the States tab.

All states currently defined for the Lifeline element are listed in the States panel.

### Add a new State

Step	Action
1	In the <b>State Name</b> field, type the name of the first new state in the Lifeline element; for example, <b>WaitState</b> .
2	<p>Click on the <b>Save</b> button.</p> <p>The state is added to the States panel and (for a State Lifeline Element) to the diagram.</p>
3	Click on the <b>New</b> button.
4	In the <b>State Name</b> field, type the name of the next state in the Lifeline element.
5	Repeat steps 2 to 5 until you have added all required states (you must add at least three to the

	Lifeline element).
6	When you have added all the required states, click on the <b>OK</b> button to close the Configure Timeline dialog.

#### Edit an existing state

Step	Action
1	Click on the state in the <b>States:</b> list.
2	In the <b>State Name</b> field, change the name of the state.
3	Click on the <b>Save</b> button.

#### Delete an existing State

Step	Action
1	Click on the state in the <b>States:</b> list.
2	Click on the <b>Delete</b> button.

#### Change the order of States

Step	Action
1	Click on the state in the <b>States:</b> list.
2	Click on the  or  buttons to move the state up or down the sequence.

#### Learn more

- [Numeric Range Generator](#)<sup>[1239]</sup>

#### 6.3.5.4.10 Numeric Range Generator

You can also use the Configure Timeline dialog to create a range of states having numeric values to be applied to the Timeline.

**Important:** This operation deletes all existing states and transitions for the Timeline element.

##### Create a range of states having numeric values

Step	Action
1	Double-click on the Lifeline element. The Configure Timeline dialog displays.
2	Click on the <b>Create Continuous Numeric States</b> button. The Numeric Range Generator dialog displays.
3	In the <b>High Value</b> and <b>Low Value</b> fields, type the upper and lower values of the range.
4	In the <b>Step Value</b> field, type the increase interval. Nonsense values do not parse; <b>Low Value</b> must be less than <b>High Value</b> , and <b>Step Value</b> must be a positive value smaller than the total range.
5	In the <b>Units</b> field, type the name of the measurement unit; for example, <b>minutes</b> .
6	Click on the <b>OK</b> button. Enterprise Architect displays a warning that existing states and transitions are to be deleted.
7	Click on the <b>Yes</b> button. The Configure Timeline dialog redisplay, with the defined range of states listed in the States panel.
8	Click on the <b>OK</b> button. For a: <ul style="list-style-type: none"> <li>Value Lifeline, the first state is shown on the Timeline for the full time range of the Timeline</li> <li>State Lifeline, the range of states is displayed as the y-axis of the Timeline</li> </ul>

#### 6.3.5.4.11 Configure Timeline - Transitions

You can also manage transitions using the Transitions tab of the Configure Timeline dialog. To display this, either:

- Double-click on the Lifeline element
- Right click on the Lifeline element and select the **Properties** context menu option, or

- On a Value Lifeline, click on the **Edit States** button (  )

The Configure Timeline dialog defaults to the States tab. Click on the Transitions tab.

All transitions defined for the Timeline element are listed in the Transition Points panel.

#### Add a new transition

Step	Action
1	Click on the <b>New</b> button.
2	In the New Transition panel, type the details of the transition.
3	Click on the <b>Save</b> button.

#### Edit a transition

Step	Action
1	Click on a transition in the list.
2	In the Edit Transition panel, edit the fields for the transition as required.
3	Click on the <b>Save</b> button.

#### Delete a transition

Step	Action
1	Click on a transition in the list.
2	Click on the <b>Delete</b> button. The transition is removed from the dialog and the Lifeline.
3	Click on the <b>OK</b> button.

### 6.3.5.5 Time Intervals

You create and manage Time Intervals using the *Interval Bar* (the pale line along the top of each selected Lifeline element). Time Intervals enable you to perform various operations on transitions, such as copy and paste. They also enable you to compress sections of the timeline so that they are not visible.

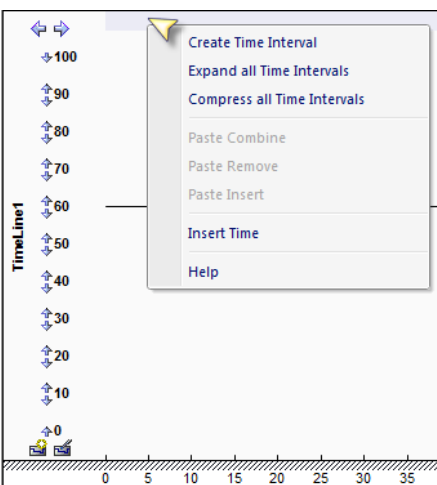

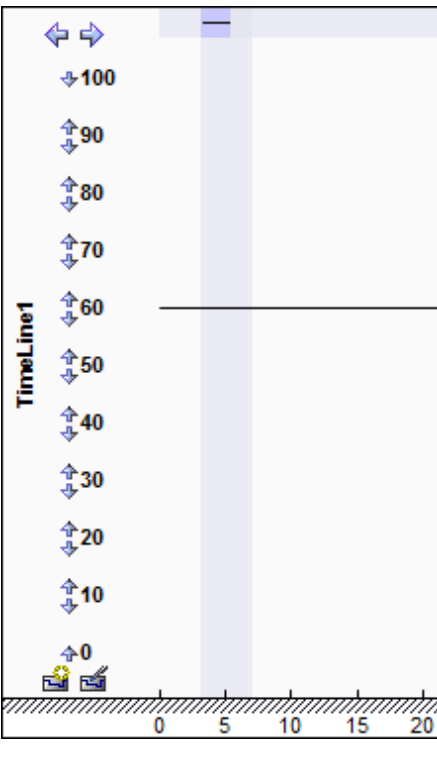

Each Time Interval displays across all Timeline elements down to the last element on the diagram.

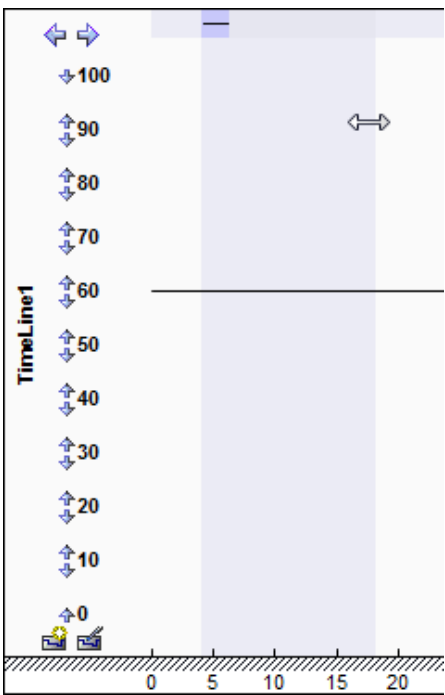

Action	Description	See also
<b>Create Time Intervals</b>	You can create a Time Interval using the: <ul style="list-style-type: none"> <li>Interval Bar - Context menu</li> <li>Interval Bar - ( <b>Shift</b> ) key, or</li> <li>Timeline - Context menu</li> </ul>	<a href="#">Create Time Intervals</a> <sup>[1241]</sup>
<b>Compress Time Intervals</b>	You can compress Time Intervals to conserve space on long timelines.	<a href="#">Compress Time Intervals</a> <sup>[1244]</sup>
<b>Select Time Intervals</b>	There are a number of ways to select Time Intervals for performing other operations.	<a href="#">Select Time Intervals</a> <sup>[1245]</sup>
<b>Move Time Intervals</b>	To move a Time Interval, move the cursor over the Interval bar within the Time Interval, hold down the mouse button and drag the interval left or right.  Time Intervals can meet, but cannot overlap.	
<b>Resize Time Intervals</b>	To resize a Time Interval, move the cursor over the Interval Bar at the start or end edge of the Time Interval, hold down the mouse button and move the edge left or right.  Time Intervals can meet, but cannot overlap.	
<b>Delete Time Intervals</b>	To delete Time Intervals, select each Time Interval to be deleted and press ( <b>Delete</b> ).  Deleting the Time Interval does not delete transitions within that interval.	

#### 6.3.5.5.1 Create Time Intervals

##### Create a Time Interval using the Interval Bar context menu

Images	Step	Action
--------	------	--------

	<p>1 Right-click on the Interval Bar at approximately the point at which to start or finish the Time Interval, and select the <b>Create Time Interval</b> context menu option.</p>
	<p>2 The Time Interval displays down all the timeline elements, as a narrow pale band with a blue compression box at the top.</p>

3

Move the cursor to the edge of the Time Interval in the Interval Bar so that the cursor changes to the drag form and drag the edge to the correct start or end point.

Create a Time Interval using the Interval Bar and ( Shift ) key

Step	Description	See also
1	Move the cursor over the Interval Bar and press ( Shift ). The cursor changes shape (  ).	
2	Click to create the Time Interval.	
3	Move the cursor to the edge of the Time Interval in the Interval Bar so that the cursor changes to the drag form (  ) and drag the edge to the correct start or end point.	

Create a Time Interval using the Timeline context menu

Step	Description	See also
1	Right-click on the timeline just after a transition. The context menu displays.	
2	Click on the <b>Select</b> menu option.	<a href="#">Compress Timeline</a> <small>1247</small>

Enterprise Architect creates a Time Interval covering the period from the selected transition up to the next transition.

If there are other Time Intervals in this period, Enterprise Architect replaces them with the single Time Interval for the transition state; you should consider this when creating the Time Interval, as it extends across the other Timeline elements in the diagram.

A value of this method is that it creates a Time Interval for a period in which no transitions occur, which could be lengthy; you can then compress this Time Interval to hide the period of inactivity.

#### 6.3.5.5.2 Compress Time Intervals

You can compress Time Intervals to conserve space on long timelines.

##### Uncompressed Time Intervals

##### Compressed Time Intervals

Notice:

Item	Description
	<p>The compression toggle boxes:</p> <ul style="list-style-type: none"> <li> is expanded, click on this to compress the selected time interval</li> <li> is compressed, click on this to expand the selected time interval again</li> </ul>
	<p>The compressed sections of the timelines themselves, in all elements.</p> <p>If there is space between the paired symbols, there are transitions within the compressed section.</p> <p>If the timeline continues through the paired symbols there are no transitions in the compressed section.</p>
25 ... 55	The compressed sections in the time range underneath the elements.

You can also compress and expand Time Intervals using context menu options,

#### Learn more

- [Time Interval Operations on Transitions](#) <sup>[1246]</sup>

#### 6.3.5.5.3 Select Time Intervals

Task	Action	See also
<b>Select a Time Interval across all elements on the diagram</b>	Click on the Interval Bar within the Time Interval.	

<b>Select a number of individual Time Intervals</b>	Press and hold ( <b>Ctrl</b> ) while clicking on the Interval Bar within each Time Interval.	
<b>Select all Time Intervals in a range</b>	Click on the Interval Bar within the first Time Interval in the range, then press and hold ( <b>Shift</b> ) and click on the Interval Bar within the last Time Interval in the range.  All Time Intervals between the two are selected.	

After you have selected one or more Time Intervals, you can modify the selection in the following ways:

Task	Action	See also
<b>Exclude Lifeline elements from the selection</b>	Press and hold ( <b>Ctrl</b> ) and click on any part of the selection within that element.  Repeat the step to toggle the selection and re-include the element.	<a href="#">Toggle Interval Selection</a> <sup>[1246]</sup>
<b>Select only one Lifeline element and exclude all others</b>	Press and hold ( <b>Shift</b> ) and click on any part of the selection within that element.	

#### 6.3.5.5.4 Time Interval Operations

You can select and update specific Time Intervals.

Right-click on the Interval Bar within an interval. A context menu displays providing the following options:

Option	Action	See also
<b>Select Interval</b> <b>Deselect Interval</b>	Select the Time Interval or, if the interval is already selected, deselect it.  You can select several Time Intervals in this way, accessing the menu separately on each interval.	<a href="#">Select Time Intervals</a> <sup>[1245]</sup>
<b>Toggle Interval Selection</b>	Switch the selection or deselection of the Time Interval within the selected Timeline element.  You select or deselect a Time Interval across all Timeline elements, but the Toggle option acts only on the element in which you access the menu.	<a href="#">Select Time Intervals</a> <sup>[1245]</sup>
<b>Compress Interval</b>	Compress the Time Interval, and hide all transitions within that Time Interval.  This is also useful for hiding long sections of inactivity on the time	<a href="#">Compress Timeline</a> <sup>[1247]</sup>

Option	Action	See also
	line.	
<b>Remove Interval</b>	Delete the Time Interval.	
<b>Copy</b>	Copy the transitions for all selected Time Intervals.	
<b>Cut</b>	Copy and delete the selected transitions from the diagram.	
<b>Cut and Remove Time</b>	Copy and delete the transitions that lie in the selected Time Intervals from the diagram.  This option also removes time from the timeline, the amount being the duration of the Time Interval.  All transitions and Time Intervals to the right of the selected time interval are moved left.	
<b>Delete</b>	Delete the selected transitions from the diagram.	
<b>Delete and Remove Time</b>	Delete the transitions that lie in the selected Time Intervals from the diagram.  This option also removes time from the timeline, the amount being the duration of the Time Interval.  All transitions and Time Intervals to the right of the current Time Interval are moved left.	
<b>Insert Time</b>	Add time to the timeline and move all transitions and time intervals to the right.  Also expand the duration of the current Time Interval.	

### Compress Timeline

The Compression toggle boxes and **Compress Interval** menu option operate on the Time Interval and compress the timeline and all transitions within the Interval. You have an alternative option that operates on the timeline and compresses a single transition state.

1. Right-click on the timeline (rather than the Interval Bar) just after a transition, and select the **Compress** context menu option.
2. Enterprise Architect creates a new Time Interval covering the period from the selected transition up to the next transition, and then compresses that Time Interval.

If there are other Time Intervals in this period, Enterprise Architect replaces them with the single Time Interval for the transition state. You should consider this when creating and compressing the Time Interval, as it extends across the other Timeline elements in the diagram.

A value of this method is that it creates a Time Interval for a period in which no transitions occur, which could be lengthy, and then compresses this Time Interval to hide the period of inactivity.

### All Time Intervals in the Diagram

To create a new Time Interval or work across all Time Intervals in the diagram, right-click on the Interval Bar between Time Intervals. A context menu displays, providing the following options (The **Paste ...** menu options become active after transitions have been copied).

Menu Option	Action	See also
<b>Create Time Interval</b>	Create a single Time Interval.	<a href="#">Create Time Intervals</a> <sup>[1248]</sup>
<b>Expand all Time Intervals</b>	Expand all Time Intervals over the whole diagram.	
<b>Compress all Time Intervals</b>	Compress all Time Intervals over the whole diagram.	
<b>Paste Combine</b>	Paste copied transitions over any existing transitions within the copied time frame.  The diagram does not allow two consecutive transitions to the same state, and removes the second transition automatically.	
<b>Paste Remove</b>	Delete all the transitions and then pastes the copied transition within the copied time frame.	
<b>Paste Insert</b>	Insert time, moving all transitions and Time Intervals to the right to make room to paste in the copied transitions.	
<b>Insert Time</b>	Add time to the timeline and move all transitions and Time Intervals to the right.  This option does not change the duration of any Time Interval.	

### Copy and paste transitions from one timeline element to another

Step	Action	See also
<b>1</b>	Press and hold ( <b>Shift</b> ) and select the Timeline element within a Time Interval to copy or cut.	
<b>2</b>	Right-click on the Interval Bar (it doesn't matter which element you select).  The context menu displays.	

Step	Action	See also
3	Copy or cut the transitions. You can also cut and remove time.	<a href="#">Copy or cut</a> <sup>[1247]</sup>
4	Select the timeline to paste transitions to and right-click on the Interval Bar. The context menu displays.	
5	Select one of the paste operations. Note that states are created if they don't already exist in the timeline. Any states that don't exist in the Timeline element you are pasting to are created. Any new states created might be in the wrong order; you can change the order via the diagram quick buttons.	<a href="#">Quick Buttons</a> <sup>[1229]</sup>

#### **Shift transitions within a selected Time Interval or multiple selected Time Intervals**

Step	Action	See also
1	Select all the Time Intervals containing the transitions to be shifted.	<a href="#">Select Time Intervals</a> <sup>[1245]</sup>
2	Press and hold ( <b>Shift</b> ) and click on the Interval Bar (it doesn't matter which Timeline element you select), and move the transition left or right.  You cannot drag transitions over other transitions; the move stops when the moved transition collides with a stationary transition.  If you have collision problems, use ( <b>Shift</b> ) + <b>select</b> to shift transitions for a single Timeline element.	

### **6.3.6 Sequence Diagram**

A Sequence diagram is a structured representation of behavior as a series of sequential steps over time. You can use it to:

- Depict work flow, message passing and how elements in general cooperate over time to achieve a result
- Capture the flow of information and responsibility throughout the system, early in analysis; messages between elements eventually become method calls in the Class model
- Make explanatory models for Use Case scenarios; by creating a Sequence diagram with an Actor and elements involved in the Use Case, you can model the sequence of steps the user and the system undertake to complete the required tasks

#### **Construction**

- Each Sequence element is arranged in a horizontal sequence, with messages passing back and forward between elements

- Messages on a Sequence diagram can be of several types; the Messages can also be configured to reflect the operations and properties of the source and target elements (see the Notes in the *Message* topic)
- An Actor element can be used to represent the user initiating the flow of events
- Stereotyped elements, such as Boundary, Control and Entity, can be used to illustrate screens, controllers and database items, respectively
- Each element has a dashed stem called a Lifeline, where that element exists and potentially takes part in the interactions

To toggle the numbering of messages on a Sequence diagram, select or deselect the **Show Sequence Numbering** checkbox on the Options dialog.

**Example Diagram** [Example Sequence Diagram](#) <sup>[1251]</sup>

### Tools

Select Sequence diagram elements and connectors from the [Interaction pages](#) <sup>[806]</sup> of the Toolbox. Click on the following elements and connectors for more information.

Sequence Diagram Elements	Sequence Diagram Connectors
 Actor	 Message
 Lifeline	 Self-Message
 Boundary	 Recursion
 Control	 Call
 Entity	
 Fragment	
 Endpoint	
 Diagram Gate	
 State/Continuation	
 Interaction	

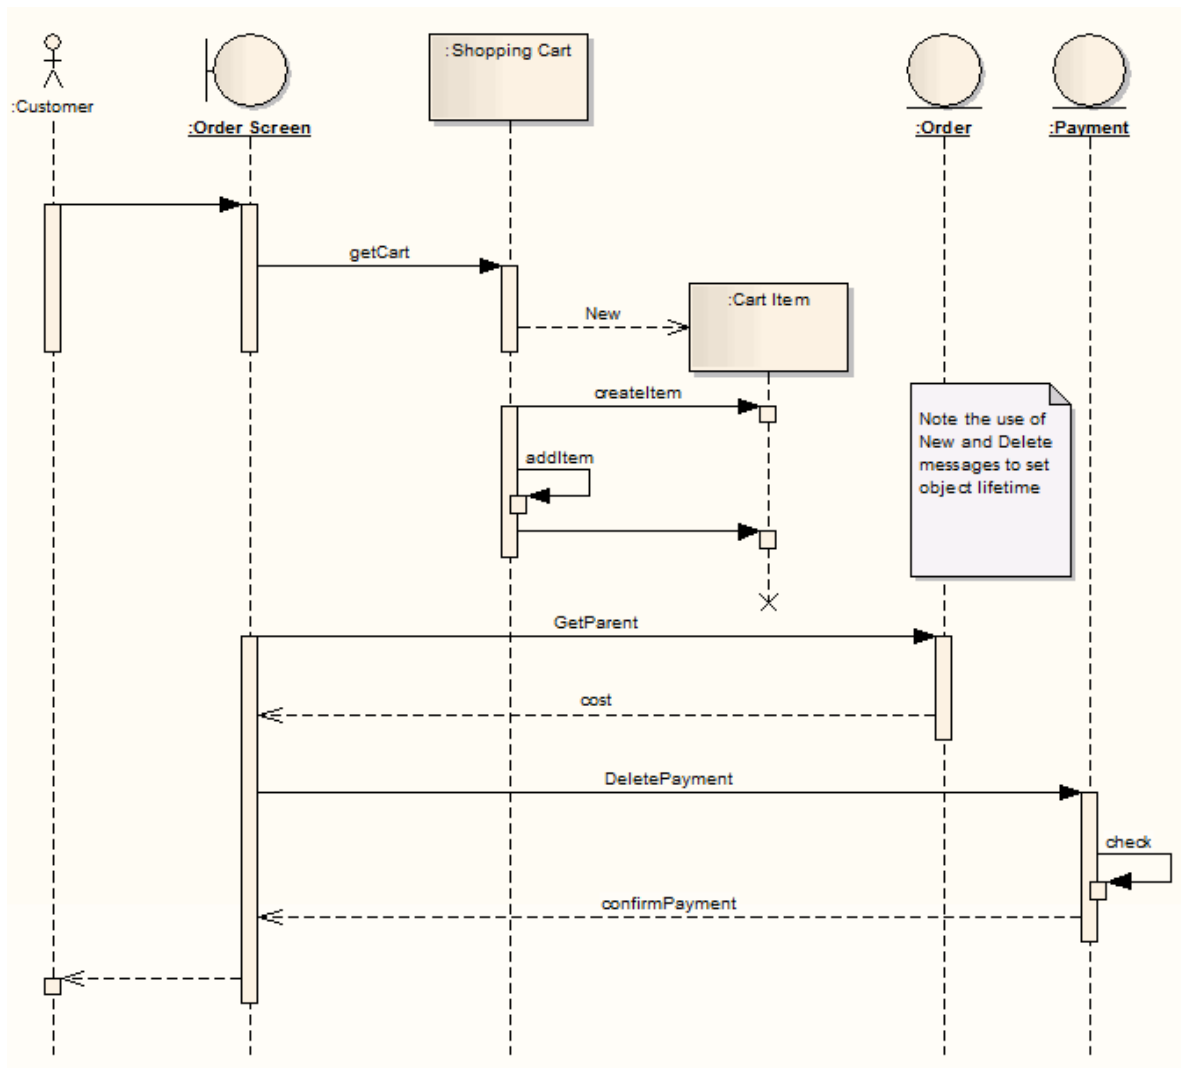

### Learn more

- [Show Sequence Numbering](#)<sup>[629]</sup>

### 6.3.6.1 Example Sequence Diagram

The following example Sequence diagram demonstrates several different elements:

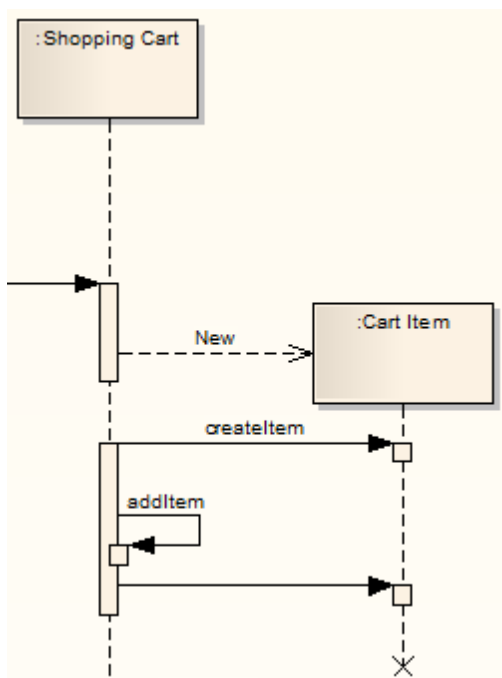

### 6.3.6.2 Denote Lifecycle of an Element

**Capture element lifetimes using messages denoted as New or Delete message types**

Step	Action
1	Double-click on a message within a Sequence diagram to display the Message Properties dialog.

2	In the <b>Lifecycle</b> field, click on the drop-down arrow and select <b>New</b> or <b>Delete</b> .
3	Click on the <b>OK</b> button to save the changes.

**Example Diagram** The example below shows two elements that have specific creation and deletion times

#### Notes

- To show the termination **X** on the lifeline in the example diagram, you must switch on garbage collection: **Tools | Options | Diagram | Sequence: Garbage Collect**

### 6.3.6.3 Layout of Sequence Diagrams

#### Offset the vertical separation of Sequence messages

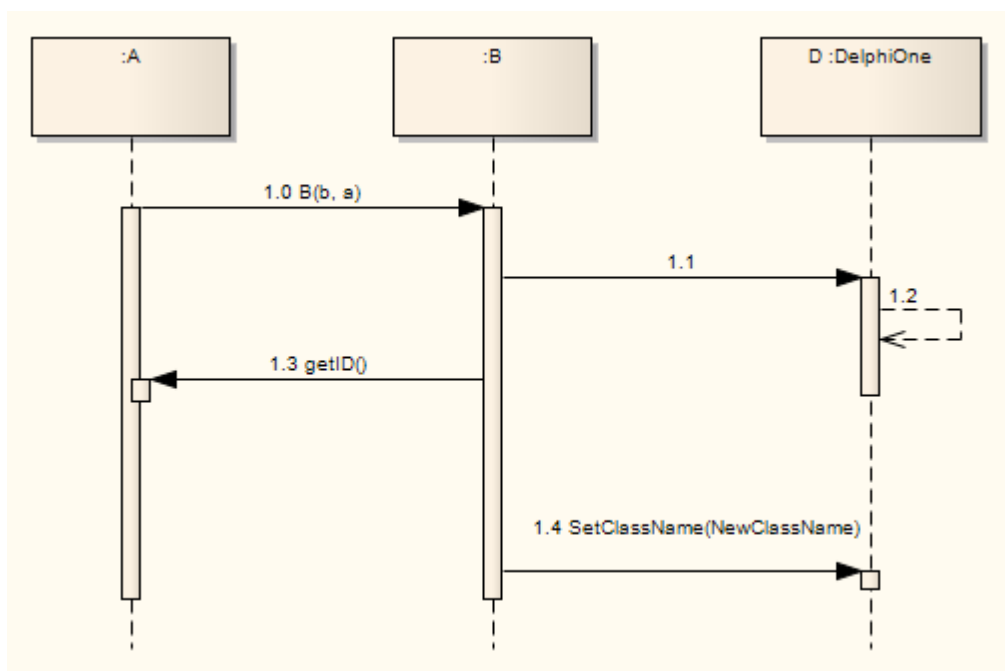

Step	Action	See also
1	Select the appropriate message in a Sequence diagram.	
2	Use the mouse to drag the message up or down as required.  As you drag a message up or down a lifeline, any messages or fragments below that message are shifted up or down the same amount.	

If you press and hold ( **Alt** ) as you drag a message up or down **past** the next or previous message, the messages **swap** positions, rather than simply move position.

As you move one Message past another, a tooltip displays to remind you to press and hold **[Alt]**, regardless of whether you are actually pressing the key. You can hide this tooltip by deselecting a checkbox on the **Diagram | Sequence** page of the Options dialog.

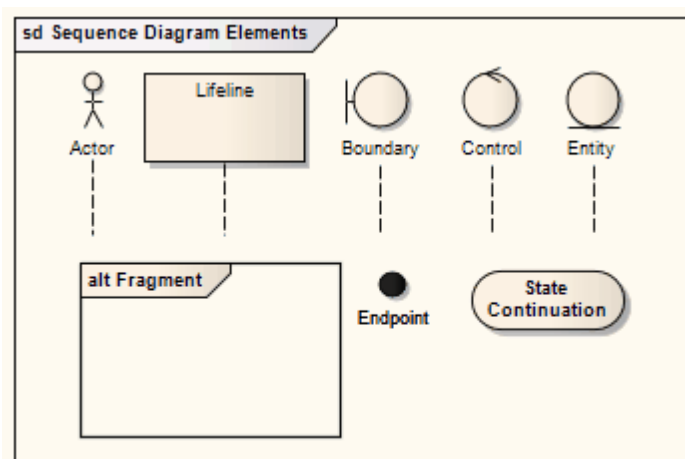

[Sequence Diagram Options](#)  
629

**Example Diagram** The example below shows an economical use of space in a Sequence diagram.

#### 6.3.6.4 Sequence Elements

The example below shows some possible elements of Sequence diagrams and their stereotyped display.

Element	Description	See also
<b>Actor</b>	An instance of an actor at runtime; this can be depicted either as the human figure or in rectangle notation.	<a href="#">Actor</a> <sup>[1284]</sup>
<b>Lifeline</b>	An Object element with the stereotype Lifeline.	<a href="#">Lifeline</a> <sup>[1321]</sup>
<b>Boundary</b>	Represents a user interface screen or input/output device.	<a href="#">Boundary</a> <sup>[1997]</sup>
<b>Entity</b>	A persistent element - typically implemented as a database table or element.	<a href="#">Control</a> <sup>[1999]</sup>
<b>Control</b>	The active component that controls what work gets done, when and how.	<a href="#">Entity</a> <sup>[2000]</sup>

### 6.3.6.5 Sequence Diagrams and Version Control

You might create Sequence diagrams that use elements from other packages as the Lifelines within the diagram. In such cases, the diagrams could be corrupted when the element packages are checked in and out under version control. This is because during checkout the elements are first deleted from the model and then re-imported, and although they are reinstated in the diagrams, any Messages connecting them are not.

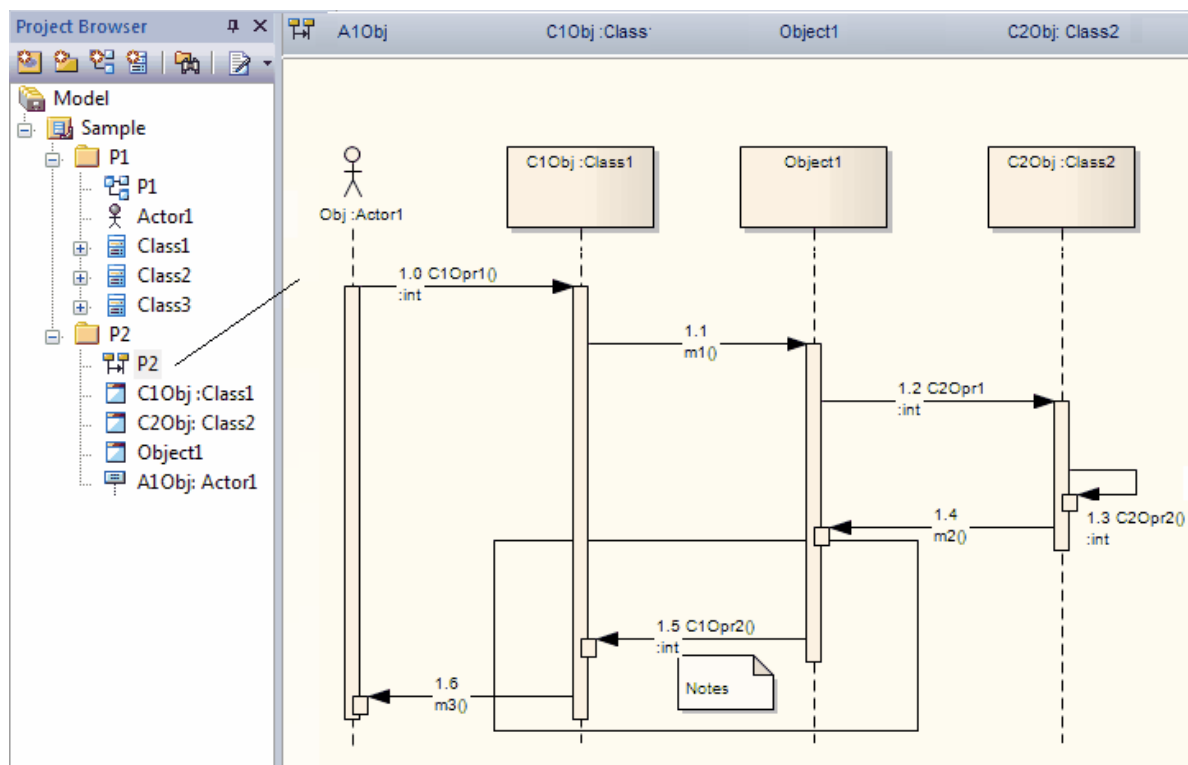

So, if the diagram and its elements reside in different packages, a round-trip of the element package through version control might damage the Sequence diagram.

The solution is to drag-and-drop each Class onto the Sequence diagram as an *object* - when you drop the Class onto the Sequence diagram, in the Paste Element dialog select the **as Instance of Element (Object)** option. This creates a new object in the *diagram*'s parent package, based on the selected Class element. You then create the Messages between the objects.

Therefore, to ensure that a Sequence diagram is not damaged by round-trips of other packages through version control, remember that:

- The Lifelines must be objects (even though you can drop elements as Lifelines onto a Sequence diagram, it is not a strictly UML compliant construct)
- The Lifelines must be in the same package as the diagram.

The following illustration shows the Project Browser with two packages: *P1*, containing the elements, and *P2*, containing a Sequence diagram that uses those elements. The diagram itself is also shown.

This diagram is not damaged, because all the Lifelines are objects and these objects reside in the same package as the Sequence diagram.

### 6.3.6.6 Sequence Element Activation

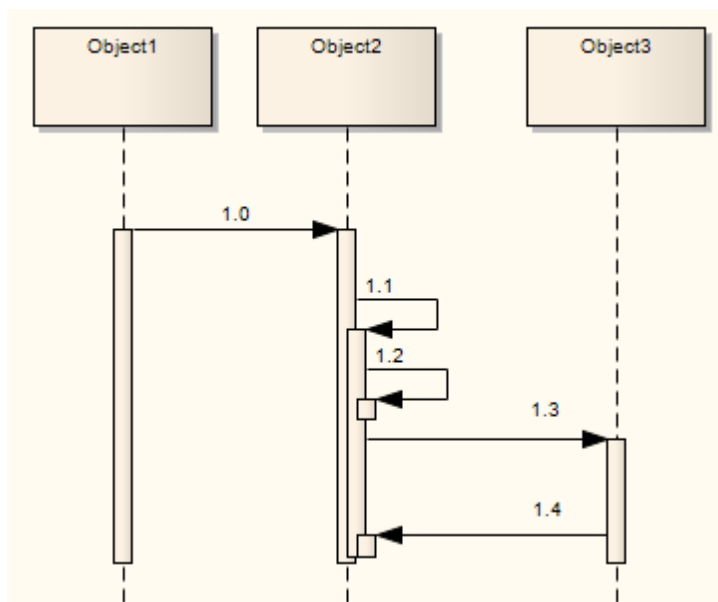

Sequence elements in a Sequence diagram have Activation rectangles drawn along their lifelines. These rectangles describe the time the element is active during the overall period of processing. This visual representation can be suppressed by right-clicking the Sequence diagram, and selecting the **Suppress Activations** context menu option.

In general, Enterprise Architect calculates the period of activation for you, but in some cases you might want to fine tune the rectangle length. There are several context menu options on a sequence message that you can use to accomplish this. To access the following context menu, right-click on the message and select the **Activations** context menu option.

Command	Description
<b>Start New Message Group</b>	Starts off a new round of processing in the current diagram.  This enables you to describe more than one processing scenario in a single diagram.
<b>Extend Source Activation Down</b>	Forces an element to stay active beyond the normal processing period.  This could be used to express an element that continues its own processing concurrently with other processes.

<b>Extend Source Activation Up</b>	Forces an element's activation upwards.
<b>End Source Activation</b>	Truncates the activation of the source element after the current message. This is useful for expressing an asynchronous message after which the source element becomes idle.
<b>End Target Activation</b>	Ends a Forced Activation started by the <b>Extend Source Activation</b> options.
<b>Raise Activation Level</b>	Displays on the context menu only where its use is appropriate. For example, after a self-message the next message starts by default at a lower activation level but the <b>Raise Activation Level</b> command displays on the context menu to enable you to raise its level.
<b>Lower Activation Level</b>	Displays on the context menu only where its use is appropriate.

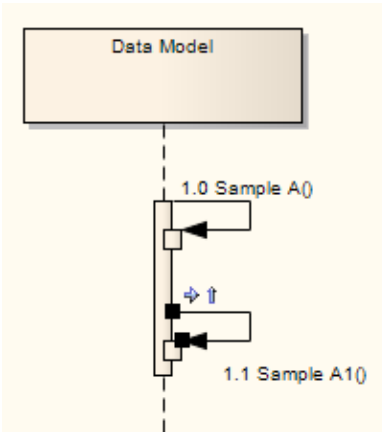

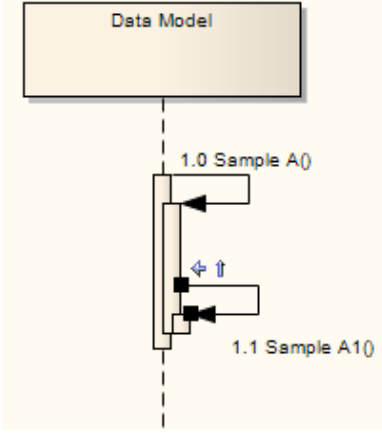

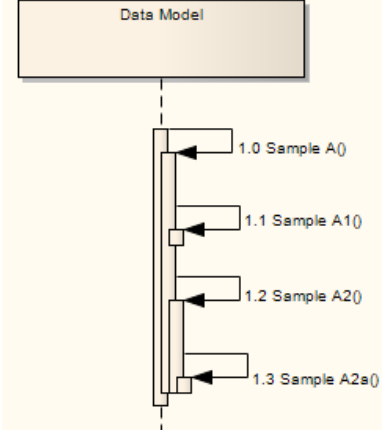

A more convenient way to change activation levels is directly on the diagram. Whenever appropriate, left and/or right arrows display on specific connectors. In the following diagram, see connector 1.3. Click on the arrow to raise or lower the activation level.

### 6.3.6.7 Lifeline Activation Levels

Complicated processing systems can be easily negotiated and reflected in Sequence diagrams, by adding activation layers on a single lifeline.

Example	Description
 <p>The diagram shows a lifeline for 'Data Model'. It starts with a message '1.0 Sample A()' which is a self-call. Below this, there is a blue double-headed arrow indicating a connector. Then, there is a message '1.1 Sample A1()' which is also a self-call. The lifeline is represented by a vertical dashed line with rectangular activation bars.</p>	<p>A Class invokes the method <i>Sample A</i>, which in turn calls <i>Sample A1</i>.</p> <p>To produce the arrangement in the diagram:</p> <ol style="list-style-type: none"> <li>1. Select the <b>More tools   Interaction</b> menu option.</li> <li>2. Click on the <b>Self-message</b> icon in the Interaction Relationships panel.</li> <li>3. Click on the lifeline.</li> </ol>
 <p>This diagram is identical to the previous one, but the blue double-headed arrow (connector) is now pointing upwards, indicating that the activation level of the 'Sample A1' message is being raised to encompass the duration of the 'Sample A' message.</p>	<p>In order to raise the Activation level of <i>Sample A1</i>, click on the raise arrow of the selected connector.</p> <p>The lifeline now visually depicts that method <i>Sample A1</i> is called during the processing of <i>Sample A</i>.</p>
 <p>The diagram shows a single lifeline with four sequential self-calls: '1.0 Sample A()', '1.1 Sample A1()', '1.2 Sample A2()', and '1.3 Sample A2a()'. Each call is represented by a message arrow pointing to the lifeline, with corresponding activation bars.</p>	<p>In the example below, a few more self-messages have been added.</p> <p>The message <i>Sample A2a</i> is called from <i>Sample A2</i>, which in turn is called from <i>Sample A</i> (not <i>Sample A1</i>).</p> <p><i>Sample A1</i> is called from <i>Sample A</i>.</p>

### 6.3.6.8 Sequence Message Label Visibility

#### Hide and show labels used in Sequence messages

Step	Action
1	Right-click on the message within the Sequence diagram and select the <b>Set Label Visibility</b> context menu option.  The Label Visibility dialog displays.
2	Select or clear the checkbox against each message label to display or hide, respectively.
3	Click on the <b>OK</b> button to save the settings.

### 6.3.6.9 Change the Top Margin

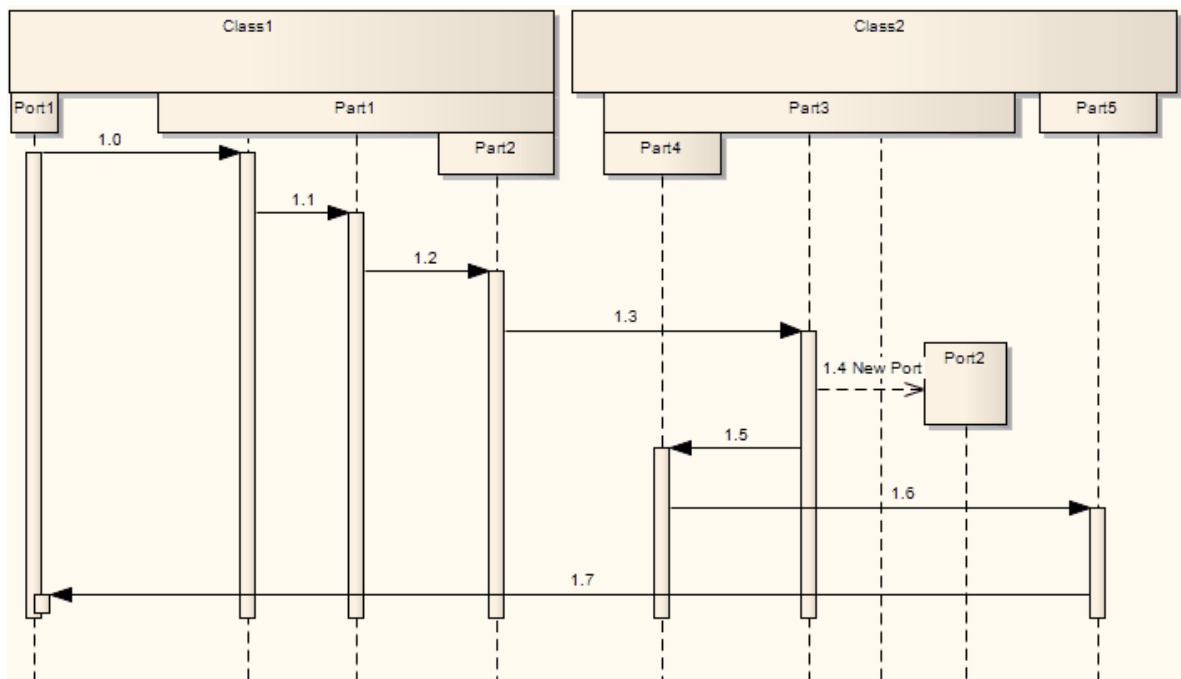

In order to change the top margin of a Sequence diagram from the default 50 units, right-click on the diagram and select the **Set Top Margin** context menu option. You can set the top margin to any value between 30 and 250 units. You can then use this space to, for example, add Note or Text elements to provide documentation on the diagram.

### 6.3.6.10 Inline Sequence Elements

On a Sequence diagram it is possible to represent existing child Part and Port elements, which render as inline sequence elements under their parent Class sequence element.

#### Represent Part and Port elements on a Sequence diagram

Step	Action
1	Right-click on the sequence elements containing the child Ports or Parts, and select the <b>Structural Elements</b> context menu option.  The Structural Elements dialog displays.
2	Select the checkbox against each Part or Port to show, and click on the <b>Close</b> button.

#### Learn more

- [Manage Structural Elements](#) <sup>[935]</sup>
- [Part](#) <sup>[1383]</sup>
- [Port](#) <sup>[1384]</sup>

### 6.3.7 Communication Diagram

A Communication diagram is a diagram that shows the interactions between elements at run-time in much the same manner as a Sequence diagram. However, Communication diagrams are used to visualize inter-object relationships, while Sequence diagrams are more effective at visualizing processing over time.

Communication diagrams employ ordered, labeled associations to illustrate processing. Numbering is important to indicate the order and nesting of processing. A numbering scheme could be:

1  
1.1  
1.1.1  
1.1.2  
1.2, and so on.

A new number segment begins for a new layer of processing, and would be equivalent to a method invocation.

**Example Diagram** [Example Communication Diagram](#) <sup>[1260]</sup>

#### Tools

Select Communication diagram elements and connectors from the Communication pages of the Toolbox. Click on the following elements and connectors for more information.

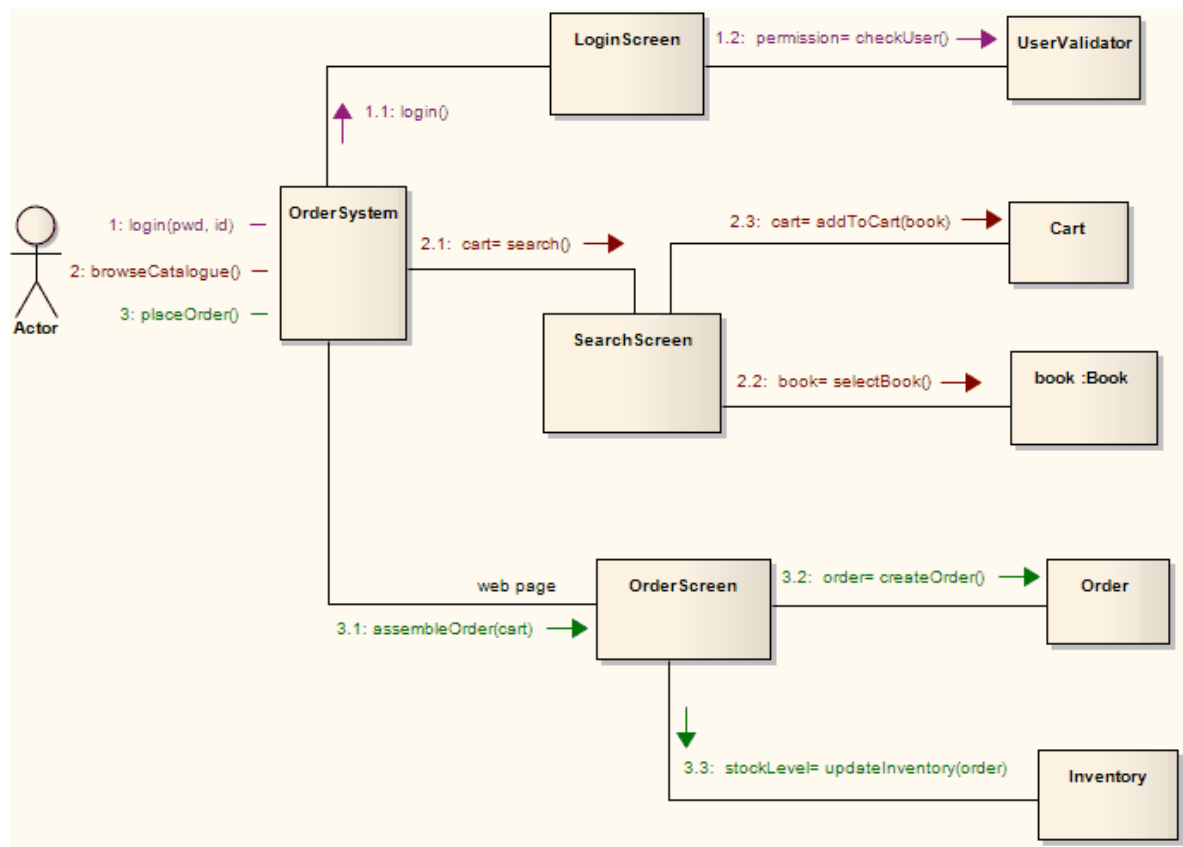

Communication Diagram Elements	Communication Diagram Connectors
 Actor	 Associate
 Object	 Nesting
 Boundary	 Realize
 Control	
 Entity	
 Package	

### Learn more

- [Communication Diagrams in Color](#)<sup>[126]</sup>

#### 6.3.7.1 Example Communication Diagram

This example illustrates a Communication diagram among cooperating object instances. Note the use of message levels to capture related flows, and the different colors of the messages.

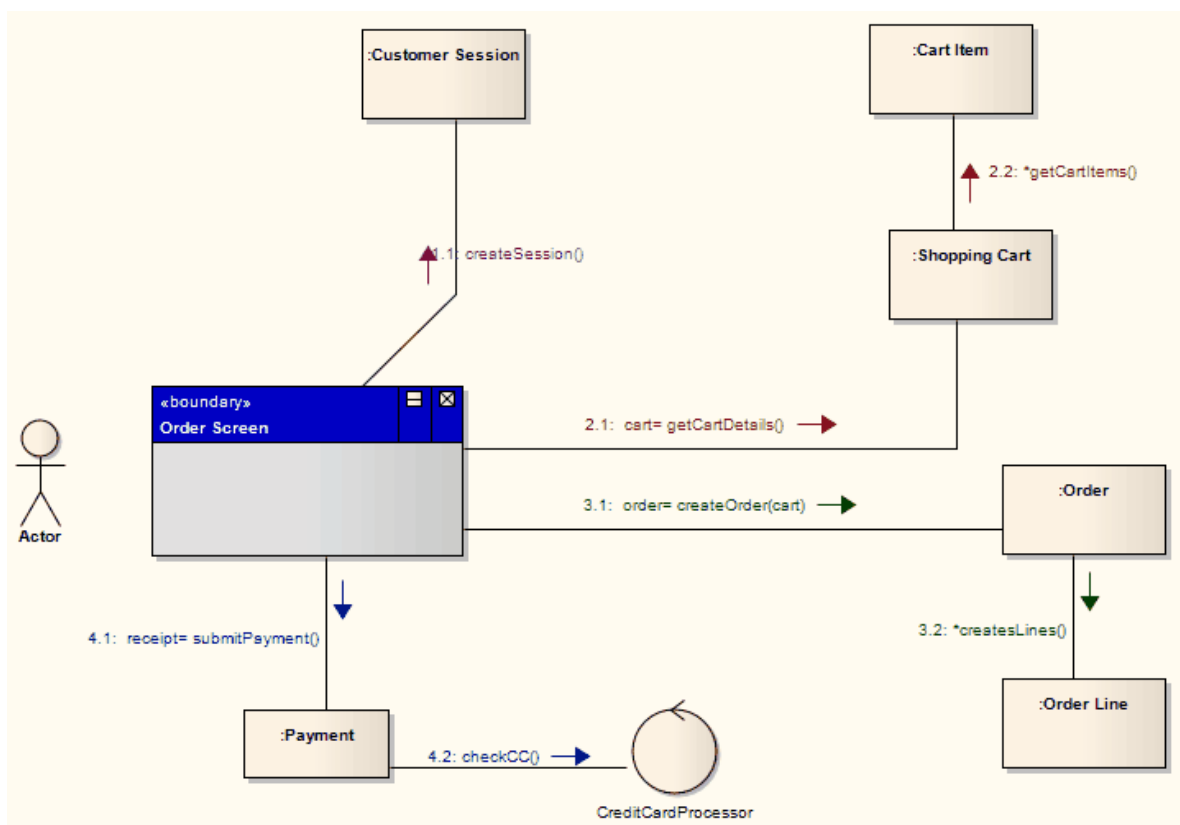

### 6.3.7.2 Communication Diagrams in Color

It is possible to highlight particular message flows in a Communication diagram using different colors for each message set.

#### Highlight the colors in a Communication diagram

Step	Action
1	Select the <b>Tools   Options   Communication Colors</b> menu option. The Communication Message Coloring page of the Options dialog displays.
2	Select the <b>Use Communication Color</b> checkbox.
3	Click on the drop-down arrow of each <b>Message n</b> field, and select the required color for each message group.
4	Click on the <b>Close</b> button. On your Communication diagram, each sequence group of messages displays in a different color, as shown.

### 6.3.8 Interaction Overview Diagram

Interaction Overview diagrams visualize the cooperation between other interaction diagrams to illustrate a control flow serving an encompassing purpose. As Interaction Overview diagrams are a variant of Activity diagrams, most of the diagram notation is the same, as is the process of constructing the diagram.

Decision points, Forks, Joins, Start points and End points are the same. Instead of Activity elements, however, rectangular elements are used. There are two types of these elements:

- Interaction elements display an inline Interaction diagram, which can be any one of the four types (Sequence, Timing, Communication or Interaction Overview)
- Interaction Occurrence elements are references to an existing Interaction diagram: they are visually represented by a frame, with **ref** in the frame's title space; the diagram name is indicated in the frame contents

To create an Interaction Occurrence, simply drag an Interaction diagram from the Project Browser onto your Interaction Overview diagram. The **ref** frame displays, encapsulating an instance of the Interaction diagram.

**Example Diagram** [Example Interaction Overview Diagram](#) 

#### Tools

Select Interaction Overview diagram elements and connectors from the Activity pages of the Toolbox. Click on the following elements and connectors for more information.

Interaction Overview Diagram Elements	Interaction Overview Diagram Connectors
 Partition	 Control Flow
 Decision	 Object Flow
 Send	 Interrupt Flow
 Receive	
 Synch	
 Initial	
 Final	
 Flow Final	
 Region	
 Exception

- [Interaction Occurrence](#)  f1317

**6.3.8.1 Example Interaction Overview Diagram**

This diagram depicts a sample sale process, shown in an Interaction Overview diagram, with sub-processes abstracted within Interaction Occurrences.

The diagram appears very similar to an Activity diagram, and is conceptualized the same way; as the flow moves into an interaction, the respective interaction's process must be followed before the Interaction Overview's flow can advance.

## 6.4 UML Elements

Models in UML are constructed from elements such as *Classes*, *Objects*, *Interfaces*, *Use Cases*, *Components* and *Nodes*, each of which has a different purpose, different rules and different notation. Model elements are used at different stages of the design process for different purposes. For example,

- During early analysis, Use Cases, Activities, Business Processes, Objects and Collaborations are used to capture the problem domain
- During elaboration, Sequence diagrams, Objects, Classes and State Machines are used to refine the system specification
- Components and Nodes are used to model larger parts of the system as well as the physical entities that are created and deployed into a production environment

### Behavioral Diagram Elements

Behavioral diagrams depict the behavioral features of a system or business process. Elements that can appear on Behavioral diagrams include Activity, Interaction, Lifeline, State Machine and Use Case.

### Structural Diagram Elements

Structural diagrams depict the structural elements composing a system or function. Elements that can appear on Structural diagrams include Class, Component, Interface, Node and Package.

### 6.4.1.1 Action

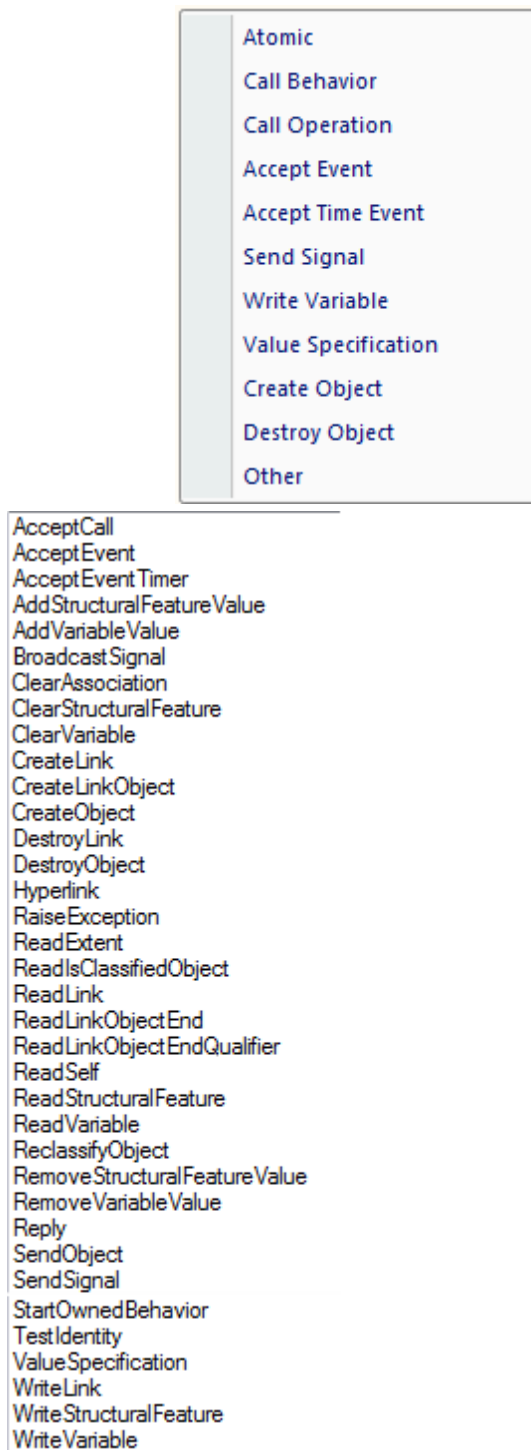

#### Description

An Action element describes a basic process or transformation that occurs within a system, and is the basic functional unit within an Activity diagram. Actions can be thought of as children of Activities; both represent processes, but Activities can contain multiple steps or decomposable processes, each of which can be embodied in an Action. An Action cannot be further broken down or decomposed.

For the purposes of simulation, you can define the effect of a basic (Atomic) Action on the Effect page of the element Properties dialog, using a Javascript expression to define the duration of the effect and selecting to display the effect on the diagram. An Action can be further defined with pre-condition and post-condition notes.

Certain properties can be graphically depicted on the Action. When you first drag the Action icon from the Toolbox onto a diagram, the system prompts you to select from a list of the more common types of Action to create. If you select the **Other** option on this list, the New Action dialog displays; the **Other** drop-down list on this dialog enables you to select a more specialized type of Action from a complete list of Action types.

If you later decide that the Action type is not appropriate, you can change it on the Advanced page of the Action element Properties dialog - select the required new type from the **Kind** drop-down list. For a Value Specification Action, you can also set the value on this page.

The data values passed out of and into an Action can be represented by Action Pins. For an Action type other than a basic Action, you can also assign Action Pins to represent specific properties.

An Action can also be depicted as an Expansion Node to indicate that the Action comprises an Expansion Region.

Toolbox iconLearn more

- [Activity Element](#) <sup>[1278]</sup>
- [Activity Diagram](#) <sup>[1199]</sup>

OMG UML Specification

The OMG UML specification (UML Superstructure Specification, v2.1.1, p. 241) states:

*An action is a named element that is the fundamental unit of executable functionality. The execution of an action represents some transformation or processing in the modeled system, be it a computer system or otherwise.*

The OMG UML specification (UML Superstructure Specification, v2.1.1, p. 313) also states:

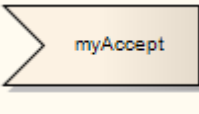

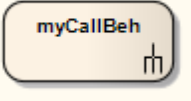

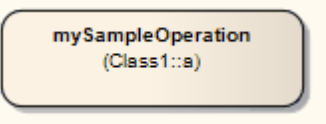

*An action may have sets of incoming and outgoing activity edges that specify control flow and data flow from and to other nodes. An action will not begin execution until all of its input conditions are satisfied. The completion of the execution of an action may enable the execution of a set of successor nodes and actions that take their inputs from the outputs of the action.*

**6.4.1.1.1 Action Types**

Action elements are extremely versatile. Enterprise Architect supports a wide range of specific Action types that you can use to represent or enact a discrete object, operation or behavior. Actions of most types are depicted as a round-cornered rectangle containing the Action type and Action name, as shown.

Certain types have their own specific **notation**; for example:

Action Kind	Notation	See also
<b>AcceptEvent</b>		
<b>AcceptEventTimer</b>		<a href="#">AcceptEvent Actions</a> <sup>[1269]</sup>
<b>CallBehavior</b>		<a href="#">CallBehavior Action</a> <sup>[1271]</sup>
<b>CallOperation</b>		<a href="#">Class Operations in Diagrams</a> <sup>[1275]</sup>
<b>SendSignal</b>		<a href="#">SendSignal Action &amp; BroadcastSignal Action</a> <sup>[1270]</sup>

### AcceptEvent Actions

An *Accept Event* Action element has a selectable output result Action Pin assigned to it, and one or more Triggers to denote the type of events accepted by the Action. You define the Triggers on the Triggers page of the Properties dialog. In a simulation, an AcceptEvent Action without a Trigger will block the simulation at the Action element.

Field	Action	See also
<b>Name</b>	Type in the name of the trigger.	
<b>Type</b>	<p>Click on the drop-down arrow and select the type of trigger: <b>Call</b>, <b>Change</b>, <b>Signal</b> or <b>Time</b>:</p> <ul style="list-style-type: none"> <li>• <b>Call</b> - specifies that the event is a CallEvent, which sends a message to the associated object by invoking an operation</li> <li>• <b>Change</b> - specifies that the event is a ChangeEvent, which indicates that the transition is the result of a change in value of an attribute</li> </ul>	

Field	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Signal</b> - specifies that the event is a SignalEvent, which corresponds to the receipt of an asynchronous signal instance</li> <li>• <b>Time</b> - corresponds to a TimeEvent; which specifies a moment in time</li> </ul> <p>Code generation for State Machines currently supports Change and Time trigger events only, and expects a specification value.</p> <p>In simulation, each Trigger should have a Signal. The result will be the Accept signal.</p>	
<b>Specification</b>	<p>Specify the event instigating the Transition.</p> <p>For an AcceptEvent<b>Timer</b> Action, you can type a JavaScript expression in this field evaluating to the number of ticks to wait for.</p>	

#### SendSignal Action & BroadcastSignal Action

A **SendSignal** Action has an assigned target ActionPin and a Signal. The Signal can have input ActionPins that bind its attribute parameters as arguments. For example:

```
:: Sender : sig. binding_To_s1: Integer
```

In a model simulation, a SendSignal Action will transfer the values of the arguments into the attributes of the created Signal instance. The target ActionPin can have an empty object, to send the Signal into the root of the simulation space. If there is no target ActionPin, simulation will stop at the Action. If the target has an Object, the Signal will be sent to the Object. You must specify the Pin type of the target ActionPin in the classifier of the Object.

A **BroadcastSignal** Action is similar to a SendSignal Action, except that it does not have a target ActionPin. In a simulation, it always sends its Signal to the root of the simulation data.

You can model the Signal to be sent and the associated arguments to be conveyed, using the Signal tab of the element Properties dialog.

Field/Button	Action
<b>Signal</b>	Click on the ( ... ) button and select the required signal from the Select Signal dialog.
<b>Attribute</b>	Click on the drop-down arrow and select the attribute (as previously created in the Signal element) with which the arguments are to be associated.
<b>Value</b>	Type the appropriate value for the attribute.
<b>Add</b>	Click on this button and select the appropriate ActionPins from the Select Pin dialog, to identify the arguments for the Signal.

Field/Button	Action
	To assign more than one ActionPin, press ( <b>Ctrl</b> ) whilst you select each one.
<b>Save</b>	Click on this button to save your changes.

### CallBehavior

A **CallBehavior Action** has a behavior such as an Activity, and a selectable ActionPin result that will put the return value. The CallBehavior Action can also transfer the values of its argument ActionPins into its behavior, if they are bound together. In a simulation, if the Action has no behavior, the simulation is blocked.

### SendObject Action

A **SendObject Action** sends a copy of an Object from the requesting ActionPin to the target ActionPin. In a simulation, the SendObject Action must have both ActionPins, otherwise the simulation is blocked at the Action.

### Structural Feature Actions

A **StructuralFeature Action** acts upon a modeling structural feature, such as a Port, Part or attribute of an Activity or of the classifier of an Object, which you identify within the Action element. Enterprise Architect supports the following types of Structural Feature Actions.

Action	Description
<b>AddStructuralFeatureValue</b>	<p>Requires an object input ActionPin where the target object will be entered, and a result output ActionPin to hold the read result. If the object Port has no value at run time, the process will pause at the Action.</p> <p>In your model design, the Port should be connected to the Port of an Object or to an Object Node of an Activity. The properties of the Port or Object Node must be correctly set, and the value Port must be set up to capture the input value when the Action takes effect.</p> <p>The result ActionPin can be connected to an input consume Port or ActionPin. For example, it can be used at the next WriteStructuralFeature Action as the input value.</p>
<b>ClearStructuralFeature</b>	Clears the single value of a structural attribute or a structural Port of an Object or an Activity, and sets the value of the structural feature to null.
<b>ReadStructuralFeature</b>	<p>Resembles AddStructuralFeatureValue, except that the value Port is not necessary.</p> <p>In a simulation, if the Object's Port has no value at run time, the simulation will pause at the Action.</p>
<b>RemoveStructuralFeature</b>	Similar to ClearStructuralFeature except that it invokes a value ActionPin to

Action	Description
<b>eValue</b>	input a value and, if that value matches the value of the specified structural feature, it sets the value to null.  If the values do not match, the Action does not clear the structural feature value.
<b>WriteStructuralFeature</b>	Identical to AddStructuralFeatureValue. In a simulation, the value Port must be set up to capture the input value when the simulation runs the Action.

Access **Right-click Action element | Advanced | Set Structural Feature: Add**

Step	Action
<b>1</b>	On the Select Property dialog (a variant of the Select <Item> dialog), browse or search for the appropriate structural feature, and double-click on it.  The feature name and location displays in the <b>structuralFeature</b> field of the Set Structural Feature dialog.
<b>2</b>	Click on the <b>OK</b> button to save the setting.

### ReadSelf

A **ReadSelf Action** reads its own host object name into its result Port. You must set an output ActionPin for the result.

The Action must be within a Class, which is instantiated during run time. When a simulation passes the Action, it puts the name of the instance of the Class into the result Port.

ReadSelf is one of a group of Object Actions, with **CreateObject** and **DestroyObject**.

- [Assign Action Pins](#) <sup>[1278]</sup>
- [Model Simulation](#) <sup>[2463]</sup>

- [Objects and Instances in Simulation](#)  <sup>[2479]</sup>
- [Create Objects in a Simulation](#)  <sup>[2480]</sup>
- [Destroy Objects in a Simulation](#)  <sup>[2483]</sup>

#### 6.4.1.1.1.1 Variable Actions

**Variable** Actions are closely concerned with the simulation of the behavior of and actions on Objects in a process. They have an **association variable** in the form of the Tagged Value **variable** with, as its value, the name of an Object in run-time. That is:

```
sim. Object Name
```

Variable Actions provide the variable not only as an Object but also as a property (such as an attribute or Port) of an Object. For example:

```
sim.a.a1
```

The parameter **a.a1** can have an integer value.

Variable Actions include:

- **ReadVariable**
- **WriteVariable**
- **ClearVariable**
- **AddVariableValue**
- **RemoveVariable**

##### ReadVariable

A **ReadVariable** Action has a Result Action Pin as an output Port. The value of the Port will be the result to be read, this being a copy of the variable read. Therefore, it is not affected by changes to the value of the variable. For example, if the variable is **sim.Object.a** that has the value **3**, and its value has been changed into **5** after it is read, the value read is still **3**.

Before reading:

```
sim.Object.a = 3;  
sim.Action1.result = null;
```

After reading:

```
sim.Object.a = 3;  
sim.Action1.result = 3;
```

After a change in the value of the variable:

```
sim.Object.a = 5;  
sim.Action2.value = 3;
```

In that example, the value is a Port of **Action2** that is connected to the result Port of **Action1** by an Object Flow connector.

##### WriteVariable

This Action has a Value Action Pin as an input Port. The value of the Port will be written into its variable. The result value is a copy of the variable from the Value Port.

#### ClearVariable

This Action clears all values of a variable, the variable being either an Object or a value.

#### AddVariableValue

This Action is effectively the same as a **WriteVariable** Action, because the current variables of the simulation do not support multiple values.

#### RemoveVariableValue

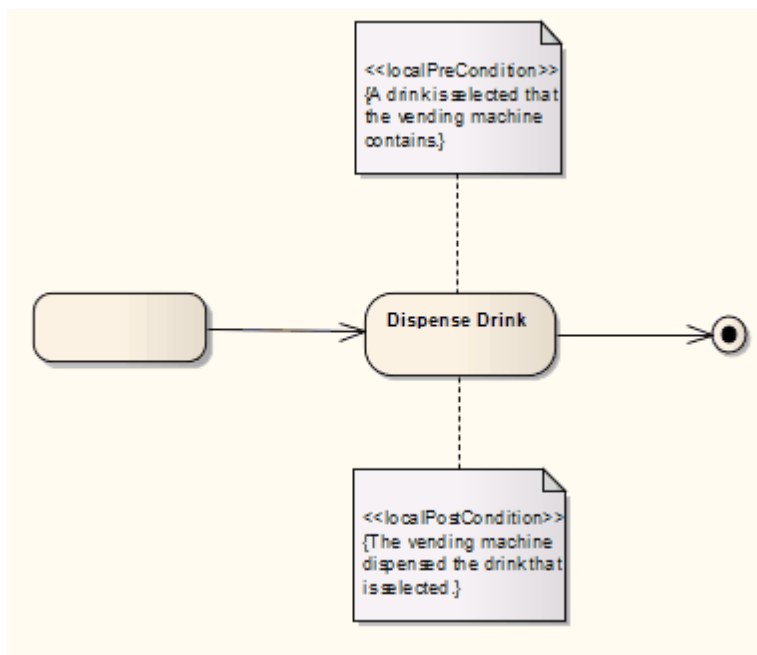

This Action is effectively the same as a **ClearVariable** Action because the current variables of the simulation do not support multiple values.

#### Learn more

- [Object Flow](#) <sup>[1435]</sup>

#### 6.4.1.1.2 Local Pre/Post Conditions

Actions can be further defined with pre-condition and post-condition notes, which constrain an Action's entry and exit. These notes can be added to an Action as defined below.

#### Attach a constraint to an Action

Step	Action
1	Right-click on the Action and select the <b>Add   Constraint</b> context menu option. A <i>Note</i> is created on the diagram, connected to the Action.
2	Right-click on the <i>Note</i> and select the <b>View Properties</b> context menu option. The Constraint dialog displays.
3	In the <b>Constraint Type</b> field, click on the drop-down arrow and select the required constraint type.
4	In the <b>Constraint</b> field, type the text for the constraint.
5	Click on the <b>OK</b> button to save the constraint.

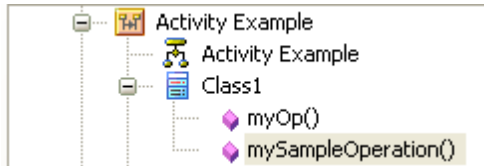

#### Learn more

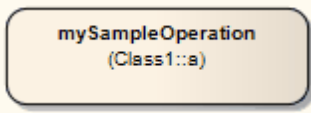

- [Action](#) 

#### 6.4.1.1.3 Class Operations in Diagrams

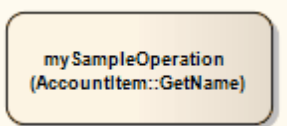

Operations from Classes can be represented by **CallOperation Action** elements on any diagram (such as an Activity, Custom or Analysis diagram). When an operation is shown as an Action, the notation of the element displays the name of the operation prefixed by the name of the Class from which it comes.

#### Add an operation to a diagram

Step	Action	See also
1	Open the target diagram.	
2	From the Project Browser open a Class and locate the operation to be added to the diagram.	
3	Drag the operation on to the diagram. 	
4	When the operation has been added to the diagram, the CallOperation Action	

Step	Action	See also
	<p>resembles the following:</p> 	

#### Change the operation that an Action refers to

Step	Action	See also
1	<p>Right-click on the Action and select the <b>Advanced   Set Operation</b> menu option.</p> <p>The Set Operation dialog displays.</p>	<a href="#">Set Operation dialog</a> [998]
2	<p>If necessary, in the <b>Go To Namespace</b> field, select the model that contains the operation.</p> <p>Browse for the operation.</p>	
3	<p>When you have located the operation, double-click on it.</p> <p>The Action updates to show the new classifier and operation names.</p> 	

#### Notes

- If you want to locate, in the Project Browser, the operation that an Action was created from, right-click on the Action in the diagram and select the **Find | Locate Operation in Project Browser** context menu option
- If you want to display the previously-generated code for the Class containing the operation, click on the Action in the diagram and press either **Ctrl+E** or **F12**; the Code Editor view displays, with the code generated for the Class (if no code has been generated for the Class, the Code Editor does not display)
- In a simulation, the CallOperation Action must have a calling operation and a target object ActionPin, the operation belonging to the object that comes from the target ActionPin; if you don't set these properties, simulation will be blocked at the Action

#### 6.4.1.1.4 Action Pin

#### Description

An *Action Pin* is used to define the data values passed out of and into an Action. An *input pin* provides values to the Action, whereas an *output pin* contains the results from that Action.

Action Pins are used below to connect two Actions:

Action Pins can be further characterized as defining exception parameters, streams, or states. Associating a state with a Pin defines the state of input or output values. For instance, the Pin could be called *Orders*, but the state could be *Validated* or *Canceled*.

To **add** an Action Pin to an Action, right-click on the Action to display the context menu and select the **New Child Element | Action Pin** menu option. (You can also **assign** Action Pins, to define specific properties of the Action.)

The Properties dialog of an Action Pin has a Pin page on which you define the specific actions of the Pin.

A Pin serves as an argument for Call Behavior Actions and Call Operation Actions - the Pin name and parameters are shown on the Arguments page of the Action Properties dialog. When an Action is associated with a valid behavior in the model, the associated behavior's parameters are listed in the **Parameter** field drop-down list to facilitate a one-to-one mapping between the argument and the parameter. The fields in the Argument panel of the Pin page are enabled only for Pins belonging to Call Actions, and only when the Action is associated with a valid behavior with valid parameters. To observe this:

1. Create an Activity element and give it an Activity Parameter (right-click on it and select **New Child Element | Activity Parameter**).
2. Create an Action and set the **kind** property to **CallBehavior** (on the Advanced page of the element's Properties dialog).
3. Make the Activity element the classifier for the Action (right-click on the Action element and select **Advanced | Set Behavioral Classifier**; then locate and select the Activity on the Select <Item> dialog).
4. The Structural Elements dialog immediately displays. Select the **Show Owned/Inherited** checkbox; when this is selected, the Activity Parameter is listed in the Defined Elements panel. Select the checkbox against the Activity Parameter, and click on the **Close** button.
5. The Action element now has an Action Pin representing an argument, with the Activity Parameter as the parameter of the argument.

You can also change the *objectState* property of an Action Pin on the Advanced page of the element Properties dialog.

- [Object Node](#) <sup>[1325]</sup>

**6.4.1.1.5 Assign Action Pins**

Apart from *adding* Action Pins to any Action, you can *assign* specialized input or output Action Pins to Actions that have a specific type (that is, those that are not Basic or Atomic Actions). These input/output Pins signify various *properties* of the Action - they are not visible as structures on the diagram unless they have previously been added, but are listed in the Project Browser as properties of the Action.

You can only assign Pins that have already been added or assigned to the Action, or that are being created specifically to be assigned to the Action.

**Assign Action Pins to an Action**

Step	Action	See also
<b>1</b>	<p>Right-click on the Action in the diagram, and select the <b>Advanced   Assign Action Pins</b> context menu option.</p> <p>The Assign Action Pins to &lt;ActionName&gt; dialog displays.</p> <p>The format of this dialog depends on the type of Action; for a:</p> <ul style="list-style-type: none"> <li>• <i>SendObject</i> Action the dialog has two fields (<b>request</b> and <b>target</b>)</li> <li>• <i>TestIdentity</i> Action, three</li> <li>• <i>CallBehavior</i> Action, one (<b>result</b>)</li> </ul> <p>The fields are populated in exactly the same way.</p>	
<b>2</b>	<p>The mandatory number and type of Pins are automatically selected (if they exist) or created.</p> <p>To change or add a Pin in a field, click on the corresponding <b>Add</b> button.</p> <p>The Select Pins dialog displays, showing the selected Action and listing all the input Pins currently owned by the Action.</p>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>3</b>	<p>Double-click on one of the Pins (or, depending on the multiplicity of the Pin, <b>Ctrl+click</b> on several Pins).</p> <p>Alternatively, if no suitable Pin exists, click on the <b>Add New</b> button and then click on the newly-created Pin.</p> <p>The selected Pin is identified in the field on the Assign Action Pins to &lt;ActionName&gt; dialog.</p>	
<b>4</b>	Click on the <b>OK</b> button.

## 6.4.1.2 Activity

### Description

An Activity organizes and specifies the participation of subordinate behaviors, such as sub-Activities or Actions, to reflect the control and data flow of a process. Activities are used in Activity diagrams for various modeling purposes, from procedural-type application development for system design, to business process modeling of organizational structures or work flow.

The following simple diagram of an Activity contains Action elements and includes input parameters and output parameters.

You can define an Activity as a composite element, either during creation or during later edits. When creating a composite Activity element, it is simpler to apply the mechanism for creating Structured Activity elements,

which reduces the number of steps to work through. If converting an existing Activity element, right-click on the element and select the **Advanced | Make Composite** context menu option.

Certain properties can be graphically depicted on an Activity. The Actions in an Activity can be further organized by Activity Partitions.

An Activity can also be depicted as an Expansion Node to indicate that the Activity comprises an Expansion Region.

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 318) states:

*An activity specifies the coordination of executions of subordinate behaviors, using a control and data flow model. The subordinate behaviors coordinated by these models may be initiated because other behaviors in the model finish executing, because objects and data become available, or because events occur external to the flow. The flow of execution is modeled as activity nodes connected by activity edges. A node can be the execution of a subordinate behavior, such as an arithmetic computation, a call to an operation, or manipulation of object contents. Activity nodes also include flow-of-control constructs, such as synchronization, decision, and concurrency control. Activities may form invocation hierarchies invoking other activities, ultimately resolving to individual actions. In an object-oriented model, activities are usually invoked indirectly as methods bound to operations that are directly invoked.*

*Activities may describe procedural computation. In this context, they are the methods corresponding to operations on classes. Activities may be applied to organizational modeling for business process engineering and workflow. In this context, events often originate from inside the system, such as the finishing of a task, but also from outside the system, such as a customer call. Activities can also be used for information system modeling to specify system level processes. Activities may contain actions of various kinds:*

- *Occurrences of primitive functions, such as arithmetic functions.*
- *Invocations of behavior, such as activities.*
- *Communication actions, such as sending of signals.*

- Manipulations of objects, such as reading or writing attributes or associations.

Actions have no further decomposition in the activity containing them. However, the execution of a single action may induce the execution of many other actions. For example, a call action invokes an operation that is implemented by an activity containing actions that execute before the call action completes.

#### 6.4.1.2.1 Activity Notation

Certain properties can be graphically depicted on an Activity element, as shown:

To define these properties, right-click on the Activity and select the **Properties** context menu option, then select the Advanced page of the Properties dialog.

You can also define the duration (the number of ticks to wait for) of the Activity, using a JavaScript expression. Open the Behavior page of the Properties dialog, and type the JavaScript expression in the **Specification** field.

#### Learn more

- [Activity](#)<sup>[1279]</sup>

#### 6.4.1.2.2 Activity Parameter Nodes

##### Description

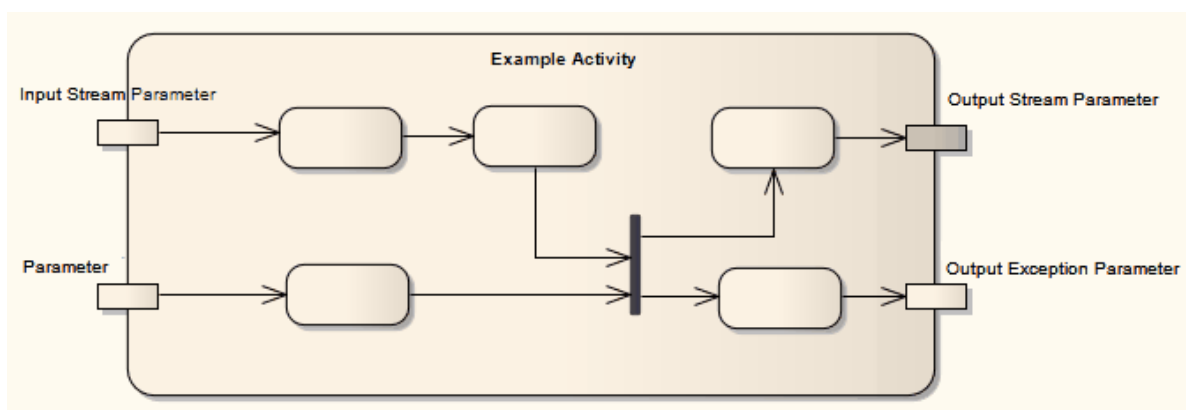

An Activity Parameter Node accepts input to an Activity or provides output from an Activity.

The following example depicts two entry parameters and one output parameter defined for the Activity.

**Define an Activity Parameter Node for an Activity**

Step	Action
1	Right-click on the element and select the <b>New Element   Activity Parameter</b> context menu option.
2	The Properties dialog displays, which prompts for the <b>Name</b> and other properties of the embedded element.
3	<p>To further define the new Activity Parameter, select the Parameter page of the Properties dialog and define:</p> <ul style="list-style-type: none"> <li>• Type</li> <li>• Default Value</li> <li>• Direction</li> <li>• Whether this is a fixed value</li> <li>• Multiplicity upper and lower bounds</li> <li>• Whether to allow duplicates and</li> <li>• Whether multiplicity is ordered</li> </ul> <p>Activity Parameter Nodes also have the <b>Exception</b> and <b>Stream</b> options:</p> <ul style="list-style-type: none"> <li>• <b>Exception</b> indicates that a parameter can emit a value at the exclusion of other outputs, usually because of some error</li> <li>• <b>Stream</b> indicates whether or not a parameter can accept or post values during the execution of the Activity</li> </ul>

**Learn more**

- [Activity Element](#)<sup>[1278]</sup>
- [Action Pin](#)<sup>[1277]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 338) states:

*An activity parameter node is an object node for inputs and outputs to activities.*

*... Activity parameter nodes are object nodes at the beginning and end of flows that provide a means to accept inputs to an activity and provide outputs from the activity, through the activity parameters.*

*Activity parameters inherit support for streaming and exceptions from Parameter.*

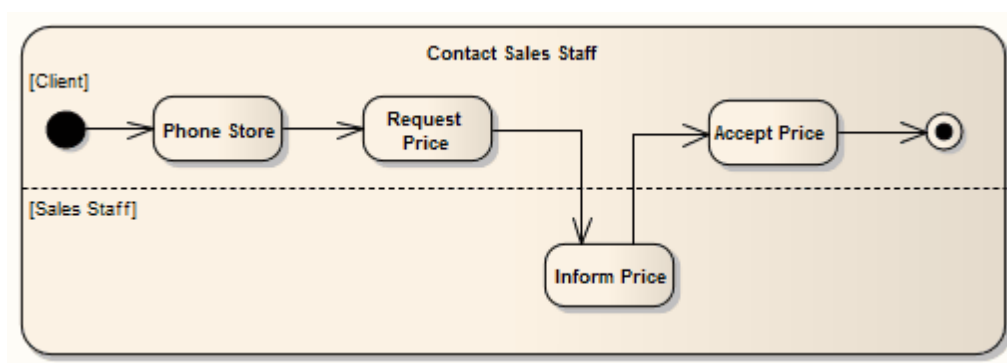

**6.4.1.2.3 Activity Partition****Description**

Enterprise Architect supports two types of *Activity Partition*:

- The Activity Partition *feature*, described in this topic, which is used to logically organize an Activity *element*
- The Activity Partition *element*, which is used to logically organize an Activity *diagram*

In effect, these are the same. They partition the Actions of the Activity without affecting the token flow, helping to structure the view or parts of the Activity.

An example of a feature-partitioned Activity is shown below:

**Define Partitions**

Step	Action
1	Right-click on the Activity element and select the <b>Advanced   Partition Activity</b> context menu option.

Step	Action
	The Activity Partitions dialog displays.
2	In the <b>Name</b> field, type the name of a partition. Click on the <b>Save</b> button.
3	Repeat step 2 for each partition to be created.

- [Activity Partition Element](#)<sup>[1325]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 341) states:

*Partitions divide the nodes and edges to constrain and show a view of the contained nodes. Partitions can share contents. They often correspond to organizational units in a business model. They may be used to allocate characteristics or resources among the nodes of an activity.*

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 341) also states:

*An activity partition is a kind of activity group for identifying actions that have some characteristic in common.*

### 6.4.1.3 Actor

### Description

An Actor is a user of the system; user can mean a human user, a machine, or even another system or subsystem in the model. Anything that interacts with the system from the outside or system boundary is termed an Actor. Actors are typically associated with Use Cases.

Actors can use the system through a graphical user interface, through a batch interface or through some other media. An Actor's interaction with a Use Case is documented in a Use Case scenario, which details the functions a system must provide to satisfy the user requirements.

Actors also represent the role of a user in Sequence Diagrams, where you can display them using rectangle

notation. Enterprise Architect supports a stereotyped Actor element for business modeling. The business modeling elements also represent Actors as stereotyped Objects.

#### Toolbox icon

#### Learn more

- [Sequence Diagrams](#)<sup>[1249]</sup>
- [Business Modeling](#)<sup>[1805]</sup>
- [Use Case](#)<sup>[1352]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 584) states:

*An actor models a type of role played by an entity that interacts with the subject (e.g. by exchanging signals and data), but which is external to the subject. ... Actors may represent roles played by human users, external hardware, or other subjects. Note that an actor does not necessarily represent a specific physical entity but merely a particular facet (i.e., "role") of some entity that is relevant to the specification of its associated Use Cases. Thus, a single physical instance may play the role of several different actors and, conversely, a given actor may be played by multiple different instances.*

### 6.4.1.4 Central Buffer Node

#### Description

A Central Buffer Node is an object node for managing flows from multiple sources and destinations, represented in an Activity diagram. It acts as a buffer for multiple in-flows and out-flows from other object nodes, but does not connect directly to Actions.

#### Toolbox icon

#### Learn more

- [Activity Diagram](#)<sup>[1199]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 352) states:

*A central buffer node is an object node for managing flows from multiple sources and destinations. ... A central buffer node accepts tokens from upstream object nodes and passes them along to downstream object nodes.*

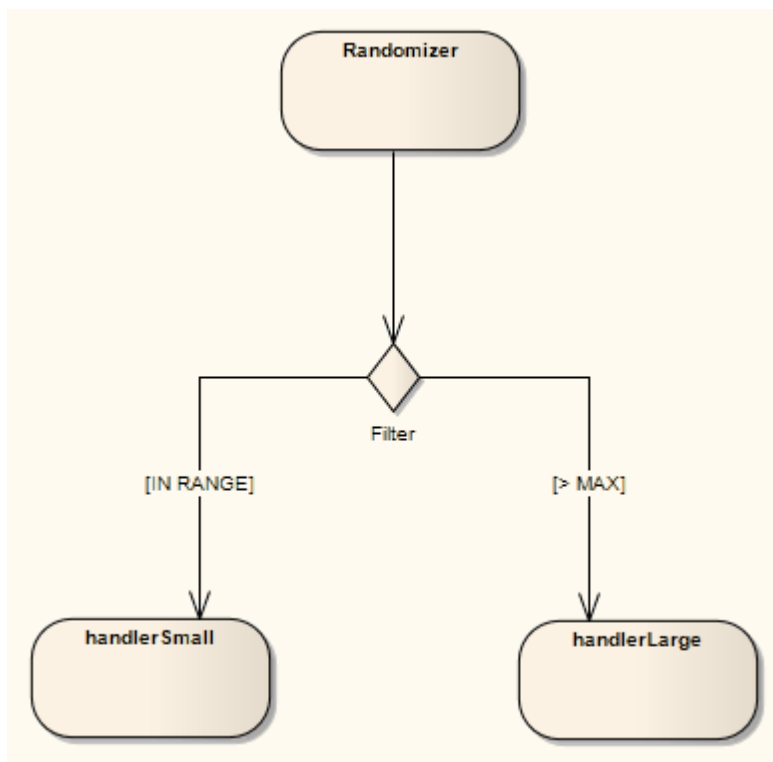

#### 6.4.1.5 Choice

##### Description

The Choice pseudo-state is used to compose complex transitional paths in, for example, a State Machine diagram, where the outgoing transition path is decided by dynamic, run-time conditions. The run-time conditions are determined by the actions performed by the State Machine on the path leading to the choice.

The following example depicts the Choice element. Upon reaching the Filter pseudo-state, a transition fires to the appropriate state based on the run-time value passed to the Filter. Very similar in form to a Junction pseudo-state, the Choice pseudo-state's distinction is in deciding transition paths at run-time.

##### Toolbox icon

### Learn more

- [State Machine Diagram](#) <sup>[1203]</sup>
- [State Machine](#) <sup>[1329]</sup>
- [Pseudo-states](#) <sup>[1208]</sup>
- [Junction](#) <sup>[1319]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 538) states:

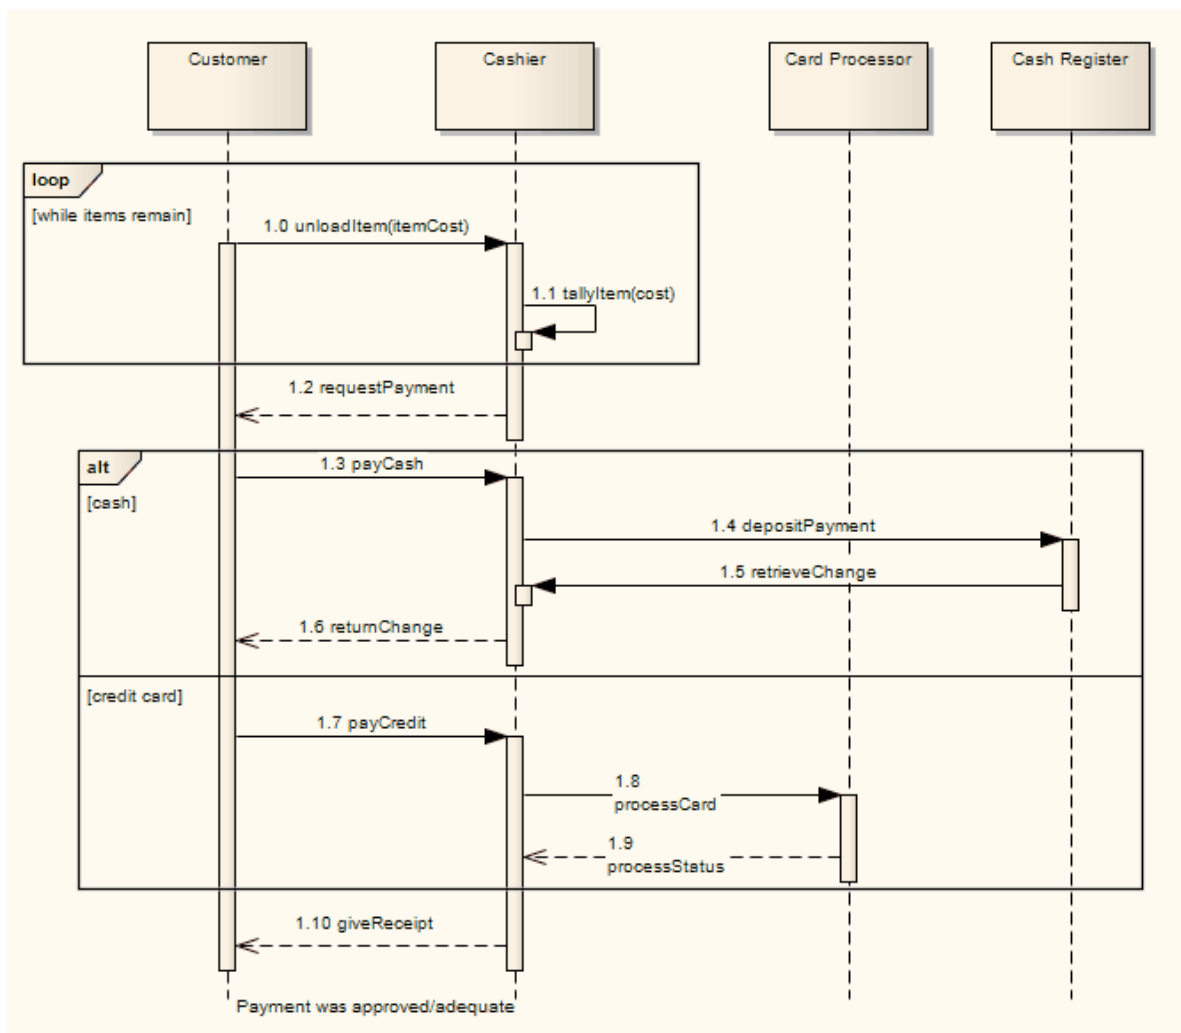

*...choice vertices which, when reached, result in the dynamic evaluation of the guards of the triggers of its outgoing transitions. This realizes a dynamic conditional branch. It enables splitting of transitions into multiple outgoing paths such that the decision on which path to take may be a function of the results of prior actions performed in the same run-to-completion step. If more than one of the guards evaluates to true, an arbitrary one is selected. If none of the guards evaluates to true, then the model is considered ill-formed. (To avoid this, it is recommended to define one outgoing transition with the predefined "else" guard for every choice vertex.) Choice vertices should be distinguished from static branch points that are based on junction points.*

### 6.4.1.6 Combined Fragment

A **Combined Fragment** reflects one or more aspects of interaction (called **interaction operands**) controlled by an **interaction operator**, with corresponding boolean conditions known as **interaction constraints**. The Fragment displays as a transparent window, divided by horizontal lines for each operand.

This Sequence diagram illustrates the use of Combined Fragments in modeling a simplified purchasing process. A **loop fragment** represents iteration through an unknown number of items for purchase, after which the cashier requests payment. An **alternative fragment** represents the payment options, the fragment being divided to show the two operands *cash* and *credit card*. After the fragment completes its trace, the cashier gives a receipt to the customer, under the fulfilled condition that payment requirements were met.

The order of interaction fragment conditions can be changed directly on the diagram:

1. Select an interaction fragment with more than one condition defined; up and down arrows appear on the right hand side of the each condition.
2. Click on the appropriate arrow to change the order.

### Notes

- In order to select a Combined Fragment, you must click near the inside edge or drag a selection rectangle around the Fragment; this prevents accidental selection when moving connectors inside the Fragment
- Once contained within a Fragment or a Fragment Operand, Messages continue to be contained by it as they are moved up and down the diagram
- To move a Message out of a Fragment, or to a different position in the message sequence within the Fragment, press and hold ( **Alt** ) as you move it
- A Fragment on a Sequence diagram will resize when a Message within it is moved up or down, to continue to contain that message
- When you select an Interaction Fragment on a diagram, it shows one of two **element icons** (off the top right corner) that indicate whether or not the fragment contains Messages and that control how freely you can move the fragment and any Messages within and below the fragment
- To move a Combined Fragment **independently** of its contents, display the 'move freely' element icon (  ) and drag the element border
- Interaction Fragments inside a Combined Fragment operand cannot be moved outside the operand unless the fragment is in 'move freely' mode
- Moving an operand line moves any objects and Messages below that line down or up by the amount the operand line is moved
- Fragments containing other fragments resize when the contained fragment is resized, unless the fragment is in 'move freely' mode

### Toolbox icon

### Learn more

- [Sequence Diagram](#) <sup>[1249]</sup>
- [Create a Combined Fragment](#) <sup>[1290]</sup>
- [Interaction Operator](#) <sup>[1290]</sup>
- [Interaction Operand Condition and Message Behavior](#) <sup>[2490]</sup> (in Model Simulation)
- [Element Icons](#) <sup>[954]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 467) states:

*A combined fragment defines an expression of interaction fragments. A combined fragment is defined by an interaction operator and corresponding interaction operands. Through the use of CombinedFragments the user will be able to describe a number of traces in a compact and concise manner.*

#### 6.4.1.6.1 Create a Combined Fragment

##### Create a Combined Fragment

Step	Action	See also
1	Drag the <i>Fragment</i> element onto the diagram from the Interaction Elements page of the Toolbox.	<a href="#">Combined Fragment</a> <sup>[1287]</sup>
2	In the <b>Type</b> field, click on the drop-down arrow and select one of the various types of interaction operator.	<a href="#">Interaction Operators</a> <sup>[1290]</sup>
3	In the <b>Condition</b> field, specify a condition or interaction constraint for each operand.	
4	A rectangular frame displays, partitioned by lines into segments for each operand.	
5	Adjust the frame to encompass the required event occurrences for each operand.	

##### Notes

- A message will always be contained within a fragment or a fragment operand when it is moved within it
- Fragments on Sequence diagrams will resize when a message is moved down to ensure that messages, once within a fragment, always remain within the fragment

#### 6.4.1.6.2 Interaction Operators

When creating **Combined Fragments**, you must apply an appropriate **interaction operator** to characterize the fragment. The following table provides guidance on the various operators, and their corresponding descriptions.

##### Interaction Operator

Operator	Action
<b>alt</b>	Divide up interaction fragments based on Boolean conditions.
<b>opt</b>	Enclose an optional fragment of interaction.

Operator	Action
<b>par</b>	Indicate that operands operate in parallel.
<b>loop</b>	Indicate that the operand repeats a number of times, as specified by interaction constraints.
<b>critical</b>	Indicate a sequence that cannot be interrupted by other processing.
<b>neg</b>	Assert that a fragment is invalid, and implies that all other interaction is valid.
<b>assert</b>	Specify the only valid fragment to occur. This operator is often enclosed within a <i>consider</i> or <i>ignore</i> operand.
<b>strict</b>	Indicate that the behaviors of the operands must be processed in strict sequence.
<b>seq</b>	Indicate that the Combined Fragment is weakly sequenced. This means that the ordering within operands is maintained, but the ordering between operands is undefined, so long as an event occurrence of the first operand precedes that of the second operand, if the event occurrences are on the same lifeline.
<b>ignore</b>	Indicate which messages should be ignored during execution, or can appear anywhere in the execution trace.
<b>consider</b>	Specify which messages should be considered in the trace. This is often used to specify the resulting event occurrences with the use of an <b>assert</b> operator.
<b>ref</b>	<p>Provide a reference to another diagram.</p> <p>The ref fragment is not created using the method described in the <i>Create a Combined Fragment</i> topic. To create a ref fragment, simply drag an existing diagram from the Project Browser onto the current diagram.</p>

#### Learn more

- [Combined Fragments](#)<sup>[1287]</sup>
- [Create a Combined Fragment](#)<sup>[1290]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 468-471*) states:

*The semantics of a CombinedFragment is dependent upon the interactionOperator as explained below.*

## Alternatives

The interactionOperator **alt** designates that the CombinedFragment represents a choice of behavior. At most one of the operands will be chosen. The chosen operand must have an explicit or implicit guard expression that evaluates to true at this point in the interaction. An implicit true guard is implied if the operand has no guard.

The set of traces that defines a choice is the union of the (guarded) traces of the operands.

An operand guarded by **else** designates a guard that is the negation of the disjunction of all other guards in the enclosing CombinedFragment.

If none of the operands has a guard that evaluates to true, none of the operands are executed and the remainder of the enclosing InteractionFragment is executed.

## Option

The interactionOperator **opt** designates that the CombinedFragment represents a choice of behavior where either the (sole) operand happens or nothing happens. An option is semantically equivalent to an alternative CombinedFragment where there is one operand with non-empty content and the second operand is empty.

## Break

The interactionOperator **break** designates that the CombinedFragment represents a breaking scenario in the sense that the operand is a scenario that is performed instead of the remainder of the enclosing InteractionFragment. A **break** operator with a guard is chosen when the guard is true and the rest of the enclosing Interaction Fragment is ignored. When the guard of the **break** operand is false, the **break** operand is ignored and the rest of the enclosing InteractionFragment is chosen. The choice between a **break** operand without a guard and the rest of the enclosing InteractionFragment is done non-deterministically.

A CombinedFragment with interactionOperator **break** should cover all Lifelines of the enclosing InteractionFragment.

## Parallel

The interactionOperator **par** designates that the CombinedFragment represents a parallel merge between the behaviors of the operands. The OccurrenceSpecifications of the different operands can be interleaved in any way as long as the ordering imposed by each operand as such is preserved.

A parallel merge defines a set of traces that describes all the ways that OccurrenceSpecifications of the operands may be interleaved without obstructing the order of the OccurrenceSpecifications within the operand.

## Weak Sequencing

The interactionOperator **seq** designates that the CombinedFragment represents a weak sequencing between the behaviors of the operands.

Weak sequencing is defined by the set of traces with these properties:

1. The ordering of OccurrenceSpecifications within each of the operands is maintained in the result.
2. OccurrenceSpecifications on different lifelines from different operands may come in any order.
3. OccurrenceSpecifications on the same lifeline from different operands are ordered such that an OccurrenceSpecification of the first operand comes before that of the second operand.

Thus weak sequencing reduces to a parallel merge when the operands are on disjunct sets of participants. Weak sequencing reduces to strict sequencing when the operands work on only one participant.

## Strict Sequencing

The interactionOperator **strict** designates that the CombinedFragment represents a strict sequencing between the behaviors of the operands. The semantics of strict sequencing defines a strict ordering of the operands on the first level within the CombinedIFragment with interactionOperator **strict**. Therefore OccurrenceSpecifications within contained CombinedFragment will not directly be compared with other OccurrenceSpecifications of the enclosing CombinedFragment.

## Negative

The interactionOperator **neg** designates that the CombinedFragment represents traces that are defined to be invalid.

The set of traces that defined a CombinedFragment with interactionOperator negative is equal to the set of traces given by its (sole) operand, only that this set is a set of invalid rather than valid traces. All InteractionFragments that are different from Negative are considered positive meaning that they describe traces that are valid and should be possible.

### Critical Region

The interactionOperator **critical** designates that the CombinedFragment represents a critical region. A critical region means that the traces of the region cannot be interleaved by other OccurrenceSpecifications (on those Lifelines covered by the region). This means that the region is treated atomically by the enclosing fragment when determining the set of valid traces. Even though enclosing CombinedFragments may imply that some OccurrenceSpecifications may interleave into the region, such as with **par**-operator, this is prevented by defining a region.

Thus the set of traces of enclosing constructs are restricted by critical regions.

### Ignore / Consider

(p. 473) The interactionOperator **ignore** designates that there are some message types that are not shown within this combined fragment. These message types can be considered insignificant and are implicitly ignored if they appear in a corresponding execution. Alternatively one can understand **ignore** to mean that the messages that are ignored can appear anywhere in the traces.

Conversely the interactionOperator **consider** designates which messages should be considered within this CombinedFragment. This is equivalent to defining every other message to be ignored.

### Assertion

The interactionOperator **assert** designates that the CombinedFragment represents an assertion. The sequences of the operand of the assertion are the only valid continuations. All other continuations result in an invalid trace. Assertions are often combined with Ignore or Consider.

### Loop

The interactionOperator **loop** designates that the CombinedFragment represents a loop. The **loop** operand will be repeated a number of times.

The Guard may include a lower and an upper number of iterations of the loop as well as a Boolean expression. The semantics is such that a loop will iterate minimum the 'minint' number of times (given by the iteration expression in the guard) and at most the 'maxint' number of times. After the minimum number of iterations have executed, and the boolean expression is false the loop will terminate. The loop construct represent a recursive application of the **seq** operator where the **loop** operand is sequenced after the result of earlier iterations.

### The Semantics of Gates

The gates of a CombinedFragment represent the syntactic interface between the CombinedFragment and its surroundings, which means the interface towards other InteractionFragments.

The only purpose of gates is to define the source and the target of messages.

#### 6.4.1.7 Datastore

#### Description

A Datastore is an element used to define permanently stored data. A token of data that enters into a Datastore is stored permanently, updating tokens for data that already exists. A token of data that comes out of a Datastore is a copy of the original data.

Use Object Flow connectors to connect elements (such as Activities) to Datastores, as values and information are being passed between nodes. Selection and transformation behavior, together composing a sort of query, can be specified as to the nature of data access. For instance, selection behavior determines which objects are affected by the connection to the Datastore. Transformation behavior might then further specify the value of an attribute pertaining to a selected object.

To define the behavior of access to a Datastore, attach a note to the Object Flow connector. To do this, right-click on the Object Flow and select the **Attach Note or Constraint** context menu option. A dialog indicates other flows in the Activity diagram, to which you can attach the note (if the behavior applies to multiple flows). To comply with UML 2, preface behavior with the notation «selection» or «transformation».

#### Toolbox icon

- [Activity Diagram](#) <sup>[1199]</sup>
- [Activity](#) <sup>[1279]</sup>
- [SysML Activity Toolbox](#) <sup>[2295]</sup>
- [Object Flow](#) <sup>[1435]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 360) states:

*A data store node is a central buffer node for non-transient information... A data store keeps all tokens that enter it, copying them when they are chosen to move downstream. Incoming tokens containing a particular object replace any tokens in the object node containing that object.*

### 6.4.1.8 Decision

#### Description

A Decision is an element of an Activity diagram or Interaction Overview diagram that indicates a point of conditional progression: if a condition is true, then processing continues one way; if not, then another.

This can also be used as a Merge node in that multiple alternative flows can be merged (but not synchronized) to form one flow. The following examples show both of these modes of using the decision element.

*Used as a decision:*

See *UML Superstructure Specification, v2.1.1, figure 12.77, p. 363.*

*Used as a merge:*

See *UML Superstructure Specification, v2.1.1, figure 12.106, p. 388.*

### Notes

- Moving a diagram generally does not affect the location of elements in packages; if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Decision elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

### Toolbox icon

### Learn more

- [Activity Diagram](#) <sup>[1199]</sup>
- [Interaction Overview Diagram](#) <sup>[1262]</sup>
- [Merge Node](#) <sup>[1322]</sup>

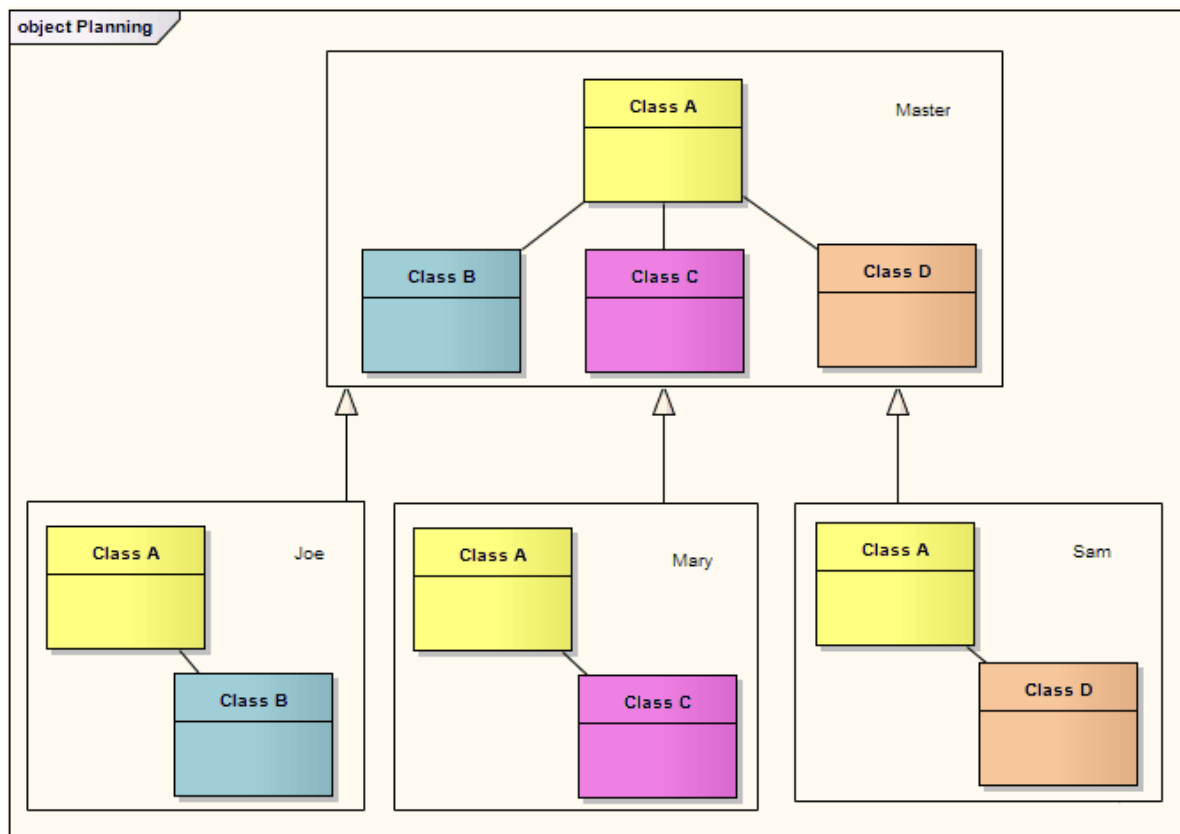

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 361 (Decision symbol)*) states:

*A decision node is a control node that chooses between outgoing flows. A decision node has one incoming edge and multiple outgoing activity edges.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 387 (Merge symbol)*) also states:

*A merge node is a control node that brings together multiple alternate flows. It is not used to synchronize concurrent flows but to accept one among several alternate flows... A merge node has multiple incoming edges and a single outgoing edge.*

**6.4.1.9 Diagram Frame**

A **Diagram Frame** element is a rendition of a diagram dropped from the Project Browser into another diagram. It is a type of **Combined Fragment** with the Interaction Operator **ref**. However, it can be created on any type of diagram, and is not created in the same way as other Combined Fragments.

When you drop the diagram from the Project Browser onto the open diagram, a dialog shows providing the following options:

- **Diagram Frame** - a Diagram Frame is inserted into the diagram, containing an image of the dropped diagram
- **Diagram Reference** - an empty frame is inserted with the name of the dropped diagram in the frame label
- **Hyperlink** - a diagram icon is inserted with no frame, and with the parent package and diagram name

next to it

In all three cases, the object acts as a hyperlink to the real referenced diagram. You can also define properties for the objects, as for other elements, by right-clicking on the object and selecting the element **Properties** context menu option.

### Diagram Frame Appearance

You can change the appearance of a Diagram **Frame**, as for other elements, but the available options are tailored for this element type. If you right-click on the frame and select the **Appearance | Diagram Frame Appearance** option, a sub-menu displays with these options:

- **Normal** - the default appearance of a visible rectangular frame with a visible frame label; you can use this option to reset the appearance after using one of the other options
- **Boundary** - hides the frame label of the Diagram Frame
- **Boundary With Name** - hides the border of the frame **label**
- **Name Only** - hides the border of the Diagram Frame and frame label, leaving the text only
- **Hidden** - hides the border and text of the Diagram Frame

### Notes

- You can change the size of all three objects, but you cannot reduce a Diagram Frame to less than the size of the enclosed diagram
- You cannot change the diagram within a Diagram Frame; to edit the diagram, double-click within the frame and edit the original diagram
- The Diagram Frame **element** is not the same as the diagram frame **border** that you can set (using the Diagram Frames panel on the Diagram page of the Options dialog) on images of diagrams that you print out, copy to file or paste into other tools; it is possible, but not usual, to paste the diagram image from the clipboard into another Enterprise Architect diagram, in which case the image initially looks the same as the Diagram Frame element, but element options do not function on this image

## 6.4.1.10 Diagram Gate

### Description

A Diagram Gate is a simple graphical way to indicate the point at which messages can be transmitted into and out of interaction fragments. A fragment might be required to receive or deliver a message; internally, an ordered message reflects this requirement, with a gate indicated on the boundary of the fragment's frame.

Any external messages 'synching' with this internal message must correspond appropriately. Gates can appear on Interaction diagrams (Sequence, Timing, Communication or Interaction Overview), interaction occurrences and combined fragments (to specify the expression).

#### Toolbox icon

#### Learn more

- [Sequence Diagram](#) <sup>[1249]</sup>
- [Timing Diagram](#) <sup>[1225]</sup>
- [Communication Diagram](#) <sup>[1259]</sup>
- [Interaction Overview Diagram](#) <sup>[1262]</sup>
- [Interaction Occurrence](#) <sup>[1317]</sup>
- [Combined Fragment](#) <sup>[1287]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 480) states:

*A Gate is a connection point for relating a Message outside an InteractionFragment with a Message inside the InteractionFragment ... Gates are connected through Messages. A Gate is actually a representative of an OccurrenceSpecification that is not in the same scope as the Gate. Gates play different roles: we have formal gates on Interactions, actual gates on InteractionUses, expression gates on CombinedFragments.*

#### 6.4.1.11 Endpoint

### Description

An Endpoint is used in Interaction diagrams (Sequence, Timing, Communication or Interaction Overview) to reflect a lost or found Message in sequence. To model this, drag an Endpoint element onto the workspace.

With Sequence diagrams, drag a Message from the appropriate Lifeline to the Endpoint. With Timing diagrams, the Message connecting the Lifeline to the Endpoint requires some timing specifications to draw the connection.

The following example depicts a lost Message in a Sequence diagram.

### Toolbox icon

- [Timing Diagram](#) <sup>[1225]</sup>
- [Communication Diagram](#) <sup>[1259]</sup>
- [Interaction Overview Diagram](#) <sup>[1262]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 492) states:

*A lost message is a message where the sending event occurrence is known, but there is no receiving event occurrence. We interpret this to be because the message never reached its destination.*

*A found message is a message where the receiving event occurrence is known, but there is no (known) sending event occurrence. We interpret this to be because the origin of the message is outside the scope of the description. This may, for example, be noise or other activity that we do not want to describe in detail.*

#### 6.4.1.12 Entry Point

##### Description

Entry Point pseudo-states are used to define the beginning of a State Machine. An Entry Point exists for each region, directing the initial concurrent state configuration.

##### Toolbox icon

##### Learn more

- [State Machine Diagram](#) <sup>[1203]</sup>
- [Pseudo-states](#) <sup>[1208]</sup>

##### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 471) states:

*An entry point pseudostate is an entry point of a state machine or composite state. In each region of the state machine or composite state it has a single transition to a vertex within the same region.*

#### 6.4.1.13 Exception

##### Description

The Exception Handler element defines the group of operations to carry out when an exception occurs. In an Activity diagram, the protected element can contain a set of operations and is connected to the exception handler via an Interrupt Flow connector. Any defined error contained within an element's parts can trigger the flow to move to an exception.

### Toolbox icon

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 364) states:

*An exception handler is an element that specifies a body to execute in case the specified exception occurs during the execution of the protected node.*

#### 6.4.1.14 Expansion Node

### Description

Representing an Action or an Activity as an *Expansion Node* is a shorthand notation to indicate that the Action/Activity comprises an Expansion Region.

To specify an Action or Activity as an Expansion Node, right-click on the Action and select the **New Element | Expansion Node** context menu option.

### Learn more

- [Action](#) <sup>[1266]</sup>
- [Activity](#) <sup>[1279]</sup>
- [Expansion Region](#) <sup>[1301]</sup>

#### 6.4.1.15 Expansion Region

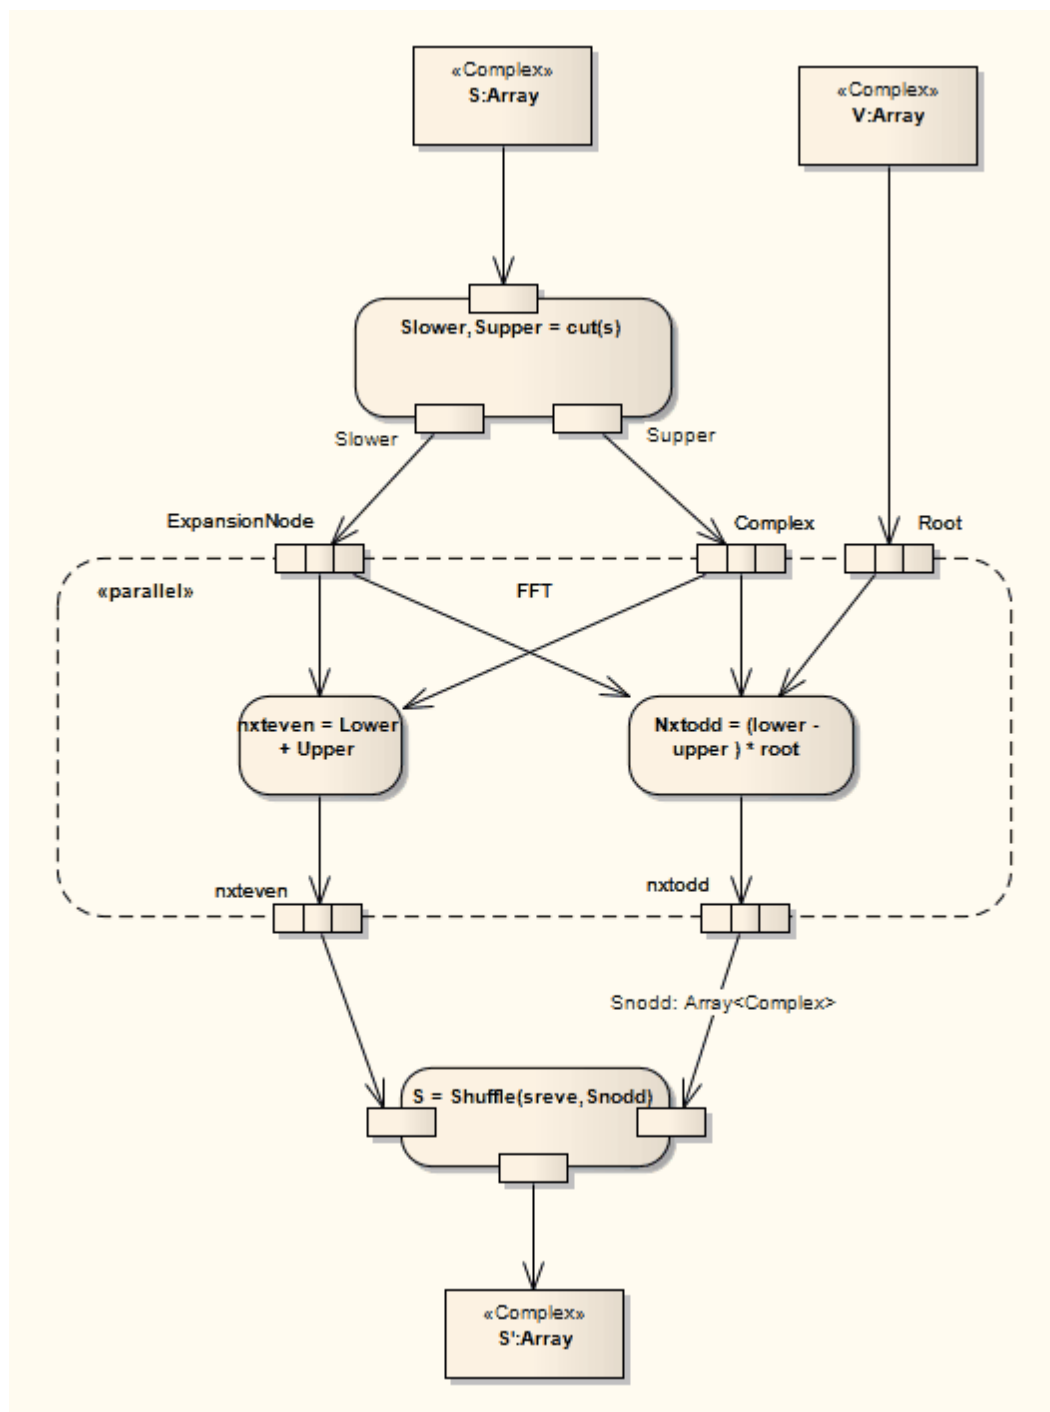

### Description

You create an Expansion Region as one variant of a Region (the other is an Interruptible Activity Region).

On an Activity diagram, an Expansion Region surrounds a process to be imposed multiple times on the incoming data, once for every element in the input collection. If there are multiple inputs, the collection sizes must match, and the elements within each collection must be of the same type. Similarly, any outputs must be in the form of a collection matching the size of the inputs.

The concurrency of the Expansion Region's multiple executions can be specified as type parallel, iterative, or stream. Parallel reflects that the elements in the incoming collections can be processed at the same time or overlapping, whereas an iterative concurrency type specifies that execution must occur sequentially. A stream-type Expansion Region indicates that the input and output come in and exit as streams, and that the Expansion Region's process must have some method to support streams.

To modify the mode of an Expansion Region, right-click on it and select the **Properties** context menu option, then select the Advanced page.

See *UML Superstructure Specification, v2.1.1*, figure 12.87, p. 372.

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 367) states:

*An expansion region is a structured activity region that executes multiple times corresponding to elements of an input collection.*

## 6.4.1.16 Exit Point

### Description

Exit Points are used in State Machine elements and State Machine diagrams to denote the point where the machine is exited and the transition sourcing this exit point, for State Machine elements, is triggered. Exit points are a type of pseudo-state used in the State Machine diagram.

### Toolbox icon

### Learn more

- [State Machines](#) <sup>[1203]</sup> (Diagrams)
- [State](#) <sup>[1329]</sup>
- [State Machine](#) <sup>[1338]</sup>
- [Pseudo-states](#) <sup>[1208]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1 p. 538) states:

*An exit point pseudostate is an exit point of a state machine or composite state. Entering an exit point within any region of the composite state or state machine referenced by a submachine state implies the exit of this composite state or submachine state and the triggering of the transition that has this exit point as source in the state machine enclosing the submachine or composite state.*

### 6.4.1.17 Final

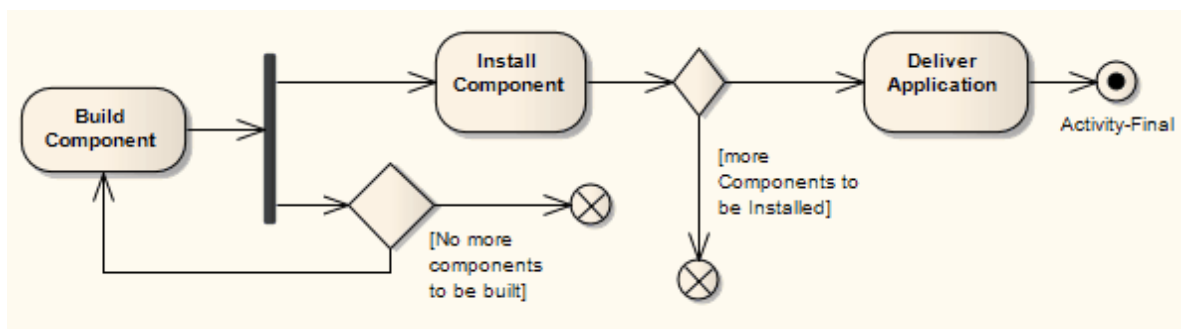

#### Description

There are two nodes used to define a Final state in an Activity, both defined in UML 2.4.1 as of type Final Node. The Activity Final element, shown above, indicates the completion of an Activity; upon reaching the Final, all execution in the Activity diagram is aborted. The other type of final node, Flow Final, depicts an exit from the system that has no effect on other executing flows in the Activity.

The following example illustrates the development of an application. The process comes to a Flow Final node when there are no more components to be built; note that the Fork element indicates a concurrent process with the building of new components and installation of completed components. The Flow Final terminates only the sub-process building components. Similarly, only those tokens entering the decision branch for the installation of further components terminate with the connecting Flow Final (that is, stop installing this component, but keep on installing other components). It is only after the Deliver Application activity is completed, after the control flow reaches the Final node, that all flows stop.

The node that initiates a flow is the Initial node.

See *UML Superstructure Specification, v2.1.1, figure 12.91, p. 374.*

#### Notes

- Moving a diagram generally does not affect the location of elements in packages; if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Final elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

#### Toolbox icon

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 332*) states:

*An activity may have more than one activity final node. The first one reached stops all flows in the activity.*

#### 6.4.1.18 Flow Final

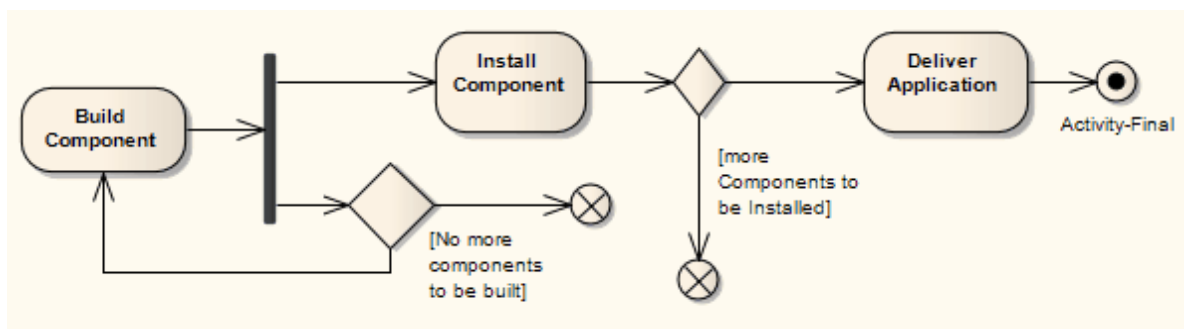

Flow Final

### Description

There are two nodes used to define a final state in an Activity, both defined in UML 2.4.1 as of type *Final Node*. The Flow Final element depicts an exit from the system, as opposed to the Activity Final, which represents the completion of the Activity. Only the flow entering the Flow Final node exits the Activity; other flows continue undisturbed.

The following example Activity Diagram illustrates the development of an application. The process comes to a Flow Final node when there are no more components to be built; note that the Fork element indicates a concurrent process with the building of new components and installation of completed components. The Flow Final terminates only the sub-process building components. Similarly, only those tokens entering the decision branch for the installation of further components terminate with the connecting Flow Final (that is, stop installing this component, but keep on installing other components). It is only after the Deliver Application activity is completed, after the control flow reaches the Final node, that all flows stop.

See *UML Superstructure Specification, v2.1.1, figure 12.91, p. 374*.

### Notes

- Moving a diagram generally does not affect the location of elements in packages: if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Flow Final elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

- [Fork](#) <sup>[1309]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 375*) states:

*A flow final destroys all tokens that arrive at it. It has no effect on other flows in the activity.*

#### 6.4.1.19 Fork/Join

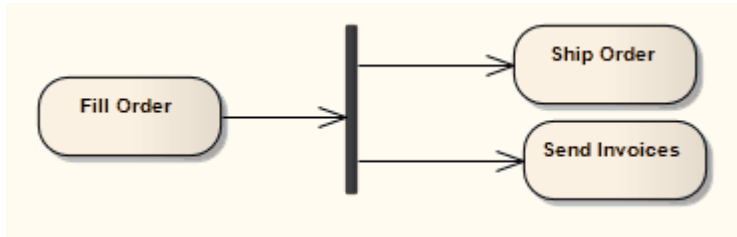

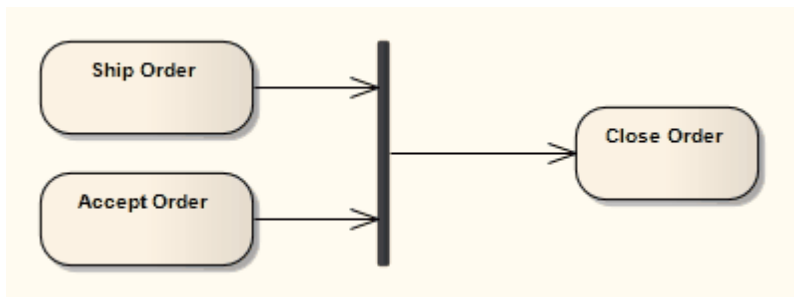

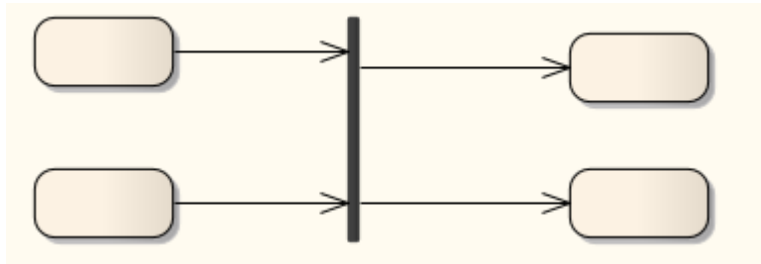

### Description

The *Fork/Join* elements have different modes of use, as follows:

- To fork or split the flow into a number of concurrent flows
- To join the flow of a number of concurrent flows
- To both join and fork a number of incoming flows to a number of outgoing flows

These elements are used in both Activity and State Machine diagrams. With respect to State Machine diagrams, Forks and Joins are used as pseudo-states. Other pseudo-states include history states, entry points and exit points. Forks are used to split an incoming transition into concurrent multiple transitions leading to different target states. Joins are used to merge concurrent multiple transitions into a single transition leading to a single target. They are semantic inverses. To learn more about these individual elements see their specific topics.

#### Example Diagrams:

Description	Diagram
<b>Fork or split the flow into a number of concurrent flows</b>	 A diagram illustrating a fork. A rounded rectangle labeled 'Fill Order' has an arrow pointing to a thick vertical line (the fork). From this line, two arrows branch out to two separate rounded rectangles labeled 'Ship Order' and 'Send Invoices'.
<b>Join the flow of a number of concurrent flows</b>	 A diagram illustrating a join. Two rounded rectangles labeled 'Ship Order' and 'Accept Order' have arrows pointing to a thick vertical line (the join). From this line, a single arrow points to a rounded rectangle labeled 'Close Order'.
<b>Join and Fork a number of incoming flows to a number of outgoing flows</b>	 A diagram illustrating a join and fork. Two rounded rectangles on the left have arrows pointing to a thick vertical line (the join). From this line, two arrows branch out to two separate rounded rectangles on the right.

- [Join](#) <sup>[1310]</sup>

#### **OMG UML Specification:**

##### **Fork**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 376) states:

*A fork node is a control node that splits a flow into multiple concurrent flows... A fork node has one incoming edge and multiple outgoing edges.*

##### **Join**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 381-382) states:

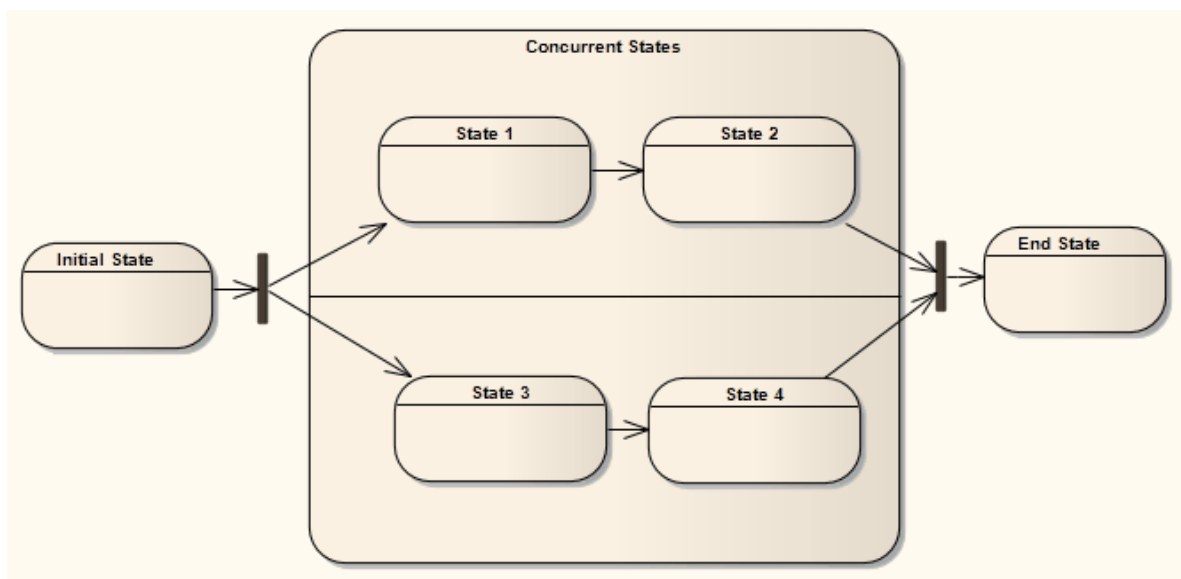

*A join node is a control node that synchronizes multiple flows... A join node has multiple incoming edges and one outgoing edge.*

#### **6.4.1.19.1 Fork**

#### **Description**

The Fork element is used in both Activity and State Machine diagrams. With respect to State Machine diagrams, a Fork pseudo-state signifies that its incoming transition comes from a single state, and it has multiple outgoing transitions. These transitions must occur concurrently, requiring the use of concurrent regions, as depicted here in the Composite State. Unlike Choice or Junction pseudo-states, Forks must not have triggers or guards. This diagram demonstrates a Fork pseudo-state dividing into two concurrent regions, which then return to the End State via the Join pseudo-state.

- [Region](#) <sup>[1328]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

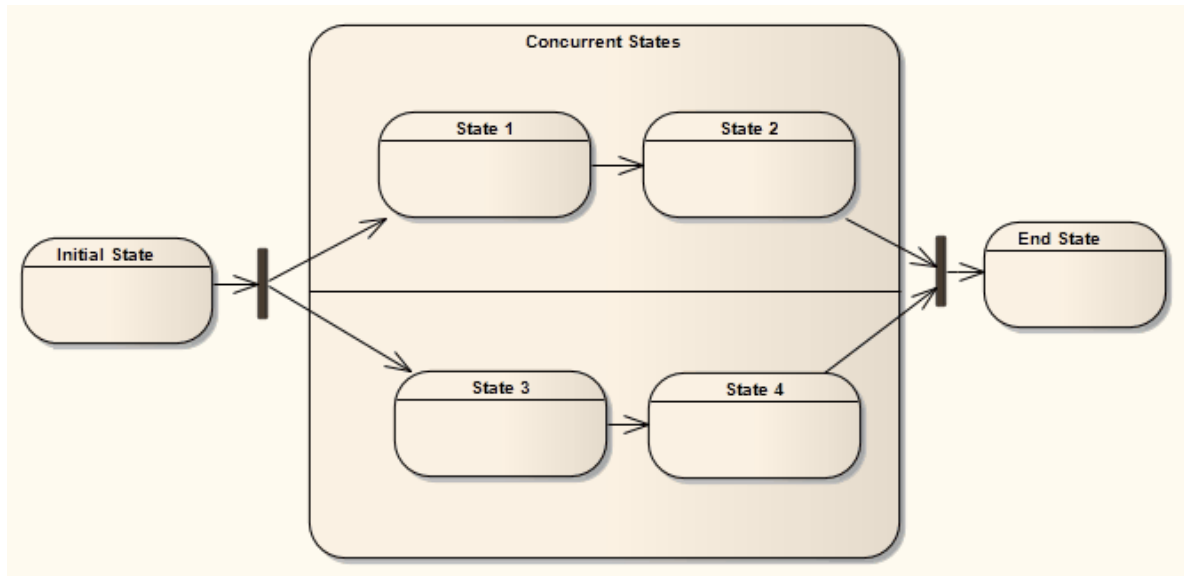

*Fork vertices serve to split an incoming transition into two or more transitions terminating on orthogonal target vertices (i.e. vertices in different regions of a composite state). The segments outgoing from a fork vertex must not have guards or triggers.*

#### 6.4.1.19.2 Join

#### Description

The Join element is used by Activity and State Machine diagrams. The example illustrates a Join transition between Activities. With respect to State Machine diagrams, a Join pseudo-state indicates multiple States concurrently transitioning into the Join and onto a single State. Unlike Choice or Junction pseudo-states, Joins must not have triggers or guards. The following diagram demonstrates a Fork pseudo-state dividing into two concurrent Regions, which then return to the End State via the Join.

- [Region](#) <sup>[1328]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

*Join vertices serve to merge several transitions emanating from source vertices in different orthogonal regions. The transitions entering a join vertex cannot have guards or triggers.*

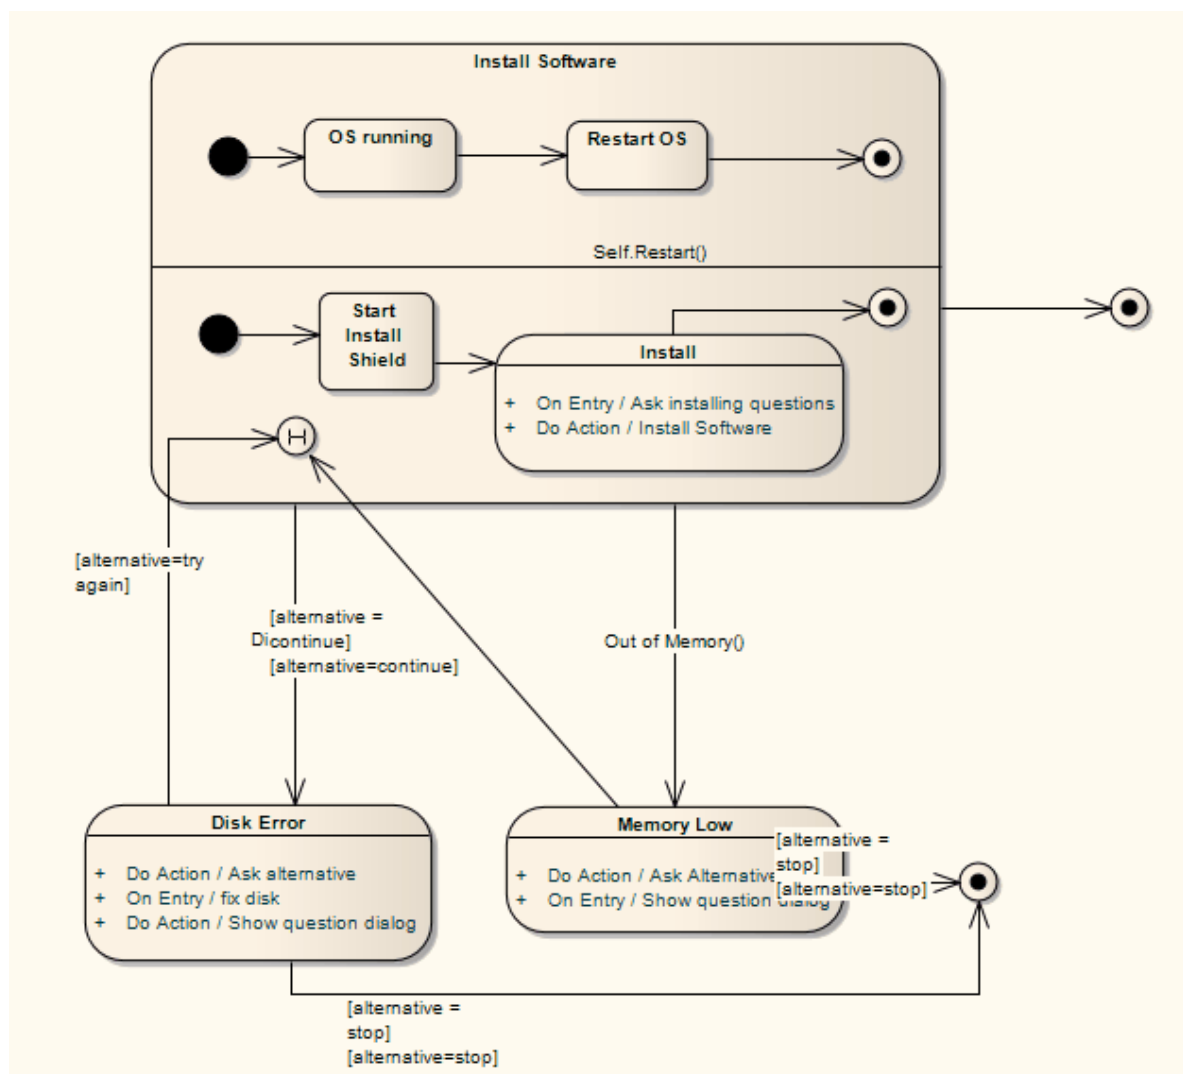

#### 6.4.1.20 History

**Description**

There are two types of History pseudo-state defined in UML: shallow and deep history. A shallow History sub-state is used to represent the most recently active sub-state of a Composite State; this pseudo-state does not recurse into this sub-state's active configuration, should one exist. A single connector can be used to depict the default shallow History state, in case the Composite State has never been entered.

A deep History sub-state, in contrast, reflects the most recent active configuration of the Composite State. This includes active sub-states of all regions, and recurses into those sub-states' active sub-states, should they exist. At most one deep history and one shallow history can dwell within a composite state. You can reassign a shallow History substate as a deep History substate using the Advanced element context menu.

**Toolbox icon**

History

### Learn more

- [Pseudo-state](#)<sup>[1208]</sup>
- [Composite State](#)<sup>[1330]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 537) states:

... *deepHistory* represents the most recent active configuration of the composite state that directly contains this pseudostate (e.g., the state configuration that was active when the composite state was last exited). A composite state can have at most one deep history vertex. At most one transition may originate from the history connector to the default deep history state. This transition is taken in case the composite state had never been active before. Entry actions of states entered on the path to the state represented by a deep history are performed.

... *shallowHistory* represents the most recent active substate of its containing state (but not the sub states of that substate). A composite state can have at most one shallow history vertex. A transition coming into the shallow history vertex is equivalent to a transition coming into the most recent active substate of a state. At most one transition may originate from the history connector to the default shallow history state. This transition is taken in case the composite state had never been active before. Entry actions of states entered on the path to the state represented by a shallow history are performed.

#### 6.4.1.21 Initial

### Description

The Initial element is used by Activity and State Machine diagrams. In Activity diagrams, it defines the start of a flow when an Activity is invoked. With State Machines, the Initial element is a pseudo-state used to denote the default state of a Composite State; there can be one Initial vertex in each Region of the Composite State.

This simple example shows the start of a flow to receive an order.

See *UML Superstructure Specification*, v2.1.1, Figure 12.97, p. 378.

The activity flow is completed by a Final or Flow Final node.

### Notes

- Moving a diagram generally does not affect the location of elements in packages; if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Initial elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

- [Flow Final](#) <sup>[1306]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 537) states:

*An initial pseudostate represents a default vertex that is the source for a single transition to the default state of a composite state. There can be at most one initial vertex in a region. The outgoing transition from the initial vertex may have a behavior, but not a trigger or guard.*

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 378) also states:

*An initial node is a control node at which flow starts when the activity is invoked.*

### 6.4.1.22 Interaction

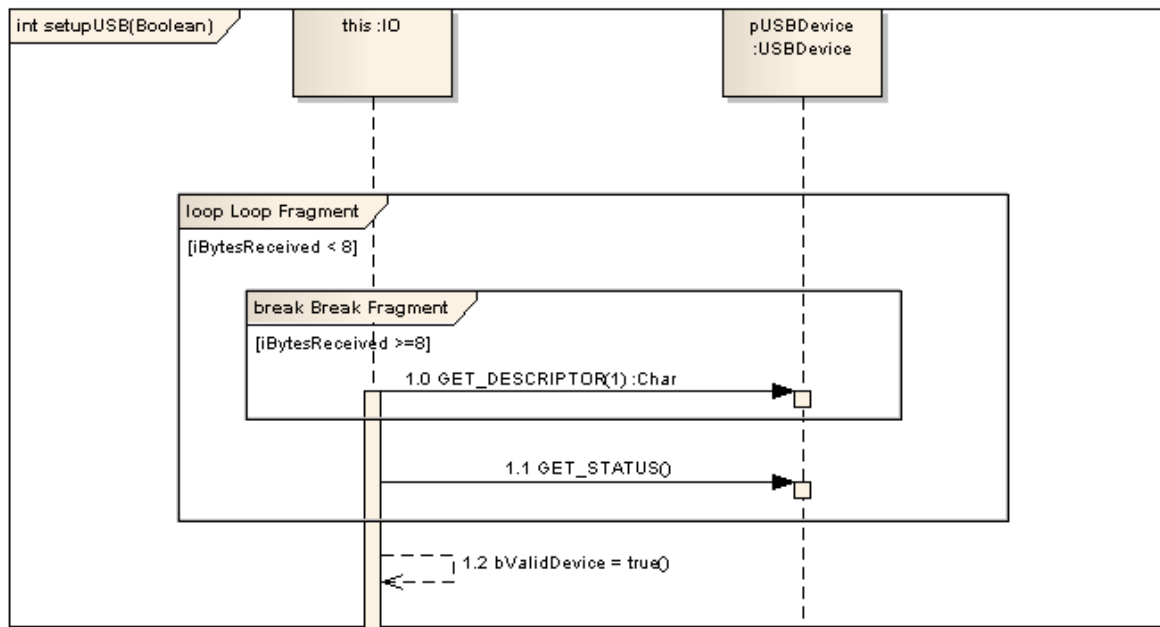

#### Description

You can use an **Interaction** element on a Sequence diagram to describe a system, representing its interactions at varying levels of detail, for review both by design professionals and by end users and stakeholders. An Interaction element can contain these types of diagram:

- Sequence

- Interaction Overview
- Communication
- Timing

An Interaction element in Enterprise Architect is treated as a behavior of the classifier it is encapsulated within. It can have parameters and return types, which are modeled using the Behavior tab of the Interaction element's Properties dialog. The element is interpreted as a method of the containing Class in the generated code (see the *Generate Code From Behavioral Model* topic).

An Interaction element can also be set as the classifier for an **Interaction Occurrence** in a Sequence diagram, or for a **Call Behavior Action** in an Activity diagram. Establishing such an association (between a behavior and a behavior call) facilitates adding arguments that can be individually mapped to the associated behavior's parameters.

### Notes

- The behavioral code generation engine expects the Sequence diagram and all its associated Messages and Interaction Fragments to be encapsulated within an Interaction element (such as `setupUSB` in this example)

(The `IO` Class is available in the *EAExample* model, under **Systems Engineering Model | Implementation Model | Software**)

- The Interaction icon is available from the **Additional** page of the Interaction Toolbox

#### **6.4.1.23 Interruptible Activity Region**

### Description

You create an Interruptible Activity Region as one variant of a Region (the other is an Expansion Region).

In an Activity diagram, an Interruptible Activity Region surrounds a group of Activity elements, all affected by certain interrupts in such a way that all tokens passing within the region are terminated should the interruption(s) be raised. Any processing occurring within the bounds of an Interruptible Activity Region is terminated when a flow is instigated across an interrupt flow to an external element.

The example below illustrates that an order cancellation kills any processing of the order at the receipt, filling or shipping stage.

See *UML Superstructure Specification, v2.1.1, figure 12.100, p. 381.*

#### Toolbox icon

#### Learn more

- [Activity diagram](#) <sup>[1199]</sup>
- [Activity](#) <sup>[1279]</sup>
- [Region](#) <sup>[1328]</sup>
- [Expansion Region](#) <sup>[1301]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 380*) states:

*An interruptible region contains activity nodes. When a token leaves an interruptible region via edges designated by the region as interrupting edges, all tokens and behaviors in the region are terminated.*

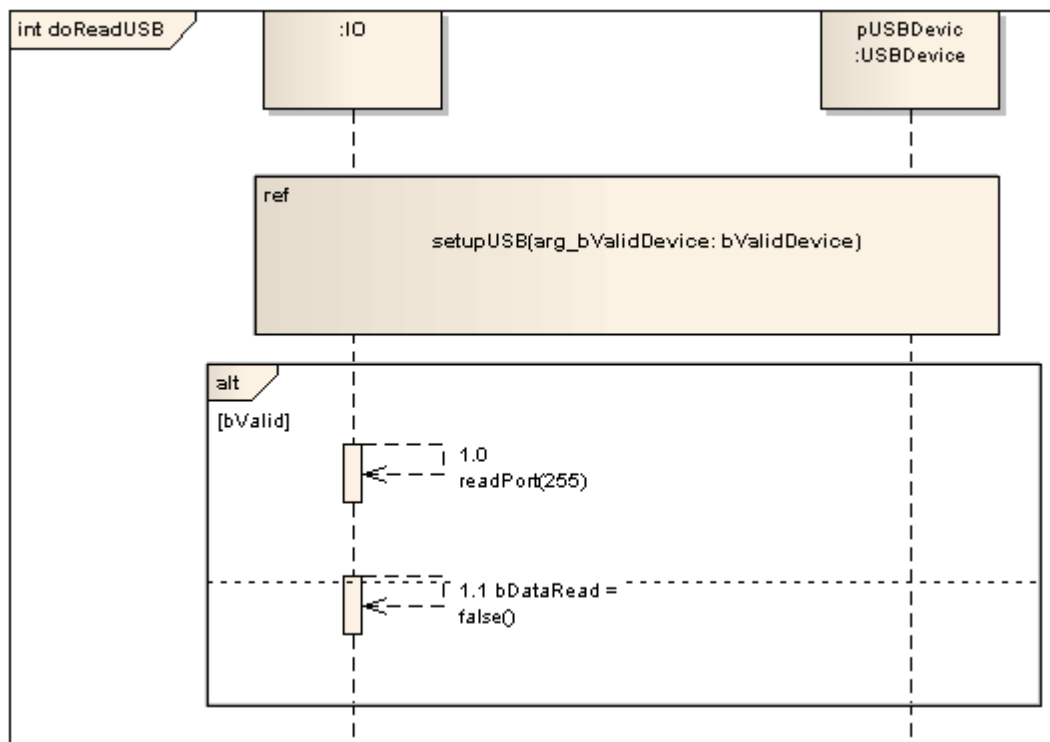

#### 6.4.1.23.1 Interaction Occurrence

An **Interaction Occurrence** (or **InteractionUse**) is a reference to an existing **Interaction** (Sequence) diagram. Interaction Occurrences are visually represented by a frame, with **ref** in the frame's title space. The diagram name is indicated in the frame contents. To create an Interaction Occurrence, simply open a Sequence diagram (preferably contained within an Interaction element) and drag another Sequence

diagram (also preferably contained within an Interaction element) into its workspace. A dialog displays, providing configuration options. The resulting Interaction Occurrence acts as an invocation of the original Interaction. You use the Call tab of the element Properties dialog to set up the actual arguments of the Interaction and also to change to a different associated Interaction element.

The following figure illustrates the use of an Interaction Occurrence in another Interaction (Sequence) diagram. You can display the sequence represented by the Interaction Occurrence by double-clicking on the element.

### Notes

- The behavioral code generation engine expects the Sequence diagram and all its associated messages and interaction fragments to be encapsulated within an Interaction element (such as `doReadUSB` in the example below)

### Learn more

- [Sequence Diagram](#) <sup>[1249]</sup>
- [Interaction element](#) <sup>[1314]</sup>
- [Behavior Calls Invocations](#) <sup>[1026]</sup>
- [Arguments](#) <sup>[1027]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 423) refers to an Interaction Occurrence as an **InteractionUse**, and states:

*An InteractionUse refers to an Interaction. The InteractionUse is a shorthand for copying the contents of the referred Interaction where the InteractionUse is. To be accurate the copying must take into account substituting parameters with arguments and connect the formal gates with the actual ones.*

*It is common to want to share portions of an interaction between several other interactions. An InteractionUse allows multiple interactions to reference an interaction that represents a common portion of their specification.*

**6.4.1.24 Junction****Description**

Junction pseudo-states are used to design complex transitional paths in State Machine diagrams. A Junction can be used to combine or merge multiple paths into a shared transition path. Alternatively, a Junction can split an incoming path into multiple paths, similar to a Fork pseudostate. Unlike Forks or Joins, Junctions can apply guards to each incoming or outgoing transition, such that if the guard expression is false, the transition is disabled.

The following example illustrates how guards can be applied to transitions coming into or out of a Junction pseudo-state.

#### Toolbox icon

#### Learn more

- [State Machine Diagram](#) <sup>[1203]</sup>
- [Pseudo-states](#) <sup>[1208]</sup>
- [Fork](#) <sup>[1309]</sup>
- [Join](#) <sup>[1310]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

*... junction vertices are semantic-free vertices that are used to chain together multiple transitions. They are used to construct compound transition paths between states. For example, a junction can be used to converge multiple incoming transitions into a single outgoing transition representing a shared transition path (this is known as a merge). Conversely, they can be used to split an incoming transition into multiple outgoing transition segments with different guard conditions. This realizes a static conditional branch. (In the latter case, outgoing transitions whose guard conditions evaluate to false are disabled. A predefined guard denoted "else" may be defined for at most one outgoing transition. This transition is enabled if all the guards*

labeling the other transitions are false.) Static conditional branches are distinct from dynamic conditional branches that are realized by choice vertices.

#### 6.4.1.25 Lifeline

##### Description

A Lifeline is an individual participant in an interaction (that is, Lifelines cannot have multiplicity). A Lifeline represents a distinct connectable element. To specify that representation within Enterprise Architect, right-click on the Lifeline and select the **Advanced | Instance Classifier** context menu option. The Select <Item> dialog displays which you use to locate the required project classifiers.

Lifelines are available in Sequence diagrams. There are different Lifeline elements for Timing diagrams (State Lifeline and Value Lifeline); however, although the representation differs between the two diagram types, the meaning of the Lifeline is the same.

##### Toolbox icon

##### Learn more

- [Instance Classifier](#) <sup>[994]</sup>
- [Sequence Diagram](#) <sup>[1249]</sup>
- [Timing diagram](#) <sup>[1225]</sup>
- [State Lifeline](#) <sup>[1335]</sup>
- [Value Lifeline](#) <sup>[1355]</sup>

##### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p.489) states:

*A lifeline represents an individual participant in the Interaction. While Parts and StructuralFeatures may have multiplicity greater than 1, Lifelines represent only one interacting entity.*

*Lifeline is a specialization of NamedElement.*

*If the referenced ConnectableElement is multivalued (i.e. has a multiplicity > 1), then the Lifeline may have an expression (the 'selector') that specifies which particular part is represented by this Lifeline. If the selector is omitted this means that an arbitrary representative of the multivalued ConnectableElement is chosen.*

### 6.4.1.26 Merge

#### Description

A Merge Node brings together a number of alternative flow paths in Activity, Analysis and Interaction Overview diagrams. For example, if a Decision is used after a Fork, the two flows coming out of the Decision must be merged into one before going to a Join; otherwise, the Join waits for both flows, only one of which arrives.

A Merge Node has multiple incoming edges and a single outgoing edge. The edges coming into and out of a Merge Node must be either all object flows or all control flows.

#### Toolbox icon

- [Join](#) <sup>[1310]</sup>
- [Object flow](#) <sup>[1435]</sup>
- [Control flow](#) <sup>[1403]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 387) states:

*A merge node is a control node that brings together multiple alternate flows. It is not used to synchronize concurrent flows but to accept one among several alternate flows.*

### 6.4.1.27 Message Endpoint

#### Description

A Message Endpoint element defines the termination of a State or Value Lifeline in a Timing diagram.

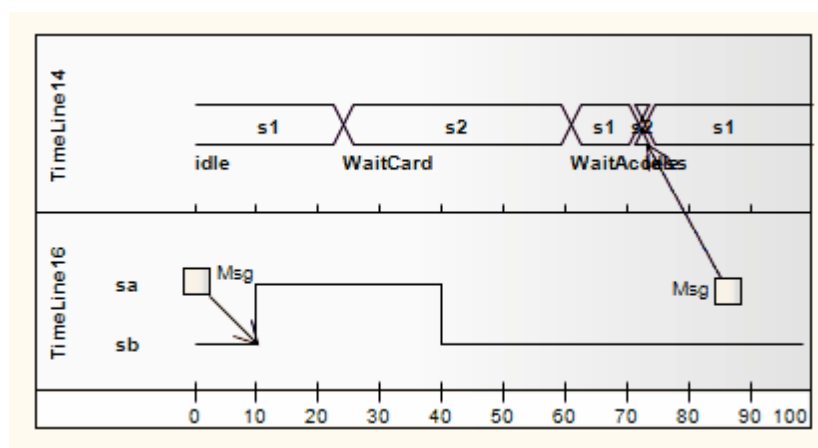

Toolbox iconLearn more

- [Timing Diagram](#)<sup>[1225]</sup>
- [State Lifeline](#)<sup>[1335]</sup>
- [Value Lifeline](#)<sup>[1355]</sup>

**6.4.1.28 Message Label**Description

A Message Label is an alternative way of denoting Messages between Lifelines, which is useful for 'uncluttering' Timing diagrams strewn with messages. To indicate a Message between Lifelines, draw a connector from the source Lifeline into a Message Label. Next, draw a connector from another Message Label to the target Lifeline. Note that the label names must match to reflect that the message occurs between the two Message Labels.

The following diagram illustrates how Message Labels are used to construct a message between Lifelines.

Toolbox iconLearn more

- [Timing diagram](#) <sup>[1225]</sup>
- [Messages](#) <sup>[1437]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 518) states:

*Labels are only notational shorthands used to prevent cluttering of the diagrams with a number of messages crisscrossing the diagram between Lifelines that are far apart. The labels denote that a Message may be disrupted by introducing labels with the same name.*

### **6.4.1.29 Note**

#### **Description**

A Note element is a textual annotation that can be attached to a set of elements of any other type. The attachment is created separately, using a Notelink connector. Both Note and Notelink are available in any Enterprise Architect diagram, through the Common pages of the Toolbox.

A Note is also called a Comment.

A Constraint is a form of Note, identifying a constraint on other elements. As for a Note, you can connect the Constraint element to other elements using a Notelink connector. This element is just a means of documenting the fact that there are constraints; it has no impact on the other elements. You define the types of constraint in the project reference data, apply them to the element in the element Properties dialog, and manage them through the Scenarios & Requirements window.

#### **Toolbox icon**

#### **Learn more**

- [Notelink Connector](#) <sup>[1435]</sup>
- [Constraint Types](#) <sup>[1160]</sup>
- [Scenarios & Requirements Window](#) <sup>[992]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 59) states:

*A comment gives the ability to attach various remarks to elements. A comment carries no semantic force, but may contain information that is useful to a modeler.*

*A comment can be owned by any element.*

#### 6.4.1.30 Object Node

##### Description

An **Object Node** holds data that is input to or output from an **Activity element**. To set the type of an Object Node, click on it and press **Ctrl+L** (to select an **Instance Classifier**). Object Nodes can be connected by **Object Flow connectors**; if the Object Nodes on each end of an Object Flow are typed, their types should be compatible.

An Action Pin is a specialized form of Object Node.

##### Learn more

- [Activity](#) <sup>[1279]</sup>
- [Object Flow](#) <sup>[1435]</sup>
- [Action Pin](#) <sup>[1277]</sup>
- [Select <item> Dialog](#) <sup>[994]</sup>

#### 6.4.1.31 Partition

##### Description

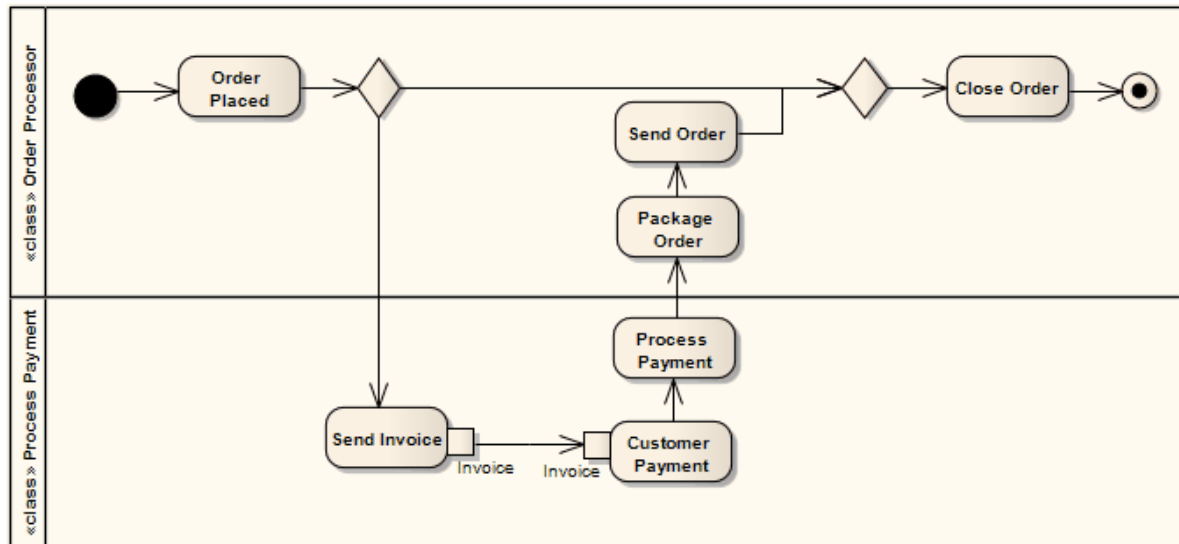

Enterprise Architect supports two types of Activity Partition:

- The Activity Partition feature, which is used to logically organize an Activity element
- The Activity Partition element, described in this topic, which is used to logically organize an Activity diagram

In effect, these are the same. They partition the Actions of the Activity without affecting the token flow, helping

to structure the view or parts of the Activity.

The following example depicts the partitioning between the Classes *Process Payment* and *Order Processor*.

The Partition orientation defaults to horizontal. To turn it into a vertical Partition, right-click on it and select the **Advanced | Vertical Partition** context menu option.

You can neatly align and join the Activity Partitions on a diagram using the element context menu **Dockable** option. For Partitions, the option defaults to selected.

#### Toolbox icon

#### Learn more

- [Activity Diagram](#)<sup>[1199]</sup>
- [Activity Element](#)<sup>[1279]</sup>
- [Activity Partition Feature](#)<sup>[1283]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 341*) states:

*Partitions divide the nodes and edges to constrain and show a view of the contained nodes. Partitions can share contents. They often correspond to organizational units in a business model. They may be used to allocate characteristics or resources among the nodes of an activity.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 341*) also states:

An activity partition is a kind of activity group for identifying actions that have some characteristic in common.

#### 6.4.1.32 Receive

##### Description

A Receive element is used to define the acceptance or receipt of a request, in an Activity diagram. Movement from a Receive element occurs only once receipt is fulfilled according to its specification. The Receive element comes in two forms:

- *Accept Event Action* element (pennant shape)
- *Accept Time Event Action* element (hourglass shape)

The following example reflects a payment process on an order. Upon receiving the payment (from *Request Payments*, a Send element), the payment is confirmed and the flow continues to ship the order.

See *UML Superstructure Specification, v2.1.1, figure 12.26, p. 312.*

To depict an Accept Time Event, use the standard Receive element from the Toolbox. Right-click on this element, and select the **Advanced | Accept Time Event** context menu option. The following example shows the hourglass-shaped *Accept Time Event Action*:

See *UML Superstructure Specification, v2.1.1, figure 12.27, p. 312.*

##### Toolbox icon

##### Learn more

- [Activity Diagram](#) <sup>[1199]</sup>
- [Send Element](#) <sup>[1328]</sup>

### **OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 239) states:

*AcceptEventAction* is an action that waits for the occurrence of an event meeting specified conditions.

#### **6.4.1.33 Region**

### **Description**

Enterprise Architect supports two types of *Region* element:

- Expansion Region
- Interruptible Activity Region

When you add a Region element to an Activity diagram, a prompt displays to enable you to specify the Region type.

### **Toolbox icon**

### **Learn more**

- [Activity Diagram](#) <sup>[1199]</sup>
- [Expansion Region](#) <sup>[1301]</sup>
- [Interruptible Activity Region](#) <sup>[1316]</sup>

#### **6.4.1.34 Send**

### **Description**

The Send element is used to depict the action of sending a signal, in an Activity diagram. It is the opposite of

a Receive element. You can also create Send events using the Event icon on the State page of the Diagram Toolbox.

The following example shows an order being processed, where a signal is sent to fill the processed order and, upon creation of the resulting invoice, a notification is sent to the customer.

See *UML Superstructure Specification, v2.1.1, figure 12.132, p. 408*.

#### Toolbox icon

#### Learn more

- [Activity Diagram](#)<sup>[1199]</sup>
- [Receive](#)<sup>[1327]</sup>
- [State Toolbox](#)<sup>[807]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 285*) states:

*SendObjectAction is an action that transmits an object to the target object, where it may invoke behavior such as the firing of state machine transitions or the execution of an activity. The value of the object is available to the execution of invoked behaviors. The requestor continues execution immediately. Any reply message is ignored and is not transmitted to the requestor.*

### 6.4.1.35 State

#### Description

A *State* represents a situation where some invariant condition holds; this condition can be static (waiting for an event) or dynamic (performing a set of activities). State modeling is usually related to Classes, and describes the enableable states a Class or element can be in and the transitions that enable the element to move there. There are two types of State: *Simple States* and *Composite States*, both created from the State

element from the Toolbox.

Furthermore, there are pseudo-states, resembling some aspect of a State but with a pre-defined implication. Pseudo-states model complex transitional paths, and classify common State Machine behavior.

You can define entry, internal and exit actions for a State using operations.

If a State element has features such as attributes or operations, the depiction of the element in a diagram has a line under the element name. This line persists if the features are hidden. The line also displays if the **Show State Compartment** checkbox is selected on the Objects page of the Options dialog (**Tools | Options | Objects**).

#### Toolbox icon

#### Learn more

- [State Machine Diagram](#) <sup>[1203]</sup>
- [Class](#) <sup>[1363]</sup>
- [Pseudo-states](#) <sup>[1208]</sup>
- [General Properties of Operations](#) <sup>[1015]</sup>
- [Composite State](#) <sup>[1330]</sup>
- [Transition](#) <sup>[1446]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 546) states:

*A state models a situation during which some (usually implicit) invariant condition holds. The invariant may represent a static situation such as an object waiting for some external event to occur. However, it can also model dynamic conditions such as the process of performing some activity (i.e., the model element under consideration enters the state when the activity commences and leaves it as soon as the activity is completed).*

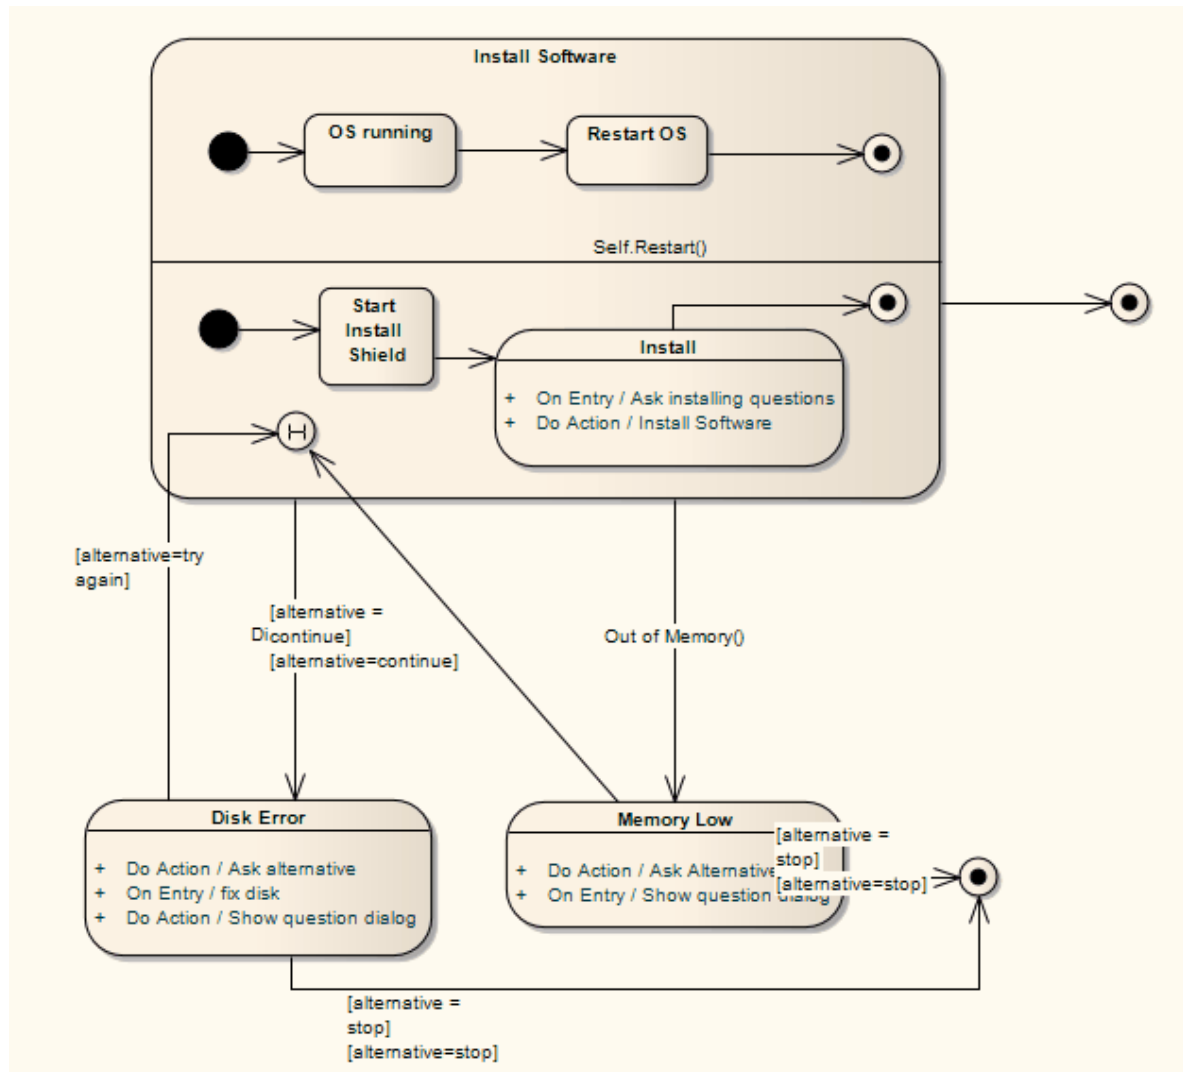

### **6.4.1.35.1 Composite State**

#### Description

Composite States are composed within the State Machine diagram by expanding a State element, adding Regions if applicable, and dragging further State elements, related elements and connectors within its boundaries. The internal State elements are then referred to as Sub-states.

(You can also define a State element, as with many other types of element, as a composite element; this then has a hyperlink to a child diagram that can be another State Machine diagram or other type of diagram elsewhere in the model.)

Composite States can be orthogonal, if Regions are created. If a Composite State is orthogonal, its entry denotes that a single Sub-state is concurrently active in each Region. The hierarchical nesting of Composite States, coupled with Region use, generates a situation of multiple States concurrently active; this situation is referred to as the active State configuration.

#### Learn more

- [State Machine Diagram](#)<sup>[1203]</sup>
- [State Element](#)<sup>[1329]</sup>
- [Regions](#)<sup>[1209]</sup>
- [Composite Element](#)<sup>[936]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 478) states:

*A composite state either contains one region or is decomposed into two or more orthogonal regions. Each region has a set of mutually exclusive disjoint sub vertices and a set of transitions. A given state may only be decomposed in one of these two ways.*

*Any state enclosed within a region of a composite state is called a sub state of that composite state. It is called a direct sub state when it is not contained by any other state; otherwise it is referred to as an indirect sub state.*

*Each region of a composite state may have an initial pseudostate and a final state. A transition to the enclosing state represents a transition to the initial pseudostate in each region. A newly-created object takes its topmost default transitions, originating from the topmost initial pseudostates of each region.*

*A transition to a final state represents the completion of activity in the enclosing region. Completion of activity in all orthogonal regions represents completion of activity by the enclosing state and triggers a completion event on the enclosing state. Completion of the topmost regions of an object corresponds to its termination.*

### 6.4.1.36 State/Continuation

#### Description

The State/Continuation element serves two different purposes for Interaction (Sequence) diagrams, as State Invariants and Continuations. The system prompts you to identify the purpose when you create the element.

#### Toolbox icon

#### Learn more

- [Sequence Diagram](#)<sup>[1249]</sup>
- [Continuation](#)<sup>[1332]</sup>
- [State Invariant](#)<sup>[1334]</sup>

#### 6.4.1.36.1 Continuation

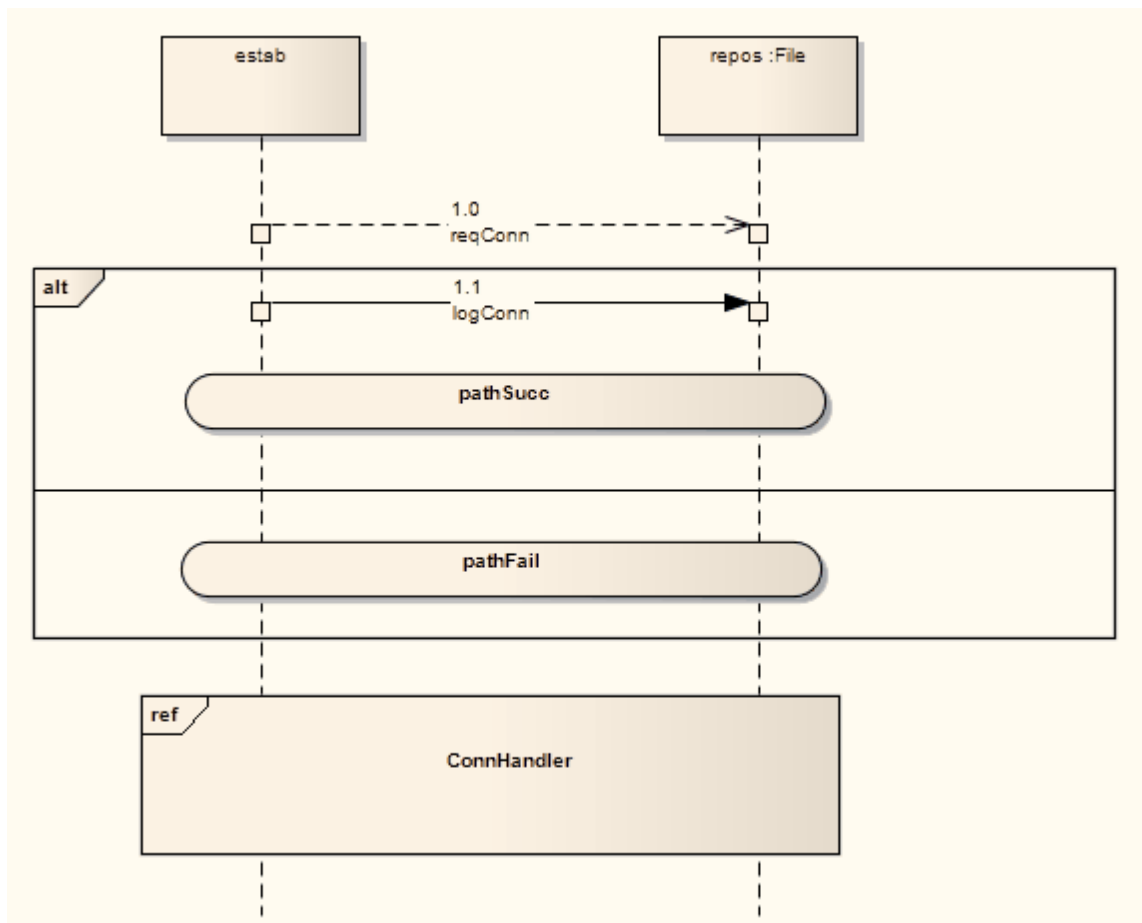

#### Description

A Continuation is used in *seq* and *alt* Combined Fragments, to indicate the branches of continuation an operand follows. To indicate a continuation, end an operand with a Continuation, and indicate the continuation branch with a matching Continuation (same name) preceding the Interaction Fragment.

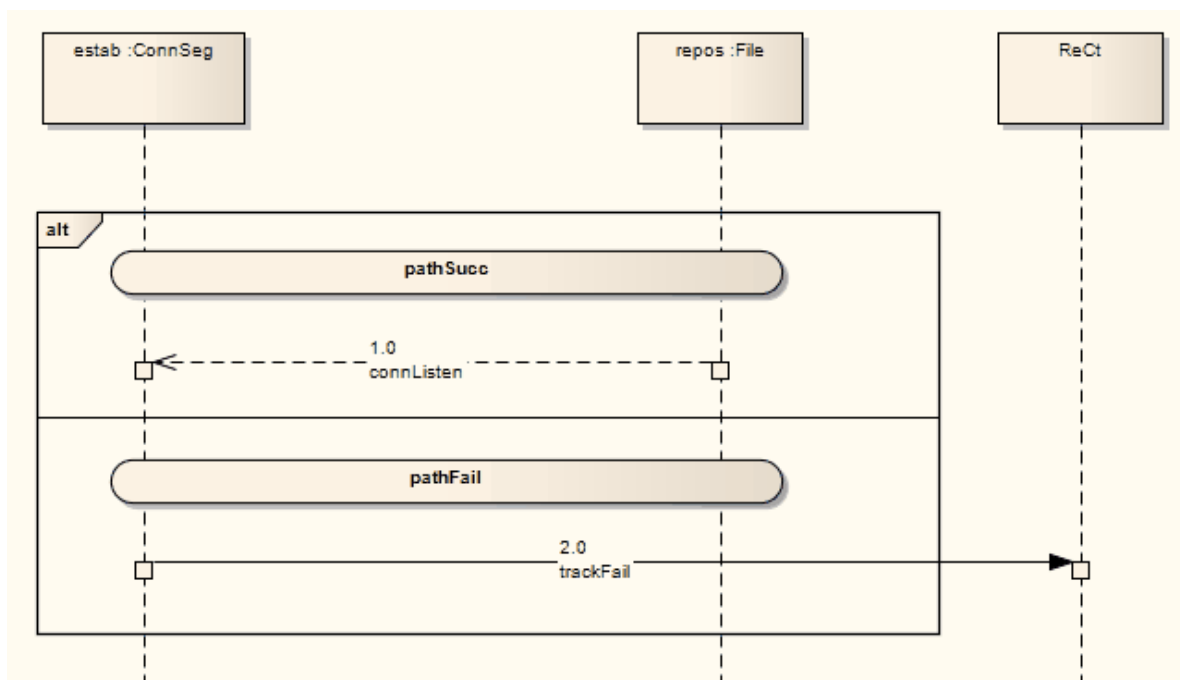

You create a Continuation by dragging the State/Continuation element onto the diagram from the Interaction Elements page of the Toolbox.

For the following continuation example, an *alt* Combined Fragment has Continuations *pathSucc* and *pathFail*. These Continuations are located within the Interaction Occurrence *ConnHandler*, which has

subsequent events based on the continuation.

The following diagram shows the interaction referenced by the *Interaction Occurrence*.

#### Learn more

- [Combined Fragments](#)<sup>[1287]</sup>
- [State/Continuation Element](#)<sup>[1332]</sup>
- [Interaction Occurrence](#)<sup>[1317]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 474) states:

*A Continuation is a syntactic way to define continuations of different branches of an Alternative CombinedFragment. Continuation is intuitively similar to labels representing intermediate points in a flow of control.*

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 474) also states:

*Continuations have semantics only in connection with Alternative CombinedFragments and (weak) sequencing.*

*If an InteractionOperand of an Alternative CombinedFragment ends in a Continuation with name (say) X, only InteractionFragments starting with the Continuation X (or no continuation at all) can be appended.*

#### 6.4.1.36.2 State Invariant

A **State Invariant** is a condition applied to a Lifeline, which must be fulfilled for the Lifeline to exist. You create a State Invariant by dragging the State/Continuation element onto the diagram from the Interaction Elements page of the Toolbox.

The following diagram illustrates a State Invariant.

When a State Invariant is moved near to a Lifeline, it snaps to the center. If the sequence object is dragged left or right, the State Invariant moves with it.

#### Learn more

- [Lifeline](#) <sup>[1321]</sup>
- [State/Continuation](#) <sup>[1332]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 502) states:

*A StateInvariant is a runtime constraint on the participants of the interaction. It may be used to specify a variety of different kinds of constraints, such as values of attributes or variables, internal or external states, and so on.*

*A StateInvariant is an InteractionFragment and it is placed on a Lifeline.*

### 6.4.1.37 State Lifeline

A **Lifeline** is the path an object takes across a measure of time, as indicated by the x-axis. There are two sorts: **State Lifelines** (defined here) and **Value Lifelines**, both used in Timing diagrams.

A State Lifeline follows discrete transitions between states, which are defined along the y-axis of the timeline. Any transition has optional attributes of timing constraints, duration constraints and observations.

An example of a State Lifeline is shown below:

See *UML Superstructure Specification, v2.1.1, figure 14.29, p. 519*.

A State Lifeline consists of a set of transition points. Each transition point can be defined with the following properties:

Property	Description
<b>At time</b>	Specifies the starting time for a change of state.
<b>Transition to</b>	Indicates the state to which the lifeline changes.
<b>Event</b>	Describes the occurring event.
<b>Timing constraints</b>	Refers to the time taken for a state to change within a lifeline, or the time taken to transmit a message (e.g. $t..t+3$ ).
<b>Timing observations</b>	Provides information on the time of a state change or sent message.
<b>Duration constraints</b>	Pertains to a lifeline's period at a particular state. The constraint could be instigated by a change of state within a lifeline, or that lifeline's receipt of a message.
<b>Duration observations</b>	Indicates the interval of a lifeline at a particular state, begun from a change in state or message receipt.

In the example diagram above, the **OK** transition point has these properties:

Property	Value
At Time	18 ms
Transition to	Idle
Event	OK
Timing constraints	t..t+3
Timing observations	—
Duration constraints	—
Duration observations	—

#### Toolbox icon

#### Learn more

- [Timing Diagram](#) 
- [Value Lifelines](#) 

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 518) states:

*This is the state of the classifier or attribute, or some testable condition, such as an discrete enumerable value.*

*It is also permissible to let the state-dimension be continuous as well as discrete. This is illustrative for scenarios where certain entities undergo continuous state changes, such as temperature or density.*

### 6.4.1.38 State Machine

#### Description

A State Machine element is a container for groups of related State elements. You can create sections of a State Machine diagram, showing the organization of the inter-related State elements, and enclose each section in a State Machine element. You can also create Regions on a State Machine element.

#### Toolbox icon

#### Learn more

- [State Machines](#)<sup>[1203]</sup> (diagrams)
- [State](#)<sup>[1329]</sup>
- [Regions](#)<sup>[1209]</sup>

### 6.4.1.39 Structured Activity

#### Description

*Structured Activity* elements are used in Activity diagrams. A Structured Activity is an activity node that can have subordinate nodes as an independent *Activity Group*. You can set an option to ensure that no other Activities or their side effects interfere with this Activity's processing (the **Must Isolate** checkbox in the Structured Activity element Properties dialog).

Enterprise Architect provides a number of forms of Structured Activity, both basic and specialized, for creating composite Activity elements quickly and simply.

**Access** [Diagram](#) | [Diagram Toolbox](#) | [More tools...](#) | [UML](#) | [Activity](#)

Topic	Description	See Also
<b>Create Structured Activities</b>	When you drag a Structured Activity icon from the Toolbox onto a diagram, a short menu displays from which you select one of the following options:	<a href="#">Loop Node</a> <sup>[1341]</sup> <a href="#">Conditional Node</a> <sup>[1345]</sup>

Topic	Description	See Also
	<ul style="list-style-type: none"> <li>• <b>Loop Node</b></li> <li>• <b>Conditional Node</b></li> <li>• <b>Other</b></li> </ul> <p>The first two options specifically create a Loop Node or Conditional Node.</p> <p>The <b>Other</b> option displays the New Structured Activity dialog, on which you can select to create one of the five following types of Structured Activity element.</p>	
<b>Simple Composite Activity</b>	Provides a Composite Activity element with a child Activity diagram.	<a href="#">Activity</a> <sup>[1275]</sup> <a href="#">Composite Elements</a> <sup>[936]</sup>
<b>Loop Node</b>	Represents a sequence of Actions and Activities that are to be repeated within the object.	<a href="#">Loop Node</a> <sup>[1341]</sup>
<b>Conditional Node</b>	Represents an arrangement of Actions and Activities where choice determines which Activities are performed.	<a href="#">Conditional Node</a> <sup>[1345]</sup>
<b>Structured Activity Node</b>	Represents an ordered arrangement of executable Activity nodes (Actions, Decisions, Merges and so on) that can include branched and nested nodes; this is the base element from which the other types of Structured Activity are derived.	<a href="#">Structured Node</a> <sup>[1340]</sup>
<b>Sequential Node</b>	Represents a sequential arrangement of executable Activity nodes.	<a href="#">Sequential Node</a> <sup>[1341]</sup>
<b>Nodes as Composite Elements</b>	<p>Loop Node and Conditional Node elements are composite elements, but the child element structures are created on the <i>same</i> diagram as the node element itself (in the same way as for a Composite State). Therefore:</p> <ul style="list-style-type: none"> <li>• The composite element symbol is not set</li> <li>• You cannot display a separate child diagram</li> <li>• The <b>Show Composite Diagram</b> facility is not available for these nodes</li> </ul> <p>You could set these nodes as 'normal' composite elements and create and open a child diagram, but you should not use Loop or Conditional Nodes in this way.</p> <p>The <b>Show Composite Diagram</b> facility is also not available on the Structured Activity Node, as this is the base element for the Loop and Conditional Nodes. You can, however:</p> <ul style="list-style-type: none"> <li>• Use the Sequential and Structured Activity nodes as</li> </ul>	<a href="#">Composite State</a> <sup>[1330]</sup>

Topic	Description	See Also
	composite elements, and <ul style="list-style-type: none"> <li>Display a child diagram structure on its parent Sequential node</li> </ul>	

### Notes

- To protect the processing of a Loop or Conditional Node Structured Activity from interference from other Activities or their side effects, open the element's Properties dialog and select the **Must Isolate** checkbox on the Loop or Condition page

- [Activity Diagram](#) <sup>[1199]</sup>

#### 6.4.1.39.1 Structured Node

### Description

On a diagram, *Structured Activity Nodes* have broken borders and composite diagram icons, as shown below:

To display the Activity diagram represented by a Structured Activity Node element, double-click on the element.

Structured Activity Node elements can point to child diagrams that themselves contain or consist of Structured Activity elements; that is, the Structured Activity elements are nested, as shown in the section of Project Browser below.

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 409) states:

*A structured activity node is an executable activity node that may have an expansion into subordinate nodes as an ActivityGroup. The subordinate nodes must belong to only one structured activity node, although they may be nested.*

*A structured activity node represents a structured portion of the activity that is not shared with any other structured node, except for nesting.*

**6.4.1.39.2 Sequential Node****Description**

On a diagram, *Sequential Activity Nodes* have broken borders and composite diagram icons, as shown below:

To display the Activity diagram represented by a Sequential Activity Node element, double-click on the element.

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 408) states:

*A sequence node is a structured activity node that executes its actions in order.*

**6.4.1.39.3 Loop Node**

A *Loop Structured Activity Node* is used for defining a loop, and is commonly associated with 'While', 'Repeat' or 'For' loop statements.

Each Loop Node has three partitions:

- **Setup** commonly initiates variables to be used in the loop's exit-condition; it is executed once on entry to the loop
- **Test** defines the loop exit-condition
- **Body** can contain Actions to be executed repeatedly until the Test produces a false value

The results of the final execution of the Test or Body are available after execution of the Loop is complete.

### Create a Loop Node

Step	Action	See Also
1	From the Activity page of the Diagram Toolbox, drag a Structured Activity icon onto the Activity diagram.  A short menu displays.	
2	Select the <b>Loop Node</b> option.  The Loop Node displays on the diagram, with the element Properties dialog (if the dialog does not display, double-click on the element).	
3	Complete as many of the common element Properties fields as required.	
4	Select the Loop page and set the following checkboxes as required: <ul style="list-style-type: none"> <li>• <b>Must Isolate</b> - defines concurrency: if selected, no object within the node can be used outside it; the objects are isolated from parallel use</li> <li>• <b>Tested First</b> - defines the loop type; select for a <i>For / While</i> loop, deselect for a <i>Repeat Until</i> loop</li> </ul>	
5	For each of the following fields, click on the ( ... ) or <b>Add</b> button as appropriate, to display the Select Pins dialog and select an Action Pin: <ul style="list-style-type: none"> <li>• <b>Decider</b> (an Output pin within the Test partition, the value of which is examined after execution of the Test to determine whether to execute the loop Body)</li> <li>• <b>Loop Variable Input</b></li> <li>• <b>Loop Variable</b></li> <li>• <b>Body Output</b> and</li> <li>• <b>Result</b></li> </ul> <p>The Select Pins dialog lists only Input pins for the <b>Loop Variable Input</b> field and only Output pins for the other fields.</p> <p>If the required Action Pin does not already exist, you can click on the <b>Add New</b> button on the dialog to automatically create the Input pin or an Output pin for the node.</p>	
6	In the Nodes panel, click on one of the <b>Setup</b> , <b>Test</b> or <b>Body</b> radio buttons to list the Actions and Activities contained in the corresponding partition of the Loop Node.  An element must be completely below the top edge of a partition to be listed for that partition - if it overlaps with the partition above in any way, it is treated as being part of that partition.	
7	Click on the <b>OK</b> button to save the properties of the Loop Node and close the Properties	

Step	Action	See Also
	dialog.	
8	<p>Right-click on the Node in the diagram and select the <b>Structural Elements</b> context menu option.</p> <p>The Structural Elements dialog displays.</p> <p>Select the checkbox against each embedded element and close the dialog.</p> <p>The Action pins should now be visible in the diagram, attached to the Node.</p>	<a href="#">Manage Structural Elements</a> 

A Loop Node is depicted on an Activity diagram as shown below:

You define the Loop nodes by dragging Action elements from the Toolbox page into the Setup, Test and Body partitions. The Body partition can contain several Actions, which can be linked and organized into the required structure. The elements are aligned on the top left of the partition, so that resizing the node maintains the organization of the structure within and between the partitions. If you try to shrink the node below the structure size, the node automatically defaults to the 'best fit' size.

### Notes

- You can check on the exact location of an existing Action Pin by right-clicking on the pin name in the Loop Node Properties dialog and selecting the **Find in Project Browser** context menu option; the location of the Action Pin in the Project Browser is expanded and highlighted

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, pp. 384-385*) states:

*A loop node is a structured activity node that represents a loop with setup, test, and body sections.*

*Each section is a well-nested subregion of the activity whose nodes follow any predecessors of the loop and precede any successors of the loop. The test section may precede or follow the body section. The setup section is executed once on entry to the loop, and the test and body sections are executed repeatedly until the test produces a false value. The results of the final execution of the test or body are available after completion of execution of the loop.*

#### 6.4.1.39.4 Conditional Node

A **Conditional Structured Activity Node** is the modeling equivalent of an **If-Then-Else** programming construct. At its simplest, it consists of a **Clause** containing:

- A **Test** partition that evaluates a condition, and
- A **Body** partition that performs one or more actions if the Test condition is satisfied

You can have more than one Clause, so that if the Test condition is not satisfied its Body is ignored and processing moves to the next Clause and evaluates another Test condition.

Each Clause has a **Decider ActionPin** to hold the result of the Test, and a **Body Output ActionPin** to hold the result of the Body's actions (if executed). The Conditional Node itself has a **result ActionPin** that makes available the overall result of the Node (the output of the first Body to be executed).

A Conditional Node is depicted on an Activity diagram like this:

You define Conditional Nodes by dragging other **Activity diagram** elements from the Toolbox page into the appropriate partition of the element, and linking and organizing the structure as required. The elements are aligned on the top left of the partition, so that resizing the node maintains the organization of the structure within and between the partitions. If you try to shrink the node below the structure size, the node automatically defaults to the 'best fit' size.

When you create a Conditional Node, the element Properties dialog displays. Much of this you can complete as for any other element. However, for the Conditional Node the dialog shows an additional **Condition** page.

On this page, in the **Result** panel, add an Action Pin to hold the result for the node, clicking on the **Add** button to display the Select Pins dialog (a version of the Select <Item> dialog).

A Conditional Node **automatically** contains one **Clause** containing a Test partition and a Body partition, and a **Decider** Pin and **Body Output** Pin. You can add further Clauses as required. For each Clause you add an Action Pin for the **Decider** and for the **Body Output**. Click on the **Save** button to save the Clause definition.

The Select Pin dialog reveals only Output pins as appropriate to the context. If the required Action Pin does not already exist, you can click on the **Add New** button on the dialog to automatically create an Output pin under the appropriate parent node.

For the **Result** and **Body Output** entries, you can check on the exact location of each Action Pin by right-clicking on the entry and selecting the **Find in Project Browser** context menu option.

The Nodes panel, by default, lists the Actions and Activities contained in the Test partition. Click on the **Body**

radio button to list the elements contained in the Body partition. An element must be completely contained in the Body partition to be listed there - if it overlaps with the Test partition in any way, it is treated as being part of the Test partition.

### Add or Remove Clauses

To add another Clause, click on the **Add** button underneath the Clause(s) list. This inserts a new Clause in the list, and identifies which is the preceding (**Predecessor**) Clause and (if appropriate) which is the following (**Successor**) Clause. The remaining fields in the Clause(s) panel are cleared to enable you to add **Decider** and **Body Output** Action Pins. New Test and Body partitions are immediately added to the element on the diagram, and you can populate these partitions with Activity elements, which are then identified in the Nodes panel.

To remove a Clause, highlight it in the list and click on the **Delete** button. This immediately removes the Clause's corresponding partitions from the diagram, along with all their contained Activity elements. Removing a Clause from between two other Clauses adjusts the numerical order; for example, if Clause 2 is removed from between Clause 1 and Clause 3, Clause 3 is renamed as Clause 2, and any further Clauses are also moved up one place.

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p.355) states:

*A conditional node is a structured activity node that represents an exclusive choice among some number of alternatives.*

*A conditional node consists of one or more clauses. Each clause consists of a test section and a body section. When the conditional node begins execution, the test sections of the clauses are executed. If one or more test sections yield a true value, one of the corresponding body sections will be executed. If more than one test section yields a true value, only one body section will be executed. The choice is nondeterministic unless the test sequence of clauses is specified. If no test section yields a true value, then no body section is executed; this may be a semantic error if output values are expected from the conditional node.*

## 6.4.1.40 Synch

### Description

A Synch state is useful for indicating that concurrent paths of a State Machine are synchronized. After bringing the paths to a synch state, the emerging transition indicates unison.

- [State Machine Diagram](#) <sup>[1203]</sup>

#### 6.4.1.41 System Boundary

##### Description

A **System Boundary** element is a non-UML element used to define **conceptual** boundaries. You can use System Boundaries to help group logically related elements (from a visual perspective, not as part of the UML model).

In the *UML Superstructure Specification, v2.1.1*, System Boundaries are described in the sections on Use Cases, because the System Boundary is often used to indicate the **application** of a Use Case to another entity. In this context, the System Boundary:

- Encloses the Use Case, and
- Is associated with a classifier such as a Class, Component or Sub-system (Actor) through the Select <Item> dialog

By associating the System Boundary - and not the Use Case - with the classifier, the classifier is linked to the Use Case as a **user**, but not as an **owner**.

You can also define a Use Case as the classifier of a System Boundary element, to link the elements enclosed in the System Boundary (such as parts of an Activity diagram) to their representation in a logical Use Case.

The element properties for a System Boundary element comprise the name, the border style, and the number of horizontal or vertical swim lanes. You can also change the overall shape of the System Boundary.

A System Boundary element can be marked as **Selectable**, using the element's context menu. When the element is not selectable, you can click on the other elements within the System Boundary space without activating or selecting the System Boundary itself.

**Notes**

- A System Boundary is the basis for the Image element, which enables you to add icons or backgrounds to a diagram, automatically displaying the Image Manager dialog from which to select the appropriate image
- A **System Boundary** is not the same as the **Boundary** element used to capture user interactions in, for example, Analysis diagrams

**Toolbox icon****Learn more**

- [Use Cases](#) <sup>[1352]</sup>
- [Mapping Use Cases to Activity Diagrams](#) (Online resource)
- [Instance Classifier](#) <sup>[994]</sup>
- [System Boundary Properties](#) <sup>[1348]</sup>
- [Boundary](#) <sup>[1997]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 594*) states:

*If a subject (or system boundary) is displayed, the Use Case ellipse is visually located inside the system boundary rectangle. Note that this does not necessarily mean that the subject classifier owns the contained Use Cases, but merely that the Use Case applies to that classifier.*

**6.4.1.41.1 System Boundary Properties**

The System Boundary element has a small set of properties that are mainly concerned with the appearance of the element. You can also apply other element control options such as default appearance, locking the element and applying an image to the element.

**Access**    **Right-click on the System Boundary element and select:**  
                  **Properties**    or  
                  **Appearance | Shape**

**Set System Boundary Properties**

Field/Option/Button	Action	See Also
<b>Name</b>	(Optional) Type a name for the element.	
<b>Border Style</b>	Select the radio button for the style you prefer: <ul style="list-style-type: none"> <li>• <b>Solid</b> - a solid line border with the system default element fill</li> </ul>	

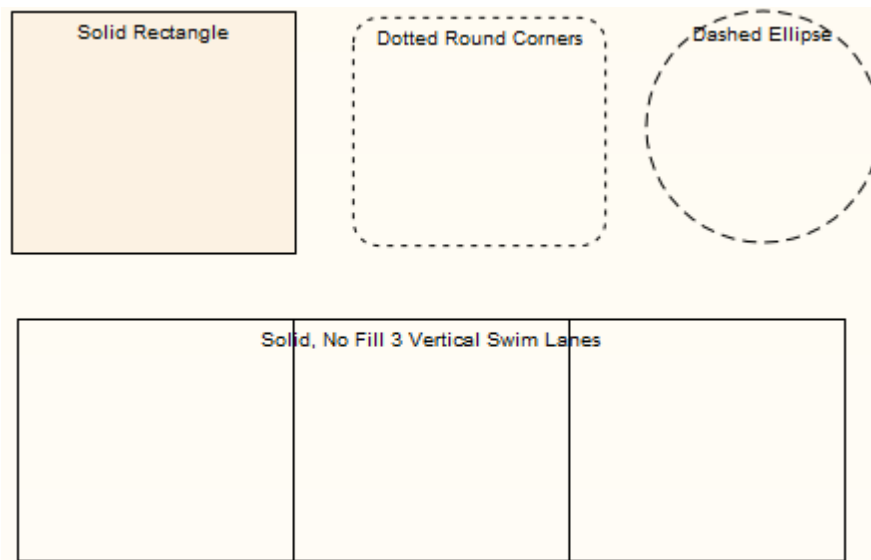

Field/Option/Button	Action	See Also
	<p>color</p> <ul style="list-style-type: none"> <li>• <b>Dotted</b> - a dotted line border with no element fill color</li> <li>• <b>Dashed</b> - a broken line border with no element fill color</li> <li>• <b>Solid-No Fill</b> - a solid line border with no element fill color</li> </ul>	
<b>Horizontal Swim Lanes</b>	<p>Type in the number of horizontal segments you want to divide the element into, to group the elements in the System Boundary in a horizontal context (for example, Client, Application and Database tiers could be represented in swim lanes).</p> <p>The field defaults to <b>1</b>.</p> <p>The swim lanes are equal divisions of the System Boundary - you cannot change their relative heights.</p>	
<b>Vertical Swim Lanes</b>	<p>Type in the number of vertical segments you want to divide the element into, to group the elements in the System Boundary in a vertical context.</p> <p>The field defaults to <b>1</b>.</p> <p>The swim lanes are equal divisions of the System Boundary - you cannot change their relative widths.</p>	

### Set System Boundary Shape

The **Shape** menu has three options. Select:

- **Rectangle** - to return the shape to the default rectangular border with sharp corners
- **Rounded Rectangle** - to set the shape to a rectangle with rounded corners
- **Ellipse** to set the shape to a circle or oval to accommodate the enclosed elements

### 6.4.1.43 *Trigger*

### Description

A Trigger indicates an event that initiates an action (and might arise from completion of a previous action). You initially define a Trigger in one of four ways:

- As a property of a Transition relationship
- As a property of an Accept Event Action (on the Triggers tab of the element Properties dialog)
- As an event in a State Machine Table
- Directly, as a Trigger element, through the New Element dialog or Diagram Toolbox (State Additional page)

When you save the Trigger, it is added to the list of elements for the parent package in the Project Browser. You can then right-click on it and select the **Properties** context menu option to view and, if required, edit its properties as an element rather than as a property itself. Triggers created as events remain as Event elements, whilst Triggers created in other ways are Trigger elements, with a Trigger tab in the Properties dialog.

Field	Action	See also
<b>Type</b>	<p>If necessary, edit the type of trigger:</p> <ul style="list-style-type: none"> <li>• <b>Call</b> - specifies that the event is a CallEvent, which sends a message to the associated object by invoking an operation</li> <li>• <b>Change</b> - specifies that the event is a ChangeEvent, which indicates that the transition is the result of a change in value of an attribute</li> <li>• <b>Signal</b> - specifies that the event is a SignalEvent, which corresponds to the receipt of an asynchronous signal instance</li> <li>• <b>Time</b> - corresponds to a TimeEvent; which specifies a moment in time</li> </ul>	
<b>Specification</b>	<p>Either type in the event instigating the Trigger, or click on the ( ... ) button and select the event (depending on the <b>Type</b> value).</p>	
<b>Ports</b>	<p>Click on the <b>Add</b> button and select the appropriate Port from the Select Port dialog.</p> <ul style="list-style-type: none"> <li>• To create new Ports using the Select Port dialog, the Trigger should be created as a child of a Class or Component element</li> <li>• To add several Ports at once, press ( <b>Ctrl</b> ) as you select each Port</li> <li>• To check the exact location of a Port, right-click on the Port name and select the <b>Find in Project Browser</b> context menu option</li> </ul>	<a href="#">Select Port Dialog</a> <sup>[994]</sup>

### Notes

- You can also drag an existing Trigger element onto another diagram, although there are limited uses

for the element in that context

- This element is not the same as a Trigger Operation, which is an operation automatically executed as a result of the modification of data in a database

#### Toolbox icon

#### Learn more

- [Transition Relationship](#)<sup>[1446]</sup>
- [Insert Trigger](#)<sup>[1218]</sup>
- [Triggers](#)<sup>[2368]</sup> (as an Operation)

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 456) states:

*Events may cause execution of behavior (e.g., the execution of the effect activity of a transition in a state machine). A trigger specifies the event that may trigger a behavior execution as well as any constraints on the event to filter out events not of interest.*

### 6.4.1.44 Use Case

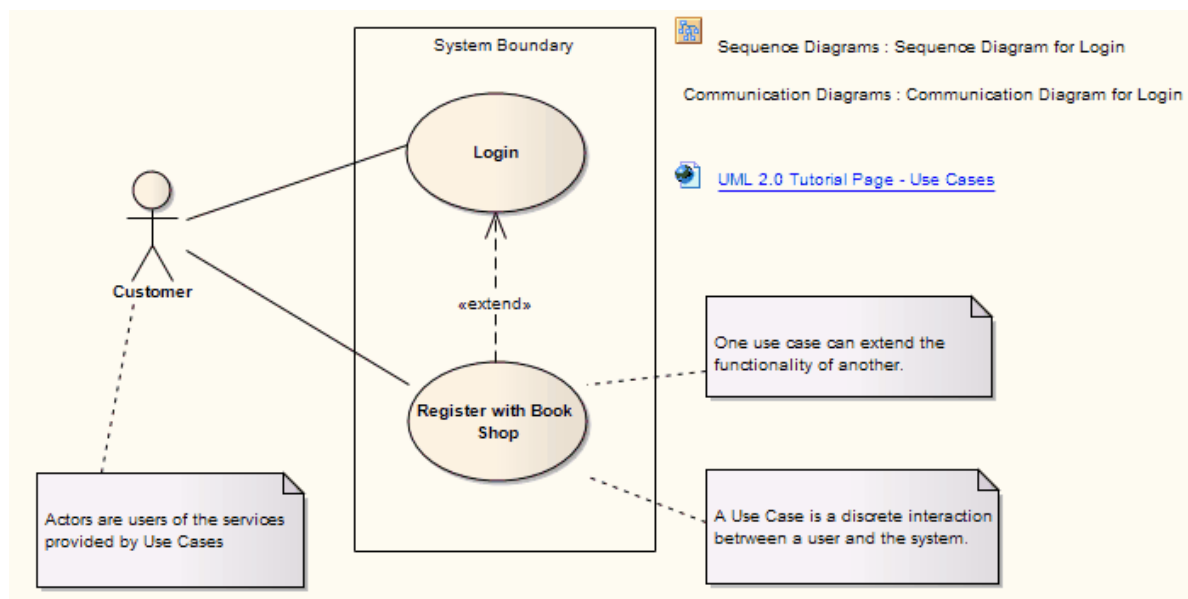

#### Description

A **Use Case** is a UML modeling element that describes how a user of the proposed system interacts with the system to perform a discrete unit of work. It describes and signifies a single interaction over time that has meaning for the end user (person, machine or other system), and is required to leave the system in a complete state: the interaction either completed or rolled back to the initial state. A Use Case:

- Typically has requirements and constraints that describe the essential features and rules under which it operates
- Can have an associated Sequence diagram illustrating behavior over time; who does what to whom, and when
- Typically has scenarios associated with it that describe the work flow over time that produces the end result; alternative work flows (for example, to capture exceptions) are also enabled

#### Example Use Case diagram

If extending a Use Case, you can specify the points of extension with Use Case Extension Points. To display the attributes, operations or constraints of a Use Case on a diagram, use Rectangle Notation.

Enterprise Architect also provides two stereotyped Use Cases: the Test Case and the Business Use Case.

#### Toolbox icon

- [Rectangle Notation](#) <sup>[1355]</sup>
- [Test Case](#) <sup>[2010]</sup>
- [Business Use Case](#) <sup>[1805]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 592) states:

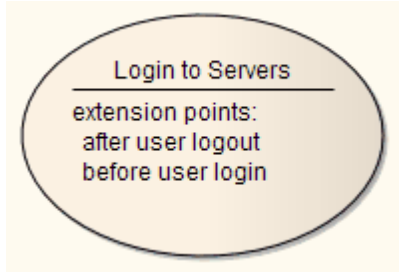

*A UseCase is a kind of behaviored classifier that represents a declaration of an offered behavior. Each Use Case specifies some behavior, possibly including variants, that the subject can perform in collaboration with one or more actors.*

#### 6.4.1.44.1 Use Case Extension Points

The behavior defined for a Use Case can **add to** the behavior of another Use Case; that is, the first Use case **extends** the second one. This is represented on the model by an **Extend** connector from the first Use Case to the second. If the extended behavior takes effect at a specific point, you can define that point as an **extension point** on the extended Use Case. The name (description) text of the extension point can be as informal or precise as is appropriate to define the point in behavior at which the extension applies. A Use Case can have more than one extension point, to allow for different source Use Cases to extend this target Use Case, or for changes in where the extending behavior applies depending on the constraints defined for the Extend connector. The connector also identifies which extension point is in effect.

**Access** [Right-click on extended Use Case element | Advanced | Edit Extension Points](#)

##### Add extension points to a Use Case

Field/Button	Action
<b>Defined Extension Points</b>	Lists the extension points currently defined for the selected Use Case.
<b>Add</b>	Click on this button to display a prompt for the name of a new extension point. Type the name and click on the <b>OK</b> button. The name is added to the Defined Extension Points list.
<b>Edit</b>	Click on an existing extension point and click on this button to display a prompt for changes to the name of the selected extension point. Overtyping the name and clicking on the <b>OK</b> button. The name is updated in the Defined Extension Points list.
<b>Remove</b>	Click on an existing extension point and click on this button to immediately remove the name from the Defined Extension Points list.
<b>OK</b>	Click on this button to save all changes to the extension points, and to close the dialog. The extension points you have defined are represented on the Use Case element in the diagram as shown.

- [Use Case](#)<sup>[1352]</sup>
- [Extend](#)<sup>[1406]</sup>

**6.4.1.44.2 Rectangle Notation**

You can display various shaped elements, such as an Interface, Use Case or Actor, using *rectangle notation*. This displays the element as a rectangle, with an icon of the 'normal' shape in the top right-hand corner. Any attributes, operations or constraints belonging to the element are shown, in the same style as a Class.

To show an element using rectangle notation, right-click on the element on the diagram and select the **Advanced | Use Rectangle Notation** context menu option. This setting only applies to the selected element, and can be toggled on and off either by deselecting the context menu option or by selecting the reciprocal option such as **Use Circle Notation** or **Use Actor Notation**.

**6.4.1.45 Value Lifeline**Description

A Lifeline is the path an object takes across a measure of time, indicated by the x-axis. There are two sorts: **Value Lifelines** (defined here) and State Lifelines, both used in Timing diagrams.

A Value Lifeline shows the Lifeline's state across the diagram, with parallel lines indicating a steady state. A cross between the lines indicates a transition or change in state.

An example of a Value Lifeline is shown below:

See *UML Superstructure Specification, v2.1.1, Figure 14.30, p. 520*.

A Value Lifeline consists of a set of transition points. Each transition point can be defined with the following properties:

Property	Description
<b>At time</b>	Specifies the starting time for a change of state.
<b>Transition to</b>	Indicates the state to which the Lifeline is to change.
<b>Event</b>	Describes the occurring event.
<b>Timing constraints</b>	Refers to the time taken for a state to change within a Lifeline, or the time taken to transmit a message.
<b>Timing observations</b>	Provides information on the time of a state change or sent message.
<b>Duration constraints</b>	Pertains to a Lifeline's period at a particular state. The constraint could be instigated by a change of state within a Lifeline, or that Lifeline's receipt of a message.
<b>Duration observations</b>	Indicates the interval of a Lifeline at a particular state, begun from a change in state or message receipt.

In the example diagram above, the **10ms** transition point has these properties:

Property	Text
<b>At Time</b>	10ms
<b>Transition to</b>	Waitcard
<b>Event</b>	Switch
<b>Timing constraints</b>	–
<b>Timing observations</b>	–
<b>Duration constraints</b>	d..3*d

Property	Text
<b>Duration observations</b>	–

**Toolbox icon****Learn more**

- [Timing Diagrams](#)<sup>[1225]</sup>
- [State Lifelines](#)<sup>[1335]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 518*) states:

*Shows the value of the connectable element as a function of time. Value is explicitly denoted as text. Crossing reflects the event where the value changed.*

## 6.4.2 Structural Diagram Elements

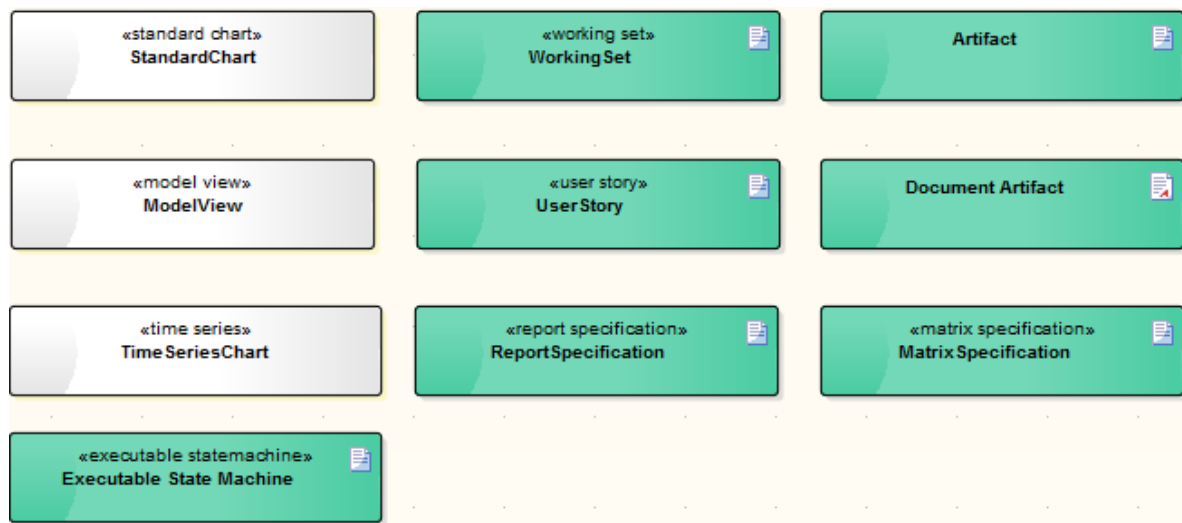

The following elements are used in UML Structural Diagrams. For more information on using each element, click on the element name in this list:

### 6.4.2.1 Artifact

#### Description

An **Artifact** is any physical piece of information used or produced by a system. In Enterprise Architect these are represented by the **Artifact element**, which can have one of a number of stereotypes to tailor it to a specific purpose, including internal operations and structures within the model, as indicated in the examples. Artifacts can have associated properties or operations, and can be instantiated or associated with other Artifacts according to the object they represent.

You can create an Artifact element by dragging one of the Artifact icons from the **Artifacts** page of the Diagram Toolbox, or from one of several other Toolbox pages according to type. The Common page of the Toolbox also has a generic Artifact icon that - when you drag it onto a diagram - offers a choice of types of Artifact to create.

#### Types of Artifact

Type	Description	See also
<b>Base Artifact</b>	<p>A <b>Base Artifact</b> defines the external artifacts used in a process and the internal artifacts generated in the process, such as model files, source files, database tables, development deliverables or support documents. The files represented by the Artifact are listed on the Files tab of the element Properties dialog.</p> <p>To open the files represented by the Artifact, click on the element on the diagram and press <b>Ctrl+E</b>. Each file is opened either on a separate tab in the Diagram View workspace (if the file can be opened within Enterprise Architect) or in the default Windows viewer/editor for the file type (if the file cannot be opened within Enterprise Architect).</p> <p>Files can also be launched individually from the Files tab (opening in the Windows default editor), as for elements of any other type that have associated files.</p> <p><b>Toolbox Icon</b></p>	<p><a href="#">Create File Artifacts</a> <sup>[1362]</sup></p> <p><a href="#">Associated Files</a> <sup>[988]</sup></p> <p><a href="#">Generate, Save and Load (Profiler) Reports</a> <sup>[2562]</sup></p>

Type	Description	See also
	 <b>Artifact</b>	
<b>Document Artifact</b>	<p>A <b>Document Artifact</b> is an Artifact having a stereotype of «<i>document</i>». You create the Document Artifact using the Artifacts, Component, Documentation or Deployment pages of the Diagram Toolbox, and associate it with an RTF document or CSV file.</p> <p>Double-click on the element to display the Linked Document Editor. When you have created the linked document, the Document Artifact element on the diagram shows an <b>A</b> symbol in the bottom right corner.</p>  <p><b>Toolbox icon</b></p> 	<p><a href="#">Linked Documents</a> <sup>[1044]</sup></p> <p><a href="#">Add Quick Linker Definition To Profile</a> <sup>[1523]</sup></p>
<b>Working Set Artifact</b>	<p>A <b>Working Set Artifact</b> defines a Working Set that opens various windows, diagrams and views, recreating a work environment that you frequently use.</p> <ul style="list-style-type: none"> <li>To create or modify the Working Set, right-click on the element and select the <b>Edit Working Set</b> option</li> <li>To execute the Working Set to open the defined windows and views and execute any commands, double-click on the element</li> </ul> <p><b>Toolbox icon</b></p> 	<p><a href="#">Working Sets</a> <sup>[561]</sup></p>
<b>Executable State Machine Artifact</b>	<p>An <b>Executable State Machine Artifact</b> is the vehicle through which you can generate, build (compile) and execute - via simulation - code for a State Machine or complex of State Machines.</p> <p>Each State Machine is the child of a Class element; when you drag the Class from the Project Browser onto the Artifact element, it is pasted inside the Artifact as a <b>Part</b>. You can paste several Classes - and, therefore, Parts - into a single Artifact.</p> <p>Having set up the Executable State Machine Artifact, you use simple context menu options on the Artifact to perform the code generation, build and execution operations on all State Machines bound within the Artifact.</p> <p><b>Toolbox icon</b></p>	<p><a href="#">Code Generation - State Machines</a> <sup>[2122]</sup></p>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 201) states:

*An Artifact defined by the user represents a concrete element in the physical world. A particular instance (or 'copy') of an artifact is deployed to a node instance. Artifacts may have composition associations to other artifacts that are nested within it. For instance, a deployment descriptor artifact for a component may be contained within the artifact that implements that component. In that way, the component and its descriptor are deployed to a node instance as one artifact instance.*

#### 6.4.2.1.1 Create File Artifacts

A File Artifact is an Artifact element that represents and is linked to a file. You can create the Artifact element on a diagram, from the file itself.

#### Create the Artifact

Step	Action	See also
1	<p>Locate the file in a file list (such as Windows Explorer) or on your Desktop. Drag the file onto your diagram.</p> <p>A context menu displays.</p>	
2	<p>Click on the menu option you need:</p> <ul style="list-style-type: none"> <li>• <b>Hyperlink</b> - to create a Hyperlink element on the diagram; you can select a sub-option to define whether users, when they double-click on the Hyperlink, will either just display the file content or open it within the appropriate file editor</li> <li>• <b>Artifact External</b> - to create an Artifact element on the diagram; the element Properties dialog displays, in which you enter any element properties you need</li> </ul> <p>Save the data you have entered and close the Properties dialog (note that the file name becomes the element name)</p> <p>If you double-click on the Artifact the <b>Properties dialog redisplay</b>s; click on the Files tab to see the file pathname listed in the Files panel, from which you can launch it in its registered application</p> <ul style="list-style-type: none"> <li>• <b>Artifact Internal</b> - to immediately create an Artifact element on the diagram</li> </ul>	

Step	Action	See also
	<p>with the file name as the element name</p> <p>The file is stored in your model, but is managed by the registered external application for the file type; if you double-click the Artifact, the <b>file is opened</b> within its external application</p> <p>If the file is changed, you are prompted to update the element within the model - click on the <b>Save</b> button to update the element, or the <b>Discard</b> button to ignore the changes</p> <ul style="list-style-type: none"> <li>• <b>Insert</b> - (graphics files) to insert the file into the diagram as a filled Boundary element; double-click on the image to display the Boundary Properties dialog</li> </ul>

### 6.4.2.2 Class

#### Description

A Class is a representation of a type of object that reflects the structure and behavior of such objects within the system. It is a template from which actual running instances are created, although a Class can be defined either to control its own execution or as a template or parameterized Class that specifies parameters that must be defined by any binding Class.

A Class can have *attributes* (data) and *methods* (*operations* or behavior). Classes can inherit characteristics from parent Classes and delegate behavior to other Classes. Class models usually describe the logical structure of the system and are the building blocks from which components are built.

The top section of a Class shows the attributes (or data elements) associated with the Class. These hold the 'state' of an object at run-time. If the information is saved to a data store and can be reloaded, it is termed 'persistent'. The lower section contains the Class operations (or methods at run-time). Operations describe the behavior a Class offers to other Classes, and the internal behavior it has (private methods).

Class elements are generally used in Class diagrams and Composite Structure diagrams.

Enterprise Architect also supports a number of stereotyped Class elements to represent various entities in web-page modeling. A Class can also be integrated with an Associate connector to form an Association Class, to allow the Associate connector to have operations and attributes that define certain types of UML relationship.

- [Composite Structure Diagram](#) <sup>[1188]</sup>
- [Association Class](#) <sup>[1398]</sup>
- [Association](#) <sup>[1393]</sup>
- [Attributes](#) <sup>[999]</sup>
- [Operations](#) <sup>[1014]</sup>
- [Web-page Modeling](#) <sup>[1995]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, pp. 52-53*) states:

*The purpose of a class is to specify a classification of objects and to specify the features that characterize the structure and behavior of those objects.*

*Objects of a class must contain values for each attribute that is a member of that class, in accordance with the characteristics of the attribute, for example its type and multiplicity.*

*When an object is instantiated in a class, for every attribute of the class that has a specified default, if an initial value of the attribute is not specified explicitly for the instantiation, then the default value specification is evaluated to set the initial value of the attribute for the object.*

*Operations of a class can be invoked on an object, given a particular set of substitutions for the parameters of the operation. An operation invocation may cause changes to the values of the attributes of that object. It may also return a value as a result, where a result type for the operation has been defined. Operation invocations may also cause changes in value to the attributes of other objects that can be navigated to, directly or indirectly, from the object on which the operation is invoked, to its output parameters, to objects navigable from its parameters, or to other objects in the scope of the operation's execution. Operation invocations may also cause the creation and deletion of objects.*

### 6.4.2.2.1 Active Classes

#### Description

An *Active Class* indicates that, when instantiated, the Class controls its own execution. Rather than being invoked or activated by other objects, it can operate standalone and define its own thread of behavior.

#### Define an Active Class in Enterprise Architect

Step	Action
1	Highlight a Class, and display its Properties dialog.
2	Select the Details page.
3	Select the <b>Is Active</b> checkbox.
4	Click on the <b>OK</b> button to save the changes.

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 438) states:

*An active object is an object that, as a direct consequence of its creation, commences to execute its classifier behavior, and does not cease until either the complete behavior is executed or the object is terminated by some external object. (This is sometimes referred to as "the object having its own thread of control.") The points at which an active object responds to communications from other objects is determined solely by the behavior of the active object and not by the invoking object. If the classifier behavior of an active object completes, the object is terminated.*

### 6.4.2.2.2 Parameterized Classes (Templates)

#### Description

Enterprise Architect supports **template** or **parameterized Classes**, which specify parameters that must be defined by any binding Class.

Parameterized Classes are commonly implemented in C++; Enterprise Architect imports and generates templated Classes for C++.

A template Class enables its functionality to be reused by any bound Class. If a default value is specified for

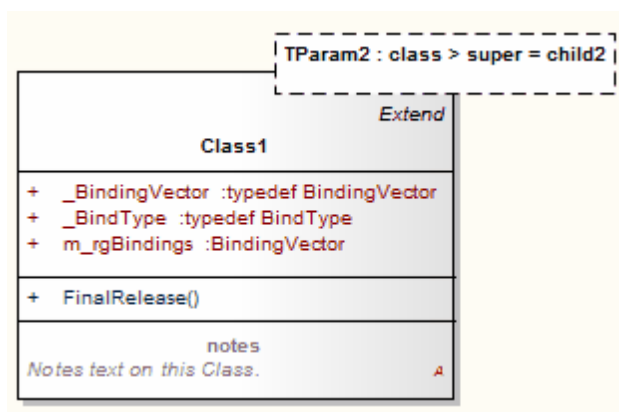

a parameter, and a binding Class doesn't provide a value for that parameter, the default is used.

### Create a parameterized Class

Step	Action
1	Display the Properties dialog for the required Class.
2	Select the Templates page.
3	In the Template Parameter(s) panel, click on the <b>Add</b> button. The Template Parameter dialog displays.
4	Type in the name and type of the parameter and, if required, click on the ( ... ) buttons after the <b>Constraints</b> and <b>Default</b> fields to select the required constraining and default Classes from the Select <Item> dialog.  The default Class can be either the constraining classifier or any Class that derives from the constraining classifier.

### Notation Example

On a diagram, template Classes are shown with the parameters in a dashed outline box in the upper right corner of the Class.

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 622*) states:

*A template is a parameterized element that can be used to generate other model elements using TemplateBinding relationships. The template parameters for the template signature specify the formal parameters that will be substituted by actual parameters (or the default) in a binding.*

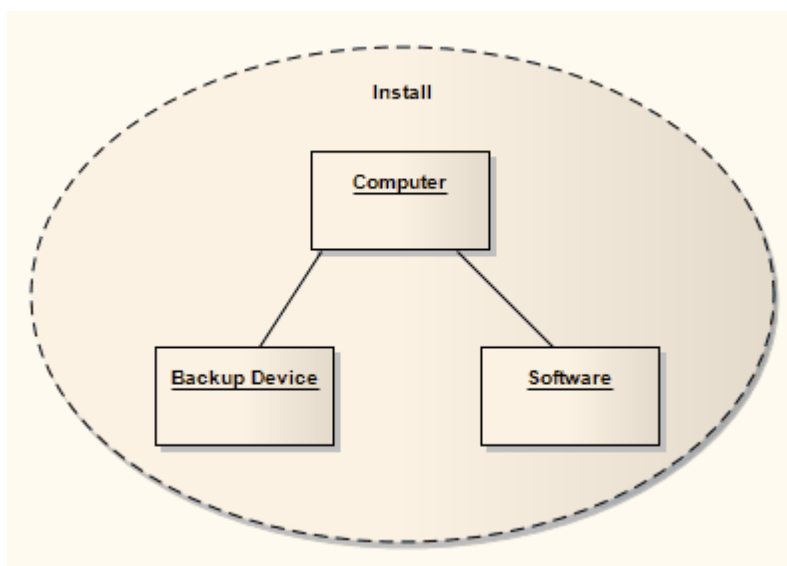

### 6.4.2.3 Collaboration

#### Description

A *Collaboration* defines a set of cooperating roles and their connectors. These are used to collectively illustrate a specific functionality, in a Composite Structure diagram. A Collaboration should specify only the roles and attributes required to accomplish a specific task or function. Although in practice a behavior and its roles could involve many tangential attributes and properties, isolating the primary roles and their requisites simplifies and clarifies the behavior, as well as providing for reuse. A Collaboration often implements a pattern to apply to various situations.

The following example illustrates an *Install* Collaboration, with three roles (Objects) connected as shown. The process for this Collaboration can be demonstrated by attaching an Interaction diagram (Sequence, Timing, Communication or Interaction Overview).

To understand referencing a Collaboration in a specific situation, see the *Collaboration Use* topic.

Enterprise Architect supports a stereotyped Collaboration to represent a Business Use Case Realization in business modeling.

#### Toolbox icon

- [Collaboration Use](#) <sup>[1368]</sup>
- [Object Element](#) <sup>[1379]</sup>
- [Business Use Case Realization](#) <sup>[1805]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 171*) states:

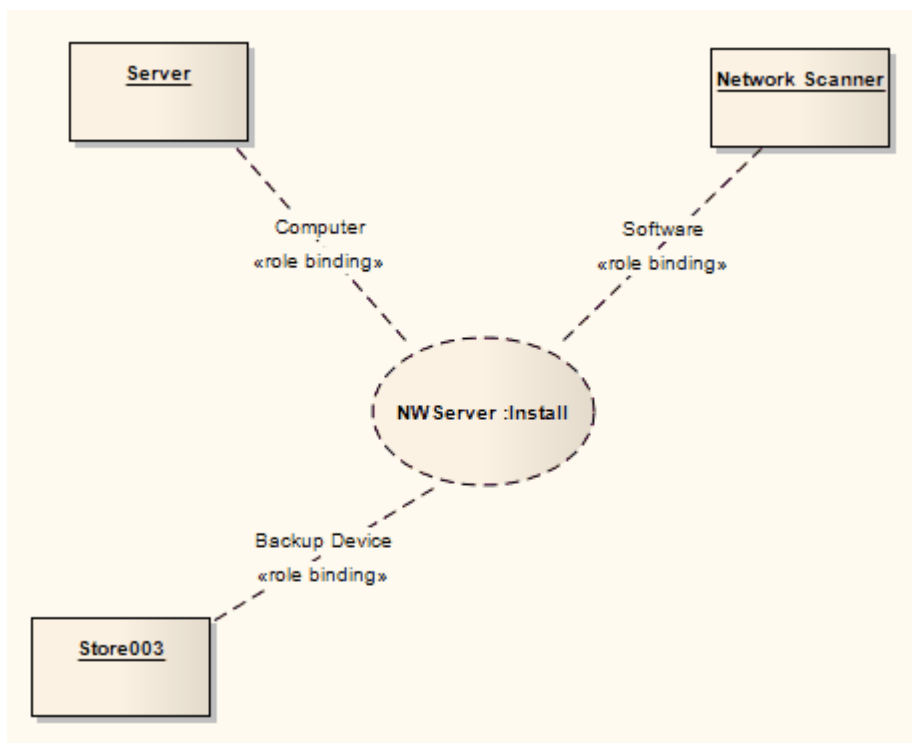

*A collaboration describes a structure of collaborating elements (roles), each performing a specialized function, which collectively accomplish some desired functionality. Its primary purpose is to explain how a system works and, therefore, it typically only incorporates those aspects of reality that are deemed relevant to the explanation.*

**6.4.2.4 Collaboration Use****Description**

Use a *Collaboration Use* to apply a pattern defined by a Collaboration to a specific situation, in a Composite Structure diagram.

The following example shows a Use, *NWServer*, of the Collaboration *Install*, to define the installation process of a network scanner. This process can be defined by an interaction attached to the Collaboration. (See the *Collaboration* topic for a representation of the *Install* Collaboration.)

To create a Collaboration Use, drag the icon from the Toolbox onto the diagram.

#### Toolbox icon

#### Learn more

- [Composite Structure Diagram](#) <sup>[1188]</sup>
- [Collaboration Element](#) <sup>[1367]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 173*) states:

*A collaboration use represents one particular use of a collaboration to explain the relationships between the properties of a classifier. A collaboration use shows how the pattern described by a collaboration is applied in a given context, by binding specific entities from that context to the roles of the collaboration. Depending on the context, these entities could be structural features of a classifier, instance specifications, or even roles in some containing collaboration. There may be multiple occurrences of a given collaboration within a classifier, each involving a different set of roles and connectors. A given role or connector may be involved in multiple occurrences of the same or different collaborations.*

### 6.4.2.5 Component

#### Description

A Component is a modular part of a system, whose behavior is defined by its provided and required interfaces; the internal workings of the Component should be invisible and its usage environment-independent. Source code files, DLLs, Java beans and other artifacts defining the system can be manifested in Components.

A Component can be composed of multiple Classes, or Components pieced together. As smaller Components come together to create bigger Components, the eventual system can be modeled, building-block style, in Component diagrams. By building the system in discrete Components, localization of data and behavior enables decreased dependency between Classes and Objects, providing a more robust and maintainable design.

#### Toolbox icon

#### Learn more

- [Component Diagram](#) <sup>1194</sup>
- [Class Element](#) <sup>1363</sup>
- [Object Element](#) <sup>1379</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 148*) states:

*A component represents a modular part of a system that encapsulates its contents and whose manifestation is replaceable within its environment.*

*A component defines its behavior in terms of provided and required interfaces. As such, a component serves as a type whose conformance is defined by these provided and required interfaces (encompassing both their static as well as dynamic semantics).*

### 6.4.2.6 Data Type

### Description

A Data Type is a specific kind of classifier, similar to a Class except that a Data Type cannot own sub Data Types, and instances of a Data Type are identified only by their value. For example, an instance of a Person Class is a Helen object, but an instance of an Integer Data Type is 12.

All copies of an instance of a Data Type, and any instances of that Data Type with the same value, are considered to be the same instance. That is, instances of Helen are not necessarily the same Helen, but all 12s are the same 12. For example, the 12 on a watch face is exactly the same integer as the number of months in a year.

Instances of a Data Type that have attributes (that is, are instances of a structured Data Type) are considered to be the same if the structure is the same and the values of the corresponding attributes are the same. If a Data Type has attributes, instances of that Data Type contain attribute values matching the attributes.

A typical use of Data Types would be to represent programming language primitive types or CORBA basic types. For example, integer and string types are often treated as Data Types.

A Data Type is denoted by a rectangle with the keyword «dataType», as above or, when it is referenced by (for example) an attribute, by a string containing the name of the Data Type, as below:

- [Class Element](#)<sup>[1363]</sup>

## 6.4.2.7 Deployment Spec

### Description

A Deployment Specification (spec) specifies parameters guiding deployment of an artifact, as is necessary with most hardware and software technologies. A specification lists those properties that must be defined for deployment to occur, as represented in a Deployment diagram. An instance of this specification specifies the values for the parameters; a single specification can be instantiated for multiple artifacts.

These specifications can be extended by certain component profiles. Examples of standard Tagged Values that a profile might add to a Deployment Specification are «*concurrencyMode*» with Tagged Values {*thread*, *process*, *none*} or «*transactionMode*» with Tagged Values {*transaction*, *nestedTransaction*, *none*}.

The following example depicts the artifact *RepositoryApp* deployed on the server node, as per the specifications of *RepositoryApp*, instantiated from the *Deployment Specification SystemSpec*.

#### Toolbox icon

#### Learn more

- [Deployment Diagram](#) 1197

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 206) states:

*A deployment specification specifies a set of properties that determine execution parameters of a component artifact that is deployed on a node. A deployment specification can be aimed at a specific type of container. An artifact that reifies or implements deployment specification properties is a deployment descriptor.*

### 6.4.2.8 Device

#### Description

A Device is a physical electronic resource with processing capability upon which Artifacts can be deployed for execution, as represented in a Deployment diagram. Complex Devices can consist of other devices; that is, a Device can be a nested element, where a physical machine is decomposed into its elements either through namespace ownership or through attributes that are typed by Devices.

#### Toolbox icon

#### Learn more

- [Deployment Diagram](#) <sup>[1191]</sup>
- [Artifact Element](#) <sup>[1358]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, 10.3.7, v2.1.1, p. 207*) states:

*In the metamodel, a Device is a subclass of Node.*

### 6.4.2.9 Document Artifact

#### Description

A Document Artifact is an artifact having a stereotype of «*document*». You create the Document Artifact using the Artifact, Common, Component, Documentation or Deployment pages of the Diagram Toolbox, and associate it with a document or CSV file. Double-click on the element to display the Linked Document Editor. When you have created the linked document, the Document Artifact element on the diagram shows an **A** symbol in the bottom right corner.

- [Artifact Element](#) <sup>[1358]</sup>
- [Add Quick Linker Definition To Profile](#) <sup>[1523]</sup>

#### 6.4.2.10 Enumeration

##### Description

An *Enumeration* is a data type, whose instances can be any of a number of user-defined enumeration literals. It is possible to extend the set of applicable enumeration literals in other packages or profiles. You create Enumerations in Class or Package diagrams, and in diagrams developed using the Metamodel and Profile pages of the Diagram Toolbox.

##### Toolbox icon

##### Learn more

- [Class Diagram](#) <sup>[1184]</sup>
- [Package Diagram](#) <sup>[1182]</sup>

##### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 69) states:

*An enumeration is a data type whose values are enumerated in the model as enumeration literals.*

#### 6.4.2.11 Execution Environment

##### Description

An Execution Environment is a node that offers an execution environment for specific types of components that are deployed on it in the form of executable artifacts. This is depicted in a Deployment diagram.

Execution Environments can be nested; for example, a database Execution Environment can be nested in an operating system Execution Environment. Components of the appropriate type are then deployed to specific Execution Environment nodes.

### Toolbox icon

### Learn more

- [Node Element](#) <sup>[1378]</sup>
- [Component Element](#) <sup>[1370]</sup>
- [Artifact Element](#) <sup>[1358]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 210*) states:

*... an ExecutionEnvironment is ... usually part of a general Node, representing the physical hardware environment on which the ExecutionEnvironment resides. In that environment, the ExecutionEnvironment implements a standard set of services that Components require at execution time (at the modeling level these services are usually implicit). For each component Deployment, aspects of these services may be determined by properties in a DeploymentSpecification for a particular kind of ExecutionEnvironment.*

## 6.4.2.12 Expose Interface

### Description

The Expose Interface element is a graphical method of depicting the required or supplied interfaces of a Component, Class or Part, in a Component or Composite Structure diagram. It just identifies the fact that the element provides or requires an interface; to depict the fact that the provided interface is used, or the

required interface provided, by another element using the Assembly connector.

The Expose Interface element must be attached to the Class or Component element, and it becomes a child element of that Class or Component; it cannot exist independently. You can attach more than one Expose Element to another element.

When you create the Expose Interface element, a dialog displays in which you enter a name for the element and specify whether it represents a required interface or a provided interface.

- [Assembly](#) <sup>[1393]</sup>

### 6.4.2.13 Information Item

#### Description

An Information Item *element* represents an abstraction of data, which data can be conveyed between two objects. The *term* 'Information Item' is also more loosely applied to any classifier that represents a more specific identification of the type of data that can be conveyed between two objects

The conveyance and realization of Information Items (of either kind) between the two objects is represented by an Information Flow connector.

#### Toolbox icon

#### Learn more

- [Information Flow](#) <sup>[1410]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 608) states:

*An information item is an abstraction of all kinds of information that can be exchanged between objects. It is a kind of classifier intended for representing information at a very abstract way, one which cannot be instantiated.*

*One purpose of information items is to be able to define preliminary models, before having made detailed modeling decisions on types or structures. One other purpose of information items and information flows is to abstract complex models by a less precise but more general representation of the information exchanged between entities of a system.*

**6.4.2.14 Interface****Description**

An *Interface* is a specification of behavior (or contract) that implementers agree to meet. By implementing an Interface, *Classes* are guaranteed to support a required behavior, which enables the system to treat non-related elements in the same way; that is, through the common interface. You also use Interfaces in a Composite Structure diagram.

Interfaces are drawn in a similar way to a Class, with operations specified, as shown below. They can also be drawn as a circle with no explicit operations detailed - right-click on the element and select the **Use Circle Notation** context menu option to switch between styles. Realize connectors to an Interface drawn as a circle are drawn as a solid line without target arrows.

An Interface cannot be instantiated (that is, you cannot create an object from an Interface). You must create a Class that 'implements' the Interface specification, and in the Class body place operations for each of the Interface operations. You can then instantiate the Class.

**Toolbox icon****Learn more**

- [Class Diagram](#) <sup>1184</sup>

- [Composite Structure Diagram](#) <sup>[1188]</sup>
- [Realization](#) <sup>[1440]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 88) states:

*An interface is a kind of classifier that represents a declaration of a set of coherent public features and obligations. An interface specifies a contract; any instance of a classifier that realizes the interface must fulfill that contract. The obligations that may be associated with an interface are in the form of various kinds of constraints (such as pre- and post-conditions) or protocol specifications, which may impose ordering restrictions on interactions through the interface.*

*Since interfaces are declarations, they are not instantiable. Instead, an interface specification is implemented by an instance of an instantiable classifier, which means that the instantiable classifier presents a public facade that conforms to the interface specification. Note that a given classifier may implement more than one interface and that an interface may be implemented by a number of different classifiers.*

#### 6.4.2.15 Node

**Description**

A Node is a physical piece of equipment on which the system is deployed, such as a workgroup server or workstation. A Node usually hosts components and other executable pieces of code, which again can be connected to particular processes or execution spaces. Typical Nodes are client workstations, application servers, mainframes, routers and terminal servers.

Nodes are used in Deployment diagrams to model the deployment of a system, and to illustrate the physical allocation of implemented artifacts. They are also used in web modeling, from dedicated web modeling pages in the Toolbox.

**Toolbox icon****Learn more**

- [Deployment Diagram](#) <sup>[1191]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 213) states:

*In the metamodel, a Node is a subclass of Class. It is associated with a Deployment of an Artifact. It is also associated with a set of Elements that are deployed on it. This is a derived association in that these PackageableElements are involved in a Manifestation of an Artifact that is deployed on the Node. Nodes may have an internal structure defined in terms of parts and connectors associated with them for advanced modeling applications.*

#### 6.4.2.16 Object

##### Description

An Object is a particular instance of a Class at run time. For example a car with the license plate AAA-001 is an instance of the general class of cars with a license plate number attribute. Objects are often used in analysis to represent the numerous artifacts and items that exist in any business, such as pieces of paper, faxes and information. To model the varying behavior of Objects at run-time, use run-time states.

Early in analysis, Objects can be used to quickly capture all the things that are of relevance within the system domain, in an Object, Composite Structure or Communication diagram. As the model progresses these analysis Objects are refined into generic Classes from which instances can be derived to represent common business items. Once Classes are defined, Objects can be typed; that is they can have a classifier set that indicates their base type - see the *Classifiers and Instances* topic.

Enterprise Architect also supports a number of stereotyped Object elements to represent various entities in business modeling.

- [Define a Run-time Variable](#) <sup>[1380]</sup>
- [Remove a Defined Variable](#) <sup>[1381]</sup>
- [Object State](#) <sup>[1381]</sup>

#### 6.4.2.16.1 Run-time State

At run-time, an Object instance can have specific values for its attributes, or exist in a particular state. To model the varying behavior of Objects at run-time, use instance values selected from the Select <Item> dialog and run-time states or run-states.

Typically there is interest in the run-time behavior of Objects that already have a classifier set. You can select from the classifier's attribute list and apply specific values for your Object instance. If the classifier has a child State Machine, its States propagate to a list where the run-time state for the Object can be defined.

##### Example

The following example defines run-time values for the listed variables, which are attributes of the instances' classifier *AccountItem*.

##### Learn more

- [Object State](#) <sup>[1381]</sup>
- [Define a Run-Time Variable](#) <sup>[1380]</sup>
- [Remove a Defined Variable](#) <sup>[1381]</sup>

#### 6.4.2.16.1.1 Define a Run-time Variable

##### How to

To add run-time state instance variables to an Object

Step	Action
1	<p>Right-click on the Object and, if Instance Variables are supported, select the <b>Advanced   Set Run State</b> menu option (or press ( <b>Ctrl+Shift+R</b> ) ).</p> <p>The Set Run State dialog displays.</p>

Step	Action
2	In the <b>Variable</b> field, click on the drop-down arrow and select the variable, or type in the new variable name.
3	Set the <b>Operator</b> , the <b>Value</b> and optionally type in a <b>Note</b> .
4	Click on the <b>OK</b> button to save the variable.

#### 6.4.2.16.1.2 Remove a Defined Variable

##### How to

To delete a run-time state variable for an Object

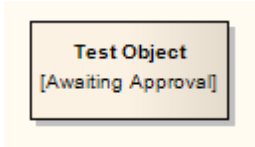

Step	Action
1	Right-click on the required Object and select the <b>Set Run State</b> context menu option. The Run State dialog displays.
2	In the <b>Variable</b> field, click on the drop-down arrow and select the variable to delete.
3	Clear the <b>Value</b> field.
4	Click on the <b>OK</b> button.

#### 6.4.2.16.2 Object State

##### How to

To set the Object state for a Class instance

Step	Action
1	Right-click on the required Object and select the <b>Advanced   Set Object State</b> context menu option. The Set Instance State dialog displays.
2	In the <b>State</b> field, either type the required State (such as <b>Awaiting Approval</b> ) or select a State from the drop-down list.

Step	Action
	<p>The drop-down list for the State field is populated with:</p> <ul style="list-style-type: none"> <li>Any States owned by the object's classifier</li> <li>Any States owned by any superclasses of the object's classifier</li> <li>Any States owned by State Machines owned by the object's classifier</li> <li>Any States owned by State Machines owned by any superclasses of the object's classifier</li> </ul>
3	<p>Click on the <b>OK</b> button to apply the State.</p> <p>The object now shows the run-time state in square brackets below the object name.</p> 

### 6.4.2.17 Package

#### Description

A *Package* is a namespace as well as an element that can be contained in other Package's namespaces. A Package can own or merge with other Packages, and its elements can be imported into a Package's namespace. In addition to using Packages in the Project Browser to organize your project contents, you can drag the Packages onto a diagram workspace (most diagram types, both standard and extended) for structural or relational depictions, including Package imports or merges.

#### Toolbox icon

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 109) states:

*A package is a namespace for its members, and may contain other packages. Only packageable elements can be owned members of a package. By virtue of being a namespace, a package can import either*

individual members of other packages, or all the members of other packages. In addition a package can be merged with other packages.

### 6.4.2.18 Part

#### Description

*Parts* are run-time instances of Classes or Interfaces. Multiplicity can be specified for a Part, using the notation:

( x{ . . . y } )

where x specifies the initial or set number of instances when the composite structure is created, and y indicates the maximum number of instances at any time.

Parts are used to express composite structures, or modeling patterns that can be invoked by various objects to accomplish a specific purpose. When illustrating the composition of structures, Parts can be embedded as properties of other Parts. When embedded as properties, Parts can be bordered by a solid outline, indicating the surrounding Part owns the Part by composition. Alternatively, a dashed outline indicates that the property is referenced and used by the surrounding Part, but is not composed within it.

#### Toolbox icon

#### Learn more

- [Composite Structure Diagram](#) <sup>[1188]</sup>
- [Class](#) <sup>[1363]</sup>
- [Interface](#) <sup>[1377]</sup>
- [Properties](#) <sup>[1189]</sup>
- [Add Property Value](#) <sup>[1383]</sup>

#### 6.4.2.18.1 Add Property Value

##### Add property value variables to a Part

Step	Action
1	Right-click on the Part and select the <b>Advanced   Set Property Values</b> context menu option (or press <b>( Ctrl+Shift+R )</b> ). The Set Property Values dialog displays.
2	In the <b>Variable</b> field, click on the drop-down arrow and select the variable, or type in the new variable

Step	Action
	name.
3	Set the <b>Operator</b> , the <b>Value</b> and optionally type in a <b>Note</b> .
4	Click on the <b>OK</b> button to save the variable.

A Part with a property value resembles the following figure:

#### 6.4.2.19 Port

##### Description

*Ports* define the interaction between a classifier and its environment. *Interfaces* controlling this interaction can be depicted using the Interface element. Any connector to a Port must provide the required interface, if defined. Ports can appear on a contained Part, a Class, or the boundary of a Composite element.

A Port is a *typed* structural feature or property of its containing classifier. Ports are typically created in Class diagrams, Object diagrams and Composite Structure diagrams.

##### Toolbox icon

##### Learn more

- [Add a Port to an Element](#) <sup>1385</sup>
- [Inherited and Redefined Ports](#) <sup>1385</sup>
- [The Property Tab](#) <sup>1386</sup>

- [Composite Structure Diagram](#) <sup>[1188]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 182*) states:

*A port is a property of a classifier that specifies a distinct interaction point between that classifier and its environment or between the (behavior of the) classifier and its internal parts. Ports are connected to properties of the classifier by connectors through which requests can be made to invoke the behavioral features of a classifier. A Port may specify the services a classifier provides (offers) to its environment as well as the services that a classifier expects (requires) of its environment.*

#### 6.4.2.19.1 Add a Port to an Element

##### Add a new Port to an element

Use *one* of the following steps:

Step	Action
1	Click on the Port symbol in the Composite Elements page of the Toolbox, and drag the symbol to (or click on) the target host element.  This creates an untyped, simple Port on the boundary, near the cursor position.
2	On the context menu of a suitable Class, Part or Composite element in the <b>Project Browser</b> , select the <b>Add   Port</b> option.
3	Drag a suitable classifier from the <b>Project Browser</b> onto a Class or Part on a <b>diagram</b> .  A prompt displays to add a typed Port or Part at the cursor position.  The new Port is typed by the original dragged classifier.
4	Use the Structural Elements dialog (on a <b>diagram</b> , <b>right-click on element   Structural Elements</b> ) to add a new Port to the currently selected element.

#### Learn more

- [Composite Elements](#) <sup>[936]</sup>
- [Inherited and Redefined Ports](#) <sup>[1385]</sup>
- [Manage Structural Elements](#) <sup>[935]</sup>

#### 6.4.2.19.2 Inherited and Redefined Ports

A Port is a *redefinable* and *re-useable* property of a composite classifier such as a Component. A Component can inherit Ports from its parent; if a Component's parent owns Ports, when you open the Structural Elements dialog for the Component and select the **Show Owned/Inherited** checkbox the inherited Ports and their named owners are listed.

If you want to show an inherited Port on a Component, the Structural Elements dialog provides two options:

- Expose an inherited Port - tick the checkbox next to the Port's name, to create a read-only copy of the Port; this is convenient for modeling Port interactions in child elements where the Ports are defined in the parent elements
- Redefine an inherited Port - select the row for the Port and click on the **Redefine** button, to create an editable copy of the Port; this is useful where a child element places additional restrictions or behavior on the Port

The above is also true for Components that inherit Ports from realized Interfaces, and for Component instances that inherit Ports from their classifying Component.

#### Learn more

- [Manage Structural Elements](#) 

### 6.4.2.19.3 The Property Page

The element Properties dialog for Ports and Parts has a Property page in place of the Class element Details page.

This page defines the type, initial value, Qualifiers, multiplicity, and redefined and subsetted properties of the Port or Part.

You set the Qualifiers by clicking on the **Qualifiers** button, to display the Qualifiers dialog.

You add **Redefined** and **Subsetted Properties** by clicking on the appropriate **Add** button, to display the Select Property dialog.

#### Learn more

- [Qualifiers Dialog](#) 
- [Select Property Dialog](#) 
- [Inherited and Redefined Ports](#) 

### 6.4.2.20 Primitive

#### Description

A Primitive element identifies a predefined data type, without any relevant substructure (that is, it has no parts in the context of UML). It could be regarded as a conceptual Data Type.

#### Toolbox icon

### Learn more

- [Data Type Element](#)<sup>[1370]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 124) states:

*A primitive data type may have an algebra and operations defined outside of UML, for example, mathematically ... The run-time instances of a primitive type are data values. The values are in many-to-one correspondence to mathematical elements defined outside of UML (for example, the various integers). Instances of primitive types do not have identity. If two instances have the same representation, then they are indistinguishable.*

## 6.4.2.21 Signal

### Description

A Signal is a specification of Send request instances communicated between objects, typically in a Class or Package diagram. The receiving object handles the Received request instances as specified by its receptions. The data carried by a Send request is represented as attributes of the Signal. A Signal is defined independently of the classifiers handling the signal occurrence.

To define a reception, create an operation in the receiving object and assign the stereotype <<signal>> to it. The reception has the same name as the signal that the object can receive.

### Toolbox icon

### Learn more

- [Class Diagram](#)<sup>[1184]</sup>
- [Package Diagram](#)<sup>[1182]</sup>
- [State Toolbox](#)<sup>[807]</sup>
- [Send Element](#)<sup>[1328]</sup>
- [Receive Element](#)<sup>[1327]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 450) states:

*A signal triggers a reaction in the receiver in an asynchronous way and without a reply. The sender of a signal will not block waiting for a reply but continue execution immediately. By declaring a reception associated to a given signal, a classifier specifies that its instances will be able to receive that signal, or a subtype thereof, and will respond to it with the designated behavior.*

*And (UML Superstructure Specification, v2.1.1, p. 447 - 448):*

*A reception is a declaration stating that a classifier is prepared to react to the receipt of a signal. A reception designates a signal and specifies the expected behavioral response. The details of handling a signal are specified by the behavior associated with the reception or the classifier itself. ...Receptions are shown using the same notation as for operations with the keyword <signal>*

## 6.5 UML Connectors

A **connector** is a logical or functional relationship between model elements. There are several different connector types, each having a particular purpose and syntax. Enterprise Architect supports all of the UML connectors as well as various custom connectors. Together with the UML Elements, these form the basis of UML models.

For more information on using these connectors, display the appropriate topic by clicking on the appropriate connector icon in the table below.

Behavioral Diagram Connectors	Structural Diagram Connectors	Inbuilt and Extended Connectors

	<b>Object Diagrams</b>	

### Notes

- **Invokes** and **Precedes** relationships are defined by the Open Modeling Language (OML); they are stereotyped Dependency relationships - **Invokes** indicates that Use Case A, at some point, causes Use Case B to happen, whilst **Precedes** indicates that Use Case C must complete before Use Case D can begin
- An **Extension** relationship shows that a Stereotype extends one or more Metaclasses; all Stereotypes must extend either one or more Metaclasses, or another Stereotype that extends a Metaclass (or another Stereotype; in theory you can have a chain of Stereotypes ultimately extending a Metaclass, but in practice you are unlikely to have more than two Stereotypes in the chain)
- A **Tagged Value** relationship defines a reference-type (that is, RefGUID) Tagged Value owned by the source stereotype; the Tagged Value is named for the target role of this association, and is limited to referencing elements with the stereotype by the association target element

## 6.5.1 Abstraction

### Description

An Abstraction is a relationship between two elements that represent the same concept, either at different levels of abstraction or from different viewpoints. This diagram above shows that two different customer Classes from different models (the Domain model and the Code model) represent the same concept.

The Abstraction relationship is a subtype of a Dependency relationship.

### Toolbox icon

### Learn more

- [Class Diagram](#) <sup>1184</sup>
- [Dependency](#) <sup>1404</sup>

## 6.5.2 Aggregation

### Description

An Aggregation connector is a type of association that shows that an element contains or is composed of other elements. It is used in Class models, Package models and Object models to show how more complex elements (aggregates) are built from a collection of simpler elements (component parts; for example, a car from wheels, tires, motor and so on).

A stronger form of aggregation, known as Composite Aggregation, is used to indicate ownership of the whole over its parts. The part can belong to only one Composite Aggregation at a time. If the composite is deleted, all of its parts are deleted with it.

### Toolbox icon

### Learn more

- [Class Diagram](#) <sup>[1184]</sup>
- [Package Diagram](#) <sup>[1182]</sup>
- [Object Diagram](#) <sup>[1186]</sup>
- [Change Aggregation Connector Form](#) <sup>[1392]</sup>

### 6.5.2.1 Change Aggregation Connector Form

In your modeling, when you create an **Aggregation** relationship it defaults to the **weak** (shared) form of the relationship, represented by a hollow diamond head. You can change this to the strong form (Composition), represented by a solid black diamond head.

#### Change the form of an Aggregation connector from weak to strong

Step	Action
1	Right-click on an Aggregation connector to display the context menu.
2	Select <b>Set Aggregation to Composite</b> . The diamond is shown as filled.

### Notes

- If the connector is already a Strong (Composition) connector, the context menu option changes to **Set Aggregation to Shared**

### Learn more

- [Aggregation](#) <sup>[1392]</sup>

## 6.5.3 Assembly

### Description

An Assembly connector bridges a component's required interface (*Component1*) with the provided interface of another component (*Component2*), typically in a Component diagram.

### Toolbox icon

### Learn more

- [Component Diagram](#) <sup>[1194]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 156*) states:

*An assembly connector is a connector between two components that defines that one component provides the services that another component requires. An assembly connector is a connector that is defined from a required interface or port to a provided interface or port.*

## 6.5.4 Association

### Description

An **Association** implies that two model elements have a relationship, usually implemented as an instance variable in one or both Classes. The connector can include named roles at each end, multiplicity, direction and constraints. You can also indicate the reading direction by adding a Name Direction Indicator arrow to a **label** on the connector, and define **template binding parameters** for an Association connector between a binding Class and a parameterized Class.

Associations act as the keys in providing possible **classifiers** for a structure of instance elements, and for automatically generating **Property** (Part) elements on the source **SysML Block** element in the Association.

When code is generated for Class diagrams, Associations become member variables in the target Class. The relationship is also used in Package, Object, Communication, Data Modeling and Deployment diagrams.

'Association' is the general relationship type between two elements; to connect more than two elements in an Association, you can use the **N-Ary Association** element. An Association connector can also be integrated with a Class element to form an **Association Class**, to allow the connector to have operations and attributes that define certain types of UML relationship.

### Toolbox icon

### Learn more

- [N-Ary Association](#) <sup>[2007]</sup>
- [Association Class](#) <sup>[1398]</sup>
- [Class Diagrams](#) <sup>[1184]</sup>
- [Template Binding](#) <sup>[1444]</sup>
- [Qualifiers](#) <sup>[1395]</sup>
- [Manage Object Labels](#) <sup>[866]</sup>
- [Classify Object Via Classifier Associations](#) <sup>[1012]</sup>
- [Generate Properties From Block Associations](#) <sup>[2304]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 41) states:

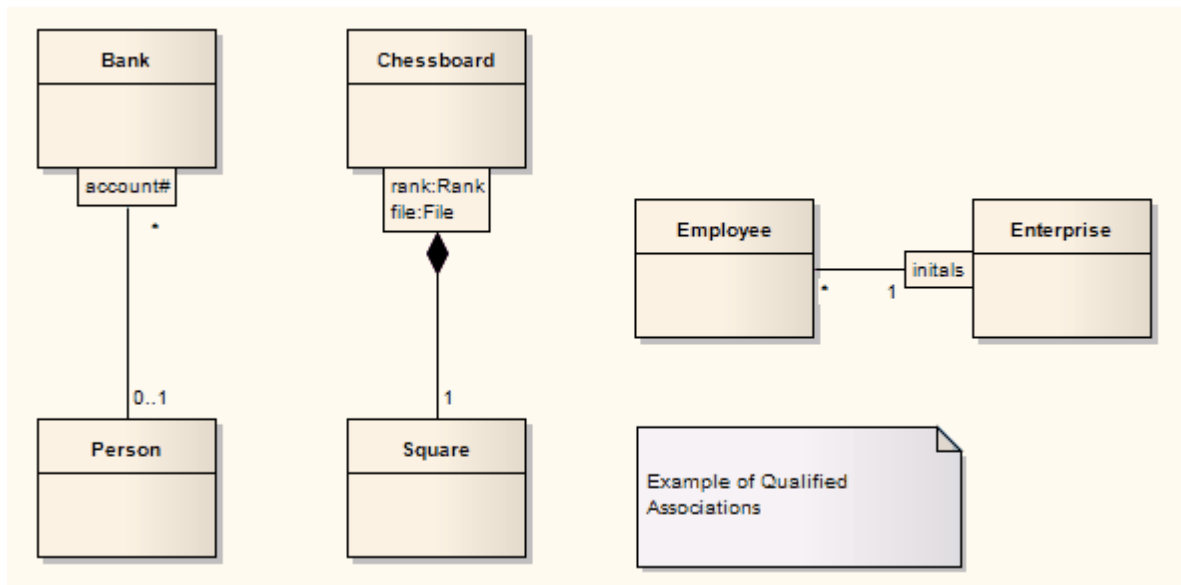

*An association specifies a semantic relationship that can occur between typed instances. It has at least two ends represented by properties, each of which is connected to the type of the end. More than one end of the association may have the same type.*

An end property of an association that is owned by an end class or that is a navigable owned end of the association indicates that the association is navigable from the opposite ends; otherwise, the association is not navigable from the opposite ends.

### 6.5.4.1 Qualifiers

Qualifiers are ordered sets of properties of an Association end point, a Part, a Port, or an Attribute, that limit the nature of the relationship between two classifiers or objects. You define a qualifier on the Qualifiers dialog, which you display by clicking on the ( ... ) button at the end of the **Qualifiers** field on the Association, Part, Port or Attribute Properties dialog.

#### Examples

#### Notes

- When typing multiple Qualifiers into the **Qualifier(s)** field on a Properties dialog, separate them with a semi-colon; each Qualifier then displays on a separate line - for example, in the diagram the Qualifier 'rank:Rank;file:File' has been rendered in two lines, with a line break at the ; character
- You can enable or disable Qualifier rectangles in the Diagram page of the Options dialog (select the **Tools | Options | Diagram** menu option) - if disabled, the old style text Qualifiers are used; it is not recommended that you disable Qualifiers as they are an integral part of the UML
- You can enable or disable a mild shading on the Qualifier rectangles in the Links page of the Options dialog

#### Learn more

- [Qualifiers Dialog](#) <sup>[1396]</sup>
- [Source Role](#) <sup>[1130]</sup>
- [Port](#) <sup>[1384]</sup>
- [Part](#) <sup>[1383]</sup>
- [Attribute](#) <sup>[999]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 129) states:

*A qualifier declares a partition of the set of associated instances with respect to an instance at the qualified end (the qualified instance is at the end to which the qualifier is attached). A qualifier instance comprises one value for each qualifier attribute. Given a qualified object and a qualifier instance, the number of objects at the other end of the association is constrained by the declared multiplicity. In the common case in which the multiplicity is 0..1, the qualifier value is unique with respect to the qualified object, and designates at most one associated object. In the general case of multiplicity 0..\*, the set of associated instances is partitioned into subsets, each selected by a given qualifier instance. In the case of multiplicity 1 or 0..1, the qualifier has both semantic and implementation consequences. In the case of multiplicity 0..\*, it has no real semantic consequences but suggests an implementation that facilitates easy access of sets of associated instances linked by a given qualifier value.*

**6.5.4.1.1 Qualifiers Dialog**

The Qualifiers dialog is used to define the Qualifiers of an Association connector end, Port, Part or Attribute.

**General Tab**

Review, edit or complete the fields as indicated in the following table:

Field	Action	See also
<b>Name</b>	Display the name of the Qualifier. For a new Qualifier, type the name (with no spaces).	
<b>Alias</b>	Display an optional alias for the Qualifier. If necessary, type in a new alias.	
<b>Type</b>	Display the Qualifier type.  The type can be defined by the code language (data type) or by a classifier element. When you click on the drop-down arrow, the set of values in the list provides the appropriate data types.  To select or define possible classifiers, either click on the <b>Select Type</b> option in the list, or click on the ( ... ) (Select) button to display the Select <Item> dialog.  To add new code language data types that can be displayed in this list, see the <i>Data Types</i> topic.	<a href="#">Select &lt;Item&gt; Dialog</a> <a href="#">Data Types</a>
<b>Scope</b>	Define the Qualifier as <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> . If necessary, click on the drop-down arrow and select a different scope.	
<b>Stereotype</b>	Define the optional stereotype of the Qualifier. If necessary, either type a different stereotype name or click on	

Field	Action	See also
	the drop-down arrow and select a stereotype.	
<b>Derived</b>	Indicate that the Qualifier is a calculated value. If you select this checkbox, the Qualifier name on the element has the derived symbol (/) as a prefix.	
<b>Static</b>	Indicate that the Qualifier is a static member.	
<b>Const</b>	Indicate that the Qualifier is a constant.	
<b>Initial</b>	Display an optional initial value. If necessary, type in a new initial value.	
<b>Notes</b>	Enter any free text notes associated with the Qualifier. You can format the notes text using the Notes toolbar at the top of the field.	<a href="#">Notes</a>  toolbar

To change the position of a Qualifier in the list in the Qualifiers panel, click on the **Scroll Up** or **Scroll Down** (hand) buttons.

### Detail Tab

Use the Detail tab to model additional properties of a selected Qualifier, such as its multiplicity, redefined properties and subsetting properties.

Select a Qualifier on the General tab, then review, edit or complete the Detail tab fields as indicated in the following table.

Field	Action	See also
<b>Multiplicity</b>		
<b>Lower bound</b>	Define a lower limit to the number of elements allowed in the collection.	
<b>Upper bound</b>	Define an upper limit to the number of elements allowed in the collection.	
<b>Allow Duplicates</b>	Indicate that duplicates are allowed.	

Field	Action	See also
	Maps to the UML property <i>isUnique</i> , value <i>FALSE</i> .	
<b>Multiplicity is Ordered</b>	Indicate that the collection is ordered.	
<b>Redefined Property</b>	Review the redefined properties for the Qualifier. Add redefined properties by clicking on the <b>Add</b> button to display the Select Property dialog.	<a href="#">Select Property Dialog</a> [996]
<b>Subsetted Property</b>	Review the subsetted properties for the qualifier. Add subsetted properties by clicking on the <b>Add</b> button to display the Select Property dialog.	<a href="#">Select Property Dialog</a> [996]

### 6.5.5 Association Class

#### Description

An *Association Class* is a UML construct that enables an Association to have *attributes* and *operations* (*features*). This results in a hybrid relation with the characteristics of an Association and a Class.

When you add an Association Class connection, Enterprise Architect also creates a Class that is automatically connected to the Association. When you hide or delete the Association, the Class is also hidden or deleted.

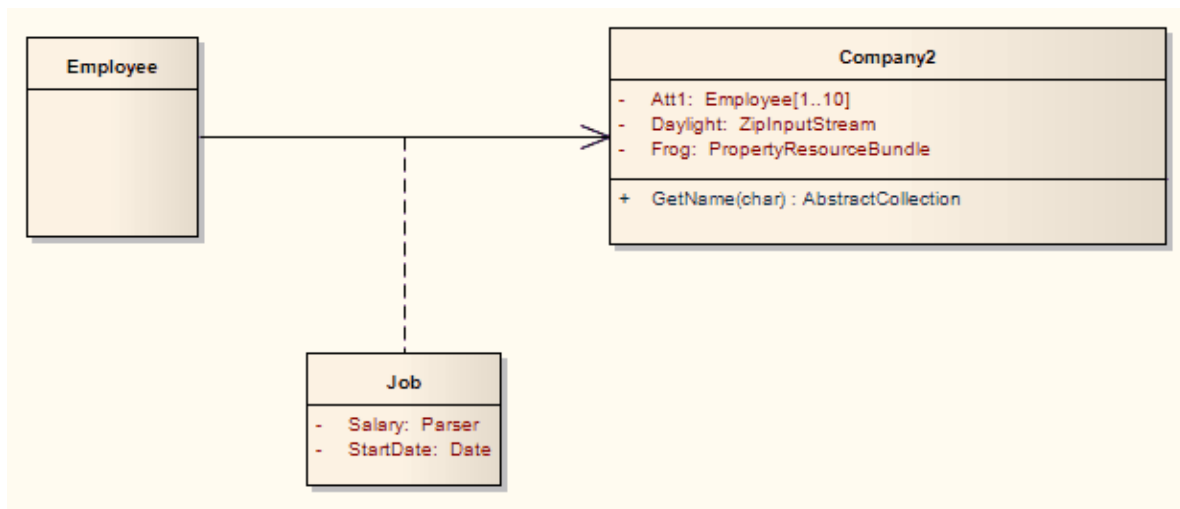

To add an Association Class to a Class or Deployment diagram, click on the *Association Class* icon in the Toolbox. Click and hold on the source object in the diagram while you drag the line to the target element,

then release the mouse button. Enterprise Architect draws the connector and adds the Class, then prompts you to add the Class name. Note that the names of the Class and the connector are the same. You can also connect a new Class to an existing Association.

You can highlight the Class part of an Association Class in the Project Browser, by selecting the **Find Association Class** context menu option on the Association connector.

### Example

The following diagram illustrates an Association Class between model elements. Note the dotted line from the Class to the Association. You cannot move or delete this line.

### Notes

- If you are applying a stereotype with a Shape Script to an Association Class, be aware that the Shape Script is applied to both the Class part and the Association part; therefore, you might have to include logic in the *shape main* that tests the type of the element so that you can give separate drawing instructions for Class and for Association
- Such logic is not necessary in the:
  - Shape source or shape target, which are ignored by Classes, or the
  - Decoration shapes, which are ignored by Association connectors
- If you dissociate the Class from the Association connector, both parts keep their Shape Scripts until the stereotypes are removed.

### Toolbox icon

### Learn more

- [Class Diagram](#) <sup>[1184]</sup>
- [Connect New Class to Association](#) <sup>[1400]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 49) states:

*A model element that has both association and class properties. An AssociationClass can be seen as an association that also has class properties, or as a class that also has association properties. It not only connects a set of classifiers but also defines a set of features that belong to the relationship itself and not to any of the classifiers.*

### 6.5.5.1 Connect New Class to Association

**How to**

To connect a new Class to an existing Association

Step	Action
1	Create a Class in the diagram containing the Association to connect.
2	Right-click on the new Class and select the <b>Advanced   Association Class</b> menu option. The Create Association Class dialog displays.
3	Select the connector to connect to.
4	Click on the <b>OK</b> button.

**Learn more**

- [Association Class](#) [1398]

### 6.5.6 Communication Path

**Description**

A *Communication Path* defines the path through which two *DeploymentTargets* are able to exchange signals and messages. Communication Path is a specialization of *Association*. A *DeploymentTarget* is the target for a deployed *Artifact* and can be a *Node*, *Property* or *InstanceSpecification* in a Deployment diagram.

### Toolbox icon

### Learn more

- [Deployment Diagram](#) <sup>[1197]</sup>
- [Association](#) <sup>[1393]</sup>

## 6.5.7 Composition

### Direction:

A Composition is used to depict an element that is made up of smaller components, typically in a Class or Package diagram. A component - or part instance - can be included in a maximum of one composition at a time. If a composition is deleted, usually all of its parts are deleted with it; however, a part can be individually removed from a composition without having to delete the entire composition. Compositions are transitive, asymmetric relationships and can be recursive.

### Example

### Toolbox icon

### Learn more

- [Aggregation](#) <sup>[1392]</sup>
- [Class Diagram](#) <sup>[1184]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 43) states:

*Composite aggregation is a strong form of aggregation that requires a part instance be included in at most one composite at a time. If a composite is deleted, all of its parts are normally deleted with it.*

### 6.5.8 Connector

**Description**

Connectors illustrate communication links between Parts to fulfill the structure's purpose, typically in a Composite Structure diagram. Each Connector end is distinct, controlling the communication pertaining to its connecting element. These elements can define constraints specifying this behavior. Connectors can have multiplicity.

**Toolbox icon****Learn more**

- [Composite Structure Diagram](#) <sup>[1188]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 177) states:

*Specifies a link that enables communication between two or more instances. This link may be an instance of an association, or it may represent the possibility of the instances being able to communicate because their identities are known by virtue of being passed in as parameters, held in variables or slots, or because the communicating instances are the same instance. The link may be realized by something as simple as a pointer or by something as complex as a network connection. In contrast to associations, which specify links between any instance of the associated classifiers, connectors specify links between instances playing the connected parts only.*

### 6.5.9 Control Flow

#### Description

The *Control Flow* is a connector connecting two nodes in an Activity diagram. Control Flow connectors bridge the flow between Activity nodes, by directing the flow to the target node once the source node's activity is completed.

Control Flows and Object Flows can define a *Guard* and a *Weight* condition.

A Guard defines a condition that must be true before control passes along that activity edge. A practical example of this is where two or more activity edges (Control Flows) exit from a Decision element. Each flow should have a Guard condition that is exclusive of the other and defines which edge is taken under what conditions. The Control Flow Properties dialog enables you to set up Guard conditions on Control Flows and on Object Flows.

A Weight defines the number of tokens that can flow along a Control or Object Flow connection when that edge is traversed. Weight can also be defined on the Control Flow and Object Flow Properties dialogs.

#### Toolbox icon

#### Learn more

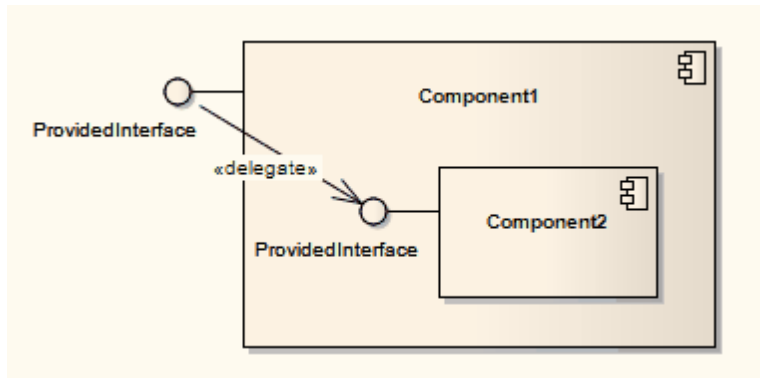

- [Activity diagram](#) <sup>[1198]</sup>
- [Object Flow](#) <sup>[1435]</sup>
- [Decision Node](#) <sup>[1294]</sup>

#### OMG UML specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 356) states:

*A control flow is an edge that starts an activity node after the previous one is finished.*

### 6.5.10 Delegate

#### Description

A Delegate connector defines the internal assembly of a component's external Ports and Interfaces, on a Component diagram. Using a Delegate connector wires the internal workings of the system to the outside world, by a delegation of the external interfaces' connections.

#### Toolbox icon

#### Learn more

- [Component Diagram](#) 1194

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 156) states:

*A delegation connector is a connector that links the external contract of a component (as specified by its ports) to the internal realization of that behavior by the component's parts. It represents the forwarding of signals (operation requests and events): a signal that arrives at a port that has a delegation connector to a part or to another port will be passed on to that target for handling.*

### 6.5.11 Dependency

#### Description

Dependency relationships are used to model a wide range of dependent relationships between model

elements in Use Case, Activity and Structural diagrams, and even between models themselves. You can create the Dependency from the Common page of the Toolbox. The Dependencies package as defined in UML 2.4.1 has many derivatives, such as Realize, Deployment and Use. Once you create a Dependency you can further refine its meaning by applying a specialized stereotype.

### Toolbox icon

### Learn more

- [Realization](#) <sup>[1440]</sup>
- [Deployment](#) <sup>[1408]</sup>
- [Use](#) <sup>[1450]</sup>
- [Apply a Stereotype](#) <sup>[1405]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 64) states:

*A dependency is a relationship that signifies that a single or a set of model elements requires other model elements for their specification or implementation. This means that the complete semantics of the depending elements is either semantically or structurally dependent on the definition of the supplier element(s).*

## 6.5.11.1 Apply a Stereotype

### How to

To apply a stereotype to a Dependency relationship

Step	Action
1	Select the Dependency relationship to change.
2	Right-click on the connector and, from the context menu, select the <b>Dependency Properties</b> option. The Dependency Properties dialog displays.
3	In the <b>Stereotype</b> field, either type in the required stereotype name or click on the drop-down arrow and select the stereotype from the list.
4	Click on the <b>OK</b> button.

Alternatively, you can right-click on the Dependency relationship and select the **Advanced | Dependency Stereotypes** context menu option, then select from a shorter list of standard stereotypes.

### 6.5.12 Deployment

#### Description

A Deployment is a type of Dependency relationship that indicates the deployment of an artifact onto a node or executable target, typically in a Deployment diagram. A Deployment can be made at type and instance levels. At the type level, a Deployment would be made for every instance of the node. Deployment can also be specified for an instance of a node, so that a node's instances can have varied deployed artifacts. With composite structures modeled with nodes defined as Parts, Parts can also serve as targets of a Deployment relationship.

#### Toolbox icon

#### Learn more

- [Deployment Diagram](#) 1197

### 6.5.13 Extend

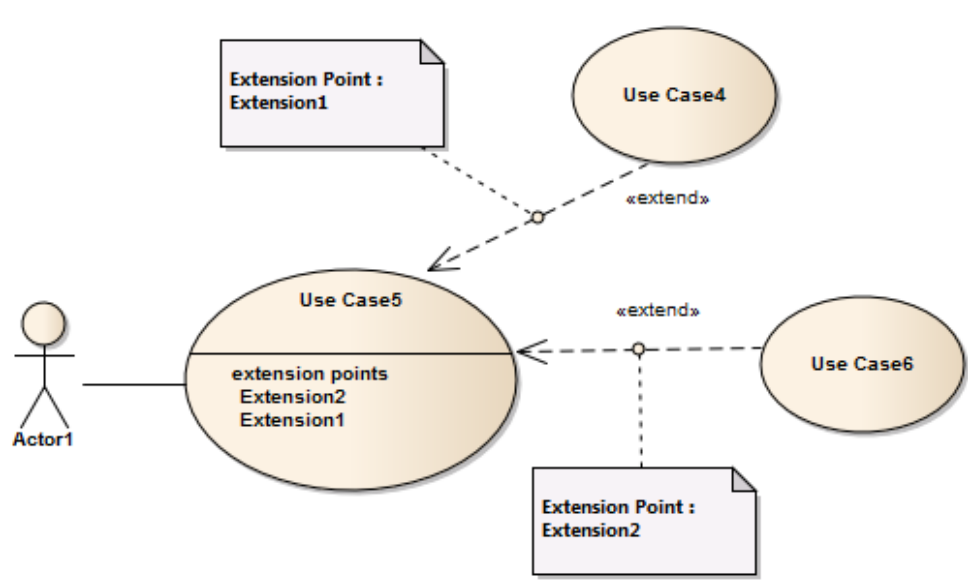

#### Description

An **Extend** connector is used to indicate that an element extends the behavior of another, mainly in **Use Case** models where one Use Case (optionally) extends the behavior of another Use Case. An extending Use Case often expresses alternative flows that are integrated with the behavior of the extended Use Case, at a specific point in the behavior flow identified within the element by an **extension point**. The extension point is represented by a text string such as 'on startup' or 'before connection is established'.

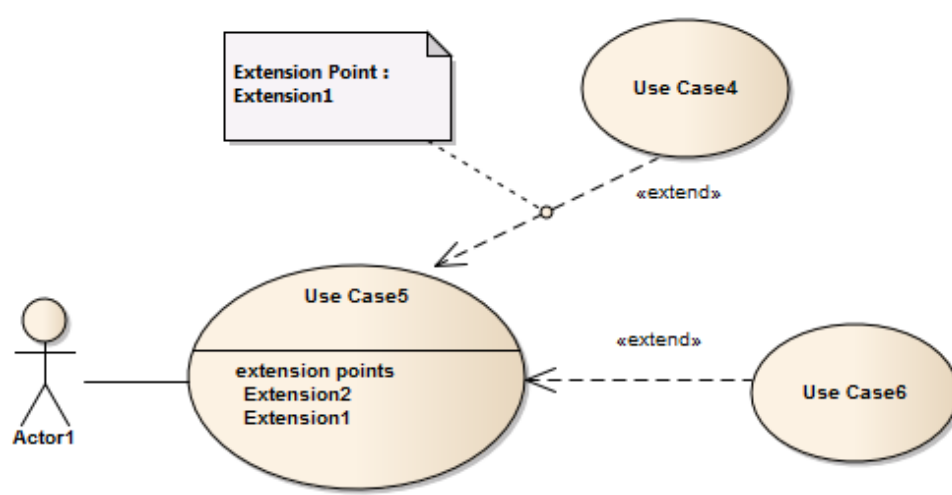

A Use Case can have more than one extension point, and can extend or be extended by more than one other Use Case. The precise relationship between the extending Use case, extended Use Case and the point at which the extension applies can be identified on the Extend relationship, as defined below.

#### Identify Extension Point

Step	Action	See also
1	<p>Right-click on the Extend connector and select the <b>Advanced   Extension Point   Set Extension Point</b> context menu option.</p> <p>The Element Usage dialog displays, listing the Extension Points currently defined in the target Use Case element.</p>	
2	<p>Click on the Extension Point on which the source Use Case acts, and click on the <b>Open</b> button.</p> <p>The dialog closes and the Extend connector shows a small circle at the mid-point, with a Notelink to a Note element that identifies the selected Extension Point.</p>  <p>(The Note might not initially display close to the Extend connector - check the upper left corner of the diagram and drag the Note to the position you want it to occupy.)</p> <p>Use these same steps to <b>change</b> the extension point identified in the Note.</p>	

#### Show/Hide Extension Point Note

Step	Action	See also
1	<p>Right-click on the Extend connector and select the <b>Advanced   Extension Point   Show Extension Point</b> context menu option.</p> <p>If there are any Extension Points identified on the selected Extend connector, they are displayed as shown above.</p>	

Step	Action	See also
2	<p>Right-click on the Extend connector and <b>deselect</b> the <b>Advanced   Extension Point   Show Extension Point</b> context menu option.</p> <p>Any Extension Points identified on the selected Extend connector are hidden, as shown:</p> 	

#### Toolbox icon

#### Notes

- The **Extend** connector is not the same as the **Extension** connector used in **Profile** diagrams to indicate that a Stereotype element extends a Metaclass or another Stereotype element; the two types of connector have different appearances

#### Learn more

- [Use Case Diagram](#) <sup>[1201]</sup>
- [Use Case](#) <sup>[1352]</sup>
- [Use Case Extension Points](#) <sup>[1354]</sup>
- [Profile Toolbox](#) <sup>[810]</sup> (Extension connector)

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 587*) states:

*This relationship specifies that the behavior of a Use Case may be extended by the behavior of another (usually supplementary) Use Case. The extension takes place at one or more specific extension points defined in the extended Use Case. Note, however, that the extended Use Case is defined independently of the extending Use Case and is meaningful independently of the extending Use Case. On the other hand, the*

*extending Use Case typically defines behavior that may not necessarily be meaningful by itself. Instead, the extending Use Case defines a set of modular behavior increments that augment an execution of the extended Use Case under specific conditions.*

*Note that the same extending Use Case can extend more than one Use Case. Furthermore, an extending Use Case may itself be extended.*

### 6.5.14 Generalization

#### Description

A Generalization is used to indicate inheritance. Drawn from the specific classifier to a general classifier, the generalization's implication is that the source inherits the target's characteristics. It is used typically in Class, Component, Object, Package, Use Case and Requirements diagrams.

You can also define template binding parameters for a Generalize connector between a binding Class and a parameterized Class.

#### Toolbox icon

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 73) states:

*A generalization is a taxonomic relationship between a more general classifier and a more specific classifier. Each instance of the specific classifier is also an indirect instance of the general classifier. Thus, the specific classifier inherits the features of the more general classifier.*

### 6.5.15 Include

#### Description

An Include connection indicates that the source element includes the functionality of the target element. Include connections are used in Use Case models to reflect that one Use Case includes the behavior of another. Use an Include relationship to avoid having the same subset of behavior in many Use Cases; this is similar to delegation used in Class models.

#### Toolbox icon

#### Learn more

- [Use Case Diagram](#) f1201

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 591) states:

*Include is a DirectedRelationship between two Use Cases, implying that the behavior of the included Use Case is inserted into the behavior of the including Use Case. It is also a kind of NamedElement so that it can have a name in the context of its owning Use Case. The including Use Case may only depend on the result (value) of the included Use Case. This value is obtained as a result of the execution of the included Use Case.*

### 6.5.16 Information Flow

#### Description

An Information Flow represents the flow of Information Items (either Information Item elements or classifiers) between two elements in any diagram. The connector is available from:

- The Common page of the Toolbox
- Every Quick Link menu, and

- Automatically whilst directly defining Information Item realization

When you create the Information Flow connector, Enterprise Architect automatically prompts you to identify which information items are conveyed.

You can have more than one Information Flow connector between the same two elements, identifying which items flow between the elements under differing conditions. The connectors can flow in the same direction, or opposite directions. You can locate the items conveyed in any Information Flow, by right-clicking on the connector and selecting the **Find Items Conveyed** context menu option.

#### Toolbox icon

#### Learn more

- [Information Item](#) <sup>[1376]</sup>
- [Using Information Flows](#) <sup>[1411]</sup>
- [Convey Information on a Flow](#) <sup>[1413]</sup>
- [Realize an Information Flow](#) <sup>[1414]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 606) states:

*An InformationFlow specifies that one or more information items circulates from its sources to its targets.*

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 607) also states:

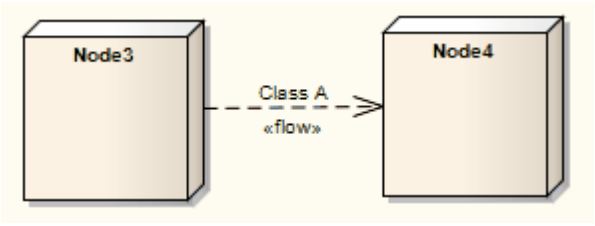

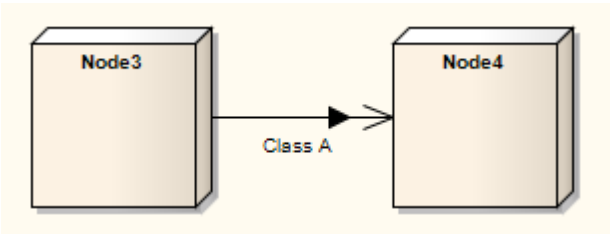

*An information flow is an abstraction of the communication of an information item from its sources to its targets. It is used to abstract the communication of information between entities of a system. Sources or targets of an information flow designate sets of objects that can send or receive the conveyed information item.*

### **6.5.16.1 Using Information Flows**

When you drag an Information Flow connector between two elements on a diagram, Enterprise Architect automatically prompts you to identify the Information items conveyed. You can also immediately go on to realize the Information Flows. However, you can also defer the identification of Information Items at either stage.

You can also create an Information Flow automatically whilst directly defining Information Flow realization, as you might do on a Message on a Sequence diagram.

#### Create and realize Information Flows

Step	Action	See also
1	Open a diagram and add two elements (for example, Nodes on a Deployment diagram).	
2	Click on the <i>Information Flow</i> connector in the Common page of the Toolbox and drag the cursor between the two elements.  The Information Items Conveyed dialog displays.  (If you prefer, click on the <b>Cancel</b> button to create the connector without identifying any information items, to return to the process at a later time.)	<a href="#">Convey Information on a Flow</a> [1413]
3	Add the classifier or Information Item element(s) to the Information Flow.  The diagram now resembles the following:    (If you prefer, click on the <b>OK</b> button to leave the information flow without realizing the flow, to return to the process at a later time.)	<a href="#">Convey Information on a Flow</a> [1413]
4	Add another connector between the same two elements (for example, a <i>Communication Path</i> connector).	
5	Right-click the connector and select the <b>Advanced   Information Flows Realized</b> context menu option.  The Information Flows Realized dialog displays.	
6	Tick the checkbox against each required information item in the realized flow and click on the <b>OK</b> button.  The combined connector now resembles the following:  	<a href="#">Realize an Information Flow</a> [1414]

**Notes**

- Once the Information Flow is realized, you cannot access the Information Items Conveyed dialog directly; you add or delete information items on the connector using the Information Items Realized dialog
- If you have more than one Information Flow connector between the elements, they form part of the same combined connector; you can again work on them separately through the Information Items Realized dialog
- If you have information flows in a diagram that you use as the source for a Pattern, the Information Items Conveyed and Information Flows Realized data is **not** copied into the Pattern
- You can locate, in the Project Browser, the classifier or information item element(s) conveyed on the Information Flow connector, using the **Find Items Conveyed** context menu option on the connector

**Learn more**

- [Message \(Sequence Diagram\)](#)<sup>[1418]</sup>

**6.5.16.2 Convey Information on a Flow**

When you create an Information Flow connector between two elements, Enterprise Architect automatically prompts you to specify which Information Items or classifiers are conveyed on this flow. You can ignore the prompt and add the information items later, or - if you have not realized the information flow with its *existing* information items - you can change and/or add to the information items conveyed.

**Access**    **Information Flow context menu | Advanced | Information Items Conveyed**

**Specify the Information Items conveyed on an Information Flow**

Step	Action	See also
1	On the Information Items Conveyed dialog, click on the <b>Add</b> button. The Select Classifier dialog displays.	
2	Browse or search for the required Information Item or classifier element or elements and select them as required.  If you do not want to retain a selected item on the Select Classifier dialog, press <b>(Ctrl)</b> and click on the item.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
3	Click on the <b>OK</b> button to return to the Information Items Conveyed dialog. Each information item you have selected is listed on a separate line in the dialog.	
4	If you do not want to retain a selected item on this dialog, click on it and click on the <b>Remove</b> button.  Click on the <b>OK</b> button to close the dialog and to show the selected information item element names on the Information Flow connector label.  If appropriate, you can now realize the information items conveyed in this Information	<a href="#">Realize an Information</a>

Step	Action	See also
	Flow.	<a href="#">Flow</a> 

#### Learn more

- [Information Flow](#) 
- [Information Item](#) 
- [Using Information Flows](#) 

### 6.5.16.3 Realize an Information Flow

After you create an information Flow connector you might want to:

- Realize one or more existing flows on the Information Flow connector
- Edit an existing flow on the Information Flow connector

You might also want to create and realize information flows on a non Information Flow connector, such as a Message on a Sequence diagram. You can perform these actions using the Information Flows Realized dialog, which displays all existing flows that can be realized on the selected connector.

**Access** [Connector context menu](#) | [Advanced](#) | [Information Flows Realized](#)

#### Review item flows on an Information Flow Connector

Operation	Action
<b>Realize Information Flows on the selected connector</b>	Select the checkbox for each required flow and click on the <b>OK</b> button.
<b>Cancel realization of a flow</b>	Deselect the checkbox against the appropriate flow, and click on the <b>OK</b> button.
<b>Change the classifier or Information Item elements conveyed on an Information Flow</b>	<p>Click on the flow text, then click on the [ ... ] button.</p> <p>The Select Classifier dialog displays:</p> <ul style="list-style-type: none"> <li>• Click on a single item to select it</li> <li>• <b>[Ctrl]+click</b> on each of several items to select them all, or</li> <li>• <b>[Ctrl]+click</b> on a selected item to deselect it</li> </ul> <p>Click on the <b>OK</b> button to return to the Information Flows Realized dialog and, if required, realize the changed flow as above.</p>
<b>Create a realized</b>	1. Right-click on the connector and select the <b>Information Flows Realized</b> context

Operation	Action
<b>information flow connector on another connector</b>	<p>menu option.</p> <ol style="list-style-type: none"> <li>Click on the <i>Click to create new information flow...</i> text. The Select Classifier dialog displays.</li> <li>Select the required classifier or Information Item elements, and click on the <b>OK</b> button to return to the Information Flows Realized dialog; the selected elements are listed first on the dialog, with the activation checkbox ticked.</li> <li>Click on the <b>OK</b> button to return to the diagram; the connector now displays as a realized Information Flow, with the selected classifier or Information Item elements named in the connector label.</li> </ol>

### Notes

- If there are several Information flows and you do not realize all of them, those that are not realized are represented by a separate Information Items Conveyed iteration of the Information Flow connector; you can only realize those flows on the *original* connector, at which point the flow is represented on that original connector
- If you realize all of the flows, they are combined on the one connector line
- If you realize an information flow on a connector, you can use the **Find Items Conveyed** context menu option to locate the corresponding Information Flow item in the Project Browser

### Learn more

- [Information Flow](#) <sup>[1410]</sup>
- [Message \(Sequence Diagram\)](#) <sup>[1418]</sup>

## 6.5.17 Interrupt Flow

### Description

The *Interrupt Flow* is a connection used to define the two UML concepts of connectors for Exception Handler and Interruptible Activity Region. An Interrupt Flow is a type of activity edge. It is typically used in an Activity diagram.

### Toolbox icon

### Learn more

- [Exception Handler](#) <sup>[1300]</sup>
- [Interruptible Activity Region](#) <sup>[1318]</sup>
- [Activity diagram](#) <sup>[1199]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 327) states:

*An activity edge is an abstract class for directed connections between two activity nodes.*

### **6.5.18 Manifest**

#### **Description**

A Manifest relationship indicates that the Artifact source embodies the target model element, typically in Component and Deployment diagrams. Stereotypes can be added to Enterprise Architect to classify the type of manifestation of the model element.

#### **Toolbox icon**

#### **Learn more**

- [Artifact Element](#) <sup>[1358]</sup>
- [Component Diagram](#) <sup>[1194]</sup>
- [Deployment Diagram](#) <sup>[1197]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 212) states:

*An artifact embodies or manifests a number of model elements. The artifact owns the manifestations, each representing the utilization of a packageable element.*

*Specific profiles are expected to stereotype the manifestation relationship to indicate particular forms of manifestation, e.g. «tool generated» and «custom code» might be two manifestations for different classes embodied in an artifact.*

### 6.5.19 Message

Messages indicate a flow of information or transition of control between elements. Messages can be used in Timing Diagrams, Sequence Diagrams and Communication Diagrams (but not Interaction Overview diagrams) to reflect system behavior. If between Classes or classifier instances, the associated list of operations is available to specify the event.

Moving a Message can disrupt the organization of other features on the diagram. To avoid this, and move *only* the Message, press **Alt** while you move the Message.

#### Toolbox icon

#### Learn more

- [Message \(Sequence Diagram\)](#) <sup>[1418]</sup>
- [Message \(Communication Diagram\)](#) <sup>[1428]</sup>
- [Message \(Timing Diagram\)](#) <sup>[1431]</sup>
- [Timing Diagram](#) <sup>[1431]</sup>
- [Sequence Diagram](#) <sup>[1418]</sup>
- [Communication Diagram](#) <sup>[1428]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 491) states:

*A Message defines a particular communication between Lifelines of an Interaction.*

*A Message is a NamedElement that defines one specific kind of communication in an Interaction. A communication can be, for example, raising a signal, invoking an Operation, creating or destroying an Instance. The Message specifies not only the kind of communication given by the dispatching ExecutionSpecification, but also the sender and the receiver.*

*A Message associates normally two OccurrenceSpecifications - one sending OccurrenceSpecification and one receiving OccurrenceSpecification.*

### 6.5.19.1 Message (Sequence Diagram)

**Sequence** diagrams depict work flow or activity over time using **Messages** passed from element to element. These Messages correspond in the software model to Class operations and behavior. When you display a Sequence diagram, the Diagram Toolbox automatically switches to the **Interaction** Toolbox pages, containing the Message icon.

**Access** Click on the **Message** icon, click on the source object and drag the cursor to the target object (If the Message Properties dialog does not display, right-click on the Message and on the Message Properties menu option)

#### Create a Message on a Sequence diagram

Field/Option/ Button	Action	See also
<b>Message</b>	<p>Type the Message name.</p> <p>If the Message flow is <b>towards</b> a Class element (dropped in from a Class diagram) or a Lifeline element having a classifier, and the <b>destination</b> Class has defined <b>operations</b>, you can click on the drop-down arrow and select an appropriate operation name; the Message then reflects the destination Class operations.</p> <p>You can also include operations that the element's classifier has inherited, in the list. To do this, select the <b>Show Inherited Methods</b> checkbox (below).</p>	<a href="#">Class Element</a> <small>[1363]</small> <a href="#">Lifeline</a> <small>[1321]</small>
<b>Operations</b>	<p>If the available operations on the destination Class are not appropriate, click on this button and define a new operation in the destination element, using the Operations dialog.</p>	<a href="#">General Properties of Operations</a> <small>[1015]</small>

Field/Option/ Button	Action	See also
	If you create a Message without making reference to the target Class operations, no new operation is added to the target Class.	
<b>Parameters</b>	Type any parameters that the Message has, as a comma-separated list.	
<b>Argument(s)</b>	(Optional) Type the actual value that corresponds to each parameter, as a comma-separated list.	
<b>Return Value</b>	If the Message has a return value or type, specify it in this field.	
<b>Show Inherited Methods</b>	Select this checkbox to include operations that the destination element's classifier has inherited, in the drop-down list of operations available in the <b>Message</b> field.  Clear the checkbox to show only operations from the classifier itself.	
<b>Assign to</b>	If the Message flow is <b>from</b> a Class element or Lifeline element with classifier that has defined attributes, click on the drop-down arrow and select an appropriate attribute name.  The Message reflects the attributes from the source Class; you cannot add further attributes to the source Class here - if no appropriate attribute is listed, open the Class element Properties dialog and add the required attribute.  Otherwise, optionally type the name of the object to assign the message flow to.	
<b>Stereotype</b>	(Optional) Type or select a stereotype for the connector (this is displayed on the diagram, if entered).	
<b>Alias</b>	(Optional) Type an alias for the name of the Message.  On the diagram, the alias displays if the <b>Use Alias if Available</b> checkbox is selected on the Diagram tab of the Diagram Properties dialog.  The Alias displays instead of or as well as the Message name, depending on the setting selected in the Alias Usage panel of the Diagram Behavior page of the Options dialog.	<a href="#">Diagram Behavior Options</a> [625]
<b>Condition</b>	Type any conditions that must be <b>true</b> in order for the Message to be sent.	
<b>Constraint</b>	Type any constraints that might exist on when the Message is sent.	

Field/Option/ Button	Action	See also
<b>Is Iteration</b>	<p>Select the checkbox to indicate that the Message will iterate until the specified condition takes the value <b>false</b>. The condition statement on the diagram is prefixed by an asterisk (*).</p> <p>Clear the checkbox to indicate that the Message will only be sent once within the process cycle, if the specified condition is <b>true</b>.</p>	
<b>Synch</b>	<p>Click on the drop-down arrow and select <b>Synchronous</b> or <b>Asynchronous</b> as appropriate.</p> <p>The value <b>Synchronous</b> disables the <b>Kind</b> field (below), synchronous Messages are always Calls.</p>	<a href="#">Call</a> <sup>[1422]</sup>
<b>Kind</b>	<p>This field is enabled when the <b>Synch</b> field is set to <b>Asynchronous</b>.</p> <p>Click on the drop-down arrow and select either <b>Call</b> or <b>Signal</b>, as appropriate.</p>	<a href="#">Asynchronous Signal Message</a> <sup>[1427]</sup>
<b>Lifecycle</b>	<p>Select <b>New</b> to create a new element at the end of the Message, or <b>Delete</b> to terminate the message flow at the end of the Message.</p> <p>If neither case applies, set the field to <b>&lt;none&gt;</b>.</p>	
<b>Is Return</b>	If the Message you have created is a return message, select this checkbox.	
<b>Notes</b>	(Optional) Type any explanatory notes, formatted if you prefer.	
<b>OK</b>	<p>Click on this button to save the Message definition.</p> <ul style="list-style-type: none"> <li>You can change the timing details of a message on the Timing Details dialog, and emphasize the sequence of closely-ordered messages using <i>General Ordering</i></li> <li>To toggle the numbering of messages on a Sequence diagram, select or deselect the <b>Show Sequence Numbering</b> checkbox on the Options dialog</li> </ul>	<a href="#">Change the Timing Details</a> <sup>[1424]</sup> <a href="#">General Ordering</a> <sup>[1426]</sup> <a href="#">Sequence diagrams</a> <sup>[1248]</sup>
<b>Cancel</b>	Click on this button to close the dialog without saving any data you have entered.	

#### Toolbox icon

### Notes

- You can also use the Message connector as an Information Flow, and realize information flows on the Message

- [Realize an Information Flow](#)<sup>[1414]</sup>

#### 6.5.19.1.1 Self-Message

A Self-Message reflects a new process or method invoked within the calling lifeline's operation. It is a specification of a Message, typically in a Sequence diagram.

Self-Message Calls indicate a nested invocation; new activation levels are added with each Call.

#### Self-Message as Return

It is possible to depict a return from a Self Message call.

#### Create a Self Message return

Step	Action
1	Create a second Self Message at the end of execution.
2	Double-click on the Message name to open the Message Properties dialog.
3	Select the <b>Is Return</b> checkbox.
4	Raise the Activation level of the return.

#### Toolbox icon

#### Learn more

- [Sequence Diagram](#) <sup>[1249]</sup>
- [Message](#) <sup>[1417]</sup>
- [Raise the Activation Level](#) <sup>[1256]</sup>
- [Call](#) <sup>[1422]</sup>

#### 6.5.19.1.2 Call

A Call is a type of Message connector that extends the level of activation from the previous Message. All Self-Messages create a new activation level, but this focus of control usually ends with the next Message (unless activation levels are manually adjusted). Self-Message Calls, as depicted above by the first Call, indicate a nested invocation; new activation levels are added with each Call. Unlike a regular Message between elements, a Call between elements continues the existing activation in the source element, implying that the

Call was initiated within the previous Message's activation scope.

### 6.5.19.1.3 Message Examples

The following are different types of Messages available on Sequence Diagrams. Note that Messages on Sequence diagrams can also be modified with Shape Scripts.

#### Other Sequence Messages

The following are examples of Messages that are not part of the sequence described by the diagram.

#### Learn more

- [Messages](#) <sup>[1418]</sup>
- [Sequence Diagrams](#) <sup>[1249]</sup>
- [Shape Scripts](#) <sup>[1582]</sup>

#### 6.5.19.1.4 Change the Timing Details

It is possible to change the timing details of a Message in a Sequence diagram.

**Access** Right-click on the Message | Timing Details

#### Change Timing

Field	Action
<b>Duration Constraint</b>	Indicate the minimum and maximum limits on how long a message can last.
<b>Duration Constraint Between Messages</b>	Indicate the minimum and maximum interval between sending or receipt of the previous message at the current message's source Lifeline, and sending the current message.

Field	Action
<b>Duration Observation</b>	Capture the duration of a message.
<b>Timing Constraint</b>	Indicate the minimum and maximum time at which the message should arrive at the target.
<b>Timing Observation</b>	Capture the point at which the message was sent.

See the OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 511*).

In this diagram, on the *Open Order* Message:

- **Duration Constraint** has been set to **0...13**

On the *Get Cart* Message:

- **Duration Constraint Between Messages** has been set to **d...d\*3**
- **Duration Observation** has been set to **d=duration**
- **Timing Constraint** has been set to **t...t+3**
- **Timing Observation** has been set to **t=now**

By typing a value in the **Duration Constraint** field, you enable the Message angle to be adjusted. After clicking on the **OK** button on the Timing Details dialog, click on the head of the Message connector and drag the connector up or down to change the angle. You cannot extent the angle beyond the life line of the connecting sequence object or create an angle of less than 5 degrees.

You can also create the **Duration Constraint Between Messages** line by dragging the General Ordering arrow up to the point at which the previous message joins the source Lifeline for the current message. A dialog displays on which you enter the value for the constraint. Having created the line, you can move it to any point within half way along the current message and half way along the previous message, to avoid overlap with other message timing details. You can edit or delete the value either **through the Timing Details** dialog or by right-clicking on the line itself and selecting the appropriate context menu option.

#### Learn more

- [Sequence Diagram](#)<sup>[1249]</sup>
- [Message](#)<sup>[1417]</sup>
- [General Ordering](#)<sup>[1426]</sup>

#### 6.5.19.1.5 General Ordering

In a Sequence diagram, the workflow is represented by the sequence of Messages down the diagram. Messages near the top of the diagram are passed before Messages lower down the diagram.

In the diagram, *Message 1* is earlier than *Message 2*. However, in a complex diagram, or when representing finely timed operations or parallel processing, this might not be apparent. You can reinforce the sequence using a **General Ordering arrow**.

Click on the Message arrow. A small arrow displays at the source anchor point.

Click on this arrow and drag it to the start of the next Message in sequence (*Message 2* in the example). The General Ordering arrow displays, indicating that the second Message follows the first.

You can have more than one General Ordering arrow issuing from or targeting a Message, if necessary.

#### 6.5.19.1.5.1 Asynchronous Signal Message

You define a Message as an asynchronous signal message by displaying the Message Properties dialog and setting the **Synch** field to **Asynchronous** and the **Kind** field to **Signal**. A *synchronous* message cannot be used to convey signals, so setting the **Synch** field to **Synchronous** disables the **Kind** field.

**Return Value**, **Assign To** and the **Operations** button, which are not applicable to asynchronous *signals*, are disabled.

The **Operations** button changes to a **Signal** button, which you click on to associate the asynchronous signal message with a Signal element in the model. You can type the arguments corresponding to the Signal attributes into the **Argument(s)** field.

When you click on the **Signal** button, the Select Signal dialog displays, through which you locate and select the required Signal element. (The Select Signal dialog is a variation of the Select <Item> dialog.)

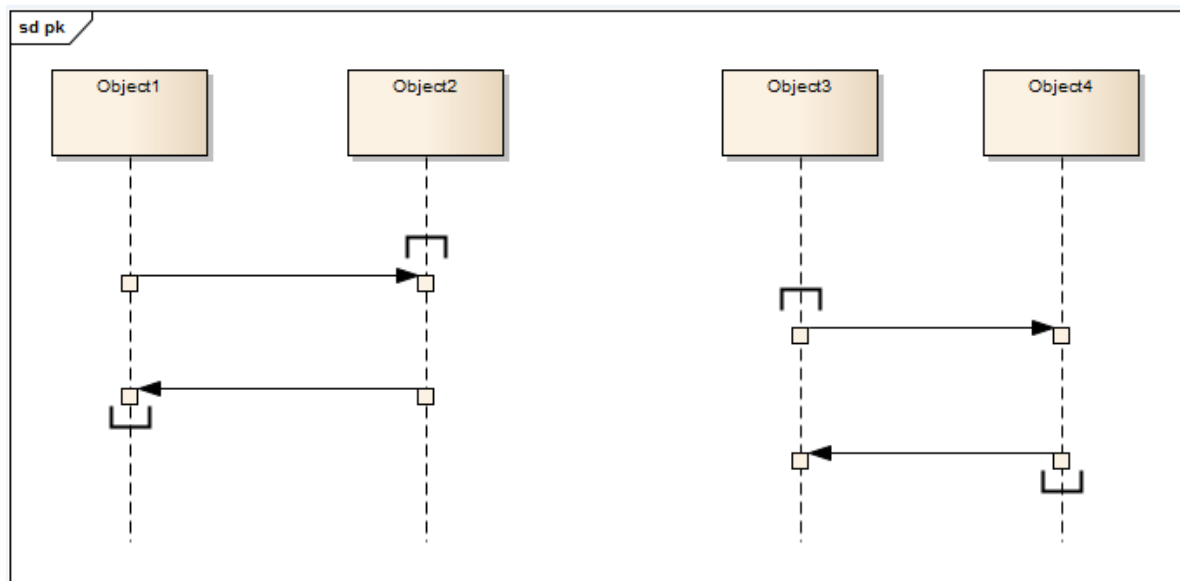

#### Learn more

- [Message Properties Dialog](#) <sup>[1418]</sup>

#### 6.5.19.1.6 Co-Region Notation

*Co-Region notation* can be used as a short hand for parallel combined fragments. You can add this notation to a Sequence diagram using the **Co-Region** submenu, which you display by right-clicking on a connector in a Sequence diagram and selecting the **Co-Region** context menu option. There are four sub-options available:

- **Start at head**
- **End at head**
- **Start at tail**
- **End at tail**

### 6.5.19.2 Message (Communication Diagram)

A Message in a Communication diagram is equivalent in meaning to a Message in a Sequence diagram. It implies that one object uses the services of another object, or sends a message to that object. Communication Messages in Enterprise Architect are always associated with an Association connector between object instances. Always create the Association first, then add a Message to the connector.

Messages can be dragged into a suitable position by clicking and dragging on the message text.

Communication Messages are ordered to reflect the sequencing of the diagram. The numbering scheme should reflect the nesting of each event. A sequencing scheme could be:

```
1
2, 2.1, 2.2, 2.3
3.
```

This would indicate the single sequence of events 2.1, 2.2 and 2.3 occurs within an operation initiated by event 2. This is the default pattern applied by Enterprise Architect.

Alternatively, the sequence could be:

```
1
2, 2.1, 2.1.1, 2.1.1.1
    2.2, 2.2.1, 2.2.1.1
3
```

This would indicate that two sequences of events can be initiated by event 2, and 2.1 and 2.2 are separate sequences, not consecutive events in one sequence. You can set the sequence pattern and order using the Message Properties dialog and the Sequence Communications dialog.

If the target object is a Class or has its instance classifier set, the drop-down list of possible message names includes the exposed operations for the base type.

#### Learn more

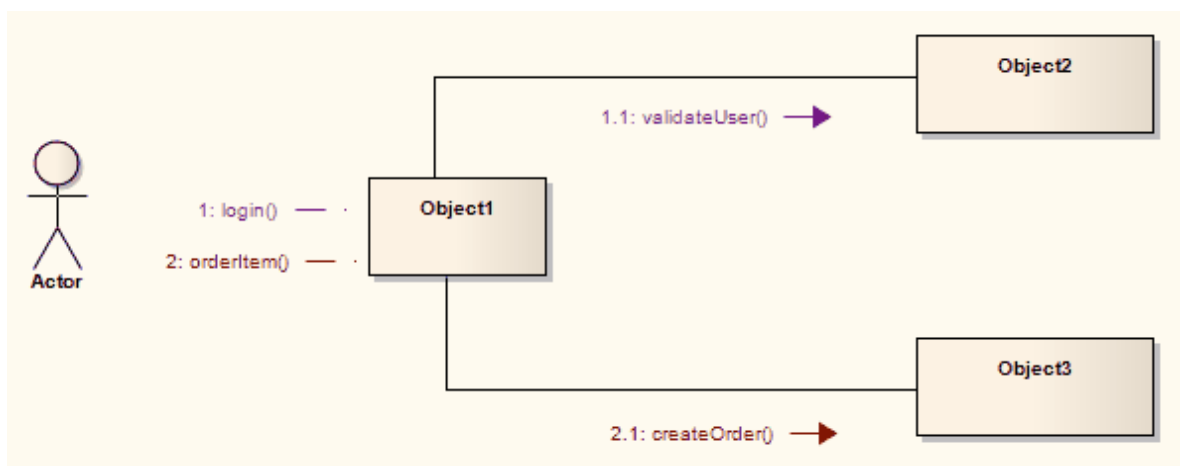

- [Communication Diagram](#) 

- [Create a Communication Message](#) <sup>[1429]</sup>
- [Re-Order Messages](#) <sup>[1430]</sup>

### 6.5.19.2.1 Create a Communication Message

#### Create a Communication Message

Step	Action
1	Open a diagram (one of: Communication, Analysis, Interaction Overview, Object, Activity or State Machine).
2	Add the required objects.
3	Add an Association relationship between each pair of objects that communicate.
4	Right-click on an Association to display the context menu.
5	Select the option to add a Message from one object to the other.
6	When the Message Properties dialog displays, type in a name and any other required details.
7	Click on the <b>OK</b> button. The Message is added, connected to the Association and Object instances.
8	Move the Message to the required position.

Learn more

- [Communication Message](#)<sup>[1428]</sup>
- [Message \(Sequence Diagram\)](#)<sup>[1418]</sup>

**6.5.19.2.2 Re-Order Messages**

When constructing your Communication diagram, it is frequently necessary to create or delete Message 'groups' and to re-order the sequence of Messages. There are two dialogs that help you perform these tasks: the Message Properties dialog and the Sequence Communications dialog.

**Organize Message Groups**

If you have several Messages in the form 1.1, 1.2, 1.3, 1.4, for example, but would like to start a new numbering group on, say, the third Message (that is, 1.1, 1.2, **2.1**, 2.2, 2.3 ), you can change a Message in the series to a *Start Group* message.

Step	Action
<b>1</b>	Double-click on a Message <i>name</i> . The Message Properties dialog displays.
<b>2</b>	To make the selected Message the start of a new group, select the <b>Start New Group</b> checkbox.
<b>3</b>	If required, in the <b>Notes</b> field, type an explanatory note. You can format the text using the Notes toolbar at the top of the field.
<b>4</b>	Click on the <b>OK</b> button to save changes.

**Sequence Messages**

In larger and more complex diagrams, you might have to use deeper levels of Messages in a group; for example, 1, 1.2, 1.2.1, 1.2.1.1. You might also have to change the sequence of Messages, making Message 1.3, for example, into Message 1.1.

Step	Action
<b>1</b>	Either: <ul style="list-style-type: none"> <li>• Select the <b>Diagram   Advanced   Sequence Messages</b> menu option</li> <li>• Click on the diagram background and select the <b>Sequence Communication Messages</b> context menu option or</li> <li>• Right-click on a Message and select the <b>Sequence Communication Messages</b> context menu option</li> </ul>

Step	Action
	The Communication Messages dialog displays.
2	Click on the Message to adjust and, at the bottom of the dialog, click on the: <ul style="list-style-type: none"> <li>• <b>Move Up</b> or <b>Move Down</b> (Hand) buttons to move the Message up or down the sequence (e.g. Message 1.2 to Message 1.1 or 1.3)</li> <li>• <b>Move Left</b> or <b>Move Right</b> (Hand) buttons to move the Message up or down a level (e.g. Message 1.2.1 to Message 1.2 or Message 1.2.1.1)</li> </ul>
3	Repeat step 2 until the Message sequence and levels match your requirements. You might have to adjust other Message numbers (in group, sequence or level) to accommodate the changes you have made.
4	Click on the <b>OK</b> button to save changes.

### 6.5.19.3 Message (Timing Diagram)

**Messages** are the communication links between Lifelines in a Timing diagram. In the case of a Timeline, a Message is a connection between two Timeline objects.

See UML Superstructure Specification, v2.1.1, figures 14.30 and 14.31, p. 520.

#### Toolbox icon

#### Learn more

- [Timing Diagram](#) <sup>[1225]</sup>
- [Lifeline](#) <sup>[1321]</sup>
- [Create a Timing Message](#) <sup>[1432]</sup>

#### 6.5.19.3.1 Create a Timing Message

You can create a Timing Message between two Lifeline objects (State or Value) on a Timing diagram, each with existing transition points.

#### Create a Message between Lifelines

Step	Action
1	Click on the Message icon on the Timing Relationships page of the Toolbox ( <b>More tools   Timing</b> ).
2	Click on the source Lifeline at the point at which the Message will start, and drag the cursor to the transition point on the destination Lifeline where the Message will end.

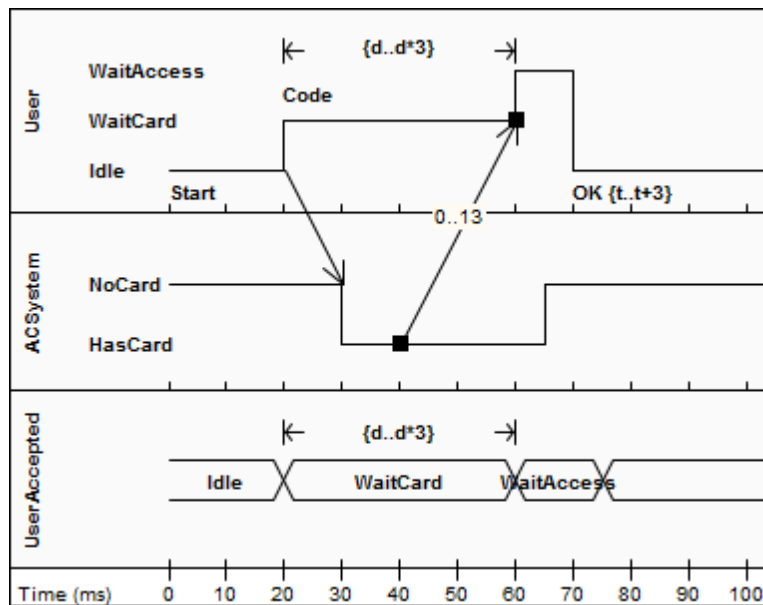

Step	Action
	A new Timing Message is created between these two points.
<b>3</b>	Double-click on the new Message to open the Timing Message dialog. Review or complete the dialog as indicated in the Dialog Fields table.

#### Dialog Fields

Field/Button	Action
<b>Start</b>	Identifies the Lifeline from which the Message originates.
<b>End</b>	Identifies the Lifeline on which the Message terminates.
<b>Start Time</b>	Shows the time after the timeline begins at which the Message starts. You can change this if you need to.
<b>End Time</b>	Shows the time after the timeline begins at which the Message ends. You can change this if you need to, but the time must correspond to a transition point on the target Lifeline.
<b>Name</b>	(Optional) Type in a name for the Message.
<b>Time Observation</b>	(Optional) Type any text to act as a label providing information on when the Message is sent.
<b>Duration Observation</b>	(Optional) Type any text to act as a label providing information on the interval of a Lifeline at a particular state, begun from receipt of the Message.
<b>Transition To</b>	The state in the target Lifeline that the Message terminates on. If necessary, you can click on the drop-down arrow and select a different state to transition to. The head of the Message moves accordingly.
<b>Event</b>	(Optional) Type in the name of any event that triggers the transition.
<b>Time Constraint</b>	(Optional) Type in the maximum time it can take to transmit the Message.
<b>Duration Constraint</b>	(Optional) Type in the maximum time the Lifeline can remain in the changed state after receipt of the Message.

Field/Button	Action

This diagram shows an example of a configured Message:

(See *UML Superstructure Specification*, v2.1.1, figures 14.30 and 14.31, p. 520.)

### Notes

- You can move the source end of the Message freely along the source timeline; however, the target end (arrow head) must attach to a transition
- If you create a new Message and do not give it a target transition, it automatically finds and attaches to the nearest transition; if you move the target end, it drags the transition with it

## 6.5.20 Nesting

### Description

The Nesting Connector is an alternative graphical notation for expressing containment or nesting of elements within other elements. It is most appropriately used for displaying Package nesting in a Package diagram.

### Toolbox icon

### Learn more

- [Package Diagram](#) f1182

## 6.5.21 Notelink

### Description

A Notelink connector connects a Note to one or more other elements of any other type.

Both Note and Notelink are available in any category of the Toolbox, in the Common page. You can also select them from the UML Elements toolbar.

### Toolbox icon

## 6.5.22 Object Flow

### Description

*Object Flows* are used in Activity diagrams and State Machine diagrams. When used in an Activity diagram, an Object Flow connects two elements, with specific data passing through it. To view sample Activity

diagrams using Object Flows, see the *Object Flows in Activity Diagrams* topic.

In State Machine diagrams, an Object Flow is a specification of a state flow or transition. It implies the passing of an Object instance between elements at run-time.

You can insert an Object Flow from the State or Activity pages of the Toolbox, or from the drop-down list of all relationships located in the header toolbar. You can also modify a transition connection to an Object Flow by selecting the **ObjectFlow** checkbox on the connection Properties dialog.

See the *Control Flow* topic for information on setting up Guards and Weights on Object Flows.

#### Toolbox icon

#### Learn more

- [Activity Diagram](#) <sup>[1199]</sup>
- [Control Flow](#) <sup>[1403]</sup>
- [Object Flows in Activity Diagrams](#) <sup>[1436]</sup>
- [Object Node](#) <sup>[1325]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 389*) states:

*An object flow is an activity edge that only passes object and data tokens.*

### **6.5.22.1 Object Flows in Activity Diagrams**

In Activity diagrams, there are several ways to define the flow of data between objects.

The following diagram depicts a simple Object Flow between two actions, *Fill Order* and *Ship Order*, both accessing order information.

See *UML Superstructure Specification, v2.1.1, figure 12.110, p. 391*.

This explicit portrayal of the data object *Order*, connected to the Activities by two Object Flows, can be refined by using the following format. Here, Action Pins are used to reflect the order.

See *UML Superstructure Specification*, v2.1.1, figure 12.110, p. 391.

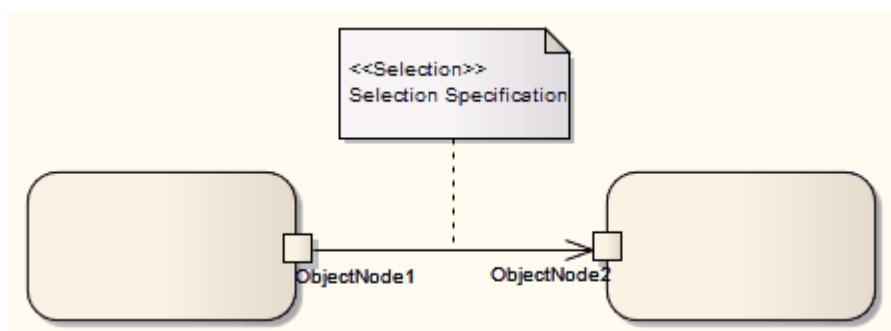

The following diagram is an example of multiple Object Flows exchanging data between two actions.

See *UML Superstructure Specification*, v2.1.1, figure 12.111, p. 391.

Selection and transformation behavior, together composing a sort of query, can specify the nature of the Object Flow's data access. Selection behavior determines which objects are affected by the connection. Transformation behavior might then further specify the value of an attribute pertaining to a selected object.

Selection and transformation behaviors can be defined by attaching a note to the Object Flow. To do this, right-click on the Object Flow and select the **Attach Note or Constraint** context menu option. A dialog lists other flows in the diagram, to which you can select to attach the note, if the behavior applies to multiple flows. To comply with UML 2, preface the behavior with the notation «*selection*» or «*transformation*».

See *UML Superstructure Specification*, v2.1.1, figure 12.112, p. 392.

### 6.5.23 Occurrence

#### Description

An *Occurrence* relationship indicates that a Collaboration represents a classifier, in a Composite Structure diagram. An Occurrence connector is drawn from the Collaboration to the classifier.

#### Toolbox icon

#### Learn more

- [Collaboration](#) <sup>[1367]</sup>
- [Composite Structure Diagram](#) <sup>[1188]</sup>

### 6.5.24 Package Import

#### Description

A Package Import relationship is drawn from a source Package to a Package whose contents are to be imported. Private members of a target Package cannot be imported. The relationship is typically used in a Package diagram.

#### Toolbox icon

#### Learn more

- [Package](#) <sup>[1382]</sup>
- [Package Diagram](#) <sup>[1182]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 112*) states:

*A package import is a relationship between an importing namespace and a package, indicating that the importing namespace adds the names of the members of the package to its own namespace. Conceptually, a package import is equivalent to having an element import to each individual member of the imported namespace, unless there is already a separately-defined element import.*

### 6.5.25 Package Merge

**Description**

In a Package diagram, a Package Merge indicates a relationship between two Packages whereby the contents of the target Package are merged with those of the source Package. Private contents of a target Package are not merged. The applicability of a Package Merge addresses any situation where multiple packages contain identically-named elements, representing the same thing. A Package Merge merges all matching elements across its merged Packages, along with their relationships and behaviors. Note that a Package Merge essentially performs generalizations and redefinitions of all matching elements, but the merged Packages and their independent element representations still exist and are not affected.

The Package Merge serves a graphical purpose in Enterprise Architect, but creates an ordered Package relationship applied to related Packages (which can be seen under the Link tab in the Package's Properties dialog). Such relationships can be reflected in XML exports or Enterprise Architect Automation Interface scripts for code generation or other Model Driven Architecture (MDA) interests.

Package Merge relationships are useful to reflect situations where existing architectures contain functionalities involving like elements, which are merged in a developing architecture. Merging doesn't affect the merged objects, and supports the common situation of product progression.

**Toolbox icon****Learn more**

- [Package Diagram](#) <sup>[1182]</sup>
- [Package](#) <sup>[1382]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 113-114*) states:

A package merge is a directed relationship between two packages that indicates that the contents of the two packages are to be combined. It is very similar to Generalization in the sense that the source element conceptually adds the characteristics of the target element to its own characteristics resulting in an element that combines the characteristics of both.

This mechanism should be used when elements defined in different packages have the same name and are intended to represent the same concept. Most often it is used to provide different definitions of a given concept for different purposes, starting from a common base definition. A given base concept is extended in increments, with each increment defined in a separate merged package. By selecting which increments to merge, it is possible to obtain a custom definition of a concept for a specific end. Package merge is particularly useful in meta-modeling and is extensively used in the definition of the UML metamodel.

Conceptually, a package merge can be viewed as an operation that takes the contents of two packages and produces a new package that combines the contents of the packages involved in the merge. In terms of model semantics, there is no difference between a model with explicit package merges, and a model in which all the merges have been performed.

### 6.5.26 Realization

#### Description

A source object implements or Realizes its destination object. Realize connectors are used in a Use Case, Component or Requirements diagram to express traceability and completeness in the model. A business process or Requirement is realized by one or more Use Cases, which in turn are realized by some Classes, which in turn are realized by a Component, and so on. Mapping Requirements, Classes and such across the design of your system, up through the levels of modeling abstraction, ensures the big picture of your system remembers and reflects all the little pictures and details that constrain and define it.

You can also define template binding parameters for a Realize connector between a binding Class and a parameterized Class.

#### Toolbox icon

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 131) states:

*A Realization signifies that the client set of elements are an implementation of the supplier set, which serves as the specification. The meaning of 'implementation' is not strictly defined, but rather implies a more refined or elaborate form in respect to a certain modeling context. It is possible to specify a mapping between the specification and implementation elements, although it is not necessarily computable.*

### 6.5.27 Recursion

#### Description

A Recursion is a type of Message used in Sequence diagrams to indicate a recursive function.

#### Toolbox icon

#### Learn more

- [Message](#) <sup>[1418]</sup>
- [Sequence Diagram](#) <sup>[1249]</sup>

### 6.5.28 Role Binding

#### Description

Role Binding is the mapping between a Collaboration Use's internal roles and the respective Parts required to implement a specific situation, typically in a Composite Structure diagram. The associated Parts can have properties defined to enable the binding to occur, and the Collaboration to take place.

A Role Binding connector is drawn between a Collaboration and the classifier's fulfilling roles, with the Collaboration's internal binding roles labeled on the classifier end of the connector.

#### Toolbox icon

### Learn more

- [Collaboration Use](#) <sup>[1368]</sup>
- [Composite Structure Diagram](#) <sup>[1188]</sup>
- [Collaboration](#) <sup>[1367]</sup>

### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 174) states:

*A mapping between features of the collaboration type and features of the classifier or operation. This mapping indicates which connectable element of the classifier or operation plays which role(s) in the collaboration. A connectable element may be bound to multiple roles in the same collaboration use (that is, it may play multiple roles).*

## 6.5.29 Represents

### Description

The Represents connector indicates that a Collaboration is used in a classifier, typically in a Composite Structure diagram. The connector is drawn from the Collaboration to its owning classifier.

### Toolbox icon

### Learn more

- [Collaboration](#) <sup>[1367]</sup>
- [Composite Structure Diagram](#) <sup>[1188]</sup>

### 6.5.30 Representation

#### Description

The Representation relationship is a specialization of a Dependency, connecting Information Item elements that represent the same idea across models, typically in an Analysis diagram. For example, Bonus and Salary are both a representation of the Information Item Wage.

#### Toolbox icon

#### Learn more

- [Dependency](#) <sup>[1404]</sup>
- [Information Item](#) <sup>[1376]</sup>
- [Analysis diagram](#) <sup>[1801]</sup>

### 6.5.31 Substitution

#### Description

A Substitution is a relationship between two Classifiers, signifying that the **substituting** Classifier complies with the **contract** specified by the **contract** Classifier. This implies that instances of the substituting Classifier are runtime-substitutable, where instances of the contract Classifier are expected. Above, the Class named *ResizableWindow* has a Substitution connector to the Class named *Window*, meaning that wherever you are asked for a window you can use a resizable window.

The Substitution relationship is a subtype of a Dependency relationship.

#### Toolbox icon

#### Learn more

- [Class Diagram](#) <sup>[1184]</sup>
- [Dependency](#) <sup>[1404]</sup>

### 6.5.32 Template Binding

#### Description

You create a Template Binding connector between a binding Class and a parameterized Class. You then define a binding expression on that connector. However, if the binding Class requires a Generalization, Realization or Association relationship with the parameterized Class, you can define the binding expression on that relationship instead.

You can create a Template Binding connector using:

- The **Template Binding** icon on the Class Relationships page of the Diagram Toolbox
- The Quicklinker arrow next to the source Class element
- The Templates tab of the binding Class element Properties dialog; here, you create the Template Binding relationship by clicking the **Add** button under the Binding(s) panel, specifying the connector type, and selecting the target parameterized Class from the Select <Item> dialog

Each of these methods creates the connector itself. For the first two methods you then double-click on the connector to display the connector Properties dialog, on which you select the Binding tab to define *parameter substitutions* as the binding expression. The third method takes you to this dialog and tab automatically.

#### Toolbox icon

#### Learn more

- [Parameterized Class](#) <sup>[1365]</sup>
- [Parameter Substitution](#) <sup>[1445]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 622) states:

*A template is a parameterized element ... used to generate other model elements using TemplateBinding relationships. The template parameters for the template signature specify the formal parameters that will be substituted by actual parameters (or the default) in a binding.*

**6.5.32.1 Parameter Substitution**

Once a Template Binding (or other binding) relationship exists, you can add parameter substitutions to identify the formal parameters that are replaced, and the actual parameters that replace them, in the binding expression.

**How to**

To define a parameter substitution

Step	Action
<b>1</b>	Display the Binding tab, in the Template Binding connector Properties dialog. The <b>Target</b> field identifies the target parameterized Class.
<b>2</b>	Click on the <b>Add</b> button below the Parameter Substitution(s) panel. The next available row in the panel is enabled for editing, and the word <i>&lt;none&gt;</i> is displayed in the <b>Formal</b> column.
<b>3</b>	Click on the field and on the drop-down arrow that is now displayed. A list of the template parameters from the target Class displays; click on the required parameter.
<b>4</b>	Click on the ( ... ) button in the corresponding <b>Actual</b> field for the parameter. If the template parameter: <ul style="list-style-type: none"> <li>Does not have a constraint, a short context menu displays offering the choice of typing a free-text value into the <b>Actual</b> field, or selecting a classifier from the Select Classifier dialog</li> <li>Has a constraint defined, the Select Classifier dialog displays automatically, showing the available classifiers</li> </ul>
<b>5</b>	Locate and select the required classifier to replace the parameter in the binding expression. If you do not define an <b>Actual</b> classifier <i>and</i> the template parameter has a default value defined, that default is used in the expression.
<b>6</b>	To edit existing parameter substitutions, click on them and make the required changes as indicated in steps 3 and 4.

Step	Action
7	Click on the <b>Apply</b> and/or <b>OK</b> button. The parameter substitutions display as a label underneath the connector.

#### Learn more

- [Template Binding](#)<sup>[1444]</sup>

### 6.5.33 Trace

#### Description

The Trace relationship is a specialization of an Abstraction, connecting model elements or sets of elements that represent the same concept across models. Traces are often used to track requirements and model changes, typically in a Traceability diagram, or in a Class, Use Case, Object or Composite Structure diagram.

As changes can occur in both directions, the order of this Trace is usually ignored. The relationship's properties can specify the trace mapping, but the trace is usually bi-directional, informal and rarely computable.

#### Toolbox icon

#### Learn more

- [Abstraction](#)<sup>[1391]</sup>
- [Example Traceability Diagram](#)<sup>[743]</sup>

### 6.5.34 Transition

**Description**

If you need to define the logical movement from one State to another in a State Machine diagram, you can drag a *Transition* connector from the Toolbox onto the diagram. You control the Transition through the connector Properties dialog.

Field	Action	See also
<b>Guard</b>	Type in the expression to be evaluated <b>after</b> an Event is dispatched but <b>before</b> the corresponding Transition is triggered.  If the guard is true at that time, the Transition is enabled; otherwise, it is disabled.	
<b>Effect is a Behavior</b>	Convert the <b>Effect</b> field from a free-text field to the definition of a specific Activity or behavior.  The Select <Item> dialog displays, prompting you to select the Activity or behavior element from the model.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
<b>Effect</b>	Either: <ul style="list-style-type: none"> <li>Type a description of the effect of the Transition, or</li> <li>If you have selected the <b>Effect is a Behavior</b> check box, select an Activity or behavior to be performed during the Transition (to change this subsequently, click on the ( ... ) button to redisplay the Select &lt;Item&gt; dialog)</li> </ul>	
<b>Trigger</b>		
<b>Name</b>	Specify the name of the trigger; either: <ul style="list-style-type: none"> <li>Type the name, or</li> <li>Select an existing trigger in the model from the Select &lt;Item&gt; dialog, which you display by clicking on the ( ... ) button</li> </ul>	
<b>Type</b>	Specify the type of trigger: <ul style="list-style-type: none"> <li><b>Call</b> - specifies that the event is a <b>CallEvent</b>, which sends a message to the associated object by invoking an operation</li> <li><b>Change</b> - specifies that the event is a <b>ChangeEvent</b>, which indicates that the transition is the result of a change in value of an attribute</li> <li><b>Signal</b> - specifies that the event is a <b>SignalEvent</b>, which corresponds to the receipt of an asynchronous signal instance</li> <li><b>Time</b> - corresponds to a <b>TimeEvent</b>; which specifies a moment in time</li> </ul> <p>Code generation for State Machines expects a specification value for any of the four types.</p>	

Field	Action	See also
<b>Specification</b>	Specify the event instigating the Transition; either: <ul style="list-style-type: none"> <li>Type the event (time or change), or</li> <li>Select an existing specification in the model using the Select &lt;Item&gt; dialog, which you display by clicking on the ( ... ) button</li> </ul>	
<b>New</b>	Clear the fields ready to begin defining a new trigger.	
<b>Save</b>	Save the newly created or edited trigger.	
<b>Delete</b>	Remove the selected trigger from the list.	
<b>&lt;trigger list&gt;</b>	List the existing triggers, which might or might not have names and types, and which can include triggers created in older models.	

### Notes

- Fork and Join segments can have neither triggers nor guards
- You can identify hidden triggers and locate triggers in the Project Browser, using the **Find Triggers Associated** option on the Transition connector context menu; if one trigger exists for the Transition it is immediately highlighted in the Project Browser, if more than one trigger exists the Element Usage dialog displays - select the required trigger and click on the **Open** button to highlight the trigger in the Project Browser
- You can define a self-Transition as an **Internal Transition**, and represent the connector and its properties in a compartment of the State element

### Toolbox icon

### Learn more

- [State Machine Diagrams](#) <sup>f203</sup>
- [Internal Transition](#) <sup>f448</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 568*) states:

*A transition is a directed relationship between a source vertex and a target vertex. It may be part of a compound transition, which takes the state machine from one state configuration to another, representing the complete response of the state machine to an occurrence of an event of a particular type.*

### 6.5.34.1 Internal Transition

If you need to define an **internal Transition** in a State, you can do so by creating an external **self-Transition** connector (where the **Source** and **Target** are the same State) and then changing the connector **kind** property. The self-Transition connector is then removed from the diagram and the internal Transition displays in a **compartment** inside the State element.

**Access**    **Open the State Machine diagram containing the State element**

#### Define an Internal Transition

Step	Action	See also
1	On the State element, create a Transition connector issuing from and terminating in the element (a self Transition).  Right-click on the connector and select the <b>Properties</b> context menu option to display the Properties dialog.	
2	Select the Constraints page and define any guard, effect and trigger for the Transition.	<a href="#">Transition</a> 
3	On the Advanced page, click on the drop-down arrow in the value field for the <b>kind</b> property and select <b>internal</b> .	
4	Click on the <b>OK</b> button. The Transitions display in the same compartment as internal activities ( <i>exit</i> , <i>do</i> , <i>entry</i> ).  	

#### Notes

- To view or edit the properties of the internal Transition, double-click on the entry in the compartment within the State
- If you need multiple internal transitions, including those with the same Trigger but different guards, you create them separately with each Transition having its own guard

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.4.1, p. 583*) states:

*An internal transition executes without exiting or re-entering the state in which it is defined. This is true even if the state machine is in a nested state within this state.*

### 6.5.35 Usage

#### Description

A Usage is a Class diagram relationship in which one element requires another element for its full implementation or operation. The diagram above shows that the Class *Order* requires the Class *LineItem* for its full implementation.

The Usage relationship is a subtype of a Dependency relationship.

#### Toolbox icon

#### Learn more

- [Class Diagram](#) 1184
- [Dependency](#) 1404

### 6.5.36 Use

#### Description

A Use relationship indicates that one element requires another to perform some interaction. The Use relationship does not specify how the target supplier is used, other than that the source client uses it in definition or implementation.

You typically use the Use relationship in Use Case diagrams to model how Actors use system functionality (Use Cases).

#### Notes

- It is more usual (and correct UML) to have an Association between an Actor and a Use Case

- The **Usage** relationship, used in Class diagrams, is a different relationship

#### Toolbox icon

#### Learn more

- [Use Case Diagram](#) <sup>[1201]</sup>
- [Association](#) <sup>[1393]</sup>
- [Usage](#) <sup>[1450]</sup>

## 6.6 UML Stereotypes

UML supports *stereotypes*, which are an inbuilt mechanism for logically extending or altering the meaning, display, characteristics or syntax of a basic UML model elements. You can apply stereotypes to a range of model element types, including:

- Elements (such as Classes and Objects)
- Relationships (such as Dependencies and Associations)
- Association Ends
- Attributes and Operations
- Operation Parameters

Different model elements have different stereotypes associated with them. You can create and use your own stereotypes in three different ways:

- To create a new object **type** based on a basic UML model element type, to be imported as part of a Profile into any model and made available for use through the Diagram Toolbox; examples of extended element types already provided in Enterprise Architect include a Table element (which is a stereotyped Class element) and Boundary, Control and Entity elements (which are are stereotyped Object elements)
- To customize the appearance or property of an **instance** of a model element of a specific type; these stereotypes are applied only through the Properties dialog of the object, within the model in which they are created, although you can transport custom stereotype definitions between models as Reference Data
- As a simple label on an element, to identify the role or nature of the object that the element represents

For further definitions of stereotypes, see the OMG UML specification (*UML Superstructure Specification*, v2.1.1, section 18.3.8, pp. 667-672).

Where a stereotype does not affect appearance, it is generally indicated by name on the base UML object shape. In the example below, «myStereotype2» is the stereotype name. Some of the built-in stereotypes are also represented by icons; see *Stereotype Visibility*.

Where the stereotype causes the element to be drawn differently, or is used to define a new type of object, the element shape can be quite different, as illustrated by the three Robustness diagram stereotypes:

You apply a new appearance or shape by associating the stereotype with either a metafile (image file) and fill, border and text colors, or a Shape Script that defines the shape, dimensions and text of the object.

### 6.6.1 Apply Stereotypes

During the course of your modeling, you may decide that an existing object needs a stereotype applied. Enterprise Architect allows new stereotypes to be applied to objects by themselves or in combination with other stereotypes. You will do this through the **Stereotype** field on:

- The object's Properties **dialog** or
- For an element, the element Properties **window**

**Access** **double-click on object > General**  
**click on element | Element | Properties Window (Alt+1)**

#### Apply stereotype to object, using Stereotype field on Properties dialog

Use any *one* of these steps:

Step	Action	See also
1	Type the stereotype(s) to apply as a comma-separated list.  The system checks the loaded and enabled Profiles and Technologies, and the Stereotypes table, for a stereotype with a matching name and base type. If it finds a	

Step	Action	See also
	<p>match, it links to that stereotype and applies the effects. If it doesn't find a match, it creates a new stereotype name in the Stereotypes table and links to that - the stereotype acting as a simple label.</p> <p>Therefore:</p> <ul style="list-style-type: none"> <li>• If you don't want the element's stereotype to match with an identically named stereotype located by the system, either: <ul style="list-style-type: none"> <li>• Disable the Technology that owns the stereotype</li> <li>• Unload the Profile that owns the stereotype, or</li> <li>• Delete the stereotype from the stereotypes table</li> </ul> </li> <li>• If you do want the stereotype to match to a specific stereotype in a Profile or Technology, load the Profile or enable the Technology.</li> </ul>	
2	Click on the drop-down arrow and select the required (single) stereotype from the list.	
3	Click on the ( ... ) button at the right of the field, and use the Stereotype Selector dialog.	<a href="#">Stereotype Selector</a> <small>[1455]</small>

#### Apply stereotype to element using Stereotype field on Properties window

Stereotype

Use any *one* of these steps:

Step	Action	See also
1	<p>Type the stereotype(s) to apply as a comma-separated list.</p> <p>The system checks the loaded and enabled Profiles and Technologies, and the Stereotypes table, for a stereotype with a matching name and base type. If it finds a match, it links to that stereotype and applies the effects. If it doesn't find a match, it creates a new stereotype name in the Stereotypes table and links to that - the stereotype acting as a simple label.</p> <p>Therefore:</p> <ul style="list-style-type: none"> <li>• If you don't want the element's stereotype to match with an identically named stereotype located by the system, either: <ul style="list-style-type: none"> <li>• Disable the Technology that owns the stereotype</li> <li>• Unload the Profile that owns the stereotype, or</li> <li>• Delete the stereotype from the stereotypes table</li> </ul> </li> <li>• If you do want the stereotype to match to a specific stereotype in a Profile or Technology, load the Profile or enable the Technology.</li> </ul>	

Step	Action	See also
2	Click on the drop-down arrow and select the required stereotype from the list.	
3	Select the <b>browse other stereotypes...</b> option at the end of the drop-down list to use the Stereotype Selector dialog.	<a href="#">Stereotype Selector</a> <sup>[1455]</sup>

#### Learn more

- [Properties Window](#)<sup>[992]</sup>
- [Custom Stereotypes](#)<sup>[1461]</sup>

## 6.6.2 Stereotype Selector

If you want to apply more than one stereotype to a UML object, from **multiple sources** such as Profiles or the Custom Stereotypes list, you can select the stereotypes from the Stereotype Selector dialog. This dialog also helps you to identify existing, valid **individual** stereotypes, and to create new stereotypes. The new stereotypes, at this point, are simple labels; if you want them to impose an effect on the object, locate them on the Stereotypes tab of the UML Types dialog and define the effect.

**Access**    **Right click object | Properties > General: Stereotype ( ... )**

#### Select stereotypes to apply or remove

Field/ Button	Action
<b>Profile</b>	Click on the drop-down arrow and choose the required stereotype source - an integrated MDG Technology or the base EAUML, or your Customized Stereotypes list (select the blank entry).
<b>Stereotypes</b>	Select the checkbox against each required stereotype. If you no longer want to use a stereotype, deselect the checkbox.
<b>New</b>	Click on this button to create a new (but undefined) stereotype. A prompt displays for the stereotype name.
<b>OK</b>	Click on this button to apply the selection.

#### Notes

- If you have selected more than one stereotype, the **Stereotypes** field of the Properties dialog only shows one of them; the full list **is** shown on the object in the diagram
- The appearance of a stereotype on an object in a diagram is influenced by the stereotype visibility settings on the Diagram Properties dialog

#### Learn more

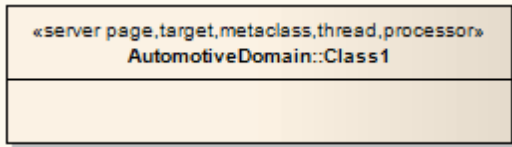

- [Custom Stereotypes](#)<sup>[1461]</sup>
- [Apply Stereotypes](#)<sup>[1453]</sup>
- [Stereotype Visibility](#)<sup>[1456]</sup>

### 6.6.3 Stereotype Visibility

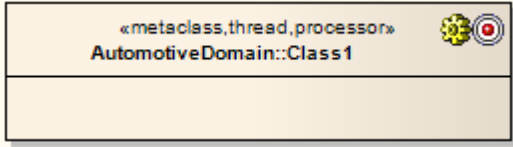

When you apply one or more stereotypes to an object, the display of that object in a **diagram** defaults to showing the stereotype names in a string within guillemets (« »); multiple names are separated by commas. Some stereotypes are associated with small icons that display in the top right corner of the element; these icons are built into the system, and cannot be deleted or added to. In both cases, you can modify the visibility of the text or icon stereotype indicators in a diagram, using the Diagram Properties dialog.

**Access** **double-click diagram background > Elements**  
**double-click diagram background > Features**

#### Set Stereotype Visibility Options

Field/Button	Action
<b>Show Element Stereotypes</b>	<p>Select this checkbox on the Elements tab to show all <b>element</b> stereotypes in the current diagram; for example (with <b>Use Stereotype icons</b> (below) <b>not</b> selected):</p>  <p>Deselect this checkbox to hide all element stereotype names (and icons).</p> 
<b>Use Stereotype Icons</b>	<p>Select this checkbox on the Elements tab to display icons instead of text, for those element stereotypes that have icons defined.</p> <p>Stereotypes that do not have associated icons are still represented by the stereotype names; for example.</p>

Field/Button	Action
	 <p>The icons represent the stereotypes «server page» and «target».</p>
<b>Show Stereotypes</b>	Select this checkbox on the Features tab to show all <b>attribute and operation</b> stereotypes in the current diagram. This option does not affect the display of element stereotypes.

**Notes:**

- In the **Project Browser**, the object name is preceded by the stereotype name(s) within guillemets, and multiple names are indicated by the first stereotype name followed by an ellipsis (...); you can hide the stereotype name by deselecting the Project Browser **Show Stereotypes** checkbox (**Tools | Options | General**)

**Learn more**

- [UML Stereotypes](#) <sup>1452</sup>

**6.6.4 Standard Stereotypes**

Below is a list of standard element stereotypes (as provided in the *EABase.eap* base model), each enclosed by guillemets (« »):

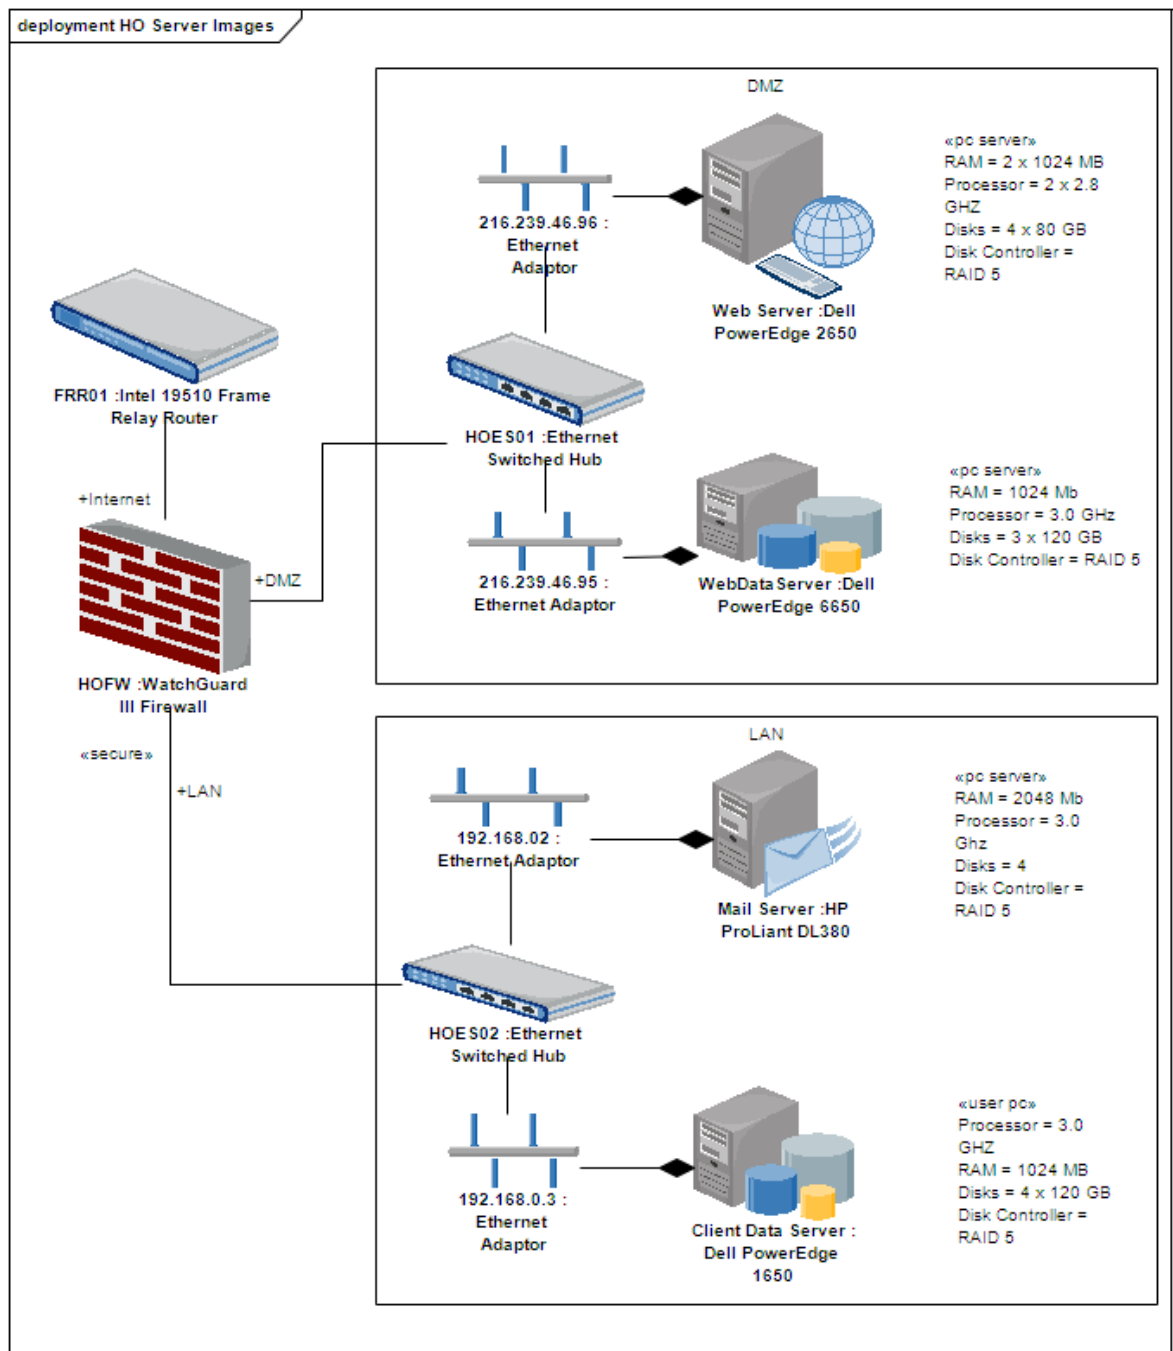

Stereotype	Base Class
«access»	Dependency
«become»	Flow
«call»	Usage
«copy»	Flow
«create»	Message
«derive»	Abstraction
«destroy»	Message

Stereotype	Base Class
«document»	Abstraction
«executable»	Abstraction
«facade»	Package
«file»	Abstraction
«framework»	Package
«friend»	Dependency
«global»	AssociationEnd
«implementation»	Class
«implementation»	Generalization
«import»	Dependency
«instantiate»	Usage
«invariant»	Constraint
«library»	Abstraction
«local»	AssociationEnd
«metaclass»	Class
«parameter»	AssociationEnd
«postcondition»	Constraint

Stereotype	Base Class
«powertype»	Class
«precondition»	Constraint
«process»	Classifier
«refine»	Abstraction
«requirement»	Comment
«responsibility»	Comment
«self»	AssociationEnd
«send»	Usage
«stub»	Package
«table»	Abstraction
«thread»	Classifier
«trace»	Abstraction
«type»	Class
«utility»	Classifier

### 6.6.5 Stereotypes with Alternative Images

If you want to represent an element using an image (for example, depict a hardware component using a 3-D box, or even using an image of the unit itself), you can do so using a stereotype that has been associated with a metafile. When the stereotype is applied to a Class or other element that supports alternative graphical format, the element is drawn using the image instead of the standard UML shape. For example, in this Deployment diagram, the Component elements all have alternative images.

### Notes

- You cannot change the representation of elements that include Lifelines, such as those in Sequence diagrams; the standard representation is important in the use and function of those elements

### Learn more

- [Custom Stereotypes](#) <sup>[1461]</sup>

### 6.6.6 Custom Stereotypes

A custom **Stereotype** applies a different appearance or characteristic to a basic UML model component or feature. You can apply a custom stereotype in two different ways:

- To change the appearance or property of **an instance** of a model component of a specific type; these stereotypes are defined on the Stereotypes tab of the UML Types dialog and applied through the Properties dialog of the object, within the model in which they are created, although you can transport custom stereotype definitions between models as Reference Data
- As a simple label on an element, to identify the role or nature of the object that an element represents; these stereotypes are simply names typed into the **Stereotype** field of the object Properties dialog, and do not affect the element display unless they are subsequently edited to have an effect

The more obvious changes you can make are to the shape, dimensions and appearance of the object, which you can apply by associating a metafile (image file) and customized colors with the stereotype, or by attaching a Shape Script to the stereotype. When you have defined and saved the stereotype, you can then apply it to any new or existing object of the base class with which it is associated.

**Access**   **Settings | UML Types > Stereotypes**

#### Maintain custom stereotypes

Field/Button	Usage	See also
<b>Stereotype</b>	Type or select the name of the stereotype.	
<b>Group name</b>	(Optional) Type a plural name under which to group the stereotype features for attributes and operations; the name will be shown on diagrams in the attributes and operations compartments.	
<b>Base Class</b>	Click on the drop-down arrow and select the name of a pre-existing object type so that the stereotyped element will inherit the base characteristics of that type.	
<b>Notes</b>	(Optional, but recommended) Type any notes concerning the stereotype (not the elements to which the stereotype is to be applied).	
<b>New</b>	Click on this button to clear the above fields to create a new stereotype definition.	
<b>Save</b>	Click on this button to save a new or edited stereotype definition.	
<b>Delete</b>	Click on this button to delete a stereotype definition from the model.	
<b>Override Appearance</b>		

Field/Button	Usage	See also
<b>None</b>	Select to retain the default element appearance for this stereotype.	
<b>Metafile</b>	Select to associate the stereotype with an image metafile (.emf or .wmf) to apply that image when the stereotype is used.	
<b>Shape Script</b>	Select to associate the stereotype with a custom shape, created using the Shape Scripting language.	<a href="#">Shape Scripts</a> 
<b>Assign</b>	Click on this button to either: <ul style="list-style-type: none"> <li>• Display the browser to locate the .emf or .wmf metafile to associate with the stereotype, or</li> <li>• Open the Shape Editor create the Shape Script to be associated with the stereotype</li> </ul>	
<b>Edit</b>	If a Shape Script is already associated with the stereotype, click on this button to open the Shape Editor to update the Shape Script.	
<b>Remove</b>	Remove the associated metafile or Shape Script from the stereotype.	
<b>Default Colors</b>		
<b>Fill</b>	Click on the drop-down arrow and select or define the default background color of the elements to be refined by the stereotype.  This color will be applied to all occurrences of any element to which the stereotype has been applied; if the color is subsequently changed, the change is immediately applied to all occurrences of any element to which the stereotype was applied (as for changes to any other property of the stereotype).  However, on elements created with the stereotype, the default color might be overridden by other color definitions of a higher priority that have been applied to the element.	
<b>Border</b>	Click on the drop-down arrow and select or define the default color of the borders of the elements to be refined by the stereotype.	
<b>Font</b>	Click on the drop-down arrow and select or define the default color of the text of the elements to be refined by the stereotype.	
<b>Reset</b>	Reset the default colors to those of the base element with which the stereotype is associated.	

Field/Button	Usage	See also

### Notes

- You can transport custom stereotype definitions between models, using the **Export Reference Data** and **Import Reference Data** options
- You can also create Stereotype **elements** that extend basic UML model element **types** to create new model element types; you can re-use these extended model elements in other projects, by incorporating them into a Profile (usually within an MDG Technology) and importing this into the various target projects

- [Import Reference Data](#) <sup>380</sup>

## 6.7 Design Patterns

**Design patterns** are a group of collaborating Objects/Classes that can be abstracted from a general set of modeling scenarios. They are also known as **parameterized collaborations**.

Design patterns are an excellent means of achieving re-use and building in robustness. As patterns are discovered in any new project, the basic pattern template from previous engagements can be re-used with the appropriate variable names modified for the current project.

Patterns generally describe how to solve an abstract problem, and it is the task of the pattern user to modify the pattern elements to meet the demands of the current engagement.

Before using a pattern it must first be created as a standard UML diagram and then saved as an XML pattern file. This XML file can then be imported as a resource that can be used in any model.

### Sparx-Created GoF Patterns

To help you start using design patterns in Enterprise Architect, Sparx Systems provides you with an MDG technology for the patterns described in the book *Design Patterns - Elements of Reusable Object-Oriented Software* by Gamma et al., referred to as the 'Gang of Four' or GoF. These patterns are made available through a set of Toolbox pages.

### Notes

- You can transport all Patterns listed in the Resources window between projects, using the **Export Reference Data** and **Import Reference Data** options

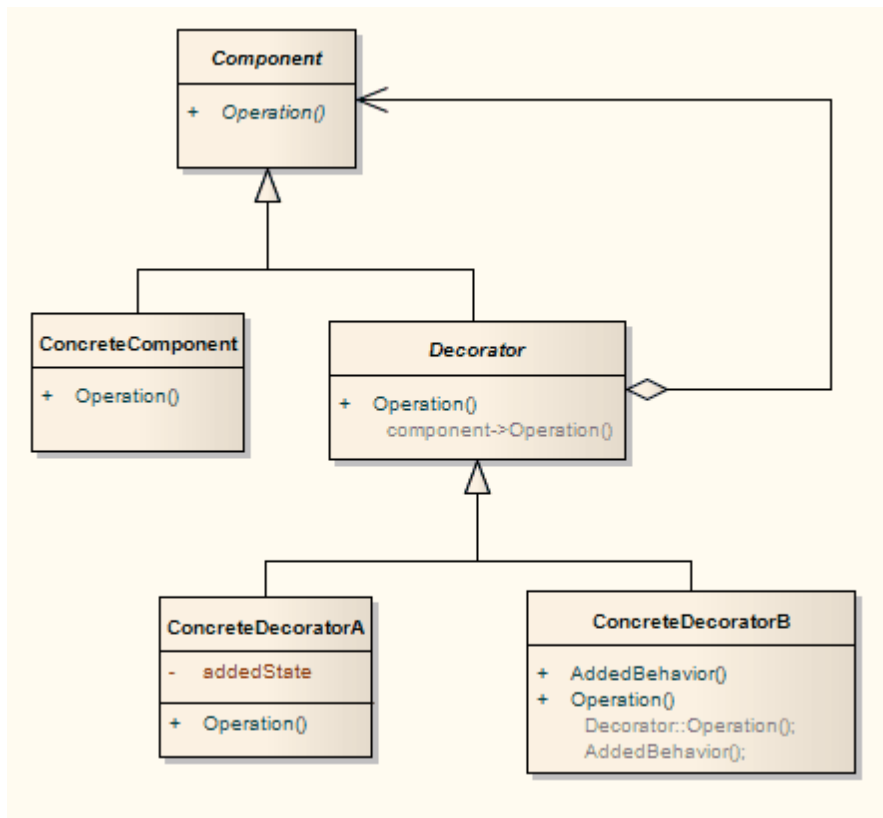

### Learn more

- [GoF Patterns](#) <sup>[2285]</sup>
- [Create a Pattern](#) <sup>[1464]</sup>
- [Import a Pattern](#) <sup>[1466]</sup>
- [Use a Pattern](#) <sup>[1467]</sup>
- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

### 6.7.1 Create a Pattern

To create a Design Pattern you first must model the Pattern as a standard UML diagram within Enterprise Architect. The following diagram was created from an example in the GoF book *Design Patterns - Elements of Reusable Object-Oriented Software* by Gamma et al.

Access [Select required diagram](#) | [Diagram](#) | [Advanced](#) | [Save UML Pattern](#)

### Reference

On the Save Diagram as UML Pattern dialog, complete the fields as indicated below:

Field/Button	Action	See also
<b>Pattern Name</b>	Type the Pattern name.	
<b>Filename</b>	Type a directory path and .XML filename into which to save the Pattern.	
<b>Category</b>	Type the Category under which the Pattern should be listed in <b>UML Patterns</b> (required).	
<b>Version</b>	Type the Pattern version number.	
Notes	Type any notes on the Pattern.	
<b>Actions</b>	Select the appropriate checkboxes to select the actions for the	<a href="#">Use a Pattern</a> <sup>1467</sup>

Field/Button	Action	See also
	<p>elements that are contained in the Pattern; these actions are performed when the Pattern is used.</p> <p>The available actions are:</p> <ul style="list-style-type: none"> <li>• <b>Create</b>: Creates the Pattern element directly without modification</li> <li>• <b>Merge</b>: Merges the Pattern element with an existing element, enabling the existing element to take on the role of the selected Pattern element</li> <li>• <b>Instance</b>: Creates the Pattern element as an instance of an existing element</li> <li>• <b>Type</b>: Creates the Pattern element types as an existing element</li> </ul> <p>If your Pattern includes an Object element, you would use <b>Instance</b> to set the classifier of the Object to one of the Classes in the diagram onto which you are dropping the Pattern.</p> <p>If your Pattern includes a Property (Port or Part) you would use <b>Type</b> to set the type of the Property to one of the Classes in the diagram onto which you are dropping the Pattern.</p>	
<b>OK</b>	<p>Click on this button twice to save the Pattern.</p> <p>Once saved you can load the Pattern into Enterprise Architect, into the Resources window.</p>	<a href="#">Import a Pattern</a> <small>[1466]</small>

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Diagrams** permission to save a diagram as a Pattern
- If your source diagram contains information flows, the Information Items Conveyed and Information Flows Realized data is not copied into the Pattern
- To change the name of one of the elements, double-click on the element to display the Edit dialog; from this dialog you can also add comments detailing the element's purpose
- Patterns can not be created for Sequence diagrams.

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Patterns | Create a Pattern**

## 6.7.2 Import a Pattern

Before using a previously created Design Pattern file in a model, you must first import it into the model; it is then available from the Resources window and optionally from the Toolbox.

**Access**   **Project | Resources (Alt+6) | Right-click on UML Patterns | Import UML Pattern**

**Import a Design Pattern**

Step	Action
1	On the Select UML Pattern Import Filename dialog, locate and click on the XML file to import.
2	Click on the <b>Open</b> button to import the Pattern.  The imported Pattern is placed in the appropriate category as defined in the XML file; if the category does not already exist under <i>UML Patterns</i> , a new one is created.

**Patterns in MDG Technologies**

A number of Technologies provide their own Patterns, and some Technologies are designed principally as a vehicle for making specific Patterns available to the model, such as the MDG Technology for Gang of Four Patterns. Such Patterns are provided through the Diagram Toolbox pages for the Technology. If you want to use such Patterns, check that the appropriate Technology has been loaded and enabled in the model.

**Learn more**

- [Create a Pattern](#) <sup>[1464]</sup>
- [Using MDG Technologies](#) <sup>[1475]</sup>

**Learning Center topics**

- (Alt+F1) | **Enterprise Architect** | **Modeling Languages** | **Patterns** | **Import a Pattern**

**6.7.3 Use a Pattern**

Using a Design Pattern, you can rapidly create template solutions for code structures that perform the same type of task in other situations, and use items defined in the Pattern with the UML model.

**Access**   **Project** | **Resources** (Alt+6) | **UML Patterns** | **Right-click on Pattern**

**Use a Pattern previously imported into the model**

Step	Action	See also
1	Open the diagram into which to add the Pattern.	
2	Select the Resources window.	

Step	Action	See also
3	Expand the <i>UML Pattern</i> folder and find the Pattern to add.	
4	<p>Either:</p> <ul style="list-style-type: none"> <li>• Select the <b>Add Pattern to Diagram</b> context menu option or</li> <li>• Drag and drop the Pattern from the Resources window onto the diagram</li> </ul> <p>You can also view the Pattern details in read-only mode by selecting the <b>View Pattern Details</b> context menu option.</p>	<a href="#">Add Pattern Dialog</a> 
5	Once the appropriate selections have been made, click on the <b>OK</b> button to import the Pattern into the model, recreating the original diagram with new GUIDs.	

#### Change the default of the Pattern element

Step	Action	See also
1	From the Add Pattern dialog select the individual element in the Pattern Element panel.	
2	<p>Click on the ( ... ) button to display the Edit dialog.</p> <p>The specific method for changing the element name is dependant upon the entry in the <b>Action</b> column of the Pattern Elements panel.</p>	
3	<p>If the <b>Action</b> entry for the element is <b>Create</b>, then in the <b>Default</b> field in the Edit dialog delete the existing value and type your own, user-defined value.</p> <p>Click on the <b>OK</b> button.</p> <p>The element default is updated on the Add Pattern dialog.</p>	
4	<p>If the <b>Action</b> entry for the element is <b>Merge</b>, in the Edit dialog click on the ( ... ) button to browse to an existing element classifier.</p> <p>The Select &lt;Item&gt; dialog displays.</p>	
5	<p>Locate and select an existing element classifier.</p> <p>You can restrict the number of choices by selecting the elements from a specific namespace; to do this, click on the <b>In Namespace</b> drop-down arrow and select a namespace.</p>	<a href="#">Using Classifiers</a>

## 7 Extending UML Models

Sometimes a modeling problem cannot be adequately expressed using the base UML model elements or, similarly, an area of work falls into a specialized domain that requires a tailored modeling approach and/or program language support. To meet such requirements, you can **extend** the capabilities of UML to develop new modeling constructs, using **MDG Technologies** to combine and deploy a wide range of **extension mechanisms** such as:

- UML Profiles
- Stereotypes
- Shape Scripts
- Tagged Values
- Constraints
- Patterns
- Customized Code and Transformation Templates, and
- Grammars

Using the **MDG Technology Creation Wizard**, you can quickly and easily integrate the extensions into a technology and rapidly tailor UML and Enterprise Architect to address a particular modeling domain not explicitly covered in the original UML specification, but using extension mechanisms that are still part of the Specification.

### Learn more

- [Using MDG Technologies](#)  <sup>1475</sup>
- [Using UML Profiles](#)  <sup>1472</sup>
- [Tagged Value Types](#)  <sup>1621</sup>
- [Shape Scripts](#)  <sup>1582</sup>
- [Developing Programming Languages](#)  <sup>1581</sup>
- [Code Template Framework](#)  <sup>1631</sup>
- [Grammar Framework](#)  <sup>1705</sup>
- [Creating an MDG Technology](#)  <sup>1527</sup>

## 7.1 Using UML Profiles

A **UML Profile** is a collection of **extensions** (**stereotypes** and their associated **Tagged Values**) to basic UML model elements, which together describe some particular modeling problem and which you can create and use to develop modeling constructs in a specific domain. The stereotypes and Tagged Values of a Profile are applied to elements, attributes, methods, method parameters, connectors and connector ends to create new, tailored model elements. A Profile is distributed and used as a component of an MDG Technology.

The deployed technology automatically generates a page of elements and relationships in the Diagram Toolbox, for each of the UML Profiles within the technology. When you drag the elements and connectors from the Toolbox onto the current diagram, the stereotype, Tagged Values and default values, notes and metafile (if one is specified) are automatically applied to the new element. You can also drag and drop Profile attributes and operations onto **existing** Classes, so that they are immediately added with the specified stereotype and Tagged Values.

### Learn more

- [MDG Technologies](#) <sup>[1475]</sup>
- [Add Profile Objects to a Diagram](#) <sup>[1472]</sup>
- [Tagged Values in Profiles](#) <sup>[1473]</sup>
- [Synchronize Tagged Values and Constraints](#) <sup>[1473]</sup>
- [MDG Technology SDK](#) <sup>[1483]</sup>

### 7.1.1 Add Profile Objects to a Diagram

After a technology has been imported into your project, the profiled objects (elements and connectors) and features (attributes and operations) are available from the technology pages of the Diagram Toolbox. The way in which you add the Profile objects to a diagram is no different from the way in which you use the standard UML objects on the system.

**Access** **Diagram | Diagram Toolbox (Alt+5): More tools | <technology name>**

### Use the Profile Objects

Action	Description
<b>Add a Profile-based element to a diagram</b>	Click on the element in the Toolbox page and drag it onto the diagram.
<b>Add a Profile-based connector to a diagram</b>	Click on the connector in the Toolbox page, then click on the source element in the diagram and drag it to the target.
<b>Add a Profile-based attribute or operation to a diagram</b>	Click on the attribute or operation in the Toolbox page, and drag it onto the host element on the diagram.  The system prompts you to enter a name for the feature.

### Learn more

- [Diagram Toolbox](#)<sup>[792]</sup>
- [MDG Technologies](#)<sup>[1475]</sup>

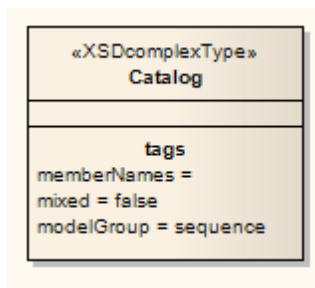

### 7.1.2 Tagged Values in Profiles

Stereotypes within a profiled element or connector can define one or more associated **Tagged Values**. When you drag a profiled element or connector from the Diagram Toolbox onto a diagram, any associated Tagged Values are automatically added to the new element or connector. Tagged Values in profiled objects are an excellent way to further extend the versatility of your UML modeling.

As an example, the UML Profile for XSD (XML Schema) provides the *XSDComplexType* stereotype to extend a Class; this stereotype has the Tagged Values:

- **memberNames**
- **mixed** and
- **modelGroup**

When you create a Complex Type element, the Tagged Values are added and are visible in the *tags* compartment of the element (including those that have no value set).

When you select the element, the Tagged Values **window** displays all the associated tags.

- The values of tags imported in a Profile **override** the values of equivalent tags in the UML Types dialog; if the initial value of the tag from the Profile is **not set**, the value of the tag shown in the element will be **blank**, even if there are default values for the tag in the UML Types dialog
- Tags that have default profile values are automatically set
- Where Tagged Values in the profiled element have a *values* section (for example, *values="element | attribute | both" default="both"*) you can select the non-default values from a drop-down list
- Where no *value* exists, you can add a value as free text; you would do this for a profile tag that has no initial value, to use a default value from the UML Types dialog

#### Learn more

- [Predefined Structured Types](#)<sup>[1622]</sup>
- [Tagged Values](#)<sup>[1134]</sup>

### 7.1.3 Synchronize Tagged Values and Constraints

When you create an element, attribute, operation or connector from a profiled object, the Tagged Values and constraints are added from the Profile stereotype. Subsequently, you might update the constraints or Tagged Values of a particular stereotype in the Profile, in which case the items already created in the model would not have those additional constraints or Tagged Value tags and notes.

Similarly, you might have manually added the stereotype to a set of objects, which automatically adds the Tagged Values but not the constraints associated with that stereotype, and now want the objects to receive

the constraints.

You can apply the updated or missing Tagged Values and constraints using the **Synchronize Stereotype** function. This operates on any profiled element in your model, from any technology that is integrated with or imported into Enterprise Architect.

**Access** **Diagram | Diagram Toolbox | More tools | <technology name>** then  
**right-click icon for profiled element/connector/feature | Synchronize Stereotype**

#### Synchronize objects using the Technology Toolbox pages

Step	Action
1	On the Synch Profiled Elements dialog, click on the <b>OK</b> button.  All elements, features or connectors created with the selected profiled object icon are updated, across the model.  The items that have been modified, and the changes that were made, are listed in the <b>Actions</b> field.
2	When the update is complete, click on the <b>Cancel</b> button.

#### Alternative - Single Object Update

You can quickly synchronize the tags and constraints of a **single** element **in a diagram**. To do this:

Step	Action
1	Drag the updated profiled element from the Diagram Toolbox page onto the element in the diagram. A short context menu displays.
2	Select the <b>Apply «stereotype name»</b> context menu option.  The diagram element is updated with any tags and constraints from the profiled element that it does not already have.

#### Notes

- The **Synchronize Stereotype** context menu option displays when a Diagram Toolbox icon represents a profiled element or and connector; it does not display for basic UML object icons
- You can review any changes by displaying the element Properties dialog and by opening the Tagged Values window and clicking on an appropriate profiled element
- Removing a stereotype from an object automatically removes any Tagged Values assigned by that stereotype

## 7.2 Using MDG Technologies

An MDG Technology is a vehicle for providing access to the resources of either a commercially-available technology or a technology that you have created yourself. Such resources include a wide range of facilities and tools, such as UML Profiles, code modules, scripts, Patterns, images, Tagged Value Types, report templates, linked document templates, Toolbox pages and Learning Center pages.

Using Enterprise Architect, you can develop models based on the standard UML specifications, and you can extend the core UML structures using UML-supported mechanisms such as Tagged Values, Stereotypes, Profiles and Design Patterns. These facilities are within the Enterprise Architect core technologies, and you can activate and use further Model Driven Generation (MDG) Technologies that are either integrated with the system or available from external locations.

If your systems or work domain require further specialization you, as a Technology Developer, can use Enterprise Architect to develop your own customized modeling languages and solutions.

### Obtain and use Technologies

Source of Technology	See also
<p>Core technologies - Enterprise Architect itself contains a:</p> <ul style="list-style-type: none"> <li>• Basic UML 2 technology as an implementation of UML 2.4.1 structural and behavioral modeling, and</li> <li>• Core Extensions technology that applies profiles and stereotypes to provide extended modeling of aspects such as Requirements, User interface and Data Modeling</li> </ul>	
Additional technologies are included in the Enterprise Architect Install directory, <i>MDGTechnologies</i> subfolder.	<a href="#">Extensions - MDG Technologies</a> 
You can import technologies from external sources into the <i>APPDATA</i> folder (% <i>APPDATA%\Sparx Systems\EA\MDGTechnologies</i> ) for your own use, or into the Resources window for other project users to access.	<a href="#">Import MDG Technologies to Model Resources</a> 
You can transfer technologies into the <i>MDGTechnologies</i> subfolder; these technologies are available when you restart Enterprise Architect (on Vista/Windows 7 systems you might have to increase your access permissions to do this).	
You can access and activate MDG Technologies in remote system folders or web sites, from Enterprise Architect.	<a href="#">Access Remote Technologies</a> 
Technology Developers can create new MDG Technologies and deploy them to the project team either through the <i>MDGTechnologies</i> subfolder or from a remote folder or website.	<a href="#">Creating an MDG Technology</a> 
To see which technologies are available within Enterprise Architect, and activate the ones you require, use the MDG Technologies dialog ( <b>Settings   MDG Technologies</b> ).	<a href="#">Manage MDG Technologies</a> 

Source of Technology	See also
<p>Having made the MDG Technologies available, you can manage their availability to users and you can work with them.</p> <p>You also have the facility to turn <b>off</b> or <b>disable</b> the Enterprise Architect <b>Basic UML 2</b> and <b>Core Extensions</b> technologies and facilities, so that you can apply the Enterprise Architect facilities and features exclusively to one or more selected MDG Technologies.</p>	<p><a href="#">Work with MDG Technologies</a> <sup>[1476]</sup></p>

### Notes

- In developing **new** technologies, you would be familiar with the modeling structures and concepts of the core system and extension mechanisms as they impact and are used by the people you are designing the technology for; that is, the system as described in the modeling sections of this *User Guide*

### Learn more - General

## 7.2.1 Work with MDG Technologies

Any MDG Technology listed on the MDG Technologies dialog can be enabled, which makes their interface profiles and Toolbox pages available for your use.

When you **enable** an MDG Technology, any Technology-specific diagram types are **added** to the New Diagram dialog lists, and the Technology's Toolbox pages are added to those available through the **More tools** menus in the Toolbox.

If you set an MDG Technology to **Active**, it becomes the main technology for the model. Only one Technology can be active at a time. The Technology's validation configuration is set, and whilst common Toolbox pages are visible at all times, the Technology's Toolbox pages **override** any parallel Enterprise Architect Toolbox pages; for example, the ICONIX *Class* pages would override the Enterprise Architect *Class* pages.

You create Technology-specific diagrams and populate them with elements and connectors in the same way as for standard Enterprise Architect diagrams.

### Learn more

- [Create New Diagrams](#) <sup>[822]</sup>
- [Manage MDG Technologies](#) <sup>[1477]</sup>

## 7.2.2 Manage MDG Technologies

You use the MDG Technologies dialog to manage the MDG Technologies accessible to the project and available to project users. The dialog lists the technologies held in a number of locations accessed by the project, such as the **APPDATA** folder and the Enterprise Architect **Install directory**. You can set these technologies to being available for use or disabled, as you require. MDG Technologies are deployed as .XML files.

[Access](#)   **Settings | MDG Technologies**

### Configure availability of Technologies

Field/Option/ Button	Action	See also
<b>Technology</b>	<p>Lists all MDG Technologies currently accessible to the project, in alphabetical order.</p> <p>If you click on a Technology name, the upper right panel of the dialog displays the technology:</p> <ul style="list-style-type: none"> <li>• Name</li> <li>• Version number</li> <li>• Logo (if defined), and</li> <li>• Location of the deployed XML file, which can be: <ul style="list-style-type: none"> <li>• Internal to Enterprise Architect</li> <li>• An extension</li> <li>• In the Install directory (just the file name)</li> <li>• In the <i>APPDATA</i> folder (filename followed by <i>(in APPDATA)</i>)</li> <li>• In the model</li> </ul> </li> </ul> <p>The lower right panel displays a description of the Technology, in many cases providing the manufacturer's web site address and a support contact.</p>	
<b>Enabled</b>	<p>Select this checkbox against each Technology that you want to be available for use in the project. When an MDG Technology is enabled:</p> <ul style="list-style-type: none"> <li>• The Technology is added to the list of available options in the <b>Profile</b> field of the <b>Default Tools</b> toolbar, so that you can apply the interface profiles of the MDG Technology</li> <li>• At least one set of Toolbox pages for the MDG Technology is automatically added to the <b>Diagram Toolbox</b>; you can access the added Toolbox pages through the <b>More Tools</b> option</li> <li>• Any MDG Technology-specific <b>diagram templates</b> are added to the <b>New Diagram</b> dialog for selection; when selected, these display the diagram-specific Toolbox pages</li> </ul>	

Field/Option/ Button	Action	See also
	<p>Clear the checkbox against a Technology to make it unavailable to the project users.</p> <p>If you disable an MDG Technology that was in use, its Toolbox pages, diagram types and quick-links are <b>omitted</b> from the Diagram Toolbox, <b>More tools</b> option, Default Tools toolbar, diagrams and New Diagram dialog in the user interface.</p>	
<b>All</b>	Click on this button to <b>select</b> the <b>Enabled</b> checkbox of every Technology listed on the dialog.	
<b>None</b>	<p>Click on this button to <b>clear</b> the <b>Enabled</b> checkbox of every Technology listed on the dialog.</p> <p>If you click on this button, scroll to the top of the list and select the <b>Basic UML 2 Technology</b> and <b>Core Extensions</b> checkboxes to re-enable the UML and Extended Toolbox pages and diagram types.</p>	
<b>Set Active</b>	<p>Click on this button when you have clicked on one preferred Technology, to make that Technology the default interface to Enterprise Architect. This displays an asterisk against the Technology name in the <b>Technology</b> panel, and selects the Technology in the <b>Profile</b> field of the Default Tools toolbar. If the MDG Technology has not yet been enabled, this button also enables it.</p> <p>Making a Technology the active Technology can change the way Enterprise Architect windows are displayed and override the Toolbox pages with pages specific to the Technology.</p>	
<b>Advanced</b>	Click on this button to add MDG Technologies in folders and websites remote from Enterprise Architect.	<a href="#">Access Remote MDG Technologies</a> [1479]
<b>Remove</b>	<p>(Enabled only for Technologies imported directly into the model.)</p> <p>Click on this button to remove the selected Technology from the list, from the Resources window and from the model.</p>	<a href="#">Resources</a> [1173]
<b>OK</b>	Click on this button to close the dialog, save your changes and put them into effect.	
<b>Cancel</b>	Click on this button to close the dialog and abort the changes you have made.	

**Notes**

- If you change the **Enabled** setting of an MDG Technology, or if you change the list of external paths, click on the **OK** button to reload all enabled technologies; you do not need to restart Enterprise Architect for the changes to take effect
- To work exclusively in a selected MDG Technology, or a small number of Technologies, you can enable just those Technologies (and perhaps set one of them to Active) and then *deselect* the **Basic UML 2 Technology** checkbox (and, if necessary, the **Core Extensions** checkbox)

#### Learn more

- [Import MDG Technologies To Model](#) 

### 7.2.3 Access Remote MDG Technologies

When you are working on your model, you can use MDG Technologies local to your system, or you can access Technologies you have identified in folders and websites remote from the system. You essentially 'bookmark' these remote Technologies for continued use, and then delete the link when you do not want to use them any more.

#### Access **Settings | MDG Technologies: Advanced**

#### Specify the location of a remote MDG Technology

Step	Action	See also
1	On the MDG Technologies - Advanced dialog, click on the <b>Add</b> button. A short context menu displays, offering the options: <ul style="list-style-type: none"> <li>• <b>Add Path</b></li> <li>• <b>Add URL</b></li> </ul>	<a href="#">Manage MDG Technologies</a> 
2	To specify an MDG Technology <i>in a directory folder</i> , select the <b>Add Path</b> option. The Browse for Folder dialog displays. Browse for the MDG Technology folder, click on it, and click on the <b>OK</b> button; go to step 4.	
3	To specify an MDG Technology <i>on a web site</i> , select the <b>Add URL</b> option. The Input dialog displays. In the <b>Enter Value</b> field, type or copy-and-paste the MDG Technology URL and click on the <b>OK</b> button.	
4	The folder path or URL for the MDG Technology displays in the Path panel. The Technology is available	

#### Notes

- To **remove** an MDG Technology listed in the MDG Technologies - Advanced dialog, click on the folder path or URL and click on the **Remove** button; the path or URL is deleted

## 7.2.4 Import MDG Technologies to Model

If you locate or create an MDG Technology that is of use to your project, you can import it into the project either:

- For **your own** use in the model; that is, import the technology into the %APPDATA%\Sparx Systems\EA\MDGTechnologies folder on your workstation, or
- To be available to **all users** of the model, through the Resources window for the model

To import an MDG Technology you must have a suitable MDG Technology XML file. If the MDG Technology includes references to any metafiles, they should be in the same directory as the MDG Technology XML file.

On startup, Enterprise Architect scans both the *APPDATA* folder and the Enterprise Architect Install directory *MDGTechnologies* subfolder for technology files, to make them available through the MDG Technologies dialog and, for model Technologies, the Resources window. Technologies imported to the *APPDATA* folder are indicated by the text *Location: Technology.xml*.

**Access**   **Tools | MDG Technology Import**  
**Project | Resources | Right-click MDG Technologies folder | Import Technology**

### Import a technology

Step	Action
1	<p>On the Copy Technology to Application Data dialog, in the <b>Filename</b> field, type the path and filename of the MDG Technology file to import, or browse for it using the ( ... ) button.</p> <p>When you enter the filename, the MDG Technology name and version display in the <b>Technology</b> and <b>Version</b> fields, and any notes display in the <b>Notes</b> field.</p>
2	<p>Select the appropriate radio button for the type of import you want to perform:</p> <ul style="list-style-type: none"> <li>• <b>Import to Model</b></li> <li>• <b>Import to User</b></li> </ul>
3	<p>Click on the <b>OK</b> button.</p> <ul style="list-style-type: none"> <li>• (If you selected the <b>Import to User</b> option) If the <i>APPDATA</i> folder does not yet exist, Enterprise Architect creates it</li> <li>• If the MDG Technology already exists, Enterprise Architect displays a prompt to overwrite the existing version and import the new one</li> </ul> <p>Once the import to <b>APPDATA</b> is complete, you must restart Enterprise Architect; the MDG Technology is then listed in the MDG Technologies dialog.</p>

### Notes

- This feature is not available in the Desktop edition of Enterprise Architect

- To remove an MDG Technology which has been added to APPDATA, locate the appropriate XML file in the %APPDATA%\Sparx Systems\EA\MDGTechnologies folder and remove it
- Consider the fact that some MDG Technologies can be large and might impose some delays on the workstation as they load each time a user connects to the model
- To remove an MDG Technology from the Resources window and the model, either:
  - Right-click on the Technology name and select the **Remove Technology** menu option, or
  - Click on the Technology name in the Manage MDG Technologies dialog and click on the **Remove** button

#### Learn more

## 7.2.5 Extensions - MDG Technologies

Enterprise Architect is the core for a range of Model Driven Generation (MDG) extensions to its modeling capabilities, using more specialized, niche frameworks and profiles.

Extensions	See also
A number of technologies are already integrated with the Enterprise Architect installer.	<a href="#">ArchiMate</a> <sup>[1926]</sup> <a href="#">BPEL</a> <sup>[1870]</sup> <a href="#">BPMN</a> <sup>[1845]</sup> <a href="#">Data Flow Diagrams</a> <sup>[1797]</sup> <a href="#">Eriksson-Penker Extensions</a> <sup>[1929]</sup> <a href="#">ICONIX</a> <sup>[2282]</sup> <a href="#">Mind Mapping</a> <sup>[1794]</sup> <a href="#">SoaML</a> <sup>[2449]</sup> <a href="#">SOMF 2.1</a> <sup>[2454]</sup> <a href="#">Strategic Modeling</a> <a href="#">Systems Modeling Language (SysML)</a> <sup>[2294]</sup>
Enterprise Architect provides support for: <ul style="list-style-type: none"> <li>• Downloading MDG Technologies from external system files or websites, or</li> <li>• Creating your own easily with the Enterprise Architect MDG Technology Wizard</li> </ul>	<a href="#">Access Remote MDG Technologies</a> <sup>[1479]</sup> <a href="#">MDG Technology SDK</a> <sup>[1483]</sup>
Sparx Systems also market a number of MDG products, as follows: <ul style="list-style-type: none"> <li>• MDG Technology For:                             <ul style="list-style-type: none"> <li>• Zachman Framework</li> <li>• The Open Group Architecture Framework (TOGAF)</li> <li>• Unified Profile for DoDAF and MODAF (UPDM)</li> </ul> </li> </ul>	

Extensions	See also
<ul style="list-style-type: none"> <li>• Data Distribution Service (DDS)</li> <li>• Python (for Enterprise Architect versions 4.5 to 5.0, integrated in later versions) (* free product! *)</li> <li>• CORBA (* free product! *)</li> <li>• Java Beans (* free product! *)</li> <li>• Testing (* free product! *)</li> <li>• MDG Integration For: <ul style="list-style-type: none"> <li>• Eclipse 3.3</li> <li>• Visual Studio 2005, 2008 &amp; 2012</li> </ul> </li> <li>• MDG Link For <ul style="list-style-type: none"> <li>• Eclipse</li> <li>• Visual Studio.NET</li> <li>• Microsoft Visio (* free product! *)</li> <li>• Telelogic DOORS</li> </ul> </li> </ul> <p>Over time, this list is being extended to include further products.</p>	
<p>Sparx Systems provide different editions of Enterprise Architect tailored for systems engineering and business engineering, or both together.</p> <p>These editions incorporate several of the above MDG Technologies and other Add-Ins.</p>	<a href="#">Enterprise Architect Editions</a> <small>[18]</small>
<p><b>Product Information:</b> For the latest list of available Add-Ins and an introduction to each product, including details of pricing, purchasing and download options, see the Sparx Systems website.</p> <p>When you purchase one of the Add-Ins, you receive one or more license keys and instructions on obtaining, installing and registering the product.</p> <p>The information page for most products provides a link to download the product User Guide in .pdf format.</p> <p>The product User Guide can also be displayed as a .chm file online within the product itself; to access this online help in Enterprise Architect, select the <b>Extensions   &lt;productname&gt;   Help</b> menu option.</p>	<a href="#">Products Page on the Sparx Systems website</a>

#### Learn more

- [Creating MDG Technologies](#) [1545]

Extension Facilities

Facility	Description	See also
<b>MDG Technologies</b>	An MDG Technology is a vehicle for providing access to the resources of a commercially-available technology or one that you have created yourself. Such resources include a wide range of facilities and tools, such as UML Profiles, code modules, scripts, Patterns, images, Tagged Value Types, report templates, linked document templates, Toolbox pages and Learning Center pages.	<a href="#">MDG Technologies - Creating</a> <sup>[152]</sup>
<b>Profiles</b>	<p>Profiles are a means of extending UML; you use them to build models in particular domains.</p> <p>A Profile is a collection of additional stereotypes and Tagged Values that extend or are applied to elements, attributes, methods and connectors, which together describe some particular modeling problem and facilitate modeling constructs in that domain.</p>	<a href="#">Using UML Profiles</a> <sup>[1472]</sup>  <a href="#">Developing Profiles</a> <sup>[1485]</sup>
<b>Stereotypes</b>	<p>Stereotypes are an inbuilt mechanism for logically extending or altering the meaning, display and syntax of a model element. Different model elements have different standard stereotypes associated with them.</p> <p>The same principles apply when you customize your own stereotypes, either through the UML Types dialog to qualify an element of an existing type, or as elements that extend a specific metaclass to define a new element type.</p>	<a href="#">UML Stereotypes</a> <sup>[1452]</sup>  <a href="#">Custom Stereotypes</a> <sup>[1461]</sup>  <a href="#">Create UML Profiles</a> <sup>[1485]</sup>
<b>Design Patterns</b>	<p>Patterns are groups of collaborating Objects/Classes that can be abstracted from a general set of modeling scenarios (that is, parameterized collaborations).</p> <p>They generally describe how to solve an abstract problem, and are an excellent means of achieving re-use and building in robustness.</p>	<a href="#">Design Patterns</a> <sup>[1464]</sup>  <a href="#">Create a Pattern</a> <sup>[1464]</sup>
<b>Shape Scripts</b>	<p>A Shape Script is a script that applies a custom shape and orientation to an element or connector, in place of that object's standard UML notation. Each script is associated with a particular stereotype, and is drawn for every object having that stereotype.</p> <p>Where you redefine the properties of a standard UML object to create a new object, you can apply a new shape to the object as well.</p>	<a href="#">Shape Scripts</a> <sup>[1582]</sup>
<b>Tagged Value Types</b>	<p>You use Tagged Values to add further properties to a model element. You can apply them at three levels:</p> <ul style="list-style-type: none"> <li>As a standard Tagged Value associated with the model element</li> <li>As a <b>customized</b> Tagged Value based on a <b>standard</b> Tagged Value Type</li> <li>As a <b>customized</b> Tagged Value based on a <b>customized</b> Tagged Value Type</li> </ul>	<a href="#">Tagged Values</a> <sup>[1134]</sup> <a href="#">Tagged Value Types</a> <sup>[1621]</sup> <a href="#">Create Custom Tagged Value Type</a> <sup>[1626]</sup>

Facility	Description	See also
<b>Code Template Frameworks</b>	Within Enterprise Architect, you can modify the way code is generated or transformed, including generating code for behavioral models, by customizing the templates that control these actions. You can also incorporate these templates in a technology, to add the customized generation and transformation to the facilities of that technology.	<a href="#">Code Template Framework</a> <sup>[1631]</sup>

## 7.3.2 Developing Profiles

Profiles are collections of extensions, based on stereotypes that are applied to UML elements, connectors and features. The stereotypes can have attributes to specifically define Tagged Values that further extend the characteristics of the stereotyped element or connector. Profiles are stored as XML files with a specific format; to apply the extensions of a Profile, you add its XML file as a component of an MDG Technology, and deploy the technology; that is:

1. Create a model in which to develop the MDG Technology, and within this create a Profile package in which you define your Profile(s)
2. Save the Profile as an XML file, with a specific format.
3. Call the XML file into an MDG Technology, using the MDG Technology Creation Wizard.
4. Deploy the MDG Technology (and hence Profile) on your system.

### Learn more

- [MDG Technologies - Creating](#)<sup>[1527]</sup>
- [Create UML Profiles](#)<sup>[1485]</sup>
- [Quick Linker](#)<sup>[1515]</sup>
- [Customize Toolbox Profiles](#)<sup>[1560]</sup>
- [Create Diagram Profiles](#)<sup>[1570]</sup>
- [Tagged Value Types](#)<sup>[1621]</sup>
- [Using UML Profiles](#)<sup>[1472]</sup>
- [UML Profiles in the Resources Window](#)<sup>[1526]</sup>

### 7.3.2.1 Create Stereotype Profiles

When you are creating a Profile to define a new modeling solution, you initially create a package with the «*profile*» stereotype. You then consider the number of model elements (and hence Stereotype elements) you will need to create. If you are going to create:

- A small number of Stereotype elements, you can manage them on a single child diagram within the Profile package, and save the **diagram** as the Profile
- A large number of Stereotype elements, create them on as many child diagrams as are convenient (one Stereotype per diagram if you prefer) and save the **package** as the Profile

Every Stereotype element extends at least one *Metaclass* element. The Stereotype elements use the Profile name as their namespace. When you have created your Profile, you can incorporate it into an MDG Technology.

The process of creating a Profile and applying it to your models comprises a number of steps. Some of

these steps are necessary only if you want the Profile to apply a specific meaning, display, appearance or syntax to a type of model element.

### Create a Profile

Step	Description	See also
1	Create a Profile package in a technology development model.	<a href="#">Create a Profile Package</a> [1487]
2	Add Stereotype and Metaclass elements to the child diagram(s) of the Profile package.	<a href="#">Add Stereotypes and Metaclasses</a> [1488]
3	Define Tagged Values for the Stereotype elements.	<a href="#">Define Stereotype Tagged Values</a> [1492]
4	Define constraints for the Stereotype elements.	<a href="#">Define Stereotype Constraints</a> [1500]
5	Add an Enumeration element to define a drop-down list of values for a Tagged Value on the Stereotype element.	<a href="#">Add An Enumeration to a Stereotype</a> [1493]
6	Add Shape Scripts for the Stereotype elements.	<a href="#">Add Shape Scripts</a> [1501]
7	Set the default appearance for each stereotyped model element.	<a href="#">Set Default Appearance</a> [1502]
8	Include Quick Linker definitions in the Profile.	<a href="#">Add Quick Linker Definition To Profile</a> [1523]
9	Save either the package or the diagram as the Profile, and export it.	<a href="#">Export Profile</a> [1523] <a href="#">Save Profile Options</a> [1525]
10	Incorporate the Profile into an MDG Technology and deploy the technology.	<a href="#">Create MDG Technologies</a> [1545] <a href="#">Add a Profile</a> [1548] <a href="#">Deploy An MDG Technology</a> [1580]

### Notes

- A Profile package can contain several diagrams and many elements and connectors, but **no other packages**; do not use nested packages in a Profile
- If you are creating a Profile to form part of an MDG Technology, note that you define the special Toolbox pages, diagrams and Learning Center pages for the Technology in **separate** Profiles

Learn more

- [Customize Toolbox Profiles](#) 
- [Create Custom Diagram Profiles](#) 

**7.3.2.1.1 Create a Profile Package**

The first stage in creating a UML Profile to define new model elements is to create a package that has the stereotype «*profile*» in your technical development model.

**Access** **Project Browser model context menu | Add | Add Diagram**

Create a Profile Package

Step	Description	See also
1	On the New Diagram dialog, click on <b>UML Structural</b> in the <b>Select From</b> field, and <b>Package</b> in the <b>Diagram Types</b> field. Click on the <b>OK</b> button. The new diagram opens in the Diagram View.	<a href="#">Add New Diagrams</a> 
2	Open the Profile page of the Toolbox ( <b>More tools   UML   Profile</b> ).	<a href="#">Profile Toolbox</a> 
3	Drag the <i>Profile</i> item onto the Package diagram. The New Model Package dialog displays.	
4	In the <b>Package Name</b> field, type a name for the Profile and select the <b>Automatically add new diagram</b> checkbox. Click on the <b>OK</b> button. The New Diagram dialog displays.	
5	In the <b>Name</b> field, type the diagram name, then click on <b>UML Structural</b> in the <b>Select From</b> field and <b>Class</b> in the <b>Diagram Types</b> field.	<a href="#">Add New Diagrams</a> 
6	Click on the <b>OK</b> button. The system creates a package with the stereotype « <i>profile</i> » and a child Class diagram. Depending on your system set-up, the Properties dialog for the package might display. If you wish, you can add any basic Package details you want to assign to the package, such as version, phase, or notes.	
7	On the diagram, double-click on the Profile Package to open the child diagram. You now use this child diagram to add Stereotype elements to the Profile.	<a href="#">Add Stereotypes and</a>

Step	Description	See also
		<a href="#">Metaclasses</a> 

#### Learning Center topics

- (Alt+F1) | [Enterprise Architect](#) | [Modeling Languages](#) | [Build a Profile](#) | [Create a Profile](#)

#### 7.3.2.1.2 Add Stereotypes and Metaclasses

When you are extending the UML to develop a domain-specific toolset, you start by creating a **Profile package** for the stereotypes you intend to customize. This package has at least one **child Class diagram**, and it is on this child diagram that you specify:

- The types of object that you are extending, represented by **Metaclass** elements, and
- The way in which each object is extended, represented by **Stereotype** elements

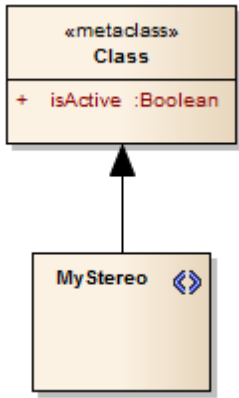

You can qualify the effect of a Stereotype on a Metaclass using a range of other tools, including:

- Shape Scripts in the Stereotype
- Tagged Values, defined by attributes in the Stereotype element
- Structured Tagged Value Classes, defined using attributes in the Stereotype element
- Enumerations, defined using attributes in the Stereotype element
- Tagged Value **connectors**, to identify possible values for a Tagged Value in an element generated with a Stereotype
- Constraints on the Stereotype element
- Special attributes, that define specific default behavior of stereotyped elements, such as the initial size and color of the element
- Modifying the default appearance of the Stereotype element

#### Add Metaclasses and Stereotypes to a Profile

Step	Description	See also
1	Open the child diagram of the Profile Package.	<a href="#">Create a Profile Package</a> 
2	<p>Drag the <i>Metaclass</i> element from the Profile page of the Toolbox onto the diagram.</p> <p>The Extend Metaclass dialog displays, listing the types of object you can extend, namely:</p> <ul style="list-style-type: none"> <li>• Core UML elements, and attributes and operations</li> <li>• Core connectors</li> <li>• Abstract metatypes such as Action types, ConnectorEnd and Gate, and</li> <li>• Stereotypes</li> </ul>	

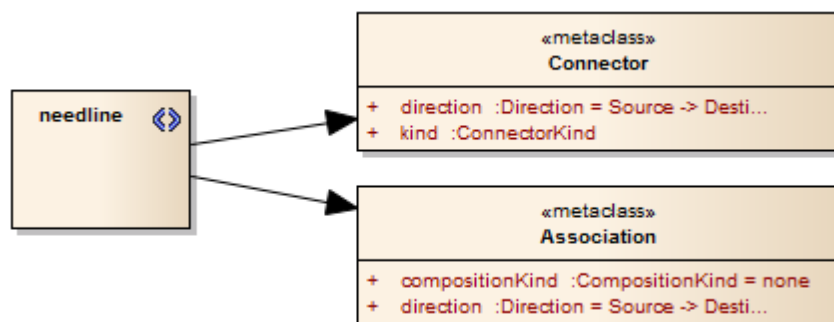

Step	Description	See also
	<p>On the Core Elements tab, you can include the set of system-defined extended elements such as ActivityRegion, Change and User, by selecting the <b>Include Extended</b> checkbox.</p> <p>On the Stereotypes tab, to specify the technology containing the stereotypes that you want to extend, click on the drop-down arrow in the top field and select the technology name.</p>	<a href="#">Create Stereotypes Extending non-UML Objects</a> <sup>[149]</sup>
3	<p>Scroll through the selected list and tick one or more object types that you want to extend.</p> <p>If you want to select all objects on a tab, click on the <b>All</b> button.</p>	
4	<p>Click on the <b>OK</b> button.</p> <p>For each checkbox that you have selected, a new <b>Metaclass</b> element is created on the diagram.</p>	
5	<p>Drag a <i>Stereotype</i> element from the Toolbox onto the diagram.</p> <p>If the Properties dialog does not display, double-click on the element on the diagram.</p>	
6	In the <b>Name</b> field, type a name for the stereotype.	
7	Click on the <b>OK</b> button.	
8	Click on the <i>Extension</i> relationship in the Toolbox and drag the connection from the Stereotype element to the Metaclass element that it will extend.	
9	<p>Your diagram now resembles the one shown below:</p>  <pre> classDiagram     class Class {         +isActive : Boolean     }     class MyStereo     MyStereo -- &gt; Class </pre> <p>The diagram shows a metaclass box labeled «metaclass» Class. It has a compartment with the attribute + isActive : Boolean. Below it is a stereotype box labeled MyStereo with a blue double-headed arrow icon. A solid line with an open arrowhead points from the MyStereo box to the Class box, representing an extension relationship.</p>

### Notes

- If you intend to extend a large number of model elements, rather than putting all of them on one diagram you can create additional child Class diagrams under the Profile package and add different types of Metaclass elements to different diagrams; in this case you save the **package** as the Profile, not the individual **diagrams**
- If you want to have a stereotype extending more than one metaclass, create one Stereotype element with an Extension connector to each of the Metaclass elements, as shown below:

- Stereotype elements must have unique names, but Metaclass elements can have the same name (for example, there can be several Action Metaclasses, each with a different *ActionKind* attribute)

Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Modeling Languages** | **Build a Profile** | **Create a New Stereotype**

**7.3.2.1.3 Create Stereotypes Extending non-UML Objects**

A Profile is typically defined by extending core UML object types to create your own modeling language or technology; however, you can also extend non-UML objects defined by another existing technology such as Archimate, BPMN, or SysML.

Extending a non-UML object allows inheritance of the following properties from the existing stereotype:

- Tagged Values
- Shape Scripts
- Stereotype colors
- Metatype properties

Create a Stereotype extending a non-UML Object

Step	Description	See also
1	Identify the base UML type of the non-UML object that you want to extend.  You can reveal an element's base UML type by deleting its Stereotypes. For example, create a SysML1.3 Block and, using the <b>Properties window</b> , delete the Block element's Stereotype. The element's type will change from Block to Class.	
2	In the Project Browser, locate the Package with the <<profile>> Stereotype and open its child diagram.  If you do not have an existing <<profile>> Package, use the <b>MDG Technology Builder</b> option in the <b>Model Wizard</b> dialog to create a new technology, then open the diagram from the newly created <<profile>> Package.	<a href="#">Using the Profile Helpers</a> 
3	Drag the <b>Metaclass</b> icon from the Profile page of the Diagram Toolbox onto the diagram.  The Extend Metaclass dialog displays.	<a href="#">Profile Toolbox</a> 
4	Select the Stereotypes tab.	
5	From the drop-down list, select the Profile to extend (for example, <b>SysML1.3</b> ) and select the checkbox next to the non-UML Stereotype to extend (for example, <b>block</b> ).  Click on the <b>OK</b> button.  The appropriate Stereotype element is added to the Profile diagram.	
6	Add a new Stereotype by dragging the <b>Add Stereotype</b> Profile Helper from the Diagram Toolbox.	

Step	Description	See also
	<p>This will be the custom Stereotype that extends the non-UML type added to the diagram in step 5.</p> <p>When defining this Stereotype, add the Metaclass identified in step 1. For example, if you intend to extend a <b>SysML Block</b>, you would add the <b>Class</b> Metaclass.</p> <p>When you have finished, the Stereotype element and Metaclass element are displayed on the Profile Diagram.</p>	<a href="#">Add Stereotypes and Metaclasses using Profile Helpers</a> <sup>[1531]</sup>
7	Draw a <b>Generalize</b> connector from the custom Stereotype added in step 6 to the non-UML Stereotype element added in step 5.	
8	Save the diagram as a Profile.	<a href="#">Export a Profile</a> <sup>[1523]</sup>
9	Define a Toolbox Profile that has items for each of your Stereotypes.	<a href="#">Create Toolbox Profiles using the Profile Helpers</a> <sup>[1538]</sup>
10	Incorporate the saved Profiles into an MDG Technology.	<a href="#">Create MDG Technology File</a> <sup>[1545]</sup>

### Notes

- When using a Shape Script to customize the Stereotype's appearance you can use the `drawparentshape()` method to render the shape that is defined for the non-UML object being extended

#### 7.3.2.1.4 Define Stereotype Tagged Values

You can define additional meta-information for a stereotype by adding various types of Tagged Value, which you identify as **attributes** of the Stereotype element. The simplest Tagged Values are those for which you type plain text into the **Value** field. For more complex Tagged Values, such as enumerations and Structured Tagged Values, see the *Learn more* section below.

**Access** Click on Stereotype element: **F9 > General**

#### Define Tagged Values for a Stereotype element

Field/Button	Description	See also
<b>New</b>	Click on this button to clear the dialog fields ready for creating a new attribute.	
<b>Name</b>	Type the name of the <b>tag</b> you are assigning to the Stereotype element.	
<b>Type</b>	Click on the drop-down arrow and select the attribute type.	
<b>Initial</b>	(Optional.) Type the initial value of the tag.	
<b>Notes</b>	Type a description of the tag.	
<b>Save</b>	Click on this button to save the new attribute details.	
<b>Close</b>	Click on this button to close the Attribute Properties dialog.

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Define Tagged Values**
- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Define Structured Tagged Values 1**
- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Define Structured Tagged Values 2**

##### **7.3.2.1.4.1 Add an Enumeration to a Stereotype**

Enumeration elements can be used to generate a drop-down list of values for a Tagged Value associated with a Stereotype element. The list is displayed, and the value selected, in the Tagged Values window.

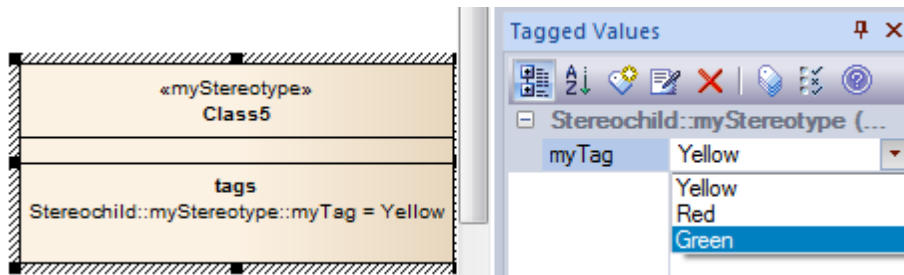

In the example below, the enumeration *Color* provides the drop-down list of values (Yellow, Red, Green) for the *myTag* Tagged Value on the *myStereotype* element.

#### Add an Enumeration to the Stereotype

Step	Description	See also
1	Open the Profile package child diagram.	
2	In the Toolbox, select <b>More tools   Profile</b> . The Profile pages of the Toolbox display.	
3	Drag an <i>Enumeration</i> item from the Toolbox onto the diagram. If the Properties dialog does not display, double-click on the element on the diagram.	
4	In the <b>Name</b> field, type the name of the new Enumeration element.	
5	Click on the Details tab and on the <b>Attributes</b> button. The Attributes Properties dialog displays.	
6	In the <b>Name</b> field, type the name of the Enumeration attribute (for example, <b>Yellow</b> ).	
7	In the <b>Type</b> field, click on the drop-down arrow and select the appropriate type (such as <b>int</b> or <b>string</b> ).	
8	Click on the <b>Save</b> button and the <b>New</b> button, and repeat steps 6 to 8 for additional attributes, to define the other values for the drop-down list.	
9	When you have defined all the values, click on the <b>Close</b> button.	

Step	Description	See also
10	Right-click on the <i>Stereotype</i> element and select the <b>Attributes</b> context menu option. The Attribute Properties dialog displays for the <b>stereotype</b> .	
11	In the <b>Name</b> field type a name for the attribute.	
12	In the <b>Type</b> field click on the ( ... ) button and select the name of the <b>Enumeration element</b> from the Select <Item> dialog.	
13	In the <b>Initial</b> field type the name of the required Enumeration attribute that defines the <b>default</b> value.	
14	Click on the <b>Save</b> and <b>Close</b> buttons.  You have now generated a drop-down list for setting the value of the tag in the Tagged Values window. When the Profile is in use, the Tagged Value for an element created with the stereotype might appear as shown:	

#### Learn more

- [Tagged Values](#) 

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Define Enumeration Tagged Values 1**
- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Define Enumeration Tagged Values 2**

#### 7.3.2.1.4.2 Define a Structured Tagged Value

If you want to define a property that has a number of components, such as an address, you can use a Structured Tagged Value. This consists of a set of related Tagged Values in a sequence that together define the property. For example, the Structured Tagged Value for the street address has the component Tagged Values:

PropertyNo - 448  
 Street - My Street  
 Town - Creswick  
 AreaCode - 3363

When you initially display this in the Tagged Value window or *tags* compartment of an element, the values of the tags are displayed in a string, such as:

**448, My Street, Creswick, 3363**

You can then expand the Structured Tagged Value to list the component tag names and values. You create a Structured Tagged Value in a profile, using an unstereotyped Class. Any attribute owned by a Stereotype element in the profile that is typed by such a Class will define the Structured Tagged Value.

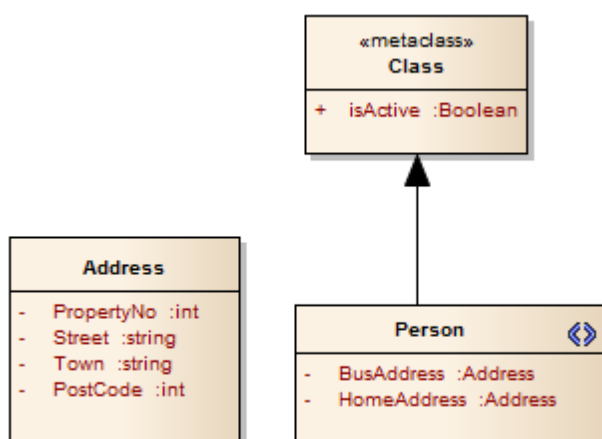

#### Create a Structured Tagged Value Class

Step	Description	See also
1	In your Profile Package, open the child Class diagram.	<a href="#">Create a Profile Package</a> 
2	In the Toolbox, select <b>More tools   Class</b> .  The contents of the Class page of the Toolbox display.	
3	Drag a Class item from the Toolbox onto the diagram.  If the Properties dialog does not display, double-click on the element on the diagram.	
4	In the <b>Name</b> field, type the name of the new Class element.	
5	Select the Details page from the Properties hierarchy, and click on the <b>Attributes</b> button.  The Attributes dialog displays.	
6	In the <b>Name</b> field, type the name of the Structured Tag attribute (for example, <b>PropertyNo</b> ).	
7	In the <b>Type</b> field, click on the drop-down arrow and select the appropriate type (such as <b>int</b> or <b>string</b> ).	
8	Click on the <b>Save</b> button, and repeat steps 6 to 8 for each remaining component tag attribute (for example: <b>Street</b> , <b>Town</b> , <b>AreaCode</b> ).	
9	When you have defined all the component tags, click on the <b>Close</b> button.	

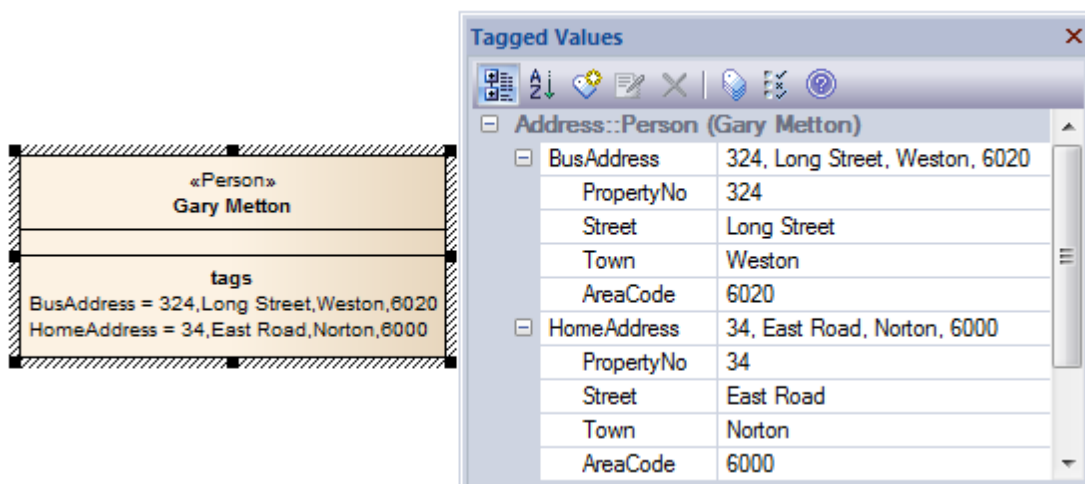

Step	Description	See also
10	Right-click on the <i>Stereotype</i> element and select the <b>Attributes</b> context menu option. The Attributes dialog displays for the <i>stereotype</i> .	
11	In the <b>Name</b> field type a name for the attribute (for example: <b>HomeAddress</b> ).	
12	In the <b>Type</b> field click on the ( ... ) button and select the name of the Structured Tagged Value Class element from the Select <Item> dialog, as the attribute's classifier.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
13	Click on the <b>Save</b> and <b>Close</b> buttons. You have now generated the components of the Structured Tagged Value to be maintained in the Tagged Values window for any element derived from this part of the profile.	<a href="#">Tagged Values</a> <sup>[1134]</sup>
14	Continue defining the profile, then save the diagram or package as a profile and either export it for use or add it to an MDG Technology file.	<a href="#">Export a Profile</a> <sup>[1523]</sup> <a href="#">Create MDG Technologies</a> <sup>[1545]</sup>

### Example

These elements when, as a Profile, are saved, exported, imported and used, provide the Structured Tagged Values for the home and business addresses in an element of the stereotype *Person*.

### Notes

- The process of applying a Structured Tagged Value through a profile is an alternative to applying the Tagged Value through an **Add-In** broadcast; see the *Learn more* topics below

### Learn more

- [Tagged Value Broadcasts](#) [3084]
- [Predefined Structured Types](#) [1622]

#### 7.3.2.1.4.3 Use the Tagged Value Connector

A common situation when creating a profile is where instances of one stereotype need to reference elements with another stereotype applied. For example, an element that defines a Collection might have a Tagged Value called **rootNode** to identify the Root of that Collection, which will be a Class with the stereotype <<Node>>. In the Tagged Values window, the user would click on the selection button ( ... ) against the **rootNode** Tagged Value; when the Select <Item> dialog displays, the user can locate all Nodes in the current model, and select one of these elements as the value of the tag.

To achieve this, you use the **Tagged Value connector**, from the Profile pages of the Toolbox. A Tagged Value connector defines a reference-type (that is, RefGUID) Tagged Value owned by the source stereotype; the Tagged Value name is the name of the **target role** of this connector, and the Tagged Value is limited to referencing elements with the stereotype of the target element.

The following diagram demonstrates how you might use the connector to create the example above. A Profile defines two stereotypes: «Collection» and «Node» (both of which extend the Metaclass Class). The «Collection» stereotype owns a Tagged Value connector with the target role *rootNode*, pointing to the «Node» stereotype. You enter the target role name on the Target Role page of the connector Properties dialog.

#### Learn more

- [Select <Item> Dialog](#) <sup>[994]</sup>
- [Target Role](#) <sup>[1132]</sup>
- [Source Role](#) <sup>[1130]</sup>

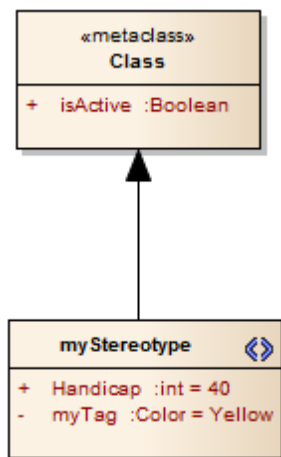

#### **7.3.2.1.4.4 With Predefined Tag Types**

Tagged Values define a wide range of properties and characteristics of a model element, and some of these properties have complex or structured values. For example, you might want your user to select a value between upper and lower limits (using 'Spin' arrows), set a date and time, select a color from a palette, or work through a checklist.

You create these complex Tagged Values from any of a number of predefined structured Tagged Value types and filters, some of which you might have created yourself (**Settings | UML Types > Tagged Value Types**); the attribute you create in the Stereotype element has the same name as the Tagged Value Type.

#### Assign Tagged Values to Stereotypes

Having created a structured Tagged Value, you assign it to the Stereotype element in the same way as for simple Tagged Values, by creating an attribute in the Stereotype element with the name of the Tagged Value Type. For example, to make the Tagged Value *Handicap* appear in a stereotype, create an attribute named *Handicap*. Depending on the tag type, you can set the default value for the tag by giving the attribute an *Initial* value.

#### Learn more

- [Predefined Structured Types](#) <sup>[1622]</sup>
- [Create Structured Tagged Values](#) <sup>[1622]</sup>
- [Define Stereotype Tagged Values](#) <sup>[1492]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Modeling Languages** | **Build a Profile** | **Define Typed Tagged Values**

#### 7.3.2.1.5 Define Stereotype Constraints

If you need to define the conditions and rules under which the Stereotype element operates and exists, you can do this by setting Constraints on the element. Typical constraints are pre- and post- conditions, which indicate things that must be true before the element is created or accessed and things that must be true after the element is destroyed or its action is complete.

You can show the constraints for an element directly on the diagram, using the Feature Visibility function.

**Access**    **Double-click Stereotype element > Constraints**

#### Define constraints for a stereotype

Field/Button	Description	See also
<b>New</b>	Click on this button to clear the fields ready to create a new constraint.	
<b>Constraint</b>	Type the value of the constraint.	
<b>Type</b>	Click on the drop-down arrow and select the appropriate type ( <b>Pre-condition</b> , <b>Post-condition</b> or <b>Invariant</b> ).	

Field/Button	Description	See also
<b>Status</b>	Click on the drop-down arrow and select the appropriate status.	
Notes	Type any additional information required.	
<b>Save</b>	Click on this button to save the constraint data.	
<b>OK</b>	Click on this button to close the dialog.	

#### Learn more

- [Feature Visibility](#)<sup>[845]</sup>

#### 7.3.2.1.6 Add Shape Scripts

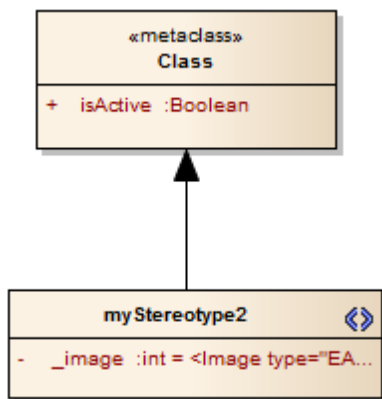

UML elements and connectors each have a standard appearance, in terms of shape, color and labeling. It is possible to change the appearance of a type of element or connector in a number of ways, using a Shape Script to define the exact feature you want to impose on the default - or main - shape. If you want to standardize the appearance, to apply to many elements, you attach the Shape Script to an attribute of a Stereotype element in a UML Profile (such as an MDG Technology UML Profile).

**Access** **Profile Stereotype element: ( F9 ) > General**

#### Add a Shape Script to a Stereotype element

Step	Description	See also
<b>1</b>	In the <b>Name</b> field, type <b>_image</b> .	
<b>2</b>	Click on the  button next to the <b>Initial Value</b> field. The Shape Editor dialog displays.	<a href="#">Shape Editor</a> <sup>[1584]</sup>
<b>3</b>	Enter the Shape Script in the Shape Editor dialog. When you have finished writing the Shape Script, click on the <b>OK</b> button and then the <b>Close</b> button.	<a href="#">Write Scripts</a> <sup>[1585]</sup>

The Stereotype element now resembles this example:

### Notes

- Your Shape Script might include externally-defined images; in this case the Shape Script would include the image method, specifying the image file name prefixed with the technology name
- If you are creating a Shape Script for an Association Class, note that the Shape Script is applied to both the Class part and the Association part; therefore, you might have to include logic in the shape main that tests the type of the element so that you can give separate drawing instructions for Class and for Association

Such logic is not necessary in the:

- shape source or shape target, which are ignored by Classes, or the
- decoration shapes which are ignored by Associations
- You can also apply Shape Scripts to elements on an ad hoc basis, attaching the Shape Script to a stereotype defined on the UML Types dialog (**Settings > UML Types**)

### Learn more

- [Create UML Profiles](#) <sup>1485</sup>
- [Shape Scripts](#) <sup>1562</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Defining an Image**

#### 7.3.2.1.7 Set Default Appearance

If you want to define a **simple** default appearance for a stereotyped element or connector, you can select the Stereotype element that defines it and just set any or all of the:

- Background/fill color
- Border color
- Border line width
- Font type, style (bold, italic) and size, or
- Font color

To set these, you use the Default Appearance dialog.

**Access** Click on Stereotype element: F4

#### Notes

- When you save the Profile defining the stereotyped elements and connectors, select the **Color and Appearance** checkbox on the Save UML Profile dialog

#### Learn more

- [Set an Element's Default Appearance](#)<sup>[927]</sup>
- [Add Stereotypes and Metaclasses](#)<sup>[1488]</sup>
- [Saving Profiles](#)<sup>[1523]</sup>

### 7.3.2.1.8 Special Attributes

It is possible to define a number of special features and behaviors of a stereotyped model element, such as the icon to represent it in the Project Browser and Diagram Toolbox, the default location of any image files associated with the stereotype, the dimensions of the element in a diagram, or whether the appearance is defined by a Shape Script. You define these features in your Profile using special attributes that can be applied to either the:

- Stereotype elements or
- Metaclass elements, referring to the stereotypes that extend them

**Access** Click on profile element: F9 > General

#### Set the attribute(s)

Field/Button	Description	See also
<b>Name</b>	Type the name of the attribute (as listed in the tables below).	
<b>Initial</b>	Type or select the initial value of the attribute.	
<b>Save</b>	Click on this button to save your changes. (You do not need to set any other values.)	
<b>Close</b>	Click on this button to close the dialog.	

#### Stereotype element Attributes

Attribute	Meaning	See also
<b>_defaultAttributeType</b>	<p>Defines the default type of the new attributes created from the Diagram Toolbox. Use this in a Stereotype element that extends an <i>Attribute</i> Metaclass, and set the attribute type as the initial value.</p> <p>If you do not provide this, the system creates attributes with the default type <b>int</b>.</p>	
<b>icon</b>	<p>Contains the bitmap file location of the 16x16-pixel icon displayed beside all elements defined by the Stereotype, in the Project Browser. This does not apply to <i>Package</i> elements. The icon is also automatically used as the Diagram Toolbox image wherever the stereotyped element is listed.</p> <p>For a transparent background, you can use light grey - RGB (192,192,192).</p> <p>For this attribute to work correctly, also set the <i>_metatype</i> attribute (see below).</p>	
<b>_image</b>	<p>Identifies a Shape Script definition, the script for which is created in the <b>Initial Value</b> field.</p> <p>For this attribute to take effect, you need to set the <b>Alternate Image</b> option when you save the Profile.</p>	<a href="#">Add Shape Scripts</a>  <sup>[1501]</sup>  <a href="#">Export a Profile</a>  <sup>[1523]</sup>
<b>_instanceMode</b>	Define what happens when an instance is created of a stereotyped element.	<a href="#">Define Creation of Instance</a>  <sup>[1510]</sup>
<b>_instanceOwner</b>		
<b>_instanceType</b>		
<b>_metatype</b>	Defines stereotypes as metatypes, so that the identity of an element as a custom, stereotyped element is hidden.	<a href="#">Define a Stereotype as a Metatype</a>  <sup>[1508]</sup>
<b>_sizeY</b>	<p>Sets the initial height of the element, in pixels, at 100% zoom.</p> <p>For this attribute to take effect, you need to set the <b>Element Size</b> option when you save the Profile.</p>	<a href="#">Export a Profile</a>  <sup>[1523]</sup>
<b>_sizeX</b>	<p>Sets the initial width of the element, in pixels, at 100% zoom.</p> <p>For this attribute to take effect, you need to set the <b>Element Size</b> option when you save the Profile.</p>	<a href="#">Export a Profile</a>  <sup>[1523]</sup>
<b>_strictness</b>	Defines the degree to which a stereotyped element can have more than one stereotype applied to it.	<a href="#">Define Multiple-Stereotype Level</a>  <sup>[1509]</sup>

**Metaclass element Attributes**

Attribute	Meaning	See also
<b>_AttInh</b>	If set to <b>1</b> , sets the <b>Inherited Features: Show Attributes</b> checkbox to selected on each new stereotyped model element.	<a href="#">Feature Visibility</a> <sup>[845]</sup>

<b>_AttPri</b>	If set to <b>1</b> , sets the <b>Attribute Visibility: Private</b> checkbox to selected on each new stereotyped model element.	
<b>_AttPro</b>	If set to <b>1</b> , sets the <b>Attribute Visibility: Protected</b> checkbox to selected on each new stereotyped model element.	
<b>_AttPub</b>	If set to <b>1</b> , sets the <b>Attribute Visibility: Public</b> checkbox to selected on each new stereotyped model element.	
<b>compositeKind</b>	When applied to an Association, defines whether the source or target end is an aggregate or composite. Permitted values are: <ul style="list-style-type: none"> <li>• <b>None</b></li> <li>• <b>Aggregate at Source</b></li> <li>• <b>Aggregate at Target</b></li> <li>• <b>Composite at Source</b></li> <li>• <b>Composite at Target</b></li> </ul>	<a href="#">Aggregation</a> <sup>[1392]</sup>
<b>_ConInh</b>	If set to <b>1</b> , sets the <b>Show Element Compartments: Inherited Constraints</b> checkbox to selected on each new stereotyped model element.	<a href="#">Feature Visibility</a> <sup>[845]</sup>
<b>_Constraint</b>	If set to <b>1</b> , sets the <b>Show Element Compartments: Constraints</b> checkbox to selected on each new stereotyped model element.	
<b>_defaultDiagram Type</b>	Defines the type of child diagram created when an element is made composite.	<a href="#">Define Child Diagram Type</a> <sup>[1512]</sup>
<b>direction</b>	Automatically created when any type of connector Metaclass element is dragged from the Profile toolbox page onto a diagram. You can set a value for this attribute in preference to using the <i>_SourceNavigability</i> or <i>_TargetNavigability</i> attributes (below).	
<b>_HideStyle</b>	Set the <b>Initial Value</b> field to a comma-separated list of stereotypes to hide those stereotypes by setting the <b>Hide Stereotyped Features</b> filter for each new stereotyped model	<a href="#">Feature Visibility</a> <sup>[845]</sup>

Attribute	Meaning	See also
	element.	
<b>_isVertical</b>	Set to <b>True</b> for a stereotyped <i>ActivityPartition</i> to make the default Activity Partition orientation vertical.	<a href="#">Partition</a> <sup>[1325]</sup>
<b>_lineStyle</b>	Sets the line style of a stereotyped connector; the <b>Initial Value</b> of the attribute can be one of: <ul style="list-style-type: none"> <li>• <b>direct</b></li> <li>• <b>auto</b></li> <li>• <b>custom</b></li> <li>• <b>bezier</b></li> <li>• <b>treeH</b> (horizontal)</li> <li>• <b>treeV</b> (vertical)</li> <li>• <b>treeLH</b> (lateral horizontal)</li> <li>• <b>treeLV</b> (lateral vertical)</li> <li>• <b>orthogonalS</b> (orthogonal, square corners)</li> <li>• <b>orthogonalR</b> (orthogonal, rounded corners)</li> </ul>	<a href="#">Connector Styles</a> <sup>[1114]</sup>
<b>_makeComposite</b>	Makes each stereotyped element a composite element when it is created.	<a href="#">Define Composite Elements</a> <sup>[1511]</sup>
<b>_OpInh</b>	If set to <b>1</b> , sets the <b>Inherited Features: Show Operations</b> checkbox to selected on each new stereotyped model element.	<a href="#">Feature Visibility</a> <sup>[845]</sup>
<b>_OpPkg</b>	If set to <b>1</b> , sets the <b>Operation Visibility: Package</b> checkbox to selected on each new stereotyped model element.	
<b>_OpPri</b>	If set to <b>1</b> , sets the <b>Operation Visibility: Private</b> checkbox to selected on each new stereotyped model element.	
<b>_OpPro</b>	If set to <b>1</b> , sets the <b>Operation Visibility: Protected</b> checkbox to selected on each new stereotyped model element.	
<b>_OpPub</b>	If set to <b>1</b> , sets the <b>Operation Visibility: Public</b> checkbox to selected on each new stereotyped model element.	
<b>_PType</b>	If set to <b>1</b> , sets the <b>Show element type (Port or Part only)</b> checkbox to selected on each new stereotyped model element.	
<b>_ResInh</b>	If set to <b>1</b> , sets the <b>Show Element Compartments: Inherited Responsibilities</b> checkbox to selected on each new stereotyped model element.	

Attribute	Meaning	See also
<b>_Responsibility</b>	If set to <b>1</b> , sets the <b>Show Element Compartments: Responsibilities</b> checkbox to selected on each new stereotyped model element.	
<b>_Runstate</b>	If set to <b>1</b> , sets the <b>Hide Object Runstate in current diagram</b> checkbox to selected on each new stereotyped model element.	
<b>_SourceAggregation</b>	<b>Deprecated.</b> See <b>compositeKind</b> , above.	
<b>_SourceMultiplicity</b>	Sets the multiplicity of the source element, such as <b>1..*</b> or <b>0..1</b> .	<a href="#">Source Role</a> <sup>[1130]</sup>
<b>_SourceNavigability</b>	If the connector is non-navigable, set this attribute to <b>Non-Navigable</b> .  If other values are more appropriate, use the <i>direction</i> attribute (above).	
<b>_subtypeProperty</b>	Specifies the fully qualified name of the Tagged Value that is used to generate a popup submenu each time an element with the stereotype is created from the Toolbox.  The Tagged Value is an enumeration and the submenu consists of a command for each enumeration literal. The Tagged Value is initialized with whichever command is selected on the submenu; if none is selected (such as if the user clicks off the submenu) then the default value is used as normal.  For example, if you create a <i>BPMN 2 Activity</i> element, a submenu displays listing the task types such as <b>BusinessRule</b> , <b>Manual</b> and <b>Receive</b> . Selecting one of these values sets it as the value of the <i>taskType</i> Tagged Value.  The Tagged Value is effectively the Activity's subtype; in the BPMN 2 profile, in the format <i>profile::stereotype::tag</i> , the <b>subtypeProperty</b> for the Activity stereotype would be:  <i>BPMN2.0::Activity::taskType</i> .	<a href="#">BPMN 2.0 Activity</a> <sup>[1904]</sup>
<b>_Tag</b>	If set to <b>1</b> , sets the <b>Show Element Compartments: Tags</b> checkbox to selected on each new stereotyped model element.	<a href="#">Feature Visibility</a> <sup>[845]</sup>
<b>_tagGroupings</b>	Maps the Tagged Values into the tag groups (below) displayed in the Tagged Values window, in the form:  <i>tagName1=groupName1;tagName2=groupName2;</i>  This facility currently is available for <b>object</b> types only, not for other types such as attributes.	
<b>_tagGroups</b>	Defines a comma-separated list of required groups in the order	<a href="#">Define Tag Groupings</a> <sup>[1514]</sup>

#### 7.3.2.1.8.1 Define a Stereotype as a Metatype

If you want to hide the identity of a custom element as a stereotyped UML element, you can set the **\_metatype** special attribute in the Stereotype element that defines it. The *\_metatype* attribute also makes custom element types appear in contexts where only Enterprise Architect's inbuilt types would normally appear; for example, in the lists of element types in the Relationship Matrix.

In the following example from SysML, *block* is defined as a Stereotype element that extends a UML Class.

However, a SysML user is not interested in UML **Classes**, only in SysML **Blocks**. If you set the `_metatype` attribute to **Block**, any element created from that stereotype, while behaving like a stereotyped Class in most contexts will:

- Show *Block* <name> rather than *Class* <name> as the title of its Properties dialog
- Be auto-numbered as *Block1* not *Class1* on creation, and
- Appear as *Block* not *Class* in many other contexts throughout Enterprise Architect

#### Learn more

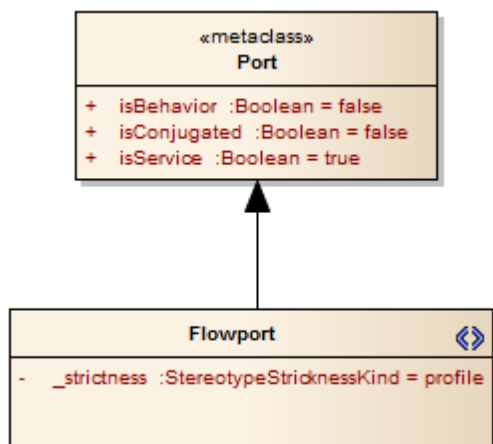

- [Stereotype and Metaclass Attributes](#) 1503

#### 7.3.2.1.8.2 Define Multiple-Stereotype Level

An element can have more than one stereotype applied to it. You can define the **level** to which multiple stereotypes can be applied, by creating the `_strictness` special attribute in the defining Stereotype element. The type of the attribute is *StereotypeStrictnessKind*, with one of four values in the **Initial Value** field:

- **profile**, which states that an element of this type cannot be given more than one stereotype from the same Profile
- **technology**, which states that an element of this type cannot be given more than one stereotype from the same technology
- **all**, which states that an element of this type cannot have multiple stereotypes at all, or
- **none**, which is the default behaviour and states that there are no restrictions on the use of multiple stereotypes

The following example is from SysML and shows that a `«flowPort»` cannot have any other stereotype applied to it.

#### Learn more

- [Stereotype and Metaclass Attributes](#) [1503]

#### 7.3.2.1.8.3 Define Creation of Instance

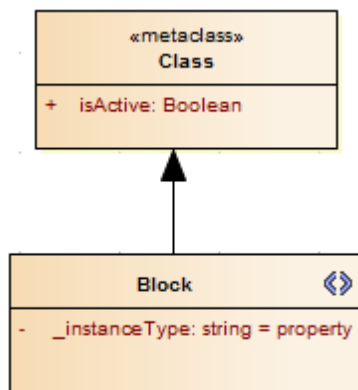

A stereotyped element can be the classifier of instances created from it. You can define **how an instance is created** from that stereotyped element, by adding special attributes to the defining Stereotype. The attributes **modify the text** on the Paste As dialog that displays when a stereotyped element is dragged out of the Project Browser onto a diagram.

#### Attributes

Attribute	Meaning	See also
<b>_instanceMode</b>	<p>Changes the second option for the <b>Paste as</b> field on the dialog to either:</p> <ul style="list-style-type: none"> <li>• <b>Instance (&lt;element type&gt;)</b> or</li> <li>• <b>Property (Object)</b></li> </ul> <p>The text is determined by the value (<b>Instance</b> or <b>Property</b>) of the attribute's <b>Initial Value</b> field.</p> <p>If the attribute is not applied, the option defaults to <b>Instance</b>.</p>	
<b>_instanceOwner</b>	<p><b>DEPRECATED</b></p> <p>Modifies the second option of the <b>Paste as</b> field on the dialog to:</p> <ul style="list-style-type: none"> <li>• <b>as Instance of &lt;element type&gt;</b></li> </ul> <p>The text is determined by the value of the attribute's <b>Initial Value</b> field, such as <b>Block</b>.</p> <p>If the attribute is not applied, the option defaults to <b>Element</b>.</p>	
<b>_instanceType</b>	Modifies the second option of the <b>Paste as</b> field on the dialog to:	<a href="#">Define a</a>

Attribute	Meaning	See also
<b>e</b>	<ul style="list-style-type: none"> <li>as Instance of Element (ProfileName::&lt;&lt;stereotype&gt;&gt;)</li> </ul> <p>The &lt;&lt;stereotype&gt;&gt; value is defined in the <b>Initial Value</b> field of the attribute, and corresponds to the metatype given to the stereotyped element using the <b>_metatype</b> attribute.</p>	<a href="#">Stereotype as a Metatype</a> <sup>[1508]</sup>

The following example from SysML shows the definition of any instances of a SysML Block element that might be created.

When a user drags a SysML Block element from the Project Browser onto a diagram, the system checks the **\_instanceType** attribute value and searches the SysML Profile for an element template with a matching **\_metatype** attribute value, and generates the instance from that - with the above definition you would get a Block element with the «property» stereotype.

#### Learn more

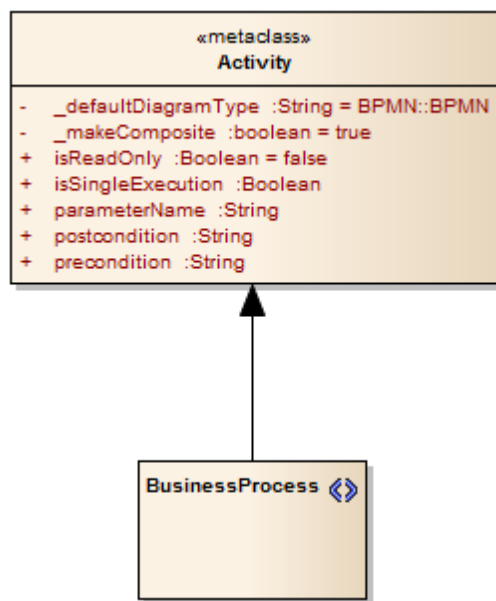

- [Paste Element from the Project Browser](#)<sup>[833]</sup>
- [Stereotype and Metaclass Attributes](#)<sup>[1508]</sup>

#### 7.3.2.1.8.4 Define Composite Elements

A stereotyped element can be created automatically as a composite element. You can define this, and whether the child diagrams of the composite are of a specific type, using special attributes.

To define whether an element is always made composite on creation, you apply the **\_makeComposite** special attribute to the appropriate **metaclass** element (not to a stereotype element). A stereotyped **class**, when created, does not default to having a child diagram, so you use the **\_makeComposite** attribute to trigger creation of the child diagram. For a stereotyped composite, the child diagram is of the usual default diagram type for the metaclass; you can change the child diagram type using the **\_defaultDiagramType** special attribute to identify the preferred diagram type,

The following example from BPMN shows that a *BusinessProcess* element is always created as a Composite element with a BPMN custom child diagram.

#### Learn more

- [Define Child Diagram Type](#) <sup>[1512]</sup>
- [Stereotype and Metaclass Attributes](#) <sup>[1503]</sup>

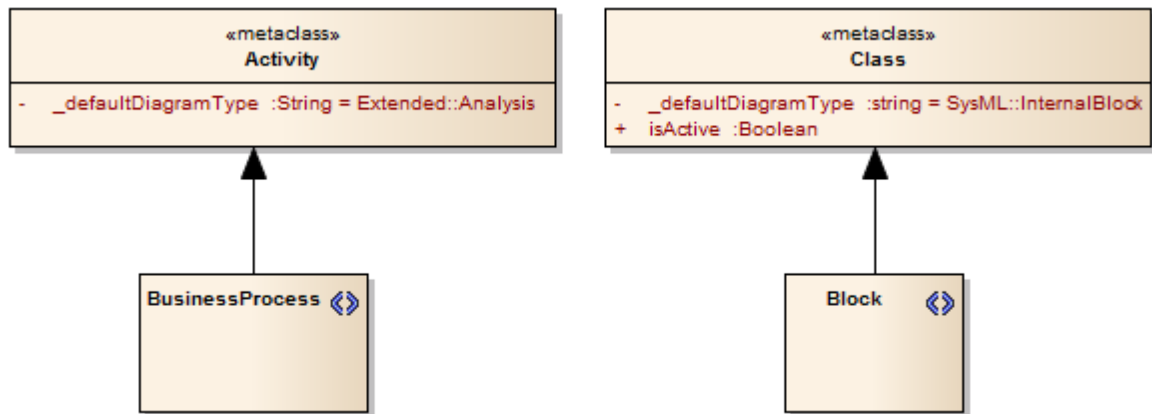

#### 7.3.2.1.8.5 Define Child Diagram Type

If you define a stereotyped element type as being a **composite**, its **child diagram type** is initially the same as the default for the Metaclass element you extend. You can change the diagram type to any other of the inbuilt UML or Extended types, or to any of your own custom diagram types, using the **\_defaultDiagramType** special attribute. As the diagram type defaults from the Metaclass element, you set the attribute on that Metaclass element (and not the Stereotype element) to change the default.

You identify the child diagram type in the **Initial Value** field for the attribute. The actual values for the inbuilt UML and Extended diagram types are listed below, in the *Initial Values* section. If you want to set a custom diagram type, you prefix the diagram type name with the **diagram profile name** and '::.'. The diagram profile name is the name given to the profile when you save it, which by default is the name of the Profile package or Profile diagram. We recommend that the diagram profile name is based on the technology name. You can also use the **\_defaultDiagramType** attribute for packages, extending the Package Metaclass element.

The following examples show a *«BusinessProcess»Activity* that, when made a composite element, automatically creates an Analysis diagram, and a *«block»* stereotype that creates a SysML *InternalBlock* custom diagram.

### Initial Values

The following strings can be used in the **Initial Value** field for `_defaultDiagramType`, to identify the inbuilt UML and Extended diagram types:

- UML Behavioral::Use Case
- UML Behavioral::Activity
- UML Behavioral::State Machine
- UML Behavioral::Communication
- UML Behavioral::Sequence
- UML Behavioral::Timing
- UML Behavioral::Interaction Overview
- UML Structural::Package
- UML Structural::Class
- UML Structural::Object
- UML Structural::Composite Structure
- UML Structural::Component
- UML Structural::Deployment
- Extended::Custom
- Extended::Requirements
- Extended::Maintenance
- Extended::Analysis
- Extended::User Interface
- Extended::Data Modeling
- Extended::ModelDocument.

### Notes

- Although we recommend that the **diagram profile name** for custom diagram types is based on the technology name, the attribute prefix is **not** a **direct reference** to the technology name

### Learn more

- [Define Composite Elements](#) <sup>[1511]</sup>
- [Custom Diagram Types](#) <sup>[1570]</sup>

#### 7.3.2.1.8.6 Define Tag Groupings

In developing a stereotyped element in a Profile, you might define a large number of Tagged Values. For example, a BPMN Activity element in the BPMN 2.0 Profile has 30 Tagged Values. By default, in the Tagged Values window for the element, these Tagged Values would initially **all** be displayed in alphabetical order, which might split related tags if they happen to have alphabetically distant names. To keep related tags together and control which tags are initially shown, in the BPMN 2.0 Profile the Tagged Values have been **grouped**. You can apply the same solution, using three tag grouping special attributes in the **Metaclass element** extended by the Stereotype element in which the tags are defined as attributes.

You apply the grouping using:

- **\_tagGroups** to define the group names
- **\_tagGroupings** to define which tags go into each group
- **\_tagGroupStates** to define which tag groups are initially expanded in the Tagged Values window, and which are collapsed

The Tagged Values window for the BPMN 2.0 Activity element initially displays as shown:

<input type="checkbox"/> BPMN2.0::Activity (Activity4)	
<input type="checkbox"/> Base Element	
<input type="checkbox"/> Activity	
activityType	Task
calledActivityRef	
instantiate	false
isACalledActivity	false
isATransaction	false
isForCompensation	false
resources	
<input type="checkbox"/> Task	
messageRef	
operationRef	
rendering	
script	
scriptFormat	
taskType	Service
<input type="checkbox"/> AdHoc	
<input type="checkbox"/> Loop	
<input type="checkbox"/> Sub-Process	
<input type="checkbox"/> Callable Element	
<input type="checkbox"/> Execution	
<input type="checkbox"/> Other	

To achieve this display of the BPMN 2.0 Activity Tagged Values, the Technology Developer defined the special attributes in the Activity Metaclass element as shown:

Attribute	Values	See also
<b>_tagGroups</b>	Base Element,Activity,Task,AdHoc,Loop,Sub-Process,Callable Element,Execution,Other	<a href="#">Special Attributes</a> <sup>[1507]</sup>
<b>_tagGroupings</b>	auditing=Base Element;categoryValue=Base Element;documentation=Base Element;monitoring=Base Element;activityType=Activity;calledActivityRef=Activity;instantiate=Activity;isACalledActivity=Activity;isATransaction=Activity;isForCompensation=Activity;resources=Activity;messageRef=Task;operationRef=Task;rendering=Task;script=Task;scriptFormat=Task;taskType=Task;adHoc=AdHoc;adHocOrdering=AdHoc; ... (and so on)	
<b>_tagGroupStates</b>	Base Element=closed;Activity=open;Task=open;AdHoc=closed;Loop=closed;Sub-Process=closed;Callable Element=closed;Execution=closed;Other=closed	

#### Notes

- This facility currently is available for object types only, not for other types such as attributes

#### 7.3.2.1.9 Quick Linker

When a user is creating new elements and connectors on a diagram they can simplify the process by using the Quick Linker arrow, which displays a list of the common connectors that can issue from a selected element and a list of the common elements each connector can connect to. These lists are derived from a Quick Linker definition, which is a Comma Separated Value (CSV) format file. As part of a Profile, you can add to or replace the built-in Quick Linker definitions using your own CSV files. These files are best manipulated in a spreadsheet, which should be set up to save the file as comma-separated text without quotation marks around text fields. You integrate the definition with the Profile by adding the CSV text to a Document Artifact element on the Profile diagram.

#### Notes

- The philosophy behind a Quick Linker definition is not to provide a **complete** list of valid or legal connections, but a short and convenient list of the **commonest** connections for the given context

### 7.3.2.1.9.1 Quick Linker Definition Format

In order to replace or change the Quick Linker menus that are displayed when a user drags the Quick Linker arrow from one of your profile elements on a diagram, you can create or edit the corresponding Quick Linker definition. This is a Comma Separated Value (CSV) text file consisting of records (rows), each record consisting of 23 comma-separated fields as defined in the table below. Some of these fields define the menu command and some act as filters, with the entry being ignored if the filter condition isn't met. A Quick Linker definition can include comments: all lines in which `//` are the first two characters are ignored by Enterprise Architect. Quotes (") in the field values are not required.

Each record of the Quick Linker definition represents a single combination of entries on the Quick Linker menus; that is, for the selected source element, a specific connector type and specific target element type. A menu is populated from all rows that satisfy the filters; that is, the first menu lists all defined connectors that are legal and valid for the source element type, and the second menu lists all target elements that are legal and valid for the combination of source element and connector type.

#### Quick Linker Definition fields

Column	Title (enter as comment for guidance)	Description
<b>A</b>	<b>Source Element Type</b>	Identifies a valid source element in the Profile; if a connector is being dragged away from this type of element, the row is evaluated. Otherwise, the row is ignored.
<b>B</b>	<b>Source Stereotype Filter</b>	Identifies a stereotype of the source element base type (for example, an Event source element can be a normal Event, or a Start Event, Intermediate Event or End Event stereotyped element).  If set, and if a connector is being dragged away from an element of this stereotype, the row is evaluated. Otherwise, the row is ignored.
<b>C</b>	<b>Target Element Type</b>	Identifies a valid target element in the Profile.  If <b>set</b> , and if a connector is being dragged <b>onto</b> this type of element, the row is evaluated.  If <b>blank</b> , and if a connector is being dragged onto an empty space on the diagram, the row is evaluated.  Otherwise the row is ignored.
<b>D</b>	<b>Target Stereotype Filter</b>	Identifies a stereotype of the target element base type.  If set, if <b>Target Element Type</b> is also set, and if a connector is being dragged onto an element of this stereotype, the row is evaluated. Otherwise, the row is ignored.
<b>E</b>	<b>Diagram Filter</b>	Contains either an inclusive list or an exclusive list of diagram types, which limits the diagrams the specified connector can be created on. <ul style="list-style-type: none"> <li>• Each diagram name is terminated by a semi-colon; for example:</li> </ul>

Column	Title (enter as comment for guidance)	Description
		<p><i>Collaboration;Object;Custom;</i></p> <ul style="list-style-type: none"> <li><b>Custom</b> diagram types from MDG Technologies can be referenced using the fully qualified diagram type (DiagramProfile::DiagramType); for example:  <i>BPMN2.0::Business Process;BPMN2.0::Choreography;BPMN2.0::Collaboration;</i></li> <li>As a shorthand for <b>all</b> diagram types in a diagram profile you can use the '*' wildcard, which must be preceded by the diagram profile ID; for example:  <i>BPMN2.0::*;</i></li> <li>Each <b>excluded</b> diagram name is preceded by an exclamation mark; for example:  <i>!Sequence;</i></li> </ul>
<b>F</b>	<b>New Element Type</b>	Defines the type of element to be created if the connector is dragged into open space, provided that the <b>Create Element</b> field is set to <b>TRUE</b> .
<b>G</b>	<b>New Element Stereotype</b>	Defines the type of element <b>stereotype</b> to be created if the connector is dragged into open space, provided that the <b>Create Element</b> field is set to <b>TRUE</b> .
<b>H</b>	<b>New Link Type</b>	Defines the type of connector to create, if <b>Create Link</b> is also set to <b>TRUE</b> .
<b>I</b>	<b>New Link Stereotype</b>	Defines the type of connector <b>stereotype</b> to correct, if <b>Create Link</b> is also set to <b>TRUE</b> .
<b>J</b>	<b>New Link Direction</b>	<p>Defines the connector direction, which can be:</p> <ul style="list-style-type: none"> <li><b>directed</b> (always creates an association from source to target)</li> <li><b>from</b> (always creates an association from target to source)</li> <li><b>undirected</b> (always creates an association with unspecified direction)</li> <li><b>bidirectional</b> (always creates a bi-directional association), or</li> <li><b>to</b> (creates either a directed or undirected association, depending on the value of the <b>Association Direction</b> field)</li> </ul>

Column	Title (enter as comment for guidance)	Description
		Not all of these work with all connector types; for example, you cannot create a bi-directional Generalization.
<b>K</b>	<b>New Link Caption</b>	Defines the text to display in the Quick Linker menu if a new connector is being created but not a new element.
<b>L</b>	<b>New Link &amp; Element Caption</b>	Defines the text to display in the Quick Linker menu if a new connector AND a new element are being created.
<b>M</b>	<b>Create Link</b>	If set to <b>TRUE</b> , results in the creation of a new connector; leave blank to stop the creation of a connector.
<b>N</b>	<b>Create Element</b>	If set to <b>TRUE</b> and a connector is being dragged onto an empty space on the diagram, results in the creation of a new element.  Leave blank to stop the element from being created. This overrides the values of <b>Target Element Type</b> and <b>Target Stereotype Filter</b> .
<b>O</b>	<b>Disallow Self connector</b>	Set to <b>TRUE</b> if self connectors are invalid for this kind of connector; otherwise leave this field blank.
<b>P</b>	<b>Exclusive to ST Filter + No inherit from Metatype</b>	Set to <b>TRUE</b> to indicate that elements of type <b>Source Element Type</b> with the stereotype <b>Source Stereotype Filter</b> do not display the Quick Linker definitions of the equivalent unstereotyped element.
<b>Q</b>	<b>Menu Group</b>	Indicates the name of the submenu in which a menu item is created.
<b>R</b>	<b>Complexity Level</b>	Not implemented, always set to <b>0</b> .
<b>S</b>	<b>Target Must Be Parent</b>	Set to <b>TRUE</b> if the menu item should only appear when dragging from a child element to its parent; for example, from a Port to its containing Class. Otherwise leave this field blank.
<b>T</b>	<b>Embed element</b>	Set to <b>TRUE</b> to embed the element being created in the target element; otherwise leave this field blank.
<b>U</b>	<b>Precedes Separator LEAF</b>	Set to <b>TRUE</b> to add a menu item separator to the Quick Linker menu, underneath this entry; otherwise leave this field blank.
<b>V</b>	<b>Precedes Separator GROUP</b>	Set to <b>TRUE</b> to add a menu item <b>group</b> separator to the Quick

Column	Title (enter as comment for guidance)	Description
		Linker sub-menu; otherwise leave this field blank.
<b>W</b>	<b>Dummy Column</b>	Depending on which spreadsheet application you use, this column might require a value in every cell to force a CSV export to work correctly with trailing blank values.

#### Learn more

- [Quick Linker](#)<sup>[1515]</sup>
- [Quick Linker Example](#)<sup>[1519]</sup>
- [Quick Linker Object Names](#)<sup>[1521]</sup>
- [Built-in Diagram Types](#)<sup>[1572]</sup>

#### 7.3.2.1.9.2 Quick Linker Example

If you want to create a Quick Linker definition, it is easiest to set it up in a spreadsheet with each menu item definition constructed across a row, as in the example below:

	A	B	C	E	F	H	J	K
1	//Source Element Type	Source ST filter	Target Element Type	Diagram Filter	New Element Type	New Link Type	New Link Direction	New Link Caption
2	Class	quick			Component	Dependency	to	
3	Class	quick			Component	Dependency	from	
4	Class	quick	Component			Dependency	to	Dependency to
5	Class	quick	Component			Dependency	from	Dependency from
6	Class	quick	Port			Dependency	to	Dependency to
7	Class	quick	Port			Dependency	from	Dependency from
8	Class	quick	Component		Port	Dependency	to	
9	Class	quick	Component		Port	Dependency	from	

	L	M	N	O	P	Q	R	S	T	U	V
1	New Link & Element Caption	Create Link	Create Element	Disallow Self connector	No inherit from metatype	Menu Group	Complexity Level	Target Must Be Parent	Embed element	Preceeds Separator LEAF	Preceeds Separator GROUP
2	Dependency to	TRUE	TRUE	TRUE	TRUE	Component	0				
3	Dependency from	TRUE	TRUE	TRUE	TRUE	Component	0			TRUE	
4		TRUE		TRUE	TRUE		0				
5		TRUE		TRUE	TRUE		0			TRUE	
6		TRUE		TRUE	TRUE		0				
7		TRUE		TRUE	TRUE		0			TRUE	
8	Dependency to	TRUE	TRUE	TRUE	TRUE	Port	0		TRUE		
9	Dependency from	TRUE	TRUE	TRUE	TRUE	Port	0		TRUE	TRUE	

The first row of the example is a comment line identifying the column headings. The subsequent lines define the connector/target element options for a Class element with the stereotype «*quick*». When a connector is dragged **away** from an element of this type, you want the user to create a Dependency either to or from a Component element. When they drag a connector onto an **existing** Port or Component element, you want a Dependency either to or from the Component **or**, in the case of a Component, you want the user to be able to create an embedded Port element.

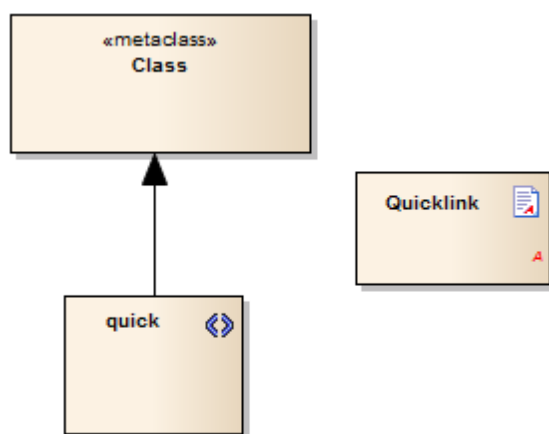

These requirements are defined in eight records in the Quick Linker definition file:

1. Dependency to new Component
2. Dependency from new Component
3. Dependency to existing Component
4. Dependency from existing Component
5. Dependency to existing Port
6. Dependency from existing Port
7. Dependency to existing Component, create new Port
8. Dependency from existing Component, create new Port

The records save to the following CSV file:

```
Cl ass, qui ck, , , , Component , , Dependency , , to , , Dependency to, TRUE, TRUE, TRUE,
TRUE, Component , 0, , , , ,
Cl ass, qui ck, , , , Component , , Dependency , , from , , Dependency from, TRUE, TRUE,
TRUE, TRUE, Component , 0, , , TRUE, ,
Cl ass, qui ck, Component , , , , , Dependency , , to, Dependency to, , TRUE, , TRUE,
TRUE, , 0, , , , ,
Cl ass, qui ck, Component , , , , , Dependency , , from, Dependency from, , TRUE, , TRUE,
TRUE, , 0, , , TRUE, ,
Cl ass, qui ck, Port , , , , , Dependency , , to, Dependency to, , TRUE, , TRUE,
TRUE, , 0, , , , ,
Cl ass, qui ck, Port , , , , , Dependency , , from, Dependency from, , TRUE, , TRUE,
TRUE, , 0, , , TRUE, ,
Cl ass, qui ck, Component , , , Port , , Dependency , , to, , Dependency to, TRUE, TRUE,
TRUE, TRUE, Port , 0, , TRUE, , ,
Cl ass, qui ck, Component , , , Port , , Dependency , , from , , Dependency from, TRUE,
TRUE, TRUE, TRUE, Port , 0, , TRUE, TRUE, ,
```

If you want to test the effect, you can create the following Profile and cut and paste the above CSV lines into the **QuickLink** Document Artifact element.

[Learn more](#)

- [Quick Linker Definition Format](#)<sup>[1516]</sup>
- [Add Quick Linker Definition To Profile](#)<sup>[1523]</sup>

#### 7.3.2.1.9.3 Hide Default Quick Linker Settings

If you create your own Quick Linker definition for an element, you might want to hide the default Quick Linker options between the given source and target elements. You can do this by setting the *Exclusive to stereotype* flag (column **P**) to **TRUE**, in the definition CSV file.

Alternatively, you might want to hide the default Quick Linker options without having a replacement custom option. For example, normally if you don't define any Quick Links for one «quick» Class to another «quick» Class, the Quick Linker arrow displays the default Quick Links for one Class to another Class. To override this behaviour, create a Quick Linker definition in which you set the:

- Source Element Type (column **A**)
- Source Stereotype Filter (column **B**)
- Target Element Type (column **C**)
- Target Stereotype Filter (column **D**)
- New Link Type (column **H**) to **<none>**
- Exclusive to ST Filter + No inherit from Metatype (column **P**) to **TRUE**

Try adding this line to the *Quick Linker Example*:

```
Cl ass, qui ck, I nt er f a c e, , , , , <none>, , , , , , TRUE, , 0, , , , ,
```

With this line in the definition, when a Quick Link is dragged from a «quick» Class to an Interface element, the default Class-to-Interface Quick Links are hidden.

#### Notes

- This technique does not affect the automatic appearance of Dependency, Trace, Information Flow and Help options on the Quick Linker menu

#### Learn more

- [Quick Linker Example](#)<sup>[1519]</sup>
- [Quick Linker Definition Format](#)<sup>[1516]</sup>

#### 7.3.2.1.9.4 Quick Linker Object Names

When you create a Quick Linker definition file, you use a range of base element and connector types to identify the:

- Source element type (column **A**)
- Target element type (column **C**)
- New element type (column **F**) and
- New link type (column **H**)

These are then qualified by the stereotypes you specify in the definition. The base element and connector types you can use are listed below.

**Element Types**

Action	ExecutionEnvironment	ObjectNode
ActionPin	ExitPoint	Package
Activity	ExitState	Part
ActivityParameter	ExpansionNode	Port
ActivityPartition	ExpansionRegion	PrimitiveType
Actor	Feature	ProvidedInterface
Artifact	FinalActivity	Receive
Boundary	GUIElement	RequiredInterface
CentralBufferNode	HistoryState	Requirement
Change	InformationItem	Screen
ChoiceState	InitialActivity	Send
Class	InitialState	Sequence
Collaboration	InteractionOccurrence	Signal
Component	Interface	State
DataType	Issue	StateLifeline
Decision	InterruptableActivityRegion	StateMachine
DeepHistoryState	JunctionState	Synchronization_H
Deployment Specification	MergeNode	Synchronization_V
Device	MessageEndpoint	SynchState
DiagramGate	n-ary Association	UMLDiagram
EntryPoint	Node	UseCase
EntryState	Object	ValueLifeline

**Connector Types**

Abstraction	Deployment	Realization
Aggregation	Extension	Redefinition
Association	Generalization	Sequence
AssociationClass	InformationFlow	StateFlow
CommunicationPath	InterfaceLink	Substitution
Composition	Manifest	TemplateBinding
ConnectorLink	Nesting	UCExtends
ControlFlow	ObjectFlow	UCIncludes
DelegateLink	PackageImport	Usage
Dependency	PackageMerge	UseCase

### 7.3.2.1.9.5 Add Quick Linker Definition To Profile

When you have set up your Profile Quick Linker definitions as a CSV file, you can incorporate them into the Profile. To do this, you copy the file contents into the Linked Document of a **Document Artifact** element that exists in the same diagram as the Stereotype elements of the Profile.

#### Add Definition to Profile

Step	Discussion	See also
1	Open the Profile child diagram containing the Stereotype elements for the Profile.	<a href="#">Create UML Profiles</a> <sup>[1485]</sup>
2	Select the Documentation page of the Diagram Toolbox ( <b>More tools   Documentation</b> ), and drag a Document Artifact element onto the diagram. Give this element the name <b>QuickLink</b> .	<a href="#">Diagram Toolbox</a> <sup>[792]</sup> <a href="#">Document Artifact</a> <sup>[1373]</sup>
3	Double-click on the element to open the Linked Document Editor; cancel the prompt for a template name.	
4	Open your CSV file in a text editor such as Notepad and copy and paste the contents into the Document Artifact element Linked Document.  Save and close the document.	<a href="#">Edit Linked Documents</a> <sup>[1048]</sup>
5	Continue working on the Profile until it is complete, and save it.  The QuickLink definitions are saved with the Profile and are processed and applied when the Profile is imported (within its MDG Technology) into another model.  A technology can contain a number of Profiles and therefore have a number of Quick Link definitions, one for each Profile.	

#### Learn more

- [Quick Linker Definition Format](#) <sup>[1518]</sup>
- [Quick Linker Example](#) <sup>[1519]</sup>

### 7.3.2.2 Export a Profile

Once you have created a Profile, defined the Stereotype elements, and added any Tagged Values, Shape Scripts, Constraints and Quick Linker definitions you need, you can save (export) the Profile to disk. The Profile can then be integrated with an MDG Technology and deployed to other models for use.

#### Save a Profile

Step	Description	See also
1	<p>If your Profile is:</p> <ul style="list-style-type: none"> <li>• A <b>single Profile</b> spread over <b>multiple diagrams</b> within the same Profile Package, find the Profile Package in the Project Browser window, right-click on it and select the <b>Advanced   Save Package as UML Profile</b> context menu option</li> <li>• One of <b>multiple</b> Profiles within the <b>same</b> Profile Package, right-click anywhere in the background of the Profile diagram and select the <b>Save as Profile</b> context menu option</li> <li>• A <b>single diagram</b> within the Profile Package, choose either the <b>Save Package as UML Profile</b> context menu option or the <b>Save as Profile</b> context menu option</li> </ul> <p>The Save UML Profile dialog displays.</p>	<a href="#">Save Profile Options</a> <sup>[1525]</sup>
2	<p>Click on the ( ... ) (Browse) button, and select the destination directory path for the XML Profile file.</p> <p>If necessary, edit the Profile filename, but do not delete the .xml extension.</p>	
3	<p>In the <b>Profile Type</b> field, use the default value <b>EA (UML)2.X</b> (or, if necessary, click on the drop-down arrow and select this value).</p>	
4	<p>Set the required export options for all stereotypes defined in the Profile:</p> <ul style="list-style-type: none"> <li>• <b>Element Size</b> - select the checkbox to export the element size attributes</li> <li>• <b>Color and Appearance</b> - select the checkbox to export the color (background, border and font) and appearance (border thickness) attributes</li> <li>• <b>Alternate Image</b> - select the checkbox to export the metafile images</li> <li>• <b>Code Templates</b> - select the checkbox to export the code templates, if they exist</li> </ul>	<a href="#">Color and Appearance</a> <sup>[1502]</sup>
5	<p>Click on the <b>Save</b> button to save the Profile to disk.</p>	

### Avoiding Profile Name and ID conflicts

Each Profile should have a unique name and ID. The Profile name is specified when saving the Profile, while the ID is derived from the GUID of the diagram or Package that was used to save the Profile. To avoid name and ID conflicts:

- When creating multiple Profiles, use a new diagram or Package for each Profile
- When saving Profiles enter a Profile name that is unique

On starting Enterprise Architect or enabling an MDG Technology, if a duplicate Profile name or duplicate Profile ID is detected, a warning will be displayed in the System Output window.

### Notes

- To quickly test a Profile, you can import the XML file on its own into the Resources window; for final

deployment, incorporate the Profile into an MDG Technology

### Learn more

- [UML Profiles in the Resources Window](#)<sup>[1526]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Save UML Profile**

#### 7.3.2.2.1 Save Profile Options

When you save a Profile, you can save it either from its parent Package or from the Profile diagram, depending on whether the Profile is:

- A single Profile spread over multiple diagrams within the same Profile Package (find the Profile *Package* in the Project Browser, right-click on it and select the **Advanced | Save Package as UML Profile** context menu option), which is typically the case for a Stereotypes Profile
- One of multiple Profiles within the same Profile Package (right-click anywhere in the background of the Profile *diagram* and select the **Save as Profile** context menu option); for example, when creating multiple Toolbox profiles
- A single diagram within the Profile package (choose *either* the **Save Package as UML Profile** context menu option *or* the **Save as Profile** context menu option)

The two context menu options produce slightly different results, which you might consider when deciding how to create your Profile, especially in the third instance where you could choose either option.

Save From Diagram	Save From Package	Notes
The Profile takes the diagram name.	The Profile takes the Package name.	Package and diagram names are not necessarily the same, although you can save a lot of confusion if you make them the same or very similar.  For example: Package <i>GL</i> with diagrams <i>GL 1</i> , <i>GL2</i> , <i>GL3</i> .
The Profile takes the diagram's notes.	The Profile takes the Package's notes.	Diagram notes can be significant in the Profile definition, such as for Toolbox Profiles.  See <a href="#">Create Toolbox Profiles</a> <sup>[1567]</sup> .
You can take the default size and appearance (including alternate image) from the diagram object.	You cannot take the default size and appearance from the diagram object.  You can use the <code>_sizeX</code> , <code>_sizeY</code> and <code>_image</code> properties, but there is no equivalent for default colors.	

Save From Diagram	Save From Package	Notes
This option can be much faster.	This option can be much slower.	<p>The difference arises because diagram objects are kept in memory and Project Browser elements are not.</p> <p>This is only likely to be an issue if the Profile is a large one and you are using a slow network connection to a remote repository.</p>

### 7.3.2.3 UML Profiles in the Resources Window

The Resources window contains a tree structure with entries for a range of items including UML Profiles. The *UML Profiles* node initially contains no entries; to be able to use Profiles from the Resources window you must import them into the project from external XML files.

Items in a Profile represent stereotypes. These can be applied to UML elements in the following ways:

- Stereotypes that apply to elements such as *Classes* and *interfaces* can be dragged directly from the Resources window to the current diagram, automatically creating a stereotyped element; alternatively, they can be dragged onto existing elements, automatically applying them to the element
- Stereotypes that apply to *attributes* can be drag-and-dropped onto a host element (such as a Class); a stereotyped attribute is automatically added to the element's feature list
- Stereotypes that apply to *operations* are like those that apply to attributes; drag-and-drop onto a host element to add the stereotyped operation
- Stereotypes that apply to *connectors* such as *associations*, *generalizations*, *messages* and *dependencies* are added by selecting them in the Resources window, then clicking on the start element in a diagram and dragging to the end element (in the same manner as adding normal connectors); a stereotyped connector is added
- Stereotypes that apply to *association ends* can be added by dragging the connector end element over the end of an Association in the diagram

#### Learn more

- [Import UML Profiles Into the Resources Window](#) 

#### 7.3.2.3.1 Import UML Profiles Into the Resources Window

Profiles exist as XML files, which can be imported into any project to provide tailored modeling structures for specific domains. A number of Profile XML files are available to you on the Sparx Systems website, for importing into your models. You can also import Profile XML files that you have created yourself. If a Profile includes references to any metafiles, copy these metafiles into the same directory as the Profile XML file.

**Access** **Project | Resources (Alt+6) > UML Profiles | Import Profile**

#### Import a Profile

Field/Button	Action	See also
<b>Filename</b>	Click on the ( ... ) (Browse) button and locate the XML Profile file to import.	<a href="#">Resources</a> 

Field/Button	Action	See also
<b>Element Size</b>	Select the checkbox to import the element size attributes for all stereotypes defined in the Profile.	
<b>Color and Appearance</b>	Select the checkbox to import the color (background, border and font) and appearance (border thickness) attributes for all stereotypes defined in the Profile.	
<b>Alternate Image</b>	Select the checkbox to import the metafile image for all stereotypes defined in the Profile.	
<b>Code Templates</b>	Select the checkbox to import the code templates, if they exist, for all stereotypes defined in the Profile.	
<b>Overwrite Existing Templates</b>	Select the checkbox to overwrite any existing code templates defined in the current project, for all stereotypes defined in the Profile.	
<b>Import</b>	<p>Click on this button to add the Profile to the <i>UML Profiles</i> folder.</p> <p>If the Profile already exists, a prompt displays for you to overwrite the existing version and import the new one.</p> <p>When the import is complete, the Profile is ready to use.</p>	<a href="#">Add Profile Objects to a Diagram</a> <sup>[1472]</sup>

### 7.3.3 MDG Technologies - Creating

If you want to access and use resources pertaining to a specific technology within Enterprise Architect, you can do so using a Model Driven Generation (MDG) Technology. There are various options for an administrator or individual user to bring existing MDG Technologies into use with Enterprise Architect. Technology Developers can also develop **new** MDG Technologies and deploy them to the project team as necessary, providing a solution tailored to your working domain or environment.

### 7.3.3.1 Using the Profile Helpers

MDG Technologies and Profiles are developed using diagrams and elements within Enterprise Architect. These diagrams and elements use specific attributes and properties which determine the content and behavior of the resulting MDG Technology. **Profile Helpers** assist in creating new MDG Technologies, and the following Profile types:

- Stereotype Profiles
- Toolbox Profiles and
- Diagram Profiles

The Profile Helpers consist of two components:

- **MDG Technology Builder** templates in the **Model Wizard** dialog which provide a starting point for creating a new MDG Technology
- **Profile Helper** items in the **Profile Toolbox** which provide dialogs that simplify the creation of Stereotype, Toolbox and Diagram Profiles

**Access**    **Right-click on a Project Browser Package node | Add a Model using Wizard (Ctrl+Shift+M)**

#### Create a new MDG Technology

Step	Description	See also
1	In the Model Wizard dialog, select <b>MDG Technology Builder</b> from the <b>Technology</b> list and tick the <b>Basic Template</b> checkbox in the <b>Name</b> list. Click the <b>OK</b> button. A prompt displays for the Technology name.	<a href="#">Model Wizard</a> <sup>[753]</sup>
2	Enter a name for your new MDG Technology, and click on the <b>OK</b> button.  This will create a basic template of Packages and example elements, which can be used as a starting point for creating an MDG Technology. The template includes three Packages, each having the same name as the technology but a different stereotype corresponding to the type of Profile they define: <ul style="list-style-type: none"> <li>• &lt;&lt;profile&gt;&gt; - Package for defining a Profile containing the Stereotypes</li> </ul>	

Step	Description	See also
	<p>users will apply to elements</p> <ul style="list-style-type: none"> <li>• <code>&lt;&lt;diagram profile&gt;&gt;</code> - Package for a Profile describing the diagram types users will create</li> <li>• <code>&lt;&lt;toolbox profile&gt;&gt;</code> - Package for a Profile describing the elements to show in a toolbox</li> </ul>	
3	<p>Within each Package, open the diagram and, referring to the sample elements provided, add additional items to the Profile.</p> <p>The <b>Profile Toolbox</b> contains a page of Profile Helper icons that, when dragged onto the diagram, help you create and populate the elements of the various Profiles.</p>	<p><a href="#">Create Stereotype Profiles using Profile Helpers</a>  <sup>[1529]</sup></p> <p><a href="#">Create Diagram Profiles using the Profile Helpers</a>  <sup>[1536]</sup></p> <p><a href="#">Create Toolbox Profiles using the Profile Helpers</a>  <sup>[1538]</sup></p>
4	Save each of these Profiles to disk.	<a href="#">Export a Profile</a>  <sup>[1523]</sup>
5	Incorporate the saved Profiles into an MDG Technology.	<a href="#">Create MDG Technology File</a>  <sup>[1545]</sup>

#### 7.3.3.1.1 Create Stereotype Profiles using Profile Helpers

When creating a technology to provide a domain-specific toolset, the typical starting point is to define each element, connector, feature and structural component you want to provide. These are defined by a **Profile**.

All **Stereotypes** defined in a Profile are either extensions of **Core UML objects** (Metaclasses) defined by Enterprise Architect, or extensions of **non-UML objects** (Stereotypes) defined by other existing Profiles and technologies.

When development of a Profile is complete, it is saved to an external XML file and then incorporated into an MDG Technology for final deployment.

Each Stereotype defined in a Profile modifies the behavior of the Metaclass or Stereotype that it extends. These modifications might include:

- Tagged Values to provide additional properties
- Constraints to define the conditions and rules that apply to each Stereotype
- A Shape Script to customize the overall appearance of the new object
- A change to the default appearance of the object, such as background, border and font colors

- Quick Linker definitions to provide a list of the most common connection types from each Stereotype
- Special attributes that define the specific appearance and behavior of the new object, including the initial element size and Project Browser icon

### Create a UML Profile

Step	Description	See also
1	<p>In the Project Browser, locate the Package with the &lt;&lt;profile&gt;&gt; stereotype and open its child diagram.</p> <p>If you do not have an existing &lt;&lt;profile&gt;&gt; Package, use the <b>MDG Technology Builder</b> option in the <b>Model Wizard</b> dialog to create a new technology, then open the diagram from the newly created &lt;&lt;profile&gt;&gt; Package.</p>	<a href="#">Using the Profile Helpers</a> [1528]
2	<p>(Optional) If you intend your Stereotype elements to include <b>Tagged Values</b> with a drop-down list of several pre-defined values, each set of values must be defined by an <b>Enumeration</b> element on the Profile diagram.</p> <p>If you intend your Stereotype elements to include a <b>Structured Tagged Value</b> to provide a composite set of information, each structure must be defined by a <b>Class</b> element on the Profile diagram.</p> <p>The Enumeration and Class elements have to exist before you can define these Tagged Value types for your Stereotype; you can either create the elements at this point, or add these Tagged Values to your Stereotype at a later time.</p>	<a href="#">Add an Enumeration to a Stereotype</a> [1493]  <a href="#">Add a Structured Tagged Value to a Stereotype</a> [1495]
3	Add a new Stereotype by dragging the <b>Add Stereotype</b> Profile Helper from the Diagram Toolbox. The dialog opened by the <b>Add Stereotype</b> Profile helper will allow you to specify various general Properties, Tagged Values, and the Shape Script for your Stereotype.	<a href="#">Add Stereotypes and Metaclasses using Profile Helpers</a> [1531]
4	(Optional) Define <b>Constraints</b> for the Stereotype.	<a href="#">Define Stereotype Constraints</a> [1500]

- [Create Toolbox Profiles using the Profile Helpers](#) <sup>[1538]</sup>

#### 7.3.3.1.1.1 Add Stereotypes and Metaclasses using Profile Helpers

You can define Stereotypes in a Profile to either extend:

- **Core UML objects (Metaclasses)** pre-defined in Enterprise Architect), or
- **Objects (Stereotypes)** defined by other Profiles and technologies (for instance objects defined in ArchiMate or SysML)

Stereotypes can extend Metaclasses in several ways:

- **One** Stereotype extending **one** Metaclass, for a specific definition of one object type
- **One** Stereotype extending **more than one** Metaclass, where the definition applies to more than one object type - such as modifying both a Class and an Object in the same way
- **Several** Stereotypes extending **one** Metaclass, where you are creating several variations of the same base object type; for example, to define types of Association connector, representing Parent, Sibling, Grandparent, Uncle/Aunt and Cousin relationships

### Add Metaclasses and Stereotypes to a Profile

Step	Description	See also
1	If you are extending a <b>non-UML</b> type defined by an existing Profile or technology, follow the process described in the <i>Create Stereotypes Extending non-UML Objects</i> Help topic.	<a href="#">Create Stereotypes Extending non-UML Objects</a> <sup>[1491]</sup>
2	In the Project Browser, locate the Package with the <<profile>> Stereotype and open its child diagram.	<a href="#">Create UML Profiles using Profile Helpers</a> <sup>[1529]</sup>

3	<p>Drag the <b>Add Stereotype</b> icon from the Profile Helpers page of the Diagram Toolbox onto the diagram.</p> <p>The Add Stereotype dialog displays.</p>	
4	<p>In the <b>Name</b> field, type the Stereotype name (which will also be the name of the new modeling object).</p>	
5	<p>Select one of the following object groups by clicking on the <b>Type</b> drop-down arrow:</p> <ul style="list-style-type: none"> <li>• <b>Element Extension</b> - to create a Stereotype that extends an element</li> <li>• <b>Connector Extension</b> - to create a Stereotype that extends a connector</li> <li>• <b>Abstract Metaclass</b> - to create a Stereotype that extends a structural or behavioral modifier</li> <li>• <b>Metaclass Extension</b> - to create a Stereotype that extends a Metaclass that already exists within your model (and most likely within the diagram you are currently working in)</li> </ul>	
6	<p>Click on the <b>Add Metaclass</b> button.</p> <p>The Extend Metaclass dialog displays, showing a list of object types associated with the <b>object group</b> selected in step 5.</p> <p>Select the Metaclass to be extended from the list and click on the <b>OK</b> button.</p> <p>If you selected <b>Metaclass Extension</b> in step 5, the Select a Profile Element browser/search dialog displays; search for and select the existing Metaclass element to extend with this Stereotype.</p> <p>The Metaclass name is added to the <b>Extensions</b> field.</p>	
7	<p>If you want to extend more than one Metaclass with the Stereotype, click on the <b>Add Metaclass</b> button again and select the next object type to extend. You can repeat this for as many Metaclasses as you want to extend with this Stereotype.</p> <p>To delete a selected Metaclass from the <b>Extensions</b> list click on the <b>Remove</b> button.</p>	
8	<p>Review the available Properties in the <b>Stereotype</b> panel. These properties modify the behaviour of the Stereotype.</p> <p>To apply a property, click in the <b>Value</b> field and type or select the appropriate value.</p> <p>When you select a property field, a description of the property's effect is displayed at the bottom of the <b>Stereotype</b> panel.</p> <p>Only provide values for properties that you want to apply to this Stereotype.</p>	
9	<p>Click on the name of a Metaclass in the <b>Extensions</b> field and review the</p>	

	<p>available properties in the <b>Metaclass</b> panel. These properties further modify the behaviour of the stereotype based on options specific to the Metaclass being extended.</p> <p>To apply a property, click in the <b>Value</b> field and type or select the appropriate value.</p> <p>When you select a property field, a description of the property's effect is displayed at the bottom of the <b>Metaclass</b> panel.</p> <p>Do not provide values for any properties that you do not want to apply to this Stereotype.</p> <p>If you are extending more than one Metaclass, click on the next Metaclass name in the <b>Extensions</b> field and review the properties for that object type.</p>	
10	Click on the <b>Next</b> button. The Define Tagged Values page displays.	
11	<p>In the <b>Property</b> panel right-click to display a context menu with options for creating and grouping Tagged Values of different types. These options include:</p> <ul style="list-style-type: none"> <li>• <b>Add Tagged Value:</b> Create a simple Tagged Value - a prompt displays for the Tagged Value name. Add a name and click on the <b>OK</b> button. This displays in the name in the <b>Property</b> column; to set a default value, type it in to the <b>Default Value</b> field</li> <li>• <b>Add Specialized Tagged Value :</b> <ul style="list-style-type: none"> <li>• <b>Enumeration:</b> create an enumeration Tagged Value, based on an existing <b>Enumeration</b> element</li> <li>• <b>Predefined:</b> select a Predefined Tagged Value Type from a list and, in the <b>Default Value</b> field, type or select an initial value if necessary</li> <li>• <b>Structured:</b> create a Structured Tagged Value composed of several other Tagged Values, typed by an existing <b>Class</b> element</li> <li>• <b>Reference:</b> create a Tagged Value with which the user can locate and reference an element created with a specified <b>Stereotype</b> (a form of <b>RefGUID</b> Tagged Value); in creating this, you must select the existing Stereotype element that defines the stereotype</li> <li>• <b>Reference List:</b> create a Tagged Value with which the user can locate and reference a <b>list</b> of elements created with a specified <b>Stereotype</b> (a form of <b>RefGUIDList</b> Tagged Value); in creating this, you must select an existing Stereotype element that defines the stereotype</li> </ul> </li> <li>• <b>Edit Tagged Value Name:</b> displays a simple prompt in which you overtype the current name to correct or change it</li> <li>• <b>Create Tag Group:</b> create Tag Groups in the <b>Metaclass</b> element, through which to organize the Tagged Values you have created in the Stereotype element</li> <li>• <b>Move Tag to Group</b> (displayed when you right-click on an existing Tagged Value): displays the Move Tag to Group dialog, on which you can select an existing Tag Group to contain the selected Tagged Value</li> </ul>	<p><a href="#">Add an Enumeration to a Stereotype</a> <sup>[1493]</sup></p> <p><a href="#">Create Tagged Value Type from Predefined Types</a> <sup>[1622]</sup></p> <p><a href="#">Add a Structured Tagged Value to a Stereotype</a> <sup>[1495]</sup></p> <p><a href="#">RefGUID Tagged Value</a> <sup>[1624]</sup></p> <p><a href="#">RefGUIDList Tagged Value</a> <sup>[1625]</sup></p> <p><a href="#">Define Tag Groupings</a> <sup>[1514]</sup></p>

	<ul style="list-style-type: none"> <li>• <b>Remove Grouping</b>: remove the selected Tag Group, leaving its member Tagged Values listed at the end of the <b>Property</b> column</li> <li>• <b>Delete</b>: Remove the selected Tagged Value from the list and from the Stereotype</li> </ul>	
12	<p>Click on the <b>Next</b> button. The Define a Shape Script page displays.</p> <p>A Shape Script can be used to define the <b>appearance</b> of the Stereotype. To include a Shape Script, click on the <b>Edit</b> button.</p> <p>The Shape Editor window displays. Create your Shape Script using this editor.</p> <p>When you have finished creating the Script, click on the <b>OK</b> button. The image defined by the Shape Script is shown in the <b>Preview</b> panel.</p> <p>Note: For the Shape Script to take effect, you must select the <b>Alternate Image</b> option when you save the Profile.</p> <p>Alternatively, you can define a simple default appearance (background color, line color) for the model object, after you have created the Stereotype element.</p>	<a href="#">Shape Scripts</a> <sup>[1582]</sup>  <a href="#">Shape Editor</a> <sup>[1584]</sup>  <a href="#">Export a Profile</a> <sup>[1523]</sup>
13	Click on the <b>Finish</b> button. The Stereotype element and Metaclass element(s) are now displayed on the Profile Diagram.	
14	<p>You can now:</p> <ul style="list-style-type: none"> <li>• Repeat steps 2 to 13 for each of the other Stereotype elements you want to create</li> <li>• Edit the Stereotype (and through it, the Metaclass) element properties you defined above, using the Profile Helper</li> <li>• Add Constraints to your Stereotype element</li> <li>• If a shape has not been set then you can now define the object's default appearance (background color, line color)</li> <li>• Set up the Quick Linker definitions for the stereotyped elements and connectors in the Profile</li> </ul>	<a href="#">Edit a Stereotype Element</a> <sup>[1535]</sup> <a href="#">Define Stereotype Constraints</a> <sup>[1500]</sup> <a href="#">Set Default Appearance</a> <sup>[1502]</sup> <a href="#">Quick Linker</a> <sup>[1515]</sup>

### Notes

- If you intend to extend a large number of model elements, rather than putting all of them on one diagram you can create additional child Class diagrams under the <<profile>> Package and add different types of Metaclass elements to different diagrams; in this case you save the **Package** as the Profile, not the individual **diagrams**
- Stereotype elements must have unique names, but Metaclass elements can have the same name (for example, there can be several *Action* Metaclasses, each with a different *ActionKind* attribute)
- If you have a number of Tagged Values in the Stereotype element, and you have assigned them to groups, you can define which of those groups default to expanded (open) in the Tagged Values window, and which default to closed; open the Attributes dialog for the metaclass and add the attribute **\_tagGroupStates** with the initial value `<groupname>=closed;<groupname>=closed;<groupname>=open;...`

### Learn more

#### 7.3.3.1.1.2 Edit a Stereotype Element

If you want to add to or correct the properties of a Stereotype or Metaclass element in a Profile, you can edit it using the standard facilities such as the element Properties dialogs and Tagged Values window. However, you can also update the Stereotype element through the **Profile Helper Stereotype Properties dialog** and, through the Stereotype, also update the Metaclass elements that the Stereotype extends.

Any changes you have made to the elements by other means, such as through the element Properties dialog, are reflected in the contents of the Profile Helper.

**Access**    **Right-click on Stereotype element | Edit with Profile Helper**

##### Edit the Stereotype element

Step	Description	See also
1	<p>The Stereotype Properties dialog defaults to the General tab. On this tab you can:</p> <ul style="list-style-type: none"> <li>• Change the Stereotype element name</li> <li>• Add further Metaclass elements to be extended by this Stereotype element</li> <li>• Add or change values for the attributes of the Stereotype element</li> <li>• Add or change values for the attributes of each Metaclass element</li> </ul>	<a href="#">Add Stereotypes and Metaclasses</a> <sup>[1534]</sup>
2	<p>Click on the Tagged Values tab. On this tab you can:</p> <ul style="list-style-type: none"> <li>• Edit the default value of a tag</li> <li>• Add a new tag of one of a range of types</li> <li>• Create a tag group</li> <li>• Assign or reassign a tag to a group</li> <li>• Remove a tag group</li> <li>• Delete a Tagged Value from the Stereotype</li> </ul>	
3	<p>Click on the Shape Script tab. On this tab you can:</p> <ul style="list-style-type: none"> <li>• Add a Shape Script (if one does not exist)</li> <li>• Edit the existing Shape Script using the Shape Editor</li> </ul>	
4	<p>When you have finished editing the Stereotype element, click on the <b>OK</b> button.</p> <p>The Profile Class diagram redisplay, with the edited elements showing the changes you have made.</p>

- [Create UML Profiles using Profile Helpers](#) <sup>[1529]</sup>
- [Add Stereotypes and Metaclasses using Profile Helpers](#) <sup>[1531]</sup>

### 7.3.3.1.2 Create Diagram Profiles using the Profile Helpers

When you develop an MDG Technology, it is possible to create **extended diagram types** and include them in your MDG Technology as custom **Diagram Profiles**. For example, you might create a DFD Diagram Profile that defines a DFD diagram as an extension of the built-in Analysis diagram, as shown:

The **Add Diagram Extension Profile Helper** can assist you in defining your Diagram Profile, adding the necessary elements and giving them the appropriate attributes to define the functionality of the resulting custom diagram types.

#### Create extended diagram types

Step	Action	See also
1	If you have not done so already, use the Model Wizard's MDG Technology Builder option to create a set of Packages for defining Profiles.  In the Project Browser, locate the Package with the <<diagram profile>> stereotype and open its child diagram.	<a href="#">Using the Profile Helpers</a> <sup>[1528]</sup>
2	Drag the <b>Add Diagram Extension</b> item from the Profile Helpers toolbox page onto the diagram.  The Add Diagram Extension Dialog displays.	
3	In the <b>Name</b> field, type the name for the custom diagram type.	
4	In the <b>Extension Type</b> field click on the drop-down arrow and select the built-in diagram type that the custom diagram type will extend.	
5	In the <b>Description</b> field type a brief description of what the diagram is used for.  When a user selects this diagram type in the New Diagram dialog, this description will be displayed in the bottom right of the dialog.	
6	Within the <b>Properties</b> pane enter values for the following fields: <ul style="list-style-type: none"> <li>• <b>Alias:</b> Defines the diagram type displayed before the word 'Diagram' on</li> </ul>	

Step	Action	See also
	<p>the diagram title bar; for example: Block Diagram.</p> <ul style="list-style-type: none"> <li>• <b>Frame ID:</b> Defines the diagram type that will appear in the diagram frame label</li> <li>• <b>Frame Format String:</b> Enter a string containing substitution macros for defining the frame title, with or without additional delimiters such as ( ); macros that can be used are: <ul style="list-style-type: none"> <li>• #DGMALIAS#</li> <li>• #DG MID#</li> <li>• #DGMNAME#</li> <li>• #DGMNAMEFULL#</li> <li>• #DGMOWNERNAME#</li> <li>• #DGMOWNERNAMEFULL#</li> <li>• #DGMOWNERTYPE#</li> <li>• #DGMSTEREO#</li> <li>• #DG MTYPE#</li> </ul> </li> <li>• <b>Toolbox Profile:</b> Enter the name of the Toolbox Profile (the name entered when saving the profile); this Toolbox will be opened automatically each time a diagram of this type is opened</li> <li>• <b>Swimlanes:</b> Defines swimlanes that will be displayed on the diagram; for example: <pre>Lanes=2; Orientation=Horizontal; Lane1=Title1; Lane2=Title2;</pre> <p>(where <b>Lanes</b> can be any value, but the number of <b>Lane&lt;n&gt;</b> values must equal the value of <b>Lanes</b>; <b>Orientation</b> can be omitted, in which case the swimlanes default to <b>vertical</b>)</p> </li> </ul>	
7	<p>The remaining fields in the <b>Properties</b> pane can be used to customize the diagram's default options. Any Attributes left blank will not be applied.</p> <p>When a user selects a field, a description of the property's effect is displayed at the bottom of the <b>Properties</b> pane.</p>	
8	Click on the <b>OK</b> button. The appropriate Stereotype and Metaclass elements are added to the diagram.	
9	Repeat steps 2 to 8 for each diagram extension to include in the diagram Profile.	
10	Save the diagram as a Profile.	<a href="#">Export a Profile</a> <sup>[1523]</sup>
11	Incorporate the Profile into an MDG Technology.	<a href="#">Create MDG Technology File</a>

Step	Action	See also
		<a href="#">1545</a>

### Notes

- After a diagram extension has been added you can modify its properties again by right clicking the appropriate Stereotype element on the diagram and selecting **Edit with Profile Helper**

#### 7.3.3.1.3 Create Toolbox Profiles using the Profile Helpers

Within an MDG Technology you can create multiple Toolbox Profiles. Each Toolbox Profile defines a single Toolbox. A Toolbox consists of one or more expandable/collapsible regions, referred to as Toolbox Pages.

#### Create a Toolbox Profile

Step	Action	See also
1	If a group of Packages for defining Profiles has not been created, use the Model Wizard's <b>MDG Technology Builder</b> option to create this group.  In the Project Browser, locate the Package with the <code>&lt;&lt;toolbox profile&gt;&gt;</code> stereotype and open its child diagram. This diagram shows an example Toolbox Profile with a single Toolbox Page.	<a href="#">Using the Profile Helpers</a> <a href="#">1528</a>
2	Drag the <b>Create Custom Toolbox</b> item from the Profile Helpers Toolbox Page onto the diagram.  The Select a Toolbox Profile Package Dialog displays.	
3	Select the Package with the <code>&lt;&lt;toolbox profile&gt;&gt;</code> stereotype referred to in step 1.  Click on the <b>OK</b> button. The Create Toolbox Page dialog displays.	
4	In the <b>Toolbox Name</b> field type the name for your Toolbox.  This is the name that will be displayed for the Toolbox when using the <b>More tools...</b> option in the Diagram Toolbox.	
5	In the <b>Description</b> field type a description for the Toolbox.  This description acts as a default <b>tool tip</b> for your Toolbox, unless you define a specific tool tip for a Toolbox Page as mentioned in step 10.	

6	<p>Click on the <b>OK</b> button.</p> <p>The diagram that you will use to define your Toolbox is created and displayed.</p>	
7	<p>(Optional) When dragging an item from a Toolbox onto a diagram, the item will typically create an element or a connector.</p> <p>It is also possible to have a single Toolbox item that, when dragged onto a diagram, will provide a selection of items to choose from. This is referred to as a <b>hidden sub-menu</b>.</p> <p>If you want your Toolbox to contain one or more hidden sub-menus you should define these before proceeding with the steps on this page.</p>	<a href="#">Create Hidden Sub-Menus using the Profile Helpers</a> 
8	<p>You can now define one or more Toolbox Pages that will appear on the Toolbox.</p> <p>Drag the <b>Add Toolbox Page</b> item from the Profile Helpers Toolbox Page onto the diagram.</p> <p>The Add Toolbox Page dialog displays.</p>	
9	<p>In the <b>Name</b> field, type a name for the Toolbox Page.</p> <p>This is text that will display in the title bar of the corresponding Toolbox Page.</p>	
10	<p>In the <b>Tool Tip</b> field, type the Tool Tip for the corresponding Toolbox Page.</p>	
11	<p>The <b>Icon</b> field in this case will be disabled. This field is only used when defining hidden sub-menu toolboxes.</p>	<a href="#">Create Hidden Sub-Menus using the Profile Helpers</a> 
12	<p>The following options can be used to determine the appearance and functionality of the Toolbox Page. When enabled:</p> <ul style="list-style-type: none"> <li>• <b>Images Only</b>: displays the Toolbox Page without the text labels next to the icons</li> <li>• <b>Is Hidden</b>: defines the Toolbox Page as a hidden sub-menu</li> <li>• <b>Is Common</b>: the Toolbox Page is common to all defined Toolboxes while your technology is active; the page is initially displayed as collapsed</li> <li>• <b>Is Collapsed</b>: the Toolbox Page is initially minimized</li> </ul>	
13	<p>You can now define items to be added to the Toolbox.</p> <p>Click on the down arrow on the right of the <b>Add</b> button. Select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Add Stereotype</b>: adds a Toolbox item for a Stereotype that is defined in a UML Profile in the current model; this Profile must be included with the Toolbox Profile in the MDG Technology</li> </ul>	

	<p>After you select this option, the Select a Profile Element dialog displays; use this to select the Stereotype you want to add</p> <ul style="list-style-type: none"> <li>• <b>Add Built in Type:</b> <ul style="list-style-type: none"> <li>• <b>Element:</b> adds a Toolbox item for a UML <b>element type</b> <p>After you select this option the Create new Toolbox Item dialog displays; in the <b>Alias</b> field, type the label to appear on the Toolbox item, and click on the <b>OK</b> button</p> <p>The Select Metaclass dialog then displays; select the UML element type to add to your Toolbox, and click on the <b>OK</b> button</p> </li> <li>• <b>Connector:</b> adds a Toolbox item for a UML <b>connector type</b> <p>After you select this option the Create new Toolbox Item dialog displays; in the <b>Alias</b> field, type the label to appear on the Toolbox item, and click on the <b>OK</b> button</p> <p>The Select Metaclass dialog then displays; select the UML connector type to add to your Toolbox, and click on the <b>OK</b> button</p> </li> <li>• <b>Add Hidden Toolbox:</b> adds a hidden Toolbox sub-menu item; the hidden Toolbox must be defined <b>before</b> you use this option <p>After you select this option, the Create new Toolbox Item dialog displays; in the <b>Alias</b> field, type the label to appear on the Toolbox item and click on the <b>OK</b> button</p> <p>The Select a Hidden Toolbox Stereotype dialog then displays; select the hidden Toolbox to add to your Toolbox, and click on the <b>OK</b> button</p> </li> <li>• <b>Add New Item:</b> adds a Toolbox item with an Alias only <p>This option alone will not create a functional Toolbox item; a Toolbox item added in this way must be later modified via the <b>Toolbox Items</b> list</p> </li> </ul> <p>Clicking on the <b>Add</b> button, and not on the drop-down arrow, is the same as selecting the <b>Add Stereotype</b> option.</p> </li> </ul>	
14	<p>(Optional) Define a Toolbox item that will create an item from an external MDG Technology. For example, adding a Toolbox item that creates a SysML 1.3 Block element.</p> <ol style="list-style-type: none"> <li>1. Click on the down-arrow on the right of the <b>Add</b> button.</li> <li>2. Select the <b>Add New Item</b> option. The Create new Toolbox Item dialog displays.</li> <li>3. In the <b>Alias</b> field, type the label to appear on the Toolbox item, and click on the <b>OK</b> button. The Toolbox item will be added to the <b>Toolbox Items</b> list.</li> <li>4. In the <b>Stereotype</b> field for this Toolbox item, type:</li> </ol>	

	<p><code>Profile : Stereotype( UML : BaseUMLType )</code></p> <p><b>Profile</b> is the name of the Profile that the Stereotype is defined in  <b>Stereotype</b> is the name of the Stereotype/Metatype that this toolbox item will create  <b>BaseUMLType</b> is the base UML type of the non-UML object</p> <p>For example, to include a <b>SysML Block</b> in a Toolbox you would type:</p> <p><code>SysML1.3 : Block( UML : Class )</code></p> <p>5. To identify the <code>Profile : Stereotype</code> string, create an element of the type to include in your Toolbox (for example; a SysML 1.3 Block), then select the element and display the Tagged Values window.</p> <p>Any predefined tags for this element will be grouped under the <code>Profile : Stereotype</code> heading. For example, a SysML 1.3 Block's tags are grouped under <code>SysML1.3 : Block</code>.</p> <p>6. All non-UML objects in Enterprise Architect are an extension of a UML Type. You can reveal an element's base UML type by deleting its Stereotypes. For example, create a SysML 1.3 Block and then, using the Properties Window, delete the Block element's Stereotype. The element type will change from <b>Block</b> to <b>Class</b>.</p>	<p><a href="#">Modify Tagged Values</a> <sup>[1138]</sup></p> <p><a href="#">Elements Used in Toolboxes</a> <sup>[1567]</sup></p> <p><a href="#">Connectors Used in Toolboxes</a> <sup>[1569]</sup></p>
15	<p>(Optional) Create a Toolbox item that will drop a Pattern onto a diagram.</p> <ol style="list-style-type: none"> <li>Click on the down arrow on the right of the <b>Add</b> button.</li> <li>Select the <b>Add New Item</b> option. The Create new Toolbox Item dialog displays.</li> <li>In the <b>Alias</b> field, type the label to appear on the Toolbox item, then click on the <b>OK</b> button.</li> <li>The Toolbox item will be added to the <b>Toolbox Items</b> list.</li> <li>In the <b>Stereotype</b> field for this Toolbox item, type: <p><code>TechnologyID : PatternName( UMLPattern )</code></p> <p><b>TechnologyID</b> is the ID of the Technology, as entered in the MDG Technology Creation Wizard  <b>PatternName</b> is the name that was entered when saving the Pattern; for example:</p> <p><code>BusFramework : Builder( UMLPattern )</code></p> <p>If you want to avoid displaying the Add Pattern dialog, replace <code>( UMLPattern )</code> with <code>( UMLPatternSilent )</code>.</p> <p>6. To define a model-based Pattern in a custom Toolbox (such as the GoF Patterns), create an attribute with a name of the format:</p> <p><code>PatternCategory : PatternName( UMLPattern )</code></p> <p>For example:</p> <p><code>GoF Behavioral Patterns : Mediator( UMLPattern )</code></p> </li></ol>	<p><a href="#">Design Patterns</a> <sup>[1464]</sup></p> <p><a href="#">Create MDG Technology File</a> <sup>[1545]</sup></p> <p><a href="#">Create a Pattern</a> <sup>[1464]</sup></p>
16	After you add the Toolbox item it will appear in the <b>Toolbox Items</b> list. You can	

	<p>optionally add a custom icon image for a Toolbox item.</p> <p>The icon image must be a <b>16x16</b> pixel <b>bitmap</b> file; for a transparent background use light grey - <b>RGB(192,192,192)</b>.</p> <p>To set the icon for a Toolbox item:</p> <ol style="list-style-type: none"> <li>1. Locate the item in the <b>Toolbox Items</b> list and click within the <b>Toolbox Icon</b> column.</li> <li>2. Click on the ellipsis (...) within this column. The Select a Toolbox Icon dialog displays.</li> <li>3. Locate the image file and click the <b>Open</b> button.</li> </ol>	
17	<p>Repeat steps 13 to 16 for each item you want to add to the Toolbox Page.</p> <p>To remove a Toolbox item, select it in the <b>Toolbox Items</b> list and click on the <b>Delete</b> button.</p> <p>Once all the appropriate Toolbox items have been added, click on the <b>OK</b> button. A Stereotype element will be added to your Toolbox Profile diagram.</p>	
18	Repeat steps 8 to 17 for each Toolbox Page you want to include in the Toolbox.	
19	Save the Toolbox Profile by right-clicking on the diagram and selecting the <b>Save as Profile</b> context menu option.	<a href="#">Export a Profile</a> <small>[1523]</small>

### Notes

- A Toolbox Page can be modified by right-clicking the appropriate Stereotype element on the Toolbox Profile diagram and selecting the **Edit with Profile Helper** option
- When assigning a name for a Toolbox Page, be aware that "elements" is a reserved word; if the word "elements" is used, it will not appear in the title bar of the corresponding Toolbox Page
- The sequence of Toolbox Pages in the Toolbox is determined by the sequence of their Stereotype elements in the Profile diagram or Profile Package; if you create and save the Profile from a:
  - Diagram, the Toolbox Page sequence is determined by the **Z-order** of the Stereotype elements on the diagram - the higher the Z-order number of the Stereotype element, the further down the Toolbox its Toolbox Page is placed; if you change the Z-order of a Stereotype element in the diagram, it changes the position of the element's page on the Toolbox
  - Package in the Project Browser, the Toolbox Page sequence is determined by the **list order** of the Stereotype elements in the Package - the Toolbox Page for the first listed element is at the top of the Toolbox; if you re-order the elements in the Project Browser, you produce the same re-ordering of pages in the Toolbox

### 7.3.3.1.3.1 Create Hidden Sub-Menus using the Profile Helpers

When you create Toolbox items, some of them may be very similar in that they are based on the same type of Metaclass. For example, there are many different types of Action element. Rather than populate a Toolbox Page with every variation, you can create a 'base' Toolbox item and offer a choice of variant from a **Sub-Menu**, which is displayed when the base item is dragged onto the diagram.

#### Define a hidden sub-menu

Step	Action	See also
1	If you have not already done so, create and display the diagram you will be using to define your Toolbox, as described in steps 1 to 6 of <i>Create Toolbox Profiles using the Profile Helpers</i> .	<a href="#">Create Toolbox Profiles using the Profile Helpers</a> 
2	Drag the <b>Add a Toolbox Page</b> item from the Profile Helpers Toolbox Page onto the diagram. The Add Toolbox Page dialog displays.	
3	In the <b>Name</b> field, type the name for the sub-menu Toolbox item.	
4	The <b>Tool Tip</b> field can be left blank in this case.	
5	Select the <b>Is Hidden</b> checkbox. The <b>Images Only</b> , <b>Is Common</b> and <b>Is Collapsed</b> checkboxes should be left unselected.	
6	After selecting the <b>Is Hidden</b> checkbox, the <b>Icon</b> field should become active. You can optionally add a custom icon image for the sub-menu Toolbox item. The icon image must be a <b>16x16 pixel bitmap</b> file; for a transparent background use light grey - <b>RGB(192,192,192)</b> . To set the icon for the sub-menu Toolbox item, click on the folder icon to the right of the <b>Icon</b> field. Select the image file and click the <b>Open</b> button.	
7	You can now add items such as elements and connectors to the sub-menu. Click on the down arrow on the right of the <b>Add</b> button, and select one of the following options: <ul style="list-style-type: none"> <li>• <b>Add Stereotype</b>: adds a Toolbox item for a Stereotype that is defined in a UML Profile in the current model; this Profile must be included with the Toolbox Profile in the MDG Technology</li> </ul> <p>After you select this option, the Select a Profile Element dialog displays; use this to select the Stereotype you want to add</p>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Add Built in Type:</b> <ul style="list-style-type: none"> <li>• <b>Element:</b> adds a Toolbox item for a UML <b>element type</b></li> </ul> <p>After you select this option the Create new Toolbox Item dialog displays; in the <b>Alias</b> field, type the label to appear on the Toolbox item, and click on the <b>OK</b> button</p> <p>The Select Metaclass dialog then displays; select the UML element type to add to your Toolbox, and click on the <b>OK</b> button</p> </li> <li>• <b>Connector:</b> adds a Toolbox item for a UML <b>connector type</b></li> </ul> <p>After you select this option the Create new Toolbox Item dialog displays; in the <b>Alias</b> field, type the label to appear on the Toolbox item, and click on the <b>OK</b> button</p> <p>The Select Metaclass dialog then displays; select the UML connector type to add to your Toolbox, and click on the <b>OK</b> button</p> <ul style="list-style-type: none"> <li>• <b>Add Hidden Toolbox:</b> adds a hidden Toolbox sub-menu item; do not use this option when creating the Hidden Toolbox sub-menu itself</li> <li>• <b>Add New Item:</b> adds a Toolbox item with an Alias only</li> </ul> <p>This option alone will not create a functional Toolbox item; a Toolbox item added in this way must be later modified via the <b>Toolbox Items</b> list</p> <p>Clicking on the <b>Add</b> button, and not on the drop-down arrow, is the same as selecting the <b>Add Stereotype</b> option.</p>	
8	<p>(Optional) After adding the Toolbox item it will appear in the <b>Toolbox Items</b> list, and you can add a custom icon image for the item.</p> <p>The icon image must be a <b>16x16 pixel bitmap</b> file; for a transparent background use <b>light grey - RGB(192,192,192)</b>.</p> <p>To set the icon for a Toolbox item, locate the item in the <b>Toolbox Items</b> list and click within the <b>Toolbox Icon</b> column. Click on the ellipsis (...) within this column. The Select a Toolbox Icon dialog displays. Locate the image file and click the <b>Open</b> button.</p>	
9	<p>Repeat steps 7 and 8 for each item to add to the sub-menu.</p> <p>To remove a Toolbox item, select it from the <b>Toolbox Items</b> list and click on the <b>Delete</b> button.</p> <p>Once all the appropriate sub-menu items have been added, click on the <b>OK</b> button. A Stereotype element will be added to your Toolbox Profile diagram.</p>	
10	Repeat steps 2 to 9 for each Toolbox sub-menu to create.	

Step	Action	See also
11	The sub-menu(s) created above can now be included as an item in a Toolbox Page.	<a href="#">Create Toolbox Profiles using the Profile Helpers</a> 

### Notes

- A sub-menu can be modified by right-clicking the appropriate Stereotype element on the Toolbox Profile diagram and selecting the **Edit with Profile Helper** option

## 7.3.3.2 Create MDG Technology File

When you create an MDG Technology file, you can include a wide range of facilities and tools, including UML Profiles, code modules, scripts, Patterns, images, Tagged Value Types, report templates, linked document templates, Toolbox pages and Learning Center pages. Building all of these into the MDG Technology file in a logical sequence is easy, using the **MDG Technology Creation Wizard**.

**Access** **Tools | Generate MDG Technology File**

### Create an MDG Technology file

Step	Description	See also
1	Select the <b>Generate MDG Technology File</b> menu option. The MDG Technology Creation Wizard screen displays.	
2	Click on the <b>Next</b> button. The MDG Technology Wizard prompts you to: <ul style="list-style-type: none"> <li>Create an MDG Technology file based on a new MDG Technology Selection (MTS) file</li> <li>Create an MDG Technology file based on an existing MTS file, or</li> <li>Not use any MTS file</li> </ul> <p>An MTS file stores the selected options that you define during the creation of an MDG Technology; if you use an MTS file, you can later modify it to add or remove specific items in the MDG Technology, which is the</p>	

Step	Description	See also																
	<b>recommended</b> process.																	
3	<p>Select the appropriate MTS file option.</p> <p>Click on the <b>Next</b> button.</p> <p>If you selected an MTS file, the MDG Technology Wizard prompts you to save the changes in the existing MTS file or into a new MTS file; this enables you to create a modification based on the existing MTS file, while preserving the original file.</p>																	
4	<p>If necessary, type in or browse for the required file path and name.</p> <p>Click on the <b>Next</b> button.</p> <p>The MDG Technology Wizard - Create screen displays.</p>																	
5	<p>Complete the fields on this screen as follows:</p> <table><tr><th>Option</th><th>Action</th></tr><tr><td><b>Technology</b></td><td>Type the name of the MDG Technology.</td></tr><tr><td><b>Filename</b></td><td>Type or select the path and filename of the MDG Technology. The file extension for this file is <b>.xml</b>.</td></tr><tr><td><b>ID</b></td><td>Type a unique reference for the MDG Technology File, up to</td></tr><tr><td><b>Version</b></td><td>Type the version number of the MDG Technology File.</td></tr><tr><td><b>Icon</b></td><td>(Optional) Type or select the path and file name of the graph technology icon. #### 7.3.3.2.2 Add a Pattern

When creating an MDG Technology file, you can include special **Design Patterns** that you want to make available as element templates.

Access **Tools | Generate MDG Technology File**

#### Add Design Patterns to the MDG Technology File

Step	Description	See also
1	<p>Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Patterns</b> checkbox.</p> <p>The MDG Technology Wizard - Pattern files selection page displays.</p>	<a href="#">Create MDG Technologies, Step 6</a> 
2	<p>In the <b>Directory</b> field, navigate to the directory containing the required Pattern or Patterns.</p> <p>The Pattern files are automatically listed in the Available Files panel.</p>	
3	<p>To select each required Pattern individually, highlight the Pattern in the Available Files list and click on the --&gt; button.</p> <p>The file name displays in the Selected Files list.</p>	

Step	Description	See also
	Alternatively, to select all available Patterns click on the -->> button, and return each one you do <b>not</b> want by selecting it and clicking on the <-- button.	
4	Click on the <b>Next</b> button to proceed.	

#### Learn More:

- [Design Patterns](#)<sup>[1464]</sup>
- [Create a Pattern](#)<sup>[1464]</sup>

#### 7.3.3.2.3 Add a Diagram Profile

When creating an MDG Technology file, you can include **Diagram Profiles** that you have defined to generate new types of diagram.

**Access** [Tools](#) | **Generate MDG Technology File**

#### Add Diagram Profiles to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Diagram Types</b> checkbox. The MDG Technology Wizard - Diagram Types page displays.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
2	In the <b>Directory</b> field, navigate to the directory containing the required Diagram Profiles. The Profiles in the directory are automatically listed in the Available Files panel.	
3	To select each required Diagram Profile individually, highlight the file name in the Available Files list and click on the --> button. The file name displays in the Selected Files list. Alternatively, to select all available Profiles (if they are all Diagram Profiles) click on the -->> button, and return each one you do <b>not</b> want by selecting it and clicking on the <-- button.	
4	Click on the <b>Next</b> button to proceed.	

Learn more

- [Create Custom Diagram Profiles](#) 

#### 7.3.3.2.4 Add a Toolbox Profile

When creating an MDG Technology file, you can include Diagram Toolbox page definitions that you have created to provide Toolbox pages to support customized diagrams.

Access   **Tools | Generate MDG Technology File**

##### Add Toolbox Profiles to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Toolboxes</b> checkbox.  The MDG Technology Wizard - Toolboxes page displays.	<a href="#">Create MDG Technologies, Step 6</a> 
2	In the <b>Directory</b> field, navigate to the directory containing the required Toolbox Profiles.  The Profile files are automatically listed in the Available Files panel.	
3	To select each required Toolbox Profile individually, highlight the file name in the Available Files list and click on the --> button.  The file name displays in the Selected Files list.  Alternatively, to select all available Profiles (if they are all Toolbox Profiles) click on the -->> button, and return each one you do <b>not</b> want by selecting it and clicking on the <-- button.	
4	Click on the <b>Next</b> button to proceed.	

Learn more

- [Customize Toolbox Profiles](#) 

#### 7.3.3.2.5 Add Tagged Value Types

When creating an MDG Technology file, you can include Tagged Value Types, from which the technology users can create domain-specific Tagged Values.

Access   **Tools | Generate MDG Technology File**

##### Add Tagged Value Types to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Tagged Value Types</b> checkbox.  The MDG Technology Wizard - Tagged Value Types page displays.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
2	To select each required Tagged Value Type individually, highlight the name in the Available Tagged Values list and click on the --> button.  The name displays in the Selected Tagged Values list, and the name, description and notes on the Tagged Value Type are displayed in the panel at the bottom of the page.  Alternatively, to select all available Tagged Value Types, click on the -->> button, and return each one you do <b>not</b> want by selecting it and clicking on the <-- button.	
3	Click on the <b>Next</b> button to proceed.	

#### Learn more

- [Tagged Value Types](#) <sup>[1627]</sup>

#### 7.3.3.2.6 Add Code Modules

When creating an MDG Technology file, you can include **code modules** for which you have set up **code templates** and **data types**. The modules can be for modifications to the system default languages, or for languages you have defined yourself using the code templates and the Code Template Editor. Before you can set up a code template for a new language in the editor, you must define at least one data type for the language. You can also specify code options for the language, which are additional settings that are not covered by the data types or code templates; they are held in an XML document that you include in the MDG Technology file with the module.

Access   **Tools | Generate MDG Technology File**

#### Add Code Modules to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Code Modules</b> checkbox.  The MDG Technology Wizard - Code Modules page displays, listing the code modules defined in your current project.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
2	Click on the checkboxes ( <b>Product</b> , <b>Data Types</b> , <b>Code Grammar</b> , and <b>Code Templates</b> ) for each of the code modules you want to include in the technology.	<a href="#">Developing Programming Languages</a> <sup>[1581]</sup>

Step	Description	See also
3	If you have created a code options XML document for a selected module, click on the ( ... ) button in the <b>Code Options</b> column for that module. A browser displays, through which you locate and select the XML document.	<a href="#">Define Code Options</a> [1553]
4	Click on the <b>Next</b> button to proceed.	

#### 7.3.3.2.6.1 Define Code Options

When modifying code generation templates for an existing programming language, or defining a new programming language, there are additional options which are only available when building an MDG Technology. These additional options can affect how Enterprise Architect handles code generation and reverse-engineering for this language. These options are specified using an XML file, created using your preferred text editor.

The root node in the XML document is named `CodeOptions`. The child nodes are named `CodeOption`. Each `CodeOption` contains a `name` attribute corresponding to the name of one of the available code options. The body of each node contains the option value. For example:

```
<CodeOptions>
  <CodeOption name="DefaultExtension">.h</CodeOption>
  <CodeOption name="HasImplementation">true</CodeOption>
  <CodeOption name="ImplementationExtension">.cpp</CodeOption>
  <CodeOption name="Editor">C:\Windows\notepad.exe</CodeOption>
</CodeOptions>
```

#### Supported code options

Code Option	Description
<b>ConstructorName</b>	The name of a function used as a constructor. Used by the <i>classHasConstructor</i> code template macro.
<b>CopyConstructorName</b>	The name of a function used as a copy constructor. Used by the <i>classHasCopyConstructor</i> code template macro.
<b>DefaultExtension</b>	The default extension when generating code.
<b>DefaultSourceDirectory</b>	The default path to which Enterprise Architect generates new files.
<b>DestructorName</b>	The name of a function used as a destructor. Used by the <i>classHasDestructor</i> code template macro.
<b>Editor</b>	The external editor used for editing source of this language.

Code Option	Description
<b>HasImplementation</b>	Specifies if code generation for this language generates both a source file and implementation file.
<b>ImplementationExtension</b>	The extension used by Enterprise Architect to generate an implementation file.
<b>ImplementationPath</b>	The relative path from the source file to generate the implementation file.
<b>PackagePathSeparator</b>	The delimiter used to separate package names when using the <i>packagePath</i> macro from the code templates.

#### Notes

- Once a language is available for use in a model (by importing and activating the MDG Technology), you can display and edit the code options on the Options dialog (select the **Tools | Options** menu option)

#### Learn more

- [Local Options](#) <sup>[604]</sup>
- [Source Code Options](#) <sup>[2247]</sup>
- [Language Options](#) <sup>[2262]</sup>
- [Field Substitution Macros](#) <sup>[1648]</sup>

#### 7.3.3.2.7 Add MDA Transforms

When creating an MDG Technology file, you can include any MDA Transformation templates that you have created or modified in the model and that you want to deploy as part of the technology.

**Access** **Tools | Generate MDG Technology File**

#### Add MDA Transformation Templates to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>MDA Transforms</b> checkbox.  The MDG Technology Wizard - Transform Modules page displays, listing the MDA transform templates available on your system.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
2	Click the checkbox against the name of each transformation template you want to add to your MDG Technology.	

Step	Description	See also
3	Click on the <b>Next</b> button to proceed.	

#### Learn more

- [Model Transformation](#)<sup>[2013]</sup>
- [Write Transformations](#)<sup>[2051]</sup>

### 7.3.3.2.8 Add Document Report Templates

When creating an MDG Technology file, you can include user-defined Document Report templates.

Access **Tools | Generate MDG Technology File**

#### Add Report Templates to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>RTF Templates</b> checkbox. The MDG Technology Wizard - RTF Report Templates dialog displays.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
2	For each required user-defined report template available in the current model, select the checkbox next to the template name.	
3	Click on the <b>Next</b> button to proceed.	

### 7.3.3.2.9 Add Linked Document Templates

When creating an MDG Technology file, you can include Linked Document templates.

Access **Tools | Generate MDG Technology File**

#### Add Linked Document Templates to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Linked Document Templates</b> checkbox.	<a href="#">Create MDG Technologies, Step 6</a>

Step	Description	See also
	The MDG Technology Wizard - Linked Document Templates dialog displays.	
2	For each required document template available in the current model, select the checkbox next to the template name.	
3	Click on the <b>Next</b> button to proceed.	

### 7.3.3.2.10 Add Images

When creating an MDG Technology file, you can incorporate images to be used in all models in which the technology is *deployed*. These images must already be available in the model in which the technology is being *developed*; you can import the images into this model using the **Add New** button on the Image Manager.

Access **Tools | Generate MDG Technology File**

#### Add Images to the MDG Technology File

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Images</b> checkbox.  The MDG Technology Wizard - Image Selection dialog displays.	<a href="#">Create MDG Technologies, Step 6</a> 
2	For each required model image available in the current model, select the checkbox next to the image name.  A preview of each image displays on the right of the dialog as you select the checkbox.	
3	Click on the <b>Next</b> button to proceed.	

#### Learn more

- [Image Manager](#)

### 7.3.3.2.11 Add Scripts

When creating an MDG Technology file, you can include scripts that you have created in the model.

Access **Tools | Generate MDG Technology File**

**Add Scripts to the MDG Technology File**

Step	Description	See also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Scripts</b> checkbox. The MDG Technology Wizard - Scripts dialog displays.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
2	For each required script available in the current model, select the checkbox next to the script name.	
3	Click on the <b>Next</b> button to proceed.	

**Notes**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

**Learn more**

- [The Scripter Window](#) <sup>[2791]</sup>

**7.3.3.2.12 Add Workspace Layouts**

When developing an MDG Technology file, you can include user-defined **workspace layouts**. Workspace layouts are arrangements of toolbars and windows appropriate to an area of work such as Requirements Management and Code Engineering. The workspace layout automatically opens and organizes all the tools to suit the way in which you use the system.

**Access** **Tools | Generate MDG Technology File**

**Add Workspace Layouts to the MDG Technology File**

Step	Description	See also
1	In your model, create the workspace layouts you want to include in your Technology.	<a href="#">Manage Workspace Layout</a> <sup>[163]</sup>
2	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Workspace Layouts</b> checkbox. The MDG Technology Wizard - Workspace Layouts dialog displays, listing the user-defined workspace layouts available to you.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>

Step	Description	See also
3	For each workspace layout that you want to incorporate in the Technology, select the checkbox next to the layout name.	
4	Click on the <b>Next</b> button to proceed.	

### 7.3.3.2.13 Add Model Views

When developing an MDG Technology file, you can include user-defined Model Views. Model Views are based on searches that extract specific information from a model to provide different perspectives of, and 'entrypoints' into, the model.

**Access** [Tools](#) | **Generate MDG Technology File**

#### Add Model Views to the MDG Technology File

Step	Description	See also
1	In your model, create the Model Views you want to include in your Technology.	<a href="#">Model Views</a> <sup>[686]</sup>
2	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Model Views</b> checkbox.  The MDG Technology Wizard - Model Views dialog displays, listing the user-defined views available in the current model.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
3	For each Model View that you want to incorporate in the Technology, select the checkbox next to the view name.	
4	Click on the <b>Next</b> button to proceed.	

#### Notes

- Technology views do not store Favorite packages, only Views
- If you incorporate a Model View that runs searches that you have defined, you must also include those searches in your MDG Technology

#### Learn more

- [Model Views Operations](#) <sup>[693]</sup>
- [Add Model Searches](#) <sup>[1559]</sup>

### 7.3.3.2.14 Add Model Searches

When developing an MDG Technology file, you can include user-defined Model Searches. You can set these searches up using the Model Search facility, in SQL, in the Query Builder or as an Add-In, and then link them into your MDG Technology.

**Access** [Tools](#) | **Generate MDG Technology File**

#### Add Model Searches to the MDG Technology File

Step	Description	See also
1	In your model, create the Model Searches you want to include in your Technology.	<a href="#">Create &amp; Modify Searches</a> <sup>[709]</sup>
2	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Model Searches</b> checkbox.  The MDG Technology Wizard - Model Searches dialog displays, listing the user-defined searches available in the current model.	<a href="#">Create MDG Technologies, Step 6</a> <sup>[1547]</sup>
3	For each Model Search that you want to incorporate in the Technology, select the checkbox next to the search name.	
4	Click on the <b>Next</b> button to proceed.	

#### Notes

- If you use a custom SQL search, the SQL must include *ea\_guid AS CLASSGUID* and the *object type*
- If you incorporate a Model View that runs searches that you have defined, you must also include those searches in your MDG Technology

#### Learn more

- [Add Model Views](#) <sup>[1558]</sup>

### 7.3.3.3 Working with MTS Files

When you are creating an MDG Technology File using the MDG Technology Wizard, you have the choice of storing all of the options and structures that you have defined in an **MDG Technology Selection (.MTS) file**. This captures all the information you enter into the Technology Wizard, so that you do not have to type it in again. If you use a .MTS file, you can subsequently edit it to change the features you selected when you generated the Technology file, and to add or remove additional, advanced features.

**Access** [Tools](#) | **Generate MDG Technology File**

**Manage the .MTS file**

Action	Description	See also
<b>Create a .MTS File</b>	To create a .MTS file, launch and work through the MDG Technology Wizard; on the second page, select the <b>Create a new MTS file</b> option.	<a href="#">Create MDG Technologies</a> <sup>[1545]</sup>
<b>Advanced Options For Your .MTS File</b>	<p>Once you have worked through the MDG Technology Wizard and set up the .MTS file, you can add, separately:</p> <ul style="list-style-type: none"> <li>• Model Validation configurations</li> <li>• Model Templates</li> </ul> <p>Firstly define the code for the model validation configurations and model templates, then open the .MTS file in a text editor and copy in the validation and/or template code just before the <code>&lt;/ MDG. Sel ect i ons&gt;</code> line.</p> <p>Save the .MTS file.</p>	<a href="#">Define Validation Configuration</a> <sup>[1576]</sup> <a href="#">Incorporate Model Templates</a> <sup>[1576]</sup>
<b>Update the MDG Technology</b>	<p>Again launch the MDG Technology Wizard, but this time on the second page select the <b>Open an Existing MTS file</b> option and specify the file path of the .MTS file you have been working on.</p> <p>Click on <b>&lt;Next&gt;</b> until the Wizard is finished; your MDG Technology .xml file is updated.</p>	

**Notes**

- Having created your MDG Technology with the Wizard and the .MTS file, you can add Import and Export scripts via the Technology .XML file

**Learn more**

- [Add Import/Export Scripts](#) <sup>[1578]</sup>

**7.3.3.4 Create Toolbox Profiles**

As a facility of your MDG Technology, you might want to provide Diagram Toolbox pages that give access to any elements and connectors that you have created within the technology. You define these Toolbox pages within specific Profiles, each Profile defining the element and connector Toolbox pages that open or can be selected for a diagram type.

**Create custom Toolboxes**

Step	Action	See also
1	Create a set of Toolbox Profiles that contain the definitions required to generate the Toolbox pages.	<a href="#">Create Toolbox Profiles</a> <sup>[1561]</sup>

Step	Action	See also
2	Edit the definitions, where appropriate, to: <ul style="list-style-type: none"> <li>• Include hidden sub-menus</li> <li>• Override the default Toolboxes</li> <li>• Change the default icons for Toolbox items</li> </ul>	<a href="#">Create Hidden Sub-menus</a>  <sup>[1564]</sup> <a href="#">Override Default Toolboxes</a>  <sup>[1567]</sup> <a href="#">Assign Icons to Toolbox Items</a>  <sup>[1565]</sup>
3	Create a .MTS file containing instructions on how to build your MDG Technology, and include the Toolbox Profiles in the technology.	<a href="#">Create MDG Technologies</a>  <sup>[1545]</sup> <a href="#">Add a Toolbox Profile</a>  <sup>[1551]</sup>

#### 7.3.3.4.1 Create Toolbox Profiles

Within an MDG Technology you can create multiple Toolbox Profiles. Each Toolbox Profile contains definitions that determine what pages appear in the Toolbox when it is opened, either by selection from the **More tools...** option in the Diagram Toolbox, or by opening or creating a diagram of the type that is linked to the Toolbox Profile.

##### Create a Toolbox Profile

Step	Action	See also
1	In a Profile package, create a Class diagram with an appropriate name by which you can refer to it later, such as <b>MyClassDiagram</b> .	<a href="#">Create a Profile Package</a>  <sup>[1487]</sup>
2	Double-click on the diagram background to display the diagram Properties dialog and, in the <b>Notes</b> field, give the diagram an alias and a description in the following format: <pre>Alias=MyClass; Notes=Structural elements for Class diagrams;</pre>	
3	On the diagram, create a Metaclass element with the name <b>ToolboxPage</b> .	
4	Create a Stereotype element for each of the Toolbox pages to create within your Toolbox, such as <i>MyClassElements</i> and <i>MyClassRelationships</i> . Double-click on each element to display the Properties dialog and, in the <b>Alias</b> field, type the text to display in the title bar of the corresponding Toolbox page, such as <b>My Classes</b> or <b>My Class Relationships</b> . In the <b>Notes</b> field of each element, type the tool-tip for the corresponding Toolbox	<a href="#">Add Stereotypes and Metaclasses</a>  <sup>[1488]</sup>

Step	Action	See also
	<p>page; for example, <b>Elements for Class Diagrams</b> or <b>Relationships for Class Diagrams</b>.</p> <p>Create an Extension connector between each Stereotype element and the <b>ToolboxPage</b> Metaclass element.</p>	
5	<p>In each of the Stereotype elements, press <b>F9</b> and create an attribute for each Toolbox item in the page defined by that element.</p> <p>The name of each attribute is the name of the element or connector to be dropped, including the element's namespace; for example, <i>UML::Package</i>, <i>UML::Class</i> and <i>UML::Interface</i>. You might not want to display names including text such as <i>UML::Package</i> or <i>UML::Class</i> in your Toolbox, so give the attributes an <b>Initial Value</b> of, for example, <i>Package</i> or <i>Class</i>.</p> <p>The Toolbox items display in the same sequence as their attributes in the element, so use the attribute ordering buttons (green up/down arrows) in the Attribute Properties dialog to define the order of icons in your Toolbox page.</p> <p>In the name of an attribute for an element or connector from <b>your own</b> technology, use your Profile name as the namespace, and then follow the item name with the element or connector type that you are extending, in brackets (to identify to Enterprise Architect what type of object to create); for example, a SysML Block element would appear as:</p> <p style="text-align: center;"><i>SysML::Block(UML::Class)</i></p> <p>Many elements and connectors can be extended for use in Toolboxes.</p>	<p><a href="#">General Properties of Attributes</a> <small>[1007]</small></p> <p><a href="#">Elements Used in Toolboxes</a> <small>[1567]</small></p> <p><a href="#">Connectors Used in Toolboxes</a> <small>[1569]</small></p>
6	<p>To define a Toolbox item to drop a <b>Pattern</b> onto a diagram, name the attribute:</p> <p style="text-align: center;"><i>My Technology::MyPattern(UMLPattern)</i></p> <p><i>MyTechnology</i> is the ID of the technology and <i>MyPattern</i> is the name of the Pattern to drop; for example:</p> <p style="text-align: center;"><i>BusFramework::Builder(UMLPattern)</i></p> <p>If you want to avoid displaying the Add Pattern dialog, replace <i>(UMLPattern)</i> with <i>(UMLPatternSilent)</i>.</p> <p>To define a <b>model-based Pattern</b> in a custom Toolbox (such as the GoF Patterns), create an attribute with a name of the format:</p> <p style="text-align: center;"><i>PatternCategory::PatternName(UMLPattern)</i></p> <p>For example:</p> <p style="text-align: center;"><i>GoF Behavioral Patterns::Mediator(UMLPattern)</i></p>	

Step	Action	See also
7	Define any attributes you need to modify the display of the Toolbox pages, such as whether the Toolbox pages are minimized or displayed without item names (labels).	<a href="#">Toolbox Page Attributes</a> <sup>[1563]</sup>
8	To save the Toolbox profile, right-click on the diagram and select the <b>Save as Profile</b> context menu option.	<a href="#">Export a Profile</a> <sup>[1523]</sup>

### Notes

- When assigning an **Alias** for a Toolbox page, 'elements' is a reserved word. If the word 'elements' is used, it will not appear in the title bar of the corresponding Toolbox page
- Each Profile element incorporated into an MDG Toolbox page enables a context menu option to synchronize the Tagged Values and Constraints of all objects created from it
- The sequence of Toolbox **pages** in the Toolbox is determined by the sequence of their Stereotype elements in the Profile diagram or Profile package; if you create and save the Profile from a:
  - Diagram, the Toolbox page sequence is determined by the **Z-order** of the Stereotype elements on the diagram - the higher the Z-order number of the Stereotype element, the further down the Toolbox its Toolbox page is placed; if you change the Z-order of a Stereotype element in the diagram, it changes the position of the element's page on the Toolbox
  - Package in the Project Browser, the Toolbox page sequence is determined by the **list order** of the Stereotype elements in the package - the Toolbox page for the first listed element is at the top of the Toolbox; if you re-order the elements in the Project Browser, you produce the same re-ordering of pages in the Toolbox

### Learn more

- [Z Order Elements](#) <sup>[844]</sup>
- [Diagram Context Menu](#) <sup>[778]</sup> (**Modify Z-Order** option)

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Technology | Create a Custom Toolbox**

#### 7.3.3.4.1.1 Toolbox Page Attributes

When you create a Stereotype element to define a Toolbox page in an MDG Technology, you can add a number of attributes to control how the page itself behaves in the Diagram Toolbox. The Stereotype element can be one of several that extend the *ToolboxPage* Metaclass.

The attributes you can add are:

- **Icon** - see [Assign Icons for Toolbox Items](#) <sup>[1565]</sup>
- **ImagesOnly** - if you set **Initial Value** to **true**, the Toolbox page displays without the text labels next to the icons
- **isCollapsed** - if you set **Initial Value** to **true**, the Toolbox page is initially minimized

- **isCommon** - if you set **Initial Value** to **true**, the Toolbox page is common to all defined Toolboxes while your technology is active; the page is initially displayed as collapsed
- **isHidden** - see [Create Hidden Sub-Menus](#) <sup>[1564]</sup>

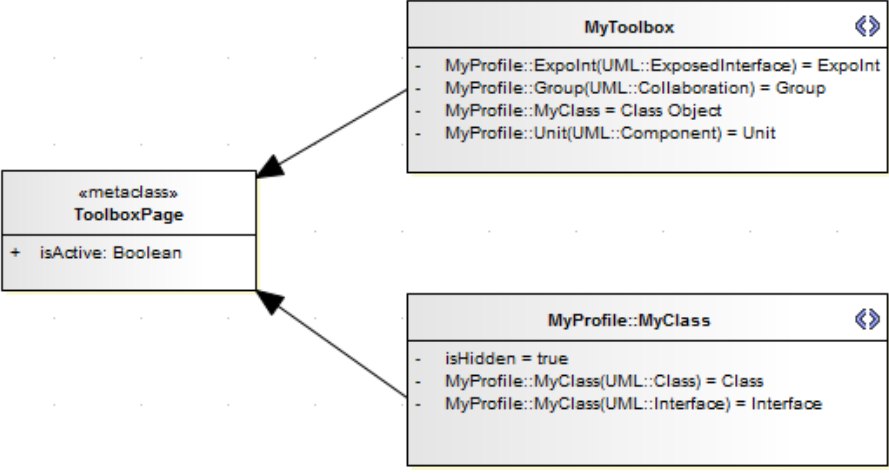

#### 7.3.3.4.2 Create Hidden Sub-Menus

When you create items on a Toolbox page, some of them might be very similar and be based on the same type of Metaclass. For example, there are many different types of Action element and, in BPMN 2.0, you can create each type of Event element either stand-alone or edge-mounted on another element. Rather than populate a Toolbox page with every variation, you can create a 'base' Toolbox item and offer a choice of variant from a **sub-menu**, which is displayed when the base item is dragged onto the diagram but is otherwise **hidden**. This technique is very useful for 'disambiguating' Stereotypes that can be applied to multiple Metaclasses.

In the submenu, you define just the variant types (as for the Action element list). However, if the variant also has a *ToolboxItemImage* defined for it, that icon is displayed against the variant name in the sub-menu (as for the BPMN 2.0 Events). You can also use this method to **specifically** define icons that will be applied to the submenu options.

##### Define a hidden sub-menu

Step	Action	See also
1	<p>Create a Stereotype element on the same diagram as the ToolboxPage Metaclass, with a name prefixed by the Profile name (this is mandatory). For example:</p> <pre>My Profile : My Submenu</pre> <p>The sub-menu element can have an alias.</p>	<a href="#">Add Stereotypes and Metaclasses</a> <sup>[1488]</sup>
2	<p>In this sub-menu Stereotype element, create the attribute <i>isHidden</i> with an initial value of <b>true</b>.</p> <p>For each sub-menu item, add an attribute to identify that item. Set the <b>Initial Value</b> to the name to display in the menu. For example, if the «<i>MySubmenu</i>» stereotype could be applied to a UML Class or UML Interface, the attributes for these two options would be:</p> <pre>My Profile : My Submenu( UML : Class )      I n i t i a l   V a l u e = C l a s s My Profile : My Submenu( UML : Interface )    I n i t i a l   V a l u e = I n t e r f a c e</pre>	<a href="#">Create Toolbox Profiles</a> <sup>[1561]</sup>
3	<p>Create a second Stereotype element and define an attribute with the same name as the sub-menu Stereotype element, and with the initial value of the text to display in the Toolbox item. For example:</p> <pre>My Profile : My Submenu = C l a s s   O b j e c t</pre> <p>Define additional attributes for the rest of the items in the Toolbox, as normal.</p>	<a href="#">Create Toolbox Profiles</a> <sup>[1561]</sup>
4	<p>Create &lt;&lt;Extension&gt;&gt; relationships between each Stereotype element and the ToolboxPage Metaclass element, as illustrated.</p>	

Step	Action	See also
	 <p>When this Profile is in use, and when the <i>Class Object</i> item is dragged onto a diagram from the Toolbox, the hidden menu displays giving the choice of Class or Interface; on selection, the element is dropped onto the diagram.</p>	
5	If no icon has been assigned to the Toolbox item from existing definitions, and you want to display one, define the image as a <code>ToolboxItemImage</code> icon.	<a href="#">Assign Icons To Toolbox Items</a> <small>1565</small>

#### 7.3.3.4.3 Assign Icons To Toolbox Items

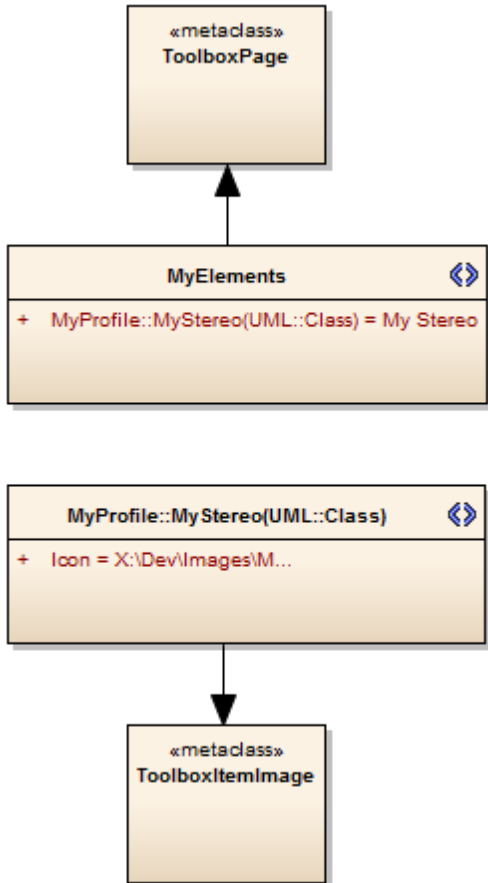

When you create a stereotyped model element to define an element or connector that is represented in a Diagram Toolbox page, you can define the image that is displayed against both the element name in the Project Browser **and** the element or connector type in the Toolbox page, by assigning the special attribute **icon** to the Stereotype element.

This image definition **for the Toolbox item** can be overridden or replaced by extending the *ToolboxItemImage* Metaclass (see below), a process that is generally optional. However, if you want to show an icon **against an item on a hidden sub-menu**, you need to use this method; the system picks up the *ToolboxItemImage* definition as the icon for the hidden menu item.

If you do not use either the **icon** attribute or the *ToolboxItemImage* Metaclass to define the Toolbox icon, the image defaults to the one used for the **standard UML** model element that has been extended. If there is no such image, the icon uses the system default generic 'Toolbox Item' image.

#### Extend the *ToolboxItemImage* Metaclass

Step	Action	See also
1	Create a new Stereotype element in the same Toolbox profile as the Toolbox item.	

Step	Action	See also
2	<p>Give the Stereotype element the same name as the element that it is assigning an image to; for example:</p> <pre>MyProfile::MyStereo(UML::Class)</pre>	
3	<p>Give the Stereotype element the special attribute <i>Icon</i> with <b>Initial Value</b> set to the full path and file name of the image to be used.</p> <p>The icon image is a 16x16 pixel bitmap file; for a transparent background use light grey - RGB(192,192,192).</p>	<a href="#">Special Attributes</a> <sup>[1503]</sup>
4	<p>Create a Metaclass element named <i>ToolboxItemImage</i> and create an Extension association from the Stereotype element to this Metaclass.</p>  <pre> classDiagram     class ToolboxPage["«metaclass»\nToolboxPage"]     class MyElements["MyElements"]     class MyProfile_Stereo["MyProfile::MyStereo(UML::Class)"]     class ToolboxItemImage["«metaclass»\nToolboxItemImage"]      ToolboxPage &lt; -- MyElements     MyElements --&gt; MyProfile_Stereo : + MyProfile::MyStereo(UML::Class) = MyStereo     MyProfile_Stereo --&gt; ToolboxItemImage : + Icon = X:\Dev\Images\I...   </pre>

- [Create Hidden Sub-Menus](#) <sup>[1564]</sup>

#### 7.3.3.4.4 Override Default Toolboxes

When you are creating a diagram of one of the inbuilt diagram types, the system displays a Diagram Toolbox based on the corresponding default Toolbox Profile. If you have customized a diagram type, it will still apply the system default Toolbox for the base diagram type that you have extended, unless you override that default with an alternative Toolbox that you might have created yourself. For example, you might have your own version of the UML::Class Toolbox that you want to be displayed every time a Class diagram is opened, when your technology is active.

##### Access    **Right-click Toolbox Profile diagram | Properties > General**

To replace a system default Toolbox with one of your own, in the **Notes** field type a *RedefinedToolbox* clause. For example:

```
RedefinedToolbox=UML::Class; Alias=Class; Notes=Structural elements for
Class diagrams;
```

This states that the Toolbox defined by this Profile replaces the system Toolbox *UML::Class* as the default Toolbox for all UML Class diagrams.

##### Names of system default toolboxes that can be overridden

- |                      |                           |
|----------------------|---------------------------|
| • UML::Activity      | • Extended::Analysis      |
| • UML::Class         | • Extended::Custom        |
| • UML::Communication | • Extended::DataModeling  |

| • UML::State         |                           |
| • UML::Timing        |                           |
| • UML::UseCase       |                           |

#### 7.3.3.4.5 Elements Used in Toolboxes

When you are creating Toolbox pages for your MDG Technology, you can incorporate both standard UML elements **and** new elements that you have created by **extending** the UML elements. You define the elements you want to use in the Toolbox Profile. The table below lists the names you use to identify either:

- The standard elements to include in the Toolbox page or
- The standard elements you are extending to define new elements to include in the Toolbox page

Each name you list in the Toolbox Page Stereotype elements is preceded by the namespace **UML::**. The text in red indicates the **label name** displayed in the default Toolbox pages, where this differs in any way from the **UML::** statement text.

### 7.3.3.5 Create Custom Diagram Profiles

When you develop an MDG Technology, it is possible to create extended diagram types and include them in your MDG Technology as custom Diagram Profiles. For example, you might create a DFD Diagram Profile that defines a DFD diagram as an extension of the built-in Analysis diagram, as below:

### Create extended diagram types

Step	Action	See also
1	<p>Create a Profile, with the <b>same name</b> as the MDG Technology in which it is to be included; for example, <i>SysML</i>.</p> <p>This Profile automatically contains one child Class diagram. Depending on how many new diagram types you intend to create, you can define:</p> <ul style="list-style-type: none"> <li>• One diagram type on one child diagram</li> <li>• Several diagram types on one diagram, or</li> <li>• Several diagram types grouped on several diagrams</li> </ul> <p>In the third case, create any further child Class diagrams you need. The diagram names do not have to reflect the technology name.</p>	<a href="#">Create a Profile Package</a> 
2	<p>Open the child Class diagram and create a Stereotype element, giving it the name of the <b>custom</b> diagram type; for example, <i>BlockDefinition</i>.</p> <p>Also on the Stereotype element Properties dialog, in the <b>Notes</b> field, type a brief description of what the diagram is used for.</p> <p>When the Technology is deployed and a diagram of this custom type is being created, this description will display in the bottom right-hand corner of the New Diagram dialog.</p>	<a href="#">Add Stereotypes and Metaclasses</a> 
3	<p>Create a Metaclass element and give it the name of the selected <b>built-in</b> diagram type, with the prefix <i>Diagram_</i>.</p> <p>For example <i>Diagram_Logical</i> to customize the Class diagram type, or <i>Diagram_Use Case</i> to customize the Use Case diagram type.</p>	<a href="#">Built-In Diagram Types</a> 
4	<p>Drag an Extension connector from the Stereotype element to the Metaclass element.</p>	
5	<p>Click on the <i>Diagram_xxxx</i> <b>Metaclass</b> element, press <b>F9</b> and create any or all of the following attributes, to set properties of the custom diagram type:</p> <ul style="list-style-type: none"> <li>• <i>alias: string = Type</i> (where <i>Type</i> will appear before the word 'Diagram' on the diagram title bar; for example, <i>Block Diagram</i>)</li> <li>• <i>diagramID: string = abc</i> (where <i>abc</i> is the diagram type that will appear in the diagram <b>frame</b> label)</li> <li>• <i>toolbox: string = ToolboxName</i> (where <i>ToolboxName</i> is the name of the Toolbox Profile for the Toolbox that opens automatically each time a diagram of this type is opened)</li> <li>• <i>frameString: string = FrameFormatString</i> (where <i>FrameFormatString</i> is a string containing substitution macros for defining the frame title, with or without additional delimiters such as ( ); macros that can be used are: <ul style="list-style-type: none"> <li>• #DGMALIAS#</li> <li>• #DGMID#</li> <li>• #DGMNAME#</li> <li>• #DGMNAMEFULL#</li> </ul> </li> </ul>	<a href="#">Diagram Frame</a> 

Step	Action	See also
	<ul style="list-style-type: none"> <li>• #DGMOWNERNAME#</li> <li>• #DGMOWNERNAMEFULL#</li> <li>• #DGMOWNERTYPE#</li> <li>• #DGMSTEREO#</li> <li>• #DGMTYPE#</li> <li>• <i>swimlanes</i>: <i>string</i> = <i>Lanes=2;Orientation=Horizontal;Lane1=Title1;Lane2=Title2</i>; (where <i>Lanes</i> can be any value, but the number of <i>Lane</i>&lt;<i>n</i>&gt; values must equal the value of <i>Lanes</i>; <i>Orientation</i> can be omitted, in which case the swimlanes default to vertical)</li> <li>• <i>styleex</i>: <i>string</i> = one or more of a range of values</li> <li>• <i>pdata</i>: <i>string</i> = one or more of a range of values</li> </ul>	<a href="#">Attribute Values - styleex &amp; pdata</a> <sup>[1573]</sup>
6	Depending on what Profile package organization you adopted at step 1, and whether you need any further Stereotype-Metaclass element pairs, repeat steps 2 - 5 on this diagram or on another child diagram.	
7	Save the diagram(s) as a Diagram Profile, using the method most appropriate to the Profile package organization you have set up.	<a href="#">Export a Profile</a> <sup>[1523]</sup>
8	Add the Diagram Profile(s) to the .mts file used in the MDG Technology.	<a href="#">Add a Diagram Profile</a> <sup>[1550]</sup>

### Learning Center topics

- (Alt+F1) | [Enterprise Architect](#) | [Modeling Languages](#) | [Build a Technology](#) | [Create a Diagram Profile](#)

#### 7.3.3.5.1 Built-In Diagram Types

In customizing Enterprise Architect to better suit your needs, you might create a Profile that:

- Redefines the type of built-in child diagram created under a new composite element
- Defines the types of built-in diagram on which a Quick Linker menu offers a type of connector, or
- Extends a built-in diagram type to create a custom diagram type

In each case, you provide the **precise** name of each built-in diagram type you are working with; these names are:

- Activity
- Analysis
- Collaboration
- Component
- CompositeStructure
- Custom
- Deployment

- InteractionOverview
- Logical (for Class diagrams)
- Object
- Package
- Sequence
- Statechart
- Timing
- Use Case (note the space between the two words)

#### Learn more

- [Define Child Diagram Type](#)<sup>[1512]</sup>
- [Quick Linker Definition Format](#)<sup>[1516]</sup>
- [Create Custom Diagram Profiles](#)<sup>[1570]</sup>

#### 7.3.3.5.2 Attribute Values - *styleex* & *pdata*

When creating a diagram profile you can define a range of characteristics of the diagrams created with the profile, using the *pdata* and *styleex* attributes. If one of these attributes is defining several characteristics at once, you put the values in a single string separated by semicolons; for example:

*styleex: string = HideQuals=0;AdvanceElementProps=1;ShowNotes=1;*

**Access** Click on Metaclass element: **F9 > General**

#### **styleex: string =**

- *AdvancedConnectorProps=1*; (to show connector property strings)
- *AdvancedElementProps=1*; (to show the element property string)
- *AdvancedFeatureProps=1*; (to show the feature property string)
- *AttPkg=1*; (to show package visible Class members)
- *DefaultLang=Language*; (to set the default language for the diagram; *Language* can be one of the built-in languages such as C++ or Java, or it can be a custom language)
- *HandDraw=1*; (to apply hand drawn mode)
- *HideConnStereotype=1*; (to hide the connector stereotype labels)
- *HideQuals=0*; (to show qualifiers and visibility indicators)
- *SeqTopMargin=50*; (to set the height of the top margin on sequence diagrams)
- *ShowAsList=1*; (to make the diagram open directly into the *Diagram List*)
- *ShowMaint=1*; (to show the element Maintenance compartment)
- *ShowNotes=1*; (to show the element Notes compartment)
- *ShowOpRetType=1*; (to show the operation return type)
- *ShowTests=1*; (to show the element Testing compartment)
- *SuppConnectorLabels=1*; (to suppress all connector labels)
- *SuppressBrackets=1*; (to suppress brackets on operations without parameters)
- *TConnectorNotation=Option*; (where *Option* is one of **UML 2.1**, **IDEF1X**, or **Information Engineering**)
- *TExplicitNavigability=1*; (to show non-navigable connector ends)

- *VisibleAttributeDetail=1*; (to show attribute details on the diagram)
- *Whiteboard=1*; (to apply whiteboard mode)

**pdata: string =**

- *HideAtts=0*; (to show the element Attributes compartment)
- *HideEStereo=0*; (to show element stereotypes in the diagram)
- *HideOps=0*; (to show the element Operations compartment)
- *HideParents=0*; (to show additional parents of elements in the diagram)
- *HideProps=0*; (to show property methods)
- *HideRel=0*; (to show relationships)
- *HideStereo=0*; (to show attribute and operation stereotypes)
- *OpParams=3*; (to show operation parameters)
- *ShowCons=1*; (to show the element Constraints compartment)
- *ShowIcons=1*; (to use stereotype icons)
- *ShowReqs=1*; (to show the element Requirements compartment)
- *ShowSN=1*; (to show sequence notes)
- *ShowTags=1*; (to show the element Tagged Values compartment)
- *SuppCN=0*; (to show collaboration numbers)
- *UseAlias=1*; (to use the aliases or elements in the diagram, if available)

**Learn more**

- [Diagram List](#)<sup>[684]</sup>

### 7.3.3.6 Set Up Technology Element Images

As you define the elements available for use in your technology, you might want to represent those elements with graphical images that will be displayed on the diagrams the users create through the technology, when it is deployed in the users' model.

**Capture images to represent MDG Technology elements**

Step	Action	See also
1	Display the Image Manager and, using the <b>Add New</b> button, import suitable images into the MDG Technology development model from their source locations.	<a href="#">Image Manager</a> <sup>[860]</sup>
2	Design and create a Stereotype (UML) Profile containing (if appropriate) a stereotype definition for each element or connector to be owned by the technology.  These stereotype definitions can contain Shape Scripts that in turn incorporate the imported images.	<a href="#">Stereotype (UML) Profile</a> <sup>[1485]</sup> <a href="#">Shape Scripts</a> <sup>[1501]</sup> <a href="#">Drawing Methods</a> <sup>[1591]</sup>

Step	Action	See also
3	<p>Design and create a Toolbox Profile with stereotype elements that contain an attribute for each element or connector that can be dropped onto a diagram from the toolbox.</p> <p>These attributes identify the name of the technology element or connector, any modifying stereotype (which might incorporate the required image) and the UML or Extended element or connector on which the technology object is based.</p> <p>For example:</p> <pre>SysML: : Block ( UML: : Class )</pre> <ul style="list-style-type: none"> <li>• <i>SysML</i> is the Technology Profile</li> <li>• <i>UML::Class</i> is the UML element used as the base, and</li> <li>• <i>Block</i> is the stereotype that modifies the Class to turn it into a SysML Block element</li> </ul>	<a href="#">Toolbox Profiles</a> <sup>[1561]</sup>
4	<p>Design and create a Diagram Profile that identifies the Toolbox Profile.</p> <p>When a diagram of the type defined in the Diagram Profile is opened, it in turn opens a set of toolbox pages as defined by the Toolbox Profile.</p>	<a href="#">Diagram Profiles</a> <sup>[1570]</sup>
5	<p>Create or update the technology as required, adding the UML Profile, Diagram Profile, Toolbox Profile and Image files to the technology from the development model.</p>	<a href="#">Creating MDG Technologies</a> <sup>[1545]</sup> <a href="#">Adding UML Profile</a> <sup>[1548]</sup> <a href="#">Adding Diagram Profile</a> <sup>[1550]</sup> <a href="#">Adding Toolbox Profile</a> <sup>[1551]</sup> <a href="#">Adding Image Files</a> <sup>[1558]</sup>
6	<p>Deploy the technology as appropriate.</p> <p>When a user applies the technology to their own model, and creates a diagram under that technology, the elements they create on the diagram should be represented by the images you assigned to those elements when you created the technology.</p>	<a href="#">Deploy an MDG Technology</a> <sup>[1580]</sup>

### Notes

- It is recommended that if you create a Shape Script incorporating an MDG Technology image (step 2), you should use the fully qualified image name to avoid conflicts with images used in other technologies
- You would probably work backwards and forwards through the steps many times, adding objects as you identify the requirement for them

### 7.3.3.7 Define Validation Configuration

Using the Model Validation Configuration dialog, you can choose which sets of validation rules are and are not executed when a user performs a validation. Rather than perform this configuration manually and potentially have to change the settings every time Enterprise Architect is started and a different technology is set active, you can define the configuration settings within the MTS file.

**Access** [Project | Model Validation | Configure...](#)

#### White List

To specify a set of rules as a white-list (that is, anything added to this list is turned ON), open your MTS file in a text editor and copy and paste the following `<Model Validation>` block at the top level inside the `<MDG. Selections>` block:

```
<Model Validation>
  <RuleSet name=" BPMNRules" /> <!-- ruleset ID defined in the Project .
  DefineRuleCategory call -->
  <RuleSet name=" MVR7F0001" /> <!-- notice you can turn on/off system
  rules as well! -->
</Model Validation>
```

Ensure that the ruleset IDs do not contain any spaces.

#### Black List

To specify a set of rules as a black-list (that is, anything added to this list is turned OFF), open your MTS file in a text editor and copy and paste the following `<Model Validation>` block at the top level inside the `<MDG. Selections>` block:

```
<Model Validation isBlackList="true">
  <RuleSet name=" BPMNRules" />
  <RuleSet name=" MVR7F0001" />
</Model Validation>
```

In the examples above, "BPMNRules" is the rule-set ID defined in the Project . DefineRuleCategory call - see [Project Interface](#)<sup>[2962]</sup> for details. "MVR7F0001" is a built-in rule-set. These validation options are applied when you activate the appropriate technology. The global (default) technology has all rules turned on.

### 7.3.3.8 Incorporate Model Templates

When a user creates a model within their project, they can choose the type of model to develop from a list of standard model templates. You can also develop **custom** model templates to add to this list via your MDG Technology.

**Access** [Project Browser package context menu | Add a Model using Wizard...](#) (Ctrl+Shift+M)

[Add custom model templates to MDG Technology](#)

Step	Action	See also
1	<p>Create a package that contains all sub-packages, diagrams, elements, notes and information links that you want to provide in your model template.</p> <p>See the <i>EAExample.eap</i> model for illustrations of what you might include, or create a model from a standard template and see what is generated.</p> <p>As a model template, the package would be self contained and not contain any dependencies or other links to elements outside the package.</p>	<a href="#">Model Wizard</a> <sup>[753]</sup>
2	Export your package to XML.	<a href="#">Export to XML</a> <sup>[475]</sup>
3	<p>Create a reference to the XML file in the MTS file; open your MTS file in a text editor and copy and paste the following <code>&lt;Model Templates&gt;</code> block at the top level inside the <code>&lt;MDG. Selections&gt;</code> block:</p> <pre> &lt;Model Templates&gt;   &lt;Model name=" Template Name"     description=" This is the description."     location=" MyTemplatePackage.xml "     default=" yes"     icon = " 34"     filter= " Filter Name"     isFramework=" false" /&gt; &lt;/ Model Templates&gt; </pre> <p>You can include as many <code>&lt;Model Templates&gt;</code> blocks in your MTS file as you have model templates.</p> <p>The attributes within a <code>&lt;Model Templates&gt;</code> block have the following meanings:</p> <ul style="list-style-type: none"> <li>• <b>Model name:</b> The name of the model template to show in the Model Wizard, which displays when you create a new model or when you execute the <b>Add a New Model using Wizard</b> menu option</li> <li>• <b>description:</b> The text to display in the Model Wizard when the name is selected</li> <li>• <b>location:</b> The path of the XML file that contains the XML export of the model template package, relative to the location of the MDG Technology file; if the XML file is in the same folder as the technology file then this just contains the file name</li> <li>• <b>default:</b> Contains either <b>yes</b> to indicate that the model template is checked by default, or <b>no</b> to indicate that the model template is unchecked by default</li> <li>• <b>icon:</b> Contains an index to Enterprise Architect's base icons list; to show the appropriate view icon, use one of the following values: <b>29</b> = Use Case, <b>30</b> = Dynamic; <b>31</b> = Class; <b>32</b> = Component; <b>33</b> = Deployment; <b>34</b> = Simple</li> <li>• <b>filter:</b> If you have a large number of model templates, you can group them on the Model Wizard by giving all the model templates in the same group the same filter name; the filter name given appears in the <b>Select from:</b> list box in the Model Wizard</li> <li>• <b>isFramework:</b> Defines the possible uses of a model pattern; there are three possible values:</li> </ul>	<a href="#">Working with MTS Files</a> <sup>[1559]</sup>

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>isFramework="true"</b> - never strip GUIDs; the Pattern is intended as a re-usable package for <b>any</b> model</li> <li>• <b>isFramework="optional"</b> - prompt to strip GUIDs; the Pattern is intended as a re-usable package, but the user can choose</li> <li>• <b>isFramework="false"</b> - always strip GUIDs (the default, if not stated); the Pattern could be applied multiple times within <b>the one</b> model</li> </ul>	

#### Learn more

- [EA\\_OnRetrieveModelTemplate](#)<sup>[3046]</sup>

### 7.3.3.9 Add Import/Export Scripts

In Enterprise Architect, it is possible to import packages from and export (or Publish) packages to external files in a range of XML and XML formats. You can also incorporate this facility in your MDG Technology, adding a script that contains your own Extensible Stylesheet Language Transformation (XSLT) to convert between the file formats.

#### Incorporate an Export (Publish) script

Step	Description	See also
1	In your preferred editor, create an XSLT to convert from the source format (as listed on the Publish Model Package dialog) into the target format you are generating.	
2	In Enterprise Architect, open the Scripter window and create a script under your preferred script engine as a Normal script.  Cut and paste the XSLT into the script editor.	<a href="#">Scripting</a> <sup>[2791]</sup>
3	Add the script to your MDG Technology, in the MDG Technology Creation Wizard.	<a href="#">Add Scripts</a> <sup>[1556]</sup>
4	Make any additions to the technology .MTS file you require, then use the MDG Technology Creation Wizard again to fully generate the technology .XML file.  Open the technology .XML file ( <b>not</b> the .MTS file) in a text editor and locate the <Script> section.	<a href="#">Working with MTS Files</a> <sup>[1559]</sup> <a href="#">Create MDG Technologies</a> <sup>[1545]</sup>
5	Edit the <Script> line to set the appropriate name, type and language: <ul style="list-style-type: none"> <li>• <i>name</i> is the technology option text to display in the <b>Extensions   Publish</b> menu in the Enterprise Architect menu bar</li> <li>• <i>type</i> is the word <b>Publish</b>- followed by the name of the file format to export, as listed on the Publish Model Package dialog</li> </ul>	

Step	Description	See also
	<ul style="list-style-type: none"> <li><i>language</i> is <b>XSLT</b></li> </ul> <p>For example:</p> <pre>&lt;Script   name="Your Technology"   type="Publish-UML 2.1(XMI 2.1)"   language="XSLT"&gt; &lt;Content   xmlns:dt="urn:schemas-microsoft-com:datatypes" dt: dt="bin.base64"&gt; &lt;/Content&gt; &lt;/Script&gt;</pre>	
6	Save the MDG technology .XML file, and deploy it on your system.	<a href="#">Deploy An MDG Technology</a> <small>[1580]</small>

#### Incorporate an Import script

Step	Description	See also
1	In your preferred editor, create an XSLT to convert from the source format into the target XML format.	
2	<p>In Enterprise Architect, open the Scripter window and create a script under your preferred script engine as a Normal script.</p> <p>Cut and paste the XSLT into the script editor.</p>	<a href="#">Scripting</a> <small>[279]</small>
3	Add the script to your MDG Technology, in the MDG Technology Creation Wizard.	<a href="#">Add Scripts</a> <small>[1556]</small>
4	<p>Make any additions to the technology .MTS file you require, then use the MDG Technology Creation Wizard again to fully generate the technology .XML file.</p> <p>Open the technology .XML file (<b>not</b> the .MTS file) in a text editor and locate the &lt;Script&gt; section.</p>	<a href="#">Working with MTS Files</a> <small>[1555]</small> <a href="#">Create MDG Technologies</a> <small>[1545]</small>
5	<p>Edit the &lt;Script&gt; line to set the appropriate name, type and language:</p> <ul style="list-style-type: none"> <li><i>name</i> is the technology option text to display in the <b>Extensions   Import</b> menu in the Enterprise Architect menu bar</li> <li><i>type</i> is the word <b>Import</b>- followed by the name of the XML file format to generate, as listed on the Publish Model Package dialog</li> </ul>	

Step	Description	See also
	<ul style="list-style-type: none"> <li><i>language</i> is <b>XSLT</b></li> </ul> <p>For example:</p> <pre>&lt;Script   name="Your Technology"   type="Import - UML 2.1 (XML 2.1)"   language="XSLT"&gt; &lt;Content   xmlns:dt="urn:schemas-microsoft-com:datatypes" dt: dt="bin.base64"&gt; &lt;/Content&gt; &lt;/Script&gt;</pre>	
6	Save the MDG technology .XML file, and deploy it on your system.	<a href="#">Deploy An MDG Technology</a> <sup>[1580]</sup>

#### Notes

- Create the content of your scripts in XSLT 1.0

- [Publish Model Package](#)<sup>[476]</sup>
- [Import from XML](#)<sup>[478]</sup>

### 7.3.3.10 Deploy An MDG Technology

An MDG Technology can be **deployed** in one of two ways: as a .xml file or from an **Add-In**.

#### Deploy From a .xml File

To deploy your technology as a **file**, you have a number of choices:

- Import the technology .xml file into the %APPDATA%\ Sparx Systems\ EA\ MDGTechnologies folder (for your personal use)
- Import the technology .xml file into the Resources window (for all project users to access)
- Copy the file to the MDGTechnologies folder under your Enterprise Architect installation directory (by default this is C:\ Program Files\ Sparx Systems\ EA). When you restart Enterprise Architect, your MDG Technology is deployed
- Copy the file to any folder in your file system, including network drives - use the Enterprise Architect **Settings | MDG Technologies...** menu option, press the **Advanced** button and add the folder to the Technologies path; this deployment method enables you to quickly and easily deploy a technology to all Enterprise Architect users on a LAN
- Upload the file to an internet or intranet location: use the Enterprise Architect **Settings | MDG**

**Technologies...** menu option, press the **Advanced** button and add the URL to the **Technologies** path; this deployment method enables you to quickly and easily deploy a technology to an even wider group of Enterprise Architect users

### Deploy From an Add-in

To deploy your technology from an **Add-In**, you must write an *EA\_OnInitializeTechnologies* function. The following example is written in VB.Net:

```
Public Function EA_OnInitializeTechnologies(ByVal Repository As EA.
Repository) As Object
    EA_OnInitializeTechnologies = My.Resources.MyTechnology
End Function
```

## 7.3.4 Developing Programming Languages

You can make use of a range of established programming languages in Enterprise Architect, but if these are not suitable to your needs you can develop your own. You would then apply it to your models through an MDG Technology that you might develop just for this purpose, or for broader purposes. After developing the language, you could also write MDA Transformation templates to convert a Product Independent Model or a model in another language into a model for your new language, or vice-versa.

**Access**   **Tools** | **Source Code Generation Templates** (Ctrl+Shift+P)

### Develop a Programming Language

Step	Description	See also
1	In the Code Template Editor, click on the <b>New Language</b> button and, on the Programming Languages Datatypes dialog, click on the <b>Add Product</b> button.  Enter your new programming language name and define the datatypes for it. You cannot access the new language in the Code Template Editor until at least one datatype has been added to the language.	<a href="#">Data Types</a> <sup>[1171]</sup>
2	After you have defined all the datatypes you need, click on the <b>Close</b> button, select the language in the <b>Language</b> field of the Code Template Editor, and start to edit or create the code templates for the new language.  The code templates define how the system should perform: <ul style="list-style-type: none"> <li>• Forward code engineering of your models in the new language</li> </ul>	<a href="#">Code Template Framework</a> <sup>[1631]</sup> <a href="#">Code and Transform Templates</a> <sup>[1632]</sup> <a href="#">Create Custom Templates</a> <sup>[1701]</sup>

Step	Description	See also
	<ul style="list-style-type: none"> <li>Behavioral Code generation (if this is appropriate)</li> </ul>	<a href="#">Customize Base Templates</a> 
3	<p>If you wish, you can also define source code options for your new language. These are additional settings for the language that are not covered by the data types or code templates, that help define how the system handles that language when generating and reverse-engineering code.</p> <p>The code options are made available to your models only through an MDG Technology.</p>	<a href="#">Define Code Options</a> 
4	<p>Defining a grammar for your language is an optional step that provides two primary benefits:</p> <ul style="list-style-type: none"> <li>Reverse engineering of existing code into your model</li> <li>Synchronization during code generation so that changes made to the file since it was last generated are not lost.</li> </ul> <p>To access the grammar editor select <b>Analyzer</b>   <b>Grammar Editor</b>.</p>	<a href="#">Grammar Framework</a> 
5	<p>If you intend MDA transformations to be made to (or from) your new programming language, you can also edit and create transformation templates for it. The process of creating transformation templates is very similar to that for creating code templates.</p>	<a href="#">Edit Transformation Templates</a>  <a href="#">Write Transformations</a> 
6	<p>Having created the datatypes, code templates, code options, grammar and transformation templates for your new language, you can incorporate and distribute them in an MDG Technology.</p>	<a href="#">Create MDG Technologies</a>  <a href="#">Add Code Modules</a>  <a href="#">Add MDA Transforms</a>  <a href="#">Deploy An MDG Technology</a> 

### 7.3.5 Shape Scripts

The elements and connectors you initially use in modeling conform to the **standard UML notation** in terms of shape, color and labeling. You can, however, extend the standard objects to create new ones, and **customize the appearance** of these new objects using **Shape Scripts** to define the exact feature you want to impose on the default - or main - shape. You create a Shape Script in a dedicated scripting language, to define the new shape, orientation, color and labeling of the element or connector. Each script is associated with a **stereotype**, and every element or connector that has that stereotype will adopt the appearance defined by the Shape Script.

If you want to standardize the appearance, to apply to many elements, you can attach the Shape Script to an attribute of a Stereotype **element** in an MDG Technology Stereotype **Profile**.

- [Example Scripts](#)  <sup>1614</sup>
- [Creating an MDG Technology](#)  <sup>1527</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Defining Shapes | Introduction to Shape Scripts**
- (Alt+F1) | **Enterprise Architect | Modeling Languages | Build a Profile | Defining an Image**

### 7.3.5.1 Getting Started With Shape Scripts

As Shape Scripts are associated with stereotypes, you define them through the Stereotypes tab of the UML Types dialog; each stereotype can have one Shape Script. The process of setting up a Shape Script is quite simple yet very flexible.

**Access**   **Settings | UML Types > Stereotypes**

#### Shape Script Process

Step	Action	See also
1	Select the stereotype to which to attach the Shape Script, from the list on the right of the dialog.  You select an existing stereotype, but if a suitable one is not available you can create a new stereotype that, once saved, displays in the list and can be selected.	<a href="#">Custom Stereotypes</a>  <sup>1461</sup>
2	In the Override Appearance panel, select the <b>Shape Script</b> radio button and then click on the <b>Assign</b> button.  The Shape Script Editor displays.	<a href="#">Shape Script Editor</a>  <sup>1584</sup>
3	Type or copy the script into the Edit window.  To review the shape in the Preview panel, click on the <b>Refresh</b> button.	<a href="#">Writing Scripts</a>  <sup>1585</sup>
4	If you define a composite Shape Script (a main shape with decorations and labels, or separate parts such as a connector with source-end and target-end shapes), click on the <b>Next Shape</b> button to page through the components of the shape, in the Preview panel.	<a href="#">Example Scripts</a>  <sup>1618</sup>
5	Once you have finished writing your Shape Script, click on the <b>OK</b> button to return to the Stereotypes tab.  Then click on the <b>Save</b> button to save the Shape Script and its assignment to the stereotype.	

Step	Action	See also
6	<p>Drag and drop the appropriate standard UML element or connector into your diagram. The object will be of the type you selected as the <b>Base Class</b> of the stereotype.</p> <p>Right-click on the object and select the <b>Properties</b> context menu option.</p> <p>On the Properties dialog, click on the <b>Stereotype</b> drop-down arrow, select the stereotype you created and click on the <b>OK</b> button.</p> <p>The object's shape now reflects the Shape Script assigned to the stereotype.</p>	<a href="#">Custom Stereotypes</a> 

### Notes

- Using a Shape Script to modify an element's appearance makes some of the normal **Appearance** context menu options redundant for that element, so they will be disabled
- Font selection is not supported in Shape Scripts because the best user experience is achieved by allowing the user to set fonts themselves
- UML defines that the standard mechanism for extending the syntax of UML is through Profiles; for this reason Shape Scripts can not be applied to any element independently of a stereotype
- Shape Scripts do not currently support:
  - Looping constructs
  - String Manipulation
  - Arithmetical Operations
  - Variable declaration

### 7.3.5.2 Shape Editor

When you create a Shape Script through the Stereotypes tab of the UML Types dialog, you write the script using the **Shape Editor**. This provides the facilities of the **Common Code Editor**, including **Intelli-sense** for Shape Script attributes and functions.

**Access** **Settings | UML Types > Stereotypes (specify stereotype): Shape Script + Assign** or  
**Settings | UML Types > Stereotypes (specify stereotype): Shape Script + Edit**

### Editor Options

Field	Usage	See also
<b>Format</b>	Click on the drop-down arrow and select the Shape Script version (currently only <b>EAShapeScript 1.0</b> is available).	
<b>Import</b>	<p>Click on this button to import a Shape Script from a text file (.txt). A file browser displays through which you can locate the file to import.</p> <p>When you have located and selected the file, click on the <b>Open</b> button to import the script into the editing panel.</p>	

Field	Usage	See also
<b>Export</b>	Click on this button to export a Shape Script to a text file. A file browser displays through which you can specify the file to export to.  When you have identified the file, click on the <b>Save</b> button to complete the export and return to the Shape Editor.	
<b>&lt;editing panel&gt;</b>	Type the script commands in this panel.	<a href="#">Write Scripts</a> 
<b>OK</b>	Click on this button to exit from the Shape Editor.  To <b>SAVE</b> your Shape Script, click on the <b>Save</b> button on the Stereotypes tab.	<a href="#">Getting Started With Shape Scripts</a> 
<b>Next Shape</b>	If you have a shape made up of different components, click on this button to rotate through the multiple shape definitions in the Preview panel.	
<b>Refresh</b>	Click on this button to parse your script and display the result in the Preview window.

### 7.3.5.3 Write Scripts

To create an alternative representation for an element or connector, you write a Shape Script that defines the size, shape, orientation and color of the representation. A Shape Script contains a number of sections for defining different aspects of the shape; for an element these include:

- Main object
- Labels
- Decoration (for example, a Document element might contain an icon depicting a document)

For a connector the sections include:

- Main object
- Shape Source
- Shape Target
- Labels

Shape Scripts operate on the basis that the default (UML) representation is used **unless** the script contains an alternative definition. That is:

- If you have a Shape Script containing just a decoration, this decoration is added on top of the **normally-drawn** object
- If you have an **empty** shape routine, it overrides the default; so, a blank 'shape label' prevents the creation of the normal floating text label for elements that have them

You can also comment your scripts using C-style comments; for example:

```
// C Style Single Line comment
/* Multi Line
comment supported */
```

Scripting is not case-sensitive: 'Shape' is the same as 'shape'.

### Script Structure

Layout	Description	See also
Example of Element Script Layout	<pre>shape main {     // draw the object }  shape label {     // draw a floating text label }  decoration &lt;identifier&gt; {     // draw a 16x16 decoration inside the     object }</pre> <p>The &lt;identifier&gt; string is an alphanumeric word.</p>	
Example of Connector Script Layout	<pre>shape main {     // draw the line }  shape target {     // draw the shape at the target end }  shape source {     // draw the shape at the source end }  label &lt;positionLabel&gt; {     // define the text for the label }</pre> <p>The &lt;positionLabel&gt; string can be any of:</p> <ul style="list-style-type: none"> <li>• lefttoplabel</li> <li>• leftbottomlabel</li> <li>• middletoplabel</li> <li>• middlebottomlabel</li> </ul>	

Layout	Description	See also
	<ul style="list-style-type: none"> <li>• righttoplabel</li> <li>• rightbottomlabel</li> </ul>	
<b>Sub-shapes</b>	<p>A shape can have Sub-shapes, which must be declared after the main Shape Script, but called from the Method commands.</p> <p>This is an example of the ordering for declarations:</p> <pre> shape main {     // Initialisation Attributes - these must be     // before drawing commands     noshadow = "true";     h_align = "center";      //drawing commands (Methods)     rectangle(0,0,100,100);     println("foo bar");      // call the sub-shape     addsubshape("red", 20, 70);      // definition of a sub-shape     shape red     {         setfillcolor(200, 50, 100);         rectangle(50,50,100,100);     }      //definition of a label     shape label     {         setOrigin("SW", 0, 0);         println("Object: #NAME#");     }      //definition of a Decoration     decoration triangle     {         // Draw a triangle for the decoration         startpath();         moveto(0, 30);         lineto(50, 100);         lineto(100, 0);          endpath();         setfillcolor(153, 204, 255);         fillandstrokepath();     } </pre> <p>The shape resulting from this script is:</p> 	<a href="#">Drawing Methods</a> <small>1597</small>

Layout	Description	See also
<b>Order of declaration</b>	Shapes can consist of Attribute declarations, Command calls and Sub-shape definitions, which must appear in that order; that is, Attribute declarations must appear before all Command calls and Sub-shape definitions must appear last.	<a href="#">Shape Attributes</a> <sup>[1588]</sup> <a href="#">Sub-Shapes</a> <sup>[1603]</sup>

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Defining Shapes | Defining an Element Shape**

#### **7.3.5.3.1 Shape Attributes**

When you define a shape using a Shape Script, you define the **properties** of that shape using **attributes**. Properties include:

- The position of the shape relative to the diagram and to other elements
- The positions of components of the shape relative to the shape borders
- Whether the shape has user-editable regions
- Whether the shape can be resized, scaled, rotated or docked

#### Attribute Syntax

*attribute* "=" *value* ";"

#### Example

```

shape main
{
    // Initialisation attributes - must be before drawing commands
    noshadow = "true";
    h_align = "center";

    // drawing commands

```

```

    rectangle(0, 0, 100, 100);
    println("foo bar");
}

```

### Attributes

Attribute Name	Type	Description	See also
<b>bottomAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the bottom edge of its parent.  For example: <i>bottomAnchorOffset=(0,-10)</i> ; move embedded element up 10 pixels from the bottom edge.	
<b>dockable</b>	<i>string</i>	Makes the shape default to dockable, so that it can be aligned with and joined to other elements (both other Shape Scripts and standard elements) on a diagram. You cannot reverse the dockable status with the <b>Appearance</b> menu option; to change the status, you must edit the Shape Script.  Valid values: <b>standard</b> or <b>off</b>	<a href="#">Operations on Elements</a> <sup>[939]</sup>
<b>editableField</b>	<i>string</i>	Defines a shape as an editable region of the element.  This field impacts element shapes only, line glyphs are not supported.  Valid Values: <b>alias</b> , <b>name</b> , <b>note</b> , <b>stereotype</b>	
<b>endPointY</b> , <b>endPointX</b>	<i>integer</i>	Only used for the reserved target and source shapes for connectors; this point determines where the main connector line connects to the end shapes.  Default: <b>0</b> and <b>0</b>	
<b>fixedAspectRatio</b>	<i>string</i>	Set to <b>true</b> to fix the aspect ratio. Do not use this if you do not want to fix the aspect ratio.	
<b>h_Align</b>	<i>string</i>	Affects horizontal placement of printed text and sub-shapes depending on the <b>layoutType</b> attribute.  Valid values: <b>left</b> , <b>center</b> , or <b>right</b>	
<b>layoutType</b>	<i>string</i>	Determines how sub-shapes are sized and positioned.  Valid values: <b>leftright</b> , <b>topdown</b> , <b>border</b>	<a href="#">Sub-Shapes</a> <sup>[1603]</sup>
<b>leftAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the left edge of its parent.	

Attribute Name	Type	Description	See also
		For example: <i>leftAnchorOffset</i> =(10,0); move embedded element right 10 pixels from the left edge	
<b>noShadow</b>	<i>string</i>	Set to <b>true</b> to suppress the shapes shadow from being rendered.  Valid values: <b>true</b> or <b>false</b> (default= <b>false</b> )	
<b>orientation</b>	<i>string</i>	Applies to decoration shapes only, to determine where the decoration is positioned within the containing element glyph.  Valid values: <b>NW</b> , <b>N</b> , <b>NE</b> , <b>E</b> , <b>SE</b> , <b>S</b> , <b>SW</b> , <b>W</b>	
<b>preferredHeight</b>		Used by the <b>border</b> layoutType - north and south.  Used in drawing the source and target shapes for connectors to determine how wide the line is.	
<b>preferredWidth</b>		Used by the <b>border</b> layoutType - east and west.  Used by <b>leftright</b> layoutType shapes where <i>scalable</i> is <b>false</b> to determine how much space they occupy for layout purposes.	
<b>rightAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the right edge of its parent.  For example: <i>rightAnchorOffset</i> =( <b>-10</b> ,0); move embedded element left 10 pixels from the right edge.	
<b>rotatable</b>	<i>string</i>	Set to <b>false</b> to prevent rotation of the shape. This attribute is only applicable to the source and target shapes for line glyphs.  Valid values: <b>true</b> or <b>false</b> (default = <b>true</b> )	
<b>scalable</b>	<i>string</i>	Set to <b>false</b> to stop the shape from being relatively sized to the associated diagram glyph.  Valid values: <b>true</b> or <b>false</b> (default= <b>true</b> )	
<b>topAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the top edge of its parent.  For example:	

Attribute Name	Type	Description	See also
		<del><code>topAnchorOffset=(0,10)</code></del> ; move embedded element down 10 pixels from the top edge.	
<b>v_Align</b>	<i>string</i>	Affects vertical placement of printed text and sub-shapes depending on the <b>layoutType</b> attribute.  Valid values: <b>top</b> , <b>center</b> , or <b>bottom</b>	

### 7.3.5.3.2 Drawing Methods

When you create a shape using a Shape Script, you define the **values** of the shape using **methods**. The values include things such as:

- What the shape is - a rectangle, a line, a sphere
- The size of the shape
- The colors of the shape and borders
- The compartments and compartment text the shape has
- The text and labels displayed in and around the shape
- Whether the shape consists of or includes a captured image

You can list the valid methods (commands) for any point in a script by pressing **Ctrl+Space**.

#### Method Syntax

```
<MethodName> "(" <ParameterList> ")" ;
```

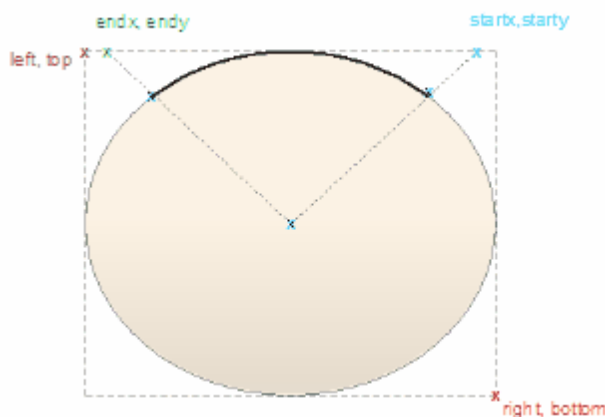

#### Example

```
shape main
{
    // Initialisation Attributes - these must be before drawing commands
    noShadow = "true";
    h_align = "center";

    // drawing commands (Methods)
    rectangle(0, 0, 100, 100);
    println("foo bar");
}
```

#### Methods

Method Name	Description	See also
<b>addsubshape</b> ( <b>string</b> <b>shapename</b> ( <b>int width</b> , <b>int height</b> ) )	Adds a sub-shape with the name <b>shapename</b> that must be defined within the current shape definition.	

Method Name	Description	See also
<b>appendcompartmenttext(</b> <b>string)</b>	<p>Appends additional strings to a compartment's text.</p> <p>The compartment the text is added to depends on the compartment name set using <b>setcompartmentname</b> (see below) prior to using <b>appendcompartmenttext</b>.</p> <p>This method must be called to have the compartment displayed.</p>	<a href="#">Add Custom Compartments to Element</a> <sup>[1604]</sup>
<b>arc(</b> <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom,</b> <b>int</b> <b>startingpointx,</b> <b>int</b> <b>startingpointy,</b> <b>int</b> <b>endingpointx,</b> <b>int</b> <b>endingpointy)</b>	<p>Draws an elliptical anticlockwise arc with the ellipse having extents at <b>left</b>, <b>top</b>, <b>right</b> and <b>bottom</b>.</p> <p>The start point of the arc is defined by the intersection of the ellipse and the line from the center of the ellipse to the point ( <b>startingpointx</b>, <b>startingpointy</b>).</p> <p>The end of the arc is similarly defined by the intersection of the ellipse and the line from the center of the ellipse to the point ( <b>endingpointx</b>, <b>endingpointy</b>).</p> <p>For example:</p> <pre>Ar c ( 0, 0, 100, 100, 95, 0, 5, 0 );</pre> 	
<b>arco(</b> <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom,</b> <b>int</b> <b>startingpointx,</b> <b>int</b> <b>startingpointy,</b> <b>int</b> <b>endingpointx,</b> <b>int</b> <b>endingpointy)</b>	<p>As for the arc method, except that a line is drawn from the current position to the starting point of the arc, and then the current position is updated to the end point of the arc.</p>	

Method Name	Description	See also
<b>bezierto</b> ( int controlpoint1x, int controlpoint1y, int controlpoint2x, int controlpoint2y, int endpointx, int endpointy)	Draws a bezier curve and updates the pen position.	
<b>defSize</b> (int width, int height)	<p>Sets the default size of the element.</p> <p>This can appear in IF and ELSE clauses with different values in each, and causes the element to be resized automatically each time the values change</p> <pre> if ( HasTag( " horizontal ", " true" ) ) {     def Si ze( 100, 20 );     rect angl e( 0, 0, 100, 100 ); } el se {     def Si ze( 20, 100 );     rect angl e( 0, 0, 100, 100 ); } </pre> <p>The above example sets the shape to the specified default size each time the Tagged Value <i>horizontal</i> is changed.</p> <p>When this is set, <b>(Alt+Z)</b> also resizes the shape to the defined dimensions.</p> <p>The minimum value for both <b>int width</b> and <b>int height</b> is <b>10</b>.</p>	
<b>drawnativeshape</b> ()	<p>Renders the shape in its usual, non-Shapescript notation; subsequent drawing commands are super-imposed over the native notation.</p> <p>This method is only enabled for <b>element</b> Shape Scripts; <b>line</b> Shape Scripts are not supported.</p>	
<b>drawparentshape</b> ()	<p>Used when extending non-UML Object types.</p> <p>Renders the shape as defined from a parent stereotype. Behaves identically to <b>drawnativeshape()</b> if no inherited shape script is available.</p>	<a href="#">Create Stereotypes Extending non-UML Objects</a> <small>1491</small>
<b>ellipse</b> ( int left, int top,	Draws an ellipse with extents defined by <b>left</b> , <b>top</b> , <b>right</b> and <b>bottom</b> .	

Method Name	Description	See also
<b>int right, int bottom)</b>		
<b>endpath()</b>	Ends the sequence of drawing commands that define a path.	
<b>fillandstrokepath()</b>	Fills the previously defined path with the current fill color, then draws its outline with the current pen.	
<b>fillpath()</b>	Fills the previously defined path with the current fill color.	
<b>hidelabel(     string     labelname)</b>	Hides the label specified by <b>labelname</b> , where <b>labelname</b> is one of the following values: <ul style="list-style-type: none"> <li>• <b>middletoplabel</b></li> <li>• <b>middlebottomlabel</b></li> <li>• <b>lefttoplabel</b></li> <li>• <b>leftbottomlabel</b></li> <li>• <b>righttoplabel</b></li> <li>• <b>rightbottomlabel</b></li> </ul>	
<b>image(     string     imageld,     int left,     int top,     int right,     int bottom)</b>	<p>Draws the image that has the name <b>imageld</b> in the Image Manager.</p> <p>The image must exist within the model in which the stereotype is used; if it does not already exist in the model, you must import it as reference data or select it from within a technology file.</p> <p>If the image is in a technology file, it should have a filename of the format <i>&lt;technology ID&gt;::&lt;imagename&gt;.&lt;extension&gt;</i>.</p>	<a href="#">Reference Data</a> <a href="#">Adding Images in MDG Technology</a>
<b>lineto(     int x,     int y)</b>	Draws a line from the current cursor position to a point specified by <b>x</b> and <b>y</b> , and then updates the pen cursor to that position.	
<b>moveto(     int x,     int y)</b>	Moves the pen cursor to the point specified by <b>x</b> and <b>y</b> .	
<b>polygon(     int centerx,     int centery,     int     numberofsides,     int radius,     float rotation)</b>	Draws a regular polygon with center at the point ( <b>centerx</b> , <b>centery</b> ), and <b>numberofsides</b> number of sides.	

Method Name	Description	See also
<b>print(</b> <b>string text)</b>	Prints the specified text string. You cannot change the font size or type of this text.	
<b>printfdefined(</b> <b>string</b> <b>propertyname,</b> <b>string truepart</b> <b>( ,</b> <b>string</b> <b>falsepart ) )</b>	Prints the <i>truepart</i> if the given property exists and has a non-empty value, otherwise prints the optional <i>falsepart</i> . You cannot change the font size or type of this text.	
<b>println(</b> <b>string text)</b>	Appends a line of text to the shape and a line break. You cannot change the font size or type of this text.	
<b>printwrapped(</b> <b>string text)</b>	Prints the specified text string, wrapped over multiple lines if the text is wider than its containing shape. You cannot change the font size or type of this text.	
<b>rectangle(</b> <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom)</b>	Draws a rectangle with extents at <b>left</b> , <b>top</b> , <b>right</b> , <b>bottom</b> . Values are percentages.	
<b>roundrect(</b> <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom,</b> <b>int</b> <b>abs_cornerwidth,</b> <b>int</b> <b>abs_cornerheight)</b>	Draws a rectangle with rounded corners, with extents defined by <b>left</b> , <b>top</b> , <b>right</b> and <b>bottom</b> . The size for the corners is defined by <b>abs_cornerwidth</b> and <b>abs_cornerheight</b> ; these values do not scale with the shape.	
<b>setcompartmentname</b> <b>(</b> <b>string)</b>	Sets a compartment name to the string provided. This method must be used <i>before</i> calling <b>appendcompartmenttext</b> (above); calling this <i>after</i> calling <b>appendcompartmenttext</b> clears any text that has already been added to the compartment.	<a href="#">Add Custom Compartments to Element</a> <sup>[1604]</sup>
<b>setdefaultcolors()</b>	Returns the brush and pen color to the default settings, or to the user-defined colors if available.	<a href="#">Color Queries</a> <sup>[1598]</sup>

Method Name	Description	See also
<b>setfillcolor</b> ( int red, int green, int blue)  <b>setfillcolor</b> ( Color newColor)	<p>Sets the fill color.</p> <p>You can specify the required color by defining RGB values or using a color value returned by <b>any</b> of the Color Queries such as:</p> <p>Get User Fill Color ( ) or Get User Border Color ( )</p> <p>If the shape script also uses <b>drawnativeshape</b>, then this color can be overridden via the Format Toolbar. In all other cases <b>setfillcolor</b> takes precedence over any color definition that applies to the element.</p>	<a href="#">Color Queries</a> <small>[1598]</small>  <a href="#">Format Toolbar</a> <small>[785]</small>
<b>setfixedregion</b> ( int xStart, int yStart, int xEnd, int yEnd)	<p>Fixes a region in a connector into which a sub-shape can be drawn, so that the sub-shape is not rescaled with the length or orientation of the connector line.</p> <p>For an example, see the Rotation Direction script in the <i>Example Scripts</i> topic.</p>	<a href="#">Example Scripts</a> <small>[1614]</small>
<b>setfontcolor</b> ( int red, int green, int blue)  <b>setfontcolor</b> ( Color newColor)	<p>Sets the font color of a text string.</p> <p>You can specify the required color by defining RGB values or using a color value returned by <b>any</b> of the Color Queries such as:</p> <p>Get User Font Color ( ) or Get User Fill Color ( )</p> <p>You can use this command with any of the text print commands.</p>	<a href="#">Color Queries</a> <small>[1598]</small>
<b>setlinestyle</b> ( string linestyle)	<p>Changes the stroke pattern for commands that use the pen.</p> <p><b>string linestyle</b>: has the following valid styles:</p> <ul style="list-style-type: none"> <li>• solid</li> <li>• dash</li> <li>• dot</li> <li>• dashdot</li> <li>• dashdotdot</li> <li>• double</li> </ul>	
<b>setorigin</b> ( string relativeTo, int xOffset, int yOffset)	<p>Positions floating text labels relative to the main shape.</p> <ul style="list-style-type: none"> <li>• <b>relativeTo</b> is one of N, NE, E, SE, S, SW, W, NW, CENTER</li> <li>• <b>xOffset</b> and <b>yOffset</b> are in pixels, not percentage values, and can be negative</li> </ul>	
<b>setpen</b> ( int red, int green, int blue,	<p>Sets the pen to the defined color and optionally sets the pen width.</p> <p>This method is only for line-drawing commands. It does not affect any text print commands.</p>	<a href="#">Color Queries</a> <small>[1598]</small>

Method Name	Description	See also
<pre>         int penwidth ) ) setpen(     Color newcolor( ,     int penwidth ) ) </pre>		
<pre> setpencolor(     int red,     int green,     int blue)  setpencolor(     Color newColor) </pre>	<p>Sets the pen color.</p> <p>You can specify the required color by defining RGB values or using a color value returned by any of the Color Queries</p> <p>Get User Fill Color ( )</p> <p>This method is only for line-drawing commands. It does not affect any text print commands.</p>	<a href="#">Color Queries</a> <small>1598</small>
<pre> setpenwidth(     int penwidth) </pre>	<p>Sets the width of the pen. Pen width should be between <b>1</b> and <b>5</b></p> <p>This method is only for line-drawing commands. It does not affect any text print commands.</p>	
<pre> showlabel(     string labelname) </pre>	<p>Reveals the hidden label specified by <b>labelname</b>, where <b>labelname</b> is one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>middletoplabel</b></li> <li>• <b>middlebottomlabel</b></li> <li>• <b>lefttoplabel</b></li> <li>• <b>leftbottomlabel</b></li> <li>• <b>righttoplabel</b></li> <li>• <b>rightbottomlabel</b></li> </ul>	
<pre> startcloudpath(     puffWidth,     puffHeight,     noise) </pre>	<p>Similar to <b>StartPath</b>, except that it draws the path with cloud-like curved segments (<i>puffs</i>).</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <i>float</i> <b>puffWidth</b> (default = <b>30</b>), the horizontal distance between puffs</li> <li>• <i>float</i> <b>puffHeight</b> (default = <b>15</b>), the vertical distance between puffs</li> <li>• <i>float</i> <b>noise</b> (default = <b>1.0</b>), the randomization of the puffs' positions</li> </ul>	
<pre> startpath() </pre>	Starts the sequence of drawing commands that define a path.	
<pre> strokepath() </pre>	Draws the outline of the previously defined path with the current pen.	

Method Name	Description	See also

### 7.3.5.3.3 Color Queries

In defining your shape, you might want to retain the fill, border and font colors you have already defined for the base shape. You can set the color definition using a **color query** to retrieve arguments for the **SetPenColor** and **SetFillColor** commands. The following queries can be used in place of arguments.

- `getUserFillColor()`
- `getUserBorderColor()`
- `getUserFontColor()`
- `getUserPenSize()`

For example:

```

shape main
{
    set fill color ( get user border color ( ) );
    set pencolor ( get user fill color ( ) );

    rectangle ( 0, 0, 100, 100 );
}

```

#### Notes

- The user colors are those that would be set on the base object if it were not being modified by the Shape Script; they would have been defined using - in order of decreasing precedence - the Format toolbar options, the Appearance options (**F4**) or the Options dialog (**Tools | Options**)
- Because the user colors are those defined for an element to which the stereotype and Shape Script are **subsequently** applied, they cannot be depicted in the Preview panel of the Shape Editor

### 7.3.5.3.4 Conditional Branching

You can incorporate condition branching in your Shape Scripts, using either the *IfElse* statement or query methods that evaluate to *True* or *False*.

When you use these conditional branching statements, you can use the **return** command to terminate execution of the script when a branch condition has been satisfied. The *Example Scripts* topic provides several examples of this, such as the *Return Statement Shape* script.

#### Learn more

- [Syntax Grammar](#) <sup>[1614]</sup> for *IfElse* statement syntax
- [Query Methods](#) <sup>[1599]</sup> for methods that can be used as the conditional expression for *IfElse* statements

- [Example Scripts](#)<sup>[1614]</sup> for an example of the use of conditional branching ()

### 7.3.5.3.5 Query Methods

When you are using **IfElse** statements in a Shape Script, the condition is usually that the object has a certain tag or property, and possibly if that tag or property has a particular value. You can set up the **conditional statement** to check for the property and value using one of the two **query methods** described below.

#### Queries

Method	Description	See also
<b>boolean HasTag(</b> <b>string tagname,</b> <b>( string</b> <b>tagvalue ) )</b>	Evaluates to <b>true</b> if the associated element has a tag with the name <i>tagname</i> .  If the second parameter <i>tagvalue</i> is provided, the tag <i>tagname</i> must be present, and the value of the tag has to be equal to <i>tagvalue</i> for the method to evaluate to <b>true</b> .	<a href="#">Tagged Values</a> <sup>[1134]</sup>
<b>boolean HasProperty(</b> <b>string</b> <b>propertyname,</b> <b>( string</b> <b>propertyvalue ) )</b>	Evaluates to <b>true</b> if the associated element has a property with the name <i>propertyname</i> .  If the second parameter <i>propertyvalue</i> is provided, the property must be present, and the value of the property has to be equal to <i>propertyvalue</i> for the method to evaluate to <b>true</b> .	<a href="#">Display Element/Connector Properties</a> <sup>[1598]</sup>

### 7.3.5.3.6 Display Element/Connector Properties

A common component of a customized shape is a text string, which can include the name and value of one of the properties of the element or connector. To display the text, you use one of the commands:

- **print**
- **println** and
- **printwrapped**

These all take a string parameter representing the text to be displayed. The element or connector property can be added to the text using the substitution macro `#<propertyname>#`; for example:

```
println("name: #NAME#");
```

You can display several properties by issuing the commands several times, once for each property. The element and connector properties you can display are **listed below**. Additionally, you can display Tagged Values by prefixing the tag name with *TAG*, as shown:

```
print("#TAG:condition#");
```

You can also test for and display an element's **custom** properties in the same way as you do the system-

named properties; for example:

```
if(hasproperty("Name","Value"))
    ...
```

and:

```
print("#Name#");
```

### **Properties for Element Shape Scripts**

- addin - returns a value from an invoked Add-In function; syntax:

```
addin:<addin_name>, <function_name>, <parameter> [, <parameter> ...]
```

Note that in the *hasproperty()* argument, Enterprise Architect requires the hash characters for addin values:

```
if(hasproperty("#ADDIN:MyAddin,MyValue#", "TheValue")) {
```

### 7.3.5.3.7 Sub-Shapes

When you define an element or connector shape using a Shape Script, you can build the shape from separate components, defined as **sub-shapes**. Using sub-shapes, you can create complex shapes that more closely resemble the objects that they represent.

#### Sub-shape Layout

To set the layout type you use the *layoutType* attribute, which must be set in the *initialization attributes* section of the script; in other words, before any of the methods are called. Valid values for this attribute are:

- **LeftRight** - Shapes with this layout position the sub-shapes side by side, with the first added on the left, and subsequent sub-shapes to the right
- **TopDown** - Places the sub-shapes in a vertical arrangement, with the first sub-shape added to the top and subsequent sub-shapes added below
- **Border** - This requires an additional argument to the **addsubshape** method to specify which region of the containing shape the sub-shape is to occupy: N, E, S, W or CENTER; each region can only be occupied by one sub-shape

A sub-shape that is assigned to the E or W region must have its *preferredwidth* attribute specified in its declaration and, similarly, sub-shapes added to N or S must have their *preferredheight* attribute set; in this case, the values for these attributes are treated as static lengths and do not scale glyphs

#### Example

```
shape main
{
    layouttype="topdown";
    setfillcolor(0,0,255);
    rectangle(0,0,100,100);
    addsubshape("sub",50,100,20,0);
    addsubshape("sub",50,100,30,-100);
    addsubshape("sub",50,100,40,-200);
    addsubshape("sub",50,100,50,-300);

    shape sub
    {
        setfillcolor(0,255,0);
        ellipse(0,0,100,100);
    }
}
```

This script defines the following shape:

### 7.3.5.3.8 Add Custom Compartments to Element

When you display an element on a diagram in normal, rectangular format, it is possible to show a number of compartments within that frame to reveal added characteristics such as Attributes, Operations and Notes, using the diagram Properties and element Feature and Compartment Visibility dialogs. If you want to reveal other added characteristics, such as **related elements** or **Ports** and **Parts**, you can use a Shape Script to add **custom compartments** to the diagram display of the element. You would usually add this Shape Script to a Stereotype element in a Profile.

Having created a custom compartment, you can add a linked Note to the element to display the content of the compartment, as you can for the other features of the element.

**Access** **Profile Stereotype element: ( F9 ) > General | Initial Value:**  **or**  
**Settings | UML Types > Stereotypes (specify stereotype): Shape Script, Assign**

#### Add custom compartments to elements

Process	Description	See also
<b>Develop script</b>	<p>For the selected stereotype, open the Shape Editor.</p> <p>In the script, replace <code>shape main</code> with:</p> <ul style="list-style-type: none"> <li>• <code>shape ChildElement Or</code></li> <li>• <code>shape RelatedElement</code></li> </ul> <p>You can keep <code>shape main</code> if you prefer, to adjust some properties of the main element (such as color); however, the main shape then requires a call to <b>DrawNativeShape()</b> in order to work correctly.</p> <p>At this point, you can use the <b>HasProperty</b> query method to search child or related elements for specific properties (such as stereotypes) to be displayed in compartments. A Related Element Shape Script determines properties of elements that are <b>linked to</b> the current element via connectors.</p> <p>Examples of Shape Scripts that define custom compartments are provided below.</p>	<p><a href="#">Shape Editor</a> <sup>[1584]</sup></p> <p><a href="#">Drawing Methods</a> <sup>[1591]</sup></p> <p><a href="#">Query Methods</a> <sup>[1599]</sup></p> <p><a href="#">Display Element/Connector Properties</a> <sup>[1599]</sup></p>
<b>Attach Linked Note</b>	<p>You can use one of two methods to create a linked Note to display custom compartment contents:</p> <ul style="list-style-type: none"> <li>• <b>Method 1</b> (the element is currently displaying custom compartments) - highlight the related or child element name in the custom compartment, then right-click on it and select the <b>Create</b></li> </ul>	

Process	Description	See also
	<p><b>Linked Note</b> menu option; the custom compartment is automatically closed, and the linked Note added to the diagram listing all element names in that compartment</p> <ul style="list-style-type: none"> <li>• <b>Method 2</b> (the element is not necessarily showing custom compartments) - drag a Note element from the Common page of the Diagram Toolbox and link it to the element containing the custom compartment with a Notelink connector</li> </ul> <p>Right-click on the connector and select the <b>Link this note to an element feature</b> menu option, to display the Link note to element feature dialog; click on the drop-down arrow in the <b>Feature Type</b> field and click on the name of the custom compartment, such as <i>Properties</i>, then click on the <b>OK</b> button</p> <p>The contents of that compartment are displayed in the Note</p> <p>In Method 2, if the compartment is displayed the method will NOT hide the compartment. It is recommended that you use this method if the compartment is already hidden.</p> <p>Any changes you make to the list of elements in the compartment, or their names, are immediately reflected in the Note to maintain the accuracy of the displayed information.</p>	
<b>Script Example 1: Add compartment without adjusting the parent element</b>	<pre>//Add compartments for Child elements. shape ChildElement {     //Check if a child element has the property stereotype     //the compartment name to Properties.     if(HasProperty("stereotype", "property"))     {         SetCompartmentName("Properties");     }      //Check if the child element has a public scope and     //symbol to the child compartment.     if(HasProperty("scope", "public"))     {         AppendCompartmentText("+");     }      //Add the child elements name to the child compartment     AppendCompartmentText("#NAME#"); }</pre> <p>The Shape Script checks all child elements to see if they have a stereotype of <i>property</i>. If this stereotype is found, the <b>SetCompartmentName</b> function sets a compartment called <i>Properties</i>.</p> <p>The script then checks whether the child element has a public scope and, if it does, appends the + symbol.</p> <p>Finally, the <b>AppendCompartmentText</b> function adds the child element's name to the compartment.</p> <p>If a compartment has already been declared by <b>SetCompartmentName</b>,</p>	

Process	Description	See also
	<p>any additional child elements that fall under the same compartment are automatically added to it without having to declare a new compartment name (that is, all child elements with the stereotype <i>property</i> end up in the <i>Properties</i> compartment).</p>	
<p><b>Script Example 2: Adjust the color of the parent element and add child compartments</b></p>	<pre>//Shape main affects the parent shape main {     //Set the color of the parent element to red     setfillcolor(255,0,0);     //draw the parents native shape     drawnativeshape(); }  //Shape ChildElement adds Child Compartments to the parent shape ChildElement {     if(HasProperty("stereotype", "part"))     {         SetCompartmentName("Parts");     }     else if(HasProperty("stereotype", "mystereotype"))     {         SetCompartmentName("My Stereotype");     }      AppendCompartmentText("#NAME#"); }</pre> <p>The <code>shape main</code> section sets the color of the main element to <b>red</b> and adds child compartments based upon stereotyped child elements.</p> <p>The script checks whether a child element has either the stereotype value <i>"part"</i> or <i>"mystereotype"</i> applied to it. If there are multiple child elements, having a combination of <i>"part"</i> and <i>"mystereotype"</i> stereotypes, two compartments are created called <i>Parts</i> and <i>My Stereotype</i>.</p> <p>In order to display the compartments, <b>AppendCompartmentText</b> must be called to insert content into the compartment.</p> <p>Values passed to <b>SetCompartmentName</b> and <b>AppendCompartmentText</b> can not contain new line characters.</p>	
<p><b>Script Example 3: Only list child element in compartment if it is not already visible on the diagram</b></p>	<pre>shape ChildElement {     //Check if the child element is on the diagram or not     if(hasproperty("IsVisible", "false"))     {         //Create a compartment for parts.         if(hasproperty("type", "part"))         {             SetCompartmentName("Parts");         }         //Create a compartment for ports.         else if(hasproperty("type", "port"))         {             SetCompartmentName("Ports");         }     } }</pre>	

Process	Description	See also
	<pre>         }          //Add child element name to compartment.         AppendCompartmentText("#NAME#");     } } </pre> <p>This script adds custom compartments for Port and Part elements that belong to the current element but that are not visible on the current diagram.</p> <p>The <b>IsVisible</b> property returns <b>true</b> if the child element is already visible on the diagram, <b>false</b> if the child element is not visible.</p> <p>This can be used to prevent the child element from being listed in the custom compartment if it is already visible on the diagram, avoiding display of redundant information.</p>	
<b>Script Example 4:</b> <b>Display elements that are the target of a Dependency connector from the element that owns the shape script</b>	<pre> shape RelatedElement {     //Check if the current connector we are processing has     //dependency type.     if(HasProperty("Connector.Type", "Dependency"))     {         //Check if the element we are currently checking         //the target of the current connector.         if(HasProperty("Element.IsTarget"))         {             //Set the compartment Name             SetCompartmentName("dependsOn");             if(HasProperty("Element.Stereotype", "             {             }             else             {                 AppendCompartmentText("&lt;#Element.Stere             }             AppendCompartmentText("#Element.Name#")         }     } } </pre> <p>With this script, if a Class1 has a stereotype with the 'RelatedElement' Shape Script <b>and</b> Class1 is the source of a Dependency connector to the target Class2, then the name <i>Class2</i> is displayed in a compartment of Class 1, called <b>dependsOn</b>.</p>	
<b>Script Example 5:</b> <b>Display a list of Realized Interfaces within a compartment on an element</b>	<pre> shape RelatedElement {     //Check if the current connector being processed is     if(HasProperty("Connector.Type", "Realization"))     {         //Only display this compartment if the relate         //are checking is the target of the connector         //shape scripts element as the source         if(HasProperty("Element.IsTarget"))     } } </pre>	

Process	Description	See also
	<pre> {     //If the element is an interface, disp     //'realizedInterfaces' compartment     if(HasProperty("Element.Type", "Interf     {         SetCompartmentName("realizedInt         AppendCompartmentText("#Element     } } </pre> <p>If an element <i>Class 1</i> has this Shape Script and is the source of a <b>Realization</b> connector to an element <i>Interface 1</i>, the name <i>Interface 1</i> is displayed in the <b>realizedInterfaces</b> compartment of <i>Class 1</i>.</p>	

### Notes

- If you use punctuation within a compartment name, it is stripped out when the script is saved; for example, *Ports, Parts and Properties* becomes *Ports Parts and Properties*
- Visibility of each individual custom compartment defined by a shape script can be controlled using the **Feature and Compartment Visibility** dialog
- The 'RelatedElement' Shape Scripts have extended capabilities to check both a connector **and** the element on the **other end** of the connector; they are applied only to an element and are solely used to retrieve information to be displayed within a compartment of that element

#### 7.3.5.3.9 Show Composite Diagram

You can define an element as being **Composite** (using the **New Diagram | Composite Structure Diagram** context menu option), which has a child **composite diagram** depicting the substructure of the element. You can also use context menu options to **display** the composite diagram **on the element**, either recasting the element as a frame or adding a compartment to the element. Ordinarily, a Shape Script that redefines the appearance of the composite element effectively circumvents the effect of these options, but you can edit the script to respond to the **Show Composite Diagram in Compartment** option and show the child composite diagram in the **center compartment** of the element.

To show composite diagrams, the script requires a layout type of **border**, with the composite diagram added to the **center** sub-shape of the **main** shape when drawing. The defining Shape Script statements are, therefore:

```

shape main
{
    layout type="Border";

    if ( HasProperty("ShowComposedDiagram", "true"))
    {
        addsubshape("ComposedDiagram", "CENTER");
    }
}

```

```

    }

    shape ComposedDiagram
    {
        DrawComposedDiagram();
    }
}

```

### Examples

An example of a Shape Script including a composed diagram is shown below:

```

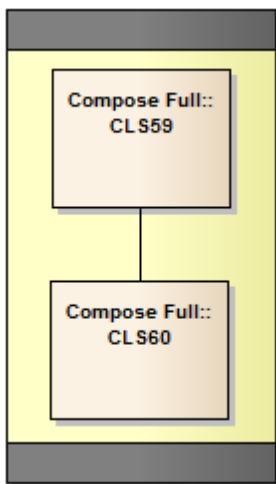

Shape main
{
    // Set the border type
    layouttype="Border";
    // Set a cream fill colour
    setfillcolor(255,255,200);
    // Draw a base rectangle for the object.
    rectangle(0,0,100,100);
    // Add some padding to the top of the shape
    addsubshape("Padding", "N");
    // Check the setting of the context menu option
    if (HasProperty("ShowComposedDiagram", "true"))
    {
        // Add the composed diagram to the center of the object
        addsubshape("ComposedDiagram", "CENTER");
    }
    // Add some padding to the bottom of the shape.
    addsubshape("Padding", "S");

    shape Padding
    {
        // Set the height of this element
        preferredHeight = 20;
        // Set the fill colour to grey
        setfillcolor(128,128,128);
        // Draw a rectangle that will take up the width of the object
        and have a height of 20 pixels.
        rectangle(0,0,100,100);
    }

    shape ComposedDiagram
    {
        // Draw the composed diagram.
        DrawComposedDiagram();
    }
}

```

This script generates the following shape.

Composed diagrams are currently only supported as the **center** sub-shape of the main shape. Adding the diagram to any other location will cause the composed diagram to either not draw correctly or not draw at all. The diagram **can** be a sub-shape of a sub-shape, but only if the parent shape and sub-shape(s) all have a "CENTER" orientation. For example:

//This shapscript is fine, because shape E is the center of shape C, which is the center of shape D, i.e. all shapes leading to DrawComposedDiagram are //"CENTER".

```

shape main
{
    layouttype = "Border";
    rectangle(0,0,100,100);
    addsubshape("D", "CENTER");

    shape D
    {
        layouttype="Border";
        addsubshape("C", "CENTER");
        shape C
        {
            layouttype="Border";
            addsubshape("E", "CENTER");
            addsubshape("Padding", "N");
            addsubshape("Padding", "S");

            shape E
            {
                DrawComposedDiagram();
            }

            shape padding
            {
                preferredHeight = 20;
                setfillcolor(10,30,80);
                rectangle(0,0,100,100);
            }
        }
    }
}

```

//This shapscript is not good - shape E is "CENTER", shape C is "S" and shape D is "CENTER"; because shape C is oriented "S"  
 //the diagram won't draw

```

shape main
{
  layouttype = "Border";
  rectangle(0,0,100,100);
  addsubshape("D", "CENTER");

  shape D
  {
    layouttype="Border";
    addsubshape("C", "S"); //<- this is bad, all parent subshape of a DrawComposedDiagram call
    MUST be                // "CENTER" oriented

    shape C
    {
      layouttype="Border";
      addsubshape("E", "CENTER");
      addsubshape("Padding", "N");
      addsubshape("Padding", "S");

      shape E
      {
        DrawComposedDiagram();
      }

      shape padding
      {
        preferredHeight = 20;
        setfillcolor(10,30,80);
        rectangle(0,0,100,100);
      }
    }
  }
}

```

### Notes

- To display the Composite diagram, the **New Diagram | Show Composite Diagram in Compartment** option should be selected on the element's context menu in the diagram
- The composed diagram is displayed at natural size, so the parent element can not be resized to be smaller than the composed diagram

#### 7.3.5.3.10 Reserved Names

When you write a Shape Script, there are certain terms that are reserved because they have special meaning in the script; use them for their specific purposes.

### Elements

Elements (such as Class, State or Event) have the following reserved names for parts of the shape.

Name	Description	See Also
<b>shape main</b>	The <b>main</b> shape is the whole shape.	
<b>shape label</b>	The shape <b>label</b> gives the shape a detached label.	
<b>decoration</b> <identifier>	<b>Decoration</b> gives the shape a decoration as defined by the name in <identifier>.	
<b>shape ChildElement</b>	Allows addition of custom compartments based on child elements belonging to the current element.	<a href="#">Add Custom Compartments to Element</a> <sup>[1604]</sup>
<b>shape RelatedElement</b>	Allows addition of custom compartments based on related elements belonging to the current element.	<a href="#">Add Custom Compartments to Element</a> <sup>[1604]</sup>

### Connectors

Connectors (such as Association, Dependency or Generalization) have the following reserved names for parts of the shape.

Name	Description
<b>shape main</b>	The <b>main</b> shape is the whole shape.
<b>shape source</b>	The <b>source</b> shape is an extra shape at the source end of the connector.
<b>shape target</b>	The <b>target</b> shape is an extra shape at the target end of the connector.
<b>shape LeftTopLabel</b>	Each of these shapes defines a detached label for the connector in the position matching the label name.
<b>shape MiddleTopLabel</b>	
<b>shape RightTopLabel</b>	
<b>shape LeftBottomLabel</b>	
<b>shape</b>	

Name	Description
<b>MiddleBottomLabel</b>	
<b>shape RightBottomLabel</b>	

### 7.3.5.3.11 Syntax Grammar

A section of a Shape Script can be quite complex, containing a number of commands and parameters. The table below provides a breakdown of the Shape Script structure, illustrating how commands and parameters are constructed. The first entry is the top-level declaration, and subsequent entries show the composition of successively more detailed components.

#### Grammar symbols

- \* = zero or more
- + = one or more
- | = or
- ; = terminator

<b>ShapeScript</b>	::=	<Shape>*;
<b>Shape</b>	::=	<ShapeDeclaration> <ShapeBody>;
<b>ShapeDeclaration</b>	::=	<ShapeType> <ShapeName>;
<b>ShapeType</b>	::=	"shape"   "decoration"   "label";
<b>ShapeName</b>	::=	<ReservedShapeName>   <stringliteral>;
<b>ReservedShapeName</b>	::=	See <a href="#">Reserved Names</a> <sup>[1611]</sup> for full reserved shape listing.
<b>ShapeBody</b>	::=	"{" <InitialisationAttributeAssignment>* <DrawingStatement>* <SubShape>* "}";
<b>InitialisationAttributeAssignment</b>	::=	<Attribute> "=" <Value> ",";
<b>Attribute</b>	::=	See <a href="#">Shape Attributes</a> <sup>[1588]</sup> for full listing of attribute names.

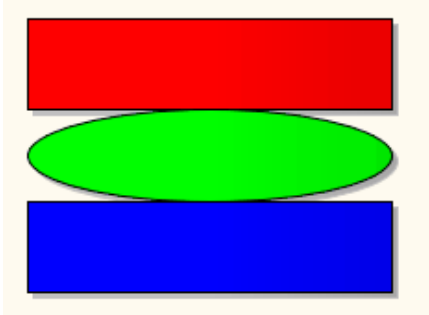

<b>DrawingStatement</b>	::=	<IfElseSection>   <Method>;
<b>IfElseSection</b>	::=	"if" "(" <QueryExpression> ")" <TrueSection> ( <ElseSection> ) ;
<b>QueryExpression</b>	::=	<QueryName> "(" <ParameterList> ")"; See <a href="#">Query Methods</a> <sup>[1599]</sup> for descriptions of the queries and their parameters.
<b>QueryName</b>	::=	See <a href="#">Query Methods</a> <sup>[1599]</sup> for the possible Query names.
<b>TrueSection</b>	::=	"{" <DrawingStatement>* "}"
<b>ElseSection</b>	::=	"else" "{" <DrawingStatement>* "}"
<b>Method</b>	::=	<MethodName> "(" <ParameterList> ")" ";"
<b>MethodName</b>	::=	See <a href="#">Drawing Methods</a> <sup>[1591]</sup> for a full listing of method names.

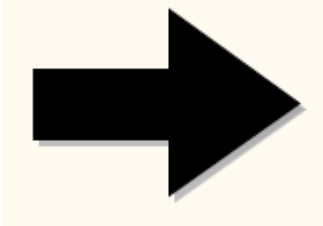

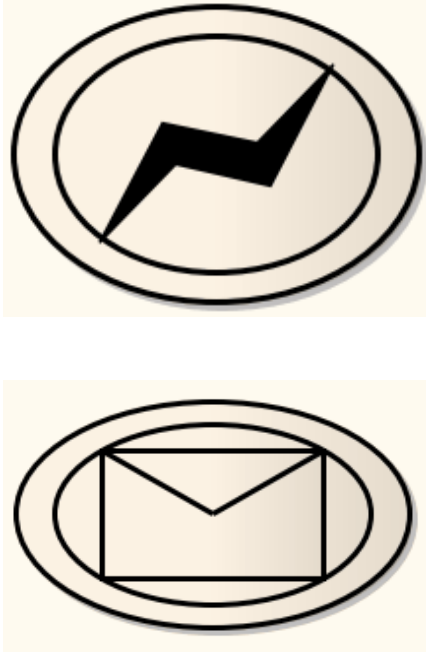

### 7.3.5.4 Example Scripts

You can create a wide range of shapes, effects and text statements using Shape Scripts, to enhance the appearance and information value of the elements and connectors you create. Some examples of such scripts are provided here.

**Access** **Settings | UML Types > Stereotypes (specify stereotype): Shape Script + Assign** or  
**Settings | UML Types > Stereotypes (specify stereotype): Shape Script + Edit**

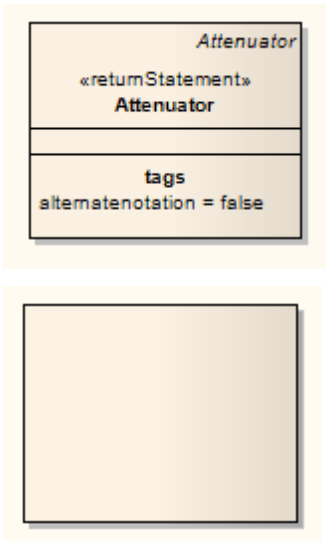

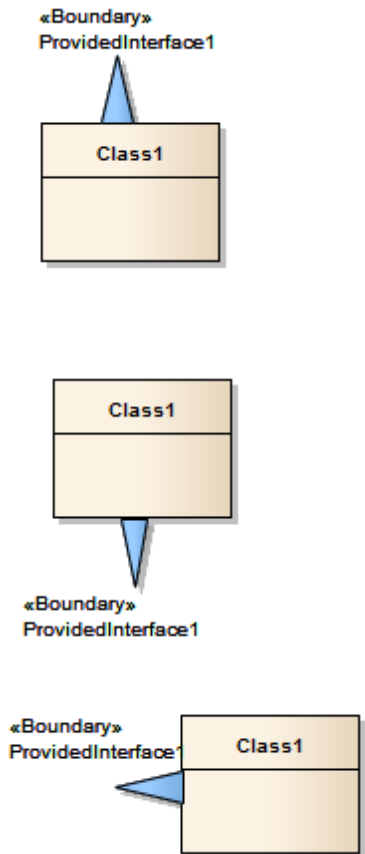

#### Shape Script examples

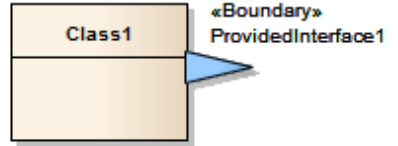

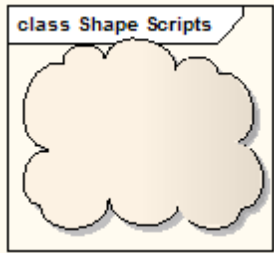

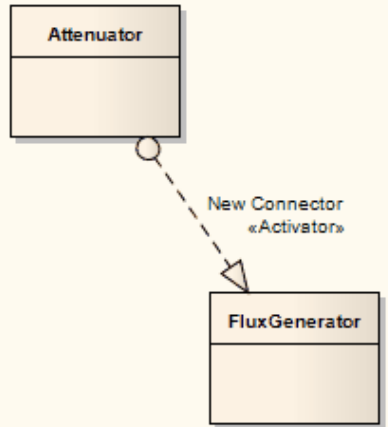

Script	Shape
<pre>// BASIC SHAPES shape main {     setfillcolor(255,0,0); // (R,G,B)     rectangle(0,0,90,30); // (x1,y1,x2,y2)      setfillcolor(0,255,0); // (R,G,B)     ellipse(0,30,90,60); // (x1,y1,x2,y2)      setfillcolor(0,0,255); // (R,G,B)     rectangle(0,60,90,90); // (x1,y1,x2,y2) }</pre>	

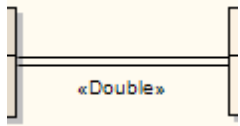

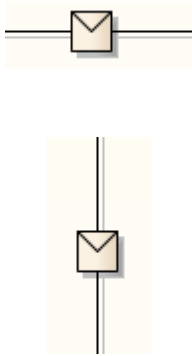

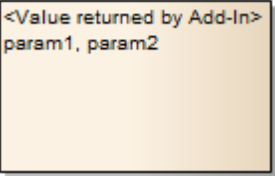

Script	Shape
<pre> // SINGLE CONDITIONAL SHAPE shape main {     if (HasTag("Trigger","Link"))     {<i>// Only draw if the object has a Tagged Value</i>         <i>// Trigger=Link</i>         <i>// Set the fill color for the path</i>         setfillcolor(0,0,0);         startpath(); <i>// Start to trace out a path</i>         moveto(23,40);         lineto(23,60);         lineto(50,60);         lineto(50,76);         lineto(76,50);         lineto(50,23);         lineto(50,40);         endpath(); <i>// End tracing out a path</i>         <i>// Fill the traced path with the fill color</i>         fillandstrokepath();         return;     } } </pre>	
<pre> // MULTI CONDITIONAL SHAPE shape main {     startpath();     ellipse(0,0,100,100);     endpath();     fillandstrokepath();     ellipse(3,3,97,97);      if (HasTag("Trigger","None"))     {         return;     }      if (HasTag("Trigger","Error"))     {         setfillcolor(0,0,0);         startpath();         moveto(23,77);         lineto(37,40);         lineto(60,47);         lineto(77,23);         lineto(63,60);         lineto(40,53);         lineto(23,77);         endpath();         fillandstrokepath();         return;     }      if (HasTag("Trigger","Message"))     {         rectangle(22,22,78,78);         moveto(22,22);         lineto(50,50);         lineto(78,22);         return;     } } </pre>	

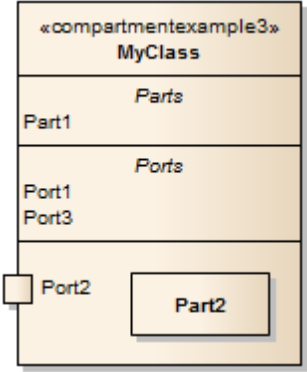

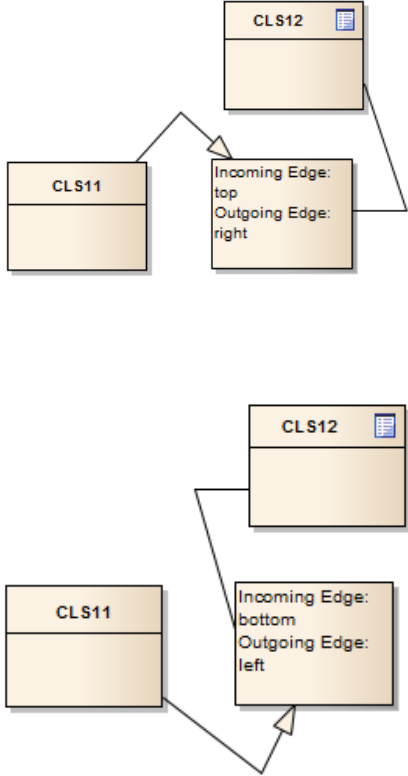

Script	Shape

**7.3.6 Tagged Value Types**

When you are working with Tagged Values, you can create your own, custom, Tagged Values based on **predefined**, system-provided Tagged Value **Types**. With these, you can create:

- Tagged Values that are **complex** and based on **predefined types**, with or without tag filters
- **Structured Tagged Values** that are composite, containing other Tagged Values
- Tagged Values that return values from the various **reference data** tables
- **Masked** Tagged Values that insert user-provided data into a text string such as line of prompts or field names

By adding Tagged Values of any type to a Stereotype element in a Profile, you can define additional meta-information for the way in which a modeling element appears and behaves in a Technology. The Tagged Values are identified by **attributes** of the Stereotype element.

**Notes**

- You can transport Tagged Value Type definitions **between models**, using the **Export Reference Data** and **Import Reference Data** options; Tagged Value Types are exported as **Property Types**

**Learn more**

### 7.3.6.1 Create Tagged Value Type from Predefined Types

When you are working with Tagged Values, you might want to use **structured** Tagged Values; that is, Tagged Values that capture and present more complex information in a specific format. The base types for such Tagged Values (the type you call in when you create a tag in the Tagged Values window) can be easily created specifically for your model, as you can base the customized structured Tagged Value types on a range of **predefined** structured Tagged Value types and **filters**.

**Access** [Settings | UML Types > Tagged Value Types](#)

#### Create a custom Structured Tagged Value type

Field/ Button	Description	See also
<b>Tag Name</b>	Type an appropriate name for your new Tagged Value type.	
<b>Description</b>	Optionally, type a short description or the purpose of the Tagged Value type.	
<b>Detail</b>	Either copy-and-paste or type the syntax of the predefined structured Tagged Value Type on which to base your new Tagged Value type.	<a href="#">Predefined Structured Types</a> <sup>[1622]</sup>
<b>Save</b>	Click on this button to save the new structured Tagged Value type. The Tagged Value type displays in the Defined Tag Types list.	
<b>New</b>	Optionally, click on this button to clear the fields so that you can enter information for another new Tagged Value type.	

### 7.3.6.2 Predefined Structured Types

Tagged Values define a wide range of properties and characteristics of a model element, and some of these properties have complex values. For example, you might want your user to select a value between upper and lower limits (using 'Spin' arrows), set a date, select a color from a palette, or work through a checklist.

You create these complex Tagged Values from any of a number of **predefined** Tagged Value **types** and **filters**, some of which you might have created yourself ([Settings | UML Types > Tagged Value Types](#)).

#### Tagged Value Type Formats

For each Tagged Value Type, the description includes the syntax for creating the initial values for use of the Tagged Value. The name and format are case-sensitive.

Tagged Value Type	Format	Used to	See also
AddinBroadcast	<b>Type=AddinBroadcast;</b> <b>Values=YourAddinName;</b>	Allow an Add-In to respond to an attempt to edit this Tagged Value by showing a dialog in which the value and notes can be edited.	
Boolean	<b>Type=Boolean;</b> <b>Default=Val;</b>	Provide for the input of <b>True</b> or <b>False</b> , either of which can be the default value.	
CheckList	<b>Type=CheckList;</b> <b>Values=Val1,Val2,Val3;</b>	<p>Create a checklist of things to be completed or satisfied before an action is approved or performed.</p> <p><b>Val1, Val2, Val3</b> and so on specify the checklist items, each of which is rendered via the Tagged Values window with a checkbox; the tag has the value <b>Incomplete</b> until each checkbox is selected, at which point the value is <b>Complete</b>.</p> <p>For example:</p> <p><b>Type=CheckList;</b> <b>Values=Does the change solve the task,issue given,Does the code have sufficient error handling,Does the code make sense,Does the code comply with the coding conventions;</b></p> <p>Whilst the element Tagged Value compartment and the Tagged Value window fields display the values <b>Complete</b> or <b>Incomplete</b>, document and web reports will show the list of checklist items and the status of each (<b>True</b> for selected, <b>False</b> for unselected).</p>	
Classifier	<b>Type=Classifier;</b> <b>Values=Type1,Type2;</b> <b>Stereotypes=Stereotype1;</b>	<b>Deprecated - use RefGUID and RefGUIDList</b>	
Color	<b>Type=Color;</b> <b>Default=Val;</b>	<p>Input a color value from a color chooser menu, where the value is the color's Hex RGB value.</p> <p>For example, the Hex RGB for Blue is <b>0000FF</b>, whilst the Hex RGB for Green is <b>00FF00</b>.</p>	
Const	<b>Type=Const;</b> <b>Default=Val;</b>	Create a read-only constant value.	

Tagged Value Type	Format	Used to	See also
Custom	<b>Type=Custom;</b>	Create your own template for predefined types, using a masked value.	<a href="#">Create Custom Masked Tagged Value Type</a> <sup>[1626]</sup>
Date	<b>Type=Date;</b>	Input the date for the Tagged Value, from a calendar menu.	
DateTime	<b>Type=DateTime;</b>	<b>Deprecated - Use Date</b> Input the date for the Tagged Value, from a calendar menu.	
Directory	<b>Type=Directory;</b> <b>Default=Val;</b>	Enter a directory path from a browser. You can set a default directory path as a string value.	
Enum	<b>Type=Enum;</b> <b>Values=Val1,Val2,Val3;</b> <b>Default=Val2;</b>	Define a comma-separated list, where <b>Val1</b> , <b>Val2</b> and <b>Val3</b> represent values in the list and <b>Default</b> represents the default value of the list.	<a href="#">Add an Enumeration to a Stereotype</a> <sup>[1493]</sup>
File	<b>Type=File;</b> <b>Default=Val;</b>	Input a filename from a file browser dialog. The named file can be launched in its default application.  You can set a default file as a string containing the file path and file name.	
Float, Decimal, Double	<b>Type=Float;</b> <b>Type=Decimal;</b> <b>Type=Double;</b> <b>Default=Val;</b>	Enter a Float, Decimal or Double value. These types all map to the same type of data.  You can set a default for any or all of these.	
Integer	<b>Type=Integer;</b> <b>Default=Val;</b>	Enter an Integer value, and a default.	
Memo	<b>Type=Memo;</b>	Input large and complex values for a tag.	
RefGUID	<b>Type=RefGUID;</b> <b>Values=Type1,Type2;</b> <b>Stereotypes=Stereotype1;</b>	Reference an element from the model by specifying the element's <i>GUID</i> , where: <ul style="list-style-type: none"> <li><b>Type1</b> and <b>Type2</b> specify one or more allowed diagram objects</li> </ul>	<a href="#">Classifier</a> <sup>[994]</sup> , <a href="#">Attribute or Operation</a> <sup>[998]</sup>

Tagged Value Type	Format	Used to	See also
		<p>(such as <b>Class</b>, <b>Component</b>, <b>Attribute</b> or <b>Operation</b>)</p> <ul style="list-style-type: none"> <li><b>Stereotype1</b> represents an allowed stereotype</li> </ul> <p>You set the classifier, attribute or operation for a Tagged Value of this type by clicking on the ( ... ) button against the Tagged Value in the Tagged Value window.</p>	
RefGUIDList	<b>Type=RefGUIDList;</b> <b>Values=Type1,Type2;</b> <b>Stereotypes=Stereotype1;</b>	<p>Reference a list of elements from the model by specifying each element's <i>GUID</i>, where:</p> <ul style="list-style-type: none"> <li><b>Type1</b> and <b>Type2</b> specify one or more allowed diagram objects (such as <b>Class</b> or <b>Component</b>)</li> <li><b>Stereotype1</b> represents an allowed stereotype</li> </ul> <p>You set the classifier, attribute or operation for a Tagged Value of this type by clicking on the ( ... ) button against the Tagged Value in the Tagged Value window.</p>	<a href="#">Classifier</a> <sup>[994]</sup> , <a href="#">Attribute or Operation</a> <sup>[998]</sup>
Spin	<b>Type=Spin;</b> <b>LowerBound=x;</b> <b>UpperBound=x;</b> <b>Default=Val;</b>	<p>Create a spin control with the value of <b>LowerBound</b> being the lowest value and <b>UpperBound</b> being the highest value.</p> <p>You can also set a default within that range.</p>	
String	<b>Type=String;</b> <b>Default=Val;</b>	<p>Enter a string value, up to 255 characters in length, and a default text string.</p> <p>For longer texts, use <b>Type=Memo</b>.</p>	<a href="#">Memo</a> <sup>[1624]</sup>
Time	<b>Type=Time;</b>	Input the time for the Tagged Value.	
TimeStamp	<b>Type=TimeStamp;</b>	Input the date and time for the Tagged Value, from a calendar menu.	
URL	<b>Type=URL;</b> <b>Default=Val;</b>	<p>Enter a web URL. The URL should start with:</p> <ul style="list-style-type: none"> <li>'http:/'</li> <li>'https:/' or</li> </ul>	

Tagged Value Type	Format	Used to	See also
		<ul style="list-style-type: none"> <li>'www.'</li> </ul> <p>You can set a default URL as a string value.</p>	

### Tag Filters

You can use filters to restrict where a Tagged Value can be applied.

Filter	Format	Description	See also
AppliesTo	<b>AppliesTo=Type1, Type2;</b>	<p>Restricts the <b>element types</b> this tag can be applied to, where <b>Type1</b> and <b>Type2</b> are the valid types.</p> <p>Possible values are:</p> <ul style="list-style-type: none"> <li>All element types</li> <li>All connector types</li> <li>Attribute</li> <li>Operation, and</li> <li>OperationParameter</li> </ul>	
BaseStereotype	<b>BaseStereotype=S1, S2;</b>	<p>Restricts the <b>stereotypes</b> that this tag belongs to, where <b>S1</b> and <b>S2</b> are the allowed stereotypes.</p>	

### Learn more

### 7.3.6.3 Create Custom Masked Tagged Value Type

If you are creating a custom predefined Tagged Value type, you can achieve great flexibility in designing model components to **accept data entries**, by defining a **mask** that formats the data into a **template**.

**Access** [Settings | UML Types > Tagged Value Types](#)

### Create a masked Tagged Value Type

Field	Action	See also
<b>Tag Name</b>	Type an appropriate name for the masked Tagged Value Type.	

Field	Action	See also
<b>Description</b>	Optionally, type a description or the purpose of the Tagged Value Type.	
<b>Detail</b>	<p>Type or copy-and-paste the Tagged Value structure:</p> <p><b>Type=Custom;</b>  <b>Mask=&lt;mask values&gt; ;</b>  <b>Template=&lt;template text&gt;;</b></p> <p>The mask values are explained in the next table, with an example to demonstrate how to use the template.</p> <p>The template text defines information to be displayed in every use of this custom Tagged Value, such as field names and prompts for data.</p>	
<b>Save</b>	<p>Click on this button to save the new masked Tagged Value type.</p> <p>The Tagged Value type displays in the Defined Tag Types list.</p>	
<b>New</b>	Optionally, click on this button to clear the fields so that you can enter information for another new Tagged Value type.	

### Mask Values

When defining the format of the mask in a masked Tagged Value type, use these characters:

Mask	Action
<b>D</b>	Display a digit only in this character space.
<b>d</b>	Display a digit or space only in this character space.
<b>+</b>	Display <b>+</b> , <b>-</b> or a space in this character space.
<b>C</b>	Display a letter of the alphabet only in this character space.
<b>c</b>	Display a letter of the alphabet or a space only in this character space.
<b>A</b>	Display any alphanumeric character in this character space.
<b>a</b>	Display any alphanumeric character or a space in this character space.
<b>.</b> or	Leave a character space, to be filled by text from the Template parameter. Using dots might

Mask	Action
<b>&lt;space&gt;</b>	make it easier to see how many spaces you have set.

### Example

The screenshot shows a software interface for defining Tagged Value Types. It has three tabs: 'Stereotypes', 'Tagged Value Types' (which is active), and 'Cardinality Values'. In the 'Tagged Value Types' tab, there are two input fields: 'Tag Name' with the value 'MemberZip' and 'Description' with the value 'Zip Code'. Below these is a 'Detail' section containing a text area with the following text: 'Type=Custom; Mask= cc dddd.dddd; Template=State: \_\_ Zip: \_\_\_\_ - \_\_\_\_;'. At the bottom right of the dialog are three buttons: 'New', 'Save', and 'Delete'.

In the diagram, the **Mask** parameter first defines seven blank spaces, which are occupied by characters defined by the **Template** parameter.

The first two visible characters in the **Mask** are each represented by a lower case **c**, indicating that the user can enter information as either an alphabetic character or a space.

The next six blank spaces again indicate characters defined by the **Template**, followed by five characters each represented by a **d**, which indicates that the user can input data in the form of digits or spaces. The dot marks a space to be filled by a hyphen from the **Template**, followed by four more **ds** (digits or spaces).

The **Template** syntax defines the template for the Mask parameter, filling in the blank spaces in the **Mask**. The text is the information to be printed with every use of this Tagged Value; the underscored values indicate the character spaces that are to be occupied by data input by the user, as defined in the **Mask** option.

### 7.3.6.4 Create Reference Data Tagged Values

When working with Tagged Values, you might want to use a Reference Data Tagged Value, which is used to return the values held in an Enterprise Architect reference table. The base types for such Tagged Values (the type you call in when you create a tag in the Tagged Values window) can be easily created specifically for your model, as you can base the customized Reference Data Tagged Value types on a range of **predefined** Tagged Value types and **filters**.

**Access** [Settings | UML Types > Tagged Value Types](#)

Create a custom Reference Data Tagged Value type

Field/ Button	Description	See also
<b>Tag Name</b>	Type an appropriate name for the new Tagged Value type.	
<b>Description</b>	Optionally, type the a description or the purpose of the Tagged Value type.	
<b>Detail</b>	Either copy-and-paste or type the syntax of the predefined Reference Data Tagged Value type on which to base your new Tagged Value type.	<a href="#">Predefined Reference Data Types</a> <sup>[1629]</sup>
<b>Save</b>	Click on this button to save the new Reference Data Tagged Value type. The Tagged Value type displays in the Defined Tag Types list.	
<b>New</b>	Optionally, click on this button to clear the fields so that you can enter information for another new Tagged Value type.	

#### Notes

- If the values in the reference data are changed after the Tagged Value Type is created, you must reload the system in order to reflect the changes in the Tagged Value Type

### 7.3.6.5 Predefined Reference Data Types

If you want to create your own, customized, Reference Data Tagged Values, you can base them on a range of **predefined** Reference Data Tagged Value **types**. Each of the predefined Reference Data Tagged Value types returns the values held in a specific reference data table.

#### Tagged Value Types

Each description includes the syntax for creating the initial values for use of the Tagged Value. The **Tagged Value Type** and **Format** entries are case-sensitive.

Tagged Value Type	Format	Drop-Down List Returned, of Data Defined for the Model	See also
<b>Authors</b>	<b>Type=Enum; List=Authors;</b>	Authors.	
<b>Cardinality</b>	<b>Type=Enum; List=Cardinality;</b>	Cardinality types.

### 7.3.7 Code Template Framework

When you use Enterprise Architect to generate code from a model, or transform the model, the system refers to the Code Template Framework (CTF) for the parameters that define how it should:

- Forward engineer a UML model
- Generate Behavioral Code
- Perform a Model Driven Architecture (MDA) Transformation

A range of standard templates is available for the direct generation of code and for transformation; if you do not want to use the standard CTF configurations, you can customize them to meet your needs.

#### CTF Templates

Template Type	Detail	See also
<b>Code Templates</b>	<p>When forward engineering a Class model, the code templates define how the skeletal code is to be generated for a given programming language. The templates for a language are automatically associated with the language.</p> <p>The templates are written as plain text with a syntax that shares some aspects of both mark-up languages and scripting languages.</p>	<a href="#">Code Template Framework Tool</a> <sup>[2281]</sup> <a href="#">Base Templates</a> <sup>[1633]</sup> <a href="#">Code Template Syntax</a> <sup>[1643]</sup> <a href="#">The Code Template Editor in MDG Development</a> <sup>[1701]</sup>
<b>Model Transformation Templates</b>	<p>Model Transformation Templates provide a fully configurable method of defining how Model Driven Architecture (MDA) Transformations convert model elements and model fragments from one domain to another.</p> <p>This process is two-tiered. It creates an intermediary language</p>	<a href="#">Edit Transformation Templates</a> <sup>[2048]</sup> <a href="#">Write Transformations</a> <sup>[2051]</sup> <a href="#">Intermediary</a>

	(which can be viewed for debugging) which is then processed to create the objects.	<a href="#">Language</a> <sup>[2053]</sup>
<b>Behavioral Code Generation Templates</b>	Enterprise Architect supports user-definable code generation of the UML Behavioral models.  This applies the standard Code Template Framework but includes specific Enterprise Architect Simulation Library (EASL) code generation macros.	<a href="#">The Code Template Editor in MDG Development</a> <sup>[1701]</sup>  <a href="#">EASL Code Generation Macros</a> <sup>[1688]</sup>

### 7.3.7.1 Code and Transform Templates

Code templates and transform (Model Transformation) templates define how the system should generate or transform code in one or other of the programming languages that Enterprise Architect supports. Each language has a wide range of base templates, each of which defines how a particular code structure is generated. You can use these base templates as they are, or you can customize and add to the templates to better support your use of the standard languages, or of other languages that you might define to the system. You review, update and create templates through the Code Template editor or Transformation Template editor.

The order in which the base templates are listed in the two editors relates to the hierarchical order of the objects and their parts that are to be processed. Calls are made from certain base templates to others, and you can add further calls to both base templates and to your own custom templates. By default, the *File* template is the starting point of a code generation process though the templates; a File consists of Classes which can contain Attributes and Operations.

**Access**    **Tools | Source Code Generation Templates**    (Ctrl+Shift+P)  
               **Tools | MDA Transformation Templates**    (Ctrl+Alt+H)

#### Application of Templates

Action	Detail	See also
<b>Calling Templates</b>	<p>Within any template, you can call other templates using %TemplateName%. The enclosing percent (%) signs indicate a macro.</p> <p>You would use this for a single call to the ClassBody template, %ClassBody% as below:</p> <pre>%list="TemplateName" @separator="\n" @indent="  "%</pre> <p>The %list macro performs an iterative pass on all the objects in the scope of the current template and calls the <i>TemplateName</i> for each of these:</p>	<a href="#">List Macro</a> <sup>[1683]</sup>

	<pre>%list="ClassBody" @separator="\n" @indent="  "%</pre> <p>After generation or transformation, each macro is substituted to produce the generated output; for a language such as C++, the result of processing the above template might be:</p> <pre>/**  * This is an example class note generated  * using code templates  * @author Sparx Systems  */ class ClassA: public ClassB {     ... }</pre>	
<b>Execution of Code Templates</b>	<p>Each template might act only on a particular element type; for example, the <i>ClassNotes</i> template only acts on UML Class and Interface elements.</p> <p>The element from which code is currently being generated is said to be <i>in scope</i>; if the element in scope is stereotyped, the system searches for a template that has been defined for that stereotype. If a specialized template is found, it is executed; otherwise the default implementation of the base template is used.</p> <p>Templates are processed sequentially, line by line, replacing each macro with its underlying text value from the model.</p>	
<b>Transfer Templates Between Projects</b>	<p>If you edit a base Code Generation or Transformation template, or create a customized template, you can copy them from one project to another as Reference Data.</p>	<p><a href="#">Export Code Generation and Transformation Templates</a> </p> <p><a href="#">Import Code Generation and Transformation Templates</a> </p>

#### 7.3.7.1.1 Base Templates

The Code Template Framework consists of a number of base templates. Each base template transforms particular aspects of the UML to corresponding parts of object-oriented languages.

#### Topics

Topic	Detail	See also
<b>Further Information</b>	<p>The base templates form a hierarchy, which varies slightly across different programming languages.</p> <p>In a typical template hierarchy relevant to a language like C# or Java (which do not have header files) the templates can be modeled as Classes, but usually are just plain text.</p> <p>This hierarchy would be slightly more complicated for languages like C++ and Delphi, which have separate implementation templates.</p> <p>Each of the base templates must be specialized to be of use in code engineering; in particular, each template is specialized for the supported languages (or 'products').</p> <p>For example, there is a <i>ClassBody</i> template defined for C++, another for C#, another for Java, and so on; by specializing the templates, you can tailor the code generated for the corresponding UML entity.</p> <p>Once the base templates are specialized for a given language, they can be further specialized based on:</p> <ul style="list-style-type: none"> <li>• A Class's stereotype</li> <li>• A feature's stereotype (where the feature can be an operation or attribute)</li> </ul> <p>This type of specialization enables, for example, a C# operation that is stereotyped as «property» to have a different <i>Operation Body</i> template from an ordinary operation; the <i>Operation Body</i> template can then be specialized further, based on the Class stereotype.</p>	<a href="#">Code Template Framework</a> <a href="#">Code and Transformation Templates</a>

### Reference

The following table lists and briefly describes the base templates used in the CTF.

Template	Description
<b>Attribute</b>	A top-level template to generate member variables from UML attributes.
<b>Attribute Declaration</b>	Used by the <i>Attribute</i> template to generate a member variable declaration.
<b>Attribute Notes</b>	Used by the <i>Attribute</i> template to generate member variable notes.
<b>Class</b>	A top-level template for generating Classes from UML Classes.
<b>Class Base</b>	Used by the <i>Class</i> template to generate a base Class name in the inheritance list of a derived Class, where the base Class doesn't exist in the model.

Template	Description
<b>Class Body</b>	Used by the <i>Class</i> template to generate the body of a Class.
<b>Class Declaration</b>	Used by the <i>Class</i> template to generate the declaration of a Class.
<b>Class Interface</b>	Used by the <i>Class</i> template to generate an interface name in the inheritance list of a derived Class, where the interface doesn't exist in the model.
<b>Class Notes</b>	Used by the <i>Class</i> template to generate the Class notes.
<b>File</b>	A top-level template for generating the source file. For languages such as C++, this corresponds to the header file.
<b>Import Section</b>	Used in the <i>File</i> template to generate external dependencies.
<b>Linked Attribute</b>	A top-level template for generating attributes derived from UML Associations.
<b>Linked Attribute Notes</b>	Used by the <i>Linked Attribute</i> template to generate the attribute notes.
<b>Linked Attribute Declaration</b>	Used by the <i>Linked Attribute</i> template to generate the attribute declaration.
<b>Linked Class Base</b>	Used by the <i>Class</i> template to generate a base Class name in the inheritance list of a derived Class, for a Class element in the model that is a parent of the current Class.
<b>Linked Class Interface</b>	Used by the <i>Class</i> template to generate an Interface name in the inheritance list of a derived Class, for an Interface element in the model that is a parent of the current Class.
<b>Namespace</b>	A top-level template for generating namespaces from UML packages (although not all languages have namespaces, this template can be used to generate an equivalent construct, such as packages in Java).
<b>Namespace Body</b>	Used by the <i>Namespace</i> template to generate the body of a namespace.
<b>Namespace Declaration</b>	Used by the <i>Namespace</i> template to generate the namespace declaration.
<b>Operation</b>	A top-level template for generating operations from a UML Class's operations.

Template	Description
<b>Operation Body</b>	Used by the <i>Operation</i> template to generate the body of a UML operation.
<b>Operation Declaration</b>	Used by the <i>Operation</i> template to generate the operation declaration.
<b>Operation Notes</b>	Used by the <i>Operation</i> template to generate documentation for an operation.
<b>Parameter</b>	Used by the <i>Operation Declaration</i> template to generate parameters.

The second table lists templates used for generating code for languages that have separate interface and implementation sections.

Template	Description
<b>Class Impl</b>	A top-level template for generating the implementation of a Class.
<b>Class Body Impl</b>	Used by the <i>Class Impl</i> template to generate the implementation of Class members.
<b>File Impl</b>	A top-level template for generating the implementation file.
<b>File Notes Impl</b>	Used by the <i>File Impl</i> template to generate notes in the source file.
<b>Import Section Impl</b>	Used by the <i>File Impl</i> template to generate external dependencies.
<b>Operation Impl</b>	A top-level template for generating operations from a UML Class's operations.
<b>Operation Body Impl</b>	Used by the <i>Operation</i> template to generate the body of a UML operation.
<b>Operation Declaration Impl</b>	Used by the <i>Operation</i> template to generate the operation declaration.
<b>Operation Notes Impl</b>	Used by the <i>Operation</i> template to generate documentation for an operation.

### 7.3.7.1.2 Export Code Generation and Transformation Templates

**Access**    **Project | Model Import/Export | Export Reference Data**

#### Use to

- Transfer Code Generation and Transformation templates between models

#### How to

To export a Code Generation template or a Transformation template

Step	Action	See also
1	On the Export Reference Data dialog, in the <b>Name</b> list, select the templates to export.  The list includes any standard Code Generation or Transformation templates that have been <i>changed</i> , and any customized templates that you have created or changed.  You can select one or more templates to be exported to a single XML file, by pressing ( <b>Ctrl</b> ) or ( <b>Shift</b> ) as you click on the template names.	
2	Click on the <b>Export</b> button.	
3	When prompted to do so, enter a valid file name with a .XML extension.	
4	Click on the <b>Save</b> and <b>OK</b> buttons.  This exports the template(s) to the file; you can use any text or XML viewer to examine the file.

#### 7.3.7.1.4 Synchronize Code

Enterprise Architect uses code templates during the forward synchronization of the following programming languages:

- ActionScript
- C
- C++
- C#
- Delphi
- Java
- PHP
- Python
- VB
- VB.Net

#### Topics

Topic	Detail	See also
<b>Change Types</b>	<p>Three types of change can occur in the source when it is synchronized with the UML model:</p> <ul style="list-style-type: none"> <li>• <b>Synchronize Existing Sections:</b> for example, changing the return type in an operation declaration</li> <li>• <b>Add New Sections to Existing Features:</b> for example, adding notes to a Class declaration, where there were previously none</li> <li>• <b>Add New Features and Elements:</b> for example, adding a new operation to a Class</li> </ul> <p>Each of these changes must be handled differently by Enterprise Architect; their effect on the CTF is described in the</p>	<p><a href="#">Synchronize Existing Sections</a> <sup>[1640]</sup></p> <p><a href="#">Add New Sections to Existing Features</a> <sup>[1640]</sup></p> <p><a href="#">Add New Features and Elements</a> <sup>[1641]</sup></p>

	topics listed on the right.	
--	-----------------------------	--

Only a *subset* of the CTF base templates is used during synchronization. This subset corresponds to the distinct sections that Enterprise Architect recognizes in the source code. The following table lists the code templates and the corresponding code sections that can be synchronized.

Code Template	Code Section
Class Notes	Comments preceding Class declaration.
Class Declaration	Up to and including Class parents.
Attribute Notes	Comments preceding Attribute declaration.
Attribute Declaration	Up to and including terminating character.
Operation Notes	Comments preceding operation declaration.
Operation Notes Impl	As for <i>Operation Notes</i> .
Operation Declaration	Up to and including terminating character.
Operation Declaration Impl	Up to and including terminating character.
Operation Body	Everything between and including the braces.
Operation Body Impl	As for <i>Operation Body</i> .

#### 7.3.7.1.4.1 Synchronize Existing Sections

##### Topics

Topic	Detail	See also
<b>Usage</b>	<p>When an existing section in the source code differs from the result generated by the corresponding template, that section is replaced.</p> <p>Consider for example, the following C++ Class declaration:</p> <pre>( asm ) class A: public B</pre> <p>Now assume you add an inheritance relationship from Class A to Class C; the entire Class declaration would be replaced with something like:</p> <pre>( asm ) class A: public B, public C</pre>	

#### 7.3.7.1.4.2 Add New Sections

##### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The following can be added as new sections, to existing features in the source code:</p> <ul style="list-style-type: none"> <li>• Class Notes</li> <li>• Attribute Notes</li> <li>• Operation Notes</li> <li>• Operation Notes Impl</li> <li>• Operation Body</li> <li>• Operation Body Impl</li> </ul> <p>Assume Class <b>A</b> from the previous example had no note when you originally generated the code, and that you now specify a note in the model for Class A. Enterprise Architect attempts to add the new note from the model during synchronization, by executing the <i>Class Notes</i> template.</p> <p>To make room for the new section to be inserted, you can specify how much white space to append to the section via synchronization macros.</p>	<p><a href="#">Synchronize Existing Sections</a> <small>1640</small></p> <p><a href="#">Synchronization Macros</a> <small>1686</small></p>

### 7.3.7.1.4.3 Add New Features and Elements

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The following features and elements can be added to the source code during synchronization:</p> <ul style="list-style-type: none"> <li>• Attributes</li> <li>• Inner Classes</li> <li>• Operations</li> </ul> <p>These are added by executing the relevant templates for each new element or feature in the model.</p> <p>Enterprise Architect attempts to preserve the appropriate indenting of new features in the code, by finding the indents specified in list macros of the Class; for languages that make use of namespaces, the <i>synchNamespaceBodyIndent</i> macro is available.</p> <p>Classes defined within a (non-global) namespace are indented according to the value set for this macro, during synchronization.</p> <p>The value is ignored:</p> <ul style="list-style-type: none"> <li>• For Classes defined within a package setup as a root namespace, or</li> <li>• If the <b>Generate Namespaces</b> option is set to <b>False</b> in the appropriate language page (C#, C++ or VB.Net) on the Options dialog (<b>Tools   Options   Source Code Engineering   &lt;language&gt;</b>)</li> </ul>	<p><a href="#">Synchronization Macros</a> <sup>[1686]</sup></p> <p><a href="#">Language Options</a> <sup>[2262]</sup></p>

### 7.3.7.2 The Code Template Editor

The Code Template Editor provides the facilities of the *Common Code Editor*, including Intelli-sense for the various macros. For more information on Intelli-sense and the Common Code Editor, see the *Editing Source Code* topic.

**Access** **Tools | Source Code Generation Templates** (Ctrl+Shift+P)

#### Reference

Option	Action	See also
<b>Language</b>	Select the programming language.	
<b>New Language</b>	Display the Programming Languages Datatypes dialog, which enables you to include programming languages other than those supported for Enterprise Architect, for which to create or edit code templates.	<a href="#">Programming Languages Datatypes</a> <sup>[1171]</sup>

<b>Template</b>	Display the contents of the active template, and provides the editor for modifying templates.	
<b>Templates</b>	List the base code templates; the active template is highlighted.  The <b>Modified</b> field indicates whether you have changed the default template for the current language.	
<b>Stereotype Overrides</b>	List the stereotyped templates, for the active base template.  The <b>Modified</b> field indicates whether you have modified a default stereotyped template.	
<b>Add New Custom Template</b>	Invoke a dialog for creating a custom stereotyped template.	
<b>Add New Stereotyped Override</b>	Invoke a dialog for adding a stereotyped template, for the currently selected base template.	
<b>Get Default Template</b>	Update the editor display with the default version of the active template.	
<b>Save</b>	Overwrite the active templates with the contents of the editor.	
<b>Delete</b>	If you have overridden the active template, the override is deleted and replaced by the corresponding default code template.	

### Notes

- User-modified and user-defined Code Templates can be imported and exported as Reference Data (see the *Sharing Reference Data* topic); the templates defined for each language are indicated in the Export Reference Data dialog by the language name with the suffix *\_Code\_Templates* - if no templates exist for a language, there is no entry for the language in the dialog

### 7.3.7.3 Code Template Syntax

Code Templates are written using Enterprise Architect's Code Template Editor. The Code Template Editor supports syntax highlighting of the Code Template Framework language.

#### Topics

Topic	Detail	See also
<b>Basic Constructs</b>	Templates can contain: <ul style="list-style-type: none"> <li>• Literal Text</li> <li>• Variables</li> <li>• Macros</li> <li>• Calls to other templates</li> </ul>	<a href="#">Literal Text</a> <sup>[1643]</sup> <a href="#">Variables</a> <sup>[1644]</sup> <a href="#">Macros</a> <sup>[1646]</sup> <a href="#">Call Templates From Templates</a> <sup>[1700]</sup>
<b>Comments</b>	If you want to add comments to the templates, use the command: <pre>\$COMMENT=" t e x t "</pre> where "text" is the text of the comment; this must be enclosed in quotes. The command is case-sensitive, so must be typed in upper case.	

#### Learn more

- [Code Template Framework](#)<sup>[1637]</sup>
- [The Code Template Editor](#)<sup>[1701]</sup>

#### 7.3.7.3.1 Literal Text

All text within a given template that is not part of a macro or a variable definition/reference, is considered literal text. With the exception of blank lines, which are ignored, literal text is directly substituted from the template into the generated code.

Consider the following excerpt from the Java Class Declaration template:

```
$bases = "Base"
```

```
class %className%$bases
```

On the final line, the word *class*, including the subsequent space, would be treated as literal text and thus for a Class named *foo* would return the output:

```
class fooBase
```

The blank line following the variable `$bases` would have no effect on the output.

#### Inserting System Characters:

The %, \$, " and \ characters have special meaning in the template syntax and cannot always be used as literal text. If these characters must be generated from within the templates, they can be safely reproduced using the following direct substitution macros:

Macro	Action
<code>%dl%</code>	Produce a literal \$ character.
<code>%pc%</code>	Produce a literal % character.
<code>%qt%</code>	Produce a literal " character.
<code>%sl%</code>	Produce a literal \ character

#### Notes

- String conjunction operators (" + " , " += ") are not required but can be used (see literals)

- [Intermediary Language](#) 

### 7.3.7.3.2 Variables

Template variables provide a convenient way of storing and retrieving data within a template. This section explains how variables are defined and referenced.

#### Variable Definitions:

Variable definitions take the basic form:

```
$<name> = <value>
```

where *<name>* can be any alpha-numeric sequence and *<value>* is derived from a macro or another variable.

A simple example definition would be:

```
$foo = %className%
```

Variables can be defined, using values from:

- Substitution, function or list macros
- String literals, enclosed within double quotation marks
- Variable references

#### Definition Rules:

The following rules apply to variable definitions:

- Variables have global scope within the template in which they are defined and are not accessible to other templates
- Each variable must be defined at the start of a line, without any intervening whitespace
- Variables are denoted by prefixing the name with \$, as in \$foo
- Variables do not have to be declared, prior to being defined
- Variables must be defined using either the assignment operator (=), or the addition-assignment operator (+=)
- Multiple terms can be combined in a single definition using the addition operator (+)

### **Examples**

Using a substitution macro:

```
$foo = %opTag: " bar " %
```

Using a literal string:

```
$foo = " bar "
```

Using another variable:

```
$foo = $bar
```

Using a list macro:

```
$ops = %list=" Operation" @separator="\n\n" @indent="\t" %
```

Using the addition-assignment operator (+=):

```
$body += %list=" Operation" @separator="\n\n" @indent="\t" %
```

The above definition is equivalent to the following:

```
$body = $body + %list=" Operation" @separator="\n\n" @indent="\t" %
```

Using multiple terms:

```
$templateArgs = %list=" ClassParameter" @separator=", " %  
$template = "template<" + $templateArgs + ">"
```

### **Variable References:**

Variable values can be retrieved by using a reference of the form:

```
$<name>
```

where <name> can be a previously defined variable.

Variable references can be used in one of the following ways:

- As part of a macro, such as the argument to a function macro
- As a term in a variable definition
- As a direct substitution of the variable value into the output

It is legal to reference a variable before it is defined. In this case, the variable is assumed to contain an empty string value: ""

**Example 1:**

Using variables as part of a macro. The following is an excerpt from the default C++ *ClassNotes* template.

```
%wrapLen = %genOpt WrapComment %
%style = %
genOpt CPPComment Style%
%i f %style == "XML.NET" %
%XML_COMMENT( $wrapLen) %
%el se%
%CSTYLE_COMMENT( $wrapLen) %
%endI f %
```

Define variables to store the style and wrap length options.

Reference to *\$style* as part of a condition.

Reference to *\$wrapLen* as an argument to function macro.

**Example 2:**

Using variable references as part of a variable definitions.

```
$foo = "foo"
$bar = "bar"

$foobar = $foo + $bar
```

Define our variables.

*\$foobar* now contains the value *foobar*.

**Example 3:**

Substituting variable values into the output.

```
$bases=%classInherits%
Class %className%$bases
```

Store the result of the *ClassInherits* template in *\$bases*.

Now output the value of *\$bases* after the Class name.

**7.3.7.3.3 Macros**

Macros provide access to element fields within the UML model and are also used to structure the generated output. All macros are enclosed within percent (%) signs in the form of:

```
%<macroName>%
```

In general, macros (including the % delimiters) are substituted with literal text in the output. For example, consider the following item from the *Class Declaration* template:

```
... class %className% ...
```

The field substitution macro, *%className%*, would result in the current Class name being substituted in the output. So if the Class being generated was named *Foo*, the output would be:

```
... class Foo ...
```

The CTF contains a number of types of macros:

#### 7.3.7.3.1 Template Substitution Macros

Template substitution macros correspond to [Base templates](#) <sup>[1633]</sup>. These macros result in the execution of the named template. By convention, template macros are named according to Pascal casing.

Structure: %<TemplateName>%

where <TemplateName> can be one of the templates listed below.

When a template is referenced from within another template, it is generated with respect to the elements currently in scope. The specific template is selected based on the stereotypes of the elements in scope.

As noted previously, there is an implicit hierarchy among the various templates. Some care should be taken in order to preserve a sensible hierarchy of template references. For example, it does not make sense to use the `%ClassInherits%` macro within any of the attribute or operation templates. Conversely, the *Operation* and *Attribute* templates are designed for use **within** the *ClassBody* template.

The CTF contains the following template substitution macros:

- Attribute
- AttributeDeclaration
- AttributeDeclarationImpl
- AttributeNotes
- Class
- ClassBase
- ClassBody
- ClassBodyImpl
- ClassDeclaration
- ClassDeclarationImpl
- ClassImpl
- ClassInherits
- ClassInterface
- ClassNotes
- ClassParameter
- File
- FileImpl
- ImportSection
- ImportSectionImpl
- InnerClass
- InnerClassImpl
- LinkedAttribute
- LinkedAttributeDeclaration
- LinkedAttributeNotes
- LinkedClassBase
- LinkedClassInterface
- Namespace
- NamespaceBody
- NamespaceDeclaration
- NamespaceImpl
- Operation
- OperationBody
- OperationBodyImpl
- OperationDeclaration
- OperationDeclarationImpl
- OperationImpl
- OperationNotes
- Parameter

#### 7.3.7.3.3.2 Field Substitution Macros

The **field substitution** macros provide access to data in your model. In particular, they are used to access data fields from:

- Packages
- Classes
- Attributes
- Operations
- Parameters

Field substitution macros are named according to Camel casing. By convention, the macro is prefixed with an abbreviated form of the corresponding model element. For example, attribute-related macros begin with **att**, as in the `%attName%` macro, to access the name of the attribute in scope.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

The following table lists a small number of project field substitution macros with a description of the result. See the *Learn more* section for tables listing groups of type-specific macros.

Macro Name	Description
eaDateTime	The current time with format: <i>DD-MMM-YYYY HH:MM:SS AM/PM</i> .
eaGUID	A unique GUID for this generation.

Macro Name	Description
eaVersion	Program Version (located in an Enterprise Architect dialog by selecting <b>Help   About EA</b> ).

- [Risk Field Substitution Macros](#) <sup>[1675]</sup>
- [Scenario Field Substitution Macros](#) <sup>[1675]</sup>
- [Tagged Value Substitution Macros](#) <sup>[1676]</sup>
- [Template Parameter Substitution Macros](#) <sup>[1677]</sup>
- [Test Field Substitution Macros](#) <sup>[1677]</sup>

Field substitution macros can be used in one of two ways:

- Direct Substitution or
- Conditional Substitution

### Direct Substitution

This form directly substitutes the corresponding value of the element in scope into the output.

Structure: %<macroName>%

Where <macroName> can be any of the macros listed in the Field Substitution Macros tables.

### Examples

- `%className%`
- `%opName%`
- `%attName%`

### Conditional Substitution

This form of the macro enables alternative substitutions to be made depending on the macro's value.

Structure: `%<macroName> ( == " <text> " ) ? <subTrue> ( : <subFalse> ) %`

Where:

- `( )` denotes that values between the parentheses are optional
- `<text>` is a string representing a possible value for the macro
- `<subTrue>` and `<subFalse>` can be a combination of quoted strings and the keyword value; where the value is used, it is replaced with the macro's value in the output.

### Examples

- `%classAbstract=="T" ? "pure" : ""%`
- `%opStereotype=="operator" ? "operator" : ""%`
- `%paramDefault != "" ? " = " value : ""%`

The above three examples output nothing if the condition fails. In this case the false condition can be omitted, resulting in the following usage:.

- `%classAbstract=="T" ? "pure" %`
- `%opStereotype=="operator" ? "operator" %`
- `%paramDefault != "" ? " = " value%`

The third example of both blocks shows a comparison checking for a non-empty value or existence. This test can also be omitted.

- `%paramDefault ? " = " value : ""%`
- `%paramDefault ? " = " value%`

All of the above examples containing `paramDefault` are equivalent. If the parameter in scope had a default value of **10**, the output from each of them would normally be:

`= 10`

### Notes

- In a conditional substitution macro, any white space following `<macroName>` is ignored; if white space is required in the output, it should be included within the quoted substitution strings

<b>connectorDestElem*</b>	<p>A set of macros that access a property of the element at the target end of a connector. The * (asterisk) is a wildcard that corresponds to any Class substitution macro in the Class macro list. For example:</p> <ul style="list-style-type: none"> <li><i>connectorDestElemAlias (classAlias)</i></li> <li><i>connectorDestElemAuthor (classAuthor)</i></li> </ul>	<a href="#">Class Field Substitution Macros</a> <small>[1652]</small>

Macro Name	Description	See also
<b>connectorDestElemType</b>	The element type of the connector destination element. (Separate from the <i>connectorDestElem*</i> macros because there is no <i>classType</i> substitution macro.)	
<b>connectorDestFeature*</b>	A set of macros that access a property of the feature at the target end of a connector. The * (asterisk) is a wildcard that corresponds to any attribute or operation substitution macro in the Attribute macro or Operation macro list, depending on the <i>connectorDestFeatureType</i> .  For example: <ul style="list-style-type: none"> <li><i>connectorDestFeatureReturnClassifierGUID</i> - an Operation's return classifier GUID</li> <li><i>connectorDestFeatureContainment</i> - an Attribute's containment</li> </ul>	<a href="#">Attribute Field Substitution Macros</a> [1651]  <a href="#">Operation Field Substitution Macros</a> [1669]
<b>connectorDestFeatureType</b>	The type of the connector destination feature. <ul style="list-style-type: none"> <li><i>connectorDestFeatureType</i>="Attribute" or "Operation"</li> </ul>	
<b>connectorDestMemberType</b>	Connector Properties dialog, Target Role tab: <b>Member Type</b> .	
<b>connectorDestMultiplicity</b>	Connector Properties dialog, Target Role tab: <b>Multiplicity</b> .	
<b>connectorDestNavigability</b>	Connector Properties dialog, Target Role tab: <b>Navigability</b> .	
<b>connectorDestNotes</b>	Connector Properties dialog, Target Role tab: <b>Role Notes</b> .	
<b>connectorDestOrdered</b>	Connector Properties dialog, Target Role tab: <b>Ordered</b> checkbox.	
<b>connectorDestOwned</b>	Connector Properties dialog, Target Role tab: <b>Owned</b> checkbox.	
<b>connectorDestQualifier</b>	Connector Properties dialog, Target Role tab: <b>Qualifier(s)</b> .	
<b>connectorDestRole</b>	Connector Properties dialog, Target Role tab: <b>Role</b> .	
<b>connectorDestScope</b>	Connector Properties dialog, Target Role tab: <b>Target Scope</b> .	
<b>connectorDestStereotype</b>	Connector Properties dialog, Target Role tab: <b>Stereotype</b> .	

Macro Name	Description	See also
<b>connectorDirection</b>	Connector Properties: <b>Direction</b> .	
<b>connectorEffect</b>	Transition Constraints dialog: <b>Effect</b> .	
<b>connectorGuard</b>	Object Flow and Transition Constraints dialog: <b>Guard</b> .	
<b>connectorGUID</b>	The unique GUID for the current connector.	
<b>connectorIsAssociationClass</b>	<b>True</b> , if the connector is an <b>AssociationClass</b> connector.	
<b>connectorName</b>	Connector Properties: <b>Name</b> .	
<b>connectorNotes</b>	Connector Properties: <b>Notes</b> .	
<b>connectorSourceAccess</b>	Connector Properties dialog, Source Role tab: <b>Access</b> .	
<b>connectorSourceAggregation</b>	Connector Properties dialog, Source Role tab: <b>Aggregation</b> .	
<b>connectorSourceAlias</b>	Connector Properties dialog, Source Role tab: <b>Alias</b> .	
<b>connectorSourceAllowDuplicates</b>	Connector Properties dialog, Source Role tab: <b>Allow Duplicates</b> checkbox.	
<b>connectorSourceChangeable</b>	Connector Properties dialog, Source Role tab: <b>Changeable</b> .	
<b>connectorSourceConstraint</b>	Connector Properties dialog, Source Role tab: <b>Constraint(s)</b> .	
<b>connectorSourceContainment</b>	Connector Properties dialog, Source Role tab: <b>Containment</b> .	
<b>connectorSourceDerived</b>	Connector Properties dialog, Source Role tab: <b>Derived</b> checkbox.	
<b>connectorSourceDerivedUnion</b>	Connector Properties dialog, Source Role tab: <b>DerivedUnion</b> checkbox.	

Macro Name	Description	See also
<b>connectorSourceElem*</b>	<p>A set of macros that access a property of the element at the source end of a connector. The * (asterisk) is a wildcard that corresponds to any class substitution macro in the Class macro list. For example:</p> <ul style="list-style-type: none"> <li><i>connectorSourceElemAlias</i> (<i>classAlias</i>)</li> <li><i>connectorSourceElemAuthor</i> (<i>classAuthor</i>)</li> </ul>	<a href="#">Class Field Substitution Macros</a> <small>[1652]</small>
<b>connectorSourceElemType</b>	The element type of the connector source element. (Separate from the <i>connectorSourceElem*</i> macros because there is no <i>classType</i> substitution macro.)	
<b>connectorSourceFeature*</b>	<p>A set of macros that access a property of the feature at the source end of a connector. The * (asterisk) is a wildcard that corresponds to any attribute or operation substitution macro in the Attribute macro or Operation macro list, depending on the <i>connectorSourceFeatureType</i>. For example:</p> <ul style="list-style-type: none"> <li><i>connectorSourceFeatureCode</i> - Operation's Code</li> <li><i>connectorSourceFeatureInitial</i> - Attribute's Initial</li> </ul>	<a href="#">Attribute Field Substitution Macros</a> <small>[1651]</small> <a href="#">Operation Field Substitution Macros</a> <small>[1669]</small>
<b>connectorSourceFeatureType</b>	<p>The type of the connector source feature.</p> <ul style="list-style-type: none"> <li><i>connectorSourceFeatureType</i>="Attribute" or "Operation"</li> </ul>	
<b>connectorSourceMemberType</b>	Connector Properties dialog, Source Role tab: <b>Member Type</b> .	
<b>connectorSourceMultiplicity</b>	Connector Properties dialog, Source Role tab: <b>Multiplicity</b> .	
<b>connectorSourceNavigability</b>	Connector Properties dialog, Source Role tab: <b>Navigability</b> .	
<b>connectorSourceNotes</b>	Connector Properties dialog, Source Role tab: <b>Role Notes</b> .	
<b>connectorSourceOrdered</b>	Connector Properties dialog, Source Role tab: <b>Ordered</b> checkbox.	
<b>connectorSourceOwned</b>	Connector Properties dialog, Source Role tab: <b>Owned</b> checkbox.	
<b>connectorSourceQualifier</b>	Connector Properties dialog, Source Role tab: <b>Qualifier(s)</b> .	

Macro Name	Description	See also
<b>connectorSourceRole</b>	Connector Properties dialog, Source Role tab: <b>Role</b> .	
<b>connectorSourceScope</b>	Connector Properties dialog, Source Role tab: <b>Target Scope</b> .

The following table lists each of the Constraint field substitution macros with a description of the result. Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
<b>constraintName</b>	Class dialog, Constraints tab: <b>Name</b> .
<b>constraintNotes</b>	Class dialog, Constraints tab: <b>Notes</b> .
<b>constraintStatus</b>	Class dialog, Constraints tab: <b>Status</b> .
<b>constraintType</b>	Class dialog, Constraints tab: <b>Type</b> .
<b>constraintWeight</b>	Class dialog, Constraints tab: ordering (hand up/down) keys.

The following table lists each of the Effort field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
effortName	Project Management window: <b>Effort</b> .
effortNotes	Project Management window: <b>Notes</b> (unlabelled).
effortTime	Project Management window: <b>Time</b> .
effortType	Project Management window: <b>Type</b> .

The following table lists each of the Class field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
fileExtension	The file type extension of the file being generated.
fileName	The name of the file being generated.
fileNameImpl	The filename of the implementation file for this generation, if applicable.
fileHeaders	Code Gen dialog: <b>Headers</b> .
fileImports	Code Gen dialog: <b>Imports</b> . For supported languages this also includes dependencies derived from associations.
filePath	The full path of the file being generated.
filePathImpl	The full path of the implementation file for this generation, if applicable.

The following table lists each of the file import field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
importClassName	The name of the Class being imported.
importFileName	The filename of the Class being imported.
importFilePath	The full path of the Class being imported.
importFromAggregation	<b>T</b> if the Class has an Aggregation connector to a Class in this file, <b>F</b> otherwise.
importFromAssociation	<b>T</b> if the Class has an Association connector to a Class in this file, <b>F</b> otherwise.
importFromAtt	<b>T</b> if an attribute of a Class in the current file is of the type of this Class, <b>F</b> otherwise.
importFromDependency	<b>T</b> if the Class has a Dependency connector to a Class in this file, <b>F</b> otherwise.
importFromGeneralization	<b>T</b> if the Class has a Generalization connector to a Class in this file, <b>F</b> otherwise.
importFromMeth	<b>T</b> if a method return type of a Class in the current file is the type of this Class, <b>F</b> otherwise.
importFromParam	<b>T</b> if an method parameter of a Class in the current file is of the type of this Class, <b>F</b> otherwise.
importFromRealization	<b>T</b> if the Class has a Realization connector to a Class in this file, <b>F</b> otherwise.
importFromTemplateBinding	<b>T</b> if the Class has a TemplateBinding connector to a Class in this file, <b>F</b> otherwise.
importInFile	<b>T</b> if the Class is in the current file, <b>F</b> otherwise.
importPackagePath	The package path with a '.' separator of the Class being imported.
ImportRelativeFilePath	The relative file path of the Class being imported from the file path of the file

Macro Name	Description
	being generated.

If you want to provide access to data concerning connectors in the model, particularly Associations and Generalizations, you can use the **Link field substitution macros**. The macro names are in **Camel** casing. Macros that represent checkboxes return a value of **T** if the box is selected; otherwise the value is empty.

### Link field substitution macros

Macro Name	Description/Result	See also
<b>linkAttAccess</b>	Association Properties dialog, Target Role: <b>Access</b> .	
<b>linkAttAggregation</b>	Association Properties dialog, Source or Target Role: <b>Aggregation</b> .	
<b>linkAttCollectionClasses</b>	The collection appropriate for the linked attribute in scope.	
<b>linkAttContainment</b>	Association Properties dialog, Target Role: <b>Containment</b> .	
<b>linkAttName</b>	Association Properties dialog: <b>Target</b> .	
<b>linkAttNotes</b>	Association Properties dialog, Target Role: <b>Role Notes</b> .	
<b>linkAttOwnedByAssociation</b>	<b>True</b> , if the <b>Owned</b> checkbox on the Source or Target Role page of the Association Properties dialog is <b>not</b> selected.	
<b>linkAttOwnedByClass</b>	<b>True</b> , if the <b>Owned</b> checkbox on the Source or Target Role page of the Association Properties dialog <b>is</b> selected.	
<b>linkAttQualName</b>	The Association target qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited).	
<b>linkAttRole</b>	Association Properties dialog, Target Role: <b>Role</b> .	

Macro Name	Description/Result	See also
<b>linkAttStereotype</b>	Association Properties dialog, Target Role: <b>Stereotype</b> .	
<b>linkAttTargetScope</b>	Association Properties dialog, Target Role: <b>Target Scope</b> .	
<b>linkCard</b>	Link Properties dialog, Target Role: <b>Multiplicity</b> .	
<b>linkGUID</b>	The unique GUID for the current connector.	
<b>linkIsAssociationClasses</b>	<b>True</b> , if the Association is an <b>AssociationClass</b> connector.	
<b>linkIsBound</b>	Returns <b>T</b> if any TemplateBindings are specified on the connector.	
<b>linkParamSubs</b>	Returns a comma-separated list of the arguments specified.	
<b>linkParentName</b>	Generalization Properties dialog: <b>Target</b> .	
<b>linkParentQualName</b>	The Generalization target qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited).	
<b>linkStereotype</b>	The stereotype of the current connector.	
<b>linkVirtualInheritance</b>	Generalization Properties dialog: <b>Virtual Inheritance</b> .

The following table lists each of the Linked File field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
linkedFileLastWrite	Class Properties dialog: <b>Last Write</b> .

Macro Name	Description
linkedFileNotes	Class Properties dialog: <b>Notes</b> .
linkedFilePath	Class Properties dialog: <b>File Path</b> .
linkedFileSize	Class Properties dialog: <b>Size</b> .
linkedFileType	Class Properties dialog: <b>Type</b> .

The following table lists each of the Metric field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
metricName	Project Management dialog, Metrics tab: <b>Metric</b> field.
metricNotes	Project Management dialog, Metrics tab: (Notes) field.
metricType	Project Management dialog, Metrics tab: <b>Type</b> field.
metricWeight	Project Management dialog, Metrics tab: <b>Weight</b> field.

The **Operation field substitution macros** provide access to data concerning operations in the model. The macro names are in Camel casing. Macros that represent checkboxes return a value of **T** if the box is selected; otherwise the value is empty.

#### Operation field substitution macros

Macro Name	Description/Result
opAbstract	Operation dialog: <b>Virtual</b> checkbox.
opAlias	Operation dialog: <b>Alias</b> .
opBehavior	Operation Behavior dialog: <b>Behavior</b> .

Macro Name	Description/Result
opCode	Operation Behavior dialog: <b>Initial Code</b> .
opConcurrency	Operation dialog: <b>Concurrency</b> .
opConst	Operation dialog: <b>Const</b> checkbox.
opGUID	The unique GUID for the current operation.
opHasSelfRefParam	Scans the list of parameters in the current Operation, returning <b>T</b> if one type is the Class reference (this could be <b>ClassA*</b> or <b>ClassA&amp;</b> , depending on the value of the <b>genOptCOperationRefParamStyle</b> code generation option field substitution macro).
opImplMacros	A space-separated list of macros defined in the implementation of this operation.
opIsQuery	Operation dialog: <b>IsQuery</b> checkbox.
opMacros	A space-separated list of macros defined in the declaration for this operation.
opName	Operation dialog: <b>Name</b> .
opNotes	Operation dialog: <b>Notes</b> .
opPure	Operation dialog: <b>Pure</b> checkbox.
opReturnArray	Operation dialog: <b>Return Array</b> checkbox.
opReturnClassifierGUID	The unique GUID for the classifier of the current operation.
opReturnQualType	The operation return type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the return type classifier has not been set, it is equivalent to the <i>opReturnType</i> macro.
opReturnType	Operation dialog: <b>Return Type</b> .
opScope	Operation dialog: <b>Scope</b> .

Macro Name	Description/Result
opStatic	Operation dialog: <b>Static</b> checkbox.
opStereotype	Operation dialog: <b>Stereotype</b> .
opSynchronized	Operation dialog: <b>Synchronized</b> checkbox.

The following table lists each of the Parameter field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
paramClassifierGUID	The unique GUID for the classifier of the current parameter.
paramDefault	Operation Parameters dialog: <b>Default</b> .
paramFixed	Operation Parameters dialog: <b>Fixed</b> checkbox.
paramGUID	The unique GUID for the current parameter.
paramIsEnum	<b>True</b> , if the parameter uses the <i>enum</i> keyword (C++).
paramKind	Operation Parameters dialog: <b>Kind</b> .
paramName	Operation Parameters dialog: <b>Name</b> .
paramNotes	Operation Parameters dialog: <b>Notes</b> .

Macro Name	Description
paramQualType	The parameter type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the parameter classifier has not been set, is equivalent to the <i>paramType</i> macro.
paramType	Operation Parameters dialog: <b>Type</b> .

The following table lists each of the Problem field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
problemCompletedBy	Maintenance dialog, Element Issues tab: <b>Completed by</b> .
problemCompletedDate	Maintenance dialog, Element Issues tab: <b>Completed</b> .
problemHistory	Maintenance dialog, Element Issues tab: <b>History</b> .
problemName	Maintenance dialog, Element Issues tab: <b>Name</b> .
problemNotes	Maintenance dialog, Element Issues tab: <b>Description</b> .
problemPriority	Maintenance dialog, Element Issues tab: <b>Priority</b> .
problemRaisedBy	Maintenance dialog, Element Issues tab: <b>Raised by</b> .
problemRaisedDate	Maintenance dialog, Element Issues tab: <b>Raised</b> .
problemStatus	Maintenance dialog, Element Issues tab: <b>Status</b> .
problemVersion	Maintenance dialog, Element Issues tab: <b>Version</b> .

The following table lists each of the Requirement field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
requirementDifficulty	Properties dialog: Require tab: <b>Difficulty</b> .
requirementLastUpdated	Properties dialog: Require tab: <b>Last Update</b> .
requirementName	Properties dialog: Require tab: <b>Short Description</b> .
requirementNotes	Properties dialog: Require tab: <b>Notes</b> .
requirementPriority	Properties dialog: Require tab: <b>Priority</b> .
requirementStatus	Properties dialog: Require tab: <b>Status</b> .
requirementType	Properties dialog: Require tab: <b>Type</b> .

The following table lists each of the Resource field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
resourceAllocatedTime	Project Management window, Resource Allocation tab: <b>Allocated Time</b> .
resourceEndDate	Project Management window, Resource Allocation tab: <b>End Date</b> .
resourceExpectedTime	Project Management window, Resource Allocation tab: <b>Expected Time</b> .
resourceExpendedTime	Project Management window, Resource Allocation tab: <b>Time Expended</b> .
resourceHistory	Project Management window, Resource Allocation tab: <b>History</b> .
resourceName	Project Management window, Resource Allocation tab: <b>Resource</b> .
resourceNotes	Project Management window, Resource Allocation tab: <b>Description</b> .
resourcePercentCompleted	Project Management window, Resource Allocation tab: <b>Completed(%)</b> .

Macro Name	Description
resourceRole	Project Management window, Resource Allocation tab: <b>Role</b> .
resourceStartDate	Project Management window, Resource Allocation tab: <b>Start Date</b> .

The following table lists each of the Risk field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
riskName	Project Management window, Risks tab: <b>Risk</b> .
riskNotes	Project Management window, Risks tab: (Notes).
riskType	Project Management window, Risks tab: <b>Type</b> .
riskWeight	Project Management window, Risks tab: <b>Weight</b> .

The following table lists each of the Scenario field substitution macros with a description of the result.

Field substitution macros are named according to Camel casing.

Macros that represent checkboxes return a value of **T** if the box is selected. Otherwise the value is empty.

Macro Name	Description
scenarioGUID	The unique ID for a scenario. Identifies the scenario unambiguously within a model.
scenarioName	Properties dialog, Scenario tab: <b>Scenario</b> .
scenarioNotes	Properties dialog, Scenario tab: (Notes).
scenarioType	Properties dialog, Scenario tab: <b>Type</b> .

*Tagged Value* macros are a special form of field substitution macros, which provide access to element tags and the corresponding Tagged Values. They can be used in one of two ways:

- Direct Substitution
- Conditional Substitution

#### **Direct Substitution:**

This form of the macro directly substitutes the value of the named tag into the output.

Structure: %<macroName>: " <tagName> " %

<macroName> can be one of:

- attTag
- classTag
- connectorDestElemTag
- connectorDestTag
- connectorSourceElemTag
- connectorSourceTag
- connectorTag
- linkAttTag
- linkTag
- opTag
- packageTag
- paramTag

This corresponds to the tags for attributes, Classes, operations, packages, parameters, connectors with both ends, elements at both ends of connectors and connectors including the attribute end.

<tagName> is a string representing the specific tag name.

#### **Example**

```
%opTag: " attribute " %
```

#### **Conditional Substitution:**

This form of the macro mimics the conditional substitution defined for field substitution macros.

Structure: %<macroName>: " <tagName> " ( == " <test> " ) ? <subTrue> ( : <subFalse> ) %

Where:

- <macroName> and <tagName> are as defined above
- ( <text> ) denotes that <text> is optional
- <test> is a string representing a possible value for the macro
- <sub True> and <sub False> can be a combination of quoted strings and the keyword value; where the value is used, it gets replaced with the macro's value in the output

### Examples

```
%opTag: "opI n l i n e" ? "i n l i n e" : "" %
%opTag: "opI n l i n e" ? "i n l i n e" %
%cl assTag: "unsaf e" == "t r u e" ? "unsaf e" : "" %
%cl assTag: "unsaf e" == "t r u e" ? "unsaf e" %
```

Tagged Value macros use the same naming convention as field substitution macros.

#### 7.3.7.3.3 Function Macros

Function macros are a convenient way of manipulating and formatting various element data. Each function macro returns a result string. There are two primary ways to use the results of function macros:

- Direct substitution of the returned string into the output, such as: `%TO_LOWER(attName)%`
- Storing the returned string as part of a variable definition such as: `$name = %TO_LOWER(attName)%`

Function macros can take parameters, which can be passed to the macros as:

- String literals, enclosed within double quotation marks
- Direct substitution macros without the enclosing percent signs

- Variable references
- Numeric literals

Multiple parameters are passed using a comma-separated list.

Function macros are named according to the All-Caps style, as in: **%CONVERT\_SCOPE(opScope)%**

The available function macros are described below. Parameters are denoted by angle brackets, as in: **FUNCTION\_NAME(<param>)**.

**CONVERT\_SCOPE(<umlScope>):**

For use with supported languages, to convert <umlScope> to the appropriate scope keyword for the language being generated. The following table shows the conversion of <umlScope> with respect to the given language.

Language	Package	Public	Private	Protected
C++	public	public	private	protected
C#	internal	public	private	protected
Delphi	protected	public	private	protected
Java		public	private	protected
PHP	public	public	private	protected
VB	Protected	Public	Private	Protected
VB .Net	Friend	Public	Private	Protected

**COLLECTION\_CLASS(<language>):**

Gives the appropriate collection Class for the language specified for the current linked attribute.

**CSTYLE\_COMMENT(<wrap length>):**

Converts the notes for the element currently in scope to plain C-style comments, using /\* and \*/.

**DELPHI\_PROPERTIES(<scope>, <separator>, <indent>):**

Generates a Delphi property.

**DELPHI COMMENT(<wrap\_length>):**

Converts the notes for the element currently in scope to Delphi comments.

**EXEC\_ADD\_IN(<addin\_name>, <function\_name>, <prm\_1>, ..., <prm\_n>):**

Invokes an Enterprise Architect Add-In function, which can return a result string.

<addin\_name> and <function\_name> specify the names of the Add-In and function to be invoked.

Parameters to the Add-In function can be specified via parameters <prm\_1> to <prm\_n>.

```
$result = %EXEC_ADD_IN( " MyAddIn" , " ProcessOperation" , classGUID, opGUID) %
```

Any function that is to be called by the *EXEC\_ADD\_IN* macro must have two parameters: an *EA.Repository* object, and a *Variant* array that contains any additional parameters from the *EXEC\_ADD\_IN* call. Return type should be *Variant*.

```
Public Function ProcessOperation( Repository As EA.Repository, args As Variant ) As Variant
```

**FIND(<src>, <subString>):**

Position of the first instance of <subString> in <src>; -1 if none.

**GET\_ALIGNMENT():**

Returns a string where all of the text on the current line of output is converted into spaces and tabs.

**JAVADOC COMMENT(<wrap\_length>):**

Converts the notes for the element currently in scope to *javadoc*-style comments.

**LEFT(<src>, <count>):**

The first <count> characters of <src>.

**LENGTH(<src>):**

Length of <src>. Returns a string.

**MID(<src>, <start>)****MID(<src>, <start>, <count>):**

Substring of <src> starting at <start> and including <count> characters. Where <count> is omitted the rest of the string is included.

**PI(<option>, <value>, {<option>, <value>}):**

Sets the PI for the current template to <value>. Valid <values> are:

- `"\n"`
- `"\t"`
- `"\"`
- `"\"`

`<option>` controls when the new PI takes effect. Valid values for `<option>` are:

- *I, Immediate*: the new PI is generated before the next non-empty template line
- *N, Next*: the new PI is generated after the next non-empty template line

Multiple pairs of options are allowed in one call. An example of the situation where this would be used is where one keyword is always on a new line, as illustrated below:

```
%PI = " " %
%classAbstract ? "abstract" %
%i f classTag: "macro" != " " %
%PI ( "I", "\n", "N", " ") %
%classTag: "macro" %
%endif %
class
%className%
```

For more details, see the [description of PI](#)<sup>[1687]</sup>.

#### **PROCESS END OBJECT(<template name>):**

Enables the Classes that are one Class further away from the base Class, to be transformed into objects (such as attributes, operations, packages, parameters and columns) of the base Class. `<template_name>` refers to the working template that temporarily stores the data.

#### **REMOVE DUPLICATES(<source>, <separator>):**

Where `<source>` is a `<separator>` separated list; this removes any duplicate or empty strings.

#### **REPLACE(<string>, <old>, <new>):**

Replaces all occurrences of `<old>` with `<new>` in the given string `<string>`.

#### **RESOLVE OP NAME():**

Resolves clashes in interface names where two method-from interfaces have the same name.

#### **RESOLVE QUALIFIED TYPE()**

#### **RESOLVE QUALIFIED TYPE(<separator>)**

#### **RESOLVE QUALIFIED TYPE(<separator>, <default>):**

Generates a qualified type for the current attribute, linked attribute, linked parent, operation, or parameter. Enables the specification of a separator other than `.` and a default value for when some value is required.

#### **RIGHT(<src>, <count>):**

The last *<count>* characters of *<src>*.

**TO LOWER(<string>):**

Converts *<string>* to lower case.

**TO UPPER(<string>):**

Converts *<string>* to upper case.

**TRIM(<string>)**

**TRIM(<string>, <trimChars>):**

Removes trailing and leading white spaces from *<string>*. If *<trimChars>* is specified, all leading and trailing characters in the set of *<trimChars>* are removed.

**TRIM LEFT(<string>)**

**TRIM LEFT(<string>, <trimChars>):**

Removes the specified leading characters from *<string>*.

**TRIM RIGHT(<string>)**

**TRIM RIGHT(<string>, <trimChars>):**

Removes the specified trailing characters from *<string>*.

**VB COMMENT(<wrap length>):**

Converts the notes for the element currently in scope to Visual Basic style comments.

**WRAP COMMENT(<comment>, <wrap length>, <indent>, <start string>):**

Wraps the text *<comment>* at width *<wrap length>* putting *<indent>* and *<start string>* at the beginning of each line.

```
$behavior = %WRAP_COMMENT( opBehavior, "40", " ", " / " ) %
```

*<wrap length>* must still be passed as a string, even though **WRAP\_COMMENT** treats this parameter as an integer.

**WRAP LINES(<text>, <wrap length>, <start string>(, <end string> )):**

Wraps *<text>* as designated to be *<wrap length>*, adding *<start string>* to the beginning of every line and *<end string>* to the end of the line if it is specified.

**XML COMMENT(<wrap length>):**

Converts the notes for the element currently in scope to XML-style comments.

#### 7.3.7.3.3.4 Control Macros

Control macros are used to control the processing and formatting of the templates. The basic types of control macro include:

- The *list* macro, for generating multiple element features, such as attributes and operations
- The branching macros, which form *if-then-else* constructs to conditionally execute parts of a template
- The PI macro for formatting new lines in the output, which takes effect from the next non-empty line
- A PI function macro that enables setting PI to a variable and adds the ability to set the PI that is generated before the next line
- The synchronization macros

In general, control macros are named according to Camel casing.

#### Learn more

- [List Macro](#) <sup>[1683]</sup>
- [Function Macros](#) <sup>[1678]</sup>
- [Branching Macros](#) <sup>[1684]</sup>
- [Synchronization Macros](#) <sup>[1686]</sup>
- [The PI Macro](#) <sup>[1687]</sup>

If you need to loop or iterate through a set of Objects that are contained within or are under the current object, you can do so using the %list macro. This macro performs an iterative pass on all the objects in the scope of the current template, and calls another template to process each one.

The basic structure is:

```
%list=<TemplateName> @separator=<string> @ndent=<string> ( <conditions>
) %
```

where <string> is a double-quoted literal string and <TemplateName> can be one of the following template names:

- Attribute
- AttributeImpl
- Class
- ClassBase
- ClassImpl
- ClassInterface
- Constraint
- Custom Template (custom templates enable you to define your own templates)
- Effort
- InnerClass
- InnerClassImpl
- LinkedFile
- Metric
- Namespace
- Operation

- OperationImpl
- Parameter
- Problem
- Requirement
- Resource
- Risk
- Scenario
- Test

`<conditions>` is optional and looks the same as the conditions for *if* and *elseif* statements.

### Example

In a Class transform, the Class might contain multiple Attributes; the following example calls the Attribute transform and outputs the result of processing the transform for each attribute of the Class in scope. The resultant list separates its items with a single new line and indents them two spaces respectively. If the Class in scope had any *stereotyped* attributes, they would be generated using the appropriately specialized template.

```
%list="Attribute" @separator="\n" @indent="  "%
```

The *separator* attribute, denoted above by `@separator`, specifies the space that should be used between the list items, excluding the last item in the list.

The *indent* attribute, denoted by `@indent`, specifies the space by which each line in the generated output should be indented.

### Special Cases

There are some special cases to consider when using the `%list` macro:

- If the *Attribute* template is used as an argument to the `%list` macro, this also generates attributes derived from Associations by executing the appropriate *LinkedAttribute* template
- If the *ClassBase* template is used as an argument to the `%list` macro, this also generates Class bases derived from links in the model by executing the appropriate *LinkedClassBase* template
- If the *ClassInterface* template is used as an argument to the `%list` macro, this also generates Class bases derived from links in the model by executing the appropriate *LinkedClassInterface* template
- If *InnerClass* or *InnerClassImpl* is used as an argument to the `%list` macro, these Classes are generated using the *Class* and *ClassImpl* templates respectively; these arguments direct that the templates should be processed based on the inner Classes of the Class in scope

### Learn more

- [Create Custom Templates](#) <sup>[1701]</sup>
- [Customize Base Templates](#) <sup>[1702]</sup>
- [Control Macros](#) <sup>[1683]</sup>

Branching macros provide if-then-else constructs. The CTF supports a limited form of branching through the following macros:

- *if*

- *elseif*
- *else*
- *endif*
- *endTemplate* (which exits the current template)

The basic structure of the *if* and *elseif* macros is:

```
%i f <test> <operator> <test>%
```

where *<operator>* can be one of:

- ==
- !=

and *<test>* can be one of:

- a string literal, enclosed within double quotation marks
- a direct substitution macro, without the enclosing percent signs
- a variable reference

Branches can be nested, and multiple conditions can be specified using one of:

- *and* or
- *or*

When specifying multiple conditions, *and* and *or* have the same order of precedence, and conditions are processed left to right.

If conditional statements on strings are case sensitive, "a String" does not equal "A STRING". Hence in some situations it is better to set the variable *\$str= TO\_LOWER(variable)* or *TO\_UPPER(variable)* then compare to a specific case.

Macros are not supported in the conditional statements. It is best to assign the results of a macro (string) to a variable, and then use the variable in the comparison.

```
$fldType = %TO_LOWER($parameter1)%
$COMMENT = "Use the first 4 characters for Date and Time field types"
$fldType4 = %LEFT($fldType, 4)%
%i f $fldType4=="date"%
Datetime
%endif%
```

This takes a parameter of value "Datetime", "DATETIME" or "Date", and returns "Datetime".

The *endif* or *endTemplate* macros must be used to signify the end of a branch. In addition, the *endTemplate* macro causes the template to return immediately, if the corresponding branch is being executed.

#### **Example 1:**

```
%i f elementType == "Interface" %
;
%else%
%OperationBody%
%endif%
```

In this case:

- If the *elemType* is "Interface" a semi-colon is returned
- If the *elemType* is not "Interface", a template called Operation Body is called

### Example 2:

```
$bases=" Cl assBase"
$I n t e r f a c e s="" %
%if $bases != "" and $I n t e r f a c e s != "" %
: $bases, $I n t e r f a c e s
%el self $bases != "" %
: $bases
%el self $I n t e r f a c e s != "" %
: $I n t e r f a c e s
%endif %
```

In this case the text returned is : Cl assBase.

### Conditions using Boolean Value:

When doing branching using conditions that involve a system checkbox (boolean fields), such as Attribute.Static (*attStatic*) the conditional statement would be written as:

```
%if attStatic == "T" %
```

For example:

```
%if attCollection=="T" or attOrderedMultiplicity == "T"%
%endTemplate%
```

### Learn more

- [Attribute Field Substitution Macros](#) <sup>[1652]</sup>

The *synchronization macros* are used to provide formatting hints to Enterprise Architect when inserting new sections into the source code, during forward synchronization. The values for synchronization macros must be set in the **File** templates.

The structure for setting synchronization macros is:

```
%<name>=<value>%
```

where <name> can be one of the macros listed below and <value> is a literal string enclosed by double quotes.

Macro Name	Description
<b>synchNewClassNotesSpace</b>	Space to append to a new Class note. Default value: \ n.
<b>synchNewAttributeNotesSpace</b>	Space to append to a new attribute note. Default value: \ n.
<b>synchNewOperationNotesSpace</b>	Space to append to a new operation note. Default value: \ n.

Macro Name	Description
<b>synchNewOperationBodySpace</b>	Space to append to a new operation body. Default value: \ n .
<b>synchNamespaceBodyIndent</b>	Indent applied to Classes within non-global namespaces. Default value: \ t .

The PI (Processing Instruction) macro provides a means of defining the separator text to be inserted between the code pieces (which represent entities) that are generated using a template.

The structure for setting the Processing Instruction is:

```
%PI =<value>%
```

where <value> is a literal string enclosed by double quotes, with the following options:

- " \ n " - New line (the default)
- " " - Space
- " \ t " - Tab
- " " - Null

By default, the PI is set to generate a new line (\ n) for each non-empty substitution, which behavior can be changed by resetting the *PI* macro. For instance, a Class's Attribute declaration in simple VB code would be generated to a single line statement (with no new lines). These properties are derived from the Class-Attribute Properties in the model to generate, for example:

```
Private Const PrintFormat As String = "Portrait"
```

The template for generating this starts with the PI being set to a space rather than a new line:

```
%PI=" "%
%CONVERT_SCOPE(attScope)%
%endIf%
%i f attConst == "T"%
Const
%endIf%
```

On transforming this, *attScope* returns the VB keyword "Private" and *attConst* returns "Const" on the same line spaced by a single space (fitting the VB Class.Attribute definition example above).

Alternatively, when generating a Class you might want the Class declaration, the notes and Class body all separated by double lines. In this case the %PI is set to "/ n/ n" to return double line spacing:

```
%PI="\n\n"%
%ClassDeclaration%
%ClassNotes%
%ClassBody%
```

#### **PI Characteristics:**

- Blank lines have no effect on the output

- Any line that has a macro that produces an empty result does not result in a PI separator (space/new line)
- The last entry does not return a PI; for example, %Classbody% (above) does not have a double line added after the body

- [Function Macros](#)

#### 7.3.7.3.3.5 EASL Code Generation Macros

Enterprise Architect provides two Enterprise Architect Simulation Library (EASL) code generation macros to generate code from behavioral models. These are:

- *EASL\_GET* and
- *EASLList*

#### EASL\_GET

The *EASL\_GET* macro is used to retrieve a property or a collection of an EASL object. The EASL objects and the properties and collections for each object are identified in the [EASL Collections](#) and [EASL Properties](#) topics.

#### Syntax

```
$result = %EASL_GET( <<Property>>, <<Owner ID>>, <<Name>> )
```

where:

- <<Property>> is either "Property" or "Collection"
- <<OwnerID>> is the ID of the owner object for which the property/collection is to be retrieved
- <<Name>> is the name of the property or Collection being accessed
- \$result is the returned value; this is "" if not a valid property

#### Example

```
$sPropName = %EASL_GET( " Property", $context, " Name" ) %
```

#### EASLList

The *EASLList* macro is used to render each object in an EASL collection using the appropriate template.

#### Syntax

```
$result = %EASLList=<<TemplateName>> @separator=<<Separator>>
          @indent=<<indent>> @owner=<<OwnedID>>
          @collection=<<CollectionName>> @option1=<<OPTI ON1>>
          @option2=<<OPTI ON2>>..... @optionN=<<OPTI ONN>>%
```

where:

- <<TemplateName>> is the name of any [behavioral model template](#)<sup>[1689]</sup> or [custom template](#)<sup>[1701]</sup>
- <<Separator>> is a list separator (such as “\n”)
- <<indent>> is any indentation to be applied to the result
- <<owner>> is the ID of the object that contains the required collection
- <<CollectionName>> is the name of the required collection
- <<OPTION1>....<<OPTION99>> are miscellaneous options that might be passed on the template; each option is given as an additional input parameter to the template
- \$result is the resultant value; this is “” if not a valid collection

### **Example**

```
$sStates = %EASLList="State" @separator="\n" @indent="\t"
           @owner=$StateMachineGUI D @collection="States"
@option=$sOption%
```

### **Behavioral Model Templates**

- Action
- Action Assignment
- Action Break
- Action Call
- Action Create
- Action Destroy
- Action If
- Action Loop
- Action Opaque
- Action Parallel
- Action RaiseEvent
- Action RaiseException
- Action Switch
- Behavior
- Behavior Body
- Behavior Declaration
- Behavior Parameter
- Call Argument
- Decision Action
- Decision Condition
- Decision Logic

- Property Declaration
- Property Notes

- Property Object
- State
- State CallBack
- State Enumerate
- State EnumeratedName
- StateMachine
- StateMachine HistoryVar
- Transition
- Transition Effect
- Trigger

This topic lists the EASL collections for each of the EASL objects, as retrieved by the [EASL\\_GET](#)<sup>[1688]</sup> code generation macro.

**Action:**

Collection Name	Description
<b>Arguments</b>	The Action's arguments.
<b>SubActions</b>	The sub-actions of the Action.

**Behavior:**

Collection Name	Description
<b>Actions</b>	The Behavior's Actions.
<b>Nodes</b>	The Behavior's nodes.
<b>Parameters</b>	The Behavior's parameters.
<b>Variables</b>	The Behavior's variables.

**Classifier:**

Collection Name	Description
<b>AllStateMachines</b>	All State Machines for the Classifier.

Collection Name	Description
<b>AsynchProperties</b>	The asynchronous properties of the Classifier.
<b>AsynchTriggers</b>	The asynchronous triggers of the Classifier.
<b>Behaviors</b>	The behaviors of the Classifier.
<b>Properties</b>	The properties of the Classifier.
<b>TimedProperties</b>	The timed properties of the Classifier.
<b>TimedTriggers</b>	The timed triggers of the Classifier.
<b>Triggers</b>	All triggers of the Classifier.

**Construct:**

Collection Name	Description
<b>AllChildren</b>	The Construct's children.
<b>ClientDependencies</b>	The client dependencies on the Construct.
<b>StereoTypes</b>	The stereotypes of the Construct.
<b>SupplierDependencies</b>	The supplier dependencies on the Construct.

**Node:**

Collection Name	Description
<b>IncomingEdges</b>	The Node's incoming edges.
<b>OutgoingEdges</b>	The Node's outgoing edges.
<b>SubNodes</b>	The sub-nodes of the Node.

Collection Name	Description

**State:**

Collection Name	Description
<b>DoBehaviors</b>	The State's Do behaviors.
<b>EntryBehaviors</b>	The State's Entry behaviors.
<b>ExitBehaviors</b>	The State's Exit behaviors.

**StateMachine:**

Collection Name	Description
<b>AllFinalStates</b>	The State Machine's final States.
<b>AllStates</b>	All States within the State Machine, including those within Submachine States.
<b>DerivedTransitions</b>	The State Machine's derived transitions with the associated valid effect.
<b>States</b>	The States within the State Machine.
<b>Transitions</b>	The transitions within the State Machine.
<b>Vertices</b>	The State Machine's vertices.

**Transition:**

Collection Name	Description
<b>Effects</b>	The Transition's effects.
<b>Guards</b>	The Transition's guards.

Collection Name	Description
<b>Triggers</b>	The Transition's triggers.

**Trigger:**

Collection Name	Description
<b>TriggeredTransitions</b>	The triggered transitions associated with the Trigger.

**Vertex:**

Collection Name	Description
<b>DerivedOutgoingTransitions</b>	The Vertex's derived outgoing transitions after traversing the pseudo-nodes.
<b>IncomingTransitions</b>	The Vertex's incoming transitions.
<b>OutgoingTransitions</b>	The Vertex's outgoing transitions.

This topic lists the EASL properties for each of the EASL objects, as retrieved by the [EASL\\_GET](#)<sup>[1688]</sup> code generation macro.

**Action**

Property Name	Description
<b>Behavior</b>	The Action's associated behavior ( <i>Call Behavior Action</i> or <i>Call Operation Action</i> ).
<b>Body</b>	The Action's body.
<b>Context</b>	The Action's context.
<b>Guard</b>	The Action's guard.
<b>IsFinal</b>	A check on whether the action is a final Action.

Property Name	Description
<b>IsGuarded</b>	A check on whether the action is a guarded Action.
<b>IsInitial</b>	A check on whether the action is an initial Action.
<b>Kind</b>	The Action's kind.
<b>Next</b>	The Action's next action.
<b>Node</b>	The Action's associated node in the graph.

#### Argument

Property Name	Description
<b>Parameter</b>	The ID of the Argument's associated parameter.
<b>Value</b>	The default value of the argument.

#### Behavior

Property Name	Description
<b>InitialAction</b>	The Behavior's initial action.
<b>isReadOnly</b>	The isReadOnly of the Behavior.
<b>isSingleExecution</b>	The isSingleExecution of the Behavior.
<b>Kind</b>	The kind of Behavior.
<b>ReturnType</b>	The return type of the Behavior.
<b>Specification</b>	The specification of the Behavior.

**CallEvent**

Property Name	Description
<b>Operation</b>	The operation of the CallEvent.

**ChangeEvent**

Property Name	Description
<b>ChangeExpression</b>	The change expression of the ChangeEvent.

**Classifier**

Property Name	Description
<b>HasBehaviors</b>	A check on whether the Classifier has behavioral models (Activity and Interaction).
<b>Language</b>	The Classifier's language.
<b>StateMachine</b>	The State Machine of the Classifier.

**Condition**

Property Name	Description
<b>Expression</b>	The Condition's expression.
<b>Lower</b>	The Condition's lower value.
<b>Upper</b>	The Condition's upper value.

**Construct**

Property Name	Description
<b>GetTaggedValue</b>	The Property's Tagged Value.

Property Name	Description
<b>IsStereotypeApplied</b>	A check on whether a particular stereotype is applied to the Property.
<b>Notes</b>	Notes on the Property.
<b>UMLType</b>	The UML type of the Property.
<b>Visibility</b>	The visibility of the Property.

#### Edge

Property Name	Description
<b>From</b>	The ID of the node from which the Edge arises.
<b>To</b>	The ID of the node at which the Edge is targeted.

#### EventObject

Property Name	Description
<b>EventKind</b>	The event kind of the Event Object.

#### Instance

Property Name	Description
<b>Classifier</b>	The classifier of the Instance.
<b>Value</b>	The value of the Instance.

#### Parameter

Property Name	Description
<b>Direction</b>	The direction of the Parameter.
<b>Type</b>	The type of the Parameter.
<b>Value</b>	The value of the parameter.

### Primitive

Property Name	Description
<b>FQName</b>	The FQ name of the Primitive.
<b>ID</b>	The ID of the Primitive.
<b>Name</b>	The name of the Primitive.
<b>ObjectType</b>	The object type of the Primitive.
<b>Parent</b>	The IDParent of the Primitive.

### PropertyObject

Property Name	Description
<b>BoundSize</b>	The bound size of the PropertyObject (if it is a collection).
<b>ClassifierStereoType</b>	The stereotype of the PropertyObject's classifier.
<b>IsAsynchProp</b>	A check on whether the PropertyObject is an asynchronous property.
<b>IsCollection</b>	A check on whether the PropertyObject is a collection.
<b>IsOrdered</b>	A check on whether the PropertyObject is ordered (if it is a collection).
<b>IsTimedProp</b>	A check on whether the PropertyObject is a timed property.

Property Name	Description
<b>Kind</b>	The PropertyObject's kind.
<b>LowerValue</b>	The PropertyObject's lower value (if it is a collection).
<b>Type</b>	The PropertyObject's type.
<b>UpperValue</b>	The PropertyObject's upper value (if it is a collection).
<b>Value</b>	The PropertyObject's value.

#### SignalEvent

Property Name	Description
<b>Signal</b>	The signal of the SignalEvent.

#### State

Property Name	Description
<b>HasSubMachine</b>	A check on whether the State is a Submachine state.
<b>IsFinalState</b>	A check on whether the State is a final state.
<b>SubMachine</b>	Get the ID of the Submachine contained by the State (if applicable).

#### StateMachine

Property Name	Description
<b>HasSubMachineState</b>	A check on whether the State Machine has a Submachine state.
<b>InitialState</b>	The State Machine's initial state.

Property Name	Description
<b>SubMachineState</b>	The State Machine's Submachine state.

#### TimeEvent

Property Name	Description
<b>When</b>	The 'when' property of the TimeEvent.

#### Transition

Property Name	Description
<b>HasEffect</b>	A check on whether the transition has a valid effect.
<b>IsDerived</b>	A check on whether the transition is a derived transition.
<b>IsTranscend</b>	A check on whether the transition transcends from one State Machine (Submachine state) to another.
<b>IsTriggered</b>	A check on whether the transition is triggered.
<b>Source</b>	The Transition's source.
<b>Target</b>	The Transition's target.

#### Trigger

Property Name	Description
<b>AsynchDestinationState</b>	The asynchronous destination state of the Trigger (if it is an asynchronous trigger).
<b>DependentProperty</b>	The ID of the property associated with the Trigger.
<b>Event</b>	The Trigger's event.

Property Name	Description
<b>Name</b>	The Trigger's name.
<b>Type</b>	The Trigger's type.

### Vertex

Property Name	Description
<b>IsHistory</b>	A check on whether the vertex is a history state.
<b>IsPseudoState</b>	A check on whether the vertex is a pseudo state.
<b>PseudoStateKind</b>	The Vertex's pseudo-state kind.

#### 7.3.7.3.4 Call Templates From Templates

Using function calls with parameters, you can call templates from other templates, whether standard templates or user-defined templates created within your project. Also, called templates can return a value, and can be called recursively.

### Examples

A call statement returning a parameter to a variable:

```
$sSource = %StateEnumeratedName($Source)%
```

A call statement to a template that has parameters:

```
%RuleTask($GUID, $index)%
```

Using the \$parameter statement in the called template:

```
$GUID = $parameter1
$index = $parameter2
```

Templates support recursive calls, such as the following recursive call on the template RuleTask:

```
$GUID = $parameter1
$index = $parameter2

%PI = ""%

$null = "Initialize condition and action object"

$count = %BR_GET("RuleCount")%
```

```

%if $count==" " or $count == $index%
%ComputeRule($GUID)%
\n
%endTemplate%

%Rule($index)%
\n
$index = %MATH_ADD($index, "1")%
%RuleTask($GUID, $index)%

```

### 7.3.7.4 The Code Template Editor in MDG Development

The following topics describe how you use the Code Template Editor window to create custom templates:

- [Create Custom Templates](#)<sup>[1701]</sup>
- [Customize Base Templates](#)<sup>[1702]</sup>
- [Add New Stereotyped Templates](#)<sup>[1703]</sup>

The Code Template Editor provides the facilities of the **Common Code Editor**, including Intelli-sense for the code generation template macros. For more information on Intelli-sense and the Common Code Editor, see the *Editing Source Code* topic.

#### Learn more

- [Code Template Framework](#)<sup>[1631]</sup>
- [Code Generation Template Macros](#)<sup>[1646]</sup>
- [Editing Source Code](#)<sup>[2146]</sup>

#### 7.3.7.4.1 Create Custom Templates

Enterprise Architect provides a wide range of templates that define how code elements are generated. If these are not sufficient for your purposes - for example, if you want to generate code in a language not currently supported by Enterprise Architect - you can create completely new custom templates. You can also add **stereotype overrides** to your custom templates; for example, you might list all of your parameters and their notes in your method notes.

**Access** **Tools | Source Code Generation Templates (Ctrl+Shift+P)**

#### Create custom templates using the Code Templates Editor

Step	Description	See also
1	In the <b>Language</b> field, click on the drop-down arrow and select the appropriate programming language.	

2	Click on the <b>Add New Custom Template</b> button. The Create New Custom Template dialog displays.	
3	In the <b>Template Type</b> field, click on the drop-down arrow and select the appropriate modeling object.  The <b>&lt;None&gt;</b> option requires special treatment; it enables the definition of a function macro that doesn't actually apply to any of the types, but must be called as a function to define variables <i>\$parameter1</i> , <i>\$parameter2</i> and so on for each value passed in.	
4	In the <b>Template Name</b> field, type an appropriate name. Click on the <b>OK</b> button.	
5	On the Code Templates Editor tab, the new template is included in the Templates list, with the value <b>Yes</b> in the <b>Modified</b> field.  The template is called <i>&lt;Template Type&gt;__&lt;Template Name&gt;</i> .  Note the double underscore character between the template type and template name.	
6	Select the template from the Templates list and edit the contents in the <b>Template</b> field to meet your requirements.	<a href="#">Code Template Syntax</a> <sup>[1643]</sup>
7	Click on the <b>Save</b> button.  This stores the new template, which is now available from the list of templates for use. You can also add a stereotype override to the template, if you wish.	<a href="#">Add New Stereotyped Templates</a> <sup>[1703]</sup>

### Notes

- For a custom language, you must define the *File* template so that it can call the *Import Section*, *Namespace* and *Class* templates, and any other templates that you decide are applicable

### Learn more

- [Developing Programming Languages](#)<sup>[1581]</sup>

#### 7.3.7.4.2 Customize Base Templates

Enterprise Architect provides a wide range of templates that define how code elements are generated. If you want to change the way a code element is generated, you can customize the appropriate templates. Your changes might be to the effect of the template itself, or to its calls to other templates. You can also add **stereotype overrides** to your customized templates; for example, you might list all of your parameters and their notes in your method notes.

When you **customize** a **system-provided** (base) template, you effectively create a **copy** of the template that is used in preference to the original. All subsequent changes are to that copy, and the original base template is hidden. If you subsequently delete the copy it can no longer override the original, which is then brought into use again.

**Access** **Tools | Source Code Generation Templates** ( Ctrl+Shift+P )

#### Customize a base template

Step	Description	See also
1	On the Code Template Editor, in the <b>Language</b> field, click on the drop-down arrow and select the programming language for which you want to customize the base templates.	
2	In the Templates list, click on the base template to edit.	
3	Update the template.	<a href="#">Code Template Syntax</a> <sup>[1643]</sup>
4	Click on the <b>Save</b> button to store your changes.	
5	Repeat steps 2 to 4 for each of the relevant base templates you want to customize.	
6	If you wish, add one or more stereotype overrides to any of the templates.	<a href="#">Add New Stereotyped Templates</a> <sup>[1703]</sup>

#### **7.3.7.4.3 Add New Stereotyped Templates**

Sometimes it is useful to define a specific code generation template for use with elements of a given stereotype. This enables different code to be generated for elements, depending on their stereotype. Enterprise Architect provides some default templates, which have been specialized for commonly used stereotypes in supported languages. For example the Operation Body template for C# has been specialized for the *property* stereotype, so that it automatically generates its constituent *get* and *set* methods. Users can override the default stereotyped templates as described in the *Override Default Templates* topic. Additionally users can define templates for their own stereotypes, as described below.

**Access** **Tools | Source Code Generation Templates** ( Ctrl+Shift+P )

#### Add a new stereotyped template using the Code Template Editor

Step	Description	See also
1	Select the appropriate language, from the <b>Language</b> list.	

Step	Description	See also
2	Select one of the base templates, from the <b>Templates</b> list.	
3	Click on the <b>Add New Stereotyped Override</b> button. The New Template Override dialog displays.	
4	Select the required <b>Feature</b> and/or <b>Class</b> stereotype. Click on the <b>OK</b> button.	
5	The new stereotyped template override displays in <b>Stereotype Overrides</b> list, marked as modified.	
6	Make the required modifications in the Code Templates Editor.	
7	Click on the <b>Save</b> button to store the new stereotyped template in the project file. Enterprise Architect can now use the stereotyped template, when generating code for elements of that stereotype.	

#### Notes

- Class and feature stereotypes can be combined to provide a further level of specialization for features; for example, if properties should be generated differently when the Class has a stereotype *MyStereotype*, then both *property* and *MyStereotype* should be specified in the New Template Override dialog

#### 7.3.7.4.4 Override Default Templates

Enterprise Architect has a set of built-in or default code generation templates. The Code Templates Editor enables you to modify these default templates, hence customizing the way in which Enterprise Architect generates code. You can choose to modify any or all of the base templates to achieve your required coding style.

Any templates that you have overridden are stored in the project file. When generating code, Enterprise Architect first checks whether a template has been modified and if so, uses that template. Otherwise the appropriate default template is used.

**Access** **Tools | Source Code Generation Templates (Ctrl+Shift+P)**

#### Reference

Override a default code generation template using the Code Templates Editor, as indicated below:

Field/Button	Description	See also
<b>Language</b>	Select the appropriate language from the list.	
<b>Templates</b>	Select one of the base templates from the list.	
<b>Stereotype Overrides</b>	If the base template has stereotyped overrides, you can select one of these from the list.	
<b>&lt;Other fields&gt;</b>	Make any other modifications required.	
<b>Save</b>	Click on this button to store the modified version of the template to the project file. The template is marked as modified.	

When generating code, Enterprise Architect now uses the overriding template, instead of the default template.

### 7.3.8 Grammar Framework

Enterprise Architect provides reverse engineering support for a number of popular programming languages. However, if the language you are using is not supported, you can **write your own grammar** for it, using the in-built **Grammar Editor**. You can then incorporate the grammar into an MDG technology to provide both reverse engineering and code synchronization support for your target language.

The framework for writing a grammar and importing it into Enterprise Architect is the direct complement to the **Code Template Framework**. While code templates are for converting a model to a textual form, grammars are required to convert text to a model. Both are required to synchronize changes into your source files.

An example language source file and an example Grammar for that language are provided in the *Code Samples* directory, which you can access from your installation directory (the default location is *C:\Program Files\Sparx Systems\EA*). Two other grammar files are also provided, illustrating specific aspects of developing Grammars.

#### Components

Component	Description	See also
<b>Grammar Syntax</b>	<p>Grammars define how a text is to be broken up into a structure, which is necessary when you are converting code into a UML representation. At the simplest level, a grammar is instructions for breaking up an input to form a structure.</p> <p>Enterprise Architect uses a variation of Backus–Naur Form (nBNF) to include processing instructions, the execution of which returns structured information from the parsed results in the form of an Abstract Syntax Tree (AST), which is used to generate a UML representation.</p>	<a href="#">Grammar Syntax</a> <small>[1706]</small>

Component	Description	See also
<b>Grammar Editor</b>	The Grammar Editor is an in-built editor that you can use to open, edit, validate and save grammar files.	<a href="#">Editing Grammars</a> <sup>[1721]</sup>
<b>Grammar Debugging</b>	You can debug the grammar files you create using two facilities: <ul style="list-style-type: none"> <li>The <b>Parser</b>, which generates the AST for the Grammar</li> <li>The <b>Profiler</b>, which also parses the Grammar and generates the AST but which exposes the Profiling pathway to show exactly what happened at each step of the process</li> </ul>	<a href="#">Parsing AST Results</a> <sup>[1722]</sup> <a href="#">Profiling Grammar Parsing</a> <sup>[1722]</sup>

### 7.3.8.1 Grammar Syntax

Grammars define how a text is to be broken up into a structure, which is exactly what is needed when you are converting code into a UML representation. At the simplest level, a grammar is just instructions for breaking up an input to form a structure. Enterprise Architect uses a variation of **Backus–Naur Form (BNF)** to express a grammar in a way that allows it to convert the text to a UML representation. What the grammar from Enterprise Architect offers over a pure BNF is the addition of **processing instructions**, which allow structured information to be returned from the parsed results in the form of an **Abstract Syntax Tree (AST)**. At the completion of the AST, Enterprise Architect will process it to produce a UML model.

#### Syntax

Syntax	Detail	See also
<b>Comments</b>	Comments have the same form as in many programming languages. <pre>// You can comment to the end of a line by adding two /s. /* You can comment multiple lines by adding a / followed by a *. The comment is ended when you add a * followed by a /. */</pre>	
<b>Instructions</b>	Instructions specify the key details of how the grammar works. They are generally included at the top of the grammar, and resemble function calls in most programming languages.	<a href="#">Grammar Instructions</a> <sup>[1707]</sup>
<b>Rules</b>	Rules make up the body of a grammar. A rule may have one or more definitions separated by pipe delimiters ( ).  For a rule to pass, any single complete definition must pass. Rules are terminated with the semi-colon character (;).	<a href="#">Grammar Rules</a> <sup>[1708]</sup>

<b>Definitions</b>	A definition is one of the paths a rule can take. Each definition is made up of one or more <b>terms</b> .	
<b>Definition Lists</b>	<p>A definition list corresponds to one or more <b>sets of terms</b>. These will be evaluated in order until one succeeds. If none succeed then the containing rule fails. Each definition is separated by a   character.</p> <p>This is a simple rule with three definitions:</p> <pre>&lt;greeting&gt; ::= "hello"   "hi"   ["good"] "morning";</pre>	
<b>Terms</b>	A term can be a reference to a rule, a specific value, a range of values, a sub-rule or a command.	<a href="#">Grammar Terms</a> <small>[1709]</small>
<b>Commands</b>	<p>Like instructions, commands resemble function calls. They serve two main purposes:</p> <ul style="list-style-type: none"> <li>To process tokens in a specific way or</li> <li>To provide a result to the caller</li> </ul>	<a href="#">Grammar Commands</a> <small>[1709]</small> <a href="#">Context Labels</a> <small>[1711]</small>

**7.3.8.1.1 Grammar Instructions**

**Instructions** specify the key details of how the grammar works. They are generally included at the top of the grammar, and resemble **function calls** in most programming languages.

Instructions

Instruction	Description
<b>caseSensitive()</b>	One of these two instructions is expected to specify if <b>token matching</b> needs to be case sensitive or not. For example, languages in the BASIC family are case insensitive while languages in the C family are case sensitive.
<b>caseInsensitive()</b>	
<b>delimiters (DelimiterRule: Expression)</b>	The delimiters instruction tells the <b>lexical analyzer</b> which rule to use for delimiter discovery. Delimiters are used during keyword analysis, and can be defined as the characters that may be used immediately before or after language keywords.
<b>lex(TokenRule: Expression)</b>	The <b>lex instruction</b> tells the lexical analyzer the name of the root rule to use for its analysis.

Instruction	Description
<b>parse(RootRule: Expression)</b> <b>parse(RootRule: Expression, SkipRule: Expression)</b>	The <b>parse instruction</b> tells the parser the name of the root rule to use for its processing. The optional second argument specifies a skip (or escape) rule which is generally used to handle comments.

#### Learn more

- [Grammar Syntax](#)<sup>[1706]</sup>

### 7.3.8.1.2 Grammar Rules

**Rules** are run to break up text into structure. A rule is made up of one or more **definitions**, each of which is made up of one or more **terms**.

#### Types of Rule

Rule	Description
<b>Named rules</b>	A name, followed by a definition list. For example: <code>&lt;rule&gt; ::= &lt;term1&gt; &lt;term2&gt;   "-" &lt;term1&gt;;</code>
<b>Inline Rules</b>	Inside a definition, a rule defined within parentheses. These act in exactly the same way as if they were a named rule being called by a term. For example: <code>&lt;rule&gt; ::= (&lt;inline&gt;);</code>
<b>Optional Rules</b>	Inside a definition, a rule defined within square brackets. This rule succeeds even if the contents fail. For example: <code>&lt;rule&gt; ::= [&lt;inline&gt;];</code>
<b>Repeating Rules</b>	Inside a definition, a term followed by a plus sign. This rule matches the inner rule once or more than once. For example: <code>&lt;rule&gt; ::= &lt;inline&gt;+;</code> <code>rule ::= (&lt;term1&gt; &lt;term2&gt;)+;</code>
<b>Optional Repeating Rules</b>	Inside a definition, a rule followed by a star. This rule matches the inner rule zero or more times, meaning it succeeds even if the inner rule never succeeds. For example: <code>&lt;rule&gt; ::= &lt;inline&gt;*;</code> <code>rule ::= (&lt;term1&gt; &lt;term2&gt;)*;</code>

Learn more

- [Grammar Terms](#)<sup>[1709]</sup>

### 7.3.8.1.3 Grammar Terms

Terms identify where tokens are consumed.

Types of Term

Type	Description
<b>Concrete terms</b>	Quoted strings. e.g. "class"
<b>Unicode characters</b>	A lexer-only term, having the prefix of U+0x followed by a hexadecimal number. e.g. U+0x1234
<b>Ranges</b>	A lexer-only term, matching any character between the two characters specified. e.g. "a".. "z"    or    U+0x1234..U+2345
<b>References</b>	The name of another rule, in angled brackets. The token will match if that rule succeeds. e.g. <anotherRule>
<b>Commands</b>	A call to a specific command.

Learn more

- [Grammar Syntax](#)<sup>[1706]</sup>

### 7.3.8.1.4 Grammar Commands

**Commands**, like Instructions, resemble function calls. They serve two main purposes:

- To process tokens in a specific way or
- To provide a result to the caller

Commands

Command	Description
<b>attribute(Name: String, Value:</b>	Creates an attribute on the current AST node. The attribute will be created with the <b>Name</b> specified in the grammar source, and will be given the value of all

Command	Description
<b>Expression)</b>	tokens consumed as a part of executing the <b>Value</b> expression.  This command produces the AST node attributes that Enterprise Architect operates on in code engineering.
<b>attributeEx(Name: String)</b> <b>attributeEx(Name: String , Value: String)</b>	Creates an attribute on the current AST node without consuming any tokens. The attribute will be created with the <b>Name</b> specified in the grammar source, and with either an empty value or the value specified by the optional <b>Value</b> argument.  This command produces the AST node attributes that Enterprise Architect operates on in code engineering.
<b>node(Name: String, Target: Expression)</b>	Creates an AST node under the current AST node (the nodes that Enterprise Architect operates on in code engineering). The node will be created with the <b>Name</b> specified in the grammar source.
<b>token(Target: Expression)</b>	Creates a token during lexical analysis for processing during parsing. The value of the token will be the value of all characters consumed as a result of executing the <b>Target</b> expression.
<b>keywords()</b>	Matches any keyword from the parser rules set for the language.
<b>skip(Target: Expression)</b> <b>skip(Target: Expression, Escape: Expression)</b>	Consumes input data (characters when lexing, and tokens when parsing) until the <b>Target</b> expression is matched. The optional <b>Escape</b> expression can be used to handle instances such as escaped quotes within strings.
<b>skipBalanced(Origin: Expression, Target: Expression)</b> <b>skipBalanced(Origin: Expression, Target: Expression, Escape: Expression)</b>	Consumes input data (characters or tokens) until the <b>Target</b> expression is matched and the nesting level reaches zero. If the <b>Origin</b> expression is matched during this process, the nesting level is increased. If the <b>Target</b> expression is matched, the nesting level is decreased. When the nesting level reaches zero, the command exits with success. An optional <b>Escape</b> expression can be provided.
<b>skipEOF()</b>	Consumes all remaining data (characters or tokens) until the end of the file.
<b>fail()</b>	Causes the parser to fail the current rule, including any remaining definitions.
<b>warning()</b>	Inserts a warning into the resulting AST.
<b>except(Target: Expression,</b>	Consumes input data that matches the <b>Target</b> expression, but fail on data that matches the <b>Exception</b> expression. This operates somewhat similar to, but

Command	Description
<b>Exception: Expression)</b>	exactly the opposite of, the <b>skip</b> command.
<b>preProcess(Target: Expression)</b>	Evaluates an expression and uses that pre-processed data in multiple definitions. This is most useful within expression parsing, where the same left hand side expression will be evaluated against a number of operators. This command reduces the work the parser must do to make this happen.

#### 7.3.8.1.5 AST Nodes

In defining a grammar, you would use **AST nodes** and **AST node attributes** that can be recognized in code engineering in Enterprise Architect, in the AST results that are returned by the **attribute**, **attributeEx** and **node** commands. These nodes and attributes are identified in the following tables. Any others will be ignored in code engineering.

#### FILE Node

The FILE node represents a file. It isn't mapped to anything, but contains all the required information.

Multiplicity	Contained Nodes/ Attributes	Description
<b>0..*</b>	PACKAGE	See <a href="#">PACKAGE Node</a> 
<b>0..*</b>	CLASS	See <a href="#">CLASS Node</a> 
<b>0..*</b>	IMPORT	
<b>0..*</b>	<i>COMMENT</i>	Field labels as part of a skip rule will be at the root level; the code generator looks for comments of this sort by position relative to the node.
<b>0..1</b>	<i>INSERT_POSITION</i>	This gives the position where new Classes, packages and method implementations can be inserted into the file. If it is not found, the code generator will automatically insert new items immediately after the last one is found in code.

#### PACKAGE node

The PACKAGE node corresponds to a namespace or equivalent in the file. When importing with *package per namespace*, Enterprise Architect will create a package directly under the import for this and place all Classes within it. When not importing namespaces, Enterprise Architect will look for Classes under this point, but it will do nothing with this node.

Additionally, if you are generating with namespaces enabled (see the *Code Options* topics for generic languages) a generated Class will not match a Class in code unless they are under the same package structure.

Contained in nodes: [FILE](#)<sup>[1711]</sup>

Multiplicity	Contained Nodes/Attributes	Description
1	NAME	See <a href="#">NAME Node</a> <sup>[1718]</sup> <sup>[1718]</sup>
0..*	CLASS	See <a href="#">CLASS Node</a> <sup>[1712]</sup>
0..*	PACKAGE	
0..1	OPEN_POSITION	Gives the position where the package body opens. This can also be used as an insert position.
0..1	INSERT_POSITION	Gives the position where new Classes and packages can be inserted into the file. If it is not found, the code generator will automatically insert new items immediately after the last one is found in code.
0..1	SUPPRESS	Prevents indenting when inserting into this package.

### CLASS/INTERFACE Node

The CLASS (or INTERFACE) node is the most important in code generation. It is brought in as Class (or Interface) Objects.

See *Class DECLARATION* (below) and [Class BODY](#)<sup>[1713]</sup>.

Contained in Nodes: [FILE](#)<sup>[1711]</sup>, [PACKAGE](#)<sup>[1711]</sup>, [Class BODY](#)<sup>[1713]</sup>

### CLASS Declaration

Contained in Nodes: CLASS/INTERFACE

Multiplicity	Contained Nodes/Attributes	Description
1	NAME	See <a href="#">NAME Node</a> <sup>[1718]</sup>

Multiplicity	Contained Nodes/Attributes	Description
0..*	PARENT	See <a href="#">PARENT Node</a>  .
0..*	TAG	See <a href="#">TAG Node</a>  .
0..1	DESCRIPTION	See <a href="#">DESCRIPTION Node</a>  .
1	NAME	The name of the Class. If there is a node NAME, that will overwrite this attribute.
0..1	SCOPE	The UML Scope of the Class - <b>Public</b> , <b>Private</b> , <b>Protected</b> or <b>Package</b> .
0..1	ABSTRACT	If present, indicates that this is an abstract Class.
0..1	VERSION	The version of the Class.
0..1	STEREOTYPE	The stereotype that Enterprise Architect should assign to the Class. This does not support multiple stereotypes.
0..1	ISLEAF	
0..1	MULTIPLICITY	
0..1	LANGUAGE	Generally, you do not need to set this.
0..1	NOTE	Generally not used as it is covered by the comments above the Class.
0..1	ALIAS	
0..*	MACRO	Adds a numbered Tagged Value that Enterprise Architect can use to round trip macros.

**Class BODY Node**Contained in Nodes: [CLASS/INTERFACE](#) .

Multiplicity	Contained Nodes/Attributes	Description
0..*	METHOD	See <a href="#">METHOD Node</a>  .
0..*	ATTRIBUTE	See <a href="#">ATTRIBUTE Node</a>  .
0..*	FIELD	See <a href="#">FIELD Node</a>  .
0..*	CLASS	See <a href="#">CLASS Node</a>  .
0..*	SCOPE	See <a href="#">SCOPE Node</a>  .
0..*	PROPERTY	
0..*	TAG	See <a href="#">TAG Node</a>  .
0..*	PARENT	See <a href="#">PARENT Node</a>  .
0..1	<i>OPEN_POSITION</i>	Gives the position where the Class body opens. This can also be used as an insert position.
0..1	<i>INSERT_POSITION</i>	Gives the position where new Class members can be inserted into the file. If it is not found, the code generator will automatically insert new items immediately after the last one is found in code.

### SCOPE Node

This is an optional feature for languages resembling C++ that have blocks that specify the scope of elements. The language needs to have a name specified that is used for the scope of all elements in the block. In all other respects it behaves identically to the **Class BODY** node.

Contained in Nodes: [Class BODY](#) .

Multiplicity	Contained Nodes/Attributes	Description
1	<i>NAME</i>	Used as the scope for all methods and attributes contained within the scope.

### METHOD Node

Contained in Nodes: [Class BODY](#)<sup>[1713]</sup>, [SCOPE](#)<sup>[1714]</sup>

Multiplicity	Contained Nodes/Attributes	Description
1	Method DECLARATION	See <i>Method DECLARATION Node</i> (below).

### 7.3.8.2 Editing Grammars

If you need to write and edit a grammar for **code imported in a new programming language**, you can do so using the in-built **Grammar Editor**.

**Access**    **Analyzer | Grammar Editor**

#### Create and Edit Grammar

Field/Button	Action	See also
<b>Open Grammar</b>	Display a browser through which you can locate and open the file containing the grammar you want to edit.	
<b>Save</b>	Save the current file.	
<b>Validate Grammar</b>	The grammar validation will run a series of tests on the current grammar to ensure its validity. Errors and warnings will be displayed informing you of both errors that will make the grammar unusable, and conditions where you may get unexpected results.	
<b>Help</b>	Display this Help topic.	

#### Context Menu Options

Field/Button	Action	See also
<b>Open File</b>	Display a browser through which you can locate and open the file containing the grammar you want to edit.	
<b>Validate</b>	The grammar validation will run a series of tests on the current grammar to ensure its validity. Errors and warnings will be displayed informing you of both errors that will make the grammar unusable, and conditions where you may get unexpected results.	
<b>Language</b>	The Grammar Editor defaults to normal Backus–Naur Form (nBNF). The <b>mBNF</b> option is also available.	
<b>Line Numbers</b>	Turn line numbers on or off in the grammar editor.	

#### Learn more

- [Grammar Framework](#)  1705

- [Grammar Syntax](#)<sup>[1706]</sup>
- [Parsing AST Results](#)<sup>[1722]</sup>
- [Profiling Grammar Parsing](#)<sup>[1722]</sup>

### 7.3.8.3 Parsing AST Results

The Abstract Syntax Tree (AST) is the code that Enterprise Architect sees as it processes a grammar.

You parse the text in the bottom half of the Grammar Editor window and review what is displayed as a result. You can either open a file or paste text in. If you have pasted text that corresponds to something that cannot appear at the file level (such as Operation Parameters) you can select an alternative rule to use as a starting point. The parse will then commence from that rule.

**Access**    **Analyzer | Grammar Editor > Grammar Debugger > AST Results**

#### Toolbar Options

Option	Action	See also
<b>Open File</b>	Open a sample input file to test against.	
<b>Parse</b>	Perform the parse operation. If the parse is successful, the AST Results tab will contain the resulting AST.	
<b>Select Rule</b>	This drop down allows you to select an alternative root rule for processing your sample source.	
<b>Help</b>	Display this Help topic.	

#### Learn more

- [Grammar Framework](#)<sup>[1705]</sup>
- [Grammar Syntax](#)<sup>[1706]</sup>
- [Editing Grammars](#)<sup>[1721]</sup>
- [Profiling Grammar Parsing](#)<sup>[1722]</sup>

### 7.3.8.4 Profiling Grammar Parsing

When you parse a grammar that you have created, it might show errors that you cannot immediately diagnose. To help you resolve such errors, you can review the process that the parser followed to generate the AST you can see, using the **Grammar Profiler**.

You again parse the text in the bottom half of the Grammar Editor window, but this time the tree shows **each rule** that the parser attempted, where it got to and if it passed or not. Rules for opening a file, pasting a file and setting the starting rule remain the same.

**Access**    **Analyzer | Grammar Editor > Grammar Debugger > Profiler Results**

### Toolbar Options

Option	Action	See also
<b>Open File</b>	Display a browser through which you can locate and open the file containing the grammar you want to edit.	
<b>Parse</b>	Perform the parse operation. If the parse is successful, the AST Results tab will contain the resulting AST, and the Profile Results tab will contain debug information regarding the path that the parser took through your grammar. The profile data is extremely useful when debugging a new grammar.	
<b>Select Rule</b>	If you want to use a different root rule for processing your sample source, click on the drop-down arrow and select the alternative rule.	
<b>Help</b>	Display this Help topic.	

### Notes

- Because profiling can take a very long time for large files, the Profile Results tab is not filled if you are not displaying that tab when you begin parsing

### Learn more

### **7.3.8.5 Example Grammars**

The Code Samples directory set up by the Enterprise Architect installer contains an example Grammar that you can load into the Grammar editor to review, and into the Grammar Debugger to parse and profile.

The Grammar example consists of two files:

- **test.ssl** - a simple sample language source file, in the style of C, and
- **ssl.nbnf** - a grammar for the simple sample language

The example illustrates:

- Tokenization (using the Lexer)
- Creation of a package
- Creation of a Class or Interface
- Creation of an attribute
- Creation of an operation (with parameters)
- Importing comments

The Code Samples directory also contains two other Grammar files that you can examine:

- **Expressions Sample.nBNF** - this illustrates how expression parsing is set up and processed, with detailed comment text providing explanations
- **CSV Sample.nBNF** - an example grammar for processing CSV files

Learn more

- [Grammar Syntax](#)

**Part**

## 8 Requirement Models

**Requirements** are essentially what a system, application or business process is required to do. A requirement can be:

- Broad and high level, defining - for example - that a process is necessary to update a particular database
- More specialized and detailed, recording the expectation that - for example - a system call must always be acknowledged by return

Detailed requirements can be organized into a hierarchy culminating in a high-level requirement, so that satisfying each of the detailed requirements results in meeting the higher-level requirements and ultimately the top-level requirement. This hierarchical structure helps manage the complexity of large systems with thousands of requirements and many processes being developed to implement those requirements.

### Gathering Requirements

Gathering requirements is typically the first step in developing a solution, be it for developing either a system or a process. Requirements are gathered from all parties expected to use, maintain or benefit from the solution, and are organized into groups, functional areas and hierarchies as necessary. They can be transcribed into a spreadsheet or a requirements gathering or management tool, or they can be created within an integrated modeling tool such as Enterprise Architect.

The management of requirements is one of the more problematic disciplines in software development, for reasons such as:

- Diverse group input into the requirements
- Organizational boundary divisions
- Tool boundary divisions
- Volatility of requirements
- Imprecision and ambiguity in natural languages

These can cause issues with:

- Traceability and
- Integration with change and configuration management systems

Enterprise Architect can reduce or eliminate these problems in Requirements Management.

### Requirements Management and Enterprise Architect

Enterprise Architect is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model. Within Enterprise Architect, you can:

- **Create** and **view** requirements as entities and properties directly in the model, as simple **text descriptions** or as **diagrammatic representations** of the elements and their organization
- Collate the requirements in an external CSV file and then **import** them into your model
- Detail **use cases** and scenarios directly in the model
- Enter **standard attributes** (properties) for each requirement, such as difficulty, status and type, and **define your own attributes** (properties)

- **Trace** requirements to Use Cases, business rules, test cases and analysis artifacts (using, for example, the Relationship Matrix)
- Trace and view the impact of **changes** on requirements (through, for example, the **Traceability** window) and **review the changes** themselves
- Create customer-quality MS Word and HTML **reports** on requirements

### Notes

- All of these features are illustrated by examples in the *EAExample.eap* model, provided as part of your Enterprise Architect installation in the Enterprise Architect Program Files directory:

..\Program Files\Sparx Systems\EA

- If your project team are not using Enterprise Architect to **manage** Requirements, they can still access, use and work with them via the Cloud, from an **Open Services for Lifecycle Collaboration (OSLC)** client tool

## 8.1 Specification Manager

In developing a model, you can use a wide range of Enterprise Architect tools to create the model specification. For the preliminary specification, such as defining Requirements, you can adopt one of two general methods:

- Diagram-based, creating UML-defined element icons in, for example, Requirements diagrams, and building the model graphically, or
- Text-based, creating elements as simple text descriptions, sketching out the elements, relationships and properties in a broad definition that you - or team members with more specific roles - can refine and develop into a more complete model

Your 'sketch pad' for the second approach is the **Specification Manager**.

The **Specification Manager** is a simple **document-based** interface to a selected Package in the model, providing the means of creating and reviewing elements as **text** representations of objects in the model, using a process that is familiar to all users including business professionals and management who might not have expertise in model development.

The Specification Manager is also an interactive reporting tool for displaying, in icon form, the status of various other features against each entry and providing access to edit each feature.

In the Specification Manager you can:

- Work on the element entries as **paragraph text** in the same way as you would edit a document using a word processor; this includes copying or dragging text from an external file into the Specification Manager, and importing data from an external spreadsheet (.csv) file
- Switch easily from element to element in a **single mouse click** or **key stroke**
- Show and in-place **edit** the current status of a number of properties of each entry
- Directly interface to a range of Enterprise Architect tools that you can quickly invoke to display, edit and discuss the properties of the selected Package or element; these tools span the range of Project Management and Model Management facilities, including:
  - Traceability (Traceability window and Relationship Matrix)
  - Change Management (Baselines and Auditing)
  - Maintenance
  - Testing
  - Risk Management
  - Documentation (document format, web format, and spreadsheet format)
  - Metrics
  - Review and Discussion (Team Review, Element Discussions and Model Mail)

Once any tool window is open, the details reflect the currently-selected element in the Specification Manager, so you can quickly run through the properties of a number of elements just by selecting them in sequence in the list

The Specification Manager makes it very easy to develop a simple, visual description of your model for initial specification, ongoing development and program management, with immediate access to a range of types of detailed information on any selected element, should you need this detail.

### Learn more

- [Specification Manager - Overview](#) 

- [Using the Specification Manager](#)<sup>[173]</sup>

### 8.1.1 Specification Manager - Overview

The **Specification Manager** is a **document-based** interface to a selected Package in the model, providing the means of creating and reviewing elements as **text** representations of model objects in that Package. You can rapidly define or edit properties of the elements in the Specification Manager window itself, and also immediately open a range of windows and dialogs to add or review further properties and characteristics specific to each element. A key feature of the Specification Manager is the speed and ease with which you can create, filter and review a large number of elements from one point, without necessarily developing or examining complex detail on each element.

**Access**    **View | Specification Manager**

#### The Specification Manager View

The Specification Manager initially displays as a tabbed view in the application work area, containing a:

- Toolbar
- List header bar of column names, and
- Blank work area

The selected Package defaults to the first top-level View or Package in your model, and the element type defaults to any type held in the Package.

If you prefer, you can drag the Specification Manager tab out of the application workspace and use it as a floating or docked window.

To begin you:

- Select an existing Package to review, or create a new Package, using the second button in the Specification Manager toolbar
- If you want to select a specific type of element to review, use the third button in the Specification Manager toolbar - this also provides the option of switching back to displaying elements of **any** type in the Package

You can also adjust the **list header bar** to include the columns that show the information of interest to you, and the **display Filter bar** to further isolate particular elements for review. For an existing Package, the Specification Manager might now resemble this:

Specification Manager:: Package: "Log in/out Use Cases"						
Item	Status	All Indicators	Stereotype	Document	Relationship	
<b>1 Admin Logout</b>	Approved					
<b>1.1 AdminClose</b>	Implemented					
<b>2 Logout Use Case</b>	Approved					
<b>3 User Login</b>	Proposed		Performance			
User logins can have different access permissions.						

The display shows:

- The element names and any **notes** they might have (you can configure the display to hide the notes)
- The elements in parent/child relationships
- The text values of each **property** represented by a column, where those values have been set; you can quickly edit any of the values
- Icons in several columns, which indicate that the element has an associated object, file or linked document; you can double-click on these icons to display the object properties or document in the window in which it was created and, if necessary, you can edit the details

After you become familiar with what each indicator icon represents, you can display them all within the single **All Indicators** column to save space.

When you click on an element in the display, it is marked by a **vertical colored line** in the left margin to indicate that the element is selected, and a vertical or horizontal line against the element **property** you clicked on, to indicate that the focus is on that property. In the illustration, the **name** of the **Logout Use Case** element is selected. If you click again on the element property, the margin line changes color, to indicate that the property is open for **editing**. For example:

### Adding, displaying and changing information

When you create or review an element on the Specification Manager, you operate through one of three areas:

- The Specification Manager **toolbar**, which provides options to:
  - Change the Package or type of element under review
  - Open tools to create, display or review the properties, characteristics and associated records of the

Package or specific elements in the package

- Configure the **appearance** of the Specification Manager display and the types of information you might develop from the data in the display
- The **display area** itself, where you can:
  - Perform **in-place editing** by directly editing text (such as Version, Phase or element notes) or selecting alternative values from drop-down lists (such as Difficulty, Status or Priority)
  - Double-click on an indicator icon and review the record or document attached to the element
- The **element context menu**, which you can display by right-clicking anywhere on an entry in the display; this provides options for:
  - Creating and deleting elements
  - Editing element properties (including adding and reviewing **extended properties**, or **Tagged Values**)
  - Locating the element in the Project Browser and
  - Refreshing the display

#### Notes

- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

#### Learn more

### **8.1.2 Using the Specification Manager**

When you begin working in the Specification Manager, there are three general areas of activity you work through:

- Setting up the Specification Manager to suit your work requirements
- Creating and/or organizing the elements in the View
- Performing whatever work you need to do on the elements

The Specification Manager is extremely versatile, and you can use it very simply to create a set of basic elements or at varying levels of complexity to develop and manage those elements in your project, as you need.

#### Initial tasks

Task	Action	See also
<b>Specify the type of element to work on</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Work with the default (all element types) or</li> <li>• Select a specific type of element</li> </ul> <p>You specify the element type first because when you come to browse for or select the Specification Package, if you have specified a particular element type the system <b>automatically filters</b> the Package selection to only those that contain elements of that type.</p>	<a href="#">Select Specification Type</a> 
<b>Select the Package to work in</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Work with the default Package</li> <li>• Select another existing Package in the model, or</li> <li>• Create a new Package in the model</li> </ul>	<a href="#">Select Specification Package</a> 
<b>Set up List Header and Filter bars</b>	<p>Use the Field Chooser dialog to organize the columns that contain the type of information you want to work with.</p> <p>Some of the columns contain indicators that represent records and documents associated with an element. You can access the item represented by an indicator, by clicking on it.</p>	<a href="#">Customize Columns</a>  <a href="#">Indicator Columns</a> 
<b>Configure the display</b>	<p>As you begin, or at any other time in your use of the Specification Manager, you can change the appearance of the display to, for example, display any hierarchy of Packages under the selected Package in a separate panel, use smaller or larger text font, partially or totally hide Notes text, or show the element names in bold.</p> <p>You can further configure the display and the element definition by including level numbering, automatic naming and Project Glossary entries, and by applying customized properties such as additional Requirement Types and Tagged Value Types.</p>	<a href="#">Specification Manager Configuration</a> 

### Organize elements

Task	Action	See also
<b>Add new elements</b>	Create new elements in the model as direct members of the Package or as child elements of those members.	<a href="#">Adding Elements</a> 
<b>Delete elements</b>	You can filter out elements from the display by type or according to the value of various properties. However, if an element does not belong in the Package and model, you can delete it completely.	<a href="#">Deleting Elements</a> 

Task	Action	See also
<b>Reorganize elements</b>	<p>The Specification Manager reflects the sequence of elements in the Package as shown in the Project Browser.</p> <p>To put the elements in the Specification Manager in a different order, move them in the Project Browser.</p>	<a href="#">Move Objects Within a Package</a> <sup>[57]</sup>

### Review the elements

Task	Action	See also
<b>Create and Review Relationships</b>	<p>You can examine existing relationships and create new ones using the <b>Relationship Matrix</b>, creating and using specific Matrix <b>Profiles</b>.</p> <p>You can also review existing relationships by opening the <b>Traceability window</b>, either from the Toolbar or by double-clicking on the blue arrow displayed in the <b>Relationship</b> and <b>All Indicators</b> columns. If the element has no relationships, the blue arrow is not shown.</p>	<a href="#">Create Matrix Profile</a> <sup>[1744]</sup> <a href="#">Open Relationship Matrix</a> <sup>[1746]</sup> <a href="#">Traceability</a> <sup>[1744]</sup>
<b>Discuss and review elements amongst project members</b>	<p>It is possible to create review documents and have recorded text message discussions on the development of your elements, using the Team Review, Element Discussion and Model Mail facilities.</p> <p>If an element has an existing Element Discussion, this is represented by a 'speech bubble' icon in the <b>Discussion</b> and <b>All Indicators</b> columns. You can open the discussion by double-clicking on that icon.</p>	<a href="#">Reviewing Elements</a> <sup>[1747]</sup> <a href="#">Create Review Document</a> <sup>[1749]</sup> <a href="#">View Review Document</a> <sup>[1751]</sup>
<b>Make, Review and Manage Changes</b>	<p>You can easily <b>view and edit</b> elements directly in the Specification Manager or by displaying the appropriate window such as the Properties window or <b>Tagged Values</b> window.</p> <p>You can also <b>monitor</b> changes to the selected Package or element made anywhere in the system, using the <b>Baselines</b> and <b>Auditing</b> Facilities.</p> <p>Further, you can <b>manage</b> changes made by other users, opening the <b>Project Management</b> window to quickly assign <b>resources</b> and <b>risks</b> to the work on the element. You can review work on the elements in the Package by displaying the Specification Manager in another tab in the form of the <b>Project Gantt</b> chart.</p> <p><b>Maintenance</b> and <b>Testing</b> are integrated and easily available to help improve software quality from the beginning of your project.</p> <p>Existing records of these items are indicated by icons in</p>	<a href="#">Editing Elements</a> <sup>[1740]</sup>  <a href="#">Managing Changes</a> <sup>[1752]</sup>  <a href="#">Indicator Columns</a> <sup>[1743]</sup>

Task	Action	See also
	the corresponding column, and can be quickly opened by double-clicking on the icon.	
<b>Generate reports</b>	<p>If you should need to extract and/or publish the information in the Specification Manager, you can do so in a range of forms such as:</p> <ul style="list-style-type: none"> <li>• Simply printing the content of the view</li> <li>• Generating standard or customized document reports in RTF, DOCX or PDF format</li> <li>• Publishing on the web in HTML, or</li> <li>• Exporting to a spreadsheet tool in CSV format</li> </ul>	<a href="#">Reporting</a> <sup>[1754]</sup>

### Notes

- As you work on the information on the Specification Manager, periodically press **F5** to refresh the view to include any updates performed by other users elsewhere in the system
- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

### 8.1.2.1 Select Specification Type

When you start to use the Specification Manager you can work on all element types in the Package (the default) or identify a **specific type of element** to work on, using the third button in the Specification Manager toolbar. You can select any type of element supported by Enterprise Architect or the MDG Technologies that are integrated with the system.

You specify the element type first because when you go on to locate the Package to work in, if you have identified a specific type or element the system automatically filters for Packages that already contain that type of element.

**Access** **View | Specification Manager |** 

#### Select the element type

Click on the drop-down arrow at the right-hand end of the button. A short menu of element types displays.

Click on the name of a specific element type to select that type **and** the **Limit Display to Selected Type** option.

To revert to listing any type of element in the Package, click on either the:

- **<Any>** option or
- **Limit Display to Selected Type** option again to **deselect** it

If the specific element type you require is not shown, click on the:

- **Structural** option to select from a short list of the most common structural element types, such as Class
- **Behavioral** option to select from a short list of the most common behavioral element types, such as Activity, or
- **Project Management** option to select from a list of the Project Management element types

If the element-type is a custom type created using a Profile, or is from another modeling language (such as a SysML requirement), click on the **Other** option and expand the appropriate technology sub-menus to locate the element type.

On the final submenu for each technology, you can select the **Activate <type name> Toolbox** option to use **that** submenu as the default shortlist of types offered when you click on the original drop-down arrow. This is useful if you intend to work within a specific technology for an extended period.

If you want to return to the initial element type shortlist, click on the **Activate Default Toolbox** option at the top of the drop-down list.

#### Learn more

- [Using the Specification Manager](#)<sup>[1731]</sup>
- [Select Specification Package](#)<sup>[1735]</sup>

### 8.1.2.2 Select Specification Package

When you start to work with the Specification Manager, you identify the **Package** in which to build your specification. When you open the facility, the Specification Package defaults to the first top-level Package in your model, as indicated by the second button in the window toolbar. If this is the Package in which you intend to work, you can go on to configure the display and create or review elements.

You might want to use a different Package that:

- Already exists in the model and already contains elements of the specified type
- Already exists in the model but contains no elements of the specified type
- You will create underneath the current Specification Package, OR
- You will create underneath a different Package elsewhere in the model

**Access**    **View | Specification Manager**

#### Locate existing Package containing specification elements

Step	Action	See also
1	Click on the drop-down arrow at the right hand end of the second toolbar button (indicated by the  icon).	
2	Select the <b>Open Specification Package</b> option.  The Select a Specification Package dialog displays. This dialog presents your model hierarchy, filtered to show only those Packages that already contain elements of the type you selected as the Specification element type.	<a href="#">Select Specification Type</a> <sup>[1734]</sup>

Step	Action	See also
3	To expand a Package, click on the arrow next to the Package name, or click on the <b>Expand All</b> button.	
4	Click on the required Package, and click on the <b>OK</b> button.  The Package name displays in the second button in the toolbar, and the elements in the Package are shown in the main body of the Specification Manager window, filtered to the specified type if appropriate.	<a href="#">Specification Manager - Overview</a> <sup>[1729]</sup>
5	Customize the columns and/or add elements to the Package.	<a href="#">Customize Columns</a> <sup>[1738]</sup> <a href="#">Adding Elements</a> <sup>[1738]</sup>

#### Locate existing empty Package

It is possible that you want to create your specification in a Package that has been set up for this purpose but does not yet contain any elements (or any of the specified type). In this case the Package would not be included in the Select a Specification Package dialog (above). To select this Package for the Specification Manager:

- Double click on the Package name in the Project Browser

The Package name displays in the second button in the toolbar.

If this does not work as described, display the Options dialog (**Tools | Options**), select the General page and click on the **Shows Properties** radio button in the Double Click on Browser panel.

#### Create new Package

This method creates a new Package underneath the current Specification Package.

Step	Action	See also
1	Click on the drop-down arrow at the right hand end of the first toolbar button, and select the <b>New Package</b> option.  The New Model Package dialog displays.	
2	In the <b>Name</b> field, type the name of the new Package. Optionally, you can also select the check boxes to automatically create and open a new diagram in the Package.	<a href="#">Add a Package</a> <sup>[772]</sup>

Step	Action	See also
3	Click on the <b>OK</b> button.  The new Package becomes the current Specification Package, named in the window toolbar. The Package is also added to the Project Browser, underneath the previous Specification Package.	
4	Customize the columns and/or add elements to the Package.	<a href="#">Customize Columns</a> <sup>[1738]</sup> <a href="#">Adding Elements</a> <sup>[1738]</sup>

### Create new Package elsewhere in the Model

This method creates a new Package underneath a different parent Package in the model.

Step	Action	See also
1	Click on the drop-down arrow at the right hand end of the second toolbar button, and select the <b>Add Package To</b> option.  The Browse Project dialog displays, exposing all the Packages in the model.	
2	Browse through the model and click on the existing Package under which to create the new Package.	
3	Click on the <b>OK</b> button.  The New Model Package dialog displays.	
4	In the <b>Name</b> field, type the name of the new Package. Optionally, you can also select the check boxes to automatically create and open a new diagram in the Package.	<a href="#">Add a Package</a> <sup>[772]</sup>
5	Click on the <b>OK</b> button.  The new Package becomes the current Specification Package, named in the window toolbar. The Package is also added to the Project Browser, underneath the selected parent Package.	
6	Customize the columns and/or add elements to the Package.	<a href="#">Customize Columns</a> <sup>[1738]</sup> <a href="#">Adding Elements</a> <sup>[1738]</sup>

### Learn more

- [Using the Specification Manager](#)<sup>[1731]</sup>

### 8.1.2.3 Customize Columns

The Specification Manager can display a wide range of properties for the elements in the selected Specification Package, each property being shown in a separate column. Using the **Field Chooser** dialog, you can customize the display of the columns so that you show as many or as few as you need, in an appropriate sequence. You can also use full or partial property values in the **Filter bar** as a means of filtering the display to show only those elements that have property values that match the filters.

**Access**    **View | Specification Manager | Right-click column headings | Field Chooser**  
**View | Specification Manager | Right-click column headings | Toggle Filter Bar**

### Using the Field Chooser

Drag the column headings that you want to include out of the Field Chooser and onto the header bar, in the position you want the column to occupy in the sequence of column headings. You can drag an existing heading from its current position in the bar to another position in the sequence, including making it the final column.

If you do not want to include a column that is already in the heading bar, drag it up or down out of the bar. It is automatically returned to the Field Chooser dialog.

### Using the Filter bar

In the Filter bar, you define a text string that any displayed values in the corresponding column must include.

In the **filter field** for a column, type the character or string that must form part of the value shown in each row of that column. As you type the string, element rows in the Specification Manager that do **not** match the filter are hidden from display.

To clear the text in the filter field, click on the green cross at the right of the field.

You can display or hide the Filter bar using either the right-click context menu or the  icon, and selecting the **Toggle Filter Bar** option.

### Learn more

- [Customizing the Search View \(Column headers\)](#)<sup>[708]</sup>
- [Customizing the Search View \(Filter Bar\)](#)<sup>[709]</sup>

### 8.1.2.4 Adding Elements

The Specification Manager is an excellent model development tool, through which you can **create elements** in the Package you are reviewing in a number of ways. You can add new elements either:

- Directly to the Package or
- As child elements of an element in the Package

The process of adding an element varies depending on whether you have set a specific element type as the **Specification Type**, or set the display to list all types of element in the Package. If you import a set of element data from an external spreadsheet (.csv) file, this setting will also filter the imported information to show elements of the specified type or all types.

**Access** **View | Specification Manager:**  **(Create new Element)**  
**View | Specification Manager | right-click window | Add New Element**  
**View | Specification Manager | Ctrl+N**  
**View | Specification Manager | right-click existing element | Add New Child** or  
**View | Specification Manager | click existing element | Ctrl+Shift+N**

### Add element of predefined Specification Type

If you have set the Specification Type to a particular type of element:

- An element of that type is immediately added to the Specification Manager; the element has either the system default element name or a name that you have set up under your own naming conventions
- The name is highlighted and, if you want to change it, you can immediately type in an alternative name
- If the element is a child of an existing element, the entry is added underneath the parent, indented and in a smaller font; the parent element is given a +/- expansion box

### Add element of any Specification Type

If the Specification Manager is listing elements of any type, or if you have set the Specification Type field to **<Any>**, the New Element dialog displays. You can use this dialog to create an element of any type that the model supports.

### Notes

- If you add an element of the defined Specification Type to the selected Package in the **Project Browser**, it is also added to the Specification Manager
- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

### Learn more

- [Select Specification Type](#)<sup>[1734]</sup>
- [Set Auto Naming and Auto Counters](#)<sup>[904]</sup>
- [Add Elements Directly To Packages](#)<sup>[903]</sup>
- [Reporting](#)<sup>[1754]</sup> (for import from a CSV file)

## **8.1.2.5 Deleting Elements**

The Specification Manager provides a direct view of a Package in your model, and reflects the contents of the Package as it appears in the Project Browser. If you **delete** an element from the Specification Manager, it is removed **from the model** and therefore also disappears from the Project Browser. Any **child objects** that the element has are **also deleted** from the model.

**Access** **View | Specification Manager | right-click on element | Delete Selected** or  
**Click on element | Ctrl+D**

### Delete an element

When you select to delete an element in the Specification Manager, a prompt displays to confirm that you want to delete the element from the model.

Click on the **Yes** button. The element is removed from the Specification Manager and all other windows and diagrams in which it appears.

### Notes

- You cannot select more than one separate element at a time in the Specification Manager, and therefore you cannot delete multiple elements there; you can, however, select and delete multiple elements from the Project Browser, which also removes them all from the **Specification Manager** in one operation
- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

### Learn more

- [Delete Elements from Diagram and Model](#)<sup>[92]</sup>

## 8.1.2.6 Editing Elements

When you have created elements in the Specification Manager, you can add and review the properties and characteristics of each element to whatever extent you need. You could simply set some basic properties such as the element version, status and general description, or you could develop extended properties (Tagged Values) or add a Linked Document to add more detailed and extensive information on the element.

**Access** **View | Specification Manager | Click twice on element**

### Editing tasks

Task	Action	See also
<b>Display/Edit Element Properties</b>	<p>Where a column in the Specification Manager contains a property value, you can double-click on the value and either:</p> <ul style="list-style-type: none"> <li>• Type a different value (such as the element name) or</li> <li>• Click on the field to display a drop-down arrow and select a value from the list</li> </ul> <p>Alternatively, click on the value and press <b>F2</b>.</p> <p>Otherwise, you can right-click on the item and select the:</p> <ul style="list-style-type: none"> <li>• <b>Properties</b> menu option (or press <b>Alt+Enter</b>) to display the Properties <b>dialog</b>, or</li> </ul>	<p><a href="#">Properties Dialog</a><sup>[95]</sup></p>

© 1998-2014 Sparx Systems Pty Ltd

### 8.1.2.7 Indicator Columns

An element specification can have any of a number of resources associated with it. You can obtain a quick indication that resources exist for the element by displaying the corresponding column (selected from the Field Chooser dialog) on the Specification Manager; if the resource exists, an icon displays in the column against that element. When an indicator is displayed, you can double-click on the icon to **immediately access** the record or the first in a set of records for the element, in the corresponding window. You can use these windows to edit, delete or (where appropriate) add to the records against the element.

#### Columns

Column Header	Indicator or	Indicates that...	See also
<b>Relationship</b>		The selected element has at least one relationship to another element, which is shown in the Traceability window.	<a href="#">The Traceability Window</a> <sup>[725]</sup>
<b>Resource</b>		There is at least one resource assigned to a task on the element, in the Project Management window.	<a href="#">Resource Allocation</a> <sup>[512]</sup>
<b>Risk</b>		There is at least one Risk item defined for the element, in the Project Management window.	<a href="#">Risk Management</a> <sup>[519]</sup>
<b>Maintenance</b>		There is at least one Maintenance item defined for the element, in the Maintenance window.	<a href="#">Working on Maintenance Items</a> <sup>[2623]</sup>
<b>Test</b>		There is at least one Test item defined for the element, in the Testing window.	<a href="#">Working On Test Records</a> <sup>[2605]</sup>
<b>File</b>		The selected element has at least one associated file, defined on the File page of the element Properties dialog.	<a href="#">Associated Files</a> <sup>[988]</sup>
<b>Discussion</b>		There is a discussion thread on this element, in the Element Discussions window.	<a href="#">Element Discussions</a> <sup>[365]</sup>
<b>Document</b>		There is a linked document for this element.	<a href="#">Linked Documents</a> <sup>[1044]</sup>
<b>All Indicators</b>	-	Any or all of the above items exist for the element, as indicated by the corresponding icon.

### 8.1.3 Traceability

As you create and set up the elements in your Specification Package, using the Specification Manager, it is critical to:

- **Trace** any **existing** relationships those elements have to the elements in the model that realize them, or are realized by them
- Follow the relationships of such elements further, to **check** how changes to a source element or its relationships might affect **other relationship chains** in which the target elements are involved
- Create **new** relationships, where you can do so quickly and with an immediate view of how elements as a group are connected across the model

The two most significant tools for this are the **Traceability window** and the **Relationship Matrix**.

When you display the Traceability window, you can review every relationship in which the element selected in the Specification Manager is the source or target, the details of each of the related elements, and the relationships in which each of **those** elements are involved.

In the context of the Specification Manager, the Relationship Matrix provides a view of the relationships between the elements within the Specification Package, or between the elements of the Specification Package and a different Package. You can also use it to quickly create many relationships between the elements, defining a simple organization within the Specification Package and defining its relationships with other Packages.

**Access**    **View | Specification Manager:**  | **Open Relationship Matrix**

**View | Specification Manager:**  | **Traceability**

**Ctrl+Shift+4 (Traceability window)**

**Click on**  **in the Relationship or All Indicators columns (Traceability window)**

#### Learn More

- [Specification Manager](#)<sup>[1728]</sup>
- [Relationship Matrix](#)<sup>[727]</sup>
- [Create Matrix Profile](#)<sup>[1744]</sup> from within the Specification Manager
- [Open Relationship Matrix](#)<sup>[1746]</sup> from within the Specification Manager
- [The Traceability Window](#)<sup>[725]</sup>

#### 8.1.3.1 Create Matrix Profile

In using the Specification Manager you work on a specific Package and element type. If you want to use a Relationship Matrix **profile** to look more closely at the relationships of elements in that Package, it is therefore more logical to define the profile from the information **already set** in the Specification Manager, before you open the Relationship Matrix. The system helps you to do this.

**Access**    **View | Specification Manager:**  | **Matrix Profiles | Create new Profile**

#### Create the Matrix Profile

Field/Option/ Button	Action	See also
<b>Profile Name</b>	Type in a name to identify the profile.	
<b>Source</b>	Displays the name of the current Specification Package, as the source Package in the Relationship Matrix.  If you need to, you can click on the ( ... ) <b>Browse</b> button and select a different Package.	
<b>Type</b>	(For the Source Package) Displays the name of the current Specification element type. If you need to, you can click on the ( ... ) <b>Browse</b> button and select a different element type.	
<b>Target</b>	Defaults to the name of the current Specification Package as the target Package of elements in the relationships to examine.  If you want to examine relationships to elements in a different target Package, click on the <b>Browse</b> button ( ... ) and, on the Browse Project dialog, locate and select that Package.  Click on the <b>OK</b> button to put the Package name in the <b>Target</b> field.	
<b>Type</b>	(For the Target Package) Defaults to <b>&lt;All&gt;</b> target element types.  If you want to examine relationships to a specific type of element, click on the drop down arrow, scroll through the list and click on the appropriate element type name.	
<b>Relationship</b>	Defaults to <b>Realization</b> as the type of relationship to display.  If you want to examine relationships of a different type, click on the drop down arrow, scroll through the list and click on the appropriate relationship type name.	
<b>Direction</b>	Defaults to <b>Source -&gt; Target</b> as the direction of the relationships to examine.  If you want to examine relationships in the opposite direction, or in both directions, click on the drop-down arrow and select the appropriate option.	
<b>OK</b>	Click on this button to create the profile and close the dialog.  The Relationship Matrix automatically opens, applying the Profile that you have just defined.	
<b>Cancel</b>	Click on this button to discard any values you have entered, and to return to the Specification Manager.	

### Notes

- After you have created a Matrix profile, the name of the profile is added to a list of profiles that include the Specification Package and Specification element type, under the **Create new Profile** menu option; when you click on the profile name, the Relationship Matrix immediately displays with that profile in effect
- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

**8.1.4 Reviewing Elements**

When you are managing or working as a member of a project team, it is useful to have mechanisms for reviewing the work you are doing and keeping some record of those reviews, whether they be casual discussions between peers or coordinated, structured and formal reviews. The Specification Manager provides a number of facilities that support the full range of review types, focussed on the elements that are defined in the Specification Package.

**Review facilities**

Facility	Description	See also
<b>Review Documents</b>	<p>It is possible to create any number of <b>Review Documents</b> on the elements of the Specification Package, both to formalize and guide specific review processes and to present the element information to be reviewed.</p> <p>The documents are stored in and easily accessed from the Team Review feature.</p>	<a href="#">Create Review Document</a> <sup>[1749]</sup>

Facility	Description	See also
<b>Bind Package to Team Review Folder</b>	By default, Review Documents are stored in folders under a special category of the Team Review, called <b>Formal Reviews</b> . You can, however, generate those documents elsewhere in the Team Review, by binding the Specification Package to whichever Team Review folder (topic) is most appropriate to the Package.	<a href="#">Create Review Document</a> <sup>[1748]</sup>
<b>Team Review</b>	<p>The <b>Team Review</b> tools provide a number of other facilities that can be of use in discussing the development and features of an element, such as the <i>Resources</i> folder or the ability to develop a sequence of communications on a specific element, on a group of elements, or on some broader aspect of the model development.</p> <p>The Specification Manager provides direct access to the Team Review, through this menu path:</p> <p><b>View   Specification Manager:</b>  <b>  Team Review</b></p>	<a href="#">Team Review Tools</a> <sup>[343]</sup>
<b>Element Discussions</b>	<p>Using the <b>Element Discussions</b> facility, you can initiate or respond in a general, ad-hoc discussion amongst your team members, on a specific element. The facility maintains a record of each initial comment or question, and every response to that comment.</p> <p>There is no limit on the number of different discussions, on the number of responses, or on the length of each item, although the facility is better suited to short queries and responses.</p> <p>When there is a discussion on an element, the  icon displays in the <b>Discussion</b> and <b>All Indicators</b> columns on the Specification Manager. Simply double-click on the icon to display the discussion.</p> <p>You can also access the Element Discussion window through this menu path:</p> <p><b>View   Specification Manager:</b>  <b>  Element Discussions</b></p>	<a href="#">Element Discussions</a> <sup>[365]</sup>
<b>Model Mail</b>	<p>The Model Mail facility is a personal, project-internal email service. You can use it to send emails to specific individuals or groups on your project, concerning the Specification Manager contents or functions, or any other subject you need to discuss.</p> <p>You can access Model Mail through this menu path:</p> <p><b>View   Specification Manager:</b>  <b>  Model Mail</b></p> <p>If you want to discuss a particular element, click on it in the Specification Manager and use the Model Mail <b>Create   Insert Quick Link</b> context menu option to create a hyperlink in the mail message to the element.</p>	<a href="#">Model Mail</a> <sup>[565]</sup>

### 8.1.4.1 Create Review Document

When you are managing the work of a project team, it is useful to have a mechanism for coordinating and guiding the work that the team members are required to do on the elements in the Specification Package, such as a **review document**. You can generate this type of document quickly and simply within the Specification Manager, to be distributed, accessed and read through the **Team Review** facility.

There are, broadly, two types of review document that you can generate:

- A specification document that contains the **material to be reviewed** - the individual features of each element - such as a Model Overview, List of Issues or Maintenance Report, and
- A management or review document that **guides** the reader in **applying** tests, checks and procedures across the Package, such a Phase Review, Test Plan or Training Plan

You can generate both kinds of document from one of a range of templates, or create a document without using any template. The templates are all those available through the Report Generator (specification documents) or Linked Document Editor (management documents), whether system-provided or user-designed.

The **specification** documents automatically structure information from the Specification Manager according to the selected template and should not require further editing to serve their purpose (although it is possible to edit them if you wish). They are therefore termed '**auto-generated documents**'.

By default, Review Documents are stored in folders (Topics) in a special category of the Team Review, called **Formal Reviews**. You can, however, generate those documents **elsewhere** in the Team Review, by binding the Specification Package to whichever Team Review folder is most appropriate to the Package. For example, if you have a modular structure in the Team Review, you might want to hold the Review Documents for a Specification Package in the same section of the Team Review as folders containing discussions and documents on the part of the model containing that Package.

**Access**    **View | Specification Manager:**  | **Create Review Document**  
                  **View | Specification Manager:**  | **Auto Generate Document**  
                  **View | Specification Manager:**  | **Bind Package to Team Review Folder**

#### Create a Review Document

Field/Option/ Button	Action	See also
<b>Name</b>	On the Review Document dialog, type a name for the document.  This is the name that you use to recognize and open the document in the Team Review folders.	<a href="#">View Review Document</a> <sup>[175]</sup>
<b>RTF Template</b>	Click on the drop-down arrow and select either: <ul style="list-style-type: none"> <li>• <b>None</b> to create a free-format document yourself, or</li> <li>• A document template name, to create a document of that type</li> </ul>	
<b>OK</b>	Click on this button to open the document in the Document Editor, which you can use to populate the document with text and images,	<a href="#">Custom Template</a>

Field/Option/ Button	Action	See also
	<p>format it and print it.</p> <p>At the same time:</p> <ul style="list-style-type: none"> <li>• The Team Review window opens</li> <li>• The <b>Formal Reviews</b> category is created (if it does not already exist) in the Team Review</li> <li>• A folder is created with the same name as the Specification Package (if it does not already exist) in the Formal Reviews category</li> <li>• The review document name is added to this folder</li> </ul> <p>If you have bound the Package to a different Team Review folder (see below), the Review Document is created in that folder instead of under the Formal Reviews category.</p>	<p><a href="#">Design Options</a>  (for editing facilities)</p> <p><a href="#">Team Review Tools</a> </p>

#### Auto-generate a Review Document

Field/Option/ Button	Action	See also
<b>Name</b>	<p>On the Review Document dialog, type a name for the document.</p> <p>This is the name that you use to recognize and open the document in the Team Review folders.</p>	<p><a href="#">View Review Document</a> </p>
<b>RTF Template</b>	Click on the drop-down arrow and select a document report system-template name, to create a document of that type	
<b>OK</b>	<p>Click on this button to generate the document through the Document Report Generator, containing the information currently displayed in the Specification Manager, within the parameters of the report template.</p> <p>At the same time:</p> <ul style="list-style-type: none"> <li>• The Team Review window opens</li> <li>• The <b>Formal Reviews</b> category is created (if it does not already exist) in the Team Review</li> <li>• A folder is created with the same name as the Specification Package (if it does not already exist) in the Formal Reviews category</li> <li>• The review document name is added to this folder</li> </ul> <p>The document is displayed in the Team Review tab for any further editing and modification you need, although the document is effectively ready for immediate use.</p> <p>If you have bound the Package to a different Team Review folder (see below), the Review Document is created in that folder instead of under the Formal Reviews category.</p>	<p><a href="#">Team Review Tools</a> </p> <p><a href="#">Custom Template Design Options</a>  (for editing facilities)</p>

Field/Option/ Button	Action	See also

#### Bind Package to different Team Review folder

Step	Action	See also
1	On the Select a Topic to Link dialog, click on the expansion box next to the appropriate category name to display the topic folders it contains.	
2	Click on the appropriate topic folder name.	
3	Click on the <b>OK</b> button. When you: <ul style="list-style-type: none"> <li>Create a Review Document, it will now be automatically stored in the selected topic folder</li> <li>Select the <b>Show Current Review Folder</b> option, the Team Review window will open with the selected folder name highlighted and expanded</li> <li>Select the <b>Current Reviews</b> option, the submenu will list the documents held in the selected folder</li> </ul>	<a href="#">View Review Document</a> <sup>[1751]</sup>

#### Notes

- For a given Specification Package, you can generate as many review documents as you require
- Before you generate a Review Document from the Specification Manager, you could run the system Spell Checker over the Specification Package to remove any errors in the text

#### Learn more

- [Create Linked Document Templates](#)<sup>[1098]</sup>

### 8.1.4.2 View Review Document

In the Specification Manager, you can generate a range of **documents** that either **guide** a structured review of the elements you have listed, or provide the actual **material** - the descriptions, features and properties of the elements - to be reviewed. These documents are, by default, stored in the **Formal Reviews** category of the **Team Review**, from which point they can be accessed in a number of ways. Whichever access path you select, the document opens in the application work area and you can read the document online, edit it and/or print it.

If you want to edit or print the document, you can do so using the facilities of the common document editor, which is used in creating and editing both documents and document templates.

The Specification Manager also provides a facility for changing the default folder into which the Review Documents are generated. and from which you can select the documents to open.

**Access** **View | Specification Manager:**  |

- **Current Reviews | <document name>**
- **Show Current Review Folder | double-click <document name> in Team Review OR**
- **Team Review | Formal Reviews | <Package name> | double-click <document name> OR**

**View | Team Review | Formal Reviews | <Package name> | double-click <document name>**

#### Notes

- If you have changed the default folder for the Package (by binding the Package to a folder other than those in the Formal Reviews category), the **Current Reviews** and **Show Current Review Folder** options will automatically show the new default folder and the documents it contains; if you access the Team Review window directly, you would need to know the name and location of the new default folder

## 8.1.5 Managing Changes

If you are responsible for a team of people who are working on the specification, you can manage their work and monitor the changes that they are making within the Specification Manager. You can use the Specification Manager toolbar options and column indicators to open a number of management and monitoring tools, keeping the focus on the specification work rather than having to establish the focus in each management tool separately.

**Access** **View | Specification Manager:** 

#### Management and Monitoring facilities

Facility	Description	See also
<b>Manage Package Baselines</b>	Click on this option to open the <b>Package Baselines</b> dialog, which you can use to capture the state of development of the Specification Package at any appropriate point in time, as a <b>Baseline</b> . You can then compare the current state of the Package with a previously-captured Baseline and establish the changes that have been made since that Baseline was made.  You can also roll back any of the changes that you do not want to keep.	<a href="#">Package Baselines</a> <sup>[457]</sup> <a href="#">Manage Baselines</a> <sup>[467]</sup>
<b>View Audit Trail</b>	Click on this option to display the <b>Audit View</b> and the <b>Audit History</b> tab of the System Output window.  You can use the Audit View initially to turn on and configure Auditing, and then to perform audit checks on changes to the	<a href="#">Auditing</a> <sup>[446]</sup> <a href="#">The Audit View</a> <sup>[457]</sup> <a href="#">The System Output Window</a> <sup>[169]</sup>

Facility	Description	See also
	elements and connectors in the Specification Package (which might include changes to objects other than those of the Specification element type). The results of the audit check are displayed both in the Audit View and in the System Output window.	
<b>Project Management</b>	<p>Click on this option to display the <b>Resource Allocation</b> tab of the <b>Project Management</b> window. You can use this tab to define and allocate work for the people (resources) working on the Specification Package, either at Package level or at element level (select an element on the Specification Manager before defining the work).</p> <p>You can also select the <b>Risk</b>, <b>Effort</b> and <b>Metrics</b> tabs to define other aspects of work on an element.</p> <p>Once you have allocated a resource or defined a risk, an icon displays on the element row in the corresponding column of the Specification Manager, and in the <b>All Indicators</b> column. You can double-click on the icon to redisplay the Project Management window and review the record, and to add more records if necessary.</p>	<p><a href="#">The Project Management Window</a> <sup>[510]</sup></p> <p><a href="#">Resource Allocation</a> <sup>[512]</sup></p> <p><a href="#">Risk Management</a> <sup>[519]</sup></p> <p><a href="#">Effort Management</a> <sup>[518]</sup></p> <p><a href="#">Metrics</a> <sup>[520]</sup></p> <p><a href="#">Indicator Columns</a> <sup>[1743]</sup></p>
<b>Maintenance</b>	<p>Click on this option to display the <b>Defects</b> tab of the <b>Maintenance</b> window, on which you can create a record to define a problem or fault in the Specification Package or a selected element within it.</p> <p>You can also select the <b>Changes</b>, <b>Issues</b> and <b>Tasks</b> tabs to create other Maintenance records associated with the Package or selected element.</p> <p>When you create one of these records, an icon displays on the element row in the <b>Maintenance</b> and <b>All Indicators</b> columns of the Specification Manager. You can double-click on the icon to redisplay the Maintenance window and review the record, and to add more records if necessary.</p>	<p><a href="#">Maintenance</a> <sup>[2619]</sup></p> <p><a href="#">Indicator Columns</a> <sup>[1743]</sup></p>
<b>Testing</b>	<p>Click on this option to display the <b>Unit (Test)</b> tab of the <b>Testing</b> window, on which you can create a record to define a Unit Test for the Specification Package or a selected element within it.</p> <p>You can also select the other test type tabs to create other test records associated with the Package or selected element.</p> <p>When you create one of these records, an icon displays on the element row in the <b>Test</b> and <b>All Indicators</b> columns of the Specification Manager. You can double-click on the icon to redisplay the Testing window and review the record, and to add more records if necessary.</p>	<p><a href="#">Testing</a> <sup>[2604]</sup></p> <p><a href="#">Indicator Columns</a> <sup>[1743]</sup></p>
<b>View Package as Gantt</b>	Click on this option to display the <b>Package Browser</b> view in <b>Gantt</b> format, for the Specification Package. This view lists all the elements in the Package, showing their assigned resources and the progress of work on their separate tasks, both in text on the left hand side and as a graphical timeline on a calendar on the right.	<a href="#">Element View</a> <sup>[542]</sup>

Facility	Description	See also
	You can review the element properties or resource details by double-clicking on the item.	

### Notes

- If a record or entry does not display on the Specification Manager when you save the record, press **F5** to refresh the display
- Package Baselines and Auditing are available in the Corporate and extended editions of Enterprise Architect
- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

### Learn more

- [Specification Manager - Overview](#)<sup>[1729]</sup>
- [Using the Specification Manager](#)<sup>[1731]</sup>

## 8.1.6 Reporting

As you develop the elements in the Specification Package, you can produce a number of documents and reports to either disseminate the information you have compiled or to extract additional information on the elements from other aspects of model development and management, that might not be immediately visible in the Specification Manager.

You can also export the data you have created to a .csv file and perhaps onwards to another tool, or import element information created outside Enterprise Architect.

**Access** **View | Specification Manager:** 

### Review facilities

Facility	Description	See also
<b>Spell-check the Package</b>	<p>Before generating and/or printing any information from the Specification Manager, you could run the system Spell Checker over the Specification Package to remove any errors that might exist in the element names and text.</p> <p>Select the <b>Spell Check Current Package</b> option to display the Spell Check: &lt;Package Name&gt; dialog, and click on the <b>Start</b> button.</p>	<a href="#">Using the Spell Checker</a> <sup>[553]</sup>
<b>Print the element list</b>	<p>A print-out of the Specification Manager element list is a simplified version of the screen display:</p> <ul style="list-style-type: none"> <li>• All elements are included, both parent and (indented) child</li> </ul>	

Facility	Description	See also
	<p>elements</p> <ul style="list-style-type: none"> <li>• The columns are narrowed to fit the page width (if necessary)</li> <li>• The indicator icons and element notes are not printed</li> <li>• The font size and type face are uniform across the report</li> </ul> <p>To generate the print-out:</p> <ol style="list-style-type: none"> <li>1. Click on the <b>OK</b> button and specify the printer settings you require.</li> <li>3. Click on the <b>OK</b> button to print the list.</li> </ol>	
<b>Generate documentation in report document format</b>	<p>Enterprise Architect provides a comprehensive report generation facility, through which you can create a range of reports on different aspects of your model. You can apply this facility to the elements of a Specification Package, to generate a report in any of these formats:</p> <ul style="list-style-type: none"> <li>• <b>RTF</b></li> <li>• <b>PDF</b></li> <li>• <b>DOCX</b></li> </ul> <p>Select the <b>Generate Documentation (RTF/PDF)</b> option.</p> <p>The Generate Documentation dialog displays, with the <b>Root Element</b> field set to <b>Selected Elements</b> (the Specification Package elements, as the target contents of the report).</p>	<p><a href="#">Document Reports</a> <sup>[2640]</sup></p> <p><a href="#">Generate Documentation</a> <sup>[2641]</sup></p>
<b>Generate documentation in web page format (HTML)</b>	<p>As you develop the Specification Package elements you can publish them on the web, where the outline structure closely mirrors the Package structure and makes it very simple to explore on-line. You export the Package to web pages, where the web report provides an easy to use, highly detailed, Javascript-based structure. In addition, any hyperlinks in the elements make browsing to related information very simple.</p> <p>Select the <b>Publish as HTML</b> option.</p> <p>The Publish as HTML dialog displays, with the Specification Package name in the <b>Package</b> and <b>Title</b> fields.</p>	<p><a href="#">Web Reports</a> <sup>[2741]</sup></p> <p><a href="#">Create a Web Report</a> <sup>[2741]</sup></p>
<b>Generate spreadsheet file (CSV) and import from a spreadsheet</b>	<p>In Enterprise Architect you can import data from a spreadsheet into a Package and export element data from a Package into a .csv file.</p> <p>You can perform both of these operations within the Specification Manager, to bring in an existing set of element definitions to the Specification Package or transfer the Enterprise Architect element definitions to a different location.</p> <p>Select the <b>CSV Import/Export</b> option.</p>	<p><a href="#">CSV Import and Export</a> <sup>[491]</sup></p>

Facility	Description	See also
	<p>As part of either operation, you need to create a CSV Specification file.</p> <p>Whilst your display might be filtered to show a specific type of element, the operations work on the Package itself and incorporate all types of element within the Package.</p> <p>After you perform an import, refresh the display (press <b>F5</b>) to show the imported elements.</p>	
<b>Generate Quality Assurance and Metrics reports</b>	<p>Enterprise Architect provides several Quality Assurance reports for checking the development and impact of development of the elements in a Package. You can access these within the Specification Manager, so that the Specification Package is automatically the target of the report.</p> <p>You can also view and adjust the metrics report should you want to monitor the impact on the project metrics of the work that the elements in the specification might entail.</p>	<p><a href="#">Testing Details Report</a> <sup>[2736]</sup></p> <p><a href="#">Implementation Details Report</a> <sup>[2737]</sup></p> <p><a href="#">Dependency Details Report</a> <sup>[2739]</sup></p> <p><a href="#">Maintenance Report</a> <sup>[2740]</sup></p> <p><a href="#">Use Case Estimation</a> <sup>[584]</sup></p> <p><a href="#">Estimating Project Size</a> <sup>[588]</sup></p>

#### Notes

- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

### 8.1.7 Specification Manager Configuration

As you work with the Specification Manager, you can tailor the display to provide more precise information, and to better represent the information. The Specification manager provides options to:

- Create reference data to work from
- Display a separate panel showing the Package Hierarchy underneath the Specification Package
- Modify the appearance of the entries, including the amount of Notes text to show
- Apply level numbering and automatic element naming and numbering

#### Learn more

- [Package Options](#) <sup>[1759]</sup>

### 8.1.7.1 Appearance Options

It is possible to tailor the appearance of the Specification Manager view to better display the information you want to examine.

**Access** **View | Specification Manager:**

#### Adjust the appearance of the display

Aspect	Description	See also
<b>Display of Notes</b>	<p>In the Specification Manager you can choose to hide, check, or create and edit Notes text on the screen. If not hidden, any Notes for an element are displayed underneath the element name.</p> <p>Click on either:</p> <ul style="list-style-type: none"> <li>• <b>Hide Notes</b> to not show the Notes at all; the element rows close up</li> <li>• <b>Notes Preview</b> to show the first line of Notes text for each element; in this mode, you cannot edit the Notes text in the Specification Manager, only in the Notes window</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>• <b>Full Notes</b> to show the complete Notes text for each element; in this mode you can create, edit and delete Notes text in the Specification Manager and perform the same operations as are available in the Notes window context menu</li> </ul>	<a href="#">Notes</a> 
<b>Display element names in bold</b>	Click on the <b>Bold Requirement Name</b> option. All element names, including the names of child elements, are displayed in bold.	
<b>Enable the use of Expansion boxes on parent elements</b>	<p>If an element has child elements, you can configure the Specification Manager to either:</p> <ul style="list-style-type: none"> <li>• Hide the child elements but provide an expansion box that you can click on to open and collapse the element hierarchy (select the <b>Allow Collapsible Regions</b> option), or</li> <li>• Automatically display the child elements indented underneath the parent element (deselect the <b>Allow Collapsible Regions</b> option)</li> </ul>	
<b>Change Font Sizes of display</b>	<p>Across the Specification Manager view, the various display components such as parent element names, child element names Notes/property values and column headings each have their own font size. You can select to increase or decrease the font sizes <b>as a set</b> across the display, relative to the current sizes.</p> <p>Select the <b>Font Size</b> option and either:</p> <ul style="list-style-type: none"> <li>• <b>Small</b></li> <li>• <b>Medium</b> or</li> </ul>	

Aspect	Description	See also
	<ul style="list-style-type: none"> <li>• <b>Large</b></li> </ul>	

### 8.1.7.2 Model Options

The Specification Manager helps you to develop the elements in a Package from 'the ground up'. You use standard, or reference, data in doing this, such as the names of team members who can create and edit model data, or the automatic naming system to apply in creating your elements. Because you can start from an early stage in the model's development, some of the reference data you want to use might not exist. The Specification Manager, therefore, also makes it easier to call up the facilities for defining the types of data you need.

Access   **View | Specification Manager:**  | **Configure**

#### Configure data for development

Data Type/Option	Description	See also
<b>Project Glossary</b>	<p>It is possible to create a Glossary of terms and definitions used throughout the Project, and to automatically link to the definition of a term where it occurs in the model text.</p> <p>Click on this menu option to to display the Project Glossary view, where you initially set up the Glossary.</p>	<a href="#">Project Glossary View</a> <sup>[534]</sup>
<b>Requirement Types</b>	<p>Requirement elements can be of one of seven system-defined types, as shown in the <b>Stereotype</b> column of the Specification Manager, if you have selected to work on Requirements.</p> <p>If these types are not sufficient for your needs, you can define alternatives on the Requirement tab of the General Types dialog.</p> <p>Click on this menu option to display the General Types dialog.</p>	<a href="#">Requirement Types</a> <sup>[1166]</sup>
<b>Project Authors</b>	<p>A Project Author is a system user who has responsibility for creating modeling structures and data in a project. Initially there are no Project Authors defined on the system, and you might need to identify the users who are in your development team.</p> <p>Click on this menu option to display the People dialog, on which you define the Project Authors.</p>	<a href="#">Project Authors</a> <sup>[1153]</sup>
<b>Auto Names and Counters</b>	<p>When you start to create elements in your model, the system automatically gives them a name based on the element type and the number of elements of that type that already exist. For example, if you create a series of Requirement elements the default names are <b>Requirement1</b>, <b>Requirement2</b>, <b>Requirement3</b> and so on. You then edit these default names.</p> <p>Alternatively, you can <b>define your own default naming and numbering system</b> for specific element types, for either the element name, the element alias, or both.</p>	<a href="#">Set Auto Naming and Auto Counters</a> <sup>[904]</sup>

Data Type/Option	Description	See also
	Click on this menu option to display the Auto Name Counters dialog, on which you define your naming and numbering system.	
<b>Extended Property Types</b>	<p>You can add Extended Properties (Tagged Values) to your elements in the Specification Manager, using the <b>Extended Properties</b> option on the element content menu.</p> <p>However, you might want to use a type of Tagged Value that is not currently available; in this case, you can create that type using the Tagged Value Types tab of the UML Types dialog.</p> <p>Click on this menu option to display the UML Types dialog.</p>	<p><a href="#">Editing Elements</a> <sup>[1740]</sup></p> <p><a href="#">Tagged Value Types</a> <sup>[1150]</sup></p>

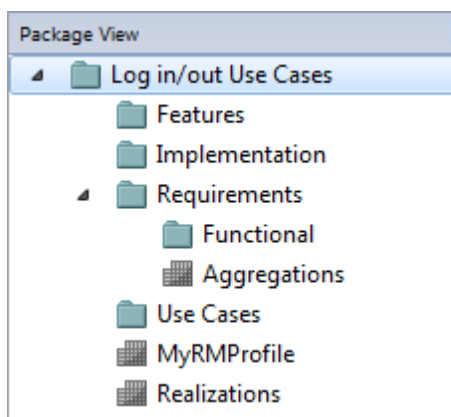

### Notes

- In the Corporate and extended editions of Enterprise Architect, a User Security system can be applied that restricts or enables access to a range of operations and functions; if you cannot access a function in the Specification Manager, check with your System Administrator or Security Administrator to see if you have access permissions to work with that function

### 8.1.7.3 Package Options

As you define the elements in your specification you can make them easier to reference by giving them more appropriate element names and/or numbers, either as the elements are created or retrospectively when a naming and numbering system has been finalized. You can also make the elements easier to locate and view by enabling level-numbering and indenting, helping you to organize and review the sequence and arrangement of the elements in the Specification Package. If you have been exploring other areas of the Project Browser, you can return focus to the Specification Package in the Project Browser.

You can also display a Package View panel to the left of the main view, showing the Package hierarchy of the **current** Specification Package. This also includes any Relationship Matrix profiles that exist in each Package.

**Access** **View | Specification Manager:**  <package name>

**View | Specification Manager:**  (for Package View)

Configure Package options

Option	Description	See also
<b>Locate Current in Project Browser</b>	Click on this option to highlight the name of the Specification Package in the Project Browser.	
<b>Apply Auto Naming to Elements</b>	<p>If you had to create elements before setting up an auto-naming and/or auto-numbering system, you can select this option to apply the system to the existing elements retrospectively.</p> <p>If you set up an auto-naming and/or auto-numbering system before creating your elements, that system is automatically applied as you create the elements.</p>	<a href="#">Apply Auto Naming to Existing Elements</a> <sup>[906]</sup>  <a href="#">Set Auto Naming and Auto Counters</a> <sup>[904]</sup>
<b>Level Numbering - Enable</b>	<p>Click on this option to apply level numbering to the elements in the Specification Package and indent each successive level, both in the Specification Manager and in the Project Browser. Nested elements are numbered hierarchically; that is:</p> <pre> 1 Name 2 Name   2.1 Name     2.1.1 Name     2.1.2 Name 3 </pre> <p>The option in the Specification Manager is the same as the option in the Project Browser Package context menu; turning the option on or off in one window also turns the option on or off in the other.</p>	<a href="#">Model Requirements</a> <sup>[1765]</sup>  <a href="#">Package Options in the Project Browser</a> <sup>[651]</sup>
<b>- Indent Description</b>	<p>If you have enabled level numbering, this option is available to indent the element <b>description</b> under each element name, to align with the element name. If the option is not selected, the text is aligned with the left-hand edge of the level number. For example:</p> <p><b>Option ON:</b></p> <pre> 1 Name   Description 2 Name   Description   2.1 Name     Description       2.1.1 Name         Description       2.1.2 Name         Description 3 Name   Description </pre> <p><b>Option OFF:</b></p>	

Option	Description	See also

## 8.2 Requirements

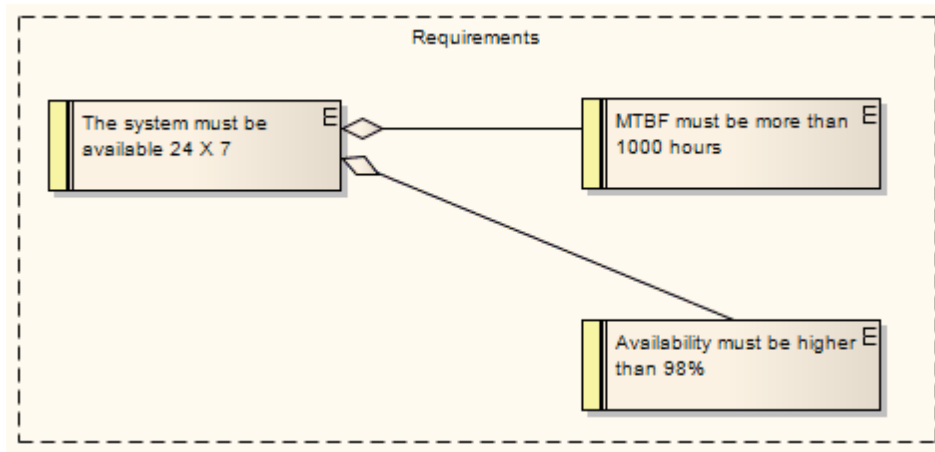

### Description

As an analysis step, often it is desirable to capture simple system requirements. These are eventually realized by Use Cases.

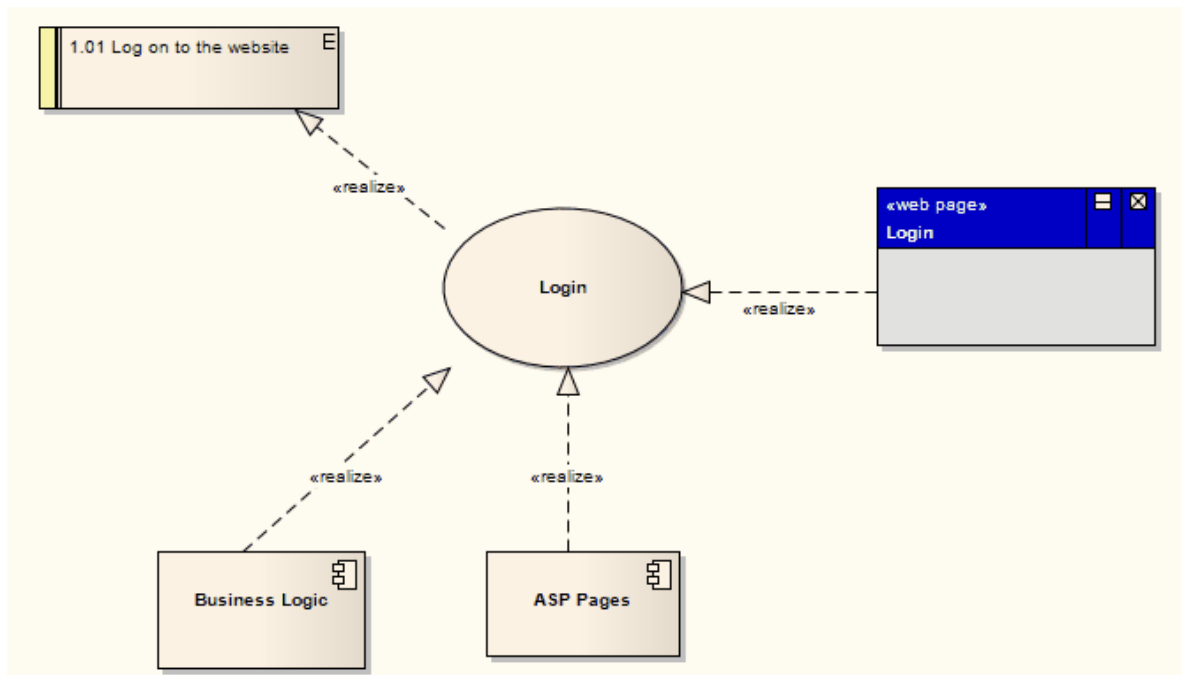

In the initial requirement gathering phase, cataloging requirements can be achieved using the Requirement extension on a Custom diagram.

### Examples

Requirements can be aggregated to create a hierarchy. The diagram below illustrates how this might be done.

In the following diagram, a **requirement** that a user can log into a website is implemented by the *Login Use Case*, which in turn is implemented by the *Business Logic*, *ASP Pages* and *Login Web Page constructions*. Using this approach, you can easily model quite detailed and complex dependencies and implementation relationships.

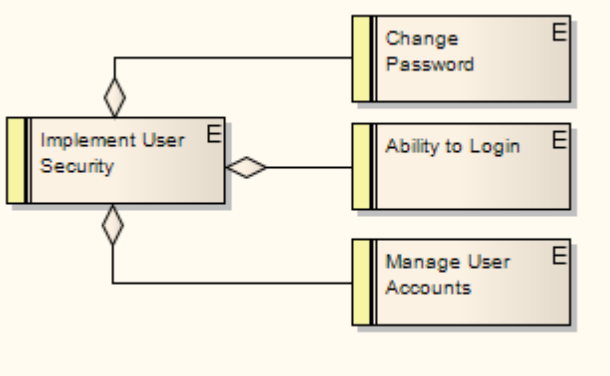

### Notes

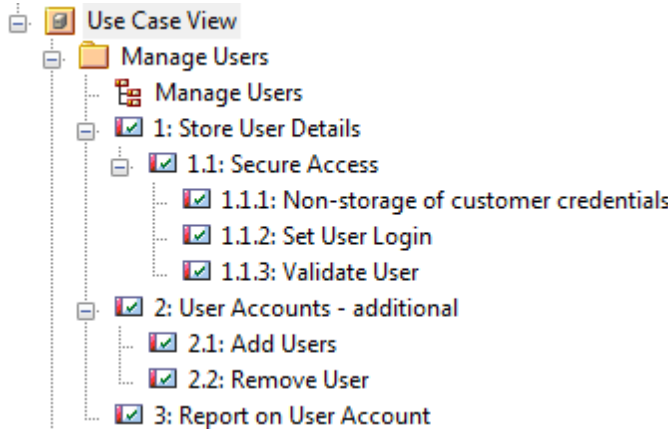

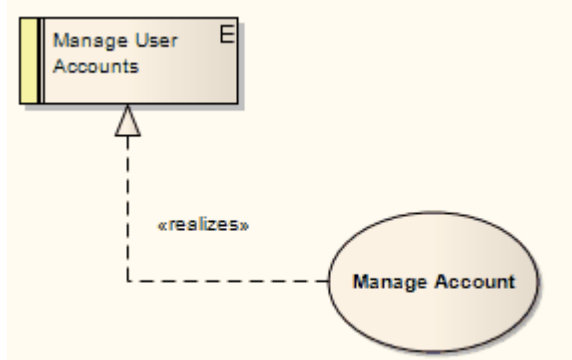

- External requirements can be displayed with or without an identifying **E** (for External) in the top right corner of the element; to toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page
- The colors on Requirement elements identify the status of the requirement; you change the status - and hence color - on the element Properties dialog, and set the color for each status on the Status Types dialog

### Toolbox icon

## Topics

Topic	Detail	See also
<b>Represent Requirements</b>	<p>In Enterprise Architect, a requirement can be modeled as an:</p> <ul style="list-style-type: none"> <li>• <b>External Requirement</b> - an expectation of the system or process, what the system or process must provide, modeled as an element; for example, a business requirement or a stakeholder request - Requirements at this level have their own properties and are reported on separately in document reports</li> <li>• <b>Internal requirement</b> – a responsibility of an existing element, what the element must do or accomplish, defined as a property of the element</li> </ul> <p>Requirements Management in Enterprise Architect is primarily concerned with external Requirement elements and the elements that implement or realize them.</p>	<a href="#">Requirements</a> <a href="#">Internal requirements</a>
<b>Requirements in the Model</b>	<p>Requirement elements can be grouped and organized within <b>Requirements diagrams</b>.</p> <p>The Requirement elements are connected to each other by <i>Aggregate</i> relationships to form a hierarchy:</p>  <p>It is quite usual to develop a package of many hundreds of Requirement elements, arranged individually and in hierarchies of varying complexity. In the Project Browser you can use the <b>Advanced   Turn On Level Numbering</b> option to highlight the order and arrangement of the Requirements quickly and easily.</p> <p>The following illustration shows a number of Requirements in a package, where Level Numbering makes the order and arrangement clear:</p>	<a href="#">Requirements Diagram</a> <a href="#">Turn On Level Numbering</a>

Topic	Detail	See also
	 <p>If elements are added, moved or deleted from the package, the numbering automatically adjusts.</p> <p>This numbering can also be applied in the <b>document report generator</b> using the <b>LevelNumber</b> field in the <i>Element</i> section – { <i>Element.LevelNumber</i> }.</p>	<a href="#">Design Custom Document Templates</a> <sup>[2684]</sup>
Use Cases	<p>Requirements are implemented (realized) by model elements such as Use Cases, Classes, Interfaces and Components. There are many ways to <b>trace</b> either the Requirement for the feature or service modeled by the elements, or the elements that develop the requirement, most visibly in <b>Traceability</b> diagrams that depict the Requirements and the model elements <b>connected</b> by Realize relationships. The Realize connector enables members of the project team to keep design objectives and development in tandem, and the development path and purpose clear.</p>  <p>The more usual realization relationship is between a Requirement and a Use Case. A Requirement can be realized by one or more Use Cases, and a Use Case can realize one or more Requirements.</p> <p>Whilst a Requirement defines a condition that must be met, the <b>Use Case</b> is the key to defining and visualizing how that condition is met. A <b>Use Case diagram</b> depicts the logical grouping of actions, processes and components to achieve a required result, and through the use of <b>Actor</b> elements also defines the user and/or system roles</p>	<a href="#">Trace: Tracking Dependencies</a> <sup>[723]</sup> <a href="#">Example Traceability Diagram</a> <sup>[743]</sup> <a href="#">Connector Requirement</a> <sup>[1779]</sup> <a href="#">Use Case</a> <sup>[1352]</sup> <a href="#">Use Case Diagram</a> <sup>[1201]</sup> <a href="#">Actor</a> <sup>[1284]</sup> <a href="#">Composite Element</a> <sup>[936]</sup> <a href="#">Sequence Diagram</a> <sup>[1249]</sup> <a href="#">Communication Diagram</a> <sup>[1255]</sup> <a href="#">Activity Diagram</a> <sup>[1199]</sup> <a href="#">State Machine Diagram</a> <sup>[1203]</sup> <a href="#">Create a Rule Flow Activity</a> <sup>[1826]</sup>

Topic	Detail	See also
	<p>participating in the process.</p> <p>Each Use Case (as a <b>composite element</b>) can contain a combination of child diagrams that define in greater detail how a particular activity or facility might be implemented - such diagrams include <b>Sequence, Communication, Activity, State Machine</b> and <b>Business Rule Flow</b> diagrams. The actual implementation of each Use Case is realized by Class, Component and Interface elements organized in their own diagrams. These realizations can also be captured and viewed in Traceability diagrams, depicting the full development pathway from initial requirement through to testing and production.</p>	

### 8.3.1 Requirements Diagram

A **Requirements diagram** is a custom diagram used to describe a system's requirements or features as a visual model. Each Requirement is defined as a Requirement element (a Custom element of type Requirement). The actual Requirement, as a text explanation, is the element name (short) or description (long) in the element properties.

Requirement elements can have relationships with other elements, such as other Requirements, Use Cases and Components, to illustrate how a requirement is satisfied by modeling and development. You can track the development arising from a specification or requirement using the Traceability window.

**Example Diagram** [Example Requirements Diagram](#) <sup>[1768]</sup>

#### Tools

You can create Requirements diagram elements and connectors by dragging them onto the diagram from the Requirements pages of the Toolbox.

Requirements Diagram Elements	Requirements Diagram Connectors
 Package	 Aggregate
 Requirement	 Inheritance
 Feature	 Associate
 Object	 Implements

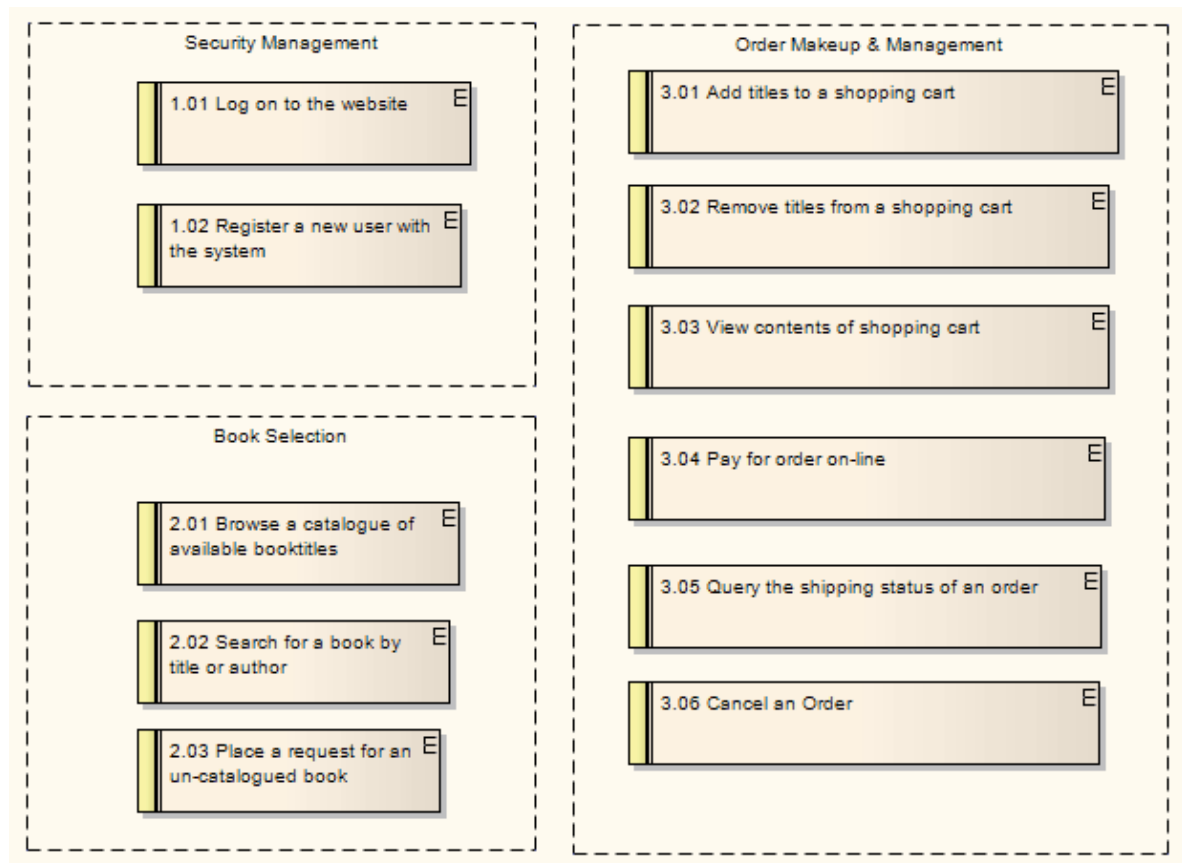

#### Learn more

- [Changes](#) <sup>[2633]</sup>
- [Issues \(Defects\)](#) <sup>[2631]</sup>

## 8.3.2 Feature

### Description

A *Feature* is a small, granular function or characteristic expressed in client-valued terms as a satisfaction of a requirement; for example: 'context-sensitive Help', or 'ability to reverse-engineer VB.Net'.

Features are the primary requirements-gathering artifact of the Feature-Driven Design (FDD) methodology. They define the product feature that satisfies what a Requirement element has formalized as a contractual, testable, expected deliverable (for example: requirement - 'every element must provide context-sensitive Help'; feature - 'every element provides context-sensitive Help'). One Feature might realize one or more

Requirements, and one Requirement might be realized by more than one Feature.

Features also have relationships with Use Cases. A Use Case defines the interaction a user has with the system in order to satisfy one or more Requirements. The Feature identifies the facility that provides the means for that interaction.

Feature elements are non-UML and are not related to the UML elements of the same name which are either BehavioralFeatures (operations, or methods) or StructuralFeatures (Ports, Parts and attributes).

Feature elements are available from the Requirements page of the Toolbox.

Feature elements can be displayed with or without an identifying **F** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page.

### 8.3.3 Internal Requirements

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Internal requirements in Enterprise Architect are element responsibilities. They are defined on the Requirements page of the element Properties dialog.</p> <p>Internal requirements form the functional requirements of the system to be built. The meaning of the requirement can vary depending on which element is the host; for example, a business process requirement might mean something different to a Use Case requirement, which again might mean something different to a Class requirement.</p> <p>For example, an internal responsibility to enable the user to login to the system has been defined for the Login Use Case. This is a responsibility of the Use Case - an action it is responsible for carrying out - and it applies only to this Use Case.</p> <p>The significant parameters (or, in Requirement Management terms, <i>attributes</i>) are the Type, Status, Difficulty and Priority. Whilst you can provide a detailed description of the responsibility in the <b>Notes</b> field, there is more scope in the name (<b>Requirement</b> field) to define the nature of the responsibility. An additional field, <b>Stability</b>, indicates the probability of the requirement changing; high stability means a low probability of change.</p>	<p><a href="#">Requirements</a><sup>[967]</sup></p> <p><a href="#">Make Internal Requirements External</a><sup>[1777]</sup></p> <p><a href="#">Scenarios &amp;</a></p>

Topic	Detail	See also
	<p>The example Use Case above also has connections to two external requirements, which are system functions that the Use Case implements either in full or in part. You can <b>convert</b> an internal responsibility into an external requirement.</p> <p>You can also create internal responsibilities for an element using the Scenarios &amp; Requirements window. A responsibility created in the window displays in the element Properties dialog, and vice versa.</p>	<a href="#">Requirements [992]</a>

### 8.3.3.1 Make Internal Requirement External

Elements in Enterprise Architect have internal requirements, or responsibilities (what they must do or accomplish). These can overlap or duplicate more formal requirements that the system in general must meet, so you might decide to make a single element's internal requirement into an external Requirement element (where the requirement can perhaps be implemented by multiple elements). You can make this conversion in one operation, using the **Move External** function.

#### Change an element's internal requirement into an external Requirement element

Step	Action	See also
1	Double-click on the element in a diagram or in the Project Browser. The element Properties dialog displays.	
2	Select the Requirements page.	
3	Locate and highlight the internal requirement.	
4	Click on the <b>Move External</b> button. The Browse Project dialog displays.	
5	Select the package to place the new requirement in.	
6	Click on the <b>OK</b> button.  A new Requirement element is created in the target package, with a Realization connector from the element to the Requirement.  In the Properties dialog, the requirement is now marked <i>external</i> and the dialog fields are grayed out. To edit its details, double-click on the requirement.	

#### Notes

- When an internal requirement is made into an external Requirement element, the **Stability** field and its value for the internal requirement are translated into the **Stability** Tagged Value in the external

Requirement

[Learn more](#)

- [Requirement Properties](#) 

## 8.4 Create Requirements

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Within Enterprise Architect you can create external Requirement elements in a number of ways, such as:</p> <ul style="list-style-type: none"> <li>• Typing or copy/pasting a text description into the body of the <b>Specification Manager</b></li> <li>• Dragging a <b>Requirement</b> icon from the Diagram Toolbox into a specific diagram</li> <li>• Generating an element within a specific package in the Project Browser</li> <li>• Dragging text from a text file onto a <b>diagram</b>, to generate a requirement based on that text - see below</li> <li>• Importing requirements from a spreadsheet application such as Excel, via CSV</li> <li>• Creating Requirement elements on the Package Browser or Diagram List for the selected package or diagram</li> <li>• Converting an internal element responsibility into an external element, in a selected target package</li> <li>• Importing requirements from another requirements management tool, such as <i>Telelogic DOORS</i> (in this case via the Sparx Systems <i>MDG Link For DOORS</i> integration tool)</li> </ul> <p>All methods that add a Requirement to a diagram or window also add the Requirement to the diagram's parent package in the Project Browser.</p>	<p><a href="#">Specification Manager</a> <sup>[1728]</sup></p> <p><a href="#">Requirements Toolbox</a> <sup>[814]</sup></p> <p><a href="#">Add Elements Directly To Packages</a> <sup>[903]</sup></p> <p><a href="#">Import Requirements using CSV</a> <sup>[1780]</sup></p> <p><a href="#">Package Browser</a> <sup>[673]</sup></p> <p><a href="#">Diagram List</a> <sup>[684]</sup></p> <p><a href="#">Converting an Internal Responsibility</a> <sup>[1771]</sup></p> <p><a href="#">Sparx Systems MDG Link For DOORS</a></p>

### Create Requirement elements from text

This procedure converts a text section heading into an element name and the section text into the element's Notes text. You can use this procedure to generate elements of a *range* of types; however, it is particularly useful for generating Requirements from a requirements specification document.

Step	Action	See also
1	Open a Requirements diagram in the Diagram View.	<a href="#">Requirements Diagram</a> <sup>[1767]</sup>
2	Open the document file containing the text you want to generate Requirement elements from (this can be opened in any common text editing tool).	
3	Highlight the required heading and associated text and drag them from the text file into the diagram.	<a href="#">Toolbox Shortcut</a>

Step	Action	See also
	The Toolbox Shortcut menu displays.	<a href="#">Menu</a> <sup>[799]</sup>
4	Navigate through the menus and select the required element type (in this case, click on <b>Common</b> and <b>Requirement</b> ).	
5	Enterprise Architect creates a (Requirement) element in the diagram, and displays the Properties dialog with the section heading in the <b>Name</b> (or equivalent) field and the text in the <b>Notes</b> field; the element is also added to the diagram's parent package.	

### Notes

- The Requirement element name can be simply descriptive text, with or without a manually-typed reference number; however, as requirements often have to have a unique reference for external checking, you can use the Enterprise Architect *auto-numbering* facility to automatically apply a numbering system with or without prefixes and suffixes - set the element type to **Requirement**
- External Requirement elements can be displayed on a diagram with or without an identifying **E** in the top right corner; to toggle display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page
- Requirement elements can be color coded on a diagram to indicate their status

### Learn more

- [Object Display Options](#)<sup>[634]</sup>
- [Set Auto Naming and Auto Counters](#)<sup>[904]</sup>
- [Color Code External Requirements](#)<sup>[1776]</sup>

## 8.4.1 Requirement Properties

Requirement properties differ slightly from the properties of other elements; they include information related to the Type, Status, Difficulty and Priority of the Requirement. The **Notes** field is also important, as it describes precisely what requirement the element represents. Requirement naming can also require careful consideration and could reflect either a categorical naming convention, or simply a loose English description of the Requirement.

**Access**    **Requirement element context menu | Properties**

### Use to

- Document requirements
- Set Requirement features such as Type, Status and Priority
- Set other element properties common to both Requirements and other model elements

### Reference

Properties Window

	<p>the Properties window, and might not be shown in the drop-down list (if it is a stereotype and not a General Type)</p> <ul style="list-style-type: none"> <li>If you select a different value from the <b>Type</b> drop-down list, you change only the first of the multiple values (the one displayed in the field); you do not change any of the other multiple values, which remain set</li> </ul>	
<b>Phase</b>	The phase of this Requirement.	
<b>Version</b>	The version of this Requirement.	
<b>Last Update</b>	Read-only field specifying when this Requirement was last changed.	
<b>Created</b>	Read-only field specifying when this Requirement was first created.	
<b>Notes</b>	The description of this Requirement.	<a href="#">Note Editors</a> <sup>[1142]</sup> <a href="#">Linked Documents</a> <sup>[1044]</sup>

### Notes

- In Requirement Management tools and texts, the characteristics of a requirement are commonly called attributes; however, in UML the term *attribute* refers to a different type of feature, and the Requirement characteristics are defined as *properties* - in this Enterprise Architect documentation, the term *properties* is used
- In a project, it might be necessary to define more information in a Requirement than is provided by the standard properties; for more information on extending the Requirement properties, see the *Extend Requirement Properties* topic

- [Extend Requirement Properties](#) <sup>[1777]</sup>

## 8.4.2 Color Code External Requirements

External requirements can be color coded on a diagram, to provide quick visual cues indicating the status of a requirement. The color code requirements use the following default conventions:

- Yellow for **Proposed**
- Blue for **Approved**
- Green for **Validated**
- Orange for **Mandatory**
- Black for **Implemented**

You can change these colors, and add or remove status types, using the Status Types dialog.

#### Enable color coded external requirements

Step	Action
1	Select the <b>Tools   Options</b> menu option. The Options dialog displays.
2	From the hierarchical tree select <b>Objects</b> , and select the <b>Show status colors on diagrams</b> checkbox to enable the status of external requirements to be represented by color coding.

#### Learn more

- [Status Types Dialog](#)<sup>[1159]</sup>

### 8.4.3 Extend Requirement Properties

#### Topics

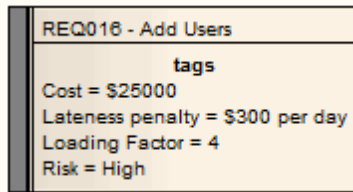

Topic	Detail	See also
<b>Introduction</b>	<p>A project might apply further properties to a requirement, such as cost, lateness penalty or risk to the business if not met. You can add these properties to specific Requirement elements, or configure them to be automatically available in all Requirement elements on creation, using <b>Tagged Values</b>. (These are sometimes referred to as User-defined attributes.)</p> <p>Extended element properties are not visible unless you open the Tagged Values window for the element. Alternatively, you can display</p>	<p><a href="#">Tagged Values</a><sup>[1134]</sup></p> <p><a href="#">Display Tagged Values on Diagrams</a><sup>[1778]</sup></p>

Topic	Detail	See also
	the additional properties on the element image on its diagrams.	
<b>Add Tagged Values to Existing Requirements</b>	<p>To add a property to a single Requirement as a Tagged Value, simply click on the Requirement, display the Tagged Values window ( <b>Ctrl+Shift+6</b> ), and enter the name of the property as the tag name and the value of the property as the tag value.</p> <p>It is likely that any property you add to one Requirement would also apply to others. You might therefore use a predefined Tagged Value Type to identify your Requirement property, so that you can select it whenever required. The predefined Tagged Value Type also enables you to define specific values for the Tagged Value.</p> <p>If the appropriate predefined Tagged Value Type does not exist, a Technology Developer can create it to add to the <b>structured tags</b>, <b>reference tags</b>, or <b>customized tags</b> collections.</p>	<a href="#">Assign a Tagged Value to an Item</a> <sup>[1137]</sup> <a href="#">Create Structured Tagged Values</a> <sup>[1622]</sup> <a href="#">Create Reference Date Tagged Values</a> <sup>[1628]</sup> <a href="#">Create a Custom Tagged Value Type</a> <sup>[1628]</sup>
<b>Configure Requirements to be Created With Extended Properties</b>	<p>If it is necessary to create all Requirements with the same extended set of properties, you can create a Requirement Template diagram and either create a special Requirement that defines those properties (as Tagged Values), or drag an existing Requirement with those properties onto the diagram. You then set the Requirement Template diagram as the template for all new Requirement elements, so that those new Requirements automatically have all of the properties you want.</p> <p>However, this then excludes other Requirement element formats, including the standard Requirement format. If you want to use another Requirement format, you have to replace or cancel the current Template. Alternatively, you can create a Profile.</p> <p>A Profile also defines exactly what a new Requirement element should contain, and how it should display in diagrams. However, a Profile is a collection of alternative element definitions, so it does not override the default Requirement format, nor does it prevent you from defining several different types of Requirement element. You can therefore have separate and parallel definitions of elements for business requirements, system requirements, project requirements, or any other category of requirement you decide to work with.</p> <p>For information on importing and using existing Profile files, see the <i>UML Profiles</i> topic. For information on creating new Profiles, see the <i>Developing Profiles</i> topic.</p>	<a href="#">Set Element Template Package</a> <sup>[929]</sup> <a href="#">Using UML Profiles</a> <sup>[1472]</sup> <a href="#">Developing Profiles</a> <sup>[1485]</sup>

#### 8.4.4 Display Tagged Values On Diagrams

##### Topics

Topic	Detail	See also
<b>Usage</b>	If you have extended the properties of a Requirement, you might want to make those properties visible in the Requirement elements in your diagrams, by switching on display of the element tags compartment.	

Topic	Detail	See also
	<p>You can do this in one of two ways:</p> <ul style="list-style-type: none"> <li>To display the <i>tags</i> compartment on all elements on a diagram, double-click on the diagram background and select the Elements tab of the Diagram Properties dialog; select the <b>Tags</b> checkbox and click on the <b>OK</b> button</li> <li>To display the <i>tags</i> compartment on a specific element on a diagram, right-click on the element and select the <b>Feature Visibility</b> context menu option; select the <b>Tags</b> checkbox in the Show Element Compartments panel of the Feature Visibility dialog, and click on the <b>OK</b> button</li> </ul> <p>The Tagged Values are then displayed in the Requirement element on the diagram.</p>

## 8.4.5 Connect Requirements

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>A Requirement element can be connected to other Requirements, most commonly using <b>Aggregate relationships</b> to form a hierarchy of requirements.</p> <p>Requirements are also connected to other types of element, most commonly Use Cases, by <b>Realize or Implements</b> relationships.</p> <p>These relationships are very important, both in identifying how the Requirements are organized and used in the model, and in <b>tracing</b> the development from the Requirements throughout the model. Both of these tasks are very simple in Enterprise Architect, because once a connector on a Requirement exists, Enterprise Architect automatically lists the Requirement in the:</p> <ul style="list-style-type: none"> <li>Requirements Traceability window (an important tool in examining the role of Requirements in the model)</li> <li>Specification Manager</li> </ul>	<a href="#">Aggregate relationships</a> <sup>[1392]</sup> <a href="#">Realization</a> <sup>[1440]</sup> <a href="#">Trace Requirements</a> <sup>[1784]</sup> <a href="#">Traceability</a> <sup>[725]</sup> <a href="#">Specification Manager</a> <sup>[1728]</sup> <a href="#">Requirements</a> <sup>[961]</sup> <a href="#">Requirement Properties</a> <sup>[1774]</sup> <a href="#">Scenarios &amp;</a>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>Requirements tab of the target element Properties dialog</li> <li>Links tab of the Requirement element Properties dialog</li> <li>Scenarios &amp; Requirements window</li> <li>Relationships Window</li> <li>Dependency and Implementation reports</li> <li>Standard document output</li> </ul> <p>The connector itself is also listed in the Links tab of the target element Properties dialog, and in the Relationship Matrix. There are, therefore, many ways to locate, view and track Requirement relationships.</p>	<a href="#">Requirements</a> <sup>[992]</sup> <a href="#">Relationships Window</a> <sup>[742]</sup> <a href="#">Dependency</a> <sup>[2739]</sup> <a href="#">Implementation reports</a> <sup>[2737]</sup> <a href="#">Document Reports</a> <sup>[2640]</sup> <a href="#">Links</a> <sup>[964]</sup> <a href="#">Relationship Matrix</a> <sup>[727]</sup>
<b>Connect On Diagram</b>	<p>Relationships can be created on a diagram by clicking on the appropriate connector icon from the Requirement and Common pages of the Toolbox, clicking on the source (originating) element, and dragging to the target element.</p> <p>If you are connecting elements in different packages, you can drag elements from the Project Browser onto a common diagram and set up the relationships there.</p>	<a href="#">Requirement Toolbox</a> <sup>[814]</sup> <a href="#">Common Page</a> <sup>[800]</sup>
<b>Quick Generation Of Realize Connector</b>	<p>You can quickly generate a Realize connector by dragging an existing Requirement element from the Project Browser into a diagram, over the element that implements the Requirement (usually a Use Case).</p> <p>Enterprise Architect interprets this as a request to create the Realize connector and does so automatically. The Requirement element is not added to the diagram. However, if you subsequently drag the Requirement onto the diagram the connector is already in place.</p>	
<b>Connect Off Diagram</b>	<p>You can also connect a Requirement element to other elements without necessarily having the elements on the same diagram, or having a diagram open.</p> <p>Use the Relationship Matrix to <b>create relationships</b> for requirements; this is a convenient way of quickly building up complex relationships and hierarchies.</p>	<a href="#">Creating Relationships</a> <sup>[737]</sup>

### 8.4.6 Import Requirements and Hierarchies in CSV

#### Topics

Topic	Detail	See also
<b>Usage</b>	You can import Requirements from a spreadsheet application in CSV format. Before doing this you must create a CSV import file specification that:	

Topic	Detail	See also
	<ul style="list-style-type: none"><li>• In the <b>Default Types</b> field has the value <b>requirement,package</b> to import requirements and a package structure to contain them</li><li>• Has the <b>Preserve Hierarchy</b> checkbox selected</li><li>• Identifies the data fields on the spreadsheet that are to be translated into Enterprise Architect, in the order in which they are plotted across the spreadsheet</li><li>• Is to operate on a spreadsheet containing the <b>CSV_KEY</b> and <b>CSV_PARENT_KEY</b> fields (which, if not generated by a CSV export from Enterprise Architect, you have added and populated yourself)</li></ul> <p>This enables you to import the individual and grouped requirements from the spreadsheet into Enterprise Architect, and to reconstruct the hierarchies of Requirements in the target package in the Project Browser.</p>

## 8.5 Manage Requirements

One of the main advantages of managing Requirements in Enterprise Architect is that you can display many different aspects of information on the Requirements, from overall organization and location through lists, current status, general properties, detailed individual notes and specific properties, to relationships and dependencies with other elements in the model.

As most of these aspects are displayed in dockable windows, you can review the Requirements from several different perspectives simultaneously in the Enterprise Architect work area, as shown below:

### Example

This display shows the position of the *Store User Details* Requirement element in the model, and how it relates to other Requirements (Project Browser); the default characteristics of the Requirement (Package Browser) and the extended characteristics (Tagged Values window), and a detailed description of the Requirement (Notes window). You can configure some of these windows to display more information, and/or use other windows and facilities.

### Learn more

- [View Requirements](#) <sup>[1783]</sup>
- [Specification Manager](#) <sup>[1728]</sup>
- [Trace Use of Requirements](#) <sup>[1784]</sup>
- [Manage Requirement Changes](#) <sup>[1785]</sup>
- [Report on Requirements](#) <sup>[1787]</sup>

### 8.5.1 View Requirements

Use the following windows and facilities to: locate and list Requirement elements in the model; add, move and delete the elements; display and edit the properties and characteristics of individual elements; and generate reports on packages or specific elements.

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Use the following windows and facilities to: locate and list Requirement elements in the model; add, move and delete the elements; display and edit the properties and characteristics of individual elements; and generate reports on packages or specific elements.</p> <ul style="list-style-type: none"> <li>• <b>Project Browser</b> - shows the content and structure of your model</li> <li>• <b>Specification Manager</b> - shows Requirements (and other element types) in a simple text format, and helps you to create and manage these elements</li> <li>• <b>Diagram List</b> - lists the elements in a diagram, filtered and sorted according to the settings you define; shows all or selected default properties of each element</li> <li>• <b>Package Browser</b> - lists the elements in a package, filtered and sorted according to the settings you define; shows all or selected default properties of each element</li> <li>• <b>(Requirements) Diagram</b> - shows the arrangement of a group of Requirements, and can show whether the elements are in the same package or different packages</li> <li>• <b>Model Search</b> - enables you to locate Requirements in general in the model, or specific Requirement elements, according to the search criteria you use</li> <li>• <b>Model Views</b> - enables you to maintain links to commonly-used elements, and to rapidly show developments and changes in (Requirement) package contents through either reports or slide shows of selected diagrams</li> <li>• <b>Properties</b> - shows every standard property of a selected element, whether updated by the user or maintained automatically by the system</li> <li>• <b>Tagged Values</b> - shows extended properties of a selected Requirement element</li> <li>• <b>Element Browser</b> - shows every added-on property, such as attributes, operations, Tagged Values and constraints</li> <li>• <b>Notes</b> - displays the detailed description of a requirement, and any other additional information recorded on the requirement</li> </ul>	<p><a href="#">Project Browser</a> <sup>[646]</sup></p> <p><a href="#">Specification Manager</a> <sup>[1728]</sup></p> <p><a href="#">Diagram List</a> <sup>[684]</sup></p> <p><a href="#">Package Browser</a> <sup>[673]</sup></p> <p><a href="#">Requirements Diagram</a> <sup>[1767]</sup> <sup>[784]</sup></p> <p><a href="#">Model Search</a> <sup>[700]</sup></p> <p><a href="#">Model Views</a> <sup>[686]</sup></p> <p><a href="#">Properties</a> <sup>[992]</sup></p> <p><a href="#">Tagged Values</a> <sup>[1134]</sup></p> <p><a href="#">Element Browser</a> <sup>[989]</sup></p> <p><a href="#">Notes</a> <sup>[1142]</sup></p>

## 8.5.2 Trace Use of Requirements

Having investigated the representation of requirements in your model, you could review either how they have been used to direct development through the model, or how a particular development was initiated. The windows and facilities you might use to follow development from Requirements are briefly described here; detailed information is also available in the *Traceability* topics.

The significant feature in tracing Requirements and development is the **connectors** between the elements.

### Facilities

Facility	Detail	See also
<b>Relationships Window</b>	Using the Relationships window, you can quickly identify every relationship of which a selected Requirement element is a member and the partner element in that relationship, whether or not the relationship is visible in the current diagram. If the partner element is not in the diagram, you have the option of adding it.	<a href="#">Relationships Window</a> <sup>[742]</sup>
<b>Traceability Window</b>	<p>The Traceability window is a very useful tool in showing chains of relationships that include the selected element. The window can show, for example, that:</p> <ul style="list-style-type: none"> <li>Requirement A is realized by a Use Case X, and</li> <li>Use Case X also realizes Requirement B, and</li> <li>Requirement B in turn is also realized by Use Case Y</li> </ul> <p>You can control the type and extent of these relationship chains. As the system checks the connectors and partner elements of every relationship within the limits you impose, if you specify broader limits the system can take some time to produce the final results.</p>	<a href="#">Traceability window</a> <sup>[725]</sup>
<b>Relationship Matrix</b>	The Relationship Matrix is a significant tool in mapping the relationships between the Requirements elements in a Package and other elements in either that Package or a different Package. Where a relationship is missing, you can add it; if an existing relationship is misplaced, you can delete it.	<a href="#">Relationship Matrix</a> <sup>[727]</sup>
<b>Requirements tab, Properties dialog</b>	On the Properties dialog for elements other than Requirements - particularly Use Cases - the Requirements tab shows all internal responsibilities and external Requirement elements attached to the element.	<a href="#">Properties Dialog</a> <sup>[956]</sup> <a href="#">Requirements</a> <sup>[967]</sup>
<b>Scenarios &amp; Requirements Window</b>	The Scenarios & Requirements window - as for the Properties dialog - shows the Requirements and responsibilities of the selected element, and the scenarios and constraints under which the Requirements are being realized.	<a href="#">Scenarios &amp; Requirements</a> <sup>[992]</sup>
<b>Validation</b>	It is useful to review the way that you have modeled your requirements, to check that they are correctly set up and connected to other elements. The Validation facility has a number of configuration	<a href="#">Model Validation</a> <sup>[2594]</sup>

Facility	Detail	See also
	options for validating various aspects of model development, as well as an option for specifically validating Requirements Management. This can reveal, for example, which of your Requirement elements do not yet have a Realization connector.	

#### Learn more

- [Connect Requirements](#)<sup>[1779]</sup>

### 8.5.3 Manage Requirement Changes

Because requirements are statements of what a system or process must do or provide, they have a great impact on the modeling and development of the system. A new requirement might initiate an extensive program of work, and changes to or removal of that requirement can therefore have a major effect on the model. Issues concerning requirements, and changes to Requirement elements, must both be carefully managed.

The first steps in managing changes to requirements would be to raise **specific Issue** and **Change** request items against the Requirement element. You could monitor the appearance of these items using the filtered searches of the **Model Views**. You might then **review** the Requirement properties and/or its relationship hierarchies. During model development, you might capture periodic **Baselines** and use these to review the changes and, if necessary, roll them back to a previous point. You might also use the **Auditing** facility to monitor changes as they are made, and to ensure that no unauthorized or potentially risky changes are being made in the model.

#### Facilities

Facility	Detail	See also
<b>Changes and Issues</b>	<p>A change is, very broadly, an item defining an addition or alteration to a requirement. An issue identifies either a failure to meet a requirement, or a risk in meeting the requirement.</p> <p>Changes and issues can arise in development at a number of levels, being raised for problems that apply system-wide down to within a specific element. There are two mechanisms that can be used to identify a change or issue, and the work required to resolve it:</p> <ul style="list-style-type: none"> <li>• <b>Change and Issue</b> (or Defect) elements - structured comments that identify a problem at system-level, although they can also be attached to a specific element from which a problem arises. Both types of element resemble the Requirement element, and can be linked to one or more other elements that have to be reviewed, with relationships such as Association, Dependency and Realize. The two types of element can also form hierarchies or groups, where complex problems arise</li> <li>• <b>Maintenance items</b> raised against a specific element, and recorded for that element in the <b>Maintenance</b> window. Maintenance items enable the distinction between Defects (a failure to meet a requirement) and Issues (a risk factor that might affect satisfying the requirement). They also include Tasks, which record work items associated with the element</li> </ul>	<p><a href="#">Changes</a><sup>[2633]</sup></p> <p><a href="#">Issues (Defects)</a><sup>[2631]</sup></p> <p><a href="#">Maintenance</a><sup>[2619]</sup></p> <p><a href="#">Working on Maintenance Items</a><sup>[2623]</sup></p> <p><a href="#">Create an Element From a Maintenance Item</a><sup>[2629]</sup></p>

Facility	Detail	See also
	Maintenance items are very specific, but if there is a possibility of an item having a wider impact on other elements or the system in general, you can <b>translate the item</b> into a Change or Issue element, or any other type of element that best identifies the problem and its solution.	
<b>Model Views</b>	<b>Model Views</b> are very useful for trapping changes and issues in the model, especially on Requirements. You can set up searches to identify the appearance of new Change or Issue elements, or to detect changes in the properties of the Requirement elements themselves.	<a href="#">Model Views</a> <sup>[686]</sup>
<b>Baselines</b>	<p>A <b>Baseline</b> is a snapshot of a package or a model branch at a particular point in time, which you determine. You can use the Baseline as a distribution mechanism for changes to the model, but the main use is to enable you to compare the current model with a previous stage, and detect what changes have been made since the Baseline was captured.</p> <p>If you do not want a change to remain in the model, you can roll the affected elements back to the state they had in the Baseline. Therefore, if you maintain your requirements in a specific package or branch, you can capture Baselines of the package and ensure that changes conform to your change management process or, if not, can be reversed.</p>	<a href="#">Baselines</a> <sup>[459]</sup>
<b>Auditing</b>	<p>The <b>Auditing</b> facility enables you to capture any changes made to your model within the selection criteria that you define. You can, for example, configure the Auditing facility to specifically record <b>changes to Requirement</b> elements.</p> <p>As auditing is continuously monitoring, you can detect changes as they are made, and verify that they are acceptable. You can also store the log of changes, and review it later on.</p> <p>Note that you cannot reverse the changes automatically, as you can with Baselines. You might therefore use Auditing to identify changes to investigate more fully and - if necessary - reverse in a Baseline comparison.</p>	<a href="#">Auditing</a> <sup>[446]</sup> <a href="#">Auditing Settings</a> <sup>[448]</sup>

## 9 Domain Based Models

Enterprise Architect provides specific modeling tools for a range of specialized model types, as outlined below.

Enterprise Architect also provides an additional set of extended diagrams and a set of inbuilt and extension stereotype elements for more general use, and supports you in developing your own modeling languages.

Topic	Detail	See also
<b>ODM</b>	Enterprise Architect enables you to develop large-scale ontologies within the fully-integrated modeling environment, for your project domain.  ODM helps you to develop a formalized representation of business semantics and taxonomies, and a knowledge representation based on those formalizations.	<a href="#">MDG Technology for ODM</a> <sup>[1971]</sup>
<b>Requirements</b>	Enterprise Architect is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model.	<a href="#">Requirement Models</a> <sup>[1726]</sup>
<b>Business Modeling</b>	Modeling the business process is an essential part of any software development process, enabling the analyst to capture the broad outline and procedures that govern what it is a business does.	<a href="#">Business modeling</a> <sup>[1807]</sup>
<b>Business Rules</b>	Business Rule modeling captures the rules that govern a business, and their relationships with the entities and specific tasks within the organization or system.	<a href="#">Modeling Business Rules</a> <sup>[1814]</sup>
<b>BPMN</b>	The Business Process Modeling Notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles; these profiles enable you to develop BPMN diagrams quickly and simply.	<a href="#">BPMN modeling</a> <sup>[1845]</sup>
<b>BPEL</b>	Business Process Execution Language is an executable language for specifying interactions with Web Services.  Enterprise Architect uses the BPMN profile as a graphical front-end to capture BPEL Process descriptions.	<a href="#">BPEL modeling</a> <sup>[1870]</sup>

<b>SysML</b>	SysML is a general-purpose graphical modeling language for specifying, analyzing, designing, and verifying complex systems that might include hardware, software, information, personnel, procedures and facilities.	<a href="#">Systems Engineering (SysML)</a> <sup>[2288]</sup>
<b>Data Modeling</b>	Enterprise Architect provides easy-to-use tools for building and maintaining all of the fundamental data models - Conceptual, Logical and Physical; because Enterprise Architect lets you visualize each type of data model in the same repository, you can easily manage dependencies between each level of abstraction.	<a href="#">Data Models</a> <sup>[1937]</sup>
<b>XSD</b>	Enterprise Architect supports rapid modeling, forward engineering and reverse engineering of W3C XML schemas (XSD), critical for the development of a complete Service Oriented Architecture (SOA).	<a href="#">XML Schema modeling (XSD)</a> <sup>[2387]</sup>
<b>WSDL</b>	Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of W3C XML Web Service Definition Language (WSDL), critical for the development of a complete Service Oriented Architecture (SOA).	<a href="#">Web Service modeling (WSDL)</a> <sup>[2423]</sup>
<b>SPEM</b>	The Software and Systems Process Engineering Meta-model (SPEM) is a conceptual framework for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes.  SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM.	<a href="#">Software Process modeling (SPEM)</a> <sup>[1919]</sup>
<b>ArchiMate</b>	ArchiMate is an open-standard enterprise architecture language based on the IEEE 1471 standard, providing a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure.  It enables Enterprise Architects to clearly describe, analyse and visualize the relationships among business domains.	<a href="#">ArchiMate</a> <sup>[1926]</sup>
<b>ArcGIS</b>	ArcGIS is a suite of Geographic Information Systems (GIS) software products developed by Esri.	<a href="#">Geodatabase Design for ArcGIS</a> <sup>[1944]</sup>
<b>Data Flow Diagrams</b>	A data flow diagram (DFD) is a graphical representation of the flow of data through an information system, and can also be used to visualize data processing (structured design).  Developing a DFD helps in identifying the transaction data	<a href="#">Data Flow Diagrams</a> <sup>[1797]</sup>

	in the data model.	
<b>Entity Relationship Diagrams</b>	<p>Entity-relationship modeling is an abstract and conceptual database modeling method, used to produce a schema or semantic data model of, for example, a relational database and its requirements, visualized in Entity-Relationship Diagrams (ERDs).</p> <p>ERDs in Enterprise Architect assist you in building conceptual data models through to generating Data Definition Language (DDL) for the target DBMS.</p>	<a href="#">Entity Relationship Diagrams</a> <sup>[1939]</sup>
<b>Eriksson-Penker Extensions</b>	<p>Eriksson-Penker extensions provide a framework for UML business processing model extensions, to which an Enterprise Architect can add stereotypes and properties appropriate to their business..</p> <p>In Enterprise Architect, the Eriksson-Penker profile provides, through a set of stereotypes, a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization.</p>	<a href="#">Eriksson-Penker Extensions</a> <sup>[1929]</sup>
<b>Group of Four Patterns</b>	<p>Gang of Four (GoF) Patterns are 23 classic software design patterns providing recurring solutions to common problems in software design.</p> <p>Enterprise Architect provides each pattern through an icon in the Diagram Toolbox.</p>	<a href="#">GoF Patterns</a> <sup>[2285]</sup>
<b>ICONIX</b>	<p>The ICONIX Process is a streamlined approach to Use Case driven UML modeling that uses a core subset of UML diagrams and techniques to provide thorough coverage of object-oriented analysis and design.</p> <p>Its main activity is robustness analysis, a method for bridging the gap between analysis and design.</p>	<a href="#">ICONIX</a> <sup>[2282]</sup>
<b>Mind Mapping</b>	<p>A Mind Map is an image-centered diagram used to represent semantic or other connections between words, ideas, tasks or other items arranged radially around a central key word or idea.</p> <p>A Mind Map is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing.</p>	<a href="#">Mind Mapping</a> <sup>[1794]</sup>
<b>SoaML</b>	Service Oriented Architecture (SOA) is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results.	<a href="#">SoaML</a> <sup>[2449]</sup>
<b>SOMF</b>	The service-oriented modeling framework (SOMF) is a	<a href="#">SOMF 2.1</a> <sup>[2454]</sup>

	service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling.	
<b>Extended Diagrams</b>	<p>Enterprise Architect provides an additional set of diagram types that extend the core UML diagrams for domain-specific models.</p> <p>Also, the specialized modeling tools listed in the first part of this table each have their own specialized diagrams.</p>	<a href="#">Analysis Diagram</a>  1801 <a href="#">Custom Diagram</a>  1796 <a href="#">Requirements Diagram</a>  1767 <a href="#">Maintenance Diagram</a>  2634 <a href="#">User Interface Diagram</a>  1990 <a href="#">Database Diagram</a>  1943 <a href="#">Business Modeling and Business Interaction Diagrams</a>  1805
<b>Inbuilt and Extension Stereotypes</b>	Behavioral and Structural elements can be extended through the use of stereotypes; Enterprise Architect provides a number of inbuilt extensions.	<a href="#">Inbuilt and Extension Stereotypes</a>  1997
<b>Build Your Own Modeling Language</b>	Enterprise Architect enables you to extend the scope both of your modeling and of the UML components you use, through the use of stereotypes, profiles and patterns to develop your own modeling applications.	<a href="#">Defining a Modeling Language</a>  1483

## 9.1 Domain Based Diagrams

In addition to diagrams defined by the UML, Enterprise Architect provides some extended diagram platforms to model business processes or develop custom diagrams.

Diagram Type	Detail	See also
<b>Analysis Diagram</b>	An Analysis diagram is a simplified Activity diagram, which is used to capture high level business processes and early models of system behavior and elements.	<a href="#">Analysis Diagram</a>

### 9.2.1 Mind Mapping

The following text is derived from the **Mind Map** entry in the online Wikipedia.

*A Mind Map is a diagram used to represent words, ideas, tasks or other items linked to and arranged radially around a central key word or idea. It is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing.*

*A Mind Map is an image-centered diagram that represents semantic or other connections between portions of information. By presenting these connections in a radial, non-linear graphical manner, it encourages a brainstorming approach to any given organizational task, eliminating the hurdle of initially establishing an intrinsically appropriate or relevant conceptual framework to work within.*

*The elements are arranged intuitively according to the importance of the concepts and are organized into groupings, branches, or areas. The uniform graphic formulation of the semantic structure of information on the method of gathering knowledge, may aid recall of existing memories.*

The use of the term Mind Maps is trademarked in the UK and the USA by The Buzan Organization, Ltd.

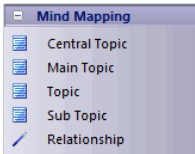

### Mind Mapping in Enterprise Architect

Within Enterprise Architect you can develop Mind Maps quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Mind Mapping facilities are provided in the form of:

- A Mind Mapping **diagram type**, accessed through the New Diagram dialog
- A Mind Mapping **page in the Toolbox**
- Mind Mapping **element** and **relationship** entries in the **Toolbox Shortcut Menu** and **Quick Linker**

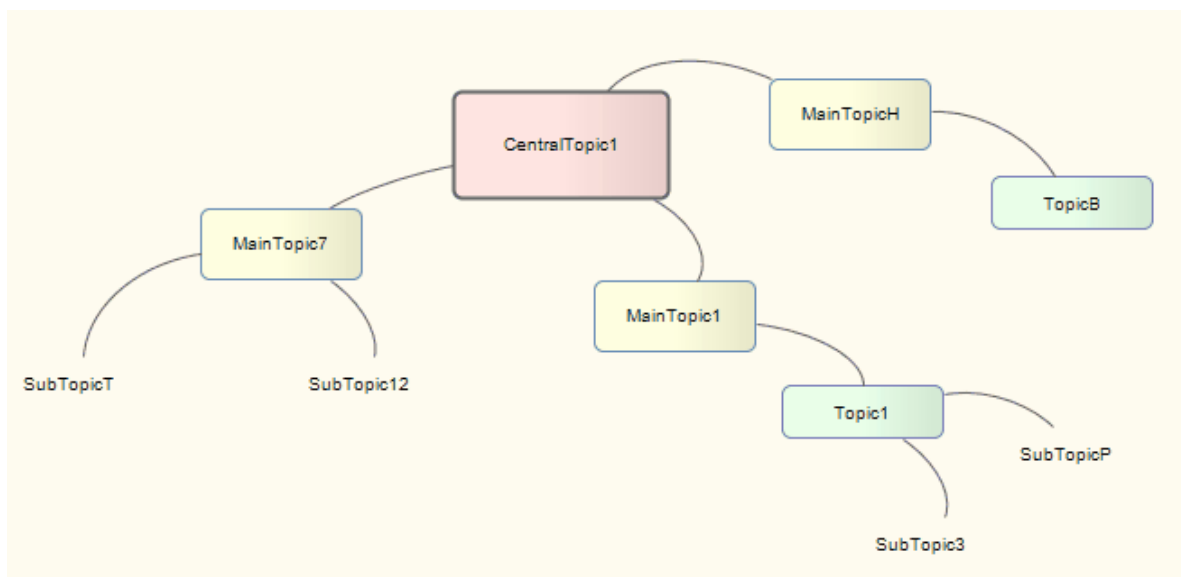

Access    **Diagram | Diagram Toolbox: More Tools | Mind Mapping**

#### Mind Mapping Toolbox Page

Page Appearance	Description	See also
	<ul style="list-style-type: none"><li>• <b>Central Topic</b> is the main theme of the Mind Map; you would normally have one or two of these on the diagram, but can add as many as are necessary</li><li>• <b>Main Topic</b> represents the immediate concepts generated by the Central Topic</li><li>• <b>Topic</b> represents the larger divisions of a Main Topic</li><li>• <b>Sub Topic</b> represents the finer divisions of a Topic or Main Topic; you could also have Subtopics of Subtopics to represent increasingly finer distinctions</li><li>• <b>Relationship</b> represents the connection between any two elements; you can have several Relationships per element</li></ul> <p>Each relationship has three anchor points, so you can curve the lines to develop the flow of concepts more easily</p>	

#### Mind Map Diagram

This is the general appearance of a Mind Mapping diagram.

As the elements can represent any concept, object or relationship, you can use the full range of element properties and features to expand on what the element represents, including adding Note elements. However, to preserve the simplicity and readability of the diagram itself, you cannot display the element compartments on the diagram.

### Disable Mind Mapping

If you prefer not to use Mind Mapping in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

### Learn more

## 9.2.2 Custom Diagram

A **Custom diagram** is an extended Class diagram that is used to capture requirements, user interfaces or custom-design models.

Custom models provide a few extensions to the UML model and enable some exploratory and non-rigorous experimentation with model elements and diagrams.

### Tools

Select Custom diagram elements and connectors from the Custom pages of the Toolbox.

Custom Diagram Elements	Custom Diagram Connectors
 Package	 Associate
 Requirement	 Aggregate
 Issue	 Generalize
 Change	 Realize
 Screen	 Nesting
 UI Control	
 Test Case	
 Entity	

### 9.2.3 Data Flow Diagrams

The following text is derived from the **Data Flow Diagram** entry in the online Wikipedia.

*A data flow diagram (DFD) is a graphical representation of the "flow" of data through an information system. A data flow diagram can also be used for the visualization of data processing (structured design). It is common practice for a designer to draw a context-level DFD first which shows the interaction between the system and outside entities. This context-level DFD is then "exploded" to show more detail of the system being modeled.*

*Data flow diagrams were invented by Larry Constantine ... based on Martin and Estrin's "data flow graph" model of computation. ( They ) are one of the three essential perspectives of Structured Systems Analysis and Design Method SSADM. The sponsor of a project and the end users will need to be briefed and consulted throughout all stages of a system's evolution. With a dataflow diagram, users are able to visualize how the system will operate, what the system will accomplish, and how the system will be implemented. The old system's dataflow diagrams can be drawn up and compared with the new system's dataflow diagrams to draw comparisons to implement a more efficient system.*

*Developing a DFD helps in identifying the transaction data in the data model.*

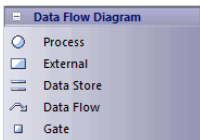

**[Access](#) [Diagram](#) | [Diagram Toolbox: More Tools](#) | [Data Flow Diagrams](#)**

**[Data Flow Diagrams in Enterprise Architect](#)**

Within Enterprise Architect, you can develop Data Flow diagrams quickly and simply through use of an MDG Technology integrated with the Enterprise Architect installer. The Data Flow diagram facilities are provided in the form of:

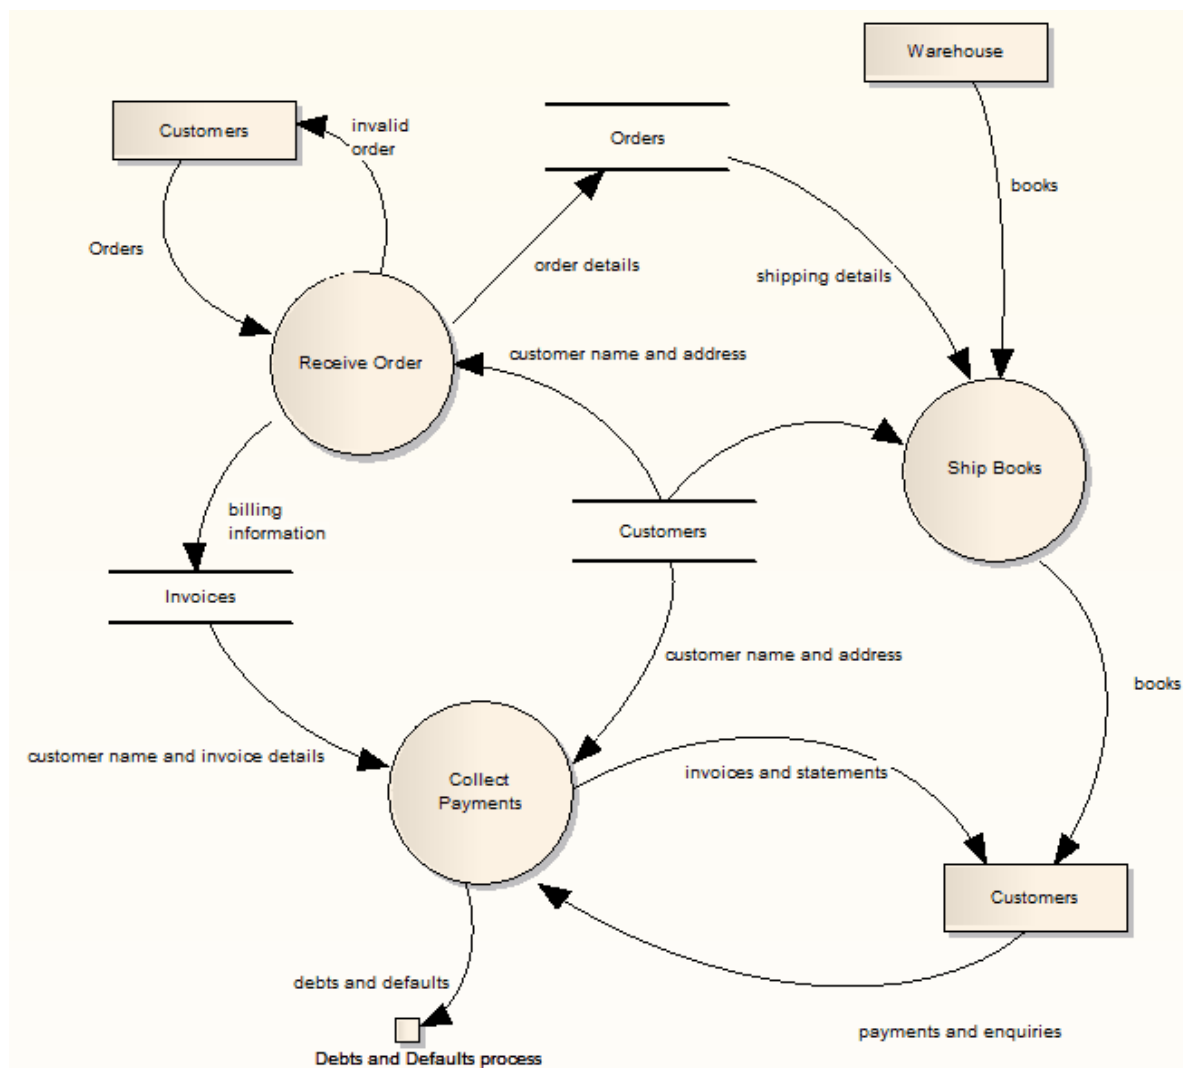

- A Data Flow diagram type, accessed through the New Diagram dialog
- A Data Flow Diagram page in the Toolbox
- Data Flow element and relationship entries in the Toolbox Shortcut Menu and Quick Linker

#### Data Flow Diagram Toolbox Page

Page Appearance	Description	See also
	<ul style="list-style-type: none"><li>• <b>Process</b> is a process or activity in which data is used or generated</li><li>• <b>External</b> represents an external source, user or repository of the data</li><li>• <b>Data Store</b> represents an internal physical or electronic repository of data, into and out of which data is stored and retrieved</li><li>• <b>Data Flow</b> (connector) represents how data flows through the system, in physical or electronic form</li><li>• <b>Gate</b> represents the termination point of incoming and outgoing messages on a lower level diagram (that is, messages to and from processes depicted elsewhere)</li></ul>	

#### Data Flow Diagram Appearance

When dragged onto a Data Flow diagram, the elements and relationships have the following appearances:

To preserve the simplicity and readability of the diagram, you cannot display the element compartments on the diagram.

### Context Diagram

A *Context* diagram is a top-level Data Flow diagram that has just one Process element representing the system being modeled, showing its relationship to external systems.

### Disable Data Flow Diagrams

If you prefer to not use Data Flow Diagramming in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

## 9.2.4 Analysis Stereotypes

Enterprise Architect provides some built in **stereotypes** that you can assign to an element during **analysis**. The effect of each of these stereotypes is to display a different **icon** from the normal **element** icon, giving a visual key to the element's purpose. The main types of inbuilt icons for elements created using the stereotypes include:

- **Boundary** - for a system boundary (for example, a Login screen)
- **Control** - to specify an element is a controller of some process (as in the **Model-View-Controller** pattern)
- **Entity** - the element is a persistent or data element

The elements created using these stereotypes are illustrated in the *Robustness* diagram below. Also see the **Business Modeling** elements, used in Business Modeling and Business Interaction diagrams.

## 9.2.5 Analysis Diagram

An **Analysis** diagram is a simplified **Activity** diagram, used to capture high level business processes and early models of system behavior and elements. It is less formal than some other diagrams, but provides a useful means of capturing the essential business characteristics and requirements. Robustness diagrams, used extensively in ICONIX, can be created as Analysis diagrams.

### 9.3.1 Business Modeling/Interaction

Business Modeling diagrams and Business Interaction diagrams enable you to model both the structure and behavior of a business system. Business Modeling diagrams are based on a Class (UML Structural) diagram, whilst Business Interaction diagrams are based on a Sequence (UML Behavioral) diagram. Both diagram types have the same default Toolbox, which consists of a Business Modeling element page. The available elements include stereotyped Objects, and a stereotyped Actor (Business Actor), Use Case (Business Use Case) and Collaboration (Business Use Case Realization).

### 9.3.2 Business Models

#### Topics

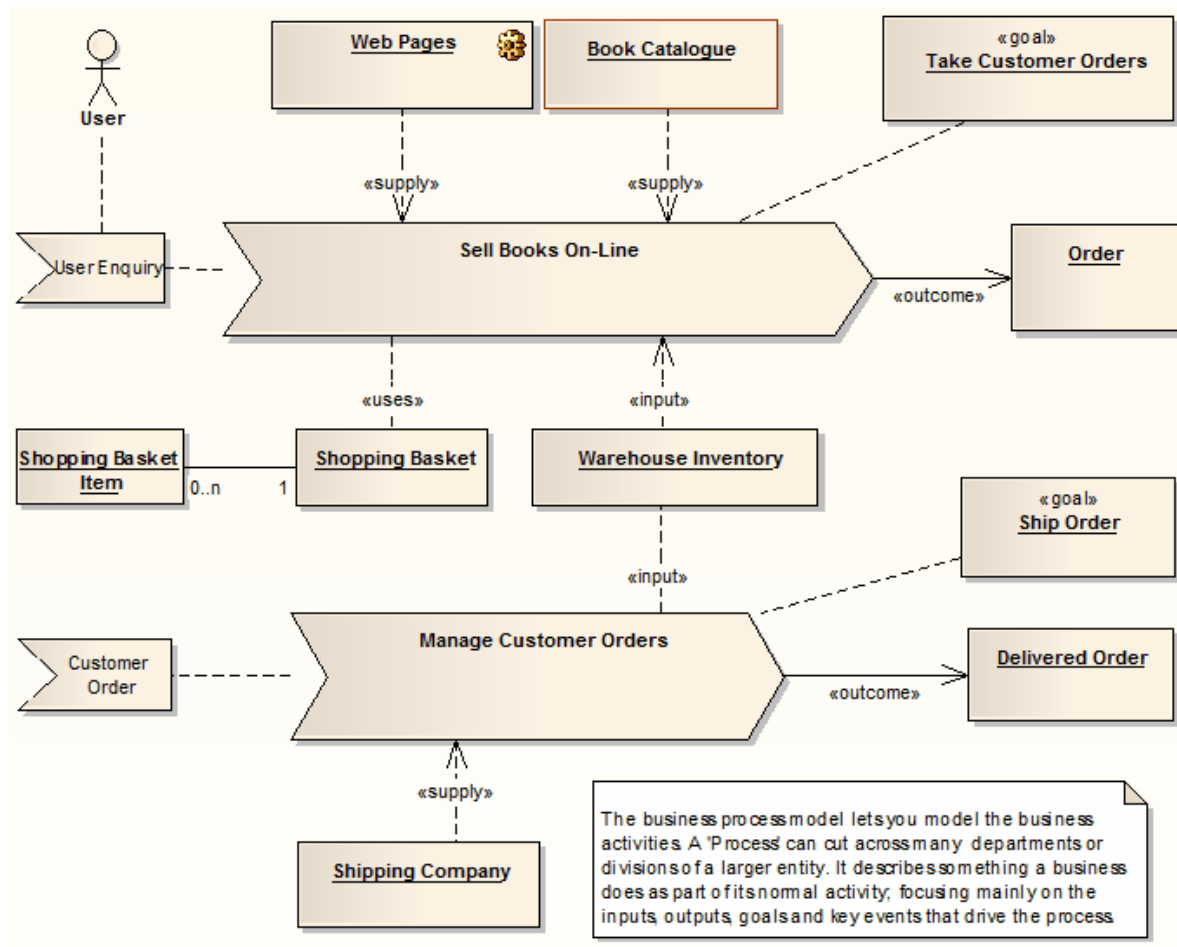

Topic	Detail	See also
<b>Modeling the Business Process</b>	Modeling the business process is an essential part of any software development process. It enables the analyst to capture the broad outline and procedures that govern what it is a business does. This <b>analysis model</b> provides an overview of where the proposed software system being considered fits into the organizational structure and daily activities. It can also provide the justification for building the	<a href="#">Analysis Model</a> 1809

Topic	Detail	See also
	<p>system by capturing the current manual and automated procedures that are to be rolled up into a new system, and the associated cost benefit.</p> <p>As an early model of business activity, it enables the analyst to capture the significant events, inputs, resources and outputs associated with business process. By connecting later design elements (such as Use Cases) back to the business process model through Implementation connectors, it is possible to build up a fully traceable model from the broad process outlines to the functional requirements and eventually to the software artifacts actually being constructed.</p> <p>As the Business Process Model typically has a broader and more inclusive range than just the software system being considered, it also enables the analyst to clearly map what is in the scope of the proposed system and what is to be implemented in other ways (such as a manual process).</p>	

#### **Example**

The example below demonstrates the kind of model that can be built up to represent a business process. In this model, the goal of the business process is to take customer orders and to ship those orders out. A user starts the process with an inquiry, which leads to the involvement of the Book Catalogue, Shopping Cart, on-line pages and warehouse inventory. The output of significance to the business is a customer order.

The second half of the process model is to respond to a customer order and ship the required items. The second process involves the warehouse inventory and shipping company, and completes when an order is delivered to the customer.

Goals	<a href="#">Goals</a> <sup>[1813]</sup>
A Complete Business Process	<a href="#">A Complete Business Process</a> <sup>[1813]</sup>

### 9.3.2.1.1 Process Modeling Notation

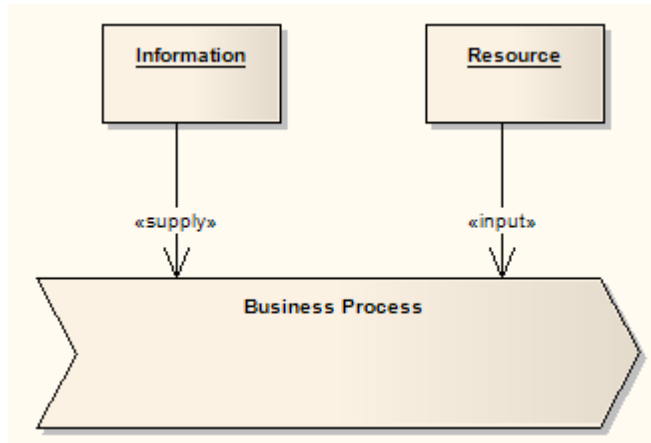

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>A business process model typically defines the following elements:</p> <ul style="list-style-type: none"> <li>• The goal or reason for the process</li> <li>• Specific inputs</li> <li>• Specific outputs</li> <li>• Resources consumed</li> <li>• Activities that are performed in some order, and</li> <li>• Events that drive the process</li> </ul> <p>The business process:</p> <ul style="list-style-type: none"> <li>• Can affect more than one organizational unit</li> <li>• Can have a horizontal organizational impact</li> <li>• Creates value of some kind for the customer; customers can be internal or external</li> </ul> <p>A business process is a collection of activities designed to produce a specific output for a particular customer or market. It implies a strong emphasis on how the work is done within an organization, in contrast to a product's focus on what. A process is thus a specific ordering of work activities across time and place, with a beginning, an end, and clearly defined inputs and outputs: a structure for action. The notation used to depict a business process is illustrated below.</p> 	<p><a href="#">Process</a> <sup>[2008]</sup></p> <p><a href="#">Events</a> <sup>[1812]</sup></p> <p><a href="#">Activity</a> <sup>[1279]</sup></p>

Topic	Detail	See also
	<p>The <b>process notation</b> implies a flow of activities from left to right. Typically an <b>Event</b> element is placed to the left of the process and the output to the right. To specifically notate the internal activities, <b>Activity</b> elements can be placed inside the process element.</p>	
<b>The BPMN File</b>	<p>One popular notation and approach to business modeling is the Business Process Modeling Notation (BPMN). This notation is specifically targeted at the business modeling community and has a relatively direct mapping to UML through a BPMN Profile. Sparx Systems provides a built-in <b>profile for BPMN</b> modeling in Enterprise Architect.</p>	<a href="#">BPMN Models</a> [1845]

### 9.3.2.1.2 Inputs, Resources and Information

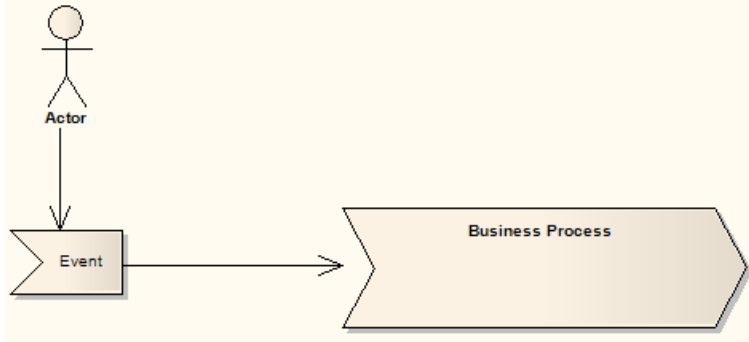

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>Business processes use information to tailor or complete their activities. Information, unlike resources, is not consumed in the process; rather it is used as part of the transformation process. Information can come from external sources, from customers, from internal organizational units and could even be the product of other processes. A resource is an input to a business process and, unlike information, is typically consumed during the processing. For example, as each daily train service is run and actuals recorded, the service resource is 'used up' as far as the process of recording actual train times is concerned.</p> <p>The notation to illustrate information and resources is shown below.</p>  <p>A <i>Supply</i> connector indicates that the information or object linked to the process is not used up in the processing phase. For example,</p>	

Topic	Detail	See also
	<p>order templates can be used over and over to provide new orders of a certain style; the templates are not altered or exhausted as part of this activity.</p> <p>An <i>Input</i> connector indicates that the attached object or resource is consumed in the processing procedure. As an example, as customer orders are processed they are completed and signed off, and typically are used only once per unique resource (order).</p>	

### 9.3.2.1.3 Events

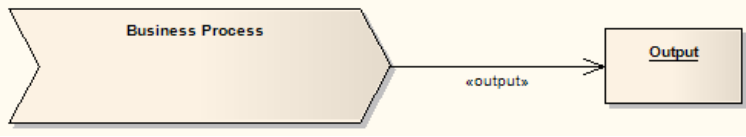

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>An <b>event</b> is the receipt of some object, a time or date reached, a notification or some other trigger that initiates the business process. The event might be consumed and transformed (for example a customer order) or simply act as a catalyst (for example, nightly batch job).</p>  <pre> graph TD     Actor((Actor)) --&gt; Event{Event}     Event --&gt; BusinessProcess[Business Process]   </pre>	<a href="#">Event</a> <small>[2007]</small>

### 9.3.2.1.4 Outputs

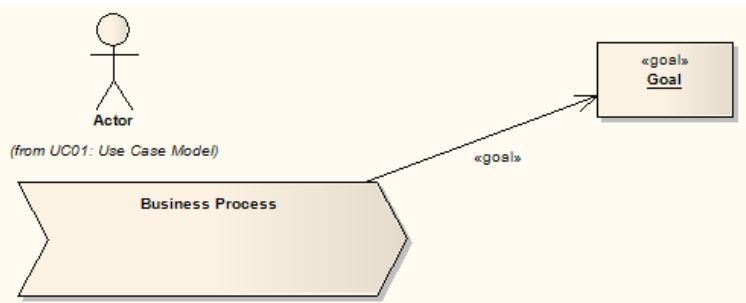

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>A business process typically produces one or more outputs of value to the business, either for internal use or to satisfy external requirements. An output might be a physical object (such as a report or invoice), a transformation of raw resources into a new arrangement (a daily schedule or roster) or an overall business result such as completing a customer order.</p> <p>An output of one business process might feed into another process, either as a requested item or a trigger to initiate new activities.</p>	

Topic	Detail	See also
	 <p>An Output connector indicates that the business process produces some object (either physical or logical) that is of value to the organization, either as an externally visible item or as an internal product (possibly feeding another process).</p>	

### 9.3.2.1.5 Goals

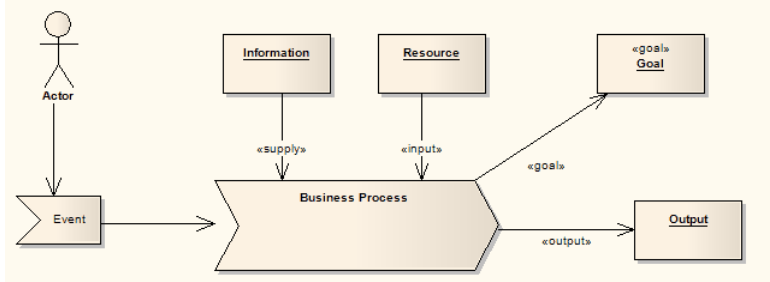

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>A business process has some well defined goal. This is the reason the organization does this work, and should be defined in terms of the benefits this process has for the organization as a whole and in satisfying the business requirements.</p>  <p>A Goal connector indicates that the attached object to the business process describes the goal of the process. A goal is the business justification for performing the activity.</p>	

### 9.3.2.1.6 A Complete Business Process

#### Topics

Topic	Detail	See also
<b>Abstract</b>	The diagram below illustrates how the various model elements can be grouped together to produce a coherent picture of a named

	<p>business process. Included are the inputs, outputs, events, goals and other resources that are of significance.</p> 	

### 9.3.3 Modeling Business Rules

In any business action or process, the start, progress and end result are usually determined by reference to a set of **rules**. These rules can be very simple, such as 'the client must present documentary evidence of being at least 18 years old', or very complex, such as the actuarial rules that determine what a tailored insurance policy will and will not cover.

Whether the rules of your business are simple or complex, there are two sets of considerations that you need to take into account:

- **How to manage the rules** - How are they initially identified? Where are they held? Are the rules easily maintained and updated? How are they refined and tested?
- **How to use the rules** - How easy is it to identify which rules apply in a specific context? How easily can any specific rule be recognized and applied? How are the rules **executed** in the process - can they be integrated with the process? Can execution of the rules be **automated** in the process?

Both sets of considerations can be easily managed by modeling your business processes in Enterprise Architect, and using the **Business Rule Model** facility.

#### Managing Rules

Broadly, modeling your business processes can clarify:

- Your business **requirements** (from which many business rules are ultimately derived)
- The **use cases** - and the scenarios in each use case - to satisfy those requirements, and
- The exact processes, stages, objects, actions and data structures that support those use cases, represented by **Classes**

This process will also clarify which of your current business **rules** are applicable to which points in each process, and what refinements or new business rules are required. You can then **map** your business rules to existing or new Classes, using two specific Business Rules models; the:

- **Business Domain** model, in which you group the business objects (represented by Classes) involved in a process or application, and develop a **Rule Flow** that defines the tasks (as **Rule Task** elements) associated with the process as a whole or specific objects in the process
- **Business Rules** model, in which you create a specific **Business Rule element** for each business rule and **associate** it with the **Rule Task** to which the rule applies

When you have defined all the tasks, their sequences, and the rules that apply to each one, you can compose the rules per task to define the values and conditions of the rules and how they take effect in the task. You can then validate the rules for the task to ensure that they are logical.

A valuable resource that you have created in this process is a **database of business rules** associated directly with the tasks and procedures they apply to, easily explored (according to the naming and/or numbering convention you have used) with the Model Search and other navigation and display facilities, and documented through the document or web reporting facilities. You can also record further information on each rule using internal or external notes, Tagged Values and Linked Documents.

### Using Business Rules

Having set up the business rules database, your users can access the models or their documentation as a reference. As explained above, the context of any given rule, or the rules applicable to a context, can be quickly established using the search, navigation or Traceability facilities.

However, you can use Enterprise Architect to model and create applications and user interfaces that can **apply** the business rules you have defined, and a further facility of Business Rule modeling is to **generate the behavioral code** for the rules in a specific task. You can merge this into your code to prompt for or even automate the correct use of the business rules in performing a task.

### Advantages of modeling Business Rules

Whether you create a database of rules, or applications that apply the rules, you have a modular solution to a business process requirement. This provides an advantage in localization. Business Rules can vary between locations; for example, car hire operates in roughly the same way in most countries, but the legal driving age differs between the countries, as do the models of car available for hire. You can easily create different localized rule modules and switch the appropriate one for the current location into the common model.

### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect

- (Alt+F1) | **Enterprise Architect | Business Modeling | Business Rules | Example Model**

### 9.3.3.1 *Develop a Business Rules Model*

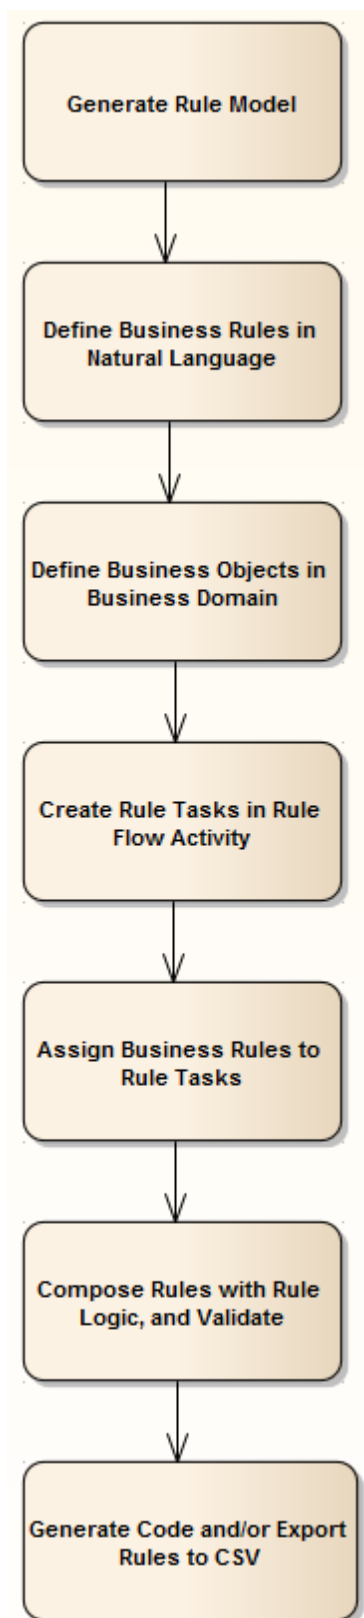

In modeling Business Rules, you first develop the **model structure** to represent the rules in the context of their use, and then effectively compile (or **compose**) the rules to make them operational within that context. From the compiled rules you can either create a spreadsheet for reference or generate behavioral code for applications that apply the rules, or both.

#### Process Summary

1. Use the Model Wizard to generate a **Business Rules Model** in which to define the business rules.
2. In the generated Business Rules **diagram**, begin to identify the business rules as Business Rule **elements**, each element representing a specific business rule.
3. In the generated Business Domain Model diagram, edit the existing Classes - and create others - to represent the Business Objects in the business domain or process; these provide the business vocabulary as the context for the business rules.
4. One of the Classes represents the actual **application** of the rules; under this Class is a Rule Flow Activity and Activity diagram, in which you create the Rule Tasks under which the business rules are grouped, in the sequence in which the business rules are executed. If you require a higher level of grouping to define different areas of rule application, you can create other rule-processing Classes with their own Activities.
5. Return to the Business Rules diagram and drag in the Rule Task elements from the Project Browser, assigning to each Task the corresponding Business Rule elements.
6. Compose and validate the business rules, using the Rule Composer.
7. If you want code that applies and executes the business rules, generate it from the Class elements that contain the Business Rules Activities.

The steps are represented graphically in the following flow:

**Notes**

- Business Rule Modeling is available in the Business and Software Engineering edition and the

Ultimate edition of Enterprise Architect

#### **9.3.3.1.1 Generate a Business Rules Model**

The Business Rules Model captures:

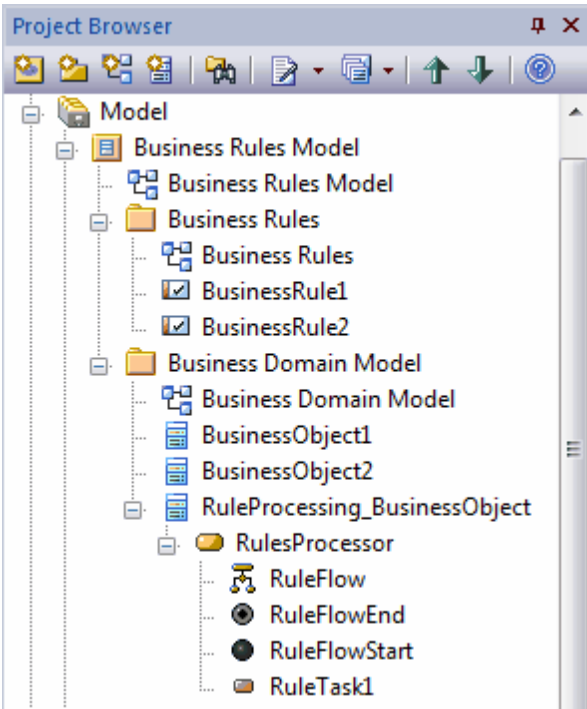

- The rules that apply to a business process
- The business tasks or objects that the rules take effect on, and
- The actual processing that takes place to apply the rules and produce a decision or result

As a very useful starting point in setting up your Business Rules model, you can generate the model structure and initial components using the Enterprise Architect Model Wizard.

**Project Browser | Right-click model root node | Add a New Model using Wizard > Model**  
**Patterns, or**  
**Project Browser | Right-click package | Add | Add a New Model using Wizard > Model Patterns**

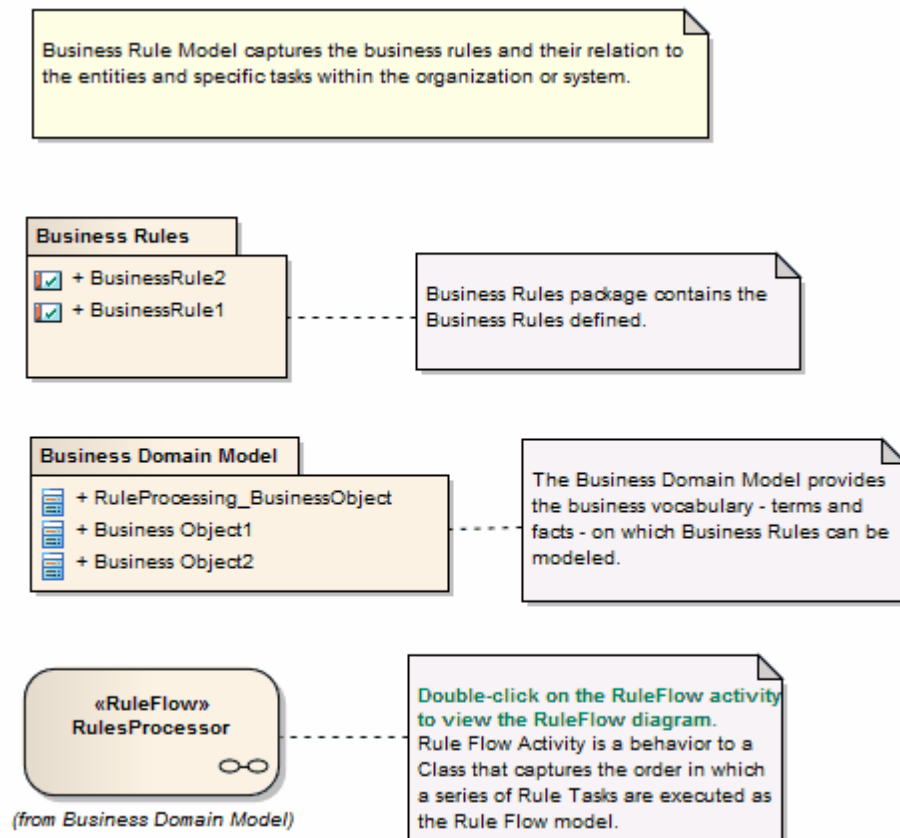

### Generate Business Rules Model from Model Wizard

Step	Action	See also
1	In the Technology panel, click on <b>Business Rule Model</b> .	
2	In the Name panel, select the checkbox next to the <b>Business Rule Model</b> icon.	
3	Click on the <b>OK</b> button.  A Business Rules Model structure is generated in the Project Browser, as shown.	

Step	Action	See also
	 <p>The screenshot shows a 'Project Browser' window with a toolbar at the top. The tree structure is as follows:</p> <ul style="list-style-type: none"><li>Model<ul style="list-style-type: none"><li>Business Rules Model<ul style="list-style-type: none"><li>Business Rules Model<ul style="list-style-type: none"><li>Business Rules<ul style="list-style-type: none"><li>BusinessRule1</li><li>BusinessRule2</li></ul></li><li>Business Domain Model<ul style="list-style-type: none"><li>Business Domain Model<ul style="list-style-type: none"><li>BusinessObject1</li><li>BusinessObject2</li></ul></li><li>RuleProcessing_BusinessObject</li></ul></li><li>RulesProcessor<ul style="list-style-type: none"><li>RuleFlow</li><li>RuleFlowEnd</li><li>RuleFlowStart</li><li>RuleTask1</li></ul></li></ul></li></ul></li></ul></li></ul>	

### Example Diagram

The *Business Rules Model* diagram generated at the top level of the model and shown below, encapsulates the components of the Business Rules model.

### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect
- To see an example of a Business Rules model, open the *EAExample* model provided with the installer, and expand:

**Project Models > Analysis and Business Modeling > Business Domain Model > Business Rule Model > Business Domain Model and > Defining Business Rules**

### 9.3.3.1.2 Model Business Rules

In the Business Rules Model, you initially define each business rule as a **Business Rule element** and later group these rules by linking them (using Dependency connectors) with **Rule Task** elements. In the:

- First stage you assemble a collection of rules
- Second stage you organize the rules into groups and sequences through the Rule Task elements created in the Business Domain model, and refine them by adding further Business Rule elements (and, if appropriate, further Rule Task elements)

In the Car Rental example in the *EAExample* model, rules have been defined and grouped to perform an eligibility check on a customer, to determine if the customer is eligible to rent a car.

#### Define Business Rule elements

Step	Action	See also
1	<p>In the generated Business Rules Model, expand the <b>Business Rules package</b> and double-click on the <b>Business Rules diagram</b> to open it. The diagram shows two example Business Rule elements connected to an example Rule Task.</p>  <p>In the Diagram Toolbox, the Rule Model pages display.</p> 	
2	<p>If you should need to create another (empty) Business Rules diagram, right-click on the Business Rules package and select <b>Add   Add Diagram</b>.</p> <p>On the New Diagram dialog, type an appropriate name in the <b>Name</b> field, select <b>Business Rule Model</b> in the Select From panel, and select <b>Rule Model</b> in the Diagram Types panel.</p> <p>Click on the <b>OK</b> button.</p>	
3	<p>For each business rule you want to identify, drag the Business Rule icon from the Toolbox.</p>	

Step	Action	See also
	Type the rule (or a shortened version of it) in the <b>Short Description</b> field of the element Properties dialog. This displays as the name of the element in the diagram.  You will later define the parameters of the rules using the Rule Composer.	<a href="#">Compose Business Rules</a> <sup>[1833]</sup>
4	When you have created all the required Business Rule elements, create the Business Domain model, the Rule Flow Activity diagram and the Business Task elements.	<a href="#">Create a Business Domain Model</a> <sup>[1824]</sup>

### Associate Business Rules with Business Tasks

After you have created the Business Domain Model and Rule Flow Activity (which contains the Rule Task elements in the context of the business process), you can link the Business Rule elements to the Rule Task for the action in which the rules take effect. You can apply a Business Rule to more than one Rule Task, if it has an effect in different contexts.

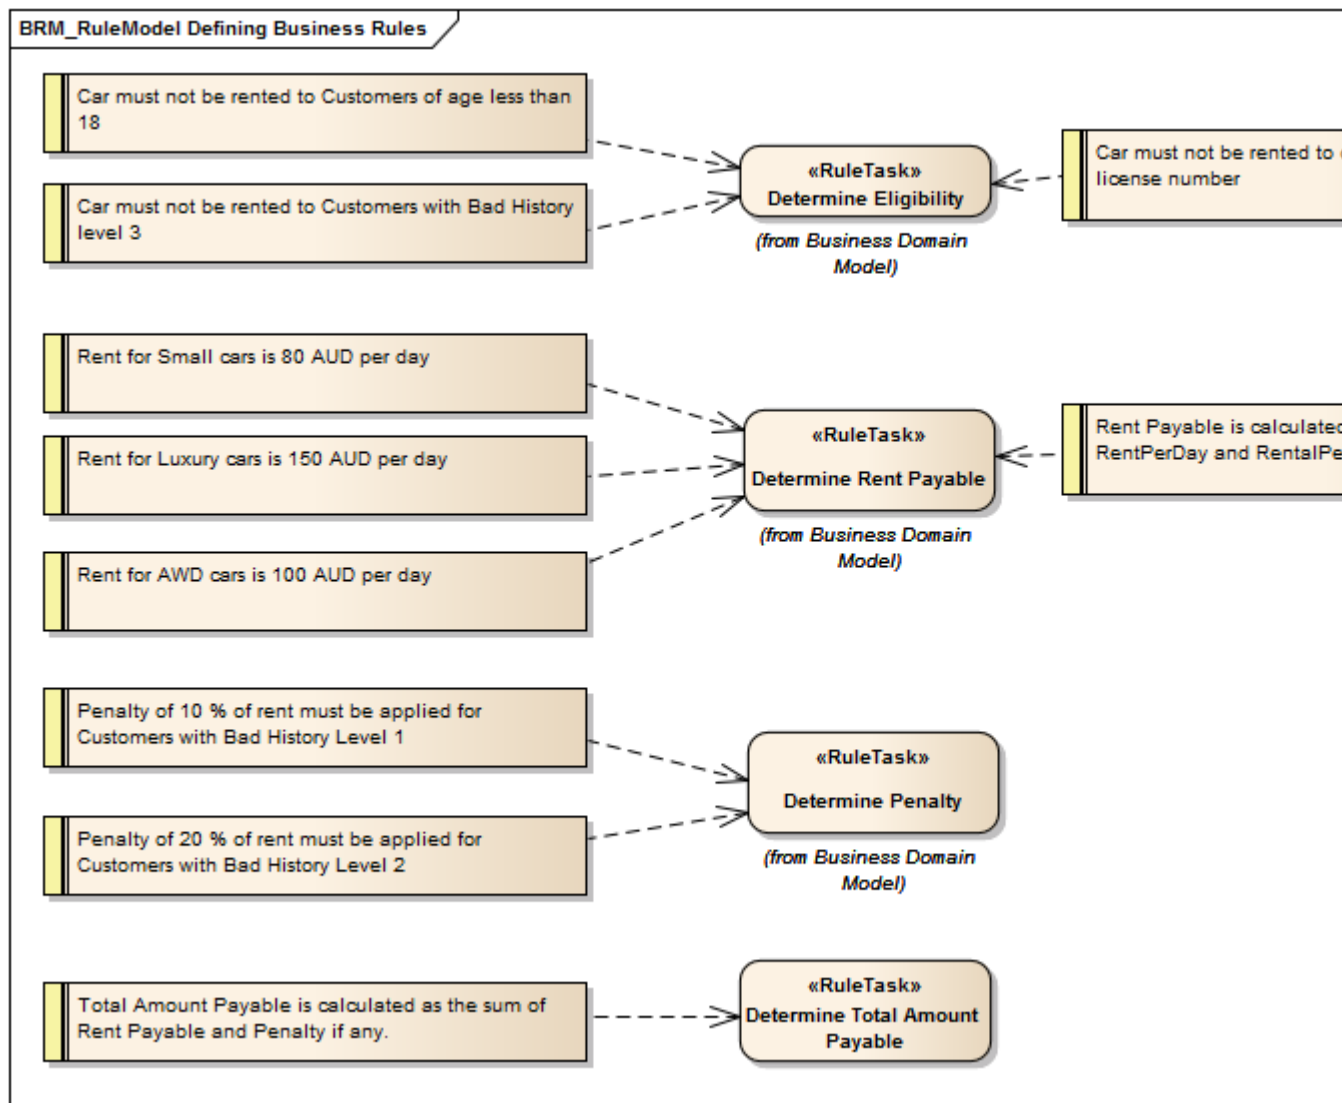

There are several ways to establish the relationship between Business Rule and Rule Task.

Method	Action	See also
<b>Use the Business Rules diagram</b>	Open the Business Rules diagram and drag onto it a Rule Task element from the RuleFlow Activity in the Project Browser.  Create a Dependency relationship to the Rule Task from each Business Rule element that applies to it (by dragging the connector from the Toolbox, or by using the Quicklinker arrow on the Business Rule element).  Repeat the process for the next Rule Task element from the Rule Flow Activity.  Create any additional Business Rule and Rule Task elements that are necessary (this should not be a common event); you must add any new Rule Tasks to the Rule Flow Activity diagram.  Save the diagram and open the Rule Composer for the first Rule Task element.	<a href="#">Create a Rule Flow Activity</a> <sup>[1826]</sup>  <a href="#">Compose Business Rules</a> <sup>[1833]</sup>
<b>Assemble existing elements through the Rule Composer</b>	In the Project Browser, open the Rule Composer on a Rule Task element, and drag each applicable Business Rule element from the Project Browser into an empty row of the Rule Statements table.  This establishes a Dependency relationship between the Rule Task element and each Business Rule element.  Continue to compose the rule conditions.	<a href="#">Compose Business Rules</a> <sup>[1833]</sup>
<b>Use the Relationship Matrix</b>	You can quickly create all the Dependency relationships between a number of Rule Task elements in the Business Domain Model package and the Business Rule elements that apply to each one.  Set the source element <b>Type</b> to <b>BusinessRule</b> and the target	<a href="#">Relationship Matrix</a> <sup>[727]</sup>

Method	Action	See also
	<p>element <b>Type</b> to <b>RuleTask</b>.</p> <p>Set the <b>Link Type</b> to <b>Dependency</b>, and the <b>Direction</b> to <b>Source-&gt;Target</b>.</p> <p>Set the <b>Source</b> package to <b>Business Rules</b> and the <b>Target</b> to <b>Business Domain Model</b>.</p> <p>In the cell at each intersection of a Business Task column and the appropriate Business Rule row, right click and select the <b>Create new relationship   UML:: Dependency</b> option.</p> <p>When you have finished creating the relationships, close the Relationship Matrix.</p> <p>Open the Rule Composer for the first Rule Task element in the Project Browser.</p>	<p><a href="#">Compose Business Rules</a> </p>

### Example

However you connect the Rule Task and Business Rule elements, if they are added to a diagram it might display as shown.

### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect

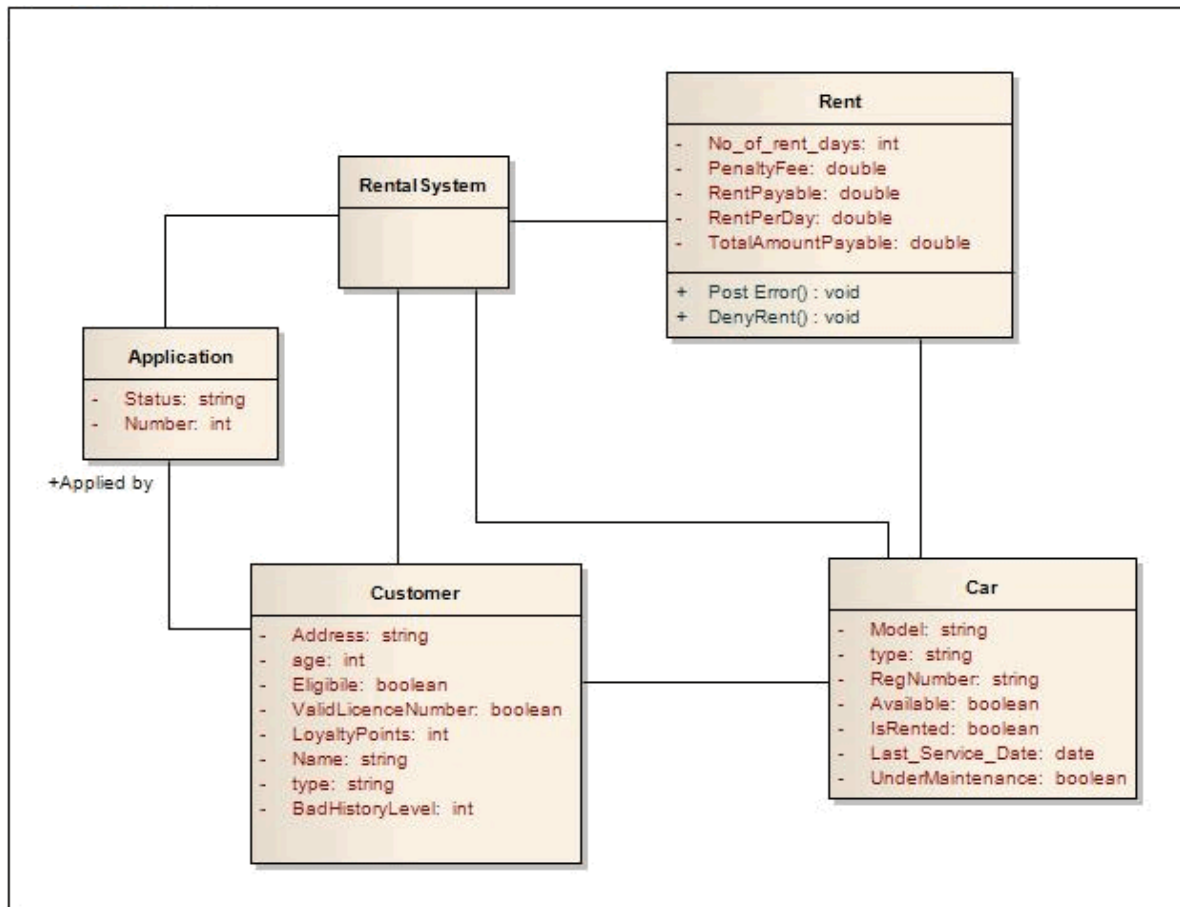

### Learning Center topics

#### 9.3.3.1.3 Create a Business Domain Model

The **Business Domain Model** provides the business **vocabulary** - the terms and facts - on which Business Rules can be modeled. In Enterprise Architect a Business Domain model is represented as a conceptual Class diagram, as illustrated by this diagram from the Car Rental System model from the *EAExample* model.

In the Business Domain model shown in this diagram, the Classes *Rent*, *Customer*, *Car* and *Application*, together with their attributes and operations, provide the **terms for the business vocabulary** for the car rental system. The operations and attributes identify the conditions that must be met, the actions that must be taken, and the calculations that must be made to filter and apply the rules to provide a specific value or outcome.

The Class *Rental System* **processes the rules**; to make this possible, you add a **Rule Flow Activity** as a **behavior** for this Class.

When you create a Rule Flow Activity under a Class, you model the events and sequence as a structure of **Rule Tasks** (Actions). When you generate code for the Class (in the example, *Rental System*) the rule flow behavior is rendered as a method inside the Class.

Alternatively, if you have existing **operations** in the Class that already suit the purpose, you can model business tasks in those operations. When code is generated for the Class, the rules logic is generated as the method body for the corresponding operation.

### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect
- When you create Classes in the Business Domain model, select the correct language for code generation to ensure that the correct data type is set for attributes and operation parameters
- Business Rules code generation is supported for the following languages:
  - C++

- C#
- Java
- VB.Net

#### Learn more

- [Create a Rule Flow Activity](#)<sup>[1826]</sup>
- [Model Rules in an Operation](#)<sup>[1830]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Business Modeling | Business Rules | Business Domain Model**

#### 9.3.3.1.4 Create a Rule Flow Activity

When you set up a Business Domain model within a Business Rules model, you create a **Rule Flow Activity** as a behavior for one of the domain Classes, to enable that Class to process a set of rules. In the Rule Flow Activity you create a number of **Rule Task** elements, which are stereotyped Actions that group Business Rules for a specific task. The Rule Flow Activity automatically generates a Rule Flow diagram, in which you create the Rule Task elements and model the **sequence** in which they are executed.

#### Add a Rule Flow Activity to a Class

Step	Action	See also
1	On the Business Domain model diagram, right-click on the Class that processes the rules (in the Car Rental example in the <i>EAExample</i> model, this would be <i>Rental System</i> ).	<a href="#">Create a Business Domain Model</a> <sup>[1824]</sup>
2	From the context menu select the <b>New Diagram   RuleFlow Activity</b> option.  A new Rule Flow Activity is created with a <b>Rule Flow diagram</b> , which immediately opens. Go on to create the Rule Task elements (below).  Code generation for a Rule Flow model renders each RuleFlow Activity as a set of operations or methods. Depending on what you want these methods to do, you might want to pass in parameters to be used within the Rule Flow Activity.	<a href="#">Pass Parameters to Rule Flow Activity</a> <sup>[1829]</sup>

#### Add Rule Task elements to the Rule Flow Activity diagram

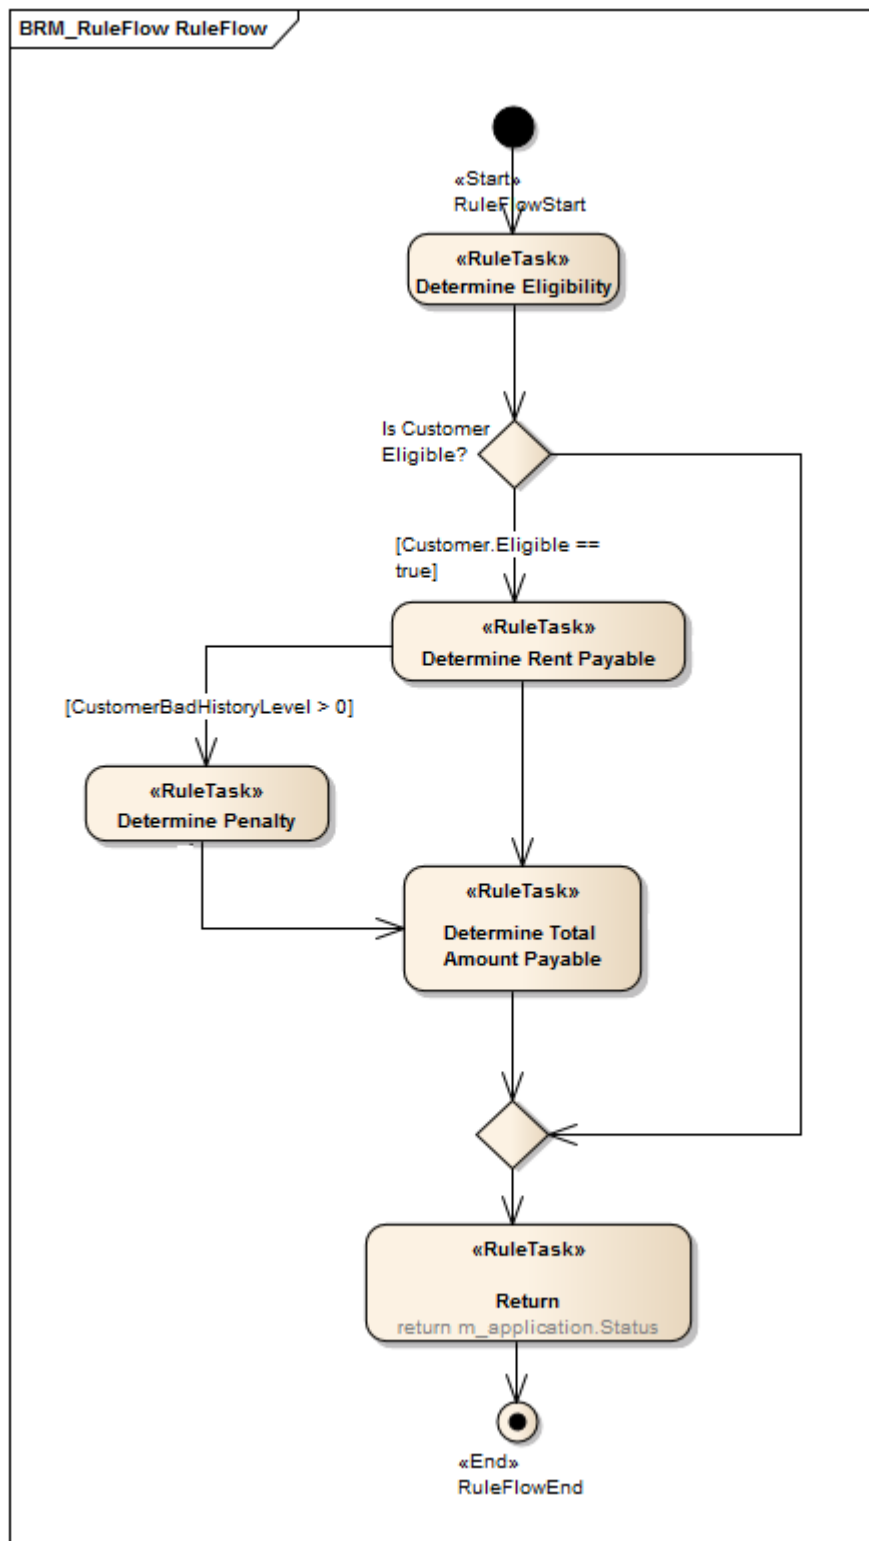

You can create Rule Task elements directly under the Rule Flow Activity in the **Project Browser**, by clicking on the **New Element** icon in the Toolbar and selecting the **UML:: Activity** toolset, **Action** element type and **RuleTask** stereotype. However, it is much simpler to create the elements on the Rule Flow diagram, and at the same time to organize them into their processing sequence.

Step	Detail	See also
1	(If necessary) Click on the <b>More tools</b> button in the Diagram Toolbox and select	

Step	Detail	See also
	<p>the <b>Business Rule Model   Rule Flow</b> option.</p> 	
2	<p>Drag the <b>Rule Task</b> icon from the Toolbox onto the diagram and give the element, as a name, the title of the task it represents, such as <i>Calculate Debit Charge</i> or <i>Determine Eligibility</i>.</p> <p>Create a Rule Task element for each task or action in the process.</p> <p>You can also use the Quicklinker arrow to create the new elements and Control Flow connectors.</p>	
3	<p>Organize the Rule Tasks into a sequence of events, initiated and terminated by the <b>Start</b> and <b>End</b> elements, and representing any branching and rejoining with <b>Decision</b> and <b>Merge</b> elements. All elements are connected by <b>Control Flow</b> connectors.</p> <p>See the example diagram below.</p>	
4	Go to the Business Rules model diagram and group the Business Rule elements on their appropriate Rule Task element.	<a href="#">Model Business Rules</a> <small>1827</small>

### Example

This Rule Flow diagram is from the *EAExample* model Car Rental example.

The Rule Task elements *Determine Eligibility*, *Determine Rent Payable*, *Determine Penalty* and *Determine Total Amount Payable* group the business rules for the specific task indicated by the element name

#### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect
- In a Rule Flow diagram, every **Decision** node has a matching **Merge** node to ensure proper code generation
- For code generation, the **Rule Task** elements must be grouped inside the appropriate Rule Flow Activity in the Project Browser (**Business Rule** elements can be defined anywhere in the model, as they can be used in more than one Rule Task)

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Business | Business Rule Flow**
- (Alt+F1) | **Enterprise Architect | Business Modeling | Business Rules | Rule Flow Model**
- (Alt+F1) | **Enterprise Architect | Business Modeling | Business Rules | Rule Flow Example**

#### **9.3.3.1.4.1 Pass Parameters to Rule Flow Activity**

When you generate code for a Rule Flow model, each RuleFlow Activity is rendered as a set of operations or methods. You can pass in Activity Parameters to be used by the Rule Tasks within the Rule Flow Activity, to define what you want the methods to do. You can use the parameters as condition variables or action variables in the Business Rule Decision Table, or as rule variables in the Computation Table for any of the Rule Tasks.

If the Activity Parameter is not accessible to a Rule Task, the system displays an error message.

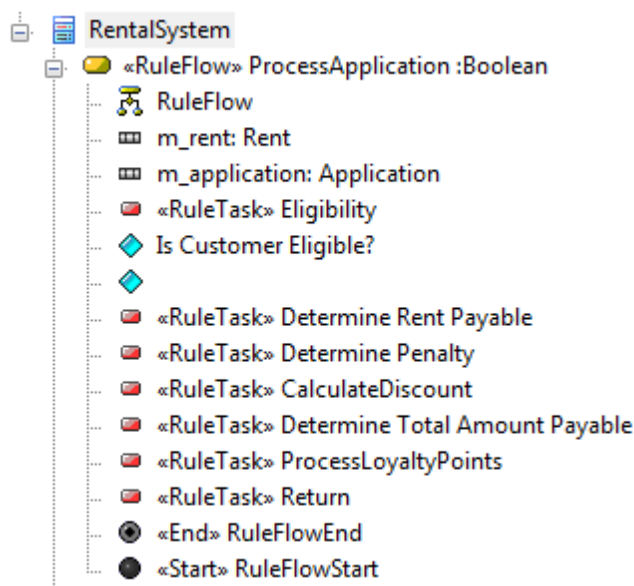

**Access**    **Project Browser | Double-click Rule Flow Activity element > Parameters**

#### Define parameters to be used within a Rule Flow Activity

Step	Action	See also
1	On the Parameters page, create and define each parameter, in particular the <b>Type</b> and <b>Default</b> values.	<a href="#">Define Parameters</a> [1028]
2	Save each parameter and, when you have finished setting all parameters, close the Properties dialog.	

#### Example

In this hierarchy, the parameters *m\_rent* and *m\_application* can be used by any of the Rule Tasks under the *ProcessApplication* Rule Flow Activity.

- [Compose Business Rules](#) <sup>[1833]</sup>

#### 9.3.3.1.5 Model Rules In an Operation

You can model business rules as Business Rule elements in the Business Rules package, and attach them to the **Rule Task elements** in a RuleFlow Activity diagram.

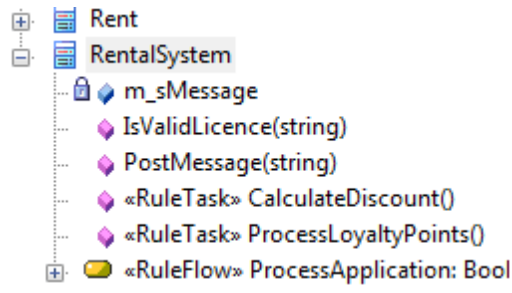

**Alternatively**, in the Business Domain model, if you have operations in the rules processing Class that represent business action, you can define each of those **operations** as a **Rule Task** and attach the Business Rules to these operations on the Business Rules diagram or within the Rule Composer.

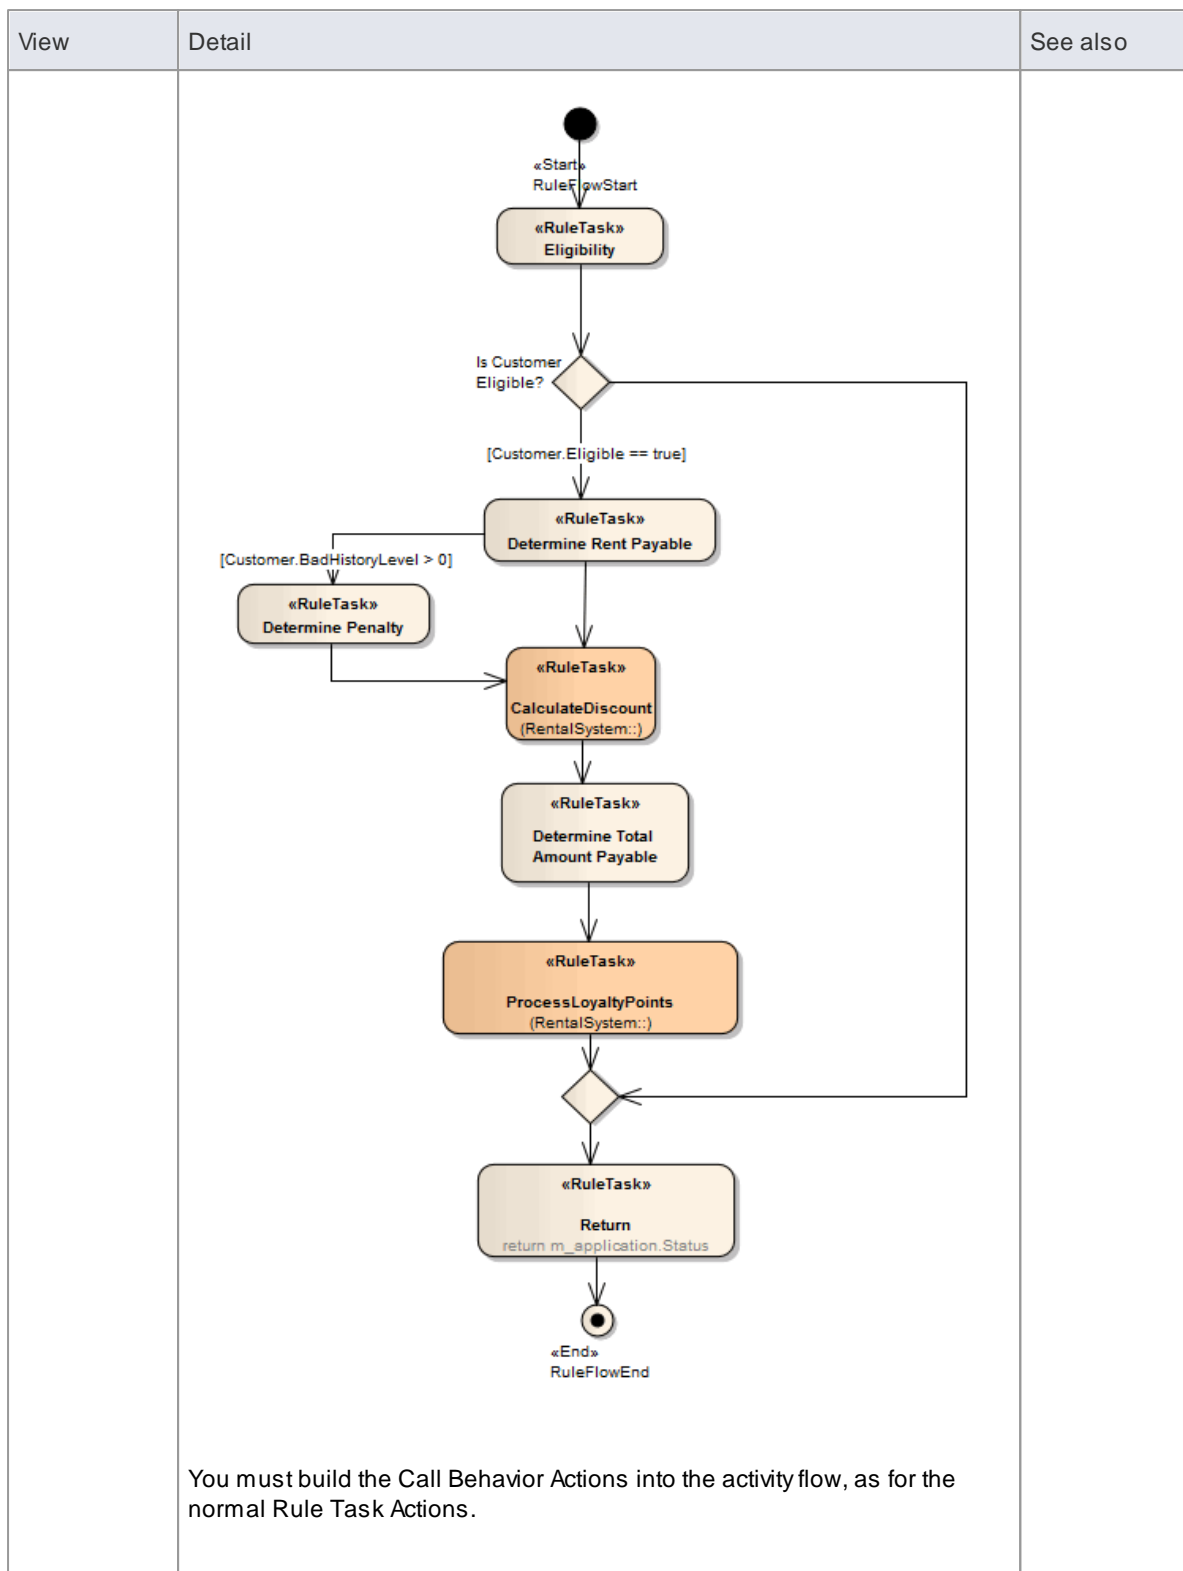

**Access** **Project Browser | Double-click on Operation > General**

#### Model Business Task on an operation

Step	Action	See also
1	In the <b>Stereotype</b> field type <b>RuleTask</b> .	
2	Click on the <b>Save</b> button and on the <b>Close</b> button.	
3	Drag the Operation from the Project Browser onto the RuleFlow Activity diagram. Also assign Business Rules to the operation, as for a Rule Task element.	<a href="#">Model Business Rules</a> <sup>[1827]</sup>

**Representation of Operation Rule Tasks**

View	Detail	See also
<b>Project Browser</b>	<p>The operations stereotyped as <b>RuleTask</b> display in the Project Browser as shown:</p>  <p>To pass the <b>parameters</b> for these operation calls, open the operation Properties dialog and select the Call page, then set the <b>Behavior</b> field to the operation to be called; under the <b>Arguments</b> field, click on the <b>Edit</b> button and set up or edit the argument values to be passed.</p> <p>On code generation, the code for rules logic is generated in the method body.</p>	<p><a href="#">Behaviour Calls</a> <sup>1026</sup></p> <p><a href="#">Behaviour Call Arguments</a> <sup>1027</sup></p>
<b>On the Rule Flow Diagram</b>	<p>When you drag and drop a RuleTask-stereotyped operation onto a Rule Flow diagram, an operation <b>Call Behavior Action</b> is created, as shown by the two darker elements.</p>	

#### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect

- [Model Business Rules](#) <sup>[1821]</sup>
- [Create a Rule Flow Activity](#) <sup>[1826]</sup>
- [Create a Business Domain Model](#) <sup>[1824]</sup>
- [Add and Remove Rules](#) <sup>[1834]</sup>

**9.3.3.2 Compose Business Rules**

In modeling your Business Rules, you first define each business rule as a **conceptual-level, plain text** string within a Business Rule element, and then group the rules by association with Business Task elements. Your next step is to define exactly how the rules operate **within the task**, setting up the values, conditions, actions and computations that define the actions of a **single** rule or a **combination** of rules. For this you use the **Rule Composer**, with which you transform each conceptual-level business rule statement into a **logical level, technology-specific tabulated statement** that you can either:

- Generate code from or
- Download to a spreadsheet application such as Microsoft Excel, via a CSV file

**Access**    **Right-click on a Rule Task element | Rule Composer**

Rule Composer Tables

The Rule Composer displays as a view in the central work area, divided into three tables.

Table	Detail	See also
<b>Rule Statements</b>	<p>The Rule Statements table lists the rules associated with the selected Rule Task; you add a rule to the table by dragging an existing Business Rule element from the Project Browser onto an empty row of the table.</p> <p>You do not create new rules within the table.</p>	<a href="#">Add and Remove Rules</a> <sup>[1834]</sup>
<b>Decision</b>	<p>The Decision Table is used to model <i>conditional</i> rules (for example: <i>Cars must not be rented to customers of age less than 18</i>).</p> <p>The table has three sections:</p> <ul style="list-style-type: none"> <li>• Rule Conditions – to model condition variables</li> <li>• Rule Actions – to model action variables</li> <li>• Rule Bindings – to link the rule in the rule table</li> </ul>	<a href="#">Define Rule Conditions</a> <sup>[1836]</sup> <a href="#">Define Rule Actions</a> <sup>[1837]</sup> <a href="#">Bind Rules to Conditions and Actions</a> <sup>[1839]</sup>
<b>Computation Rule</b>	<p>Using the Computation Rule table, you model rules that require a calculation to be performed on the source information, and/or the interaction of rules.</p> <p>The table has the following columns:</p> <ul style="list-style-type: none"> <li>• Computation Rule Actions</li> </ul>	<a href="#">Define Computation Rules</a> <sup>[1840]</sup>

Table	Detail	See also
	<ul style="list-style-type: none"> <li>• Expression</li> <li>• Rule Bindings</li> <li>• Rule Dependency</li> </ul>	

### Notes

- Business Rule Modeling is available in the Business and Software Engineering edition and the Ultimate edition of Enterprise Architect
- To assist with traceability as you complete the relationships across the Rule Composer, selecting an entry in one table automatically highlights the corresponding rows and columns of the other tables; for example, if a Rule Statement is selected, the related rule column in the Decision Table and row in the Computation Rule Table are highlighted

Similarly, if a Computational Rule is selected, the corresponding column in the Decision Table and row in the Rule Statements list are highlighted

- If the table columns are not wide enough to display their contents, you can drag the column header margins to increase the width; all tables on the Decision Table tab and the Computation Rule Tab are linked, so if you increase the column width on one table it changes the width on all tables
- The Rule Composer can be opened and the rules logic viewed in the **Lite edition** of Enterprise Architect

- (Alt+F1) | **Enterprise Architect | Business Modeling | Business Rules | Rule Composer Example**

#### 9.3.3.2.1 Add and Remove Rules

When you open the Rule Composer for a Business Task, all Business Rules **currently linked** to that task are already listed in the Rule Statements table. You can add further rules that are available in the Project Browser, or remove a rule from the **table** that is no longer applicable to the task.

You do not create or delete the rules themselves in the Rule Composer.

**Access** **Diagram | Right-click Rule Task element | Rule Composer, or**  
**Project Browser | Right-click Rule Task element | Rule Composer**

#### Add a business rule to be associated with the selected Rule Task

When you open the Rules Composer	Action	See also
<b>There are no rules listed</b>	The Rule Statements table has a <b>single</b> empty row. Select the Business Rule in the Project Browser and drag it onto this empty row.  Another empty row is automatically created underneath the first row. Drag the next Business Rule from the Project Browser onto the Rule Statements table.	
<b>There are rules listed</b>	The Rule Statements table has <b>no</b> empty rows.  Click on the <b>No</b> column and select the <b>Add Row</b> context menu option; an empty row is added to the table.  Drag a Business Rule from the Project Browser onto the table, as above.	

When you add a Business Rule to the Rule Statements table, if the Business Rule element is not already on the Business Rules diagram, the element is added to the diagram. A Dependency relationship is created between the 'new' Business Rule and the selected Rule Task.

#### Remove a rule that is no longer required in the Rule Composer

Right-click on the appropriate **No** field and select the **Remove Rule** context menu option. The rule is removed from the Rule Composer and the Dependency relationship with the Rule Task element is deleted.

The Business Rule element is **not** deleted from either the Business Rule diagram or the Project Browser (where, in either case, it might be in use with other Rule Task elements).

### 9.3.3.2.2 Define Rule Conditions

When you create the Business Domain model, you set up a number of Classes that define the business terms and entities (such as **Customer**) and their associated attributes and operations. You create the attributes and operations as you set up the Class, with at least some values or parameters, and you tailor some of the features to the rules to define the **conditions** through which a rule takes effect, in the Rule Conditions table.

For example, in a Class that defines the properties of *Car*, the attribute **Type** might be used to set the condition 'Car is: **Small**, **Medium** or **Large**', through which the rules defining base rental charge would be filtered and applied.

**Access** [Diagram](#) | [Right-click Rule Task element](#) | [Rule Composer](#) > [Decision Table](#)

#### Model Rule Conditions

Step	Action	See also
1	<p>From the appropriate Class element in the Project Browser, drag and drop the condition attribute (such as <i>age</i>) or operation (such as <i>IsValidLicense()</i>) onto the first empty field in the <b>Rule Conditions</b> column.</p> <ul style="list-style-type: none"> <li>The <b>Rule Conditions</b> fields apply Intelli-sense to display possible entries for the field; press <b>(Ctrl+Spacebar)</b> in the field to display a list of possible Classes, double-click on the selected Class, type . (a period) and double-click on the attribute or operation in the automatically-displayed list</li> <li>If the Rule Condition is of type <i>enum</i>, the <b>Allowable Values</b> field is automatically set with the <i>enum</i> literals; this procedure then ends here.</li> </ul>	
2	Determine a range of accepted values for the Rule Condition.	
3	<p>Right-click on the <b>Allowable Values</b> column and select:</p> <ul style="list-style-type: none"> <li>For an attribute, the <b>Edit Allowable Values</b> context menu option; the Edit Allowable Values dialog displays</li> <li>For an operation, the <b>Edit Parameters</b> context menu option; the Edit Parameters dialog displays (see step 5)</li> </ul> <p>Type each required value or range of values in the <b>Value</b> field, and click on the <b>Save</b> button to display the value in the <b>Allowable Values</b> list box</p> <p><i>age</i> could have the values:</p> <p><b>&lt;18</b>  <b>&gt;18 and &lt;50</b>  <b>&gt;50</b></p> <p><i>IsValidLicense()</i> could return:</p> <p><b>True</b>  <b>False</b></p>	
4	Click on the <b>OK</b> button to save the values and close the dialog; for an attribute, a new constraint <i>AllowableValues</i> is created.	

Step	Action	See also
	<ul style="list-style-type: none"> <li>You can check this constraint by opening the Properties dialog for the attribute and selecting the Constraints tab</li> <li>If the Rule Condition references an enumeration, the enum literals are not editable in the Edit Allowable Values dialog</li> </ul>	
5	<p>If the Rule Condition is an operation, you can pass parameters to it.</p> <p>Right click on the <b>Allowable Values</b> field, and select the <b>Edit Parameters</b> context menu option; the Edit Parameters dialog displays, listing the parameters that already exist for the operation.</p> <p>Select the parameters and type their values into the <b>Value</b> text box; click on the <b>OK</b> button to cancel the dialog.</p> <ul style="list-style-type: none"> <li>You can add an operation as a Rule Condition more than once, so you can call the operation with different sets of parameters</li> </ul>	
6	<p>To add another Rule Condition, right-click on the <b>No</b> column and select the <b>Add Row</b> context menu option; an empty row is added to the table.</p> <p>To remove a Rule Condition from the table, right-click on the appropriate <b>No</b> field and select the <b>Delete Row</b> context menu option.</p> <ul style="list-style-type: none"> <li>If the condition is based on an attribute, this does not affect either the original attribute <b>or the new constraint</b> in the model; you can either re-use the attribute with its constraint, or use the attribute Properties dialog to remove the constraint</li> </ul>	
7	If any of the condition values invoke an action or a decision, you can define it as a <b>Rule Action</b> .	<a href="#">Define Rule Actions</a> <sup>[1837]</sup>

Learn more

**9.3.3.2.3 Define Rule Actions**

In the Classes in the Business Domain model, the attributes and operations that you set up to define the **conditions** through which a rule takes effect might in their turn call a decision attribute or an operation, which you can assign as an **action** in the **Rule Actions (Outcome)** table. You create the attributes and operations as you set up the Class, with at least some values or parameters, and you tailor some of these features to define the actions that determine the **effect** of the rule.

**Access** [Diagram](#) | [Right-click Rule Task element](#) | [Rule Composer](#) > [Decision Table](#)

### Model Rule Actions

Step	Action	See also
1	<p>From the appropriate business term Class element in the Project Browser, drag and drop the decision attribute (such as <i>Eligible - Yes/No</i>) or operation (such as <i>post error</i>) onto the first empty field in the <b>Rule Actions (Outcome)</b> column.</p> <ul style="list-style-type: none"> <li>The <b>Rule Actions</b> fields apply Intelli-sense to display possible entries for the field; press (<b>Ctrl+Spacebar</b>) in the field to display a list of possible Classes, double-click on the selected Class, type . (a period) and double-click on the attribute or operation in the automatically-displayed list</li> </ul>	
2	<p>For an <b>attribute</b>, if the dropped action variable is of type <i>enum</i>, the <b>Allowable Values/Parameters</b> fields are automatically set with the enum literals.</p> <p>Otherwise, double-click on the <b>Allowable Values/Parameters</b> field (or right-click and select the <b>Edit Allowable Values</b> menu option); the Edit Allowable Values dialog displays.</p> <p>Click on the <b>New</b> button, type a possible value in the text box (such as <b>Yes</b> or <b>Accept</b>), click on the <b>Save</b> button, and repeat the process for the next possible value (such as <b>No</b> or <b>Reject</b>).</p>	
3	<p>When you have entered all possible values, close the dialog and select the appropriate response in the <b>Result&lt;n&gt;</b> column field underneath the appropriate <b>Value&lt;n&gt;</b> field for the calling condition.</p>	
4	<p>For an <b>operation</b>, a checkbox displays in each of the <b>Result&lt;n&gt;</b> column fields; to call the operation as the response to a value of the corresponding condition, select the checkbox in the <b>Result&lt;n&gt;</b> field underneath that condition <b>Value &lt;n&gt;</b> field.</p>	
5	<p>To pass <b>parameters</b> to the operation, double-click on the <b>Allowable Values/Parameters</b> field (or right-click and select the <b>Edit Parameters</b> menu option); the Edit Parameters dialog displays.</p> <p>Select the parameters and type the values into the <b>Value</b> text box; click on the <b>Save</b> button and close the dialog.</p> <p>You can add an operation as a Rule Action more than once, so you can call the operation with different sets of parameters.</p>	
6	<p>Click on the <b>Save</b> button in the Rule Composer toolbar to save the values.</p>	
7	<p>To <b>add</b> another Rule Action, right-click on the <b>No</b> column and select the <b>Add Row</b> context menu option; an empty row is added to the table.</p> <p>To <b>remove</b> a Rule Action from the table, right-click on the appropriate <b>No</b> field and select the <b>Delete Row</b> context menu option; this does not affect the original attribute or operation in the model.</p>

#### 9.3.3.2.4 Bind Rules to Conditions and Actions

After defining which rules are applied, which conditions are evaluated and/or which actions are taken in the completion of a Rule Task, you bind the rules to the conditions and actions to define:

- Which rules are evaluated against a condition
- What values of that condition are applicable to each rule
- What decisions or actions are taken on each value output from evaluation of the rule, and what the result of that decision or action is

You bind the rules, conditions and actions using the Rule Bindings table, just above the Rule Conditions table.

**Access**   **Diagram | Right-click Rule Task element | Rule Composer > Decision Table**

### Bind rules

Step	Action	See also
1	Click on the <b>Rule Bindings</b> field immediately above the appropriate <b>Value&lt;n&gt;</b> and/or <b>Result&lt;n&gt;</b> field.  Click on the number of the rule that is evaluated against the condition for the specific value and to generate the action to provide the specific result identified in those two fields.	<a href="#">Define Rule Conditions</a> <sup>[1836]</sup>  <a href="#">Define Rule Actions</a> <sup>[1837]</sup>
2	Ensure that the values set in the <b>Value&lt;n&gt;</b> and/or <b>Result&lt;n&gt;</b> field underneath the rule number do all operate under the rule.	
3	Click on the <b>Save</b> icon in the Rule Composer toolbar.  Continue to bind business rules to conditions and actions having logical values for an instance of the rule.	

**Example**

- Rule 2 is *A car must not be rented to a customer of age less than 18*
- The first Rule Condition is *Customer.age*
- The **Value1** field contains the value **< 18** against that Rule Condition
- The first Rule Action (or decision) is *Customer.Eligible*
- The **Result1** field contains the value **No** against that Rule Action
- The second Rule Action is *Application.Status*
- The **Result1** field contains the value **Reject** against that Rule Action

You would select **2** in the **Rule Bindings** field over the **Value1/Result1** column, so that a when a customer's application to rent a car is tested against rule 2, if the customer is found to be under 18 they are automatically classified as ineligible and the application rejected.

**9.3.3.2.5 Define Computation Rules**

In a business process, some actions and effects are dependent on the interaction of rules with either another rule or a calculation. For example:

- Rule 1) *Cars cannot be rented to customers aged under 18 years*, Rule 2) *Customers must have a valid driving licence* - Rule 1 must be satisfied before Rule 2 is tested
- Rule 4) *Penalty of 10% of total rental cost applies to customers with Bad History Level 1* - If the customer has a Bad history Level 1, multiply the rent payable value by 1.1

**Access** **Diagram | Right-click Rule Task element | Rule Composer > Computation Rule Table**

**Define a computation rule**

Step	Action	See also
1	<p>In the Project Browser, expand the appropriate business entity Class in the Business Domain model, and drag the attribute that represents the computed action into the <b>Computation Rule Actions</b> field.</p> <p>Alternatively, you can use Intelli-sense in both the <b>Computation Rule Actions</b> field and the <b>Expression</b> field to display a list of possible Classes and attributes:</p> <ol style="list-style-type: none"> <li>1. Press <b>(Ctrl+Spacebar)</b> in the field to display the list of Classes.</li> <li>2. Double-click on the required Class, and type . (period) after it; a list of attributes</li> </ol>	<a href="#">Create a Business Domain Model</a> 

Step	Action	See also
	for that Class displays automatically. 3. Double-click on the required attribute.	
2	In the <b>Expression</b> field, complete the expression to be evaluated. For example: <ul style="list-style-type: none"> <li>If computing Rule 4 above, and you have selected <i>Rent.RentPayable</i> in the <b>Expression</b> field, then type <b>*1.1</b> immediately after it</li> </ul>	
3	In the <b>Rule Bindings</b> field, click on the drop-down arrow and select the number of the rule being modeled (as listed in the Rule table) to link the computation data to the rule.	<a href="#">Add and Remove Rules</a> <sup>[1834]</sup>
4	If the rule depends on another rule being satisfied first (as for Rule 2 above), type the number of that rule in the <b>Rule Dependency</b> field.	
5	Click on the <b>Save</b> icon in the Rule Composer toolbar to save the computation rule.  If the computation rule is also a Rule Conditions rule, add the condition variable in the Decision table and bind the appropriate rule in the Rule Bind section.	<a href="#">Define Rule Conditions</a> <sup>[1836]</sup>  <a href="#">Bind Rules to Conditions and Actions</a> <sup>[1839]</sup>

**9.3.3.2.6 Validate Business Rules**

Before you generate code for the Rule Task elements, or export them to a CSV file, it is recommended that you validate the business rules in the Rule Composer. When you do this, the business rules on the Rule Composer are parsed and any errors or warnings that might indicate incomplete or unfavorable code generation are displayed on the RuleComposer Validation tab on the system Output window.

Access    [Diagram](#) | [Right-click Rule Task element](#) | [Rule Composer](#)

**Validate Rules**

Step	Detail	See also
1	<p>Click on the <b>Validation</b> icon (green tick) in the Rule Composer toolbar:</p>  <p>The Output window displays, showing the status of the validation - <i>Validation complete</i> plus any validation errors or warnings - on the RuleComposer Validation tab.</p>	
2	Double-click on each warning or error message in turn to highlight and investigate the faulty data that caused that message, in the Rule Composer.	

**Learn more**

- [Compose Business Rules](#) <sup>[1833]</sup>
- [Export Composed Rules to CSV](#) <sup>[1842]</sup>
- [Code Generation For Business Rules](#) <sup>[1843]</sup>
- [The System Output Window](#) <sup>[169]</sup>

**Learning Center topics**

- (Alt+F1) | **Enterprise Architect | Business Modeling | Business Rules | Validate Business Rules**

**9.3.3.2.7 Export Composed Rules to CSV**

It is possible to export composed Business Rules to an external spreadsheet - such as Microsoft Excel - as a .csv file. You can then maintain the spreadsheet in that tool for use as a reference for the organization, if you have not created an application to automatically apply those rules.

**Access**    **Diagram | Right-click Rule Task element | Rule Composer**

**Export the contents of the Rule Composer to a CSV file**

Step	Action	See also
1	<p>Click on the <b>Export to CSV</b> icon () in the Rule Composer toolbar.</p> <p>The Windows Browser dialog displays.</p>	
2	Browse to the required file location and type in a name for the .csv file to export the data into.	

Step	Action	See also
3	Click on the <b>Save</b> button to export the data.	

#### Learn more

- [CSV Import and Export](#)<sup>[497]</sup>
- [Compose Business Rules](#)<sup>[1833]</sup>

#### 9.3.3.2.8 Code Generation For Business Rules

After you have modeled rules for all Rule Task elements in the Rule Flow diagram, the Business Domain model is ready for **code transformation**. The internal code templates provided for generating technology-specific rule code work hand-in-hand with the **EASL code templates** to generate the code from the rules-processing Class and its Rule Flow structure.

#### Return a value from the Rule Flow behavior

Step	Action	See also
1	Double-click on the last <b>Rule Task</b> element before the end node of the Rule Flow diagram.  The element's Properties dialog displays.	<a href="#">Create a Business Domain Model</a> <sup>[1824]</sup>
2	Click on the Effect tab.	
3	In the <b>Effect</b> field, type the <i>return</i> statement; for example, <i>return true</i> .	
4	Click on the <b>Save</b> button, and on the <b>OK</b> button to close the dialog.  Generate code for the Class containing the rule flow behavior (in our initial example, <i>Rental System</i> ); the code for business rules logic is generated, with the rule statements expressed in natural language as comments.	<a href="#">Generate code for a single class</a> <sup>[2113]</sup>

#### Example

The following code snippet was generated from the *Rental System* Class element in the *EAExample* model:

```

////////////////////////////////////
// RentalSystem.cs
// Implementation of the Class RentalSystem
// Generated by Enterprise Architect
// Created on:      08-May-2012 2:39:23 PM
////////////////////////////////////

```

```

public class RentalSystem {

    public Customer m_Customer;
    public Car m_Car;
    public Rent m_Rent;

    public RentalSystem() {

    }

    ~RentalSystem() {

    }

    public virtual void Dispose() {

    }

    /* Begin - EA generated code for Activities and Interactions */

    public bool ProcessApplication(Rent m_rent, Application m_application)
    {
        // behavior is an Activity

## 9.3.4 BPMN Models

If you need to model the activity of a business, capturing the behavior and the information flows within the organization or system, you can do so using the Business Process Modeling Notation (BPMN). BPMN is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles integrated with the Enterprise Architect installer. Through use of these profiles, you can develop BPMN diagrams quickly and simply, including:

- Maintain existing diagrams created in BPMN 1.0 format, and create new diagrams in BPMN 1.0

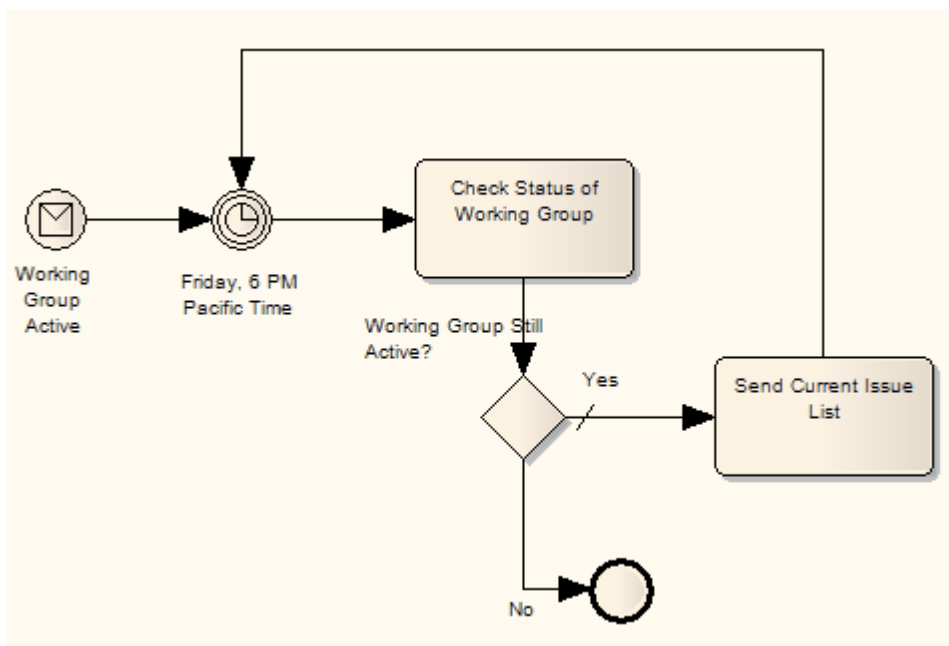

- Create and maintain diagrams in the BPMN 1.1 and BPEL formats
- Create and maintain diagrams in the BPMN 2.0 and BPEL formats
- Migrate a BPMN 1.0 model (or part of a model) to BPMN 1.1, and a BPMN 1.1 model (or part of a model) to BPMN 2.0

The Enterprise Architect installer for releases later than 8.0 provides you with separate versions of the MDG Technology for BPMN that support BPMN versions 1.0, 1.1 and 2.0, and BPEL.

**Access** BPMN facilities are provided in the form of:

- A BPMN diagram type, accessed through the New Diagram dialog
- BPMN pages in the Toolbox
- BPMN element and relationship entries in the Toolbox **Shortcut** menu and Quick Linker.

Specifications of BPMN elements and relationships are defined by Tagged Values; for example, to define the *Message*, *Timer* and *Default Path (/)* symbols in this diagram:

### BPMN 2.0 Diagram Orientation

On a **BPMN 2.0** diagram, you can set the flow orientation to either horizontal or vertical, or not apply an orientation.

To set or clear the orientation, right click on the diagram background and click on the **Set Diagram Flow Direction** context menu option. Then click on either:

- **None** (the default, no specific orientation set)
- **Horizontal** (diagram flow across the page, Pool and Lane elements occupy the full width of the diagram), or
- **Vertical** (diagram flow down the page, Pool and Lane elements occupy the full height of the diagram)

### **BPMN 2.0 Sequence Flow and Message Flow Rules**

Rules concerning the use of Sequence Flows and Message Flows, as defined in the *BPMN 2.0 Specification* and described below, are implemented by the MDG Technology for BPMN 2.0.

The following rules apply to **Sequence Flows** in relation to Events (Start, Intermediate and End), Activities (Task and Sub-Process, for Processes), Choreography Activities (Choreography Task and Sub-Choreography, for Choreographies) and Gateways:

- A Sequence Flow cannot cross a Pool boundary
- An End Event, **unless** edge-mounted, **cannot** be the source element for a Sequence Flow
- A Start Event, **unless** edge-mounted, **cannot** be the target element for a Sequence Flow
- An Intermediate Event, **if** edge mounted, **cannot** be the source element for a Sequence Flow; it cannot have incoming Sequence Flows
- An Intermediate Event - **if** edge mounted **and** having the Tagged Value *eventDefinition=Compensation*, cannot be either the source or target element for a Sequence Flow
- Objects **within** a Sub-Process cannot have a Sequence Flow relationship with objects **outside** the Sub-Process
- A Sequence Flow cannot connect directly to a Pool

The following rules apply to **Message Flows** in relation to Events (Start, Intermediate and End), Activities (Task and Sub-Process, for Processes), Choreography Activities (Choreography Task and Sub-Choreography, for Choreographies) and Pools:

- Message Flows **can be** created from objects in one Pool to objects in another Pool; Message Flows can connect directly to another Pool
- A Message Flow can connect to Events (Start, Intermediate and End) **only** if they have the Tagged Value *eventDefinition=Message* or *eventDefinition=Multiple*
- A Start Event **cannot be** the source element for a Message Flow
- An End Event **cannot be** the target element for a Message Flow

### **BPMN Toolbox Pages**

You can access the BPMN Toolbox pages through the **Diagram | Diagram Toolbox: More tools...** option; select the **BPMN 1.0**, **1.1** or **2.0** options as appropriate.

You can also set BPMN as the active default technology to access the Toolbox pages directly.

### **Disable BPMN**

If you prefer not to use BPMN in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

	<b>Web Service</b>		
	<b>Property</b>		

### 9.3.4.2 BPMN 2.0 Toolbox Pages

You can create BPMN elements and relationships on diagrams in **BPMN 2.0** and **BPEL** formats using the **BPMN 2.0 pages** of the Diagram Toolbox.

**Access** [Diagram](#) | **Diagram Toolbox: More tools** | **BPMN 2.0**

Enterprise Architect provides a set of pages for each of the following BPMN 2.0 diagram types:

Topic	See also
<b>Business Process</b> - contains the constructs needed to build Business Process models.	<a href="#">BPMN 2.0 Business Process Toolbox Pages</a> <sup>[1852]</sup>
<b>Choreography</b> - contains the constructs needed to build Choreography models.	<a href="#">BPMN 2.0 Choreography Toolbox Pages</a> <sup>[1854]</sup>
<b>Collaboration</b> - contains the constructs required to build Collaboration models.	<a href="#">BPMN 2.0 Collaboration Toolbox Page</a> <sup>[1856]</sup>
<b>Conversation</b> - contains the constructs needed to build Conversation models.	<a href="#">BPMN 2.0 Conversation Toolbox Pages</a> <sup>[1859]</sup>

Topic	See also
<b>Types</b> - contains the constructs common to all BPMN 2.0 diagrams.	<a href="#">BPMN 2.0 Type Toolbox Page</a> <sup>1861</sup>

#### 9.3.4.2.1 BPMN 2.0 Business Process Toolbox Pages

To create BPMN elements and relationships on **business process** diagrams in either BPMN 2.0 or BPEL formats, you can use the BPMN 2.0 **Business Process** pages of the Diagram Toolbox.

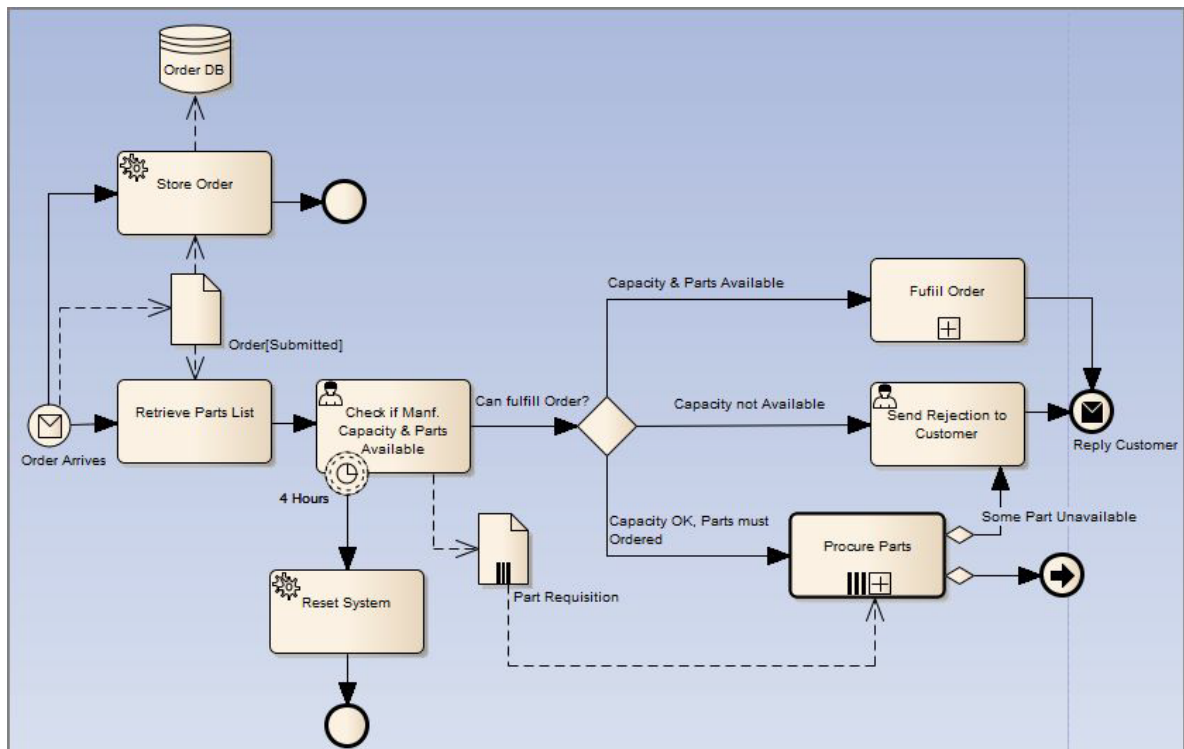

Access   **Diagram | Diagram Toolbox: More tools | BPMN 2.0 | BPMN 2.0 Business Process**

#### Element and Connector Descriptions

Page	Item	Use to
<b>BPMN 2.0 Business Process</b>	<b>Business Process</b>	Extend a composite Activity that defines a business process.
	<b>BPEL</b>	Define the behavior of an executable or abstract business process.
	<b>Activity</b>	Represents work that is performed within a <i>Business Process</i> . An <i>Activity</i> can be modeled as a: <ul style="list-style-type: none"> <li>• <b>Sub-Process</b> - a compound <i>Activity</i> that is defined as a flow of other <b>BPMN 2.0</b> elements or</li> <li>• <b>Task</b> - an atomic <i>Activity</i> that cannot be broken down into a smaller unit</li> </ul> <p>As a sub-process, the Activity can be made a composite element that links to a child diagram containing the flow of other BPMN elements.</p>
	<b>Choreography</b>	Extend an Activity element to represent a process unit of information exchange between Participants.  Enterprise Architect currently supports two to four participant bands within one Choreography Activity/Task.
	<b>Conversation</b>	Extend a Class element to group a set of Message Flows together based on a certain concept.
	<b>Data Object</b>	Provide or store the information for an Activity.
	<b>Data Store</b>	Represent a mechanism for an Activity to retrieve or update stored information.

Page	Item	Use to
	<b>Start Event</b>	Define the initiating event in a process.
	<b>Intermediate Event</b>	Define an intermediate event in a process.
	<b>End Event</b>	Define the terminating event in a process.
	<b>Gateway</b>	Define a decision point in a business process. If a condition is <b>true</b> then processing continues one way; if <b>false</b> , then another.
	<b>Pool</b>	Extend a Partition element to logically organize an Activity.
	<b>Lane</b>	Extend a Partition element to subdivide a Pool.
	<b>Message</b>	Represent the contents of a communication between two Participants.
	<b>Group</b>	Extend a Boundary element to group other elements.
	<b>Text Annotation</b>	Create a comment.
<b>BPMN 2.0 Business Process Connectors</b>	<b>Sequence Flow</b>	Extend a Control Flow relationship to define the flow of activity.
	<b>Message Flow</b>	Extend a Control Flow relationship to define the flow of communications in the process.
	<b>Data Association</b>	Move data between Data Objects, Data Store, Properties and Activities, Processes.
	<b>Association</b>	Link the information and Artifacts with BPMN graphic elements.
	<b>Conversation Link</b>	Connect a Conversation Node with a Participant, in either direction.

<b>BPMN 2.0 Collaboration</b>	<b>Pool</b>	Extend a Partition element to logically organize an Activity.
	<b>Lane</b>	Extend a Partition element to subdivide a Pool.
	<b>Conversation</b>	Extend a Class element to group a set of Message Flows based on a certain concept.

Page	Item	Use to
	<b>Start Event</b>	Define the initiating event in a process.
	<b>Intermediate Event</b>	Define an intermediate event in a process.
	<b>End Event</b>	Define the terminating event in a process.
	<b>Gateway</b>	Define a decision point in a business process.  If a condition is <b>true</b> then processing continues one way; if <b>false</b> , then another.
	<b>Activity</b>	Represents work that is performed within a <i>Business Process</i> . An <i>Activity</i> can be modeled as a: <ul style="list-style-type: none"> <li>• <b>Sub-Process</b> - a compound <i>Activity</i> that is defined as a flow of other <b>BPMN 2.0</b> elements or</li> <li>• <b>Task</b> - an atomic <i>Activity</i> that cannot be broken down into a smaller unit</li> </ul> As a sub-process, the Activity can be made a composite element that links to a child diagram containing the flow of other BPMN elements.
	<b>Choreography</b>	Extend an Activity element to represent a process unit of information exchange between participants.  Enterprise Architect currently supports two to four participant bands within one Choreography Activity/Task.
	<b>Data Object</b>	Provide or store the information for an Activity.
	<b>Data Store</b>	Represent a mechanism for an Activity to retrieve or update stored information.
	<b>Group</b>	Extend a Boundary element to group other elements.
<b>BPMN 2.0 Collaboration Connectors</b>	<b>Text Annotation</b>	Create a comment.
	<b>Message Flow</b>	Extend a Control Flow relationship to define the flow of communications in the process.
	<b>Conversation Link</b>	Connect a Conversation Node to or from a Participant.

Page	Item	Use to
	<b>Sequence Flow</b>	Extend a Control Flow relationship to define the flow of activity.
	<b>Association</b>	Link the information and artifacts with BPMN graphic elements.

### Example BPMN 2.0 Collaboration Diagram

#### 9.3.4.2.4 BPMN 2.0 Conversation Toolbox Pages

To create BPMN elements and relationships on **Conversation** diagrams in either BPMN 2.0 or BPEL formats, you can use the BPMN 2.0 **Conversation** pages of the Diagram Toolbox.

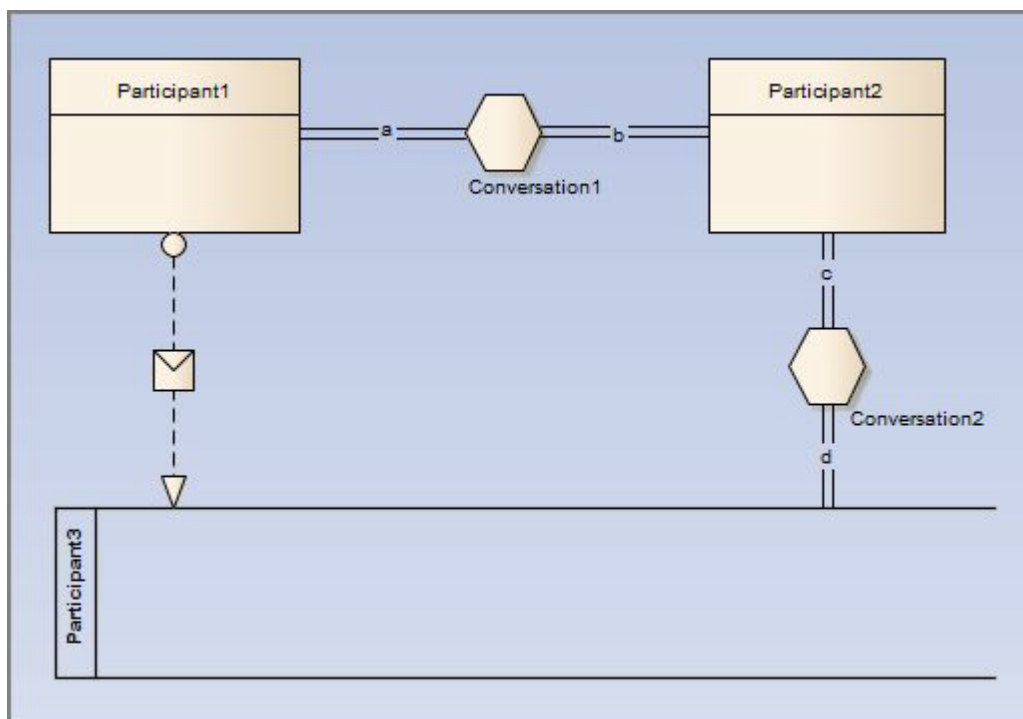

**Access** [Diagram](#) | [Diagram Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Conversation](#)

#### Element and Connector Descriptions

Page	Item	Use to
<b>BPMN 2.0 Conversation</b>	<b>Conversation Model</b>	Extend a composite Activity that defines the logical relationship of Message exchanges between two or more business entities.
	<b>Conversation</b>	Extend a Class element to group a set of Message Flows together based on a certain concept.
	<b>Participant</b>	Represent a specific organization or individual that is involved in a business process.
	<b>Pool</b>	Extend a Partition element to logically organize an Activity.
	<b>Activity</b>	Represents work that is performed within a <i>Business Process</i> . An <i>Activity</i> can be modeled as a: <ul style="list-style-type: none"> <li>• <b>Sub-Process</b> - a compound <i>Activity</i> that is defined as a flow of other <b>BPMN 2.0</b> elements or</li> <li>• <b>Task</b> - an atomic <i>Activity</i> that cannot be broken down into a smaller unit</li> </ul> <p>As a sub-process, the Activity can be made a composite element that links to a child diagram containing the flow of other BPMN elements.</p>
	<b>Start Event</b>	Define the initiating event in a process.
	<b>Intermediate Event</b>	Define an intermediate event in a process.
	<b>End Event</b>	Define the terminating event in a process.
	<b>Gateway</b>	Define a decision point in a business process.  If a condition is <b>true</b> then processing continues one way; if <b>false</b> , then another.

Page	Item	Use to
	<b>Text Annotation</b>	Create a comment.
<b>BPMN 2.0 Conversation Connectors</b>	<b>Conversation Link</b>	Connect a Conversation Node to a Participant, in either direction. <b>Either</b> the source <b>or</b> target element for a Conversation Link <b>must</b> be a Conversation Node element.
	<b>Message Flow</b>	Extend a Control Flow relationship to define the flow of communications in the process.
	<b>Sequence Flow</b>	Extend a Control Flow relationship to define the flow of activity.
	<b>Association</b>	Link the information and artifacts with BPMN graphic elements.

**9.3.4.2.5 BPMN 2.0 Type Toolbox Page**

When you are working on a BPMN 2.0 diagram, you can also create a range of elements and connectors that are common to all of the BPMN 2.0 diagram types, by dragging them from the BPMN 2.0 **Types** page of the Diagram Toolbox.

**Access**    **Diagram | Diagram Toolbox: More tools | BPMN 2.0 | BPMN 2.0 <diagram type>**

Element and Connector Descriptions

Page	Item	Use To
<b>BPMN 2.0 Types</b>	<ul style="list-style-type: none"> <li>• Assignment</li> <li>• CorrelationKey</li> <li>• CorrelationProperty</li> <li>• CorrelationPropertyBinding</li> <li>• CorrelationPropertyRetrieval</li> <li>• CorrelationSubscription</li> <li>• Category</li> <li>• CategoryValue</li> <li>• ComplexBehaviorDefinition</li> <li>• ItemDefinition</li> <li>• Error</li> <li>• Escalation</li> <li>• Signal</li> <li>• IOSpecification</li> <li>• InputSet</li> <li>• OutputSet</li> <li>• InputOutputBinding</li> <li>• Interface</li> <li>• Endpoint</li> </ul>	<p>Define the non-graphic elements or properties (Tagged Values) of the Core BPMN 2.0 graphic elements.</p> <p>See <a href="#">Change BPMN Element Appearance</a><sup>[1862]</sup>.</p>

Page	Item	Use To
	<ul style="list-style-type: none"> <li>• Operation</li> <li>• Participant</li> <li>• Resource</li> <li>• ResourceRole</li> <li>• ResourceParameter</li> <li>• Property</li> <li>• ParticipantAssociation</li> <li>• ConversationAssociation</li> </ul>	

### 9.3.4.3 Change BPMN Element Appearance

A number of Tagged Values directly affect the appearance of the BPMN element or connector they apply to. Therefore, you can change the appearance of the object by changing the value of the tag.

Access **View | Tagged Values**

#### Define the appearance of BPMN elements and connectors

Step	Action	See also
1	Open the Tagged Values window.	<a href="#">Tagged Values</a> 
2	Select the required element or relationship in a diagram.  The Tagged Values window shows the appropriate Tagged Values and provides a list of values to assign to each one.	
3	Set the required value, based on the value descriptions in the table below.	

#### Values For Tags

Element	Tags	Values Setting
<b>Activity</b>	<i>activityType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Task</b> for no decoration</li> <li>• <b>Sub-Process</b> to display the <i>plus-in-box</i> decoration on the bottom edge of the shape</li> </ul>

Element	Tags	Values Setting
	<i>adHoc</i>	Set to <b>true</b> to display the <i>tilde</i> decoration on the bottom edge of the shape, indicating that this is an ad-hoc Activity.
	<i>isACallActivity</i>	Set to <b>true</b> to show the boundary of the Activity element as a thick line, indicating that this is a Call Activity.
	<i>isATransaction</i>	Set to <b>true</b> to give the Activity element a double-lined border, indicating that this is a Transaction.
	<i>isForCompensation</i>	Set to <b>true</b> to display the <i>rewind</i> icon on the bottom edge of the shape, indicating that this is a Compensation Activity.
	<i>isSequential</i>	Set to <b>true</b> to display three horizontal bars on the bottom edge of the shape.  The <i>loopCharacteristics</i> tag must first be set to <b>MultilInstance</b> .
	<i>loopCharacteristics</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Standard</b> to display three vertical bars at the bottom edge of the shape</li> <li>• <b>MultilInstance</b> to display a loop icon at the bottom edge of the shape</li> </ul>
	<i>taskType</i>	When set to different value, the associated decoration is displayed at the top-left corner of the shape.
	<i>triggeredByEvent</i>	Set to <b>true</b> to show the boundary of the Activity element as a dotted line.
<b>Choreography</b>	<i>choreographyType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Task</b> for no decoration</li> <li>• <b>Sub-Process</b> to display the <i>plus-in-box</i> decoration on the bottom edge of the shape.</li> </ul>
	<i>initiatingParticipant</i>	Set a value to show the corresponding participant band in a light color, which indicates that this is the initiating participant.
	<i>isACallChoreography</i>	Set to <b>true</b> show the boundary of the Choreography element as a thick line.
	<i>loopType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Standard</b> to display three vertical bars at the bottom edge of the</li> </ul>

Element	Tags	Values Setting
		<p>shape</p> <ul style="list-style-type: none"> <li>• <b>MultilInstance</b> to display a loop icon at the bottom edge of the shape</li> </ul> <p>Each Participant has its own MultilInstance setting.</p>
	<i>numberOfParticipants</i>	Set to the appropriate numerical value to indicate the number of Participant bands for a choreography Activity or Task.
	<i>participantA</i> or <i>participantARef</i>	<p><i>participantA</i> - Type the name of the Participant to show on the Participant band of the Choreography.</p> <p>If the Participant is known and referenced, use the <i>participantARef</i> tag and leave the <i>participantA</i> tag blank; the name of the referenced Participant is shown on the Participant band of the Choreography.</p> <p>The same usage is applied to other Participant bands.</p>
<b>Conversation</b>	<i>isACallConversation</i>	Set to <b>true</b> to show the boundary of the Conversation element as a thick line.
	<i>isComposite</i>	Set to <b>true</b> to display a <i>plus-in-box</i> decoration on the bottom edge of the shape, indicating that the Conversation is a composite element.
<b>Data Object</b>	<i>dataInOut</i>	<p>Set to:</p> <ul style="list-style-type: none"> <li>• <b>Input</b> to add a light-colored arrow at the top-left corner of the Data Object, indicating that it represents a Data Input element</li> <li>• <b>Output</b> to add a dark-colored arrow at the top-left corner of the Data Object, indicating that it represents a Data Output element</li> </ul>
	<i>isCollection</i>	Set to <b>true</b> to add three vertical lines at the bottom edge of the shape, indicating that the object is a collection.
<b>Event</b>	<i>cancelActivity</i>	<p>For Intermediate Event only.</p> <p>Set to <b>false</b> to show the Intermediate Event border as a dashed line.</p>
	<i>catchOrThrow</i>	<p>For Intermediate Event only.</p> <p>Set to:</p> <ul style="list-style-type: none"> <li>• <b>Catch</b> or</li> <li>• <b>Throw</b></li> </ul>
	<i>eventDefinition</i>	Use to change the decoration of a Start Event, Intermediate Event or

Element	Tags	Values Setting
		End Event.
	<i>isInterrupting</i>	For Start Event only.  Set to <b>false</b> to show the border of the Start Event as a dashed line, indicating that the Start Event is not an interrupting event.
<b>Gateway</b>	<i>eventGatewayType</i>	Use to define two types of Event-based Gateway: <ul style="list-style-type: none"> <li>• <b>Exclusive</b> and</li> <li>• <b>Parallel</b></li> </ul>
	<i>gatewayType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Exclusive</b> to render the Gateway as a diamond shape without any marker in the middle; if you also set the <i>markerVisible</i> tag to <b>true</b>, the Gateway is rendered as a diamond shape with an X inside</li> <li>• <b>Complex</b> to render the Gateway as a diamond shape with an asterisk (*) inside</li> <li>• <b>Inclusive</b> to render the Gateway as a diamond shape with a circle (o) inside</li> <li>• <b>Parallel</b> to render the Gateway as a diamond shape with a plus (+) inside</li> <li>• <b>Event</b> to define the Gateway as Event-based.</li> </ul>
	<i>instantiate</i>	Use only to define the Exclusive and Parallel Event-based Gateway.
<b>Message</b>	<i>IsInitiate</i>	Set to <b>true</b> to make the envelope color gray, indicating that this is an initiating Message.
<b>Message Flow</b>	<i>messageVisible</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Unspecified</b> to make the Message Flow connector without decoration</li> <li>• <b>Initiating</b> to add a white envelope to the Message Flow connector</li> <li>• <b>Non-Initiating</b> to add a gray envelope to the Message Flow connector</li> </ul>
<b>Participant</b>	<i>participantMultiplicity</i>	Set to <b>true</b> to display three vertical bars at the bottom edge of a rectangle Pool element.  Participant is rendered as a normal UML Class shape exclusively on Conversation diagrams.

Element	Tags	Values Setting
<b>Pool</b>	<i>blackBoxPool</i>	Set to <b>true</b> to render the Pool element as a rectangle, which is used in a Main Pool diagram.
	<i>participantMultiplicity</i>	Set to <b>true</b> to display three vertical bars at the bottom edge of a rectangle Pool element.
<b>Sequence Flow</b>	<i>conditionType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Expression</b> to show an unfilled diamond marker at the source end of the connector</li> <li>• <b>Default</b> to show a slash marker at the source end of the connector</li> </ul>

#### Notes

- Some BPMN elements changed in appearance between BPMN version 1.0 and BPMN version 1.1
- In Enterprise Architect releases later than 7.1, if you work on a BPMN 1.0 model created in an earlier release, existing elements default to their version 1.0 appearance; new elements assume the BPMN version 1.1 appearance and automatically have a Tagged Value **BPMNVersion** set to 1.1
- If you want a new element to revert to the BPMN version 1.0 appearance, set the **BPMNVersion** Tagged Value to 1.0
- Conversely, if you want an older element to assume the BPMN version 1.1 appearance, assign the **BPMNVersion** Tagged Value to it, with the value 1.1

#### 9.3.4.4 Migrate BPMN 1.0 Model to BPMN 1.1

It is possible to migrate a BPMN 1.0 model (or part of a model) to BPMN 1.1 or BPMN1.1::BPEL, using the Automation Interface. There are two functions you can use:

- *MigrateToBPMN11()*
  - `proj.MigrateToBPMN11 sGUID, "BPMN"`
  - `proj.MigrateToBPMN11 sGUID, "BPEL"`
- *Migrate()*
  - `proj.Migrate sGUID, "BPMN", "BPMN1.1"`
  - `proj.Migrate sGUID, "BPMN", "BPMN1.1::BPEL"`

These functions update the Tagged Values and, if required, stereotypes to BPMN 1.1 for all elements, attributes, connectors and diagrams under the selected package or element.

#### Example

The following VB script calls the *MigrateToBPMN11()* function to migrate the Tagged Values to BPMN 1.1:

```
Sub MigrateElement (sGUID, lngPackageID)

    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.MigrateToBPMN11 sGUID, "BPMN"
```

```

' refresh the model
If lngPackageID <> 0 Then
    Repository.RefreshModelView (lngPackageID)
End If

End Sub

Sub MigrateSelectedItem

    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package

    selType = GetTreeSelectedItemType

    If selType = 4 Then ' means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Complete", 0, "BPMN 1.1 Migration"

    ElseIf selType = 5 Then ' means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Complete", 0, "BPMN 1.1 Migration"

    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "BPMN 1.1 Migration"

    End If

End Sub

Sub Main

    MigrateSelectedItem

End Sub

Main

```

### Notes

- In BPMN 1.0, various tags have free-text direct-entry value fields, and you can provide additional information on these tags in the Tagged Value Note dialog, for display at the bottom of the Tagged Values window

In BPMN 1.1, some of these tags (such as the *Categories* tag on a *BusinessProcess* stereotyped element) have been changed to **Memo** type, and you use the Tagged Value Note dialog to enter the value; therefore, you cannot have additional notes for these tags, all information must be within the tag's value

- For such tags, when migrating from BPMN 1.0 to BPMN 1.1, the BPMN 1.0 tag value is moved into the BPMN 1.1 tag **Notes** field and the BPMN 1.0 tag notes are discarded; if you want to preserve the tag notes text, take a copy of the BPMN 1.0 model before migration to enable you to copy the tag notes text into the tag value after migration

### Learn more

- [MigrateToBPMN11\(\)](#)  <sup>[2978]</sup>
- [Migrate\(\)](#)  <sup>[2978]</sup>

### 9.3.4.5 Migrate BPMN 1.1 Model to BPMN 2.0

It is possible to migrate a BPMN 1.1 model (or part of a model) to BPMN 2.0, using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to BPMN 2.0 for all elements, attributes, connectors and diagrams under the selected package or element.

#### Example

The following VB script calls the *Migrate()* function to migrate the package or element to BPMN 2.0:

```
Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "BPMN1.1", "BPMN2.0"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "BPMN 2.0 Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "BPMN 2.0 Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "BPMN 2.0 Migration"
    End If
End Sub

Sub Main
    MigrateSelectedItem
End Sub

Main
```

#### Notes

- Please backup your project before you run the BPMN 2.0 Migrator
- Normalization occurs on the following tags:
  - BPMN1.1::Activity::InMessageRef
  - BPMN1.1::Activity::OutMessageRef
  - BPMN1.1::Activity::IORules
  - BPMN1.1::Activity::InputSets
  - BPMN1.1::Activity::OutputSets
  - BPMN1.1::Activity::ComplexMI\_FlowCondition
  - BPMN1.1::Activity::Performers
  - BPMN1.1::BusinessProcess::InputSets

- BPMN1.1::BusinessProcess::OutputSets
- BPMN1.1::BusinessProcess::Performers
- BPMN1.1::EndEvent::ErrorCode
- BPMN1.1::IntermediateEvent::ErrorCode

Taking *BPMN1.1::Activity::InMessageRef* as an example, the following steps take place:

- (1) Create a new element *BPMN2.0::Operation*
- (2) Insert the reference tag *BPMN2.0::Activity::operationRef*
- (3) Migrate *BPMN1.1::Activity::InMessageRef* to *BPMN2.0::Operation::InMessageRef*

- Denormalization occurs on the following tags:
  - BPMN1.1::Transaction::TransactionProtocol
  - BPMN1.1::WebService::Operation
  - BPMN1.1::WebService::Interface
  - BPMN1.1::WebService::ParticipantRef
  - BPMN1.1::Condition::ConditionExpression
  - BPMN1.1::BPELProcess::InputSets
  - BPMN1.1::BPELProcess::OutputSets

Taking *BPMN1.1::Transaction::TransactionMethod* as an example, the following steps take place:

- (1) Find element *BPMN1.1::Transaction* by '*BPMN1.1::Transaction::TransactionProtocol*
- (2) Migrate *BPMN1.1::Transaction::TransactionMethod* to *BPMN2.0::transactionMethod*
- (3) Migrate *BPMN1.1::Transaction::TransactionProtocol* to *BPMN2.0::transactionProtocol*

- If a BPMN1.1 stereo tag is discarded in BPMN2.0, it is preserved if the tag has a value

#### Learn more

- [Migrate\(\)](#)<sup>[2978]</sup>

### 9.3.4.6 BPMN 2.0 XML

It is possible to serialize **BPMN 2.0 Models** in **BPMN 2.0 XML**. The serialized XML file contains both the model semantics as well as the diagram-interchange information.

**Access** Click on a package in the Project Browser, then:

**Project | Publish Model**  
**Project | Model Import/Export | Export Package to XMI File: Publish, or**  
**Right-click | Import/Export | Export Package to XMI: Publish**

#### Serialize a Model

Step	Action	See also
1	Open the Publish Model Package dialog.	<a href="#">Publish Model Package</a> <sup>[476]</sup>

2	In the <b>XML Type</b> field, select <b>BPMN 2.0 XML</b> .	
3	Click on the <b>Export</b> button to initiate the BPMN 2.0 XML serialization.	

### Notes

- The package being serialized is assumed to be self-contained
- Only the contents of the selected package are considered for serialization - child packages (and their contents) are ignored
- Serialization of the **Group** element in the BPMN 2.0 **Business Process** Toolbox is not supported
- Serialization of the following items in the BPMN 2.0 **Types** section of the Toolbox is not supported:
  - *InputOutputBinding*
  - *Participant Association*
  - *Conversation Association*

### Learn more

- [XML Schema for BPMN 2.0 XML](#) (Online Resource)
- [BPMN 2.0 Toolbox Pages](#) 

## 9.3.5 BPEL Models

The following text is derived from the **BPEL** entry in the online Wikipedia:

**Business Process Execution Language (BPEL)**, short for **Web Services Business Process Execution Language (WS-BPEL)**, is an executable language for specifying interactions with **Web Services**. Processes in Business Process Execution Language export and import information by using Web Service interfaces exclusively.

Web service interactions can be described in two ways :

1. Executable business processes, which model the actual behavior of a participant in a business interaction.
2. Abstract business processes, which are partially specified processes that are not intended to be executed. An Abstract Process may hide some of the required concrete operational details.

**BPEL** is an **Orchestration** language, serialized in XML, which specifies an executable process that involves message exchanges with other systems. This messaging facility depends on the use of the **Web Services Description Language (WSDL) 1.1** to describe outgoing and incoming messages.

### BPEL in Enterprise Architect:

Enterprise Architect supports generating **BPEL** from executable processes in the **Business and Software Engineering** and the **Ultimate** editions. Although there is no standard graphical notation for **WS-BPEL**, Enterprise Architect uses **BPMN** profile as a graphical front-end to capture **BPEL** Process descriptions. With the help of the **BPMN** Profile, Enterprise Architect enables you to develop **BPEL** diagrams quickly and simply. While **BPMN** provides a graphical notation for visualizing business process, **BPEL** provides a way for visualizing this graphical business process in XML.

Enterprise Architect supports generating:

- BPEL 1.1  from models created using constructs in BPMN 1.1 Profile
- BPEL 2.0  from models created using constructs in BPMN 2.0 Profile

### Notes

- BPEL is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect
- Enable BPMN 1.1 Technology for BPEL 1.1 and BPMN 2.0 Technology for BPEL 2.0 modeling in the MDG Technologies dialog ( **Settings | MDG Technologies** )

### Learn more

- [BPEL](#) (Online Resource)
- [Orchestration](#) (Online Resource)
- [BPEL 1.1 Model](#) 
- [BPEL 2.0 Model](#) 
- [BPMN Model](#) 

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Business Modeling | BPEL | Getting Started**

#### 9.3.5.1 BPEL 1.1 Model

Enterprise Architect uses **BPMN 1.1** as a graphical front-end to capture **BPEL 1.1** Process description ( as BPEL 1.1 does not have not a standard graphical notation ). Enterprise Architect uses the partial mapping specified in the *OMG BPMN 1.1 Specification* to map BPMN 1.1 constructs to BPEL 1.1.

### How to

Step	Action	See also
1	Create a <b>BPEL 1.1 Package Structure</b> .	<a href="#">BPEL 1.1 Package Structure</a>   <

	<div> <div>d</div> <div>Click on the <b>BPEL Process</b> icon from the BPMN 1.1 Core toolbox and add it to the created BPEL diagram.</div> </div>	
2	Open the BPEL diagram under the <i>BPELProcess</i> stereotyped element.	
3	<p>Model the <i>BPEL Process</i> using the constructs in the BPMN 1.1 Core toolbox; use the following constructs in this toolbox to model BPEL 1.1:</p> <p>BPMN 1.1 - Core page:</p> <ul style="list-style-type: none"> <li>• BPEL Process</li> <li>• Activity</li> <li>• Start Event</li> <li>• Intermediate Event</li> <li>• End Event</li> <li>• Gateway</li> <li>• Pool</li> </ul> <p>BPMN 1.1 - Relationships page:</p> <ul style="list-style-type: none"> <li>• Sequence Flow</li> <li>• Message Flow</li> <li>• Association</li> </ul> <p>BPMN 1.1 Types page:</p> <ul style="list-style-type: none"> <li>• Assignment</li> <li>• Condition</li> <li>• Message</li> <li>• Participant</li> <li>• Web Service</li> </ul>	<a href="#">BPMN 1.1 Core Toolbox</a> <sup>[1848]</sup> <a href="#">Model BPEL 1.1 Process</a> <sup>[1876]</sup>
4	Create <b>Web Service</b> for the <i>BPEL Process</i> and other related <i>Pools</i> , if required.	<a href="#">BPEL Web Service</a> <sup>[1890]</sup>
5	Generate <b>BPEL 1.1</b> code from the <i>BPEL Process</i> .	<a href="#">Generate BPEL 1.1</a> <sup>[1893]</sup>

### Notes

- Generating BPEL 1.1 from a BPMN 1.1 model is supported in the Business and Software Engineering and the Ultimate editions of Enterprise Architect
- Ensure that BPMN 1.1 Technology is enabled in the MDG Technologies dialog ( **Settings | MDG Technologies** )

### BPEL 1.1 Example

- The Enterprise Architect Example file ( *EAExample.EAP* ) has a sample BPMN 1.1 model from which BPEL 1.1 can be generated
- If you have installed Enterprise Architect at the default location, open this file: *C:\Program Files\Sparx Systems\EA\EAExample.EAP*
- The BPMN 1.1 model package is in: **Project Models | Analysis and Business Modeling | BPEL Example | BPEL 1.1 Model**

### Modeling Restrictions

- Every *BPEL Process* and *Sub-Process* should start with a *Start Event* and end with an *End Event*
  - A *Start Event* or an *End Event* should not be attached to the boundary of a *Sub-Process*
- *Sequence Flow* Looping is not supported - only *Activity* looping is supported; all *Sequence Flows* should flow downstream and not upstream
- Mapping of an *Intermediate Event* with multiple triggers to BPEL 1.1 is not supported
- Mapping of *Multi-Instance Parallel While* loops to BPEL 1.1 is not supported
- Mapping of *Independent Sub-Process* to **BPEL 1.1** is not supported
- *Pools* are treated as *black box* (i.e. they do not expose any details) and hence they cannot contain any child elements or have any incoming/outgoing *Sequence Flow* connectors

#### 9.3.5.1.1 Create BPEL 1.1 Model Structure

A BPEL 1.1 model consists of a *BPEL Process* ( containing a BPEL diagram and mappable BPMN 1.1 constructs ) and other supporting elements ( like BPMN 1.1 *Assignment*, BPMN 1.1 *Web Service* ) required for generating BPEL 1.1 code. A sample BPEL 1.1 package structure can be created in the Project Browser, using the Select Model(s) (Model Wizard) dialog. You can use this package structure as a template for developing your *BPEL Process*.

### Access

- **Project Browser package context menu | Add a Model using Wizard** ( or )
- **Project Browser toolbar: New Model from Pattern**

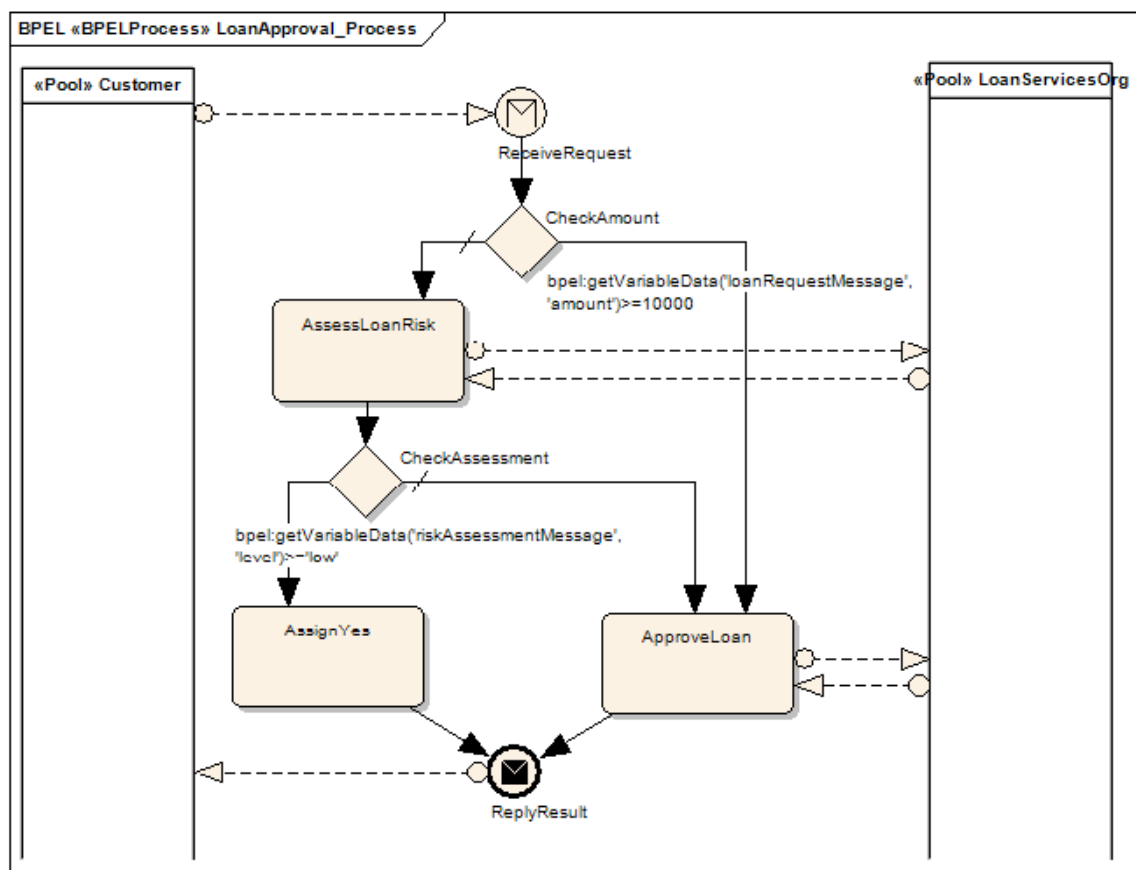

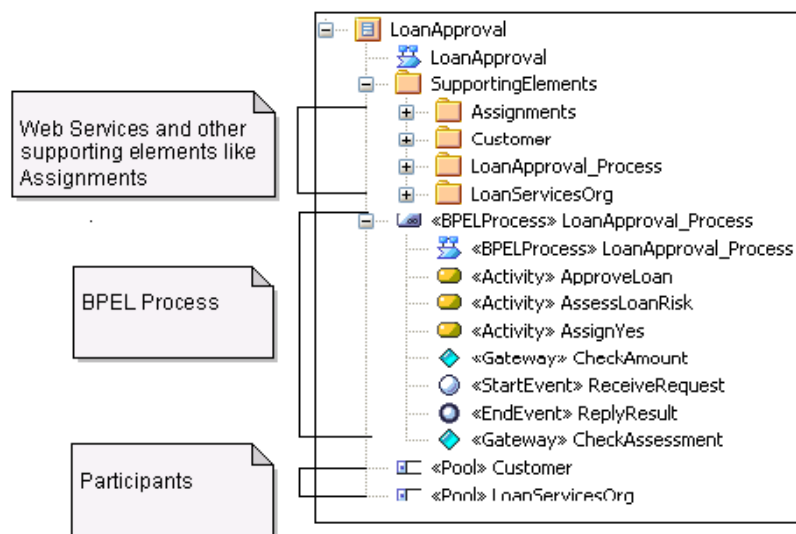

### Create a new BPEL 1.1 Package structure as a starting point for developing a BPEL Process

Step	Action	See also
1	Select the root node or a package in the Project Browser.	
2	Click on the <b>New Model from Pattern</b> icon in the toolbar.	<a href="#">Project Browser Toolbar</a> <sup>[66]</sup>
3	Select the value <b>BPMN 1.1</b> in the Technology section.	<a href="#">Model Wizard</a> <sup>[75]</sup>
4	Check the option <b>BPEL 1.1 Model</b> in the Name section.	

5	Click on the <b>OK</b> button to create the sample BPEL 1.1 package structure.	

**Example BPEL 1.1 Package Structure:**

The BPEL Process *LoanApproval\_Process* acts as container for the BPEL diagram and elements. The *SupportingElements* package contains supporting components like **Assignments** and **Web Services**.

### Learn more

- [Model a BPEL 1.1 Process](#) <sup>1876</sup>
- [Create a BPEL 1.1 Web Service](#) <sup>1890</sup>
- [Generate BPEL 1.1](#) <sup>1893</sup>

### 9.3.5.1.2 Model a BPEL 1.1 Process

The *BPEL Process* in Enterprise Architect represents the top-level container for the BPMN 1.1 elements, from which BPEL 1.1 can be generated. Conceptually it maps to the BPEL *process* element.

#### BPEL Properties:

- Double-click on the *BPEL Process* in the BPEL diagram
- Right-click on the *BPEL Process* | **BPEL** | **BPEL Properties**

#### Reference

Field/Button	Usage	See also
<b>Name</b>	Specify the name for the <i>BPEL Process</i> .	
<b>Query Language</b>	Specify the value of the language used in the <i>BPEL Process</i> for the selection of nodes in <i>Assignments</i> . Defaults to <b>XPath 1.0</b> .	
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> [956]

#### Learn more

The *BPEL Process* element acts as a container for the following BPMN 1.1 constructs:

- [Start Event](#) [1877]
- [Intermediate Event](#) [1878]
- [Activity](#) [1881]
- [Gateway](#) [1884]
- [End Event](#) [1885]
- [Sequence Flow](#) [1887]

The following BPMN 1.1 constructs can be optionally used in BPEL modeling:

- [Pool](#) [1888]
- [Assignment](#) [1889]

### 9.3.5.1.2.1 Start Event

ABPMN 1.1 *Start Event* indicates where a particular *Process* begins. Every *Process* in Enterprise Architect must begin with a *Start Event*.

#### BPEL Properties:

- Double-click on the *Start Event* in the BPEL diagram ( or )
- Right-click on the *Start Event* | **BPEL** | **BPEL Properties**

<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> 

**Notes**

- **Cancel**, **None** and **Signal Event** types cannot be mapped to BPEL 1.1
- Either set **Time Cycle** or **Time Date** for **Timer Trigger Type** but not both as they are mutually exclusive fields

- For a **Compensation Intermediate Event** edge-mounted on an *Activity*, create a BPMN 1.1 *Association* from this event to the *Compensation Activity*; ensure that the *IsCompensation* tag for the *Activity* is set to true
- **Link Intermediate Event** can be used either as a GOTO or an off-page connector; therefore, this event can have either incoming or outgoing *Sequence Flows* - but not both

#### 9.3.5.1.2.3 Activity

A BPMN 1.1 *Activity* represents work that is performed within a *Process*. An *Activity* can be modeled as a:

- **Sub-Process** - a compound *Activity* that is defined as a flow of other **BPMN 1.1** elements or
- **Task** - an atomic *Activity* that cannot be broken down into a smaller unit

Activities - both *Tasks* and *Sub-Processes* - can also, optionally, act as *Looping constructs*. The *OMG BPMN 1.1 Specification* defines two types of *Looping construct*:

- **Standard Loop** ( *while* or *until* )
- **Multi-Instance Loop** ( *for each* )

#### BPEL Properties:

- Double-click on the *Activity* in the BPEL diagram
- Right-click on the *Activity* | **BPEL** | **BPEL 1.1 Properties**

#### Reference

Notes

- **Cancel**, **Link**, **None** and **Signal** *Event* types cannot be mapped to BPEL 1.1

**9.3.5.1.2.6 Sequence Flow**

A BPMN 1.1 *Sequence Flow* connector shows the order in which the activities (*Tasks* and *Events*) are performed in a *BPEL Process*.

BPEL Properties:

- Double-click on the *Sequence Flow* in the BPEL diagram
- Right-click on the *Sequence Flow* | **BPEL** | **BPELProperties**

Reference

Field/Button	Usage	See also
<b>Condition Type</b>	Specify the type of the condition on the <i>Sequence Flow</i> , namely : <ul style="list-style-type: none"> <li>• None</li> <li>• Default</li> <li>• Expression</li> </ul>	
<b>Expression</b>	This field gets enabled when the <b>Condition Type</b> is set to <b>Expression</b> . Specify a boolean expression to act as a gating condition.	
<b>Ordering</b>	This field gets enabled when the <b>Condition Type</b> is set to <b>Expression</b> .	

	Specify a numerical value that determines the order in which the condition set in the <b>Expression</b> field is to be evaluated.	
<b>Assignments</b>	Select one or more <i>Assignment</i> elements created in the <i>SupportingElements</i> package in this tab (Optional).	<a href="#">Assignment</a> <sup>1885</sup> <a href="#">Create BPEL 1.1 Model Structure</a> <sup>1873</sup>
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> <sup>956</sup>

#### 9.3.5.1.2.7 Pool

A BPMN 1.1 *Pool* represents a Participant in a *Process* and does not map to any specific BPEL 1.1 element. Enterprise Architect uses Pools to represent external Participants, with which the BPEL Process communicates. These are 'black box' *pools*; that is, they are abstract and do not expose any details (they do not contain any BPMN 1.1 elements inside them).

#### BPEL Properties:

- Double-click on the *Pool* in the BPEL diagram
- Right-click on the *Pool* | **BPEL** | **BPEL Properties**

#### Reference

Field/Button	Usage	See also
<b>Name</b>	Specify the name for the <i>Pool</i> .	
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> <sup>956</sup>

**Notes**

- A *BPEL Process* should not contain a *Pool* as its child element
- A BPEL diagram under a *BPEL Process* contains an implicit *Pool* - so it is invalid to add a *Pool* in this BPEL diagram to represent the *BPEL Process*
- *Pool* cannot have any incoming or outgoing *Sequence Flow* connectors - it can have only incoming or outgoing *Message Flow* connectors

**9.3.5.1.2.8 Assignment**

A BPMN 1.1 *Assignment* element enables data to be copied between messages and new data to be inserted, using expressions within a *BPEL Process*. A BPMN 1.1 *Assignment* element maps to a BPEL 1.1 *assign* activity and copies the specified value from the source to the target.

In Enterprise Architect, *Assignment* elements should be created in the *Assignments* package in *SupportingElements*<sup>[1897]</sup>. If they are created elsewhere, they cannot be enacted correctly.

**Access:** [Diagram](#) | [Diagram Toolbox: More tools](#) | [BPMN 1.1](#) | [BPMN 1.1 Types](#)

**BPEL Properties:**

- Double-click on the *Assignment* in the BPEL diagram
- Right-click on the *Assignment* | [BPEL](#) | [BPEL Properties](#)

#### Notes

- Messages are created when you create Web Services
- If you select **Expression**, Enterprise Architect uses the *getVariableData XPATH 1.0* function to create the expression from the selected Message and Part

#### 9.3.5.1.3 Create BPEL 1.1 Web Service

BPEL is an **Orchestration** language, which orchestrates services that are exposed using **WSDL 1.1**. It coordinates the execution of the various operations of these involved services. BPEL 1.1 supports **WSDL 1.1 one-way** and **request-response** operations only (and not **solicit-response** and **notification** operations). Enterprise Architect enables you to create, for *BPEL Process* and *Pool* elements, **Web Service Operations** that support either *synchronous* (request-response) or *asynchronous* (one-way) interactions.

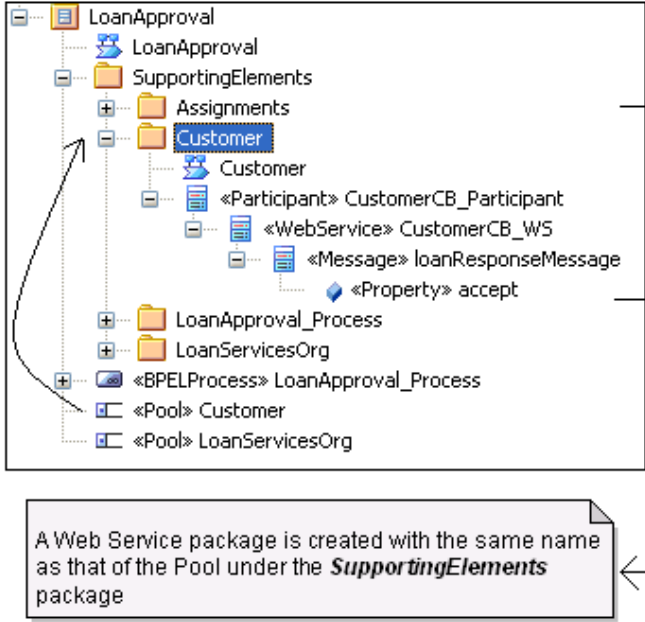

**Access** Right-click on a *BPEL Process* or *Pool* | **BPEL | Create WebService**

#### Reference

- The Output tab is not applicable for an Asynchronous operation

#### 9.3.5.1.4 Generate BPEL 1.1

**BPEL 1.1** code can be generated from a *BPEL Process*. Enterprise Architect validates the *BPEL Process* before generating the **BPEL 1.1** code. In addition to generating the **BPEL 1.1** code, **WSDL 1.1** files are generated for the *BPEL Process* and all the involved *Pools* ( provided **Web Services** are defined for them ).

**Access** Right-click on a BPEL Process and select the following context menu: **BPEL | Generate BPEL**

#### Reference

Field/Button	Usage	See also
<b>File Name</b>	Specify the path where the BPEL 1.1 file is to be generated.	
<b>Namespace Details</b>	Double-click on an entry ( if any ) in this field to open the Namespace Details dialog and add / edit the namespace details.  The entry <b>DefaultPool</b> represents the current <i>BPEL Process</i> .	
<b>Generate BPEL</b>	Validate the model and generate BPEL 1.1.	<a href="#">BPEL Model Validation</a> <sup>[1917]</sup>
<b>Close</b>	Close this dialog.	
<b>Help</b>	Display this Help topic.

### 9.3.5.2 BPEL 2.0 Model

Enterprise Architect uses BPMN 2.0 as a graphical front-end to capture BPEL 2.0 *Process* description (as BPEL 2.0 does not have a standard graphical notation). Enterprise Architect uses the partial mapping specified in the BPMN 2.0 specification to map BPMN 2.0 constructs to BPEL 2.0.

#### How to

Step	Action	See also
1	Create a BPEL 2.0 Package Structure.	<a href="#">BPEL 2.0 Package Structure</a> <sup>[1897]</sup>  <

	<table><tr><td></td><td></td></tr><tr><td>d</td><td>Click on the <b>BPEL</b> icon from the BPMN 2.0 - Business Process To into the created BPEL diagram.</td></tr></table>			d	Click on the <b>BPEL</b> icon from the BPMN 2.0 - Business Process To into the created BPEL diagram.	
d	Click on the <b>BPEL</b> icon from the BPMN 2.0 - Business Process To into the created BPEL diagram.					
2	Open the BPEL diagram under the <i>BPELProcess</i> stereotyped element.					
3	<p>Model the <i>BPEL Process</i> using the constructs in the BPMN 2.0 - Business Process Toolbox. Use the following constructs in this toolbox to model BPEL 2.0:</p> <p>BPMN 2.0 - Business Process page:</p> <ul style="list-style-type: none"><li>• BPEL</li><li>• Activity</li><li>• Data Object</li><li>• Start Event</li><li>• Intermediate Event</li><li>• Event</li><li>• Gateway</li><li>• Pool</li></ul> <p>BPMN 2.0 - Business Process Connectors page:</p> <ul style="list-style-type: none"><li>• Sequence Flow</li><li>• Association</li><li>• Message Flow</li></ul> <p>BPMN 2.0 Types page:</p> <ul style="list-style-type: none"><li>• Assignment</li><li>• Error</li><li>• Interface</li><li>• Operation</li><li>• Participant</li><li>• Property</li></ul>	<p><a href="#">BPMN 2.0 Business Process Toolbox</a><sup>[1852]</sup></p> <p><a href="#">Model BPEL 2.0 Process</a><sup>[1898]</sup></p>				
4	Create Web Service Operations for the <i>BPEL Process</i> and other related <i>Pools</i> , if required.	<p><a href="#">Web Service Operation</a><sup>[1914]</sup></p>				
5	Generate BPEL 2.0 code from the <i>BPEL Process</i> .	<p><a href="#">Generate BPEL 2.0</a><sup>[1916]</sup></p>				

**Notes**

- Generating BPEL 2.0 from a BPMN 2.0 model is supported in the Business and Software Engineering

and the Ultimate editions of Enterprise Architect

- Ensure that BPMN 2.0 Technology is enabled in the MDG Technologies dialog (**Settings | MDG Technologies**)

#### **BPEL 2.0 Example:**

- The Enterprise Architect Example file ( *EAExample.EAP* ) has a sample BPMN 2.0 model from which BPEL 2.0 can be generated
- If you have installed Enterprise Architect at the default location, open this file: *C:\Program Files\Sparx Systems\EA\EAExample.EAP*
- The BPMN 2.0 model package is in: **Project Models | Analysis and Business Modeling | BPEL Example | BPEL 2.0 Model**

#### **Modeling Restrictions:**

- Every BPEL *Process* and *Sub-Process* should start with a *Start Event* and end with an *End Event*
  - Boundary *Start* and *End Events* are not supported
- *Sequence Flow* Looping is not supported in both **Normal** and **Exception Paths**
  - All *Sequence Flows* should flow downstream and not upstream
- *Sub-Process* cannot be a **Loop** node and have boundary *Intermediate Events*
- *Event Sub-Process* cannot act as a **Loop** Node
- *Assignments* are not supported on:
  - *Start Events* on *Event Sub-Process*
  - *End Events*
  - *Sub-Process*
  - Boundary *Intermediate Event*
  - *Gateway*
  - *Task* and *Intermediate Event* that immediately follow an *XOR Event Gateway*
- **Exception Path** has to merge back into the **Normal Path**
  - An exception to this rule is boundary *Compensation Intermediate Event* which should have a BPMN 2.0 *Association* to a *Compensation Activity* (that has no incoming or outgoing *Sequence Flows*)
  - Multiple **Exception Paths** from an *Activity* must join at the same location in the **Normal Path**
  - An **Exception Path** should not cross another **Exception Path**
- *Activities* in an **Exception Path** cannot have boundary **Intermediate Events**.
- *Pools* are treated as *black boxes* (that is, they do not expose any details) and hence they cannot contain any child elements or have any incoming/outgoing *Sequence Flow* connectors

#### **Learning Center topics**

- (Alt+F1) | **Enterprise Architect | Business Modeling | BPEL | Getting Started**

### 9.3.5.2.1 Create BPEL 2.0 Model Structure

A BPEL 2.0 model consists of a *BPEL Process* (containing a BPEL diagram and mappable BPMN 2.0 constructs) and other supporting elements (like BPMN 2.0 *Assignment*, BPMN 2.0 *Operation*) required for generating a BPEL 2.0 code.

A sample BPEL 2.0 package structure can be created in the Project Browser, using the Select Model(s) (Model Wizard) dialog. You can use this package structure as a template for developing your *BPEL Process*.

#### Access

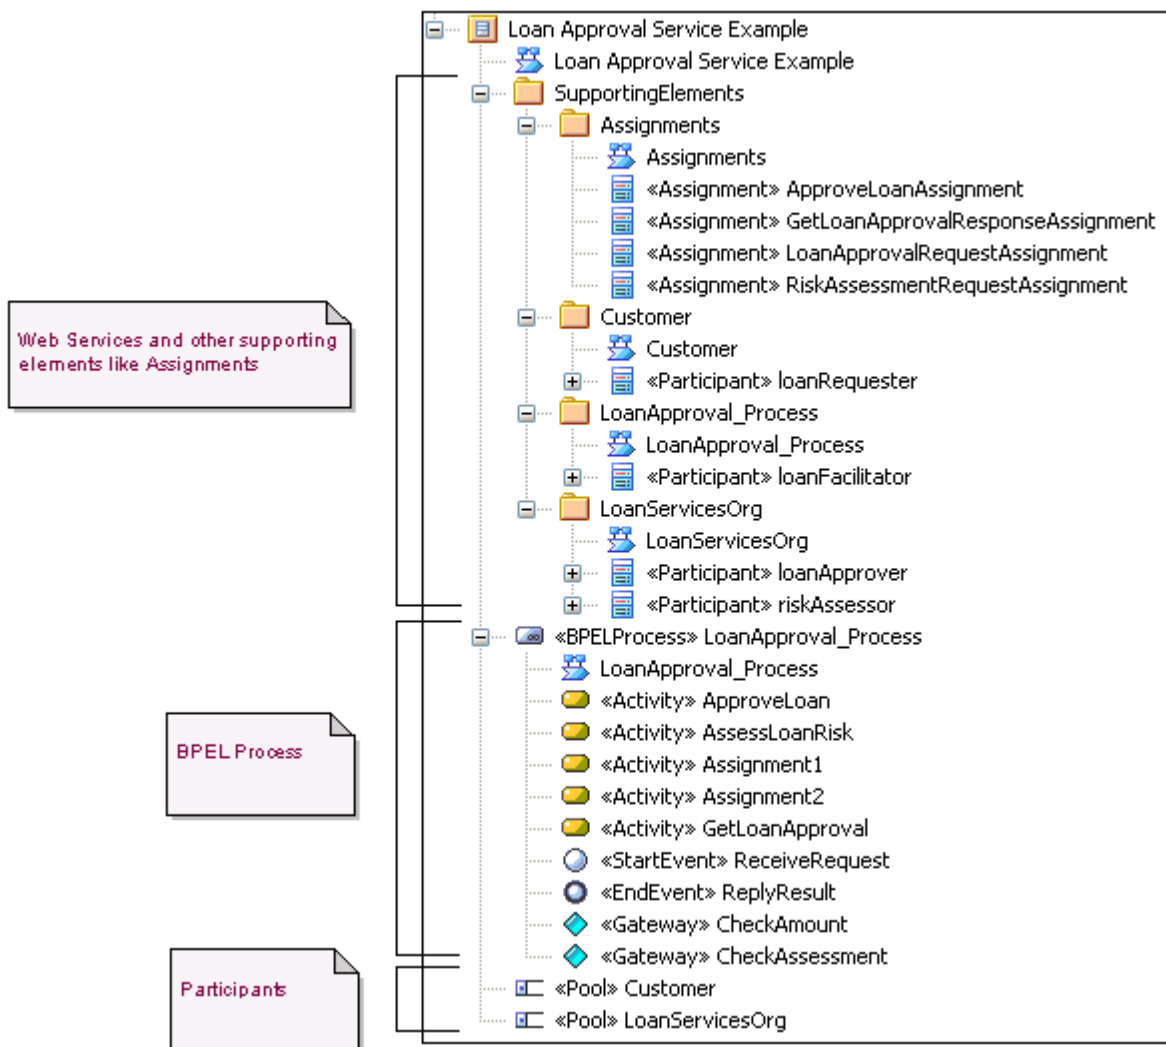

- **Project Browser package context menu | Add a Model using Wizard**, or
- **Project Browser toolbar: New Model from Pattern**

#### Create a BPEL 2.0 Package structure as a starting point for developing a BPEL Process

Step	Action	See also
1	Select the root node or a package in the Project Browser.	
2	Click on the <b>New Model from Pattern</b> icon in the Project Browser toolbar.	<a href="#">Project Browser Toolbar</a> <sup>[669]</sup>
3	Select the value <b>BPMN 2.0</b> in the <b>Technology</b> section.	<a href="#">Model Wizard</a> <sup>[753]</sup>
4	Check the option <b>BPEL 2.0 Model</b> in the <b>Name</b> section.	
5	Click on the <b>OK</b> button to create the sample BPEL 2.0 package structure.	

#### Example BPEL 2.0 Package Structure:

The *BPEL Process* **LoanApproval\_Process** acts as container for the BPEL diagram and elements. The *SupportingElements* package contains supporting components like **Assignments** and **Web Service Operations**.

#### Learn more

- [Model a BPEL 2.0 Process](#) <sup>[1898]</sup>
- [Create a Web Service Operation](#) <sup>[1914]</sup>
- [Generate BPEL 2.0](#) <sup>[1916]</sup>

#### 9.3.5.2.2 Model a BPEL 2.0 Process

The *BPEL Process* in Enterprise Architect represents the top-level container for the **BPMN 2.0** elements, from which **BPEL 2.0** can be generated. Conceptually it maps to the BPEL *process* element.

#### BPEL Properties:

- Double-click on the *BPEL Process* in the **BPEL** diagram ( or )
- Right-click on the *BPEL Process* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

**Reference**

Field/Button	Usage	See also
<b>Name</b>	Specify the name for the <i>BPEL Process</i> .	
<b>Query Language</b>	Specify the value of the language used in the <i>BPEL Process</i> for the selection of nodes in <i>Assignments</i> . Defaults to <b>XPath 1.0</b> .	
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> [956]

**Learn more**

The *BPEL Process* element acts as a container for the following BPMN 2.0 constructs:

- [Start Event](#) [1900]
- [Intermediate Event](#) [1901]
- [Activity](#) [1904]
- [Gateway](#) [1906]
- [End Event](#) [1907]
- [Data Object](#) [1909]
- [Property](#) [1910]
- [Sequence Flow](#) [1910]

The following BPMN 2.0 constructs can be optionally used in BPEL modeling:

- [Pool](#) [1888]
- [Assignment](#) [1889]

### Notes

- **Cancel**, **Conditional**, **Escalation**, **Multiple**, **None**, **Parallel Multiple** and **Signal** event type cannot be mapped to BPEL 2.0
- The Assignments tab is not available on *Intermediate Events* that are attached to the boundary of an *Activity*
- Either set **Time Cycle** or **Time Date** for **Timer Trigger Type** but not both as they are mutually exclusive fields
- The **Error** event type is valid only on an *Intermediate Event* attached to the boundary of an *Activity*
- The **Compensation** event type is valid only on an *Event Sub-Process* or when attached to the boundary of an *Activity*
- The **Link Intermediate Event** can be used either as a *GOTO* or an *off-page* connector; therefore, this event can have either incoming or outgoing *Sequence Flows* - but not both

### 9.3.5.2.2.3 Activity

A BPMN 2.0 *Activity* represents work that is performed within a *Process*. An *Activity* can be modeled as a:

- **Sub-Process** - a compound *Activity* that is defined as a flow of other BPMN 2.0 elements or
- **Task** - an atomic *Activity* that cannot be broken down into a smaller unit

Activities - both *Tasks* and *Sub-Processes* - can also, optionally, act as *Looping constructs*. The *OMG BPMN 2.0 Specification* defines two types of *Looping construct*:

- **Standard Loop** (*while* or *until*)
- **Multi-Instance Loop** (*for each*)

#### BPEL Properties:

- Double-click on the *Activity* in the BPEL diagram
- Right-click on the *Activity* | **BPEL | BPEL 2.0 Properties**

#### Reference

Field/Option/ Button	Action	See also
<b>Name</b>	Type a name for the <i>Activity</i> .

<b>General</b>	Click on this button to open the UML Properties dialog.	<a href="#">Properties</a> 

#### Notes

- The Assignments tab is not applicable for *Sub-Process*
- The Loop Details tab is not applicable for *Event Sub-Process*
- **Business Rule**, **Manual**, **Script** and **User Task** types cannot be mapped to BPEL 2.0
- **Ad-Hoc**, **Call Activity** and **Transaction Sub-Process** types cannot be mapped to BPEL 2.0

#### 9.3.5.2.2.4 Gateway

A BPMN 2.0 *Gateway* controls the way in which *Sequence Flows* converge and diverge within a *Process*. They provide a gating mechanism that either allows or blocks a *Sequence Flow*.

#### BPEL Properties:

- Double-click on the *Gateway* in the BPEL diagram
- Right-click on the *Gateway* | **BPEL | BPEL 2.0 Properties**

#### Reference

Field/Button	Usage	See also
<b>Name</b>	Specify the name for the <i>Gateway</i> .	
<b>Gateway</b>	Select the type for the <i>Gateway</i> , namely: <ul style="list-style-type: none"> <li>• Complex</li> <li>• Event</li> <li>• Exclusive</li> <li>• Inclusive</li> <li>• Parallel</li> </ul>	

<b>Details</b>	<p>Depending on the selected <b>Gateway</b>, the Details tab changes as follows:</p> <table><tr><td>Field</td><td>Usage</td></tr><tr><td colspan="2"><b>Event Gateway</b></td></tr><tr><td><b>Event Type</b></td><td>Set to <b>Exclusive</b> to represent an Exclusive Event Based Gateway.</td></tr></table>	Field	Usage	<b>Event Gateway</b>		<b>Event Type</b>	Set to <b>Exclusive</b> to represent an Exclusive Event Based Gateway.	
Field	Usage							
<b>Event Gateway</b>								
<b>Event Type</b>	Set to <b>Exclusive</b> to represent an Exclusive Event Based Gateway.							
<b>OK</b>	Save the values entered in the dialog.							
<b>Cancel</b>	Discard the values entered in the dialog.							
<b>Help</b>	Display this Help topic.							
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> 9561						

#### Notes

- The target of the outgoing *Sequence Flows* of this **Event Exclusive Gateway** must be either a:
  - Receive Task** or a
  - Message** or **Timer Intermediate Event**
- If a **Message Task** is one of the targets of the outgoing *Sequence Flow* of an **Event Exclusive Gateway**, then a **Message Intermediate Event** cannot be the target of the other outgoing *Sequence Flows* of this **Event Exclusive Gateway**

#### 9.3.5.2.2.5 End Event

A BPMN 2.0 *End Event* indicates where a particular *Process* ends. Every *Process* in Enterprise Architect must end with an *End Event*.

#### BPEL Properties:

- Double-click on the *End Event* in the BPEL diagram
- Right-click on the *End Event* | **BPEL** | **BPEL 2.0 Properties**

#### Reference

Field/Button	Usage	See also																
Name	Specify the name for the <i>End Event</i> .																	
Event Type	Select the type for the <i>End Event</i> , namely: <ul style="list-style-type: none"><li>• Cancel</li><li>• Compensation</li><li>• Error</li><li>• Escalation</li><li>• Message</li><li>• Multiple</li><li>• None</li><li>• Signal</li><li>• Terminate</li></ul>																	
Details	<div>Depending on the selected <b>Event Type</b>, the Details tab changes as follows:</div> <table><tr><th>Field</th><th>Usage</th></tr><tr><td colspan="2"><b>Message Event Type</b></td></tr><tr><td><b>Pool Package</b></td><td>Select the package that represents one of the involved <i>Participants</i>.</td></tr><tr><td><b>Operation</b></td><td>Select an Operation from the list of operation the selected <b>Pool Package</b>.</td></tr><tr><td colspan="2"><b>Compensation Event Type</b></td></tr><tr><td><b>Activity</b></td><td>Select an <i>Activity</i> from the list of Activity element under the current <i>Process / Sub-Process</i>.</td></tr><tr><td colspan="2"><b>Error Event Type</b></td></tr><tr><td><b>Error</b></td><td>Select an <i>Error</i> element.</td></tr></table>	Field	Usage	<b>Message Event Type</b>		<b>Pool Package</b>	Select the package that represents one of the involved <i>Participants</i> .	<b>Operation</b>	Select an Operation from the list of operation the selected <b>Pool Package</b> .	<b>Compensation Event Type</b>		<b>Activity</b>	Select an <i>Activity</i> from the list of Activity element under the current <i>Process / Sub-Process</i> .	<b>Error Event Type</b>		<b>Error</b>	Select an <i>Error</i> element.	
Field	Usage																	
<b>Message Event Type</b>																		
<b>Pool Package</b>	Select the package that represents one of the involved <i>Participants</i> .																	
<b>Operation</b>	Select an Operation from the list of operation the selected <b>Pool Package</b> .																	
<b>Compensation Event Type</b>																		
<b>Activity</b>	Select an <i>Activity</i> from the list of Activity element under the current <i>Process / Sub-Process</i> .																	
<b>Error Event Type</b>																		
<b>Error</b>	Select an <i>Error</i> element.																	
OK	Save the values entered in the dialog.																	

<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> 

#### Notes

- The **Compensation** Event type is valid only on an *Event Sub-Process*
- **Cancel**, **Escalation**, **Multiple** and **Signal** Event types cannot be mapped to BPEL 2.0

#### 9.3.5.2.2.6 Data Object

A BPMN 2.0 *Data Object* is mapped to a BPEL 2.0 *Variable* and occurs in the context of a Process or Sub-Process, just like a [Property](#) . A *Data Object* cannot have any incoming or outgoing *Sequence Flow* or *Message Flow*.

#### BPEL Properties:

- Double-click on the *Data Object* in the BPEL diagram
- Right-click on the *Data Object* | **BPEL** | **BPEL 2.0 Properties**

#### Reference

Field/Button	Usage	See also
<b>Name</b>	Specify the name for the <i>Data Object</i> .	
<b>Type</b>	Either: <ul style="list-style-type: none"> <li>• Select an <b>XML Schema</b> <i>basic</i> type from the drop-down list or</li> <li>• Use the ( ... ) button to select <b>XML Schema</b> <i>ComplexType</i>, <i>SimpleType</i>, <i>Union</i> or <i>Enumeration</i></li> </ul>	
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> 

### 9.3.5.2.2.7 Property

A BPMN 2.0 *Property* is mapped to a BPEL 2.0 *Variable* and occurs in the context of a *Process* or *Sub-Process*, just like a [Data Object](#) <sup>[1909]</sup>.

However, unlike a *Data Object*, *Property* is not displayed on a BPEL diagram. Enterprise Architect supports *Property* on *BPMN 2.0 BPEL* and *BPMN 2.0 Activity* elements.

[Access](#) **Diagram | Diagram Toolbox: More tools | BPMN 2.0 | BPMN 2.0 Business Process | BPMN 2.0 Types**

#### BPEL Properties:

- Right-click on the *Property* | **BPEL | BPEL 2.0 Properties**

#### Reference

Field/Button	Usage	See also
<b>Name</b>	Specify the name for the <i>Property</i> .	
<b>Type</b>	Either: <ul style="list-style-type: none"> <li>• Select an <b>XML Schema</b> <i>basic</i> type from the drop-down list or</li> <li>• Use the ( ... ) button to select <b>XML Schema</b> <i>ComplexType</i>, <i>SimpleType</i>, <i>Union</i> or <i>Enumeration</i></li> </ul>	
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">General Properties of Attributes</a> <sup>[1001]</sup>

### 9.3.5.2.2.8 Sequence Flow

A BPMN 2.0 **Sequence Flow** connector shows the order in which the activities (**Tasks** and **Events**) are performed in a **BPEL Process**.

#### Access BPEL Properties

- Double-click on the Sequence Flow in the BPEL diagram
- Right-click on the Sequence Flow | **BPEL | BPEL 2.0 Properties**

Define the Sequence Flow

Field/Button	Action	See also
<b>Condition Type</b>	Click on the drop-down arrow and select the type of the condition on the Sequence Flow, namely: <ul style="list-style-type: none"> <li>• <b>None</b></li> <li>• <b>Default</b></li> <li>• <b>Expression</b></li> </ul>	
<b>Expression</b>	This field is enabled when the <b>Condition Type</b> is set to <b>Expression</b> . Type in a boolean expression to act as a gating condition.	
<b>Ordering</b>	This field is enabled when the <b>Condition Type</b> is set to <b>Expression</b> . Type in a numerical value that determines the order in which the condition set in the <b>Expression</b> field is to be evaluated.	
<b>OK</b>	Click on this button to save the values entered in the dialog.	
<b>Cancel</b>	Click on this button to discard the values entered in the dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>General</b>	Click on this button to open the UML Properties dialog.	<a href="#">Properties</a> [956]

**9.3.5.2.2.9 Pool**

A BPMN 2.0 *Pool* represents a Participant in a *Process* and does not map to any specific BPEL 2.0 element. Enterprise Architect uses *Pools* to represent external Participants, with which the *BPEL Process* communicates. These are 'black box' *pools*; that is, they are abstract and do not expose any details (they do not contain any BPMN 2.0 elements inside them).

**BPEL Properties:**

- Double-click on the *Pool* in the BPEL diagram
- Right-click on the *Pool* | **BPEL** | **BPEL 2.0 Properties**

**Reference**

Field/Button	Usage	See also
--------------	-------	----------

<b>Name</b>	Specify the name for the <i>Pool</i> .	
<b>OK</b>	Save the values entered in the dialog.	
<b>Cancel</b>	Discard the values entered in the dialog.	
<b>Help</b>	Display this Help topic.	
<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> 9561

#### Notes

- A *BPEL Process* should not contain a *Pool* as its child element
- A *BPEL* diagram under a *BPEL Process* contains an implicit *Pool*, so it is invalid to add a *Pool* in this *BPEL* diagram to represent the *BPEL Process*
- *Pool* cannot have any incoming or outgoing *Sequence Flow* connectors - it can have only incoming or outgoing *Message Flow* connectors

#### 9.3.5.2.2.10 Assignment

A BPMN 2.0 *Assignment* element enables data to be copied between messages and variables within a *BPEL Process*. An *Assignment* element maps to a BPEL 2.0 *assign* activity and copies the specified value from the source to the target.

In Enterprise Architect, *Assignment* elements should be created in the *Assignments* package in *SupportingElements*. If they are created elsewhere, they cannot be enacted correctly.

**Access** [Diagram](#) | **Diagram Toolbox: More tools** | **BPMN 2.0** | **BPMN 2.0 Business Process** | **BPMN 2.0 Types**

#### BPEL Properties:

- Double-click on the *Assignment* in the **BPEL** diagram
- Right-click on the *Assignment* | **BPEL** | **BPEL 2.0 Properties**

<b>General</b>	Open the UML Properties dialog.	<a href="#">Properties</a> <sup>[956]</sup>

**Notes**

- Messages are created when you create a Web Service Operation

### 9.3.5.2.3 Create BPEL 2.0 Web Service Operation

BPEL is an **Orchestration** language, which orchestrates services that are exposed using **WSDL 1.1**. It coordinates the execution of the various operations of these involved services. BPEL 2.0 supports **WSDL 1.1 one-way** and **request-response** operations only (and not **solicit-response** and **notification** operations). Enterprise Architect enables you to create, for *BPEL Process* and *Pool* elements, **Web Service Operations** that support either *synchronous* (request-response) or *asynchronous* (one-way) interactions.

**Access** Right-click on a **BPEL Process or Pool** | **BPEL** | **Create WebService**

#### Reference

This Package will act as a container for all the Web Service Operations created for that <i>Pool</i>.</p>	<a href="#">SupportingElements</a> <sup>1897</sup>
<b>Cancel</b>	Discard the values entered in the dialog and abort creating the Web Service Operation.	
<b>Help</b>	Display this Help topic.	

#### Notes

- The Output tab is not applicable for an Asynchronous operation

#### 9.3.5.2.4 Generate BPEL 2.0

BPEL 2.0 code can be generated from a *BPEL Process*. Enterprise Architect validates the *BPEL Process* before generating the BPEL 2.0 code. In addition to generating the BPEL 2.0 code, WSDL 1.1 files are generated for the *BPEL Process* and all the involved *Pools* (provided Web Service Operations are defined for them).

**Access** Right-click on BPEL Process | BPEL | Generate BPEL 2.0

#### Reference

Field/Button	Usage	See also
<b>File Name</b>	Specify the path where the BPEL 2.0 file is to be generated.	
<b>Namespace Details</b>	Double-click on an entry ( if any ) in this field to open the Namespace Details dialog and add / edit the namespace details.  The entry <b>DefaultPool</b> represents the current <i>BPEL Process</i> .	
<b>Generate BPEL</b>	Validate the model and generate BPEL 2.0.	<a href="#">BPEL Model Validation</a> <sup>[1917]</sup>
<b>Close</b>	Close this dialog.

### 9.3.5.3 BPEL Model Validation

The BPEL model is validated for both *syntax* and *semantic* errors before generating the BPEL code. Upon successful validation, the BPEL file (and the associated WSDL 1.1 files, if any) are generated. The results of the validation, as well as the progress of the BPEL generation, are displayed in the BPEL Progress tab of the Output window.

#### Example BPEL Model Violation:

The following model shows several basic BPEL violations:

- *StartEvent1* is of type **Signal**, which cannot be mapped to BPEL
- The *Message Flow* connector between *StartEvent1* and *Activity1* is invalid, as *Message Flow* cannot be used to connect *Activities* or *Events* within a *Process*
- *EndEvent1* is of type **Cancel**, which cannot be mapped to BPEL
- *EndEvent1* cannot have any outgoing *Sequence Flow* connector, as it represents the end of a *Process*
- *Activity2* is not valid, as only an *End Event* represents the end of a *Process*

### Notes

- Double-click on a validation error entry in the BPEL Progress tab of the Output window to go to the source of the error in the Project Browser

### 9.3.6 SPEM

The **MDG Technology for SPEM 2.0** is one of the business modeling tools integrated with Enterprise Architect.

"The **Software and Systems Process Engineering Meta-model (SPEM)** is a process engineering meta-model as well as conceptual framework, which can provide the necessary concepts for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes. An implementation of this meta-model would be targeted at process engineers, project leads, project and program managers who are responsible for maintaining and implementing processes for their development organizations or individual projects."

(Quoted from the *Object Management Group (OMG) Software & Systems Process Engineering Meta-Model Specification (Version 2.0, April 01 2008)*)

SPEM is a Profile of UML, which uses UML as a notation and takes an object-oriented approach. To accommodate UML 2, the SPEM specification was upgraded to **2.0** in April 2008. SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM, to describe an actual development process.

### 9.3.6.1 *SPEM Toolbox Pages*

The SPEM pages of the Diagram Toolbox provide a wide range of specialized elements and connectors for modeling development processes on SPEM diagrams. To create elements and relationships on a SPEM diagram, you can drag the appropriate icons from the Toolbox pages.

Access   **Diagram | Diagram Toolbox: More Tools | SPEM**

Toolbox Pages

Each element and connector provided in the SPEM Toolbox pages is described in the table below.

Page	Object	Action
<b>Base Plug-in</b>	<b>Phase</b>	Create a predefined special Activity representing a significant period in a project.
	<b>Iteration</b>	Group a set of nested Activities that are repeated more than once. Typically, Iteration is an Activity for which the default value of the <i>isRepeatable</i> attribute is <b>True</b> .
	<b>Process</b>	Represent a special Activity that describes a structure for particular types of development projects, or parts of them.
	<b>Delivery Process</b>	Represent a special Process describing a complete and integrated approach for implementing a specific project type.
	<b>Process Pattern</b>	Represent a special Process to describe a reusable cluster of Activities in a general process area that provides a consistent development approach to common problems.
	<b>Process Planning Template</b>	Represent a special Process that is prepared for instantiation by a project planning tool.
	<b>Artifact</b>	Represent a Work Product Definition that provides a description and definition for tangible work product types.
	<b>Deliverable</b>	Represent a Work Product Definition that provides a description and definition for packaging other Work Products, and that can be delivered to an internal or external party.
	<b>Outcome</b>	Represent a Work Product Definition that provides a description and definition for non-tangible work products.
<b>Method Content</b>	<b>Category</b>	Categorize content based on the user's criteria.
	<b>Guidance</b>	Identify reference items such as Guidelines, Templates, Checklists, Tool Mentors, Estimates, Supporting Materials, Reports and Concepts.
	<b>Metric</b>	Define a standard measurement for instances of Method Content elements.

Page	Object	Action
	<b>Role Definition</b>	Define a set of related skills, competencies, and responsibilities.
	<b>Step</b>	Represent parts or subunits of a Task Definition.
	<b>Task Definition</b>	Describe an assignable unit of work. Every Task Definition is assigned to specific Role Definitions. A Task is associated with input and output Work Products.
	<b>Tool Definition</b>	Describe the tools that are recommended or necessary for completing a specific Task.
	<b>Work Product Definition</b>	Define any forms of document, report or outcome that are consumed, produced or modified by Tasks.
<b>Package</b>	<b>Method Content Package</b>	Create a physical container to organize the Method Content elements.
	<b>Method Library</b>	Create an overall physical container for all SPEM 2.0 elements.
	<b>Method Plugin</b>	Create a physical container for Method Content Package and Process Packages. It can be used stand-alone as well as extended to many other Method Plugins.
	<b>Process Package</b>	Create a physical container that contains different kinds of Process element.
	<b>Process Component</b>	Offers the choice of creating a Process Component <b>package</b> - a special type of Process Package that provides the mechanism of encapsulation - or a Process Component <b>element</b> .
	<b>Work Product Port</b>	Defines the Work Products input and output for a Process Component. A Work Product Port identifies one type of Work Product for one Process Component, and defines whether the Work Product type is to be required (input) or supplied (output) by the Process Component, and whether this input or output is optional or not.
	<b>Expose Interface</b>	Represents a required or supplied interface to identify the fact that the element provides or requires an interface. A small dialog displays on which you type or select the name of the interface and whether it is provided or required.

Page	Object	Action
<b>Process</b>	<b>Activity</b>	Define basic units of work within a Process as well as the Process itself.
	<b>Composite Role</b>	Represent an aggregation of Role Definition references for an Activity.
	<b>Milestone</b>	Represent any significant events in a development project.
	<b>Process</b>	Create a special Activity that describes a structure for particular types of development project.
	<b>Role Use</b>	Represent a Role Definition in the context of one specific Activity.
	<b>Task Use</b>	Represent a Task Definition in the context of one specific Activity.
	<b>Team Profile</b>	Define a nested hierarchy of teams and team members.
	<b>Work Product Use</b>	Represent a Work Product Definition in the context of one specific Activity.

- [Example SPEM Diagram](#)<sup>[1924]</sup>

### 9.3.6.2 Example SPEM Diagram

You can model the development processes underpinning software and business process modeling using SPEM diagrams, and the wide range of specialized elements and connectors provided in the SPEM Toolbox.

Access **Project Browser package context menu | Add Diagram | Type = SPEM, Diagram Types = SPEM Diagram**

#### Example Diagram

### SPEM Element appearance

Every SPEM stereotype can be presented in one of two ways:

- Iconic presentation, where the shape is the object's icon (as shown for *Designer*, which has the Role Definition icon shape), or
- Textual presentation, where the shape is a rectangular outline with the object's icon as a decoration in the top right corner (as shown for *SPEM\_TaskDefinition*)

To set the presentation format for an element, use the *iconstyle* Tagged Value. To use:

- Iconic presentation, set the *iconstyle* Tagged Value to **True**
- Textual presentation, set the Tagged Value to **False**

### 9.3.7 ArchiMate

The **MDG Technology for ArchiMate 2.0** is one of the business modeling tools integrated with Enterprise Architect.

ArchiMate an open-standard enterprise architecture language from The Open Group, based on the IEEE 1471 standard. It offers a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure, which Enterprise Architects can use to describe, analyse and visualize the relationships among business domains clearly.

**Access** [Diagram](#) | [Diagram Toolbox: More Tools](#) | [ArchiMate2](#) | [<diagram type>](#)

#### ArchiMate Integration

Topic	Detail	See also
<b>ArchiMate in Enterprise Architect</b>	<p>Developing ArchiMate diagrams is fast and simple using the ArchiMate MDG Technology. The ArchiMate facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>Several ArchiMate diagram types, accessed through the New Diagram dialog</li> <li>A comprehensive set of ArchiMate pages in the Toolbox, for each diagram type</li> <li>ArchiMate element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul>	<a href="#">New Diagram</a> [822] <a href="#">Toolbox Shortcut</a> [799] <a href="#">Quick Linker</a> [896]
<b>ArchiMate Toolbox Pages</b>	<p>For each of the Business, Application and Technology diagram types, the toolbox pages show separate categories of elements - Information, Behavior and Structure - which provides clear differentiation between elements in different layers; for example, Business Service, Application Service and Infrastructure Service.</p> <p>Similarly, there are separate connector pages - Structural, Dynamic, and Other - although the connectors have parallels with standard UML connectors.</p> <p>The ArchiMate integration provides two further diagram types:</p> <ul style="list-style-type: none"> <li>Motivation             <ul style="list-style-type: none"> <li>For modeling stakeholders, drivers for change, business goals, principles and requirements</li> <li>Contains additional elements - Stakeholder, Driver, Assessment, Goal, Requirement, Constraint and Principle</li> <li>Contains an additional relationship - Influence</li> </ul> </li> <li>Implementation and Migration             <ul style="list-style-type: none"> <li>Supports project portfolio management, gap analysis, and transition and migration planning</li> <li>Contains additional elements - Work Package, Deliverable, Plateau and Gap</li> </ul> </li> </ul> <p>You can modify the appearance of elements by toggling the <b>Advanced</b>  </p>	<a href="#">Rectangle Notation</a> [1355]

Topic	Detail	See also
	<p><b>Use Rectangle Notation</b> context menu option on the element in a diagram.</p> <ul style="list-style-type: none"> <li>For Artifact, Process, Function, Interaction, Service, Event, Actor, Role, Collaboration, Interface, Component, Node and Device elements: <ul style="list-style-type: none"> <li>Select <b>Use Rectangle Notation</b> to show a rectangle with a decoration in the top corner</li> <li>Deselect <b>Use Rectangle Notation</b> to show the iconic representation of the element</li> </ul> </li> </ul> <p>You can set an Interface element to <i>provided</i>, <i>required</i>, <i>symmetric</i> or <i>assembly</i>, through its <b>interfacekind</b> Tagged Value. If <b>Use Rectangle Notation</b> is unselected, the orientation of the interface shape is determined automatically by the edge to which an incoming connector is attached.</p> <p>Because there is a large range of ArchiMate elements, using the <b>Quick Linker</b> arrow is very helpful in guiding you in selecting appropriate source and target elements and relationship types to model your enterprise architecture.</p>	
<b>Disable ArchiMate</b>	<p>If you prefer not to use the MDG Technology for ArchiMate, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p>	<a href="#">MDG Technologies</a> <small>[147]</small>

### Notes

- Enterprise Architect also supports ArchiMate 1.0; if you wish, you can migrate your ArchiMate 1.0 model to ArchiMate 2.0

### Learn more

- [Migrate Archimate 1.0 to Archimate 2.0](#) [1927]

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Modeling Languages | Business | ArchiMate**

## 9.3.7.1 Migrate ArchiMate 1.0 to ArchiMate 2.0

If you have created a model for ArchiMate 1.0, you can migrate all or part of it to ArchiMate 2.0 using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to ArchiMate for all elements, attributes, connectors and diagrams under the selected package or element.

### Example

The following VB script calls the *Migrate()* function to migrate the package or element to ArchiMate 2.0:

```

Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "ArchiMate", "ArchiMate2"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "ArchiMate2 Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "ArchiMate2 Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "ArchiMate2 Migration"
    End If
End Sub

Sub Main
    MigrateSelectedItem
End Sub

Main

```

### Notes

- All diagrams are converted to Business Layer diagrams
- Collaboration elements are converted to Business Collaboration or Application Collaboration depending on the value of the **collaborationtype** Tagged Value
- Object elements are converted to Business Object, Contract or Data Object depending on the value of the **objecttype** Tagged Value
- Interface elements are converted to Business Interface, Application Interface or Infrastructure Interface depending on the value of the **interfacetype** Tagged Value
- Function elements are converted to Business Function or Application Function depending on the value of the **functiontype** Tagged Value
- Interaction elements are converted to Business Interaction or Application Interaction depending on the value of the **interactiontype** Tagged Value
- Service elements are converted to Business Service, Application Service or Infrastructure Service depending on the value of the **servicetype** Tagged Value
- The **iconstyle** Tagged Value is removed and the **Use Rectangle Notation** menu option is set on or off as appropriate
- Process elements become Business Process elements
- Event elements become Business Event elements
- Actor elements become Business Actor elements

- Role elements become Business Role elements
- Component elements become Application Component elements
- Software elements become System Software elements
- Specialisation connectors become Specialization connectors
- Realisation connectors become Realization connectors
- Network Connector connectors become Network
- Node elements now extend UML Class elements
- Software elements now extend UML Class elements
- Junction elements now extend UML Decision elements

### 9.3.9 Decision Models

Enterprise Architect provides the **Decision Tables** facility, based on the OMG *Decision Model and Notation (DMN) specification* (2014). As stated in this document:

"The purpose of DMN is to provide the constructs that are needed to model decisions, so that organizational decision-making can be readily depicted in diagrams, accurately defined by business analysts, and (optionally) automated. ...

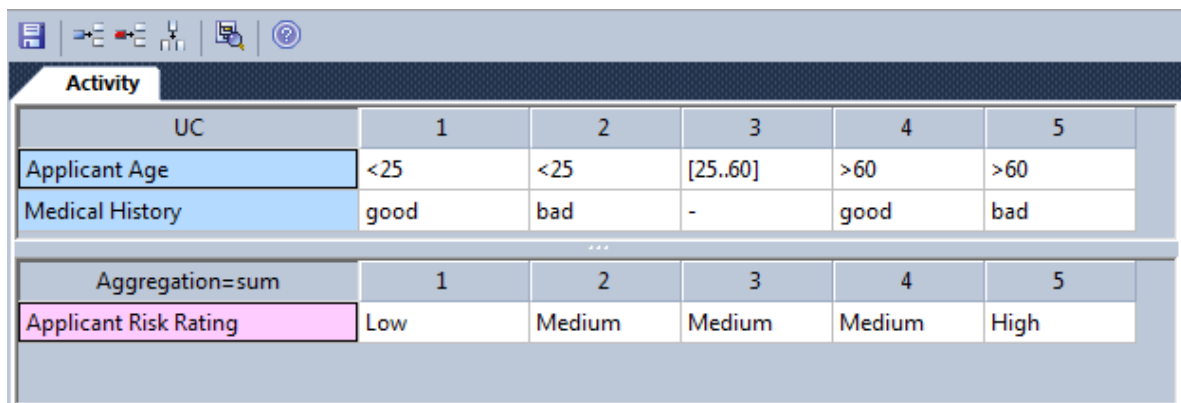

... DMN provides a common notation that is readily understandable by all business users, from the business analysts needing to create initial decision requirements and ... more detailed decision models, to the technical developers responsible for automating the decisions in processes, and... the business people who will manage and monitor those decisions. DMN creates a standardized bridge for the gap between the business decision design and decision implementation."

DMN is designed to be usable beside BPMN, and to support the exchange of decision models across organizations via XML.

The Decision Tables facility provides a simple method of modeling how a decision is made, and provides the capability of generating code for the decisions.

**Access** (Project Browser or Diagram) Click on Activity element | View | Decision Table or (Diagram) Right-click on Activity element | Decision Table

This example illustrates how you could model a decision on an insurance Risk Rating based on the applicant's age and medical history.

UC	1	2	3	4	5
Applicant Age	<25	<25	[25..60]	>60	>60
Medical History	good	bad	-	good	bad

...

Aggregation=sum	1	2	3	4	5
Applicant Risk Rating	Low	Medium	Medium	Medium	High

#### 9.3.9.1 Decision Table Editor

When you select to create a new Decision Table for an Activity element, or edit an existing one, the name of the Activity element displays in the tab under the Decision Table toolbar.

**Access** (Project Browser or Diagram) Click on Activity element | View | Decision Table (Diagram) Right-click on Activity element | Decision Table

Complete the Decision Table

Task	Action	See also
<b>Enter a condition</b>	<p>You can enter a condition into the table in a number of ways:</p> <ul style="list-style-type: none"> <li>• Type the text of the condition into the first available row, overtyping the <b>Add Condition</b> text</li> <li>• Drag onto the <b>Add Condition</b> cell the appropriate behavioral object from the Project Browser, such as a model element, Activity Parameter, Operation or Attribute, or</li> <li>• Click on the <b>Add Condition</b> cell and press <b>Ctrl+Spacebar</b>; <b>Intelli-Sense</b> is invoked to provide a list of possible objects that you can select from to complete the condition</li> </ul>	
<b>Add another condition</b>	<p>You can add further condition rows to the list in any of these ways:</p> <ul style="list-style-type: none"> <li>• Click on the  icon underneath the list of conditions</li> <li>• Right-click anywhere on the condition panel and select the <b>Add Condition</b> menu option, or</li> <li>• Click on the  (<b>Add Condition</b>) icon in the Decision Table toolbar</li> </ul> <p>Each condition that you add is bound to the previous conditions, so that they are evaluated in combination.</p>	
<b>List allowable values for the condition</b>	<p>(Optional) You can provide a comma-separated value (CSV) list of the values that you could assign to a condition. If you do this, those values are offered as suggestions to enter in the value fields along the same row.</p> <p>The <b>allowable values</b> column is hidden by default. To display it, click on the  icon in the Decision Table toolbar.</p> <p>In the allowable values cell against each condition, type in all the possible values separated by commas. These values can include operators such as &gt;, &lt;, = and ... .</p> <p>Attributes dragged from the Project Browser and classified by an Enumeration will complete the cell automatically and make the field Read Only.</p>	
<b>Set condition values</b>	<p>Each of the conditions you set have defined values that act as a decision point. For example, a person under the age of 18 years old cannot hire a car, so the values of <b>Yes</b> and <b>No</b> are decision points for the condition <b>18 or over</b>.</p> <p>In each of the columns 1, 2, 3 and so on, provide a condition value by either:</p> <ul style="list-style-type: none"> <li>• Typing the value into the cell (including operators such as &gt;, &lt;, = and ...) or</li> <li>• Right-clicking on the cell and selecting the <b>Allowable Values</b></li> </ul>	

Task	Action	See also
	<p>  <b>&lt;value&gt;</b> option (as set in the allowable values cell)</p>	
<b>Add further condition value columns</b>	<p>To add further value columns to the table, either:</p> <ul style="list-style-type: none"> <li>Right-click anywhere on the condition panel and select the <b>Add Column</b> menu option, or</li> <li>Click on the  (<b>Add Column</b>) icon in the Decision Table toolbar</li> </ul> <p>These options add the column to both the Condition and Conclusion panels.</p>	
<b>Set the Policy and Completeness</b>	<p>The Decision <b>Hit Policy</b> defines if and how the conditions are combined in making a decision. <b>Completeness</b> identifies whether or not the decision set is complete.</p> <p>To set these two flags, right-click on the <b>Condition</b> header (top left corner of the Condition panel) and select the options:</p> <ul style="list-style-type: none"> <li><b>Hit Policy   &lt;value&gt;</b> and</li> <li><b>Completeness   Complete</b> or <b>Incomplete</b></li> </ul> <p>If you do not want to display the completeness, select the <b>Completeness   Clear</b> option.</p>	
<b>Delete Column or Condition</b>	<p>To remove a condition that no longer applies, or a column of values that are no longer tested, right-click on the appropriate column or row and select the options:</p> <ul style="list-style-type: none"> <li><b>Delete Condition</b> or</li> <li><b>Delete Column</b></li> </ul> <p>A prompt displays to confirm the deletion. You cannot delete the title column or condition number row, nor can you delete the allowable values column.</p>	
<b>Enter a Conclusion</b>	<p>You can enter a conclusion into the table in a number of ways:</p> <ul style="list-style-type: none"> <li>Type the text of the conclusion into the first available row, overtyping the <b>Add Conclusion</b> text</li> <li>Drag onto the <b>Add Conclusion</b> cell the appropriate behavioral object from the Project Browser, such as a model element, Activity Parameter, Operation or Attribute</li> </ul>	
<b>Add Further Conclusions</b>	<p>You can add further conclusion rows to the list in any of these ways:</p> <ul style="list-style-type: none"> <li>Click on the  icon underneath the list of conclusions</li> <li>Right-click anywhere on the conclusion panel and select the <b>Add Conclusion</b> menu option, or</li> </ul>	

Task	Action	See also
	<ul style="list-style-type: none"> <li>Click on the  (<b>Add Conclusion</b>) icon in the Decision Table toolbar</li> </ul> <p>Each conclusion that you add is bound to the previous conclusions, so that the final decision takes them all into account.</p>	
<b>List allowable values for the conclusion</b>	<p>(Optional) You can provide a comma-separated value (CSV) list of the values that you could assign to a conclusion. If you do this, those values are offered as suggestions to enter in the value fields along the same row.</p> <p>The <b>allowable values</b> column is hidden by default. To display it, click on the  icon in the Decision Table toolbar.</p> <p>In the allowable values cell against each conclusion, type in all the possible values separated by commas. These values can include operators such as &gt;, &lt;, = and ... .</p> <p>Attributes dragged from the Project Browser and classified by an Enumeration will complete the cell automatically and make the field Read Only.</p>	
<b>Set Conclusion values</b>	<p>Each of the conclusions you set have values that define the outcome of the conditional values in the same column, when the conditions are met.</p> <p>In each of the columns 1, 2, 3 and so on, provide a conclusion value by either:</p> <ul style="list-style-type: none"> <li>Typing the value into the cell (including operators such as &gt;, &lt;, = and ...) or</li> <li>Right-clicking on the cell and selecting the <b>Allowable Values   &lt;value&gt;</b> option (as set in the allowable values cell)</li> </ul>	
<b>Add Further Conclusion Columns</b>	<p>To add further value columns to the table, either:</p> <ul style="list-style-type: none"> <li>Right-click anywhere on the conclusion panel and select the <b>Add Column</b> menu option, or</li> <li>Click on the  (<b>Add Column</b>) icon in the Decision Table toolbar</li> </ul> <p>These options add the column to both Condition and Conclusion panels.</p>	
<b>Set the Table Aggregation Values</b>	<p>The Table Aggregation value indicates how the conclusion values are to be combined to form the decision.</p> <p>Set the value by right-clicking on the <b>Conclusion</b> column heading and selecting the <b>Aggregation   &lt;value&gt;</b> option.</p> <p>If you do not want to set the Table Aggregation, select the <b>Aggregation   Clear</b> option.</p>	

Task	Action	See also
<b>Delete Column or Conclusion</b>	<p>To remove a conclusion that is no longer valid, or a column of result values that are no longer produced, right-click on the appropriate column or row and select the options:</p> <ul style="list-style-type: none"> <li>• <b>Delete Conclusion</b> or</li> <li>• <b>Delete Column</b></li> </ul> <p>A prompt displays to confirm the deletion. You cannot delete the title column or conclusion number row, nor can you delete the allowable values column.</p>	
<b>Check Object properties and location</b>	<p>If you have created a condition or conclusion by dragging an object from the Project Browser, you can right-click on its row and:</p> <ul style="list-style-type: none"> <li>• Display the Properties dialog for the object, by selecting the <b>Properties</b> menu option</li> <li>• Locate the object in the model by selecting the <b>Find in Project Browser</b> option</li> </ul>	
<b>Save your changes</b>	At regular intervals, and before you exit from the table, click on the <b>Save</b> icon in the Decision Table toolbar.

### 9.3.9.2 Code Generation from Decision Models

It is possible to generate the method code of a Class from an Activity element, based on the logic defined in its Decision Table, by placing the Activity as a child of the Class element from which the code is generated.

#### Set up Class and generate code

Step	Action	See also
<b>1</b>	Create an Activity with a Decision Table.	<a href="#">Decision Table Editor</a> [1931]
<b>2</b>	Make the Activity element a child of a Class element.	<a href="#">Paste from Project Browser</a> [833]
<b>3</b>	Select the Class and press <b>F11</b> to open the Generate Code dialog, and generate the code.	<a href="#">Generate a Single Class</a> [2113]

Step	Action	See also
4	Press <b>F12</b> to view the generated source code.	

### Decision Table code templates

Code Generation from a Decision Table automatically applies these EASL code generation templates:

- **Behavior Body**
- **Decision Table**
- **Decision Logic**
- **Decision Condition**
- **Decision Action**

### Notes

- Currently **C++** is the only language implemented in the EASL templates for Decision Table code generation
- You can use `ActivityParameters` to define method parameters
- You can add `Attributes` to the `Activity` element to define local variables

## 9.4 Data Models

Data Modelers and Information Architects are challenged with creating data models that span multiple levels of abstraction - from concept to physical implementation. They might also be responsible for maintaining traceability between these models. Enterprise Architect helps to meet these challenges with easy-to-use tools for building and maintaining all of the fundamental data models - Conceptual, Logical and Physical.

### Data Models

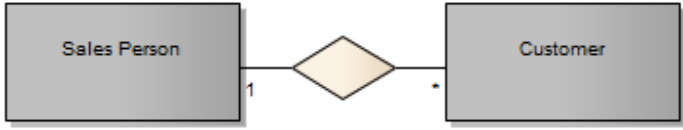

Type	Detail	See also
<b>Conceptual Data Models</b>	<p>Conceptual data models, also called Domain models, establish the basic concepts and semantics of a given domain and help to communicate these to a wide audience of stakeholders.</p> <p>Conceptual models also serve as a common vocabulary during the analysis stages of a project; they can be created in Enterprise Architect using Entity-Relationship or UML Class models.</p>	<a href="#">Conceptual Data Model</a> <sup>[1938]</sup>
<b>Logical Data Models</b>	<p>Logical data models add further detail to conceptual model elements and refine the structure of the domain; they can be defined using Entity-Relationship or UML Class models.</p> <p>One benefit of a Logical data model is that it provides a foundation on which to base the Physical model and subsequent database implementation.</p> <p>Entity-relationship modeling is an abstract and conceptual database modeling method, used to produce a schema or semantic data model of, for example, a relational database and its requirements, visualized in Entity-Relationship Diagrams (ERDs).</p> <p>ERDs assist you in building conceptual data models through to generating Data Definition Language (DDL) for the target DBMS.</p>	<a href="#">Logical Data Model</a> <sup>[1939]</sup>  <a href="#">Entity Relationship Diagrams (ERDs)</a> <sup>[1939]</sup>
<b>Logical to Physical Model</b>	A Logical model can be transformed to a Physical Data model using a DDL Transformation.	<a href="#">DDL Transformation</a> <sup>[2025]</sup>
<b>Physical Data Models</b>	<p>Physical data models in Enterprise Architect help you visualize your database structure and automatically derive the corresponding database schema; you use Enterprise Architect's UML Profile for Data Modeling specifically for this purpose.</p> <p>The profile provides useful extensions of the UML standard that map database concepts of tables and relationships onto the UML concepts of Classes and Associations; you can also model database keys, triggers, constraints, referential integrity and other relational database features.</p> <p>Because Enterprise Architect lets you visualize each type of data model in the same repository, you can easily manage dependencies between each level of abstraction; this helps you</p>	<a href="#">Database Engineering</a> <sup>[2334]</sup> <a href="#">Physical Data Model</a> <sup>[2335]</sup>

Type	Detail	See also
	maximize traceability and verify completeness of system implementation.	

### 9.4.1 Conceptual Data Model

A Conceptual data model is the most abstract form of data model. It is helpful for communicating ideas to a wide range of stakeholders because of its simplicity. Therefore platform-specific information, such as data types, is omitted from a Conceptual data model. Other implementation details, such as procedures and interface definitions, are also excluded. Below is an example of a Conceptual data model that is rendered using two of the notations supported by Enterprise Architect.

#### Topics

Topic	Detail	See also
<b>Example</b>	<p>Using Entity-Relationship (ER) notation, we represent the data concepts <i>Sales Person</i> and <i>Customer</i> as Entities with a 1-to-many relationship between them.</p>  <p>A Conceptual data model that uses Entity-Relationship notation</p> <p>We can represent the exactly the same semantic information using UML Classes and Associations.</p>  <p>An equivalent model using UML Class notation</p> <p>Whether you use UML or ER notation to represent data concepts in your project depends on the experience and preferences of the stakeholders involved.</p> <p>The detailed structure of the data concepts illustrated above is defined later by the Logical data model.</p>	<p><a href="#">Entity Relationship Diagrams (ERDs)</a> <sup>[1939]</sup></p> <p><a href="#">UML Class Modeling</a> <sup>[1184]</sup></p>

- [UML Class modeling](#)<sup>[1184]</sup>

### 9.4.2 Logical Data Model

Logical data models help to define the detailed structure of the data elements in a system and the relationships between data elements. They refine the data elements introduced by a Conceptual data model and form the basis of the Physical data model. In Enterprise Architect, a Logical data model is typically represented using the UML Class notation.

#### Topics

Topic	Detail	See also
<b>Example</b>	<p>A simple example of a Logical data model is provided below.</p> <p>Note that the data elements <i>Sales Person</i> and <i>Customer</i> contain UML Attributes; the Attribute types, however, remain platform-independent.</p>  <pre> classDiagram     class SalesPerson {         - Name :string         - Department :string     }     class Customer {         - Name :string         - Address :string     }     SalesPerson "1" -- "*" Customer           </pre> <p>A Logical data model defined using UML Class notation</p> <p>Platform-specific Attribute types and other meta-data that relate to a specific DBMS implementation are defined by the Physical data model.</p>	<a href="#">UML Class Modeling</a> <sup>[1184]</sup>

### 9.4.3 Entity Relationship Diagrams (ERDs)

According to the online [Wikipedia](#):

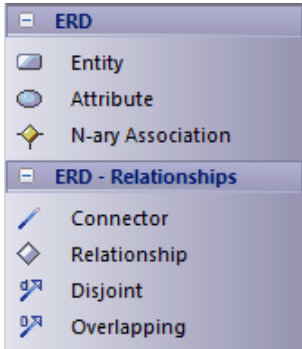

*An entity-relationship model (ERM) is an abstract and conceptual representation of data. Entity-relationship modeling is a database modeling method, used to produce a type of conceptual schema or semantic data model of a system, often a relational database, and its requirements in a top-down fashion. Diagrams created by this process are called Entity-Relationship Diagrams, ER Diagrams, or ERDs.*

#### Entity Relationship Diagrams in Enterprise Architect

Entity Relationship Diagrams in Enterprise Architect are based on Chen's ERD building blocks: entities are represented as rectangles, attributes are represented as ellipses and relationships are represented as diamond-shape connectors.

ERD technology in Enterprise Architect assists you in every stage from building conceptual data models to generating Data Definition Language (DDL) for the target DBMS.

Topics

Topic	Detail	See also
<b>MDG Technology for ERD and ERD Transformations</b>	<p>Enterprise Architect enables you to develop Entity Relationship diagrams quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer.</p> <p>The Entity Relationship diagram facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• An Entity Relationship diagram type, accessed through the New Diagram dialog</li> <li>• An Entity Relationship Diagram page in the Toolbox</li> <li>• Entity Relationship element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul> <p>Enterprise Architect also provides transformation templates to transform Entity Relationship Diagrams into Data Modeling Diagrams, and vice versa.</p>	<a href="#">New Diagram Dialog</a> <sup>[822]</sup> <a href="#">Toolbox Shortcut</a> <sup>[799]</sup> <a href="#">Quick Linker</a> <sup>[896]</sup> <a href="#">ERD to Data Model Transformation</a> <sup>[2032]</sup> <a href="#">Data Model to ERD Transformation</a> <sup>[2024]</sup>
<b>Entity Relationship Diagram Toolbox Page</b> 	<p>You can access the Entity Relationship Diagram page of the Toolbox through the <b>More tools   Entity Relationship Diagrams</b> option.</p> <ul style="list-style-type: none"> <li>• <i>Entity</i> is an object or concept that is uniquely identifiable; the property of Multiplicity in the SourceRole and TargetRole definitions for the <i>Relationship</i> connector (below) can be used to define the cardinality of an Entity that participates in this relationship</li> <li>• <i>Attribute</i> is a property of an entity or a relationship type</li> <li>• <i>N-ary Association</i> represents unary (many-to-many recursive) or ternary relationships and can also be used to represent relationships that have attributes among the entities; the N-ary Association element should always be at the target end of a connector</li> <li>• <i>Connector</i> is a connector between an Entity and an Attribute, and between two Attributes</li> <li>• <i>Relationship</i> is a diamond-shape connector, representing the meaningful association among entities</li> <li>• <i>Disjoint</i> and <i>Overlapping</i> represent the relationships between the super-class Entity and the sub-class Entity</li> </ul>	

Topic	Detail	See also
<b>A typical Entity Relationship diagram</b>		
<b>Disable Entity Relationship Diagrams</b>	<p>If you prefer not to use Entity Relationship Diagrams in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p>	<a href="#">MDG Technologies</a> <sup>1477</sup>

### Tagged Values

Some of the Entity Relationship diagram components can be modified by Tagged Values, as indicated below:

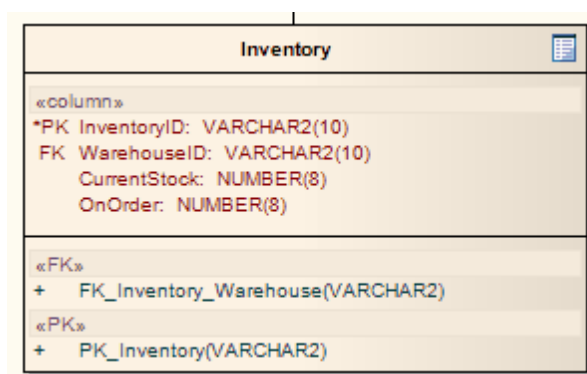

Component	Tagged Value	Notes
<b>Entity</b>	isWeakEntity	If <b>true</b> , this entity is a weak entity.
<b>Attribute</b>	attributeType	<p>Four options:</p> <ul style="list-style-type: none"> <li>• normal Attribute</li> <li>• primary key attribute</li> <li>• multi-valued Attribute</li> <li>• derived Attribute</li> </ul>
	commonDataType	Defines the common data type for each attribute.

Component	Tagged Value	Notes
	dbmsDataType	<p>Defines the customized DBMS data type for each attribute.</p> <p>You must define the customized type first through the <b>Settings   Database Datatypes</b> menu option.</p> <p>Also, set the <i>commonDataType</i> tag to <b>na</b> to activate the <i>dbmsDataType</i> tag.</p>
<b>N-ary Association</b>	isRecursive	<p>If <b>true</b>, the N-ary Association represents the many-to-many recursive relationship.</p> <p>For one-to-many and one-to-one recursive relationships, we suggest using the normal Relationship connector.</p> <p>Sometimes you might want to limit the stretch of the diamond-shape Relationship connectors; simply pick a Relationship connector, right-click to display the context menu, and select the <b>Bend Line at Cursor</b> option.</p>
<b>Relationship</b>	isWeak	If <b>true</b> , the Relationship is a weak relationship.
<b>Disjoin Overlapping</b>	Participation	Two options: <b>partial</b> and <b>total</b> .

#### Notes

- Entity Relationship Diagrams are supported in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

### 9.4.4 Table

#### Description

A Table is a stereotyped Class. It is drawn with a small table icon in the upper right corner. You typically use this element in Data Modeling diagrams.

A Table element has a special Properties dialog, with settings for database type and the ability to set column information and data-related operations such as triggers and indexes. When setting up a Table, make sure you set the default database type for that Table, otherwise you do not have any data types to choose from when creating columns.

## 9.5 Geodatabase Design for ArcGIS

The **ArcGIS** system, developed by **Esri**, supports the development and management of geodatabases. As for other databases, it is useful to **model the design of a geodatabase** using a standard notation such as UML. You can perform such modeling in Enterprise Architect, using the UML profile for ArcGIS, which is part of the built-in MDG Technology for ArcGIS. Once you have modeled an ArcGIS schema in Enterprise Architect, you can **export the model to ArcGIS** as an XML Workspace document. You can also visualize an existing ArcGIS geodatabase schema, by **importing the ArcGIS XML Workspace document** into Enterprise Architect.

### Notice of Acknowledgement:

*Support for modeling ArcGIS databases in Enterprise Architect was developed in collaboration with the Commonwealth Scientific and Industrial Research Organization (**CSIRO**), who defined mappings between UML 2 and ArcGIS concepts, and prototyped an automated import and export capability for ArcGIS geodatabase schemas represented in UML.*

### Notes

- The MDG Technology for ArcGIS is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

**Notes**

- The MDG Technology for ArcGIS is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

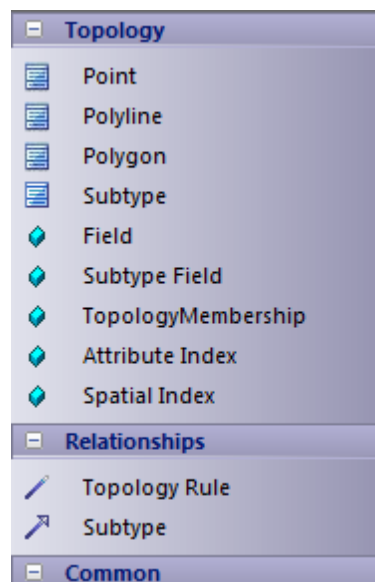

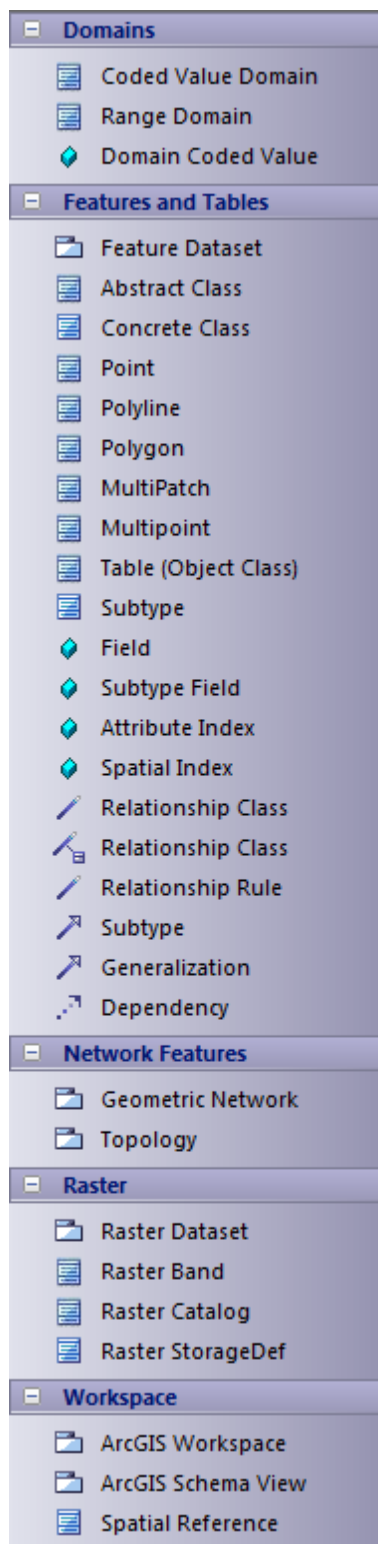

### 9.5.1.1 ArcGIS Toolbox Pages

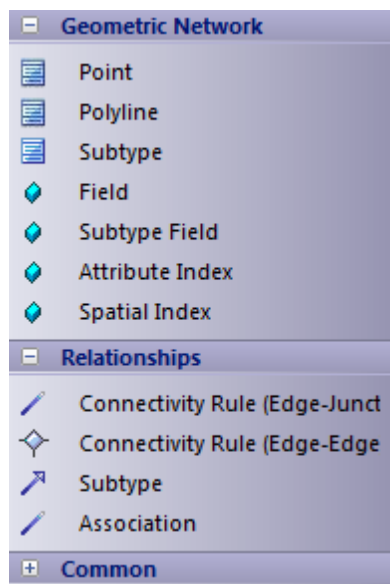

The ArcGIS Toolbox pages provide elements and connectors that you can use to model ArcGIS geodatabase concepts and relationships. The ArcGIS Toolbox consists of five core pages:

- Domains - for coded value and range domains
- Features and Tables - for custom feature types and tables
- Network Features - to identify geometric network and topology packages
- Raster - for raster datasets
- Workspace - for ArcGIS workspace and spatial reference information

Two additional Toolboxes group the objects used specifically in creating Geometric Network and Topology diagrams.

[Diagram | Diagram Toolbox: More Tools | ArcGIS | Topology](#)

#### Diagram toolbox icons

Toolbox Icon	Description
<b>Packages</b>	
<b>ArcGIS Workspace</b>	The geodatabase workspace Package, which holds all the ArcGIS modeling elements. Export the contents of this Package to produce the Geodatabase XML Workspace Document, which can be imported to <b>Esri ArcCatalog</b> .
<b>ArcGIS Schema View</b>	<p>A stereotyped Package that represents a subset of the geodatabase schema defined within the ArcGIS Workspace Package. ArcGIS Schema View Packages are useful if you need to create partial or modular schemas based on your complete geodatabase design. You can create any number of ArcGIS Schema View Packages under your ArcGIS Workspace Package.</p> <p>Add this element to a diagram under your workspace, then create a UML Dependency connector from it to each Package to include in the generated XML Workspace Document. For example, you could include only a subset of your Feature Datasets and Domains, by drawing UML Dependency connectors to the appropriate Packages.</p> <p>To export your ArcGIS Schema View for use with ArcCatalog, right-click on it and select the <b>Extensions   ArcGIS   Export to ArcGIS Workspace XML</b> option. The system generates a Workspace XML document containing only the elements associated with the ArcGIS Schema View Package.</p> <p>See the <i>Export Modular ArcGIS Schemas</i> topic.</p>
<b>Feature Dataset</b>	<p>A stereotyped Package that holds or organizes Point, Polyline, Polygon or Multipatch elements with the same spatial reference, geometry type and attribute fields (that is, Feature Classes).</p> <p>The Feature Dataset is only created under the ArcGIS Workspace Package (above); it can not be created under another Feature Dataset Package. Feature Dataset</p>

Toolbox Icon	Description
	<p>Packages can contain other types of subpackages, however, which can be useful for organizing large Feature Datasets. When exported to an XML Workspace document, <b>elements</b> of any subPackages are included while the subPackages themselves are ignored, resulting in a 'flattened' model hierarchy.</p> <p>Although ArcGIS forbids Tables (ObjectClasses) being defined under Feature Datasets, Enterprise Architect lets you model Tables under Feature Datasets for convenience. On export, Tables are placed at the root level to create a valid schema.</p>
<b>Geometric Network</b>	An extended UML Package that represents the logical relationships between features in a network system – implemented in ArcGIS as a geometric network.
<b>Raster Dataset</b>	A stereotyped package that holds or organizes the raster data (as Raster Band elements; see below).
<b>Topology</b>	An extended UML Package that represents the shared geometry of a set of Feature Classes from a Feature Dataset.
<b>Elements (in alphabetical order)</b>	
<b>Abstract Class</b>	A standard UML Abstract Class, representing a concept and set of fields, that can be shared by multiple Feature Classes. Feature Classes that connect to an Abstract Class via an Inheritance relationship gain all of its fields. Since the geodatabase does not directly support Abstract Classes, inherited fields are exported into the definition of each child Feature Class when generating a schema from the model.
<b>Coded Value Domain</b>	An extended UML Class, representing a set of valid values that might apply to any type of attribute.
<b>MultiPatch</b>	An extended UML Class, representing the ArcGIS MultiPatch.
<b>Multipoint</b>	An extended UML Class, representing the ArcGIS Multipoint.
<b>Point</b>	An extended UML Class, representing the ArcGIS Point.
<b>Polygon</b>	An extended UML Class, representing the ArcGIS Polygon.
<b>Polyline</b>	An extended UML Class, representing the ArcGIS Polyline.
<b>Range Domain</b>	An extended UML Class, representing a valid range of numeric values that might apply

Toolbox Icon	Description
	to a numeric type of attribute.
<b>Raster Band</b>	An extended UML Class, representing one layer of a matrix of cell values. Every Raster Dataset (above) contains one or more Raster Bands.
<b>Raster Catalog</b>	An extended UML Class, representing a collection of Raster Datasets in the geodatabase.
<b>Raster StorageDef</b>	An extended UML Class, representing the storage properties for a Raster value in the geodatabase; this information is required when a Raster Dataset package element is created (see above).
<b>Spatial Reference</b>	An extended UML Class that defines the spatial reference information of your schema, such as a coordinate system and XYTolerance. You can define one or more Spatial Reference elements, which you link to other ArcGIS elements via their <b>Spatial Reference</b> Tagged Value.
<b>Subtype</b>	An extended UML Class, holding a subset of the attributes of an element in the Feature Dataset (see above).
<b>Table (Object Class)</b>	An extended UML Class, representing a collection of nonspatial data of the same type or Class.
<b>Relationships (in alphabetical order)</b>	
<b>Association</b>	A normal UML Association connector.
<b>Connectivity Rule (Edge-Edge)</b>	An extended UML N-ary Association that models the valid relationships between edge elements in a Geometric Network. For an example, see <i>Connectivity Rule Examples</i> .
<b>Connectivity Rule (Edge-Junction)</b>	An extended UML Association that models the valid relationships between edge and junction elements in a Geometric Network. For an example, see <i>Connectivity Rule Examples</i> .
<b>Dependency</b>	A normal UML Dependency connector.
<b>Generalization</b>	Indicates inheritance from the specific classifier to a general classifier.

Toolbox Icon	Description
<b>Relationship Class</b>	An extended UML <i>Association</i> , providing the relationship between: <ul style="list-style-type: none"> <li>Two elements in the Feature Dataset, or</li> <li>An element in the Feature Dataset and an Object Class element</li> </ul>
<b>Relationship Class</b>	An extended UML <i>Association Class</i> , providing the attributed relationship between: <ul style="list-style-type: none"> <li>Two elements in the Feature Dataset, or</li> <li>An element in the Feature Dataset and an Object Class element</li> </ul>
<b>Relationship Rule</b>	An extended UML Association that determines which subtypes can be related in the geodatabase.
<b>Subtype</b>	An extended UML Association, providing the relationship between a Feature Class element and a Subtype element.
<b>Topology Rule</b>	An extended UML Association that connects Feature Class and Subtype elements in the geodatabase.
<b>Attributes (in alphabetical order)</b>	
<b>Attribute Index</b>	An extended UML Attribute that represents the ArcGIS Attribute Index.
<b>Domain Coded Value</b>	An extended UML Attribute that specifies the value of an ArcGIS Coded Value Domain.
<b>Field</b>	An extended UML Attribute that represents an ArcGIS field of the geodatabase, in a Table or Feature Class.
<b>Spatial Index</b>	An extended UML Attribute that represents the ArcGIS Spatial Index.
<b>Subtype Field</b>	An extended UML Attribute that represents the subtype field of an ArcGIS Table or Feature Class.
<b>TopologyMembership</b>	An extended UML Attribute that represents the <b>accuracy ranks</b> of a Feature Class.

#### 9.5.1.1.1 Connectivity Rule Examples

In an ArcGIS **Geometric Network** diagram, you can use one or other of the two **Connectivity Rule** relationships - **Edge-Junction** or **Edge-Edge**. These examples illustrate the use of each type.

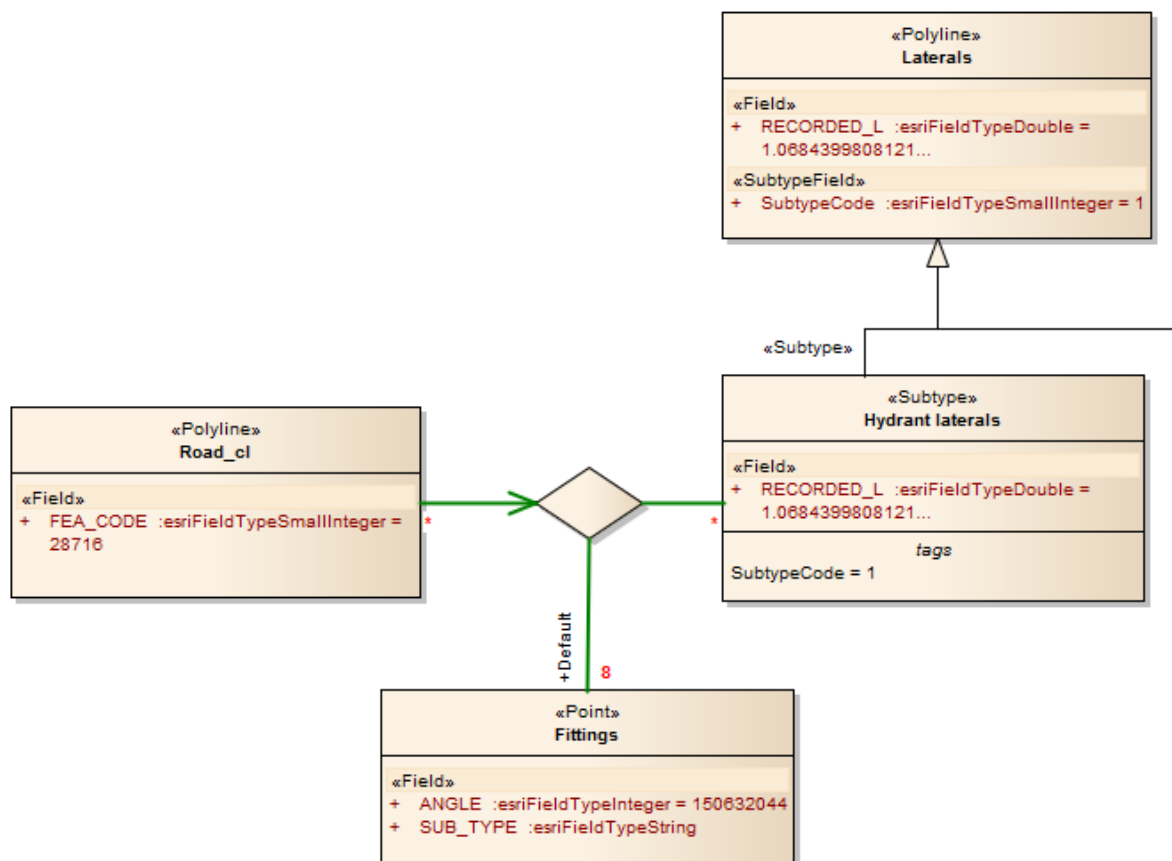

##### Edge-Junction Connectivity Rule

- The Connectivity-Rule (Edge-Junction) connector is a UML binary Association connector
- The connection includes one **edge** element ( «Point», or «Subtype» with «Point» as parent) and one **junction** element ( «Polyline» , or «Subtype» with «Polyline» as parent )
- Cardinality can be set from the source and target **Multiplicity** fields on the connector Properties dialog
- You can set the **Source Role** or **Target Role** fields to **Default** on the connector Properties dialog
- All the elements within this Edge-Junction rule must be held in the «GeometricNetwork» package

##### Edge-Edge Connectivity Rule

- The Connectivity-Rule (Edge-Edge) connector is a UML N-ary Association connector
- The connection should include two **edge** elements («Polyline», or «Subtype» with «Polyline» as parent) and any number of **junction** elements («Point», or «Subtype» with «Point» as parent)
- It is recommended that you use a **Direct Association** connector, drawn from one of the edge elements to the **N-ary** element, to indicate the 'from' Class - in the above diagram, **Road\_cl** is the edge element that is set as the 'from' Class; for the rest of connection, you can use Association connectors to connect the edge or junction element and the N-ary element, drawn either **from** the edge or junction elements **to** the N-ary element, or **from** the N-ary element **to** the edge or junction elements
- Cardinality can be set from the source or target element **Multiplicity** fields on the connector Properties dialog; you only need to set the multiplicity of **one** end of the connector - if **both** ends are set, only the multiplicity of the **target** end is used
- You must mark **one** of the Junction-N-ary connections as **Default**, using the **Source Role** or **Target Role** field on the connector Properties dialog
- All the elements within this Edge-Edge rule must be held in the «GeometricNetwork» package

- [Target Role](#) <sup>[1132]</sup>

### 9.5.1.1.2 Topology Example

In geodatabases, **topology** defines the spatial relationship between geographic features; that is, how Point, Polyline, and Polygon features share coincident geometry. Topology is fundamental to **data integrity** in a GIS database. In the Enterprise Architect ArcGIS profile, you use a «*Topology*» Package to model data integrity among the Feature Classes.

Modeling topology in the Enterprise Architect ArcGIS model is simple:

1. Select a «*FeatureDataset*» Package in which to create topology relationships.
2. Open the **diagram** under the «*FeatureDataset*» Package.
3. From the Diagram Toolbox ArcGIS **Network Features** page, drag and drop a «*Topology*» Package icon onto the diagram; this creates a Package that will contain all the elements and relationships that are required for topology definition.

A Topology defined in Enterprise Architect has these characteristics:

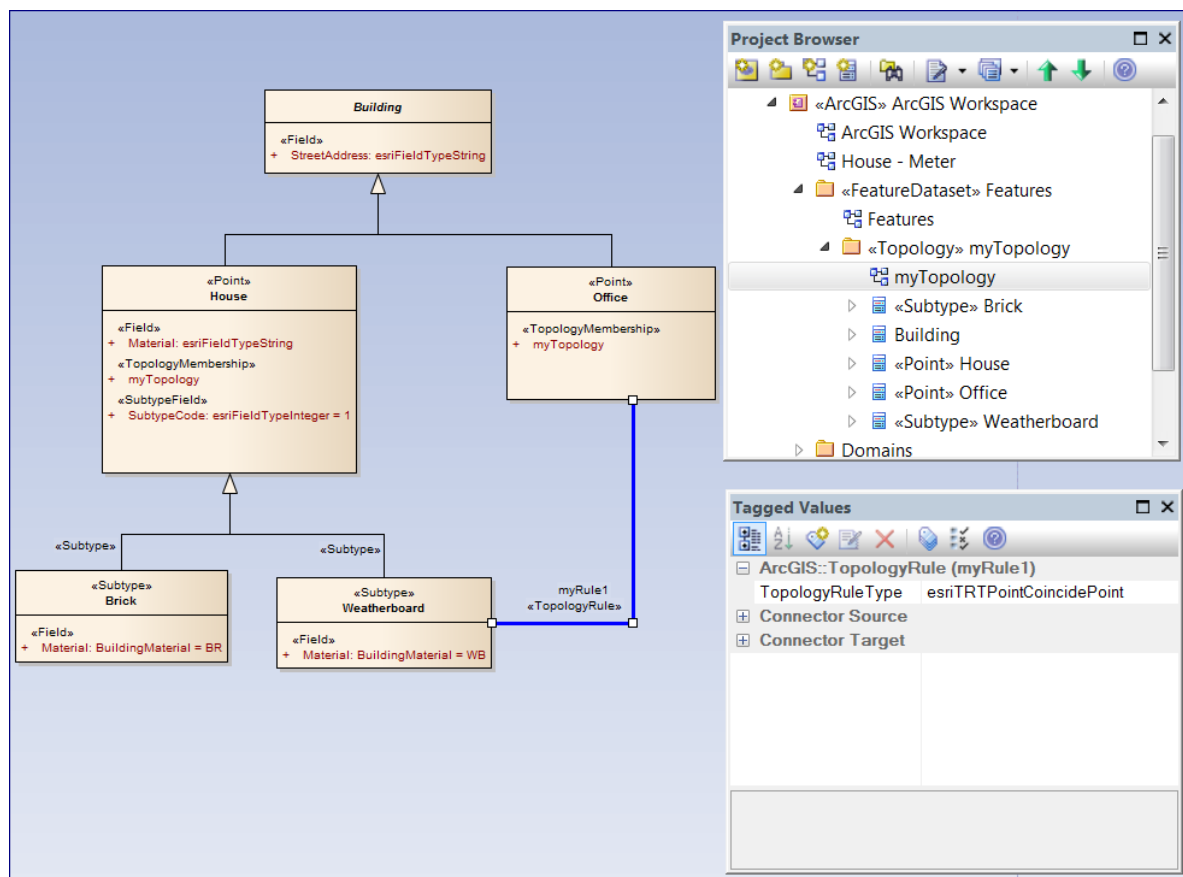

- The «*Topology*» Package cannot be created outside a «*FeatureDataset*» Package
- Within one «*FeatureDataset*» Package, multiple «*Topology*» Packages can be created
- A Feature Class (Point, Polyline or Polygon) can only participate in one «*Topology*» Package
- A Feature Class cannot participate in both a «*Topology*» Package and a «*GeometricNetwork*» Package

#### Elements of Topology

Element	Description	See also
<b>Name</b>	You can define the name for the Topology as the « <i>Topology</i> » Package name.	<a href="#">ArcGIS Toolbox Pages</a> <sup>[1946]</sup>
<b>List of Feature Classes</b>	Either: <ul style="list-style-type: none"> <li>• Create new Feature Classes from the Diagram Toolbox or</li> <li>• Drag existing Feature Classes from the Project Browser into the «<i>Topology</i>» Package</li> </ul>	
<b>X,Y Cluster Tolerance and Z Cluster Tolerance</b>	You define the cluster tolerance values using the <b>ClusterTolerance</b> and <b>ZClusterTolerance</b> Tagged Values of the « <i>Topology</i> » Package.	
<b>Accuracy ranks</b>	Accuracy ranks are defined using the Tagged Values of the <b>TopologyMembership</b> attribute, which you can create using the <b>TopologyMembership</b> icon on the Topology page of the Diagram Toolbox.  Add this stereotyped attribute to each Feature Class element and then set a value for each rank. <ul style="list-style-type: none"> <li>• The <b>name</b> of the attribute should be the name of the «<i>Topology</i>» Package</li> <li>• You do not need to set the <b>type</b> of the attribute</li> </ul>	

Element	Description	See also
	<p>Each Feature Class only has one TopologyMembership attribute. If you do not add a TopologyMembership attribute to a Feature Class, the ArcGIS exporter will generate a set of default ranking values for you. The values for <b>XYRank</b> and <b>ZRank</b> are between 1 and 50.</p>	
<b>Topology Rules</b>	<p>Topology Rules are represented by a UML Association connector that has the «<i>TopologyRule</i>» stereotype. You can create the connector using the <b>Topology Rule</b> icon on the Topology page of the Diagram Toolbox.</p> <p>Use this connector to link:</p> <ul style="list-style-type: none"><li>• Two Feature Class («<i>Point</i>», «<i>Polyline</i>» or «<i>Polygon</i>») elements</li><li>• Two «<i>Subtype</i>» elements</li><li>• A Feature Class («<i>Point</i>», «<i>Polyline</i>» or «<i>Polygon</i>») element to a «<i>Subtype</i>» element</li><li>• A Feature Class («<i>Point</i>», «<i>Polyline</i>» or «<i>Polygon</i>») itself, or</li><li>• A «<i>Subtype</i>» element itself</li></ul> <p>The <b>TopologyRuleType</b> tag is used to define the type of Topology Rule.</p>	

#### Example Topology Rule connection

### 9.5.1.1.3 Relationship Rule Example

In ArcGIS modeling, you can use **relationship rules** to **refine** the cardinality of a **«RelationshipClass»** connector between a source Feature Class or Table and a destination Feature Class or Table; a Relationship Class connector only defines the initial cardinality, such as one-to-many or many-to-many.

A relationship rule in Enterprise Architect is represented by a **«RelationshipRule»** connector, a stereotyped UML Association connector, which you can create using the **Relationship Rule** icon on the ArcGIS Core page of the Diagram Toolbox. You set the cardinality from the source and target **Multiplicity** fields on the connector Properties dialog.

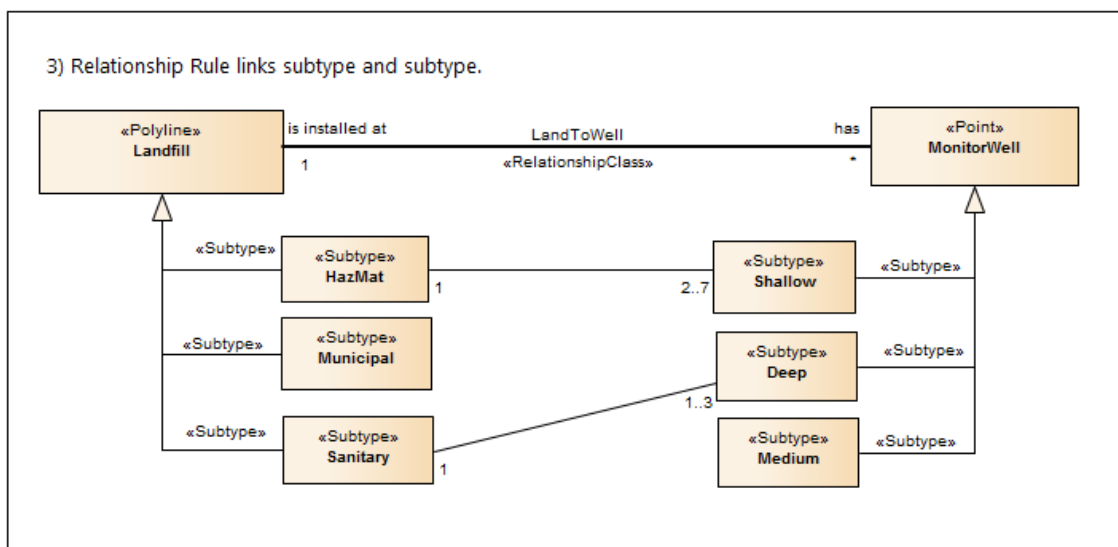

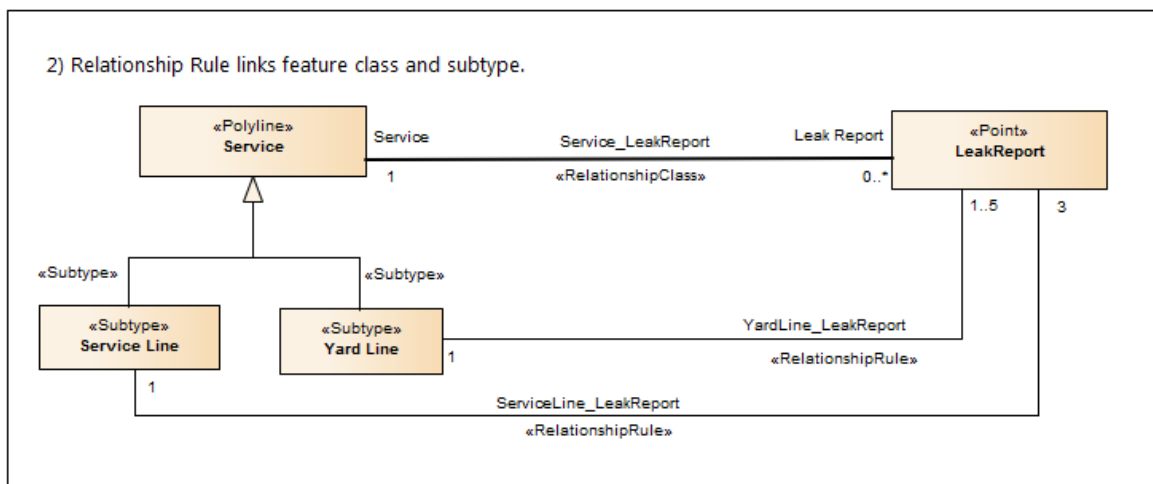

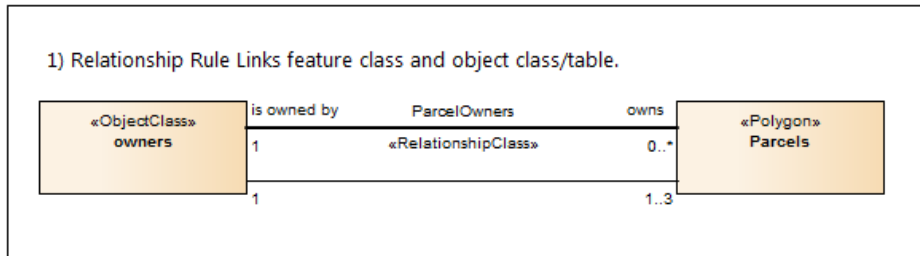

When creating a **«RelationshipRule»** connector between two objects, you must have:

- An existing **«RelationshipClass»** connector between the two objects that you want to define the relationship rule for; if there is no connector, the **«RelationshipRule»** you create is ignored during ArcGIS schema generation
- A cardinality range at each end that is compatible with the cardinality of the parent **«RelationshipClass»**; for example, if you define a cardinality of **1-M** in a **«RelationshipClass»** connector, the source end of the **«RelationshipRule»** connector must be **1**, while you can set the target end of the **«RelationshipRule»** to a specific number such as **3** (see the example diagrams in this topic)

Relationship rules can also restrict the type of object in the source Feature Class or Table that can be related to a certain kind of object in the destination Feature Class or Table. For example, if the source Class has **no** subtype elements, the relationship rule applies to **all** features. If the source Class **has** subtype elements and the **«RelationshipRule»** is linked to one of the subtype elements, this means only the associated subtype element is related to the **«RelationshipRule»**. The same restriction is also applied to the destination Feature Class or Table.

## Examples

This diagram provides three examples of possible «RelationshipRule» connections in an ArcGIS model. A custom Line Thickness has been applied to highlight the Relationship Class connectors, and the «RelationshipRule» stereotype label has been hidden where appropriate:

### 9.5.1.2 Setting ArcGIS Coordinate Systems

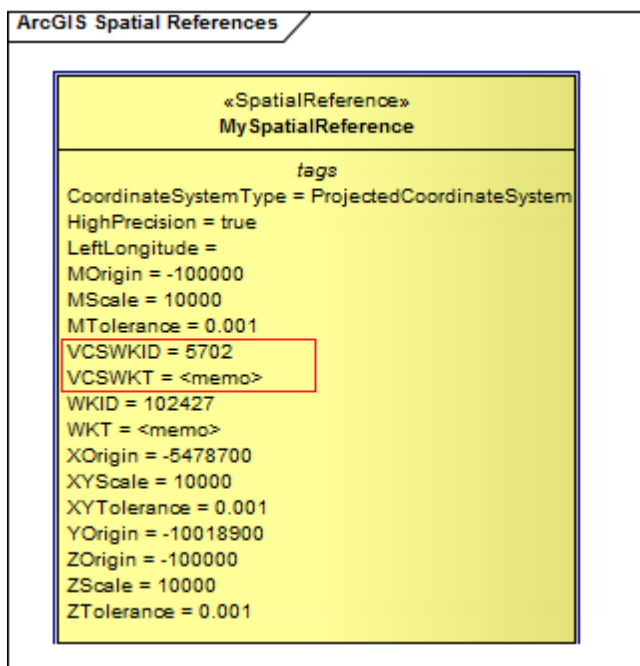

ArcGIS Feature Classes and Feature Datasets use **spatial references**, which consist of a coordinate system and associated values such as XY resolution and various tolerance values.

You can capture spatial reference properties using a Class stereotyped as «*SpatialReference*», which is available from the ArcGIS Toolbox pages. The ArcGIS model pattern includes a Package named **Spatial References**, as a placeholder for creating such elements.

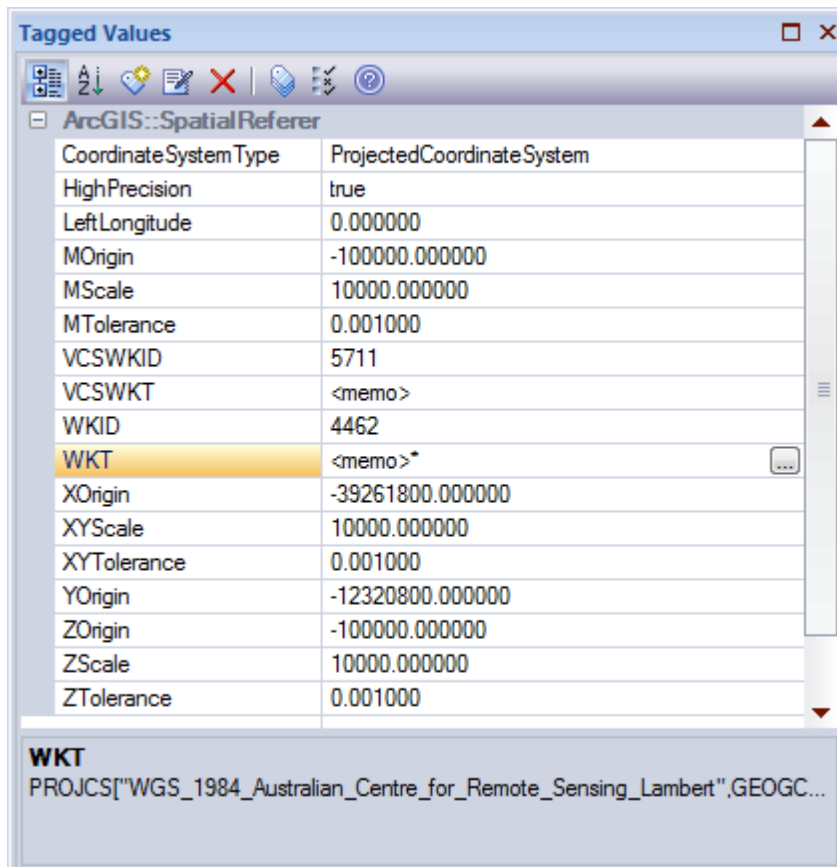

To help you model spatial reference properties, Enterprise Architect provides a dialog for selecting one of the predefined coordinate systems supported by ArcGIS. When you select a Geographic or Projected coordinate system, Enterprise Architect automatically inserts default values for the associated properties, such as **Well Known Text (WKT)**, resolution, precision or tolerances. These values are held as Tagged Values on the «*SpatialReference*» element.

You can also add vertical coordinates to a selected Geographic or Projected coordinate system; the vertical coordinate is loaded to the **VCSWKID** and **VCSWKID** Tagged Values on the «*SpatialReference*» element.

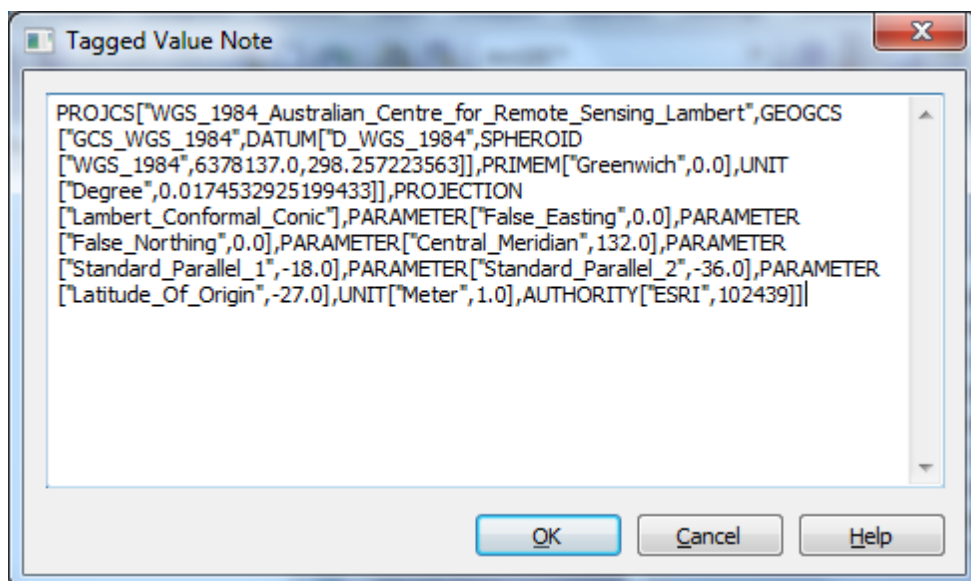

This is an example «*SpatialReference*» element:

Looking at the **WKT** Tagged Value in the Tagged Value window for this element, you can see that the *WGS 1984 Australian Centre for Remote Sensing Lambert* Projected Coordinate system has been selected.

You can expand the information held in this Tagged Value by viewing its Tagged Value Note.

#### Define a Spatial Reference element

Step	Action	See also
1	Open the diagram under the <i>Spatial References</i> package of your ArcGIS model.  (You can actually use any ArcGIS diagram in your model to define Spatial Reference elements; however, this diagram is a convenient placeholder created by Enterprise Architect's model pattern for ArcGIS.)	
2	Drag a Spatial Reference element from the Workspace page of the ArcGIS Core Toolbox onto the diagram.	
3	Right-click on the Spatial Reference element, and select the <b>Extensions   ArcGIS   Set Coordinate System</b> menu option.  The Set Coordinate System dialog displays.	
4	Expand the Geographic or Projected Coordinate Systems hierarchy as appropriate and click on the required coordinate system in the list.	
5	If you want to also apply a vertical coordinate system, click on the [ ... ] button at the right of the <b>Vertical Coordinate</b> field.  The Set Vertical Coordinate System dialog displays, containing a hierarchy that you again expand and from which you select a listed vertical coordinate system.  Click on the <b>OK</b> button to return to the Set Coordinate System dialog; the <b>Vertical Coordinate</b> field now displays the system you selected.	
6	Click on the <b>OK</b> button to close the dialog and return to the diagram.  The Tagged Values for the Spatial Reference element are updated with the Coordinate System information you have selected..	

### Notes

- You can refer to a «*SpatialReference*» Class from any other Feature Dataset or Feature Class in your model, using the **SpatialReference** Tagged Value; the «*SpatialReference*» Class thus provides a single point of control, should you need to change the Spatial Reference information later
- If a Feature Class element references a «*SpatialReference*» Class that contains a vertical coordinate, set the **HasZ** Tagged Value on that Feature Class element to **true** if you want this Feature Class element to store three-dimensional data
- If you do not refer to a «*SpatialReference*» Class from any Feature Dataset or Feature Class in your ArcGIS model, the system will generate an XML schema with the *Unknown* Spatial Reference type for these elements

## 9.5.2 Export ArcGIS XML Workspace

When you have modeled your Geodatabase Workspace XML Document (containing the ArcGIS schema), you can export it to an external directory (using the *Publish Model Package* facility), from which you can then import it to the **Esri ArcCatalog**.

**Access** Click on an ArcGIS stereotyped package (your ArcGIS Workspace Package) in the Project Browser, then either:

**Extensions | Publish | ArcGIS**

**Extensions | ArcGIS | Export to ArcGIS Workspace XML**

**Project | Model Publisher**

**Project | Model Import/Export | Export Package to XMI File: Publish**, or

**Right-click | Import/Export | Export Package to XMI: Publish**

**Right-click | Extensions | ArcGIS | Export to ArcGIS Workspace XML**

### Export the Workspace

Field/Option/ Button	Action	See also
<b>Root Package</b>	Display the name of the selected ArcGIS Workspace package.	
<b>Filename</b>	Type in or browse for the file path into which the XML file is to be generated.	
<b>XML Type</b>	Select ArcGIS as the XML/XMI version to export the package to.	
<b>Format XML Output</b>	Format the output into readable XML (this takes a few more seconds at the end of the run).	
<b>Write Log File</b>	Write a log of the export activity (recommended). The log file is saved to the directory into which the XML file is exported.	
<b>View XML</b>	View the exported XML file.	
<b>Export</b>	Initiate XML export.	
<b>Close</b>	Close this dialog.	
<b>Progress</b>	Observe the progress of the XML export.	

### Notes

- The MDG Technology for ArcGIS is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Export XML** permission to export to XML
- Before exporting your model to an ArcGIS schema, you must define at least one Spatial Reference element; Spatial Reference elements are referred to by other schema elements via a dynamically linked Tagged Value, named *SpatialReference*
- The *DefaultSpatialReference* tag on an ArcGIS **package** is used to specify a Spatial Reference that can be applied to all Feature Datasets and Feature Classes in the workspace; therefore, you do not need to apply a Spatial Reference element to **each** Feature Dataset or Feature Class
- If you do not reference a Spatial Reference Class from any Feature Dataset or Feature Class in your ArcGIS model, Enterprise Architect by default will generate an XML schema with *Unknown type of Spatial Reference* for these elements

## 9.5.3 Export Modular ArcGIS Schemas

In Enterprise Architect, in addition to exporting your **entire** ArcGIS workspace, you can also export **partial schemas**. This is useful if you have a large geodatabase schema, as might be defined in an industry reference model. You might require the entire schema in some situations, but only require small parts of it for particular spatial applications, such as field data collection. In such a scenario, you would want to export a schema that contains only the Feature Classes, Tables and Domains that your field data application uses – without duplicating parts of your original schema model. You use the «**ArcGISSchemaView**» stereotyped Package for this purpose.

An «ArcGISSchemaView» Package is modeled as a subPackage of an ArcGIS **Workspace** Package. You can define any number of «ArcGISSchemaView» Packages - each representing a different subset of the **geodatabase schema**. You specify which parts of the schema are included by drawing a UML **Dependency** connector from the «ArcGISSchemaView» Package to each included Package. When you **export** the «ArcGISSchemaView» Package, the system includes any other Packages that your included Packages depend on (via Dependency connectors).

This figure shows a partial schema that includes only one of the three Feature Datasets from the complete schema.

### Create an ArcGISSchema Package

Step	Action	See also
1	Create or open an ArcGIS diagram within your ArcGIS Workspace.	
2	Drag the <b>ArcGIS Schema View</b> icon from the <b>Core</b> Diagram Toolbox onto your diagram.  A prompt displays to enter the Package name.	
3	Type in a meaningful Package name and click on the <b>OK</b> button.	
4	Drag onto the diagram any other Packages that you want to include in the exported schema.  (You could achieve the same result using the child diagram of the «ArcGISSchema View» Package to draw the included Packages).	

Step	Action	See also
5	Draw a Dependency connector from the «ArcGISSchemaView» Package to each of the other Packages.	

### Notes

- Defining the Dependency relationships on a **diagram** is convenient, but not necessary; as long as the dependencies are defined in the **model** – irrespective of whether they exist on a diagram – the ArcGIS schema exporter will use them
- You can arrange your dependency diagrams in whatever part of the ArcGIS Workspace seems appropriate – the diagrams can reside under the «ArcGISSchemaView» Package itself or under any other element within the ArcGIS Workspace

### Export an ArcGIS Schema View for use with ArcCatalog

Step	Action	See also
1	Select the <b>ArcGIS Schema View</b> Package in a diagram or in the Project Browser.	
2	Right-click and select <b>Extensions   ArcGIS   Export to ArcGIS Workspace XML</b> .	
3	Identify the target file and click on the <b>Export</b> button.  The system generates a Workspace XML document containing only the elements associated with the ArcGIS Schema View package.	

### Which related elements are included when you export an ArcGIS Schema View Package?

The following rules apply when you export an ArcGIS Schema View Package:

- Dependencies are modeled using the UML **Dependency** connector
- All elements of a Package that the ArcGIS Schema View depends on (directly or indirectly) are included in the generated schema
- All fields **inherited from** Abstract Classes by included elements are exported, regardless of the Package in which the Abstract Classes reside
- All **Coded Value Domain** elements to which included elements refer are exported, regardless of the Package in which the Coded Value Domain elements reside
- If an ArcGIS Schema View Package depends on one or more subPackages of a **Feature Dataset** Package, the Feature Dataset is exported with only those elements contained in the linked subPackages
- If a field of an included element refers to a **Coded Value Domain** element, that Coded Value Domain element is exported, irrespective of whether the ArcGIS Schema View Package has an explicit

dependency on the Coded Value Domain element's Package

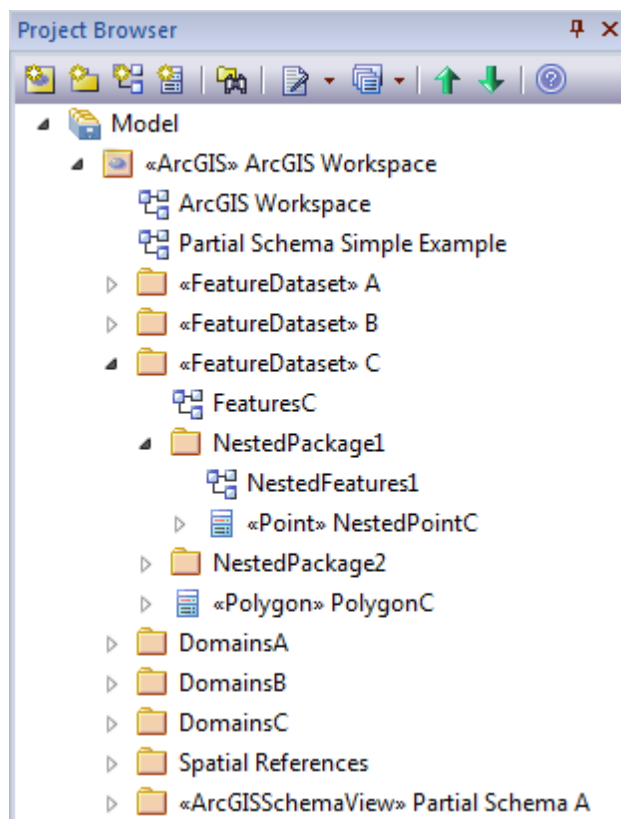

- If an included element has a **Relationship Class** connector to another element X AND element X is not already included by the ArcGIS Schema View, neither element X nor the Relationship Class connector are exported; the log file will hold a list of names of the Relationship Class connectors that, for this reason, are not exported

### Examples of modeling partial schemas

Consider this complete Workspace, which includes three Feature Datasets named **A**, **B** and **C**, and three Packages of Coded Value Domains named **DomainsA**, **DomainsB** and **DomainsC**:

The corresponding model hierarchy in the Project Browser looks like this:

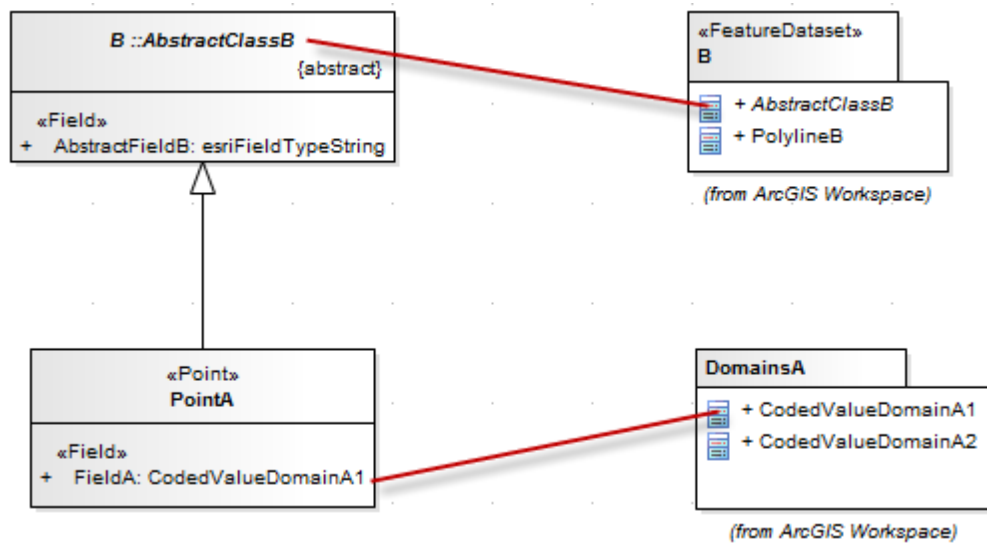

Assume that we want to export only Feature Dataset A and its required elements. We could model the Schema as a partial schema that includes a single Feature Dataset, as shown:

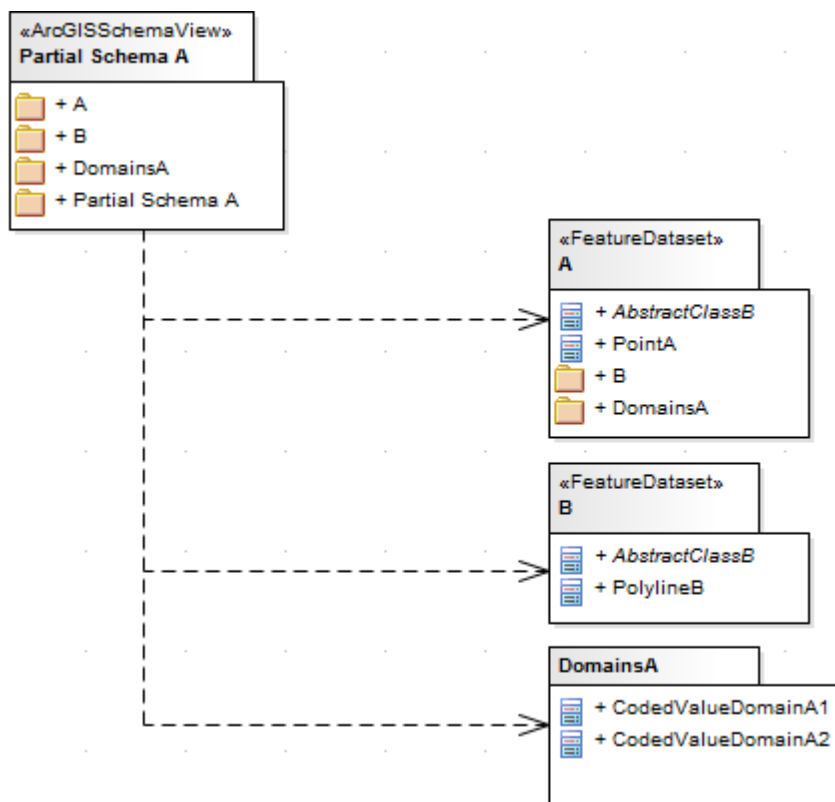

(This diagram is equivalent to the first diagram provided at the start of the topic.) Assuming that **Point A** depends on no other elements, the resulting schema would include only **FeatureDataset A** with its **Feature Class**, Point A.

Now assume that Point A inherits from the Abstract Class **AbstractClassB** (defined in **FeatureDataset Package B**) and that one of A's fields has type **CodedValueDomainA1** defined in the **DomainsA** Package (as in the model diagram below). Now, the same Partial Schema model above would result in an exported schema that included the fields of AbstractClassB and CodedValueDomainA1, even though Partial Schema A does not explicitly depend on Package B or Package DomainsA, because partial schemas automatically include elements that are related by inheritance or are referred to by field types. The exporter thus helps you to generate valid ArcGIS schemas by including such required elements.

If we wanted to include all **CodedValueDomains** in **DomainsA** and all **Feature Classes** in **FeatureDataset B** (including any domains they depended on), we could model this situation to include entire Packages of elements in a partial schema via direct and indirect UML Dependency connectors, as shown.

Finally, let's assume we want to create a partial schema that includes only the elements in **NestedPackage1**. We model the scenario as a partial schema Package that refers to nested Packages within a Feature Dataset.

The resulting schema would include a Feature Dataset named **C** that contained all elements within **NestedPackage1**. The elements in **NestedPackage2** would be excluded as would **PolygonC** (assuming no explicit relationships existed with the elements of NestedPackage1).

### 9.5.4 Import ArcGIS XML Workspace

If you have a Geodatabase Workspace XML Document (containing the ArcGIS schema) you can import it into your Enterprise Architect project as a UML model.

**Access** Click on the target Package in the Project Browser, then either:

**Extensions | Import | ArcGIS**

**Extensions | ArcGIS | Import ArcGIS Workspace XML**

**Project | Model Import/Export | Import Package From XMI File: Other XML File Formats | ArcGIS**

**Right-click | Import/Export | Import Package From XMI File: Other XML File Formats | ArcGIS**

**Right-click | Extensions | ArcGIS | Import ArcGIS Workspace XML**

#### Import a Geodatabase Workspace XML document

Field/Option/ Button	Action	See also
<b>Filename</b>	Type in or browse for the name of the ArcGIS XML file to import.	
<b>Create Diagrams</b>	Select the checkbox to create Class diagrams under the imported Packages.	
<b>Hide System-Level ArcGIS Fields on Diagrams</b>	<p>Select the checkbox to hide these stereotyped attributes:</p> <ul style="list-style-type: none"> <li>• RequiredField</li> <li>• AttributeIndex</li> <li>• SpatialIndex</li> </ul> <p>on these stereotyped Classes:</p> <ul style="list-style-type: none"> <li>• Point</li> <li>• Polyline</li> <li>• Polygon</li> </ul>	

Field/Option/ Button	Action	See also
	<ul style="list-style-type: none"> <li>MultiPatch</li> </ul> <p>The RequiredField and AttributeIndex attributes are also hidden for the Table (Object Class) Class.</p> <p>This option is enabled only when the <b>Create Diagrams</b> checkbox is selected.</p>	
<b>Strip GUIDs</b>	The Strip GUIDs feature is currently mandatory for ArcGIS imports, which means that elements are created 'as new' each time an ArcGIS schema is imported.	
<b>Write Log File</b>	<p>Select the check box to write a log of import activity (recommended).</p> <p>The log file is saved in the directory from which the file is being imported, with the same name as the imported file plus the suffix <i>_import.log</i>.</p>	
<b>View XML</b>	Click on this button to view the XML before import.	
<b>Import</b>	Click on this button to import the ArcGIS XML file.	
<b>Close</b>	Click on this button to close this dialog.	
<b>Help</b>	Click on this button to display this Help page.	
<b>Import Progress</b>	This field indicates the progress of the import.	

**Notes**

- The MDG Technology for ArcGIS is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

- [Validate an ArcGIS Workspace](#)<sup>[1970]</sup>

### 9.5.5 Validate an ArcGIS Workspace

When you have developed or imported an ArcGIS model, you can validate it against a set of rules in a system-provided ArcGIS validation table.

**Access**   **Project Browser | Right-click «ArcGIS» Workspace Package | Extensions | ArcGIS | Validate ArcGIS Model**

The menu option launches a validation script on the workspace. While running, the script logs information to the ArcGIS Model Validation tab of the System Output window. Check the script output for errors and warnings.

There are two ways to investigate the errors reported by the model validation script:

- Expand the System Output window and review the errors and warnings directly; you can double-click on a warning or error line to highlight the element or attribute the message relates to, in the Project Browser

**or**

- Copy all of the output to a text file and open the file using your preferred text editor; this is likely to provide cleaner formatting of the script's output

## 9.6 MDG Technology for ODM

**MDG Technology for ODM** is the implementation of the Object Management Group's **Ontology Definition Metamodel** for Enterprise Architect. It provides ontology modeling capabilities within Enterprise Architect (9.2 or later), enabling you to develop large-scale ontologies within the fully-integrated modeling environment, for your project domain.

Through the MDG Technology for ODM, you have access to the following features:

- A **UML Profile for the Resource Description Framework (RDF)**
- A **UML Profile for Web Ontology Language (OWL)**
- Customized **diagram types** and **toolbox pages**, for convenient access to elements and relationships to model ontologies and resources effectively
- **Model Templates** to get started quickly with ontology modeling
- Commands to **import and export** RDF and OWL files, and to define new **namespaces** for ODM packages and new **labels** for OWL and RDF elements

### Topics

Topic	Detail	See also
<b>Ontologies</b>	<p>Ontologies define a common vocabulary for sharing information in a domain. They provide a standardized, machine-interpretable definition of basic concepts within the domain, and of relations among them. Formally defined ontologies give stakeholders the ability to:</p> <ul style="list-style-type: none"> <li>• Share common understanding of the structure of information among themselves or among software agents</li> <li>• Reuse domain knowledge</li> <li>• Explicitly codify domain assumptions</li> <li>• Separate domain knowledge from operational knowledge</li> <li>• Analyze domain knowledge effectively</li> </ul>	
<b>The OMG ODM</b>	<p>The Ontology Definition Metamodel has been formalized by the OMG as a standard.</p> <p>It defines an important set of enabling capabilities for Model Driven Architecture (MDA) for a formalized representation of business semantics and taxonomies, and knowledge representation based on those formalizations. It defines extensions to the Unified Modeling Language (UML) to provide a custom modeling notation for ontology definition. These extensions are:</p> <ul style="list-style-type: none"> <li>• The Resource Description Framework (RDF), used to represent data, properties and formal semantics of information in the web</li> <li>• Web Ontology Language (OWL), used to represent terms in vocabularies, and their interrelationships; OWL extends the RDF to define both the domain information and the relevant domain meaning</li> </ul>	
<b>Disable MDG Technology for ODM</b>	<p>If you prefer not to use the MDG Technology for ODM in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p>

### 9.6.1.1 OWL Elements & Relationships

This topic explains each of the icons on the Web Ontology Language (OWL) Toolbox pages for Ontology Definition diagrams and Ontology Facts diagrams.

Access [Diagram](#) | [Diagram Toolbox: More tools](#) | [ODM 1.0](#) | [Web Ontology Language](#)

#### OWL Elements:

Toolbox Icon	Description
<b>Ontology</b>	The OWL ontology package, which holds all the OWL modeling elements. You can export the contents of this package to produce the Ontology XML document.
<b>Class</b>	An extended UML Class that represents an OWL Class that describes an instantiable entity with properties and semantic meaning.
<b>Data Range</b>	An extended UML Enumeration that defines a collection of values for an OWL Property.
<b>Enumerated Class</b>	An extended UML Class that defines an OWL Class extension defined by any one of the range of the allowed OWL Individuals.
<b>Restriction</b>	An extended UML Class that defines an OWL Class extension as restricted by the specified property and its allowable values.
<b>Singleton</b>	An extended UML Class, representing an OWL Class for a specific OWL Individual.

#### OWL Properties (Elements):

Toolbox Icon	Description
<b>Annotation</b>	An extended UML Class, representing an OWL Annotation Property definition.
<b>Datatype Property</b>	An extended UML Class, representing an OWL Datatype Property definition.
<b>Object Property</b>	An extended UML Class, representing a semantic OWL Property definition.
<b>Ontology Property</b>	An extended UML Part, representing a property defined on the OWL Ontology.

Toolbox Icon	Description
<b>Individual</b>	An extended UML Object, representing an instance of an OWL Class which defines an individual fact.
<b>Value</b>	An extended UML Part, holding a value defined in an OWL Property or OWL Individual.

**OWL Relationships:**

Toolbox Icon	Description
<b>Imports</b>	An extended UML PackageImports, that enables an OWL ontology to reference another OWL Ontology.
<b>Domain</b>	An extended UML Association, that specifies the OWL Classes that apply the specified OWL Property (Annotation, Datatype or Object Property).
<b>Range</b>	An extended UML Association, that specifies the OWL Class with the value type applicable to the specified OWL Property (Annotation, Datatype or Object Property).
<b>Inverse Of</b>	An extended UML Association, between two opposing, but related OWL Property elements.
<b>Sub Property Of</b>	An extended UML Generalization between two OWL Property elements.
<b>Subclass Of</b>	An extended UML Generalization between two OWL Class elements.
<b>Value</b>	An extended UML Association, defining an OWL Property and value between OWL Classes.

**OWL Semantics (Relationships):**

Toolbox Icon	Description
<b>All Different</b>	An extended UML Dependency between different (ie: unique) OWL Individuals typed by the same OWL Class.

Toolbox Icon	Description
<b>Backward Compatible With</b>	An extended UML Dependency between an OWL Ontology and another that it's backward compatible with.
<b>Complement Of</b>	An extended UML Dependency between an OWL Class and its complement (or opposite).
<b>Different From</b>	An extended UML Dependency between two semantically different OWL Individuals typed by the same OWL Class.
<b>Disjoint With</b>	An extended UML Dependency between two OWL Classes that have no common individuals.
<b>Equivalent Class</b>	An extended UML Dependency between two equivalent OWL Classes.
<b>Equivalent Property</b>	An extended UML Dependency between two equivalent OWL Property elements.
<b>Incompatible With</b>	An extended UML Dependency between an OWL Ontology and another that it is incompatible with.
<b>Intersection Of</b>	An extended UML Dependency between an OWL Class and others it also specializes.
<b>Ontology Property</b>	An extended UML Dependency, representing a property defined on the OWL Ontology.
<b>Prior Version</b>	An extended UML Dependency between an OWL Ontology and its predecessor.
<b>Same As</b>	An extended UML Dependency between two semantically identical OWL Individuals typed by the same OWL Class.
<b>Union Of</b>	An extended UML Dependency between a general OWL Class and others that distinctly specialize it.

### 9.6.1.2 RDF Elements & Relationships

This topic explains each of the icons on the Resource Description Framework (RDF) pages for Resource Definition diagrams.

[Access](#) [Diagram](#) | [Diagram Toolbox: More tools](#) | [ODM 1.0](#) | [Resource Description Framework](#)

#### RDF Elements:

Toolbox Icon	Description
<b>Document</b>	The RDF Document package, which holds all the RDF modeling elements. You can export the contents of this package to produce the Resource Description XML document.
<b>Graph</b>	An extended UML Package that represents a set of RDF subject and object triples within the RDF Document.
<b>Resource</b>	An extended UML Object that represents a uniquely identifiable general resource.
<b>URI Reference Node</b>	An extended UML Object that represents a uniquely identifiable external resource.
<b>Blank Node</b>	An extended UML Object that represents a uniquely identifiable internal resource.
<b>Class</b>	An extended UML Class representing an RDF Class, which describes an instantiable resource with properties.
<b>Property</b>	An extended UML Class, representing an RDF Property definition.
<b>Global</b>	An extended UML Class, representing a global RDF Property definition.
<b>Datatype</b>	An extended UML Datatype, representing an RDF Datatype definition.
<b>Comment</b>	A UML Comment element.

#### RDF Relationships:

Toolbox Icon	Description
<b>Domain</b>	An extended UML Association that specifies the RDF Classes that apply the

Toolbox Icon	Description
	specified RDF Property.
<b>Range</b>	An extended UML Association that specifies the RDF Class with the value type applicable to the specified RDF Property.
<b>Property</b>	An extended UML Association that defines a RDF property between two RDF Classes.
<b>Global</b>	An extended UML Association that defines a global RDF property between two RDF Classes.
<b>Sub Property Of</b>	An extended UML Generalization between two RDF Property elements.
<b>Subclass Of</b>	An extended UML Generalization between two RDF Class elements.
<b>Is Defined By</b>	An extended UML Dependency between a RDF Resource and another that defines it.
<b>Reifies</b>	An extended UML Dependency between a RDF Resource and another that it reifies.
<b>See Also</b>	An extended UML Dependency between a RDF Resource and another that contains more information about it.

### 9.6.3 ODM Commands

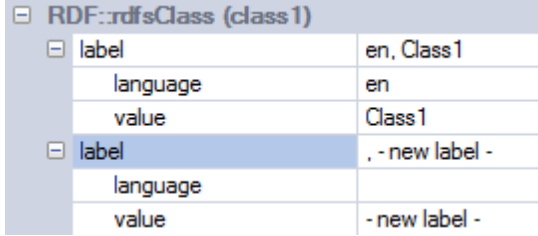

The MDG Technology for ODM provides four management commands to help you maintain your ODM models:

- **Export** OWL/RDF models as an .rdf or .xml file
- **Import** OWL or RDF content (in .owl or .rdf xml file format) as an ODM model package
- Create a new **namespace definition** for an rdfDocument or owlOntology package
- Create a new **label definition** for a valid RDF or OWL element (such as an owlClass, objectProperty, rdfClass or rdfProperty)

**Access**    **Extensions | ODM | <command>**  
**Extensions | Import | OWL/RDF**, or  
**Extensions | Publish | OWL/RDF**

#### Commands:

Command	Detail	See also																		
Export OWL/RDF	<p>In the Project Browser, select the <code>rdfDocument</code> or <code>owlOntology</code> package to export.</p> <p>Select either:</p> <ul style="list-style-type: none"><li>• <b>Extensions   ODM   Export OWL/RDF</b>, or</li><li>• <b>Extensions   Publish   OWL/RDF</b></li></ul> <p>A browser dialog displays, on which you specify the file location to export to, and the <code>.owl</code> or <code>.rdf</code> filename.</p> <p>Click on the <b>Save</b> button.</p> <p>The package content is exported to the specified file.</p>																			
Import OWL/RDF	<p>In the Project Browser, select the <code>rdfDocument</code> or <code>owlOntology</code> package into which to import the <code>.owl</code> or <code>.rdf</code> file.</p> <p>Select either:</p> <ul style="list-style-type: none"><li>• <b>Extensions   ODM   Import OWL/RDF</b>, or</li><li>• <b>Extensions   Import   OWL/RDF</b></li></ul> <p>A browser dialog displays, through which you locate and select the file to import.</p> <p>Click on the <b>Open</b> button.</p> <p>The file content is imported into the selected package.</p>																			
Define New Namespace	<p>Ensure that the <b>Show Duplicate Tags</b> checkbox is selected in the Options dialog (<b>Tools   Options   Objects</b>).</p> <p>In the Project Browser, select the RDF or OWL package to be allocated a new namespace.</p> <p>Select the <b>Extensions   ODM   Define New Namespace</b> command.</p> <p>Double-click on the selected package to display the package Properties dialog, and select the <b>RDF</b> page. Notice the additional <code>namespaceDefinition</code> tag.</p> <table><tr><td></td><td><code>namespaceDefinition</code></td><td><code>ns0, http://myontologies/newOntology</code></td></tr><tr><td></td><td><code>namespacePrefix</code></td><td><code>ns0</code></td></tr><tr><td></td><td><code>namespaceURI</code></td><td><code>http://myontologies/newOntology</code></td></tr><tr><td></td><td><code>namespaceDefinition</code></td><td><code>- new prefix -, - new URI -</code></td></tr><tr><td></td><td><code>namespacePrefix</code></td><td><code>- new prefix -</code></td></tr><tr><td></td><td><code>namespaceURI</code></td><td><code>- new URI -</code></td></tr></table> <p>Click on the <code>namespacePrefix</code> and <code>namespaceURI</code> value fields for the new namespace definition, and type in the appropriate new values.</p> <p>If necessary, click on the previous <code>namespaceDefinition</code> tag and on the  (<b>Delete</b>) icon in the RDF page toolbar.</p>		<code>namespaceDefinition</code>	<code>ns0, http://myontologies/newOntology</code>		<code>namespacePrefix</code>	<code>ns0</code>		<code>namespaceURI</code>	<code>http://myontologies/newOntology</code>		<code>namespaceDefinition</code>	<code>- new prefix -, - new URI -</code>		<code>namespacePrefix</code>	<code>- new prefix -</code>		<code>namespaceURI</code>	<code>- new URI -</code>	
	<code>namespaceDefinition</code>	<code>ns0, http://myontologies/newOntology</code>																		
	<code>namespacePrefix</code>	<code>ns0</code>																		
	<code>namespaceURI</code>	<code>http://myontologies/newOntology</code>																		
	<code>namespaceDefinition</code>	<code>- new prefix -, - new URI -</code>																		
	<code>namespacePrefix</code>	<code>- new prefix -</code>																		
	<code>namespaceURI</code>	<code>- new URI -</code>																		

Command	Detail	See also
	Click on the <b>OK</b> button.	
<b>Define New Label</b>	<p>Ensure that the <b>Show Duplicate Tags</b> checkbox is selected in the Options dialog (<b>Tools   Options   Objects</b>).</p> <p>In the Project Browser, select the RDF or OWL element to be allocated a new label.</p> <p>Select the <b>Extensions   ODM   Define New Label</b> command.</p> <p>Double-click on the selected element to display the element Properties dialog, and select the <b>RDF</b> page. Notice the additional <i>label</i> tag.</p>  <p>Click on the <b>language</b> and <b>value</b> value fields for the new label definition, and type in the appropriate new values.</p> <p>If necessary, click on the previous <i>label</i> tag and on the  (<b>Delete</b>) icon in the RDF page toolbar.</p> <p>Click on the <b>OK</b> button.</p>

## 9.7 MDG Technology For GML

MDG Technology for GML is the implementation of the Open Geospatial Consortium's **Geography Markup Language (GML) 3.3** for Enterprise Architect, which provides an XML grammar for geographical feature modeling capabilities within Enterprise Architect at or later than Release 10.

Through the MDG Technology for GML, you can:

- Apply a **UML Profile for the Geography Markup Language (GML) 3.3**
- Make use of **customized diagram types** and **toolbox pages**, for convenient access to elements and relationships to model **geographical features** effectively
- Generate **GML Application Schema** files

### \*Beta Implementation\*

This is a BETA release of the GML profile and associated tools. As such, it is supplied without warranty of any kind and is subject to change without notice during the Beta period. Sparx Systems welcomes any feedback, issues, suggestions and comments on this implementation. As with all Beta software, please take due care when using the GML profile in a production environment.

### Notes

- The MDG Technology for GML is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

### Learn more

- [UML Profile for GML](#)<sup>[1983]</sup>
- [Generate GML Application Schema](#)<sup>[1987]</sup>
- [The Open Geospatial Consortium GML Specification](#) (Online Resource)

### 9.7.1 UML Profile for GML

The MDG Technology for GML is built into the Enterprise Architect installer. A key component of the technology is the UML Profile for GML.

### Access   **Extensions | GML**

**9.7.1.1 GML Toolbox Pages**

When you begin to model GML concepts and relationships, you can represent them on a GML diagram using the elements and connectors provided in the GML Toolbox pages.

**Access** [Diagram | Diagram Toolbox: More Tools | GML](#)

GML Toolbox pagesGML Toolbox page icons

Toolbox Icon	Description
<b>Packages</b>	
<b>ApplicationSchema</b>	The GML workspace package, which holds all the GML modeling elements. You can export the contents of this package to produce the GML Application Schema.
<b>Leaf</b>	A stereotyped package that can be created under an Application Schema. <i>Leaf</i> is a convenient package for grouping elements within an Application Schema.  If the value of the tag <b>xsdDocument</b> on this package is empty, the contents of this package will be exported as a part of the parent package whose tag <b>xsdDocument</b> is <b>not</b> empty.
<b>Elements</b>	
<b>FeatureType</b>	An extended UML Class that maps to an XSD Global element, whose content model is a globally scoped XML Schema type derived by direct/indirect extension of <b>gml:AbstractFeatureType</b> .
<b>Type</b>	An extended UML Class that maps to an XSD element, whose content model is a

Toolbox Icon	Description
	globally scoped XML Schema type derived by direct/indirect extension of <b>gml:AbstractGMLType</b> .
<b>DataType</b>	An extended UML Class that maps to an XSD Global element, whose content model is a globally scoped XML Schema <b>complexType</b> .
<b>CodeList</b>	An extended UML Class, that maps to: <ul style="list-style-type: none"> <li>• A union of an enumeration and a pattern, or</li> <li>• an external Dictionary</li> </ul>
<b>Union</b>	An extended UML Class that maps to an XSD Choice group, whose members are GML objects or features, or objects corresponding to DataTypes.
<b>Enumeration</b>	An extended UML Class that is a restriction of XSD string with enumeration values.
<b>Relationships</b>	
<b>Generalization</b>	Identifies an element as a specialized descendant of another element, containing additional properties. This relationship is allowed between: <ul style="list-style-type: none"> <li>• Feature Types</li> <li>• DataTypes and Unions</li> <li>• Types</li> </ul> <p>An element can have a maximum of one Generalization connector.</p>
<b>Association</b>	Identifies the connection between two elements. Only navigable Association Ends will be mapped to GML Application Schema.
<b>Aggregation</b>	An extended UML Association that shows that an element is composed of other elements.
<b>Composition</b>	An extended UML Association that is a stronger form of Aggregation, indicating ownership of the whole over its parts.
<b>Association Class</b>	Identifies the attributed connection between two elements. Only navigable Association Ends can be mapped to GML Application Schema.
<b>Attribute</b>	

Toolbox Icon	Description
<b>Property</b>	An extended UML Attribute, whose type is either a property type (if the type is a complex type) or a simple type.
<b>Association Role</b>	
<b>Property</b>	An extended UML Association Role, whose type is always a property type.

### Notes

- In GML, **Association Class** is specific to GML 3.3; when generating GML 3.2.1 Application Schema, the Association and Class of an Association Class are treated as separate entities
- The values for tags on the «Application Schema» and «Leaf» stereotyped packages can be entered using either:
  - [The Tagged Values window](#)<sup>[1134]</sup> or
  - [The Generate GML Application Schema dialog](#)<sup>[1987]</sup>

### Learn more

- [MDG Technology For GML](#)<sup>[1983]</sup>

## 9.7.2 Generate GML Application Schema

After you have created a GML model using the built-in MDG Technology for GML, you can generate GML Application Schema from the model Package.

**Access**    **Extensions | GML | Generate GML Application Schema**

### Generate GML Application Schema

Field/Option/ Button	Action	See also
<b>Source Package</b>	Displays the name of the selected «Application Schema» stereotyped package.	
<b>Directory</b>	Type in or browse for the directory into which the application schema file is to be generated.	
<b>GML Version</b>	Click on the drop-down arrow and select the version of the GML Application Schema. Currently versions <b>3.3</b> and <b>3.2.1</b> are supported.	

Field/Option/ Button	Action	See also										
XML Encoding	Click on the drop-down arrow and select the XML encoding scheme to be used.											
Ignore Element and Property Visibility	Click on this option to include all <b>Classes</b> , <b>Attributes</b> and <b>Association End</b> roles in the GML Application Schema, irrespective of their visibility (or Scope). Otherwise, only those with <b>Public</b> visibility will be considered for generation.	(Element) <a href="#">Details</a> <sup>[959]</sup> <a href="#">General Properties of Attributes</a> <sup>[100]</sup> <a href="#">Source Role</a> <sup>[1130]</sup>										
Stylesheet	(Optional) Select an XSL stylesheet to post-process the Schema before saving it to file.  Import the required stylesheet into the project through the Resources window before selecting it in this field.	<a href="#">Resources</a> <sup>[1173]</sup>										
Application Schema(s)	Lists all the Application Schema packages under the selected source package.  Click on a package to display its details, as well as any of its child «Leaf» stereotyped package details, in the Package Details panel.  GML Application Schema will not be generated for any package in the list that is unchecked.											
Package Details	Against each of the child «Application Schema» and (optionally) «Leaf» stereotyped packages (if any), enter a filename. To do this, double-click on the package name in the list and, on the Package Details dialog, review or complete the fields: <table><tr><th>Field/Option/Button</th><th>Action</th></tr><tr><td>Package</td><td>The selected package name.</td></tr><tr><td>Stereotype</td><td>The stereotype of the selected package.</td></tr><tr><td>Filename</td><td>Optional for a «Leaf» stereotyped package.  Click on the [ ... ] button and type the name of the .x GML Application Schema is to be generated.  The filename must be in the same file path as selected field on the Generate GML Application Schema dialog.</td></tr><tr><td>Namespace</td><td>Not required for a «Leaf» stereotyped package.</td></tr></table>	Field/Option/Button	Action	Package	The selected package name.	Stereotype	The stereotype of the selected package.	Filename	Optional for a «Leaf» stereotyped package.  Click on the [ ... ] button and type the name of the .x GML Application Schema is to be generated.  The filename must be in the same file path as selected field on the Generate GML Application Schema dialog.	Namespace	Not required for a «Leaf» stereotyped package.	
Field/Option/Button	Action											
Package	The selected package name.											
Stereotype	The stereotype of the selected package.											
Filename	Optional for a «Leaf» stereotyped package.  Click on the [ ... ] button and type the name of the .x GML Application Schema is to be generated.  The filename must be in the same file path as selected field on the Generate GML Application Schema dialog.											
Namespace	Not required for a «Leaf» stereotyped package.											

Field/Option/ Button	Action	See also						
	<table><tr><th>Field/Option/Button</th><th>Action</th></tr><tr><td></td><td>Type in the namespace for the selected package.</td></tr><tr><td><b>Namespace Prefix</b></td><td>Not required for a «Leaf» stereotyped package. Type the abbreviated value that represents the Nar</td></tr></table>	Field/Option/Button	Action		Type in the namespace for the selected package.	<b>Namespace Prefix</b>	Not required for a «Leaf» stereotyped package. Type the abbreviated value that represents the Nar	
	Field/Option/Button	Action						
		Type in the namespace for the selected package.						
	<b>Namespace Prefix</b>	Not required for a «Leaf» stereotyped package. Type the abbreviated value that represents the Nar						
	<ul style="list-style-type: none"><li>• The value of the <b>Filename</b> field will be saved as the value of the tag <b>xsdDocument</b> on the package</li><li>• The value of the <b>Namespace</b> field will be saved as the value of the tag <b>targetNamespace</b> on the package</li><li>• The value of the field <b>Namespace Prefix</b> will be saved as the value of the tag <b>xmlns</b> on the package</li></ul>							
<b>Generate</b>	Generate the GML Application Schema for each of the checked packages in the Package Details panel.							
<b>View Schema</b>	Display the generated GML Application Schema for the selected package in the Package Details panel.							
<b>Close</b>	Close the Generate GML Application Schema dialog.							
<b>Help</b>	Display this Help topic.							

### Notes

- The MDG Technology for GML is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- A «CodeList» stereotyped Class with the tag **asDictionary** set to **true** will be exported as a separate XML file to the directory specified in the **Directory** field, with the filename *CodeList\_<classname>.xml* (where <classname> is the name of the «CodeList» stereotyped Class)
- Using the configurable file **GMLStereotypes.xml** in the Sparx Systems > EA > Config > GML folder, you can specify aliases for the standard GML stereotypes; the GML Application Schema Generator will also consider these aliases during Schema generation
- Association Class** is specific to **GML 3.3**; when generating **GML 3.2.1** Application Schema, the Association and Class of an Association Class are treated as separate entities

## 9.8 User Interface Models

**User Interface** diagrams are **customized** UML diagrams on which you can visually represent a system's user interface using forms, controls and labels.

**Example Diagram** [Example User Interface Diagram](#) 

### Tools

Select User Interface diagram elements and connectors from the **User Interface - Simple** pages of the Toolbox.

User Interface Diagram Elements	User Interface Diagram Connectors
 Package	 Associate
 Screen	 Aggregate
 UI Control	 Generalize
 Object	 Realize

### Notes

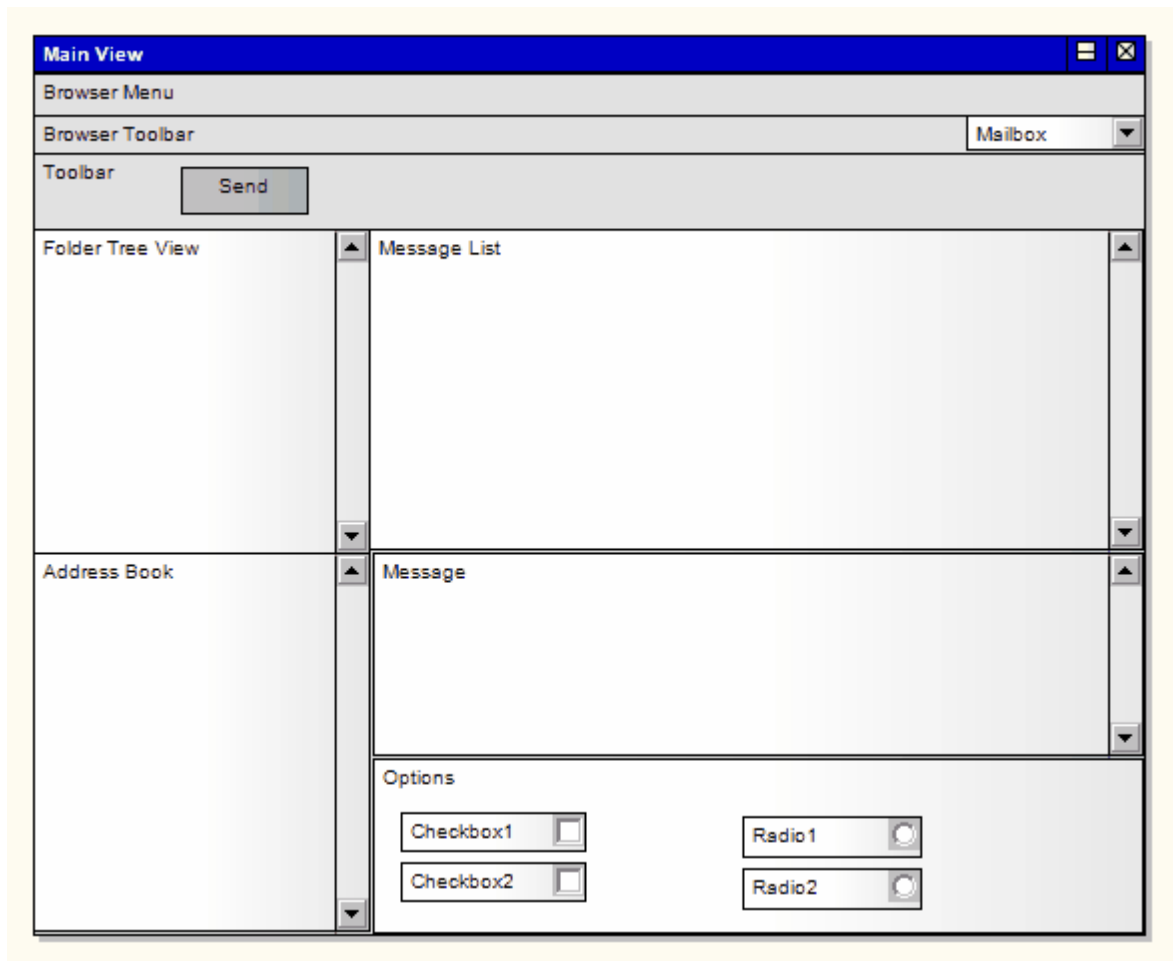

- Using stereotyped Classes, you can model the design of a web page user interface
- The Enterprise Architect Professional, Corporate and Suite editions also include the **MDG Win32 UI Technology**, with which you can design user interface components that render more precisely as Win32® User Interface elements

### Learn more

- [Web Stereotypes](#) 
- [Win32 UI Technology](#) 

### 9.8.1 Example User Interface Diagram

In this example User Interface diagram, forms, controls and labels are arranged on the diagram to define the appearance of a user interface screen and controls. UI Control elements can also be traced to other model elements linking the UI with the underlying implementation.

#### Learn more

- [Screen](#) [1991]
- [UI Control Elements](#) [1992]

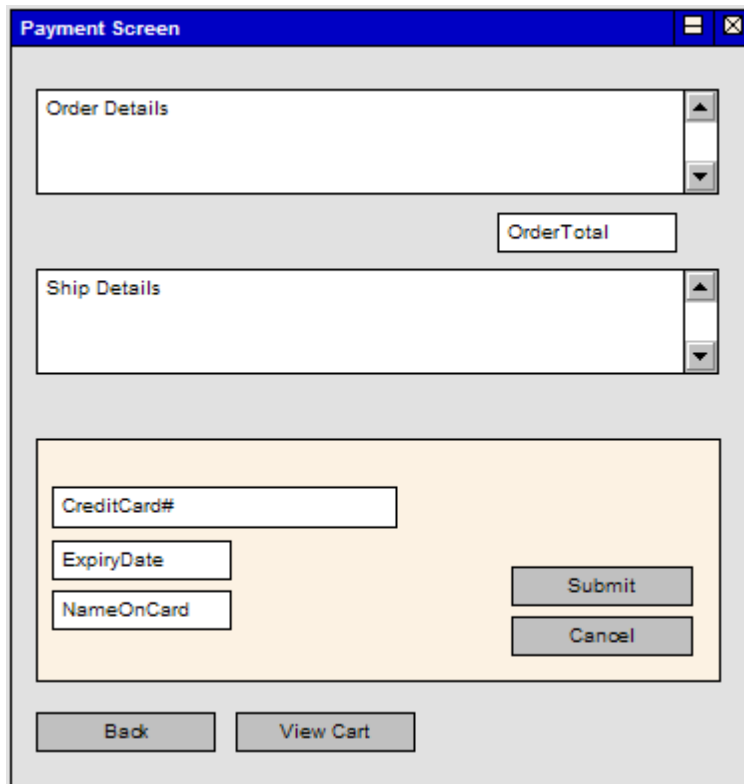

### 9.8.2 Screen

A **Screen** is used to prototype User Interface screen flow. By using UML features such as requirements, constraints and scenarios against User Interface diagram elements, you can build up a solid and detailed understanding of user interface behavior without having to use code. This provides an excellent means of establishing the precise behavior of the system from a user's perspective, and in conjunction with the Use Case model, defines exactly how a user gets work done.

Web pages can also be prototyped and specified rigorously using Enterprise Architect's custom interface extensions.

#### Example

This example diagram illustrates some features of Enterprise Architect's screen modeling extensions that support web page prototyping. By adding requirements, rules, scenarios and notes to each element, a detailed model is built up of the form or web page, without having to resort to GUI builders or HTML.

Enterprise Architect displays UI Controls as a range of special icons, depending on the stereotype used; for example, a Control stereotyped as a «list» displays with a vertical scroll bar.

#### Toolbox icon

#### Learn more

- [User Interface Models](#) <sup>[1990]</sup>
- [UI Controls](#) <sup>[1992]</sup>

### 9.8.3 UI Control Elements

A **UI Control** element represents a user interface control element (such as an edit box). It is used for capturing the components of a screen layout and requirements in a Custom or User Interface diagram.

There are a number of UI Control elements available in the User Interface page of the Toolbox. These include:

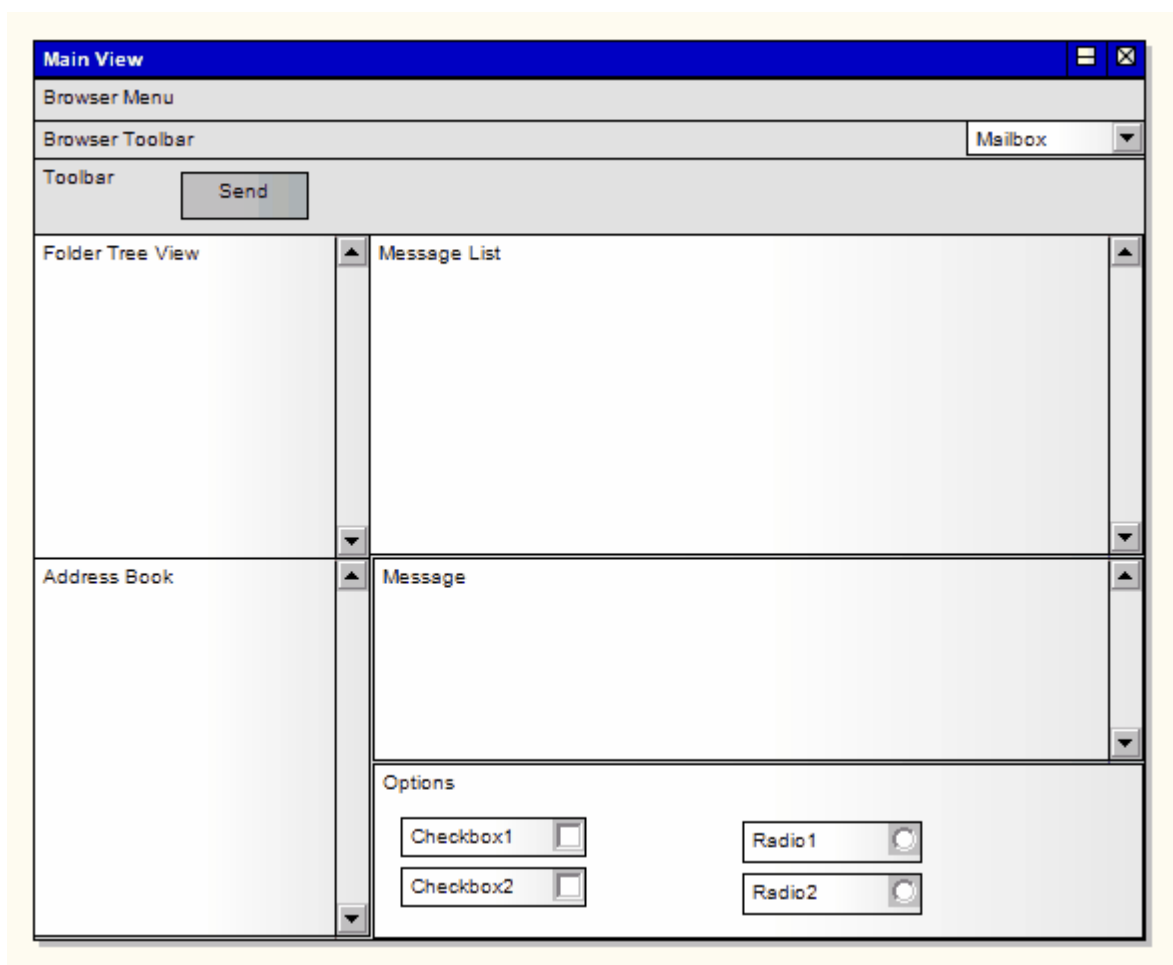

- List
- Table

- Text Box
- Label
- Form
- Panel
- Button
- Combobox
- Checkbox
- Checkbox (left hand side)
- Radio button
- Radio button (left hand side)
- Vertical Line
- Horizontal Line

### Example

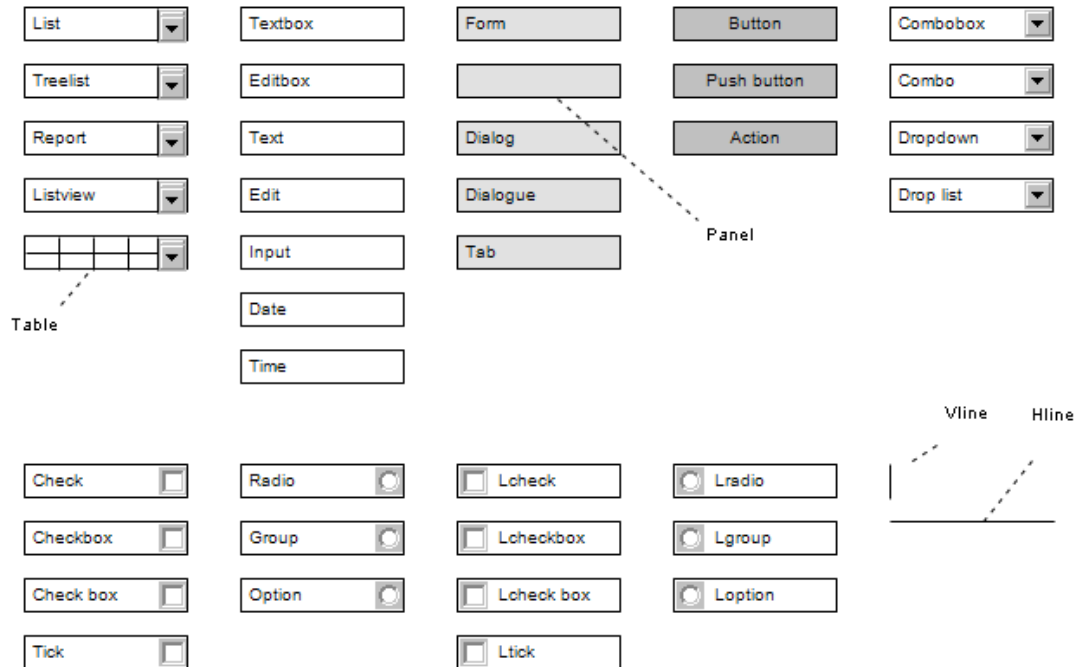

The icons can be combined on a Screen icon to represent the appearance of a user interface screen, as shown:

You can also extend the available icons by selecting other stereotypes in the UI Control Element Properties

dialog. The full set of available stereotypes is shown below; type or select the text in the **Stereotype** field to create the corresponding icon.

#### ui User Interface

#### Toolbox icon

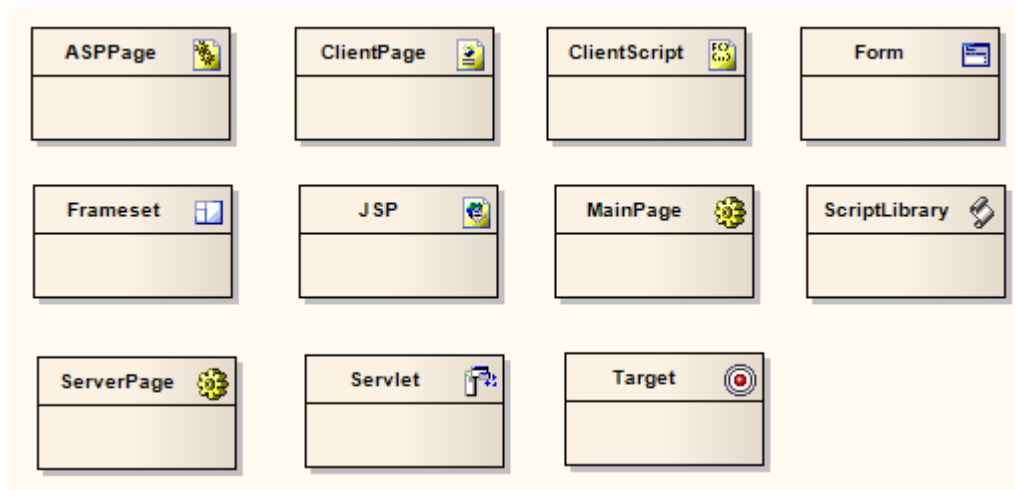

(where **UI Control** is the name of the user interface element type)

#### Learn more

- [User Interface Models](#)<sup>[1990]</sup>
- [Screen](#)<sup>[1991]</sup>

### 9.8.4 Web Stereotypes

Enterprise Architect supports a number of stereotypes for web page modeling, the graphical elements for which display with a **graphical icon** instead of the usual «*stereotype*» format. These stereotypes are only supported for Class elements. These are the various graphical icons and their associated stereotypes:

A similar set of web modeling elements and their relationships are also available through dedicated Web Modeling pages in the Diagram Toolbox.

#### To set a web icon

Step	Action
1	Create a new Class element in a diagram.
2	Display the Class Properties dialog.
3	In the <b>Stereotype</b> field, either type in the required stereotype name or click on the drop-down arrow and select the required stereotype (as named above).
4	Click on the <b>OK</b> button. The Class displays as in one of the examples shown.

#### Learn more

- [User Interface Models](#)<sup>[1990]</sup>
- [Diagram Toolbox](#)<sup>[792]</sup>

### 9.8.5 Win32 UI Technology

Using the **MDG Win32 UI Technology**, you can design user interface screens that render as Win32® user interface elements, so that you can create and maintain User Interface diagrams in the Win32® User Interface format.

**Access** The Win32 UI facilities are provided in the form of:

- A Win32 User Interface diagram type, accessed through the New Diagram dialog
- Win32 User Interface pages in the Toolbox
- Win32 User Interface element and relationship entries in the Toolbox Shortcut menu and Quick Linker

#### Win32 User Interface Toolbox Pages

You can access the Win32 User Interface Toolbox pages through the **Diagram | Diagram Toolbox: More tools... User Interface - Win32** option.

You can also set Win32® User Interface Modeling as the active default technology to access the Toolbox pages directly.

#### Disable Win32 User Interface Technology

If you prefer not to use the Win32® UI Technology in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

#### Notes

- The MDG Win32® User Interface Technology is available in the Enterprise Architect Professional, Corporate and Suite editions
- When you initially drag the **Combo Box** icon onto a diagram, of **Type Drop Down** or **Drop Down List**, the middle 'tracking handle' on each side of the element is white, indicating that you can only adjust the **width** of the element

To adjust the **height** of the element as well as the width, click on the drop-down arrow part of the image; the middle 'tracking handle' on the bottom edge is now white, indicating that you can drag the base down to set the **virtual** height (the height of the element when it is expanded to show all possible values in the drop-down list)

#### Learn more

- [Web Stereotypes](#) <sup>[1995]</sup>

### Learn more

- [UML Stereotypes](#) <sup>[1452]</sup>

### 9.9.1 Boundary

#### Description

A Boundary is a stereotyped Object that models some system boundary, typically a user interface screen. You can also create a Boundary as a stereotyped Class. Boundary elements are used in analysis to capture user interactions, screen flows and element interactions (or 'collaborations').

A Boundary is used in the conceptual phase to capture users interacting with the system at a screen level (or some other boundary interface type). It is often used in Sequence and Robustness (Analysis) diagrams. It is the View in the Model-View-Controller pattern.

Toolbox iconLearn more

- [Create a Boundary](#) <sup>[1998]</sup>
- [Analysis Stereotypes](#) <sup>[1800]</sup>
- [Sequence Diagram](#) <sup>[1249]</sup>
- [Communication Diagram](#) <sup>[1259]</sup>
- [Object Diagram](#) <sup>[1186]</sup>
- [Analysis Diagram](#) <sup>[1801]</sup>

**9.9.1.1 Create a Boundary**Create a Boundary element on a diagram as an Object

Step	Action
1	In the Toolbox, select the <b>More tools   Extended   Analysis</b> menu option.
2	From the Analysis Elements page, drag the Boundary element onto the diagram.

Create a Boundary element as a stereotyped Class

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the <b>Properties</b> context menu option; the Properties dialog displays.
3	In the <b>Stereotype</b> field, type the value <b>boundary</b> .
4	Click on the <b>Apply</b> and <b>OK</b> buttons.
5	Save the diagram ( <b>Ctrl+S</b> ).

## 9.9.2 Control

### Description

A Control is a stereotyped Object that models a controlling entity or manager. A Control organizes and schedules other activities and elements, typically in Analysis (including Robustness), Sequence and Communication diagrams. It is the controller of the Model-View-Controller pattern.

You can also create a Control as a stereotyped Class.

### Toolbox icon

### Learn more

- [Create a Control Element](#) <sup>[1999]</sup>
- [Analysis Stereotypes](#) <sup>[1800]</sup>
  - [Sequence Diagram](#) <sup>[1249]</sup>
  - [Communication Diagram](#) <sup>[1259]</sup>
  - [Object Diagram](#) <sup>[1186]</sup>
  - [Analysis Diagram](#) <sup>[1801]</sup>

### 9.9.2.1 Create a Control Element

#### How to

To create a Control element on a diagram as an Object, follow the steps below

Step	Action
1	In the Toolbox, select the <b>More tools   Analysis</b> menu option.
2	From the Analysis Elements page, drag the Control element onto the diagram.

To create a Control element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the <b>Properties</b> context menu option. The Properties dialog displays.
3	In the <b>Stereotype</b> field, type the value <b>control</b> .
4	Click on the <b>Apply</b> and <b>OK</b> buttons.
5	Save the diagram ( <b>Ctrl+S</b> ).

### 9.9.3 Entity

#### Description

An Entity is a stereotyped Object that models a store or persistence mechanism that captures the information or knowledge in a system. It is the Model in the Model-View-Controller pattern.

You can also create an Entity as a stereotyped Class. See the *Create an Entity* topic.

#### Toolbox icon

#### Learn more

- [Create an Entity](#) <sup>[2001]</sup>
- [Analysis Stereotypes](#) <sup>[1800]</sup>
- [Sequence Diagram](#) <sup>[1249]</sup>
- [Communication Diagram](#) <sup>[1259]</sup>
- [Object Diagram](#) <sup>[1186]</sup>
- [Analysis Diagram](#) <sup>[1801]</sup>

### 9.9.3.1 Create an Entity

#### How to

To create an Entity element on a diagram as an Object

Step	Action
1	In the Toolbox, select the <b>More tools   Analysis</b> menu option.
2	From the Analysis Elements page, drag the <i>Entity</i> element onto the diagram.

To create an Entity element as a stereotyped Class, using the Class Properties dialog

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the <b>Properties</b> context menu option; the Properties dialog displays.
3	In the <b>Stereotype</b> field, type the value <b>entity</b> .
4	Click on the <b>Apply</b> and <b>OK</b> buttons.
5	Save the diagram ( <b>Ctrl+S</b> ).

### 9.9.4 Event

#### Description

Two elements are used to model *Events*; the:

- *Send Event* which models the generation of a stimulus in the system and the passing of that stimulus to other elements, either within the system or external to the system

- *Receive Event*, depicted as a rectangle with a recessed 'V' on the left side, which indicates that an event occurs in the system due to some external or internal stimulus; typically this invokes further activities and processing

Send and Receive Events can be added from the Analysis, State and Activity Element pages of the Toolbox.

If you should select the wrong type of event, or otherwise want to change the type, right-click on the Event and select the **Advanced | Make Sender** or **Advanced | Make Receiver** context menu option, as appropriate.

#### Toolbox icon

#### Learn more

- [Analysis Toolbox](#)<sup>[812]</sup>
- [State Toolbox](#)<sup>[807]</sup>
- [Activity Toolbox](#)<sup>[808]</sup>

## 9.9.5 Hyperlinks

### Description

You can place a *Hyperlink* element onto a diagram. This element is a type of text element, but one that can contain a pointer to a range of objects such as associated document files, web pages, Help, model features and even other Enterprise Architect model files. When you double-click on the element, Enterprise Architect executes the link.

To add a Hyperlink element, drag the Hyperlink icon from the Common page of the Toolbox onto the diagram.

(Alternatively, click on the **Hyperlink** icon in the UML Elements toolbar and then click on the diagram.)

### Configure the Hyperlink

When you add the Hyperlink to the diagram, the Hyperlink Details dialog displays. If you want to display the information in a more readable layout, you can resize the dialog.

You first select the type of object to link to; click on the drop-down arrow in the **Type** field and select a type. The Hyperlink Details dialog then displays the appropriate fields, prompts or dialog to enable you to specify the object to link to. For example, if you intend to hyperlink to:

- An attribute, the Set Attribute dialog displays to enable you to select that attribute

- A file, the **Action** field displays to enable you to specify whether to Open the file in read only mode, or Edit the file; in either case the file is opened within Enterprise Architect if possible or, if not possible, with the Windows default viewer/editor for the file type

For example, if you hyperlink to a .rtf file, you can *view* it in whichever viewer is appropriate; however, you cannot *edit* .rtf files in Enterprise Architect, so the file always opens in the *Windows* default .rtf editor

- A diagram, the Select a Diagram dialog displays, which enables you to select the diagram from anywhere in the project; you can filter the selection to diagrams of certain types

In most cases you define the location of the hyperlinked object in the **Address** field, either by overtyping the field or by clicking on the ( ... ) (Browse) button. You can use full paths or local (path substitution) paths.

If you select **EA Command** as the link type, the **Address** field is replaced by a drop-down list of Enterprise Architect commands. You can select **LocalPath** and click on the ( ... ) (Browse) button to display the Local Paths dialog, which you complete as required. Subsequently, when you click on the hyperlink the Local Paths dialog immediately displays and you can apply, switch, expand or update the current path.

If you select to link to a **Learning Center** topic, you define the link through two drop-down lists; the first to specify the Learning Center **category** and the second to specify the Learning Center **page** or **topic**.

In the **Alias** field, type the text to display in the hyperlink. If you do not provide an alias, either the text defaults to the link itself, or (for certain link targets such as a matrix profile) the dialog generates a simple text instruction.

If you prefer to display only the hyperlink text, without the icon, select the **Hide Icon** checkbox.

### Notes

- If required, you can create a number of empty hyperlinks to complete later; if you then double-click on an empty hyperlink, the Hyperlink Details dialog displays and you can enter the details
- Once you have created the hyperlink, you can also edit the hyperlink text by clicking once on the field and once on the text, then right-clicking and selecting the **Edit Selected** context menu option
- You can add notes to the hyperlink, which display in the Hyperlink Details dialog when you right-click on the hyperlink and select the **Properties** context menu option; you can format these notes using the Notes toolbar

### Learn more

- [Hyperlinks to Files](#)<sup>[2004]</sup>
- [Hyperlinks to Scripts](#)<sup>[2004]</sup>
- [Add Action as a Hyperlink](#)<sup>[2004]</sup>
- [Hyperlinks between Diagrams](#)<sup>[2005]</sup>
- [Notes Toolbar](#)<sup>[1143]</sup> (to create hyperlinks in Notes text)
- [Hyperlink From Linked Document](#)<sup>[1095]</sup>
- [Insert Reference Links](#)<sup>[1083]</sup> (to create hyperlinks in document Reports)
- [Add Object Links](#)<sup>[359]</sup> (to create hyperlinks in Team Review posts)

### 9.9.5.1 Hyperlinks To Files

To create a hyperlink on a diagram to an external file, simply click on the file in a file list (such as Windows Explorer) or on your Desktop and drag it onto the diagram.

A short context menu displays with two options - **Hyperlink** and **Artifact**. Click on the **Hyperlink** option to create the hyperlink on the diagram.

The link is effective immediately, and you can right-click on it to add or change properties as necessary.

Files of most types - including .sql and .ddl - are opened within the appropriate Enterprise Architect code editor.

#### Learn more

- [Hyperlinks](#) 

### 9.9.5.2 Script Hyperlinks

You can create a hyperlink on a diagram to execute a script. Simply drag the required script from the [Execution Analyzer](#)  window onto the diagram. A context menu displays, from which you select whether the script to be executed is a Build, Test, Run, Debug or Deploy script. The hyperlink is effective immediately; when you click on it, the script executes.

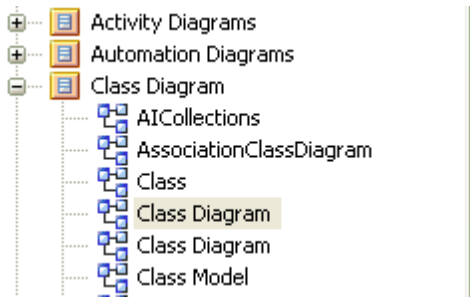

### 9.9.5.3 Add Action As Hyperlink

#### Create an Action element to represent a hyperlink

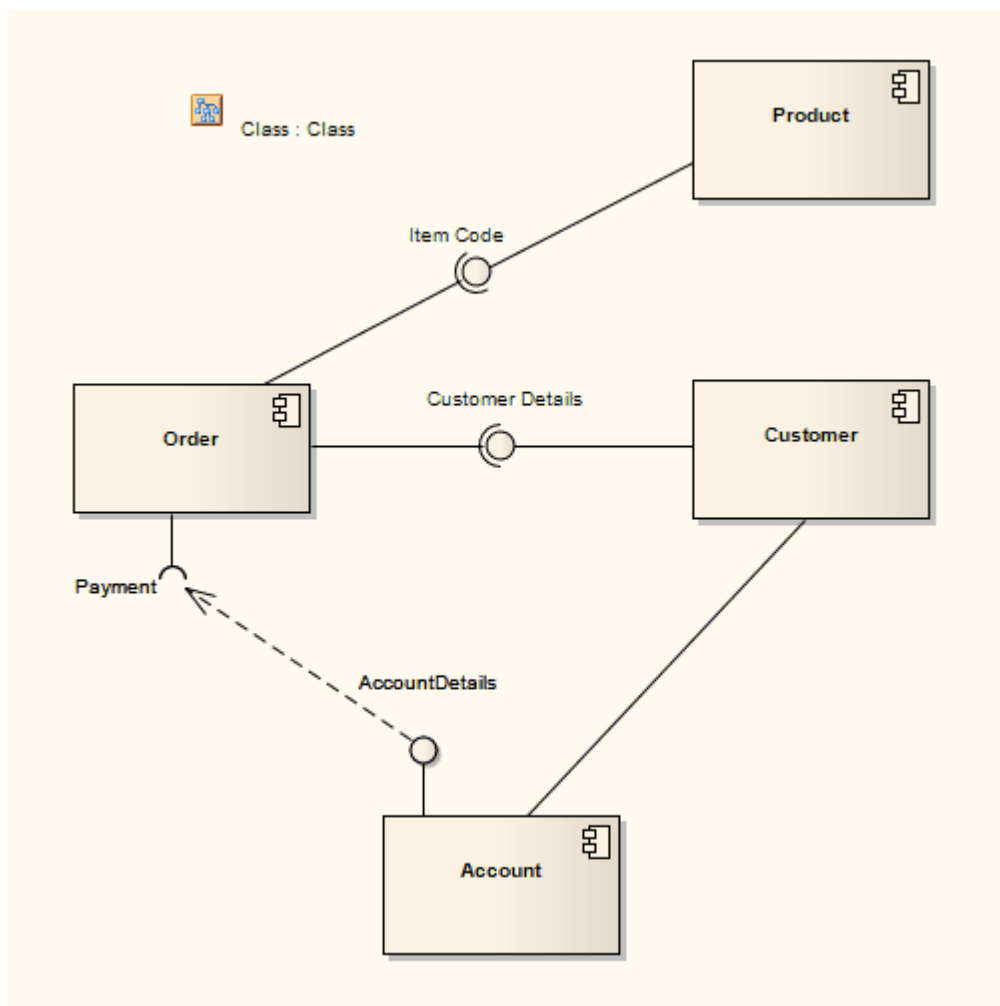

Step	Action
1	Drag an Action element from the Activity page of the Toolbox onto the diagram. A context menu immediately displays.
2	Select the <b>Other</b> menu option. The New Action dialog displays, with the <b>Other</b> radio button selected.
3	Click on the drop down arrow on the field in the Select Kind panel, and click on the <b>Hyperlink</b> option.
4	Click on the <b>OK</b> button. The <i>Hyperlink Action</i> element displays on the diagram.
5	Right click on the element and select the <b>Advanced   Set Hyperlink</b> menu option. The Hyperlink Details dialog displays.
6	<a href="#">Set the hyperlink's properties</a> 

### 9.9.5.4 Hyperlinks Between Diagrams

#### Create a hyperlink between diagrams

Step	Action
1	<p>Open the diagram in which to display the hyperlink to another diagram.</p> <p>From the Project Browser select the diagram you want to create a hyperlink to:</p> 
2	<p>Drag the diagram on to the current diagram.</p> <p>The Select Type dialog displays.</p>
3	<p>Select the <b>Hyperlink</b> option and click on the <b>OK</b> button.</p> <p>The final hyperlinked diagram should resemble the diagram below, where the Class diagram is the diagram to which the Product Order diagram hyperlinks (notice that the hyperlink icon is different).</p>

#### Example

#### Notes

- If the hyperlink appears as a Sub Activity, select the **Tools | Options | Diagram | Behavior** menu option and deselect the **Use Automatic SubActivities** checkbox

### 9.9.6 Image

#### Description

An *Image* is a System Boundary element that automatically displays first the Boundary Properties dialog and then the Select Alternate Image dialog to change its representation to an imported image. You can use it as

an icon for an element or group of elements, or as a diagram background.

Image elements are available from the Common page of the Toolbox.

#### Toolbox icon

#### Learn more

- [System Boundary](#)<sup>[1347]</sup>

### 9.9.7 N-Ary Association

#### Description

An *n-Ary Association* element is used to model complex relationships between three or more elements, typically in a Class diagram. It is not a commonly-employed device, but can be used to good effect where there is a dependant relationship between several elements. It is generally used with the Association connector, but the relationships can include other types of connector.

In the example above there is a relationship between a *Company*, an *Employee* and a *Salary*.

#### Toolbox icon

#### Learn more

- [Class Diagram](#) [1184]
- [Association](#) [1393]

### 9.9.8 Process

#### Description

A Process is an Activity element with the stereotype *process*, which expresses the concept of a business process. Typically this involves inputs, outputs, work flows, goals and connections with other Processes. The Process element is typically used in Analysis diagrams.

Business processes typically range across many parts of the organization and span one or more systems.

#### Toolbox icon

#### Learn more

- [Analysis diagram](#) [1801]

### 9.9.9 Packaging Component

#### Description

A *Packaging Component* is an element that appears very similar to a Component in a diagram but behaves as a Package in the Project Browser (that is, it can be version controlled and can contain other Packages and elements). It is typically used in Component diagrams.

In the Project Browser, the three elements display as shown below:

The Component element cannot contain child Packages or Packaging Components.

#### Toolbox icon

#### Learn more

- [Component diagrams](#)<sup>[1194]</sup>
- [Component](#)<sup>[1370]</sup>
- [Package](#)<sup>[1382]</sup>

### 9.9.10 Risk

#### Description

A Risk is defined as the effect of uncertainty on objectives. In Project Management, it is necessary to try to identify risks and assess:

- The likelihood that they have a negative effect on a project and
- How large that effect is likely to be

Those risks with a high probability of occurrence and/or a large impact on the project can be mitigated.

A Risk Management process might consist of the following five steps:

1. Identify risks and represent each with a Risk element.
2. Identify which elements (such as Components, Use Cases or Features) are vulnerable to each risk; you might decide to create «trace» dependencies from these elements to the Risk elements.
3. Assess the likelihood and magnitude of the risks.
4. Identify ways to mitigate the risks.

5. Prioritize the risk reduction measures based on their likelihood, magnitude and ease of mitigation.

Risk *elements* are not the same as the risks that you assign *to* an element through the Project Management window. Such risks are internal to the selected element, whilst a Risk element can be associated with a number of elements, either in a logical group or totally separate.

Risk elements are available from the Requirements page of the Toolbox.

#### Notes

- Risk elements can be displayed with or without an identifying **R** in the top right corner of the element; to toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page

#### Toolbox icon

### 9.9.11 Task

#### Description

A Task element represents a task that must be performed in relation to an element. The Task element enables you to assign resources to the task itself, rather than just to the parent element.

You can create a hierarchy or tree structure of Task elements to break a large task into separate parts and assign different resources to each part.

#### Toolbox icon

#### Learn more

- [Resource Management](#)<sup>512</sup>

### 9.9.12 Test Case

### Description

A *Test Case* is a stereotyped Use Case element. You might use it to extend the facilities of the Testing window, by applying element properties and capabilities to the tests of a feature represented by another element or - more appropriately - set of elements. That is, you can define in one go - in the Testing window for the Test Case element - the details of the tests that apply to each of several elements, instead of recording the details separately in each element.

Within the Test Case element properties you can define test requirements and constraints, and associate the test with test files. You can also link the element to Document Artifacts or (in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions) directly to linked documents, such as a Test Plan.

The Test Case element enables you to give greater visibility to tests, in the Project Browser, Diagram List, Package Browser, Model Search, Relationship Matrix, Traceability window and reports.

The Test Case element is available through the Use Case and Maintenance pages of the Toolbox.

## 10 Model Transformation

**Model Driven Architecture (MDA) Transformations** provide a fully configurable method of converting model elements and model fragments from one domain to another. This typically involves converting **Platform-Independent Model (PIM)** elements to **Platform-Specific Model (PSM)** elements. You can transform a single element from the PIM into **multiple** PSM elements across multiple domains.

Transformations are a huge productivity boost, and reduce the necessity of manually implementing stock Classes and elements for a particular implementation domain; for example, database tables generated from persistent PIM Classes. For a further productivity boost, Enterprise Architect can automatically generate code for your transformed Classes that target code languages.

### Ready-built Transformations

The Enterprise Architect installer includes a number of basic **built-in** transformations, including:

- PIM to:
  - C#
  - C++
  - DDL table elements
  - EJB Entity Bean
  - EJB Session Bean
  - Java
  - PHP
  - VB.Net
  - XSD
- Data Model to Entity Relationship Diagram (ERD)
- Entity Relationship Diagram (ERD) to Data Model
- Sequence diagram to Communication diagram
- Communication diagram to Sequence diagram
- Java Model to JUnit test model
- .NET model to NUnit test model
- WSDL interface model to WSDL

Further transformations will become available over time, either built in or as downloadable modules from the Sparx Systems website.

### Customized Transformations

You can **modify** the built-in transformations or **define your own**, using Enterprise Architect's simple code generation template language. This involves little more than writing templates to create a simple **intermediary source** file; the system reads the source file and binds that to the new PSM.

### Transformation Dependencies

When you execute a transformation, the system creates internal bindings (**Transformation Dependencies**) between each PSM created and the original PIM. This is essential, providing the ability to forward

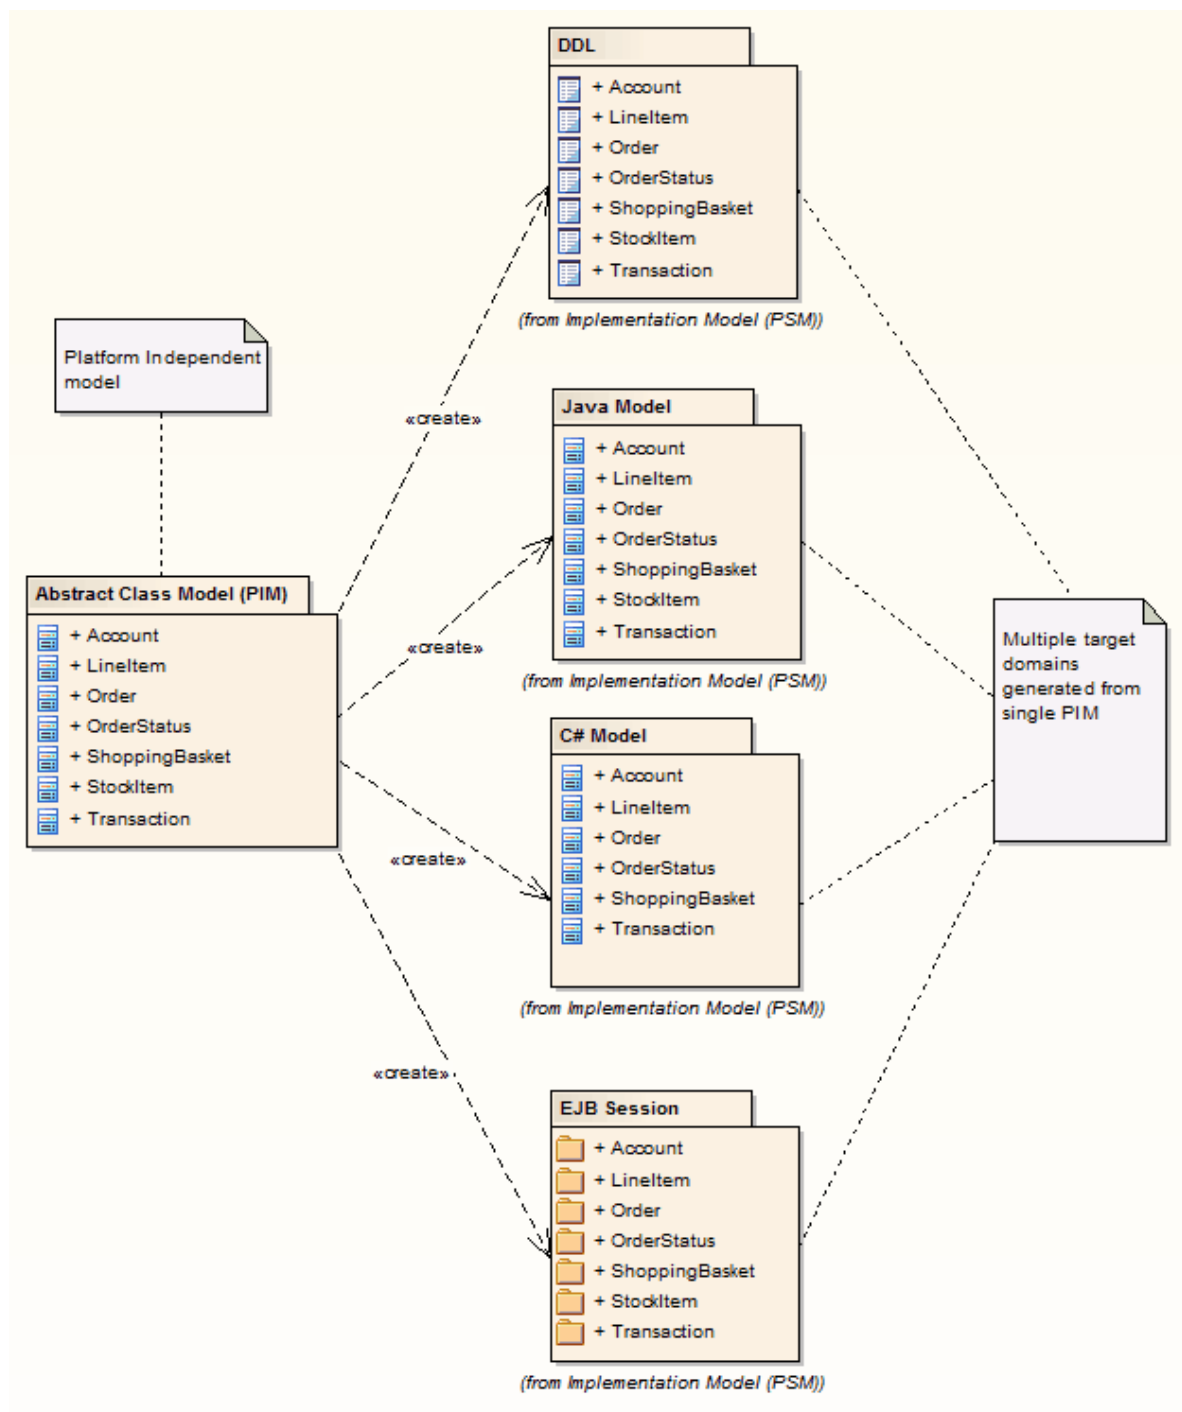

synchronize from the PIM to the PSM many times, adding or deleting features as you go; for example, adding a new attribute to a PIM Class can be forward synchronized to a new column in the Data Model.

You can observe the Transformation Dependencies for a package using the Traceability window, to check the impact of changes to a PIM element on the corresponding elements in each generated PSM, or to verify where a change required in a PSM should be initiated in the PIM (and also to reflect back in other PSMs). The Transformation Dependencies are a valuable tool in managing the traceability of your models.

Enterprise Architect does not delete or overwrite any element features that were not originally generated by the transform; therefore, you can add **new** methods to your elements, and Enterprise Architect does not act on them during the forward generation process.

### **Example of a Transformation**

This diagram highlights how transformations work and how they can significantly boost your productivity.

### Notes

- If you are using the Corporate, Business and Software Engineering, System Engineering or Ultimate edition, if security is enabled you must have **Transform Package** access permission to perform an MDA Transformation on the elements of a package

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Enterprise Architect | Model Transformations**

## 10.1 Transform Elements

When you perform a Model Transformation of elements of any kind, you can initiate the transformation either from a diagram or from a Package.

### Access

Transform selected elements on a diagram:

**Tools | Model Transformation (MDA) | Transform Selected Elements**, or  
**On diagram | Class context menu | Advanced | Transform (Ctrl+H)**

Transform all elements in the Package currently selected in the Project Browser:

**Tools | Model Transformation (MDA) | Transform Current Package**, or  
**Project Browser package context menu | Advanced | Transform Package (Ctrl+Shift+H)**

### Perform a Transformation

Field/Option/Button	Action	See also
<b>Elements</b>	Lists all of the individual elements selected in the diagram or held in the Package. Either: <ul style="list-style-type: none"> <li>Click on an element to include just that element in the transformation</li> <li>Hold <b>Ctrl</b> and click on several separate elements to include them in the transformation, or</li> <li>Hold <b>Shift</b> and click on the first and last elements in a block to include those elements in the transformation</li> </ul>	
<b>All</b>	Click on this button to select all of the elements in the list to include them in the transformation.	
<b>None</b>	Click on this button to deselect all of the elements in the list.	
<b>Include child packages</b>	(If you have selected to transform elements in a <b>Package</b> .) Select this checkbox to include (in the <b>Elements</b> list and potentially in the transformation) elements from the child Packages of the selected Package.	
<b>Transformations</b>	Select the checkbox against each type of transformation to perform. When you select a checkbox, the Browse Project dialog displays; locate and select the target Package into which to generate the transformed elements.  If you want to change a selected target Package, click on the ( ... ) button to the right of the Package name and select the new Package	

Field/Option/ Button	Action	See also
	from the dialog.	
<b>Generate Code on result</b>	Select this checkbox to specify whether or not to <b>automatically</b> generate code for transformed Classes that target code languages.  If you select this option, the first time you transform to the Class the system prompts you to select a filename to generate code into; subsequent transformations automatically generate code to that filename.	
<b>Perform Transformations on result</b>	Select the checkbox to automatically execute transformations <b>previously</b> done on the target Class or Classes.	<a href="#">Chaining Transformations</a> <sup>[2019]</sup>
<b>Intermediary File</b>	If you want to capture the intermediary language file (for example, to debug it), either type in the file path and name or click on the browse button ( ... ) and locate and select the file.	
<b>Write Always</b>	Select this checkbox to always write the intermediary file to disk.	<a href="#">Intermediary Language</a> <sup>[2053]</sup>  <a href="#">Intermediary Language Debugging</a> <sup>[2053]</sup>
<b>Write Now</b>	Click on this button to generate the intermediary file without performing the full transformation.	
<b>Do Transform</b>	Click on this button to execute the transformation.  When the transformation is complete, the Model Transformation dialog closes.	
<b>Close</b>	Click on this button to close the Model Transformation dialog without performing the transformation.	

**Notes**

- When the dialog displays, all elements are selected and all transformations previously performed from any of these Classes are checked
- This procedure does not apply to the Sequence diagram/Communication diagram transformation, or the Communication diagram/Sequence diagram transformation

**Learn more**

- [Sequence/Communication Diagram Transformations](#) <sup>[2041]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Model Transformations | Transform | Transform Elements**
- (Alt+F1) | **Enterprise Architect | Model Transformations | Transform | Transform Packages**

## **10.1.1 Chaining Transformations**

Chaining transformations provides an extra degree of flexibility and power to performing transformations. For example, if two transformations have a common element; you might separate this element out into its own transformation, and then perform the original transformations from the common point. The separated transform could even produce a useful model itself.

You can chain transformations by setting the **Perform Transformations on result** checkbox in the Model Transformation dialog, so that transformations that have already been performed on target Classes are executed **automatically** next time that Class is transformed to.

### Learn more

- [Transform Elements](#)  2017

## 10.2 Built-in Transformations

Enterprise Architect provides a number of built-in transformations that are designed to be of value to as wide a range of users as possible, to act as a base that you can tailor to the specifics of your custom domain, and to serve as examples of how to write transformations.

### 10.2.1 C# Transformation

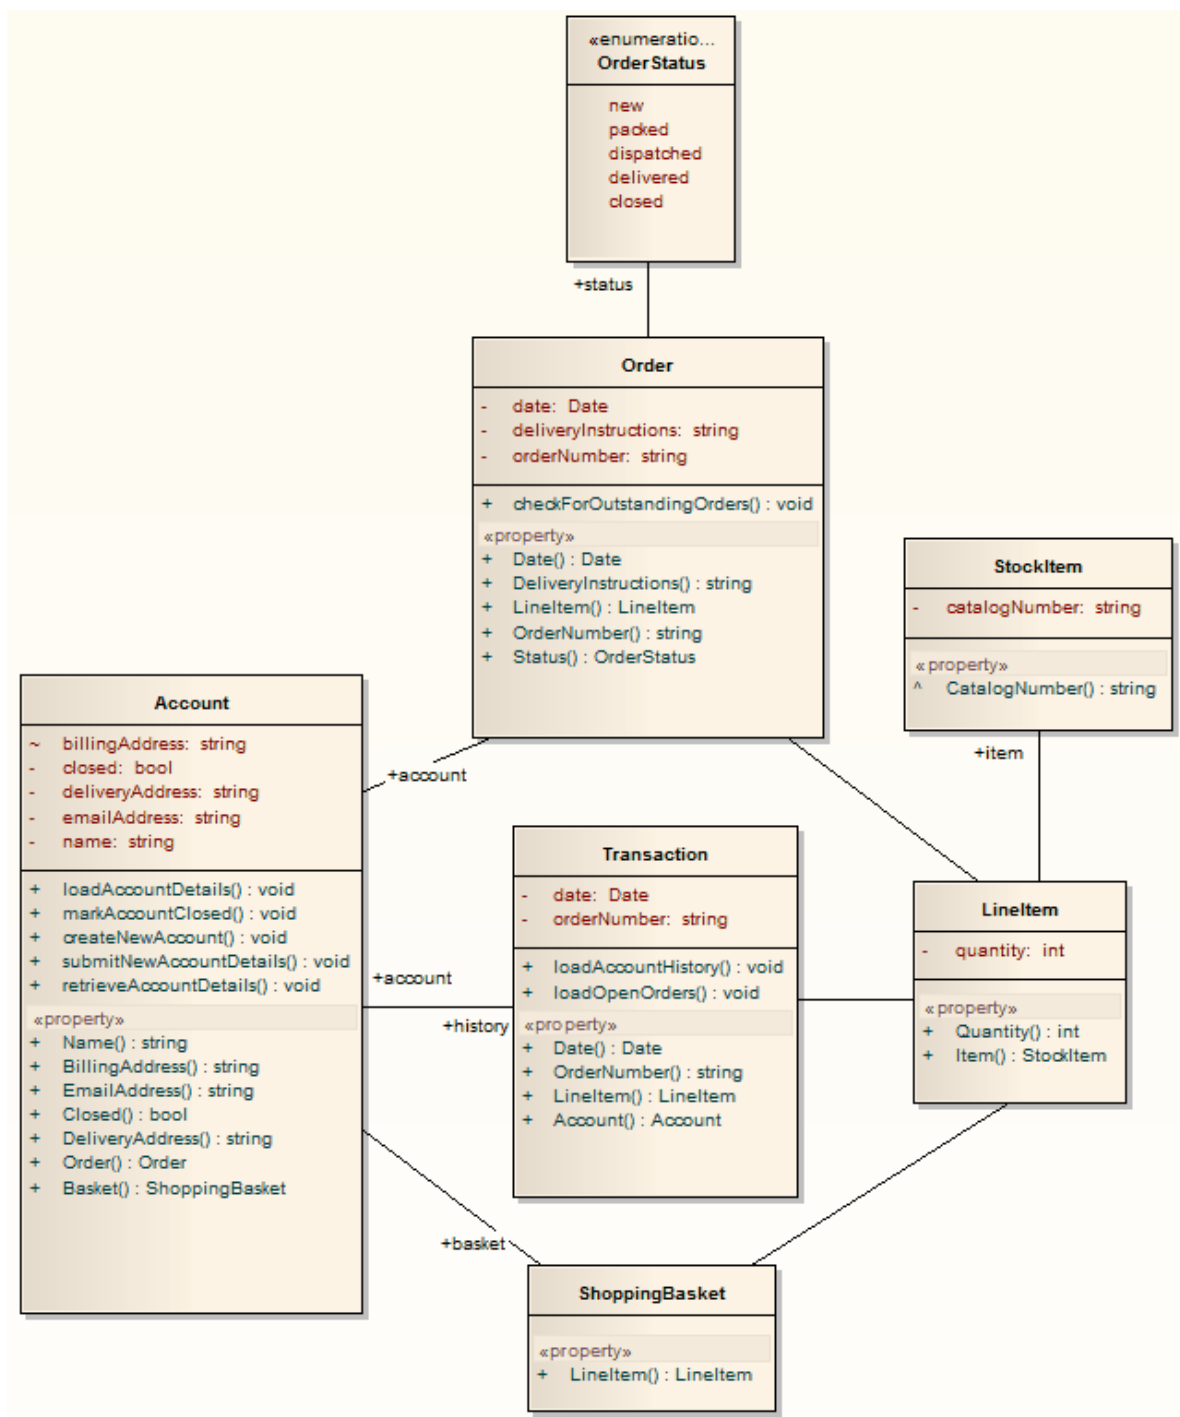

The **C#** transformation converts Platform-Independent Model (PIM) element types to C#-specific Class element types, and creates encapsulation according to the system options you have set for creating properties from C# attributes (on the C# Specifications page of the Options dialog).

#### Example

#### The PIM elements

After transformation, become the PSM elements

### Learn more

- [C# Options Page](#) <sup>2268</sup>

## 10.2.2 C++ Transformation

The **C++** transformation converts Platform-Independent Model (PIM) element types to C++ specific Class element types and creates encapsulation (producing the getters and setters) according to the options you have set for creating properties from C++ attributes (on the C++ Specifications page of the Options dialog). Note that the **public** attributes in the PIM are converted to **private** attributes in the PSM. All operations on an

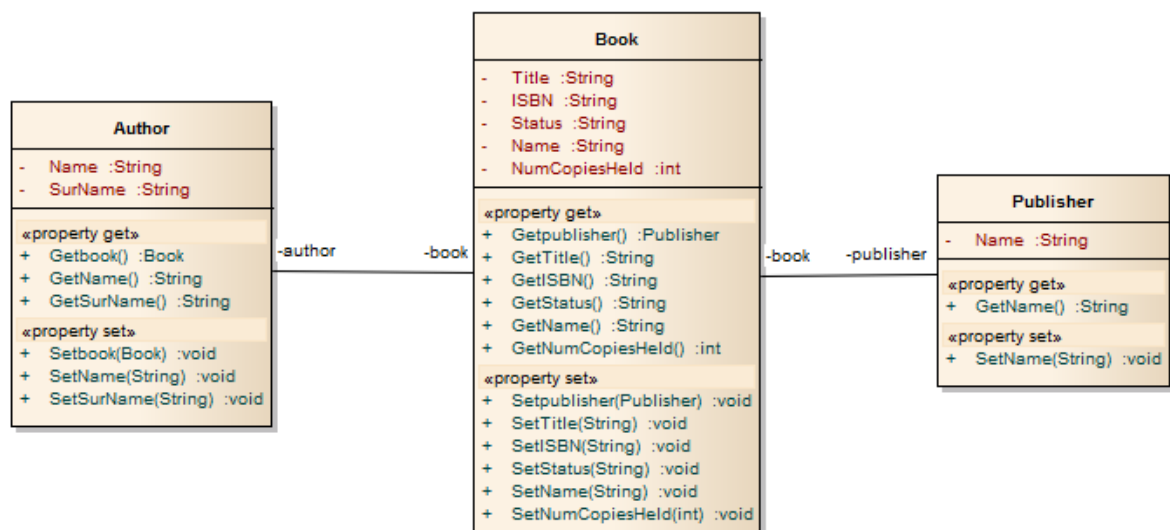

interface are transformed into pure virtual methods on an equivalent class.

### Example

#### The PIM elements

#### After transformation, become the PSM elements

### Learn more

- [C++ Options](#) <sup>[2269]</sup>

## 10.2.3 Data Model To ERD Transformation

The **Data Model to Entity Relationship Diagram (ERD)** transformation creates an ERD logical model from a Data Model. It is the reverse of the **ERD to Data Model** transformation. This transformation uses and demonstrates support in the intermediary language for a number of database-specific concepts.

### Supported Concepts

Concept	Effect	See also
<b>Entity</b>	Mapped one-to-one onto <b>Table</b> elements.	

Concept	Effect	See also
<b>Attribute</b>	Mapped one-to-one onto <b>Columns</b> .	
<b>Primary Key</b>	Derived from the <b>PrimaryKey</b> type of column.	

### Notes

- Sometimes you might want to limit the stretch of the diamond-shaped **Relationship** connectors; simply pick a Relationship connector, right-click to display the context menu, and select the **Bend Line at Cursor** option

### Learn more

- [ERD to Data Model Transformation](#) <sup>[2032]</sup>
- [Data Models](#) <sup>[1937]</sup>

## 10.2.4 DDL Transformation

The **DDL** transformation converts the logical model to a data model that is targeted at the default database type and that is ready for DDL generation. The data model can then be used to automatically generate DDL statements to run in one of the system-supported database products.

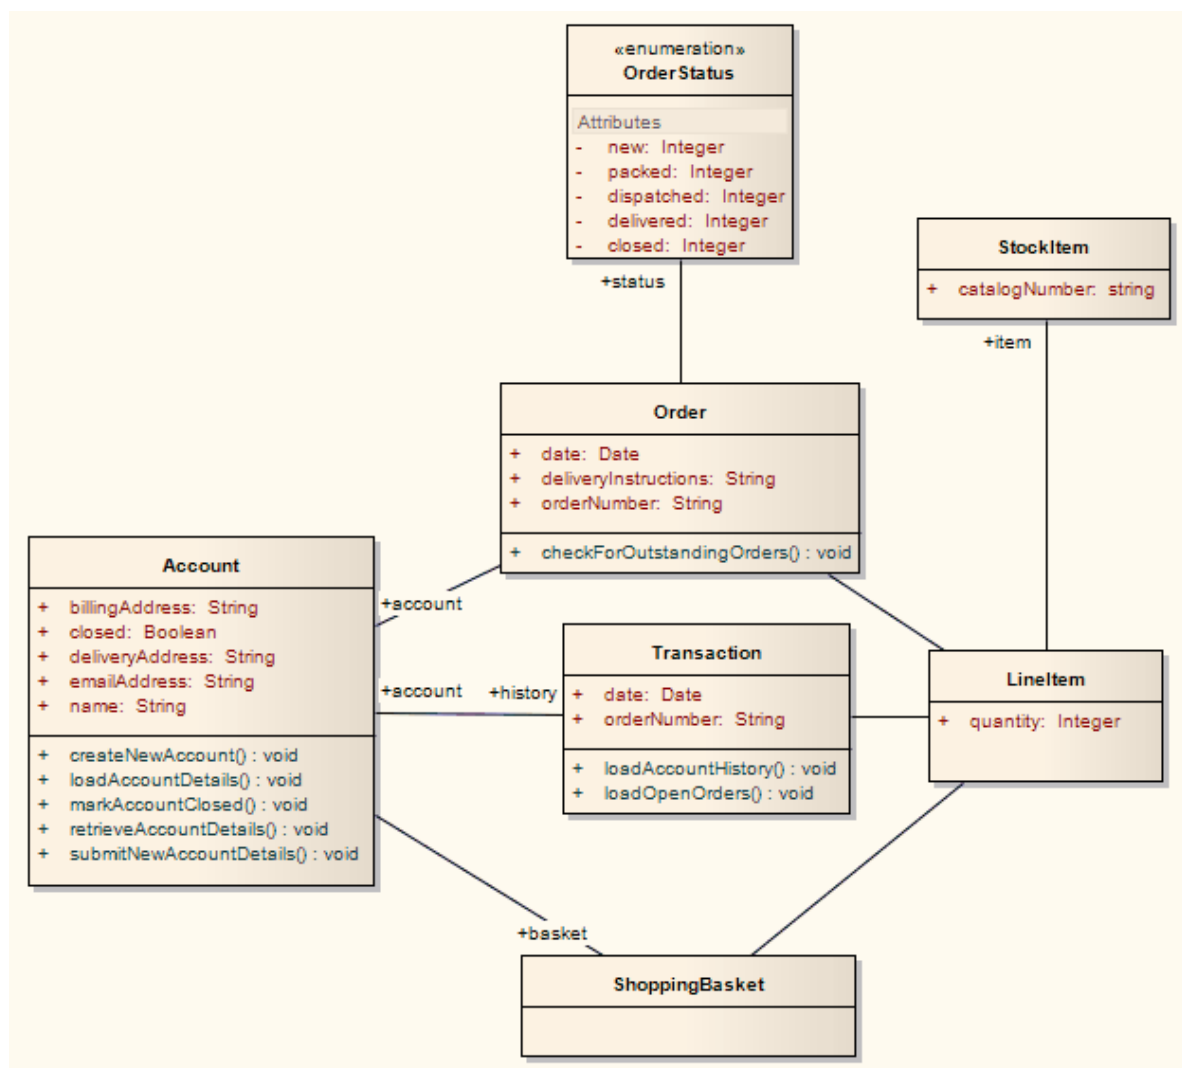

The DDL transformation uses and demonstrates support in the intermediary language for a number of database-specific concepts.

### Concepts

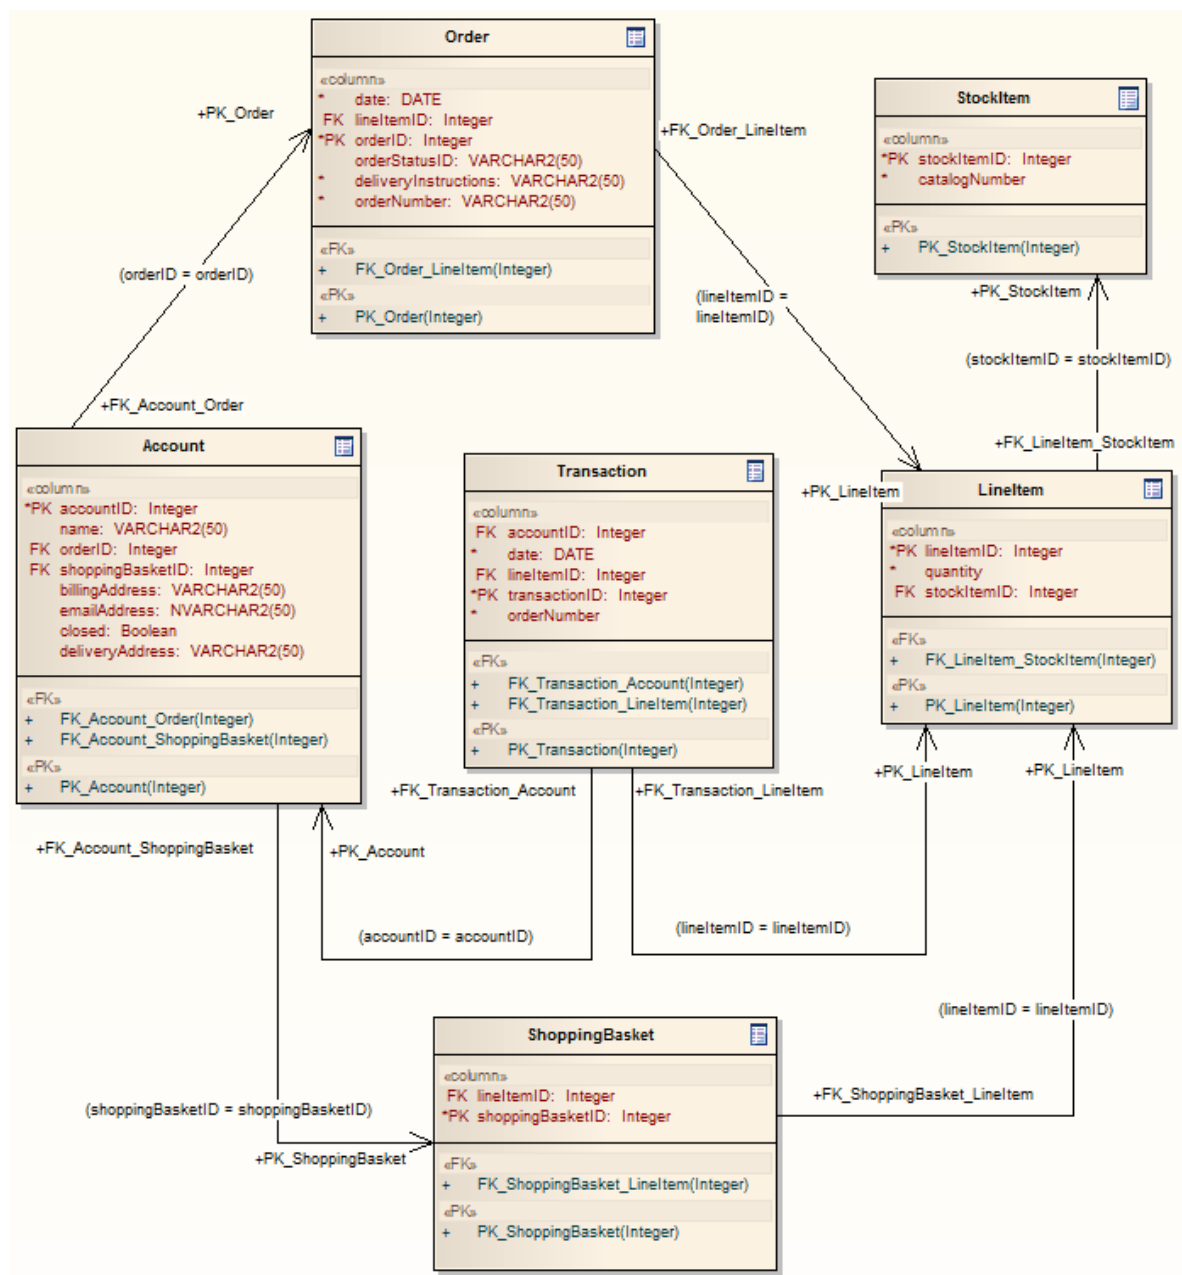

Concept	Effect	See also
<b>Table</b>	Mapped one-to-one onto <b>Class</b> elements.  'Many-to-many' relationships are supported by the transformation, creating <b>Join</b> tables.	
<b>Column</b>	Mapped one-to-one onto <b>attributes</b> .	
<b>Primary Key</b>	Lists all the columns involved so that they exist in the Class, and creates a <b>Primary Key Method</b> for them.	
<b>Foreign Key</b>	A special sort of connector, in which the <b>Source</b> and <b>Target</b> sections list all of the columns involved so that: <ul style="list-style-type: none"> <li>The columns exist</li> <li>A matching Primary Key exists in the destination Class, and</li> <li>The transformation creates the appropriate Foreign Key</li> </ul>	<a href="#">Transform Foreign Keys</a> <sup>[2065]</sup>

**Notes**

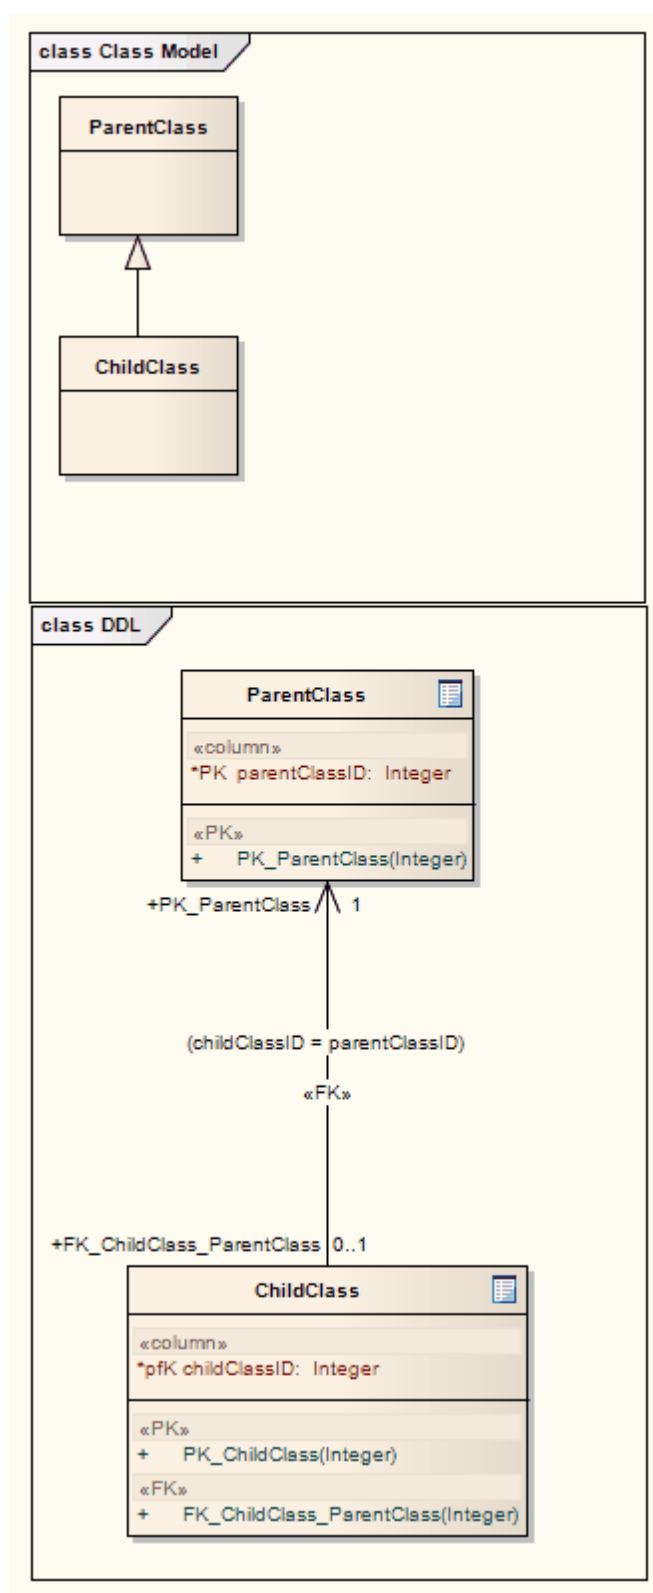

- You can define DBMS-specific aspects not depicted in a Logical model, such as Stored Procedures, Triggers, Views and Check Constraints, after the transformation; see the *Physical Data Model* topic

**Example****The PIM elements**

After transformation, become the PSM elements

**Generalizations** are handled by providing the child element with a Foreign Key to the parent element, as shown. Copy-down inheritance is not supported.

#### Learn more

- [Intermediary Language](#) <sup>[2053]</sup>
- [Data Models](#) <sup>[1937]</sup>

- [Physical Data Model](#) 

## 10.2.5 EJB Transformations

The **EJB Session Bean** and **EJB Entity Bean** transformations reduce the work required to generate the internals of Enterprise Java Beans. You can therefore focus on modeling at a higher level of abstraction.

### Transformations

Transformation	Detail	See also
<b>EJB Session Bean</b>	This transformation converts a single Class element (containing the attributes, operations and references required for code generation by the javax.ejb.* package) to <ul style="list-style-type: none"><li>• An <b>implementation Class</b> element</li><li>• A <b>home interface</b> element</li><li>• A <b>remote interface</b> element</li></ul>	
<b>EJB Entity Bean</b>	This transformation converts a single Class element (containing the attributes, operations and references required for code generation by the javax.ejb.* package) to: <ul style="list-style-type: none"><li>• An <b>implementation Class</b> element</li><li>• A <b>home interface</b> element</li><li>• A <b>remote interface</b> element</li><li>• A Primary Key element</li></ul>	

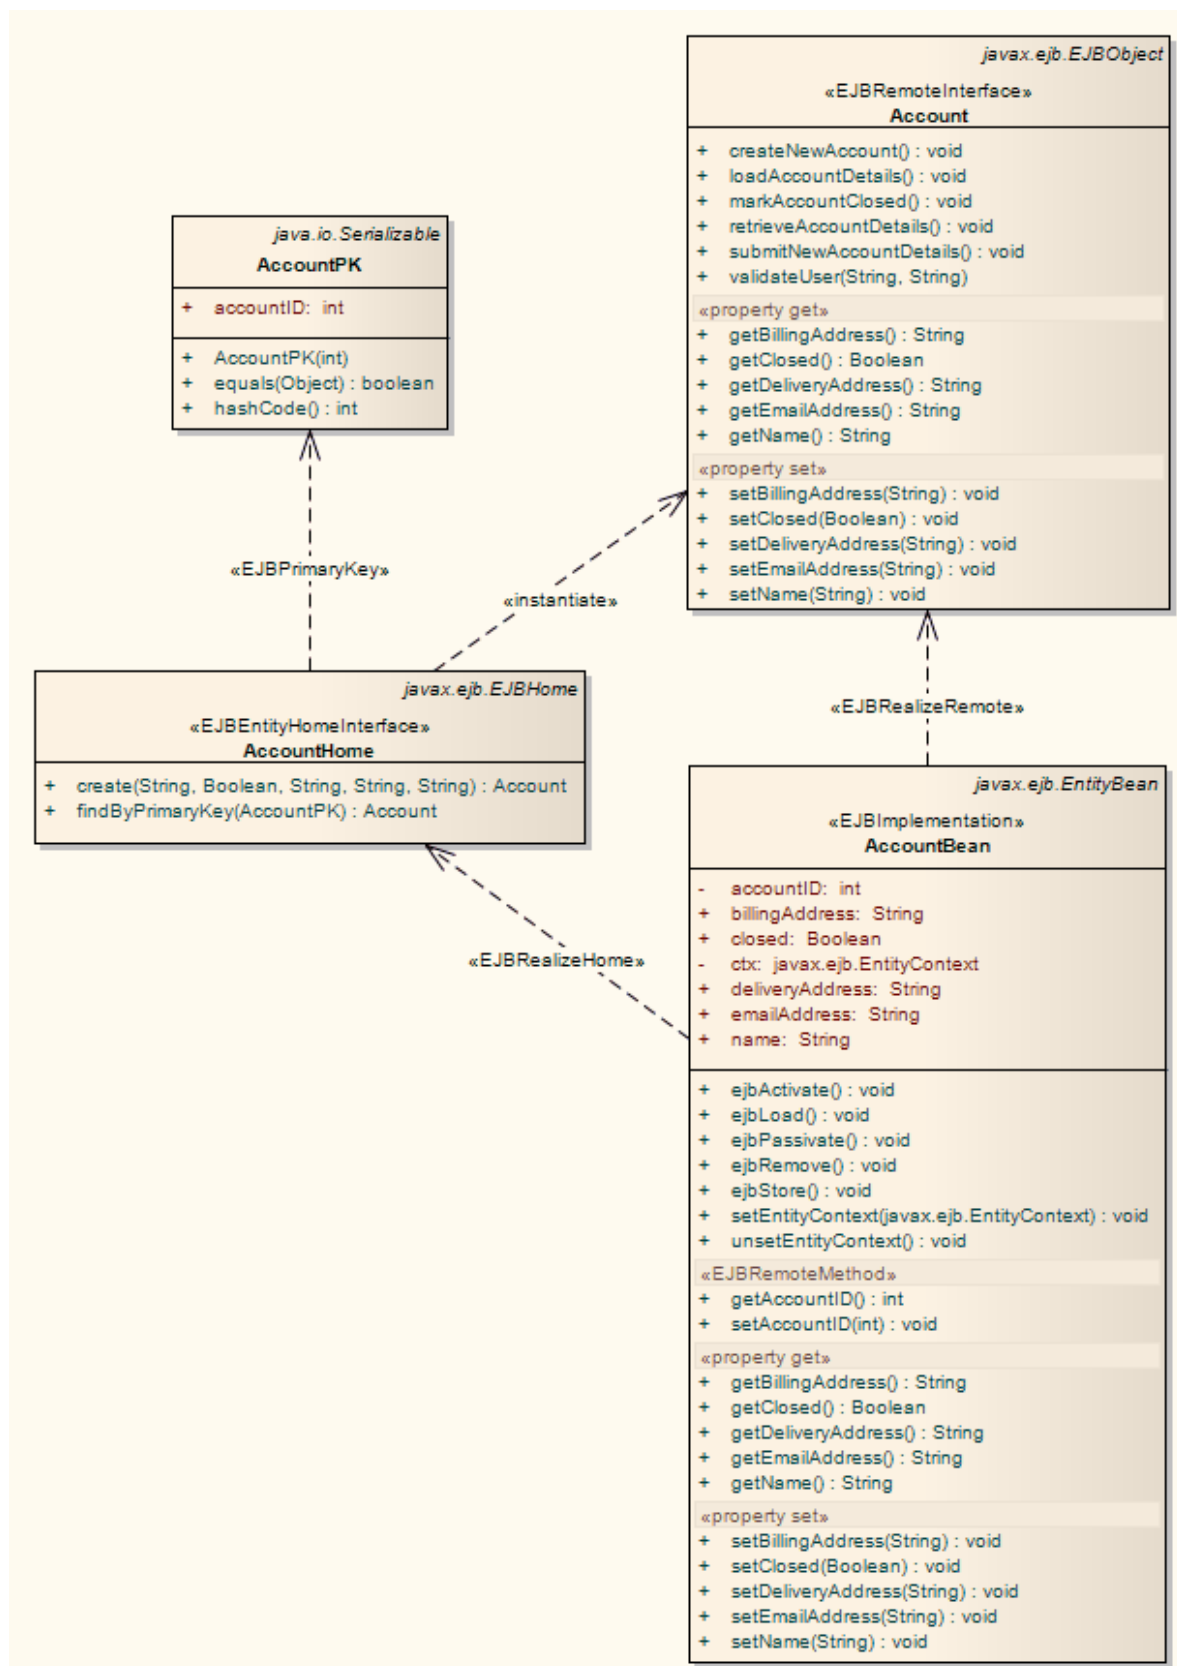

Both transformations also generate a **META-INF** package containing a **deployment descriptor** element.

### Example

#### The PIM elements

After transformation generate a set of Entity Beans, where each one takes the following form (for the Account Class)

[Learn more](#)

- [Software Engineering](#) <sup>[2073]</sup>
- [Generate Source Code](#) <sup>[2111]</sup>

### 10.2.6 ERD To Data Model Transformation

The **Entity Relationship Diagram (ERD) to Data Model** transformation converts an ERD logical model to a data model targeted at the default database type, ready for generating DDL statements to run in one of the system-supported database products. Before doing the transformation, you define the common data type for each attribute and select a database type as the default database. You can then automatically generate the data modeling diagram.

The transformation uses and demonstrates support in the intermediary language for a number of database-specific concepts.

#### Concepts

Concept	Definition	See also
<b>Table</b>	Mapped one-to-one onto <b>Class</b> elements.	
<b>Column</b>	Mapped one-to-one onto <b>attributes</b> .	
<b>Primary Key</b>	Lists all the columns involved so that they exist in the Class, and creates a <b>Primary Key Method</b> for them.	
<b>Foreign Key</b>	<p>A special sort of connector, in which the <b>Source</b> and <b>Target</b> sections list all of the columns involved so that:</p> <ul style="list-style-type: none"> <li>• The columns exist</li> <li>• A matching Primary Key exists in the destination Class, and</li> <li>• The transformation creates the appropriate Foreign Key</li> </ul>	<a href="#">Transform Foreign Keys</a> <sup>[2065]</sup>

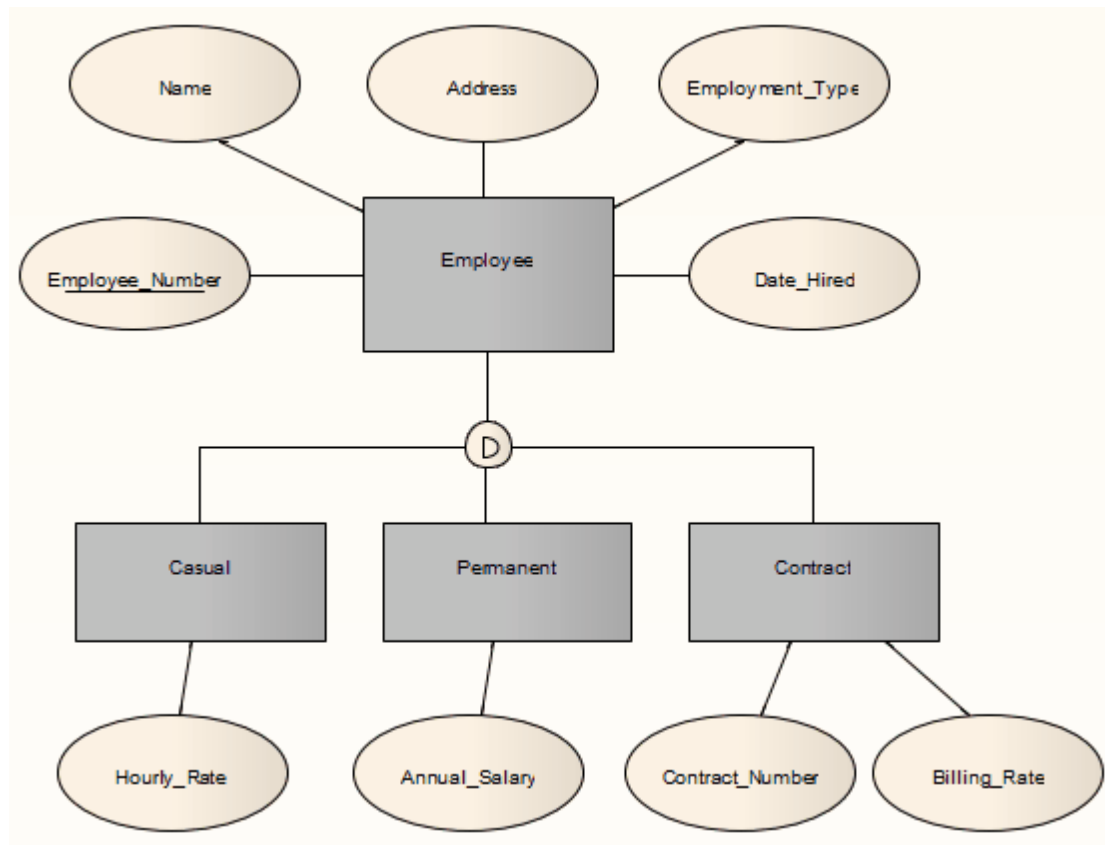

#### Generalization

ERD technology can handle Generalization, as shown. Note that the copy-down inheritance is currently supported with two levels only.

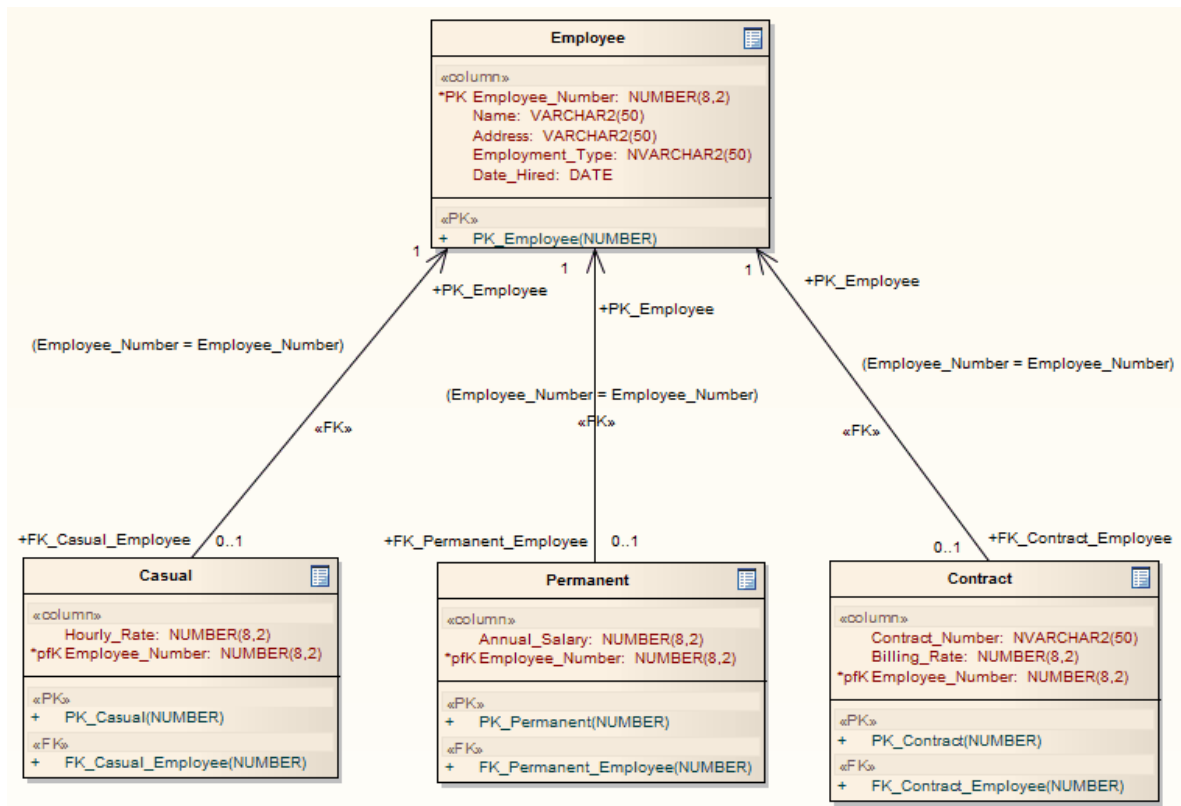

#### Example

The ERD elements

After transformation, become the Data Model elements

## Notes

- Sometimes you might go back to the ERD, make some changes and then need to do another transformation; in this case, to achieve better results, always **delete** the **previous** transformation package before doing the next transformation

### 10.2.8 JUnit Transformation

The **JUnit** transformation converts an existing Java Class with public methods into a Class with a test method for each public method. The resulting Class can then be generated and the tests filled out and run by JUnit.

#### Example

The Java model elements (originally transformed from the PIM)

After transformation, become the PSM elements

<div>junit.framework.TestCase</div> <div>AccountTest</div> <div>+ AccountTest(String) + <u>main(String[]) : void</u> # setUp() : void # tearDown() : void + testCreateNewAccount() : void + testGetBasket() : void + testGetBillingAddress() : void + testGetClosed() : void + testGetDeliveryAddress() : void + testGetEmailAddress() : void + testGetName() : void + testGetOrder() : void + testLoadAccountDetails() : void + testMarkAccountClosed() : void + testRetrieveAccountDetails() : void + testSetBasket() : void + testSetBillingAddress() : void + testSetClosed() : void + testSetDeliveryAddress() : void + testSetEmailAddress() : void + testSetName() : void + testSetOrder() : void + testSubmitNewAccountDetails() : void</div>	<div>junit.framework.TestCase</div> <div>OrderTest</div> <div>+ <u>main(String[]) : void</u> + OrderTest(String) # setUp() : void # tearDown() : void + testCheckForOutstandingOrders() : void + testGetDate() : void + testGetDeliveryInstructions() : void + testGetLineItem() : void + testGetOrderNumber() : void + testGetStatus() : void + testSetDate() : void + testSetDeliveryInstructions() : void + testSetLineItem() : void + testSetOrderNumber() : void + testSetStatus() : void</div>	<div>junit.framework.TestCase</div> <div>TransactionTest</div> <div>+ <u>main(String[]) : void</u> # setUp() : void # tearDown() : void + testGetAccount() : void + testGetDate() : void + testGetLineItem() : void + testGetOrderNumber() : void + testLoadAccountHistory() : void + testLoadOpenOrders() : void + testSetAccount() : void + testSetDate() : void + testSetLineItem() : void + testSetOrderNumber() : void + TransactionTest(String)</div>	
<div>junit.framework.TestCase</div> <div>LineItemTest</div> <div>+ LineItemTest(String) + <u>main(String[]) : void</u> # setUp() : void # tearDown() : void + testGetItem() : void + testGetQuantity() : void + testSetItem() : void + testSetQuantity() : void</div>	<div>junit.framework.TestCase</div> <div>ShoppingBasketTest</div> <div>+ <u>main(String[]) : void</u> # setUp() : void + ShoppingBasketTest(String) # tearDown() : void + testGetLineItem() : void + testSetLineItem() : void</div>	<div>junit.framework.TestCase</div> <div>StockItemTest</div> <div>+ <u>main(String[]) : void</u> # setUp() : void + StockItemTest(String) # tearDown() : void + testGetCatalogNumber() : void + testSetCatalogNumber() : void</div>	<div>junit.framework.TestCase</div> <div>OrderStatusTest</div> <div>+ <u>main(String[]) : void</u> + OrderStatusTest(String) # setUp() : void # tearDown() : void</div>

### Notes

- For each Class in the Java model, a corresponding Test Class has been created containing a test method for every public method in the source Class, plus the methods required to appropriately set up the tests; you fill in the details of each test

### Learn more

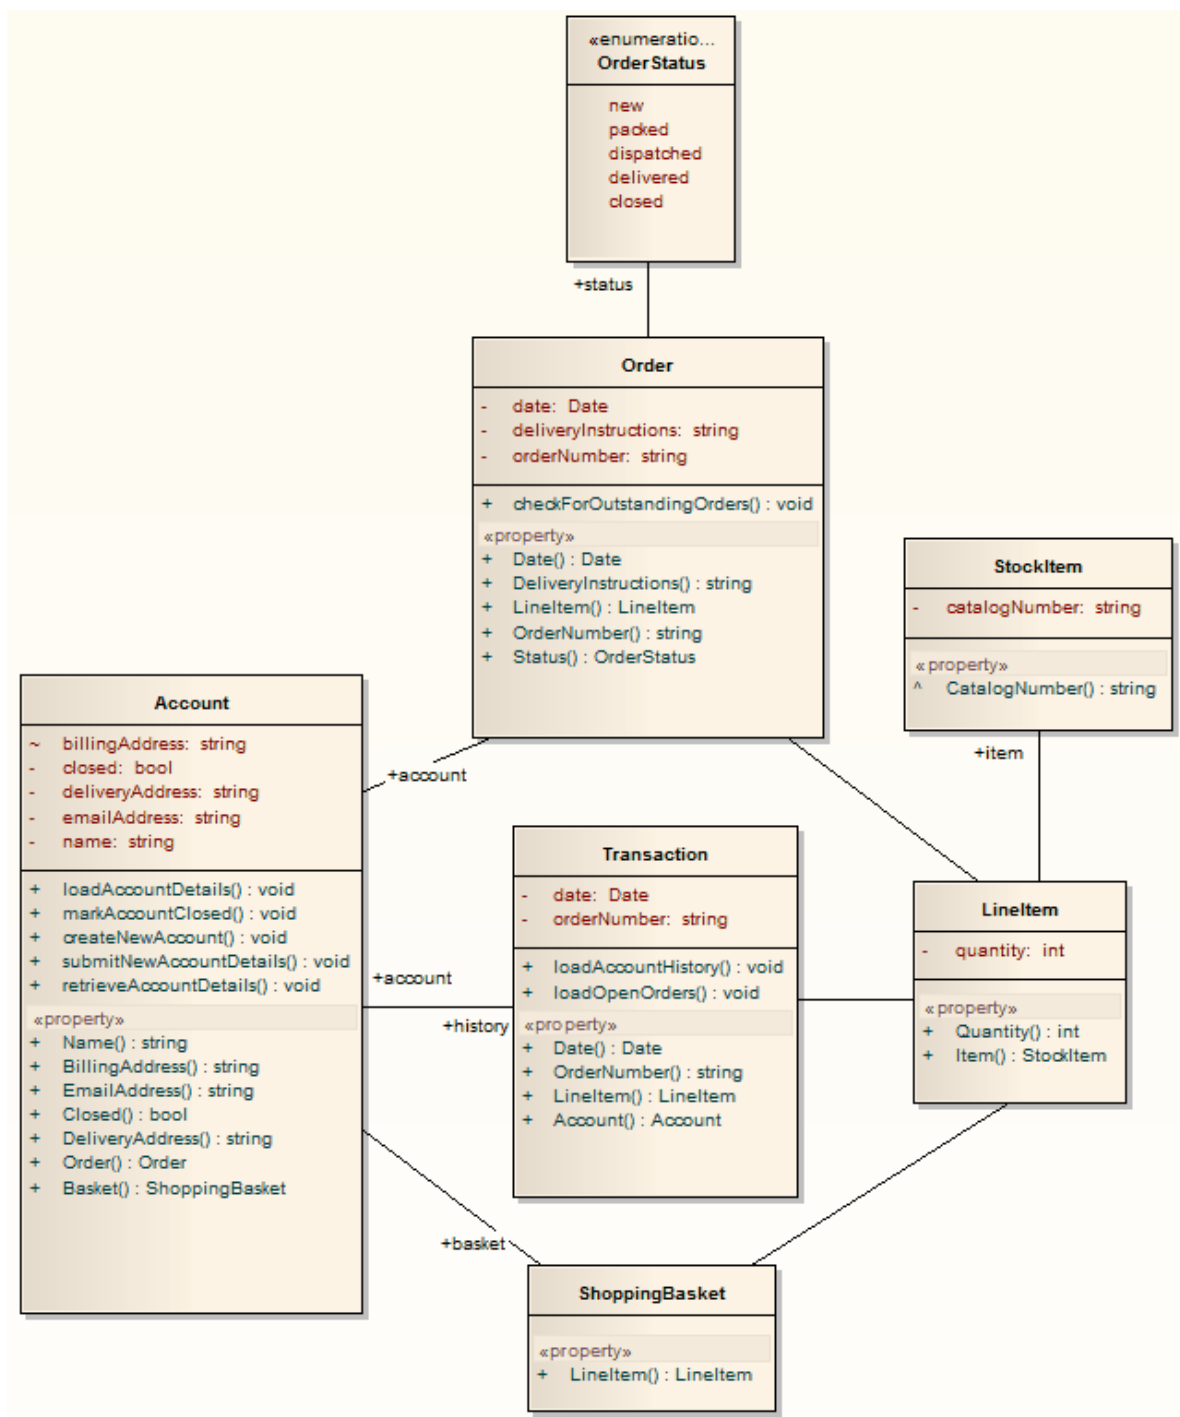

- [Unit Testing](#) <sup>[257]</sup>

## 10.2.9 NUnit Transformation

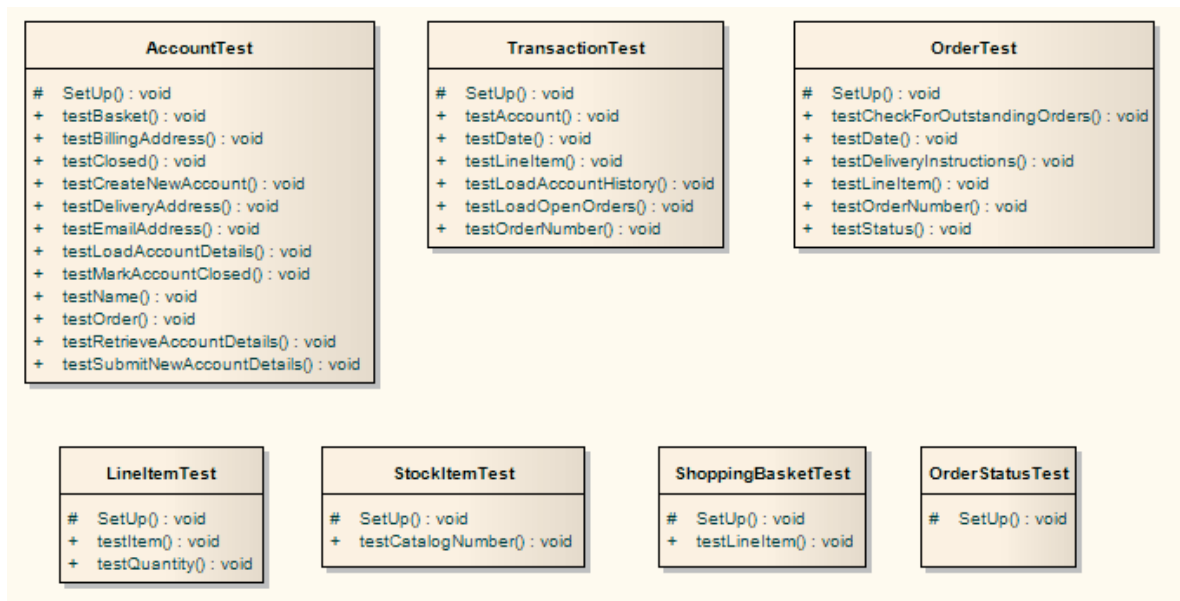

The **NUnit** transformation converts an existing .Net compatible Class with public methods into a Class with a test method for each public method. The resulting Class can then be generated and the tests filled out and run by NUnit.

### Example

The C# elements (originally transformed from the PIM)

After transformation, become the PSM elements

### Notes

- For each Class in the C# model, a corresponding Test Class has been created containing a test method for every public method in the source Class, plus the methods required to appropriately set up the tests; you fill in the details of each test

### Learn more

**10.2.11 Sequence/Communication Diagram Transformations**

It is possible to transform a Sequence diagram into a Communication diagram, and to transform a Communication diagram into a Sequence diagram. In each case, every element or message in the source diagram type is mapped 1:1 to a matching element or message in the target diagram.

**Access** **Open source diagram | Tools | Model Transformation (MDA) | Transform Current Package (Ctrl+Shift+H)** or **Open source diagram, click on element | Tools | Model Transformation (MDA) | Transform Selected Elements (Ctrl+H)**

Perform a Transformation

Field/Button	Action	See also
<b>Elements</b>	Lists and highlights all the elements from the diagram, which will be included in the transformation.	
<b>Transformations</b>	<p>Select:</p> <ul style="list-style-type: none"> <li>• The <b>Communication</b> checkbox, if transforming a Sequence diagram into a Communication diagram, or</li> <li>• The <b>Sequence</b> checkbox, if transforming a Communication diagram into a Sequence diagram</li> </ul> <p>In either case, the Browse Project dialog displays. Click on the <b>OK</b> button; in these transformations the target diagram is automatically created in the same package as the source diagram.</p>	
<b>Do Transform</b>	Click on this button to execute the transformation.	

Field/Button	Action	See also
	<p>The target diagram is created and listed in the Project Browser under the parent package with the name (depending on which transformation you have executed):</p> <p><i>&lt;source diagram name&gt; Communication</i> or  <i>&lt;source diagram name&gt; Sequence</i></p>	

### Notes

- Once you have selected the **Communication** or **Sequence** checkbox, these transforms ignore any other field setting in the dialog and will perform a direct transformation of every element in the source diagram

## 10.2.12 VB.Net Transformation

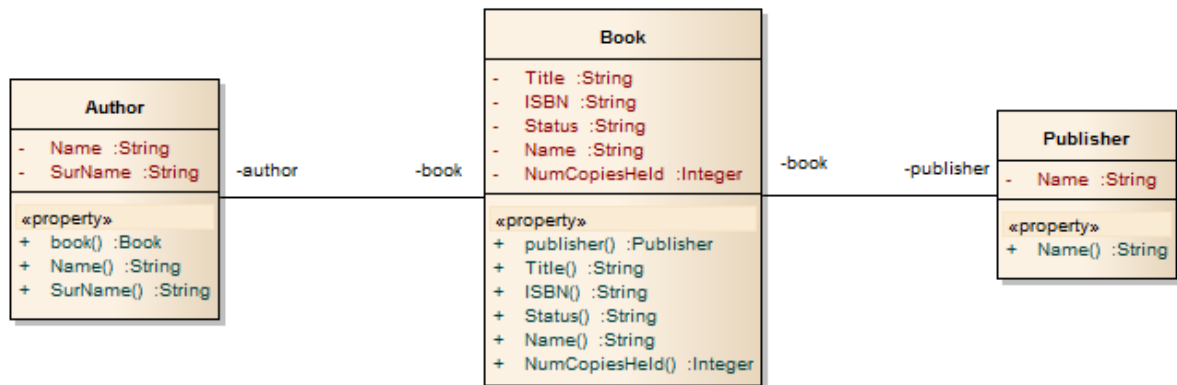

The **VB.Net** transformation converts Platform-Independent Model (PIM) element types to language-specific VB.Net Class element types, and creates encapsulation according to the options you have set for creating properties from VB.Net attributes (on the VB.Net Specifications page of the Options dialog). Note that the **public** attributes in the PIM are converted to **private** attributes in the PSM.

### Example

The PIM elements

After transformation, become the PSM elements

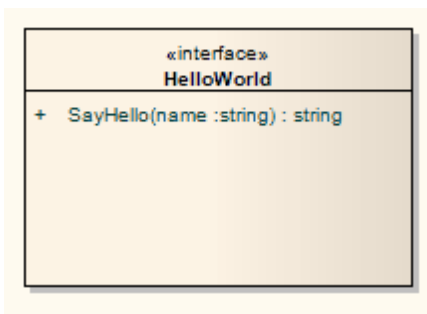

### Learn more

- [VB.Net Options](#) 2275

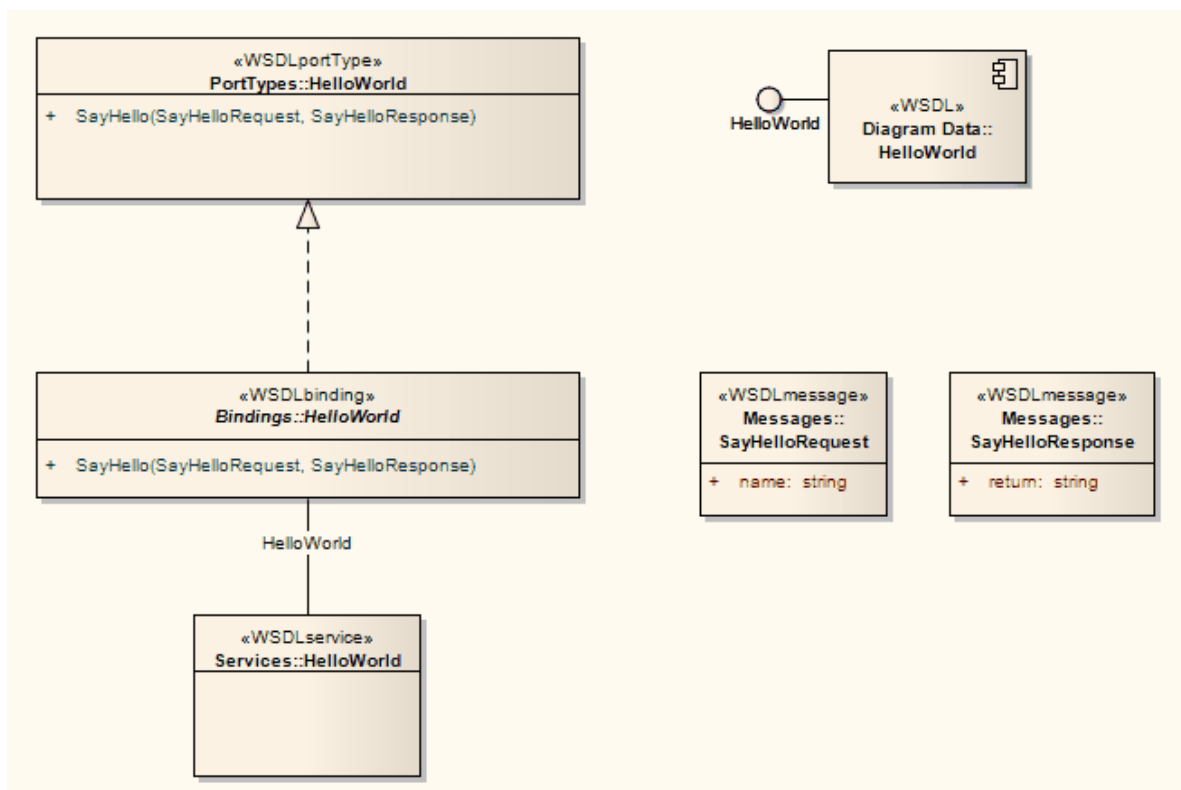

## 10.2.13 WSDL Transformation

The **WSDL transformation** converts a simple model into an expanded model of a WSDL interface that is suitable for generation. Take the following example interface:

Transformation of this generates the corresponding WSDL Component, Service, Port Type, Binding and Messages as follows:

- Classes are handled in the same way as in the XSD Transformation
- All **in** parameters are transformed into WSDL **Message Parts** in the **Request** message
- The return value and all **out** and **return** parameters are transformed into WSDL **Message Parts** in the **Response** message
- All methods where a value is returned are transformed into **Request-Response** operations, and all methods not returning a value are transformed into **OneWay** operations
- The transformation does not handle the generation of **Solicit-Response** and **Notification** methods or faults

In the resulting package you can then fill out the specifics using the WSDL editing capabilities of Enterprise Architect, and finally generate the package using the WSDL generation tools.

### 10.2.14 XSD Transformation

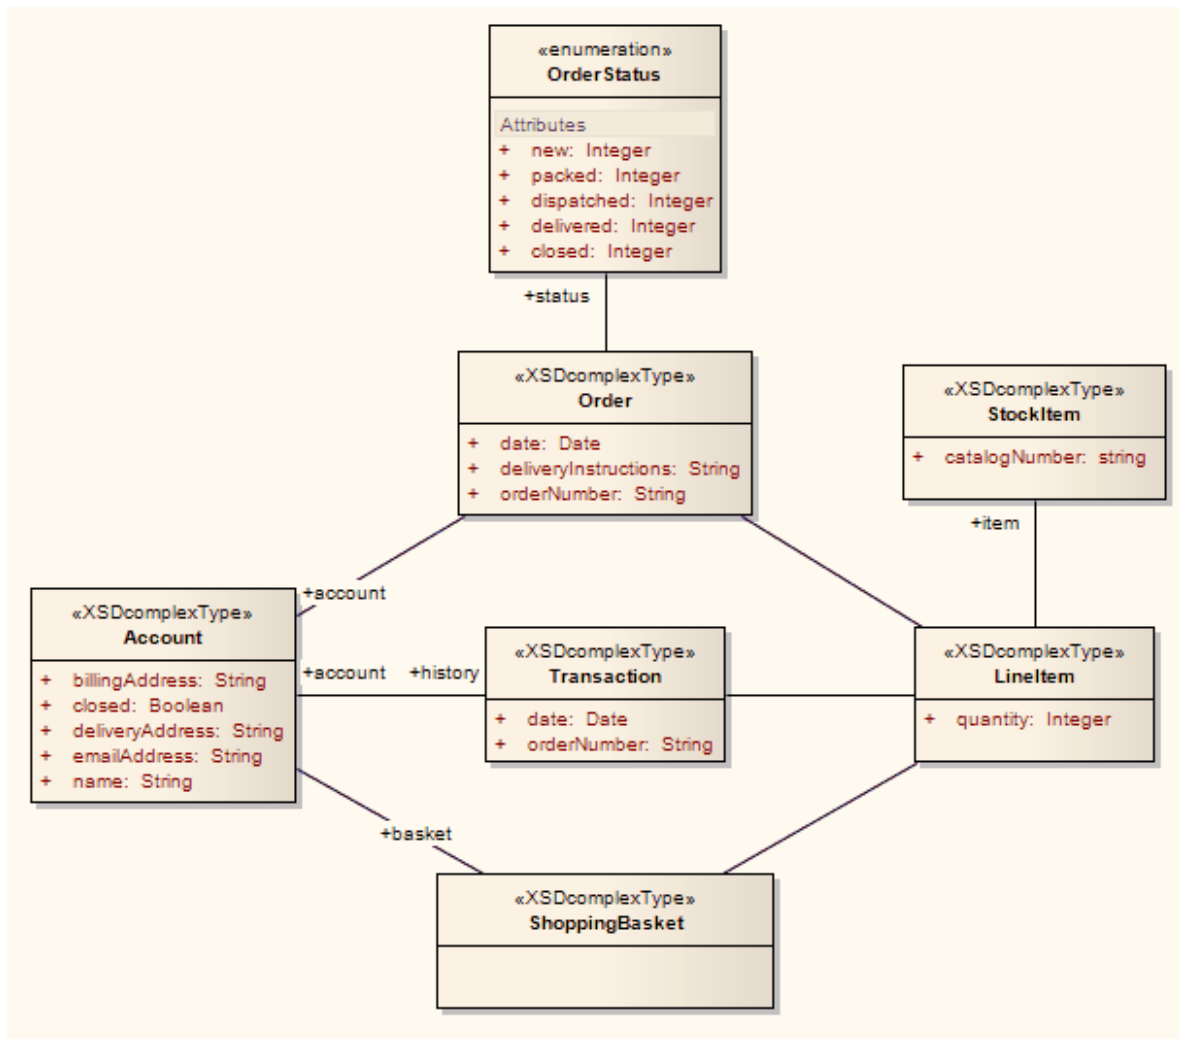

The **XSD transformation** converts Platform-Independent Model (PIM) elements to UML Profile for XML elements as an intermediary step in creating an XML Schema. Each selected PIM Class element is converted to an `«XSDcomplexType»` element.

#### Example

The PIM elements

After transformation become the PSM elements

These in turn generate this XSD

```

<?xml version="1.0" encoding="ISO-8859-1"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="Account" type="Account"/>
  <xs:complexType name="Account">
    <xs:sequence>
      <xs:element name="name" type="xs:string"/>
      <xs:element name="billingAddress" type="xs:string"/>
      <xs:element name="emailAddress" type="xs:string"/>
      <xs:element name="closed" type="xs:boolean"/>
      <xs:element name="deliveryAddress" type="xs:string"/>
      <xs:element ref="Order"/>
      <xs:element ref="ShoppingBasket"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="LinelItem" type="LinelItem"/>
  <xs:complexType name="LinelItem">
    <xs:sequence>
      <xs:element name="quantity" type="xs:integer"/>
      <xs:element ref="StockItem"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Order" type="Order"/>
  <xs:complexType name="Order">
    <xs:sequence>
      <xs:element name="date" type="xs:date"/>
      <xs:element name="deliveryInstructions" type="xs:string"/>
      <xs:element name="orderNumber" type="xs:string"/>
      <xs:element ref="Account"/>
      <xs:element ref="Transaction"/>
      <xs:element ref="LinelItem"/>
      <xs:element ref="StockItem"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Transaction" type="Transaction"/>
  <xs:complexType name="Transaction">
    <xs:sequence>
      <xs:element name="date" type="xs:date"/>
      <xs:element name="orderNumber" type="xs:string"/>
      <xs:element ref="Account"/>
      <xs:element ref="LinelItem"/>
      <xs:element ref="ShoppingBasket"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="ShoppingBasket" type="ShoppingBasket"/>
  <xs:complexType name="ShoppingBasket">
    <xs:sequence>
      <xs:element name="basket" type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="StockItem" type="StockItem"/>
  <xs:complexType name="StockItem">
    <xs:sequence>
      <xs:element name="catalogNumber" type="xs:string"/>
      <xs:element ref="LinelItem"/>
      <xs:element ref="ShoppingBasket"/>
    </xs:sequence>
  </xs:complexType>
</xs:schema>

```

```

        <xs:sequence>
            <xs:element name="date" type="xs:date"/>
            <xs:element name="deliveryInstructions" type="xs:string"/
>
            <xs:element name="orderNumber" type="xs:string"/>
            <xs:element ref="LineItem"/>

## 10.3 Edit Transformation Templates

A single transformation applies a number of **transformation templates**, each of which defines a **type of object** that is acted on within the transformation, and the **actions** that are performed on objects of that type. The system provides a range of built-in default templates, and each **type of transformation** uses a specific subset of these templates. Typically, the transformation type and the subset of templates are tailored to the language the model is being transformed **into**. Some default templates within a set have no content; these are 'latent', and represent the potential for acting on an object that is not generally included in the transformation but is perfectly valid if you wanted to include it. For example, the **Linked Class Base** template in the **C#** transformation.

You can tailor the transformation templates in various ways:

- **Adjust** the code in one or more of the templates in a default set
- **Add** code to a 'latent' default template
- Add a new **custom template**, based on **one** of the defaults but serving a different purpose that you define
- Add a new **transformation type** containing - initially - a basic **set** of default templates
- Add (or remove) a stereotyped override for a template

A stereotyped override directs the transformation to use the modified template only if the element and/or feature are of the specified stereotyped types. If the object or feature are not of that type, the transformation applies the base template.

**Access**   **Tools | MDA Transformation Templates** (Ctrl+Alt+H)

### Edit Transformation Templates

Field/Option/ Button	Action	See also
<b>Language</b>	Click on the drop-down arrow and select the name of the transformation.	
<b>New Transformation Type</b>	Click on this button if you want to create a new transformation. A prompt displays for the name of the transformation; type in the name and click on the <b>OK</b> button.  The Templates list shows the default set of built-in templates, from which you can develop your transformation. Your custom transformation is <b>not saved or available</b> for use <b>unless</b> you add and/or edit one or more templates in the transformation.	
<b>Templates</b>	Lists the transformation templates for the current transformation.  Click on a template name to highlight it and display its content in the Template panel. The <b>Modified</b> column indicates whether you have edited the template for this transformation.	<a href="#">The Code Template Editor in MDG Development</a> <sup>[170]</sup>
<b>Template</b>	Displays the contents of the currently-selected template, and provides the editor facilities for modifying the template (right-click	<a href="#">Write Transformations</a>

Field/Option/ Button	Action	See also
	on the code text).	 <a href="#">The Code Template Editor in MDG Development</a>  <a href="#">Code Template Syntax</a> 
<b>Stereotype Overrides</b>	Lists the stereotyped templates, for the active base template.  The <b>Modified</b> column indicates whether you have modified a stereotyped template.	
<b>Add New Custom Template</b>	<p>Click on this button to create a custom template to add to the current transformation.</p> <p>A dialog displays, prompting you to specify:</p> <ul style="list-style-type: none"> <li>The object type (base template type) that this new template will respond to - click on the drop-down arrow and select the name (custom template types are not included in this list)</li> <li>The name of the new template - type in the appropriate text</li> </ul> <p>Click on the <b>OK</b> button. The new template name is added to the list of templates, and it is opened in the template editor ready for you to add its code.</p>	
<b>Add New Stereotyped Override</b>	<p>Click on this button to add a new stereotype override for the currently selected template. A dialog displays, prompting you to specify the:</p> <ul style="list-style-type: none"> <li>Base Class (stereotyped Class type - click on the drop-down arrow and click on the type in the list) and/or</li> <li>Feature (click on the drop-down arrow and click on the stereotyped feature in the list)</li> </ul> <p>Click on the <b>OK</b> button. The override is added to the <b>Stereotype Overrides</b> list.</p>	
<b>Get Default Template</b>	<p>Click on this button to update the editor display with the <b>default version</b> of the current <b>built-in</b> template or to <b>clear the content</b> of the current <b>custom</b> template.</p> <p>If you have saved the changed template, re-instating the default version is a change, so the <b>Modified</b> field still displays the word <b>Yes</b>.</p>	
<b>Save</b>	Click on this button to save the new or edited current template. You	

Field/Option/ Button	Action	See also
	cannot switch to another template without saving the current template, so this effectively saves the transition as well.	
<b>Delete</b>	Click on this button to delete the current <b>custom</b> template or stereotype override, or the most recent <b>changes</b> to a built-in template (effectively returning it to the default, base content). You cannot <b>delete</b> a <b>built-in</b> template.  You are prompted to confirm the deletion.	
<b>Help</b>	Click on this button to display this Help topic.	

**Notes**

- Transformation template editing is based very strongly on code generation template editing; for additional information on editing transformation templates see the *Code Template Editor* section and the *Editing Source Code* topic

## 10.4 Write Transformations

In Enterprise Architect, you have the facility to **write your own transformations**. Transformations are based on the Code Generation Template Framework, therefore it is suggested that you read and understand the topics covering **Code Generation Templates** prior to using the Transformation Template language.

**Access** [Tools | MDA Transformation Templates](#) (Ctrl+Alt+H)

### Factors concerning Transformation Templates

Factor	Detail	See also
<b>Default Transformation Templates</b>	Enterprise Architect provides a set of default transformation templates that you can use 'as is' or customize to your requirements.	<a href="#">Default Transformation Templates</a> <sup>[2052]</sup>
<b>General Syntax for the Intermediary Language</b>	Transformations in Enterprise Architect generate an intermediary code form of the model being created in the transformation. You can review and edit this code.	<a href="#">Intermediary Language</a> <sup>[2053]</sup>
<b>Intermediary Language Debugging</b>	You can also debug transformation scripts by checking the intermediary code generated from the Transform script.	<a href="#">Intermediary Language Debugging</a> <sup>[2053]</sup>
<b>Editing transformation templates and code</b>	When writing transformations, you use the facilities of the common Code Editor.	<a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>Code Template Framework</b>	You use the Code Template Framework to perform forward engineering of UML models. The Transformation Template Framework is derived from this.	<a href="#">Code Template Framework Tool</a> <sup>[2281]</sup> (Using) <a href="#">Code Template Framework</a> <sup>[1631]</sup> (Modifying)
<b>Syntax for Creating Objects</b>	To generate objects or elements in a transformation, you apply a specific syntax in the template script.	<a href="#">Objects</a> <sup>[2055]</sup>
<b>Syntax for Creating Connectors</b>	To generate connectors (relationships) in a transformation, you also apply a specific syntax in the template script.	<a href="#">Connectors</a> <sup>[2060]</sup> <a href="#">Transform Connectors</a> <sup>[2063]</sup>
<b>Transforming Duplicate Information</b>	In many transformations there is a substantial amount of information to be copied. Rather than place this information in the template, you can use macros to read it from its source.	<a href="#">Copy Information</a> <sup>[2066]</sup>
<b>Transforming</b>	In a transformation template, if you are transforming	<a href="#">Transform Template</a>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Model Transformations | Transform | Write Transforms**

### 10.4.1 Default Transformation Templates

Transformation templates provide the ability to represent the existing information in a model in a modified way. When creating a new transformation Enterprise Architect provides a **default** set of transformation templates that perform a direct copy of the source model to the target model. This allows you to think in terms of how the source model and target model are different. For each template you are able to prevent properties from being copied and add additional information until the appropriate target model is created.

You can list and examine the default templates in the Transformation Editor. The combination of default templates varies according to the language you are transforming.

Access   **Tools | MDA Transformation Templates (Ctrl+Alt+H)**

#### Notes

- When creating a new transformation you must modify at least **one** template before the new transformation becomes available

Learn more

- [Write Transformations](#) <sup>[2051]</sup>
- [Edit Transformation Templates](#) <sup>[2048]</sup>
- [Copy Information](#) <sup>[2066]</sup>

### 10.4.2 Intermediary Language

All transformations in Enterprise Architect create an **intermediary language** form of the model to generate. You can access and edit the file containing this intermediary language code using an external editor. Each object is represented in this language by the **object type** (for example, Class, Action, Method, Generalization or Tag) followed by the **object properties** and the **features** that it is made from; the grammar of the object description resembles this:

```

element :
    elementName { (elementProperty | element)* }

elementProperty:
    packageName
    stereotype
    propertyName = " propertyValueSymbol * "

packageName:
    name = " propertyValueSymbol * " ( . " propertyValueSymbol * " ) *
stereotype:
    stereotype = " propertyValueSymbol * " ( , " propertyValueSymbol * "
) *

propertyValueSymbol :
    \ \
    \ "
    Any character except " (U+0022), \ (U+005C)

```

- *elementName* is any one of the set of element types
- *propertyName* is any one of the set of properties

Literal strings can be included in property values by 'escaping' a quote character:

```
default = "\" Some string value.\""
```

Learn more

- [Intermediary Language Debugging](#) <sup>[2053]</sup>
- [Objects](#) <sup>[2055]</sup>
- [Connectors](#) <sup>[2060]</sup>

### 10.4.3 Intermediary Language Debugging

The script from an MDA template produces intermediate language text. However, on generating the model this script could return errors. When an error occurs, you can **view and debug** the generated text externally, preferably in an editor that prompts on updates to the file alterations.

**Access** **Project Browser Package context menu | Advanced | Transform Package** (Ctrl+Shift+H)

**Example**

For a MySQL database, the template code might resemble the following:

```
$enumFieldname = "test"

Column
{
    name=%qt%%CONVERT_NAME($enumFieldname, "Pascal Case", "Camel Case")%%qt%
    type=%qt%%CONVERT_TYPE(genOptDefaultDatabase, "Enum")%%qt%
}
```

This returns the output in the generated text file as:

```
Column
{
    name = "test"
    type = "ENUM"
}
```

If there is an error in the original transform, such as a spelling error - 'Colum' - clicking the **Do Transform** button returns an error message referring to the first line of intermediate code that includes the error 'Colum'.

**Debug when errors are returned on generating altered code**

Step	Description	See also
1	Select the Package to be transformed, and the <b>Transform Package</b> context menu. The Model Transformations dialog displays.	<a href="#">Transform Elements</a> <sup>2017</sup>
2	In the <b>Name</b> column, select the checkbox against the type of transformation being altered.	
3	In the <b>Intermediary File</b> field, click on the ( ... ) button and set the file location into which to generate the code.	
4	Select the <b>Write Always</b> checkbox, and click on the <b>Write Now</b> button to generate the script.  This only generates the script, not the model.	
5	If an error is returned specifying the line number of the problem, open the file in an external Code Editor (with Line Numbering) and locate the line number of problem.	
6	Alter the template code to correct the error.	

Step	Description	See also
7	Click on the <b>Do Transform</b> button to check that the alteration has corrected the problem.	

#### 10.4.4 Objects

**Objects** are generated in a transformation as text in the following form:

```
objectType
{
    objectProperties*
    XRef{xref}*
    Tag{tag}*
    Attribute{attributes}*
    Operation{operations}*
    Classifier{classifiers}*
    Parameter{parameters}*
}
```

For example:

```
Class
{
    name = "Example"
    language = "C++"
    Tag
    {
        name = "defaultCollectionClass"
        value = "List"
    }
    Attribute
    {
        name = "count"
        type = "int"
    }
}
```

Every object created in a transformation should include an **XRef** syntax element (see the end of this topic), as it helps the system to synchronize with the object and makes it possible to create a connector to that Class in the transformation.

#### Syntax elements in the code

### Special Cases

Certain types of object have variations of the object definition syntax.

Object	Detail	See also
<b>Packages</b>	<p>Packages differ from other objects in the following ways:</p> <ul style="list-style-type: none"> <li>• They have a reduced set of properties: <i>alias</i>, <i>author</i>, <i>name</i>, <i>namespaceRoot</i>, <i>notes</i>, <i>scope</i>, <i>stereotype</i> and <i>version</i></li> <li>• The property <i>namespaceRoot</i> is only given to Packages</li> <li>• A <i>name</i> must be specified for each Package</li> <li>• The <i>name</i> property can be a qualified name; when a qualified name is specified, the properties given are applied only to the final package</li> </ul>	

Object	Detail	See also
	<ul style="list-style-type: none"> <li>Only Packages can contain other packages</li> <li>Packages can't contain attributes and operations</li> </ul>	
<b>XRef</b>	<p>Cross references are defined using the transform statements. The properties include:</p> <ul style="list-style-type: none"> <li><i>Namespace</i></li> <li><i>Name</i></li> <li><i>Source</i></li> <li><i>Notes</i></li> </ul>	<a href="#">Cross References</a> <small>[2068]</small>
<b>Tables</b>	<p>Tables are a special type of object, with the following differences from other object types:</p> <ul style="list-style-type: none"> <li>They can include columns and primary keys</li> <li>They cannot include attributes</li> </ul>	<a href="#">Foreign Key</a> <small>[2068]</small>
<b>Columns</b>	<p>Columns are similar to attributes, but have an <i>autonumber</i> element containing <i>Startnum</i> and its increment, and the following added properties:</p> <ul style="list-style-type: none"> <li><i>Length</i></li> <li><i>NotNull</i></li> <li><i>Precision</i></li> <li><i>PrimaryKey</i></li> <li><i>Scale</i></li> <li><i>Unique</i></li> </ul> <p>In the column definition, you cannot assign a value to the <i>NotNull</i>, <i>PrimaryKey</i> or <i>Unique</i> properties.</p>	

### 10.4.5 Connectors

The process of creating **connectors** in a transformation has the same form as for creating elements. It is a little more complex, because you also define each **end** of the connector.

Connectors are represented in the Intermediary language as:

```

Connector Type
{
    connector Properties*
    AssociationClass {associationClassProperties*}
    Source {sourceProperties*}
    Target {targetProperties*}
}

```

For example:

```

Association
{
  name="anAssociation"
  stereotype=""
  direction="Unspecified"
  Source
  {
    access="Private"
    navigability="Unspecified"
  }
  Target
  {
    access="Private"
    multiplicity="1..*"
  }
}

```

## 10.4.6 Transform Connectors

You can use two different types of Class as a connector end: a Class **created by a transformation**, or an **existing** Class for which you already know the **GUID**.

### Connect to a Class Created by a Transformation

The most common connection is to a Class created by a transformation; to create this connection you use three items of information:

- The original Class GUID
- The name of the transformation
- The name of the transformed Class

This type of connector is created using the **TRANSFORM\_REFERENCE** function macro; when the element is in the current transformation, it can be safely omitted from the transformation. The simplest example of this is when you have created multiple Classes from a single Class in a transformation, and you want a connector between them; consider this script from the EJB Entity transformation:

```
Dependency
{
  %TRANSFORM_REFERENCE( " EJBReal i zeHome" , cl assGUI D) %
st er eot ype=" EJBReal i zeHome"
  Sour ce
  {
    %TRANSFORM_REFERENCE( " EJBEnt i tyBean" , cl assGUI D) %
  }
  Tar get
  {
    %TRANSFORM_REFERENCE( " EJBHomeI nt er f ace" , cl assGUI D) %
  }
}
```

In this script there are three uses of the **TRANSFORM\_REFERENCE** macro: one to identify the connector for

synchronization purposes and the other two to identify the ends; all three use the same source GUID, because they all come from the one original Class. None of the three have to specify the transformation because the two references are to something within the current transformation - each of them then only has to identify the transform name.

It is also possible to create a connector from another connector. You can create a connector template and list all connectors connected to a Class from the Class level templates; you don't have to worry about only generating the connector once, because if you have created a **TRANSFORM\_REFERENCE** for the connector then the system automatically synchronizes them.

This script copies the source connector:

```
%connector Type%
{
    %TRANSFORM_CURRENT( ) %
    %TRANSFORM_REFERENCE( " Connector " , connect or GUI D) %

    Source
    {
        %TRANSFORM_REFERENCE( " Cl ass " , connect or SourceGUI D) %
        %TRANSFORM_CURRENT( " Source " ) %
    }
    Target
    {
        %TRANSFORM_REFERENCE( " Cl ass " , connect or Dest GUI D) %
        %TRANSFORM_CURRENT( " Target " ) %
    }
}
```

### Connecting to a Class for which you know the GUID

The second type of Class that you can use as a connector end is an **existing** element for which you know the current **GUID**. To create this connection, specify the GUID of the target Class in either the source or target end; this script creates a Dependency **from** a Class created in a transformation, **to** the Class it was transformed from:

```
Dependency
{
    %TRANSFORM_REFERENCE( " SourceDependency " , cl assGUI D) %
    stereotype="transformedFrom"
    Source
    {
        %TRANSFORM_REFERENCE( " Cl ass " , cl assGUI D) %
    }
    Target
    {
        GUI D=%qt %%cl assGUI D%%qt %
    }
}
```

### Notes

- Each connector is transformed at both end objects, therefore the connector might appear twice in the transformation; this is not a problem, although you should check carefully that the connector is generated exactly the same way, regardless of which end is on the current Class

- [Cross References](#) 

- [Copy Information](#)<sup>[2066]</sup>
- [Connectors](#)<sup>[2060]</sup>

### 10.4.7 Transform Foreign Keys

**ForeignKey** is a special case where not just a connector is created - you must also list the **columns** involved in the transformation. In addition, **tags** specified on the connector are actually created on the foreign key operation in the source Class, and you can add a cascade property:

```
cascade="update", "delete"
```

#### Example

This example is from the DDL transformation **Connector** template. For the template:

```
ForeignKey
{
  %TRANSFORM_REFERENCE( " FK1" , connector GUI D) %
  Source
  {
    %TRANSFORM_REFERENCE( " LinkTable" , connector GUI D) %
    name=%qt %%connector Dest ElementName%%qt %
    Column
    {
      name=%qt %%CONVERT_NAME( connector Dest ElementName, " Pascal
Case", " Camel Case" ) %d %qt %
      type=%qt %%CONVERT_TYPE( genOpt Default Database, " Integer" ) %%qt %
    }
  }
  Target
  {
    %TRANSFORM_REFERENCE( " Table" , connector Dest ElementGUI D) %
    Column
    {
      name=%qt %%CONVERT_NAME( connector Dest ElementName, " Pascal
Case", " Camel Case" ) %d %qt %
      type=%qt %%CONVERT_TYPE( genOpt Default Database, " Integer" ) %%qt %
    }
  }
}
```

This code is generated for a Foreign Key:

```
ForeignKey
{
  XRef { namespace=" DDL" name=" FK1" source="{ 18ED24EA- 0669- 499c- A066-
FABEE6772ED1}" }
  Source
  {
    XRef { namespace=" DDL" name=" Table" source="{ CC6A084C- 9B56- 4a1e-
8196- C66A74E59B66}" }
    name=" FK_account "
    multiplicity=" 0..*"
    Column
    {
      name=" account "
      type=" I NTEGER"
    }
  }
  Target
  {
    XRef { namespace=" DDL" name=" Table" source="{ 791AEAB5- 7831- 4d2a-
92C7- 198C10B31AF0}" }
    multiplicity=" 1"
  }
}
```

```

Column
{
    name="accountID"
    type="INTEGER"
}
}

```

### 10.4.8 Copy Information

In many transformations there is a substantial amount of information to be copied.

It would be tedious to type all of the common information into a template so that it is copied to the transformed Class; the alternative is to use the **TRANSFORM\_CURRENT** and **TRANSFORM\_TAGS** function macros.

#### Use of Macros

Objective	Detail	See also
<b>Copy Object</b>	<b>TRANSFORM_CURRENT(&lt;listOfExcludedItems&gt;)</b>  The function generates an exact copy of all the properties of the current item, except for the items named in <listOfExcludedItems>.	<a href="#">Objects</a> <sup>[2055]</sup>
<b>Copy Connector</b>	Another form of the function is available when transforming connectors to copy either end of the connector:  <b>TRANSFORM_CURRENT(&lt;connectorEnd&gt;,&lt;listOfExcludedItems&gt;)</b>  This generates an exact copy of the connector end specified by <connectorEnd> (either <b>Source</b> or <b>Target</b> ) except for the items named in <listOfExcludedItems>.	<a href="#">Connector</a> <sup>[2060]</sup>
<b>Copy Tags</b>	<b>TRANSFORM_TAGS(&lt;listOfExcludedItems&gt;)</b>  The function generates an exact copy of all the Tagged Values of the current item, except for the items named in <listOfExcludedItems>.	

### 10.4.9 Convert Types

Different target **platforms** almost certainly require different **data types**, so you usually require a method of converting between types. This is offered by the macro:

**CONVERT\_TYPE(<destinationLanguage>, <originalType>)**

This function converts <originalType> to the corresponding type in <destinationLanguage> using the datatypes and common types defined in the model, where <originalType> is assumed to be a platform independent common type.

A similar macro is available when transforming common datatypes to the datatypes for a specified database:

**CONVERT\_DB\_TYPE(<destinationDatabase>, <originalType>)**

This function converts *<originalType>* to the corresponding datatypes in *<destinationDatabase>*, which is defined in the model; *<originalType>* refers to a platform independent common datatype.

### 10.4.10 Convert Names

Different target **platforms** use different **naming conventions**, so you might not want to copy the names of your elements directly into the transformed models. To facilitate this requirement, the transformation templates provide a **CONVERT\_NAME** function macro.

Another way in which you can transform a name is to remove a prefix from the original name, with the **REMOVE\_PREFIX** macro.

#### CONVERT\_NAME <originalName>, <originalFormat>, <targetFormat>)

This macro converts *<originalName>*, which is assumed to be in *<originalFormat>*, to *<targetFormat>*.

The supported formats are:

- **Camel Case:** new words start with a capital letter except for the first word, which begins with a lower case letter; for example, *myVariableTable*
- **Pascal Case:** the same as Camel Case but the first letter of the first word is upper case; for example, *MyVariableTable*
- **Spaced:** words are separated by spaces; the case of letters is ignored
- **Underscored:** words are separated by underscores; the case of letters is ignored

The **original format** might also specify a list of delimiters to be used. For example a value of ' \_ ' breaks words whenever either a space or underscore is found. The **target format** might also use a format string that specifies the case for each word and a delimiter between them. It takes the following form:

*<firstWord>(<delimiter>)<otherWords>*

- *<firstWord>* controls the case of the first word (see below)
- *<delimiter>* is the string generated between words
- *<otherWords>* applies to all words after the first word

Both *<firstWord>* and *<otherWords>* are a sequence of two characters. The first character represents the case of the first letter of that word, and the second character represents the case of all subsequent letters. An upper case letter forces the output to upper case, a lower case letter forces the output to lower case, and any other character preserves the original case.

**Example 1:** To capitalize the first letter of each word and separate multiple words with a space:

" Ht ( ) Ht " to output " My Var i abl e Tabl e "

**Example 2:** To generate the equivalent of Camel Case, but reverse the roles of upper and lower case; that is, all characters are upper case except for the first character of each word *after* the first word:

" HT( ) hT" to output " MY vARI ABLE t ABLE "

#### REMOVE\_PREFIX(<originalName>, <prefixes>)

This macro removes any prefix found in *<prefixes>* from *<originalName>*. The prefixes are specified in a semi-colon separated list.

The macro is often used in conjunction with the **CONVERT\_NAME** macro. For example, this code creates a get property name according to the options for Java:

```
$propertyName=%REMOVE_PREFIX( attributeName, genOptPropertyPrefix) %
%if genOptGenCapitalisedProperties=="T" %
$propertyName=%CONVERT_NAME( $propertyName, "camel case", "pascal case") %
%endif %
```

#### Notes

- Acronyms are not supported when converting from Camel Case or Pascal Case

### 10.4.11 Cross References

**Cross References** are an important part of transformations. You can use them to:

- Find the transformed Class to synchronize with
- Create connectors between transformed Classes
- Specify a classifier of a type
- Determine where to transform to for future transformations

Each cross reference has three different parts:

- A **Namespace**, corresponding to the transformation that generated the element
- A **Name**, which is a unique reference to something that can be generated in the above transformation, and
- A **Source**, which is the GUID of the element that this element was created from

When writing the templates for a transformation it is easiest to generate the cross references using the macro defined for this purpose:

**TRANSFORM\_REFERENCE** (<name>, <sourceGuid>, <namespace>)

The three parameters are optional. The macro generates a reference that resembles the following.

```
XRef { namespace=" <namespace>" name=" <name>" source=" <sourceGuid>"
```

- If <name> is not specified the macro gets the name of the current template
- If <sourceGUID> is not specified the macro gets the GUID of the current Class
- If <namespace> is not specified the macro gets the name of the current transformation

The only time that this should be specified is when creating a connector to a Class created in a different transformation.

A good example of the use of cross references is in the **DDL transformation** provided with Enterprise Architect. In the **Class** template a cross reference is created with the name *Table*. Then up to two different connectors can be created, each of which must identify the two Classes it connects using cross references, while having its own unique cross reference.

#### Specify Classifiers

Objects, attributes, operations and parameters can all reference another element in the model as their type. When this type is created from a transformation you must use a cross reference to specify it, using the macro:

**TRANSFORM\_CLASSIFIER** (<name>, <sourceGuid>, <namespace>)

This macro generates a cross reference within a classifier element, where the parameters are identical to the **TRANSFORM\_REFERENCE** macro but the name *Classifier* is generated instead of *XRef*.

If the target classifier already exists in the model before the transformation, **TRANSFORM\_CLASSIFIER** is inappropriate, so instead the GUID can be given directly to a classifier attribute.

If a classifier is specified for any type, it overrides that type.

### 10.4.12 Transform Template Parameter Substitution

If you want to provide access in a transformation template to data concerning the transformation of a Template Binding connector's binding parameter substitution in the model, you can use the **Template Parameter substitution macros**.

#### Factors in the Transformation

Factor	Detail	See also
<b>Intermediary Language</b>	<p>Template Parameter Substitutions are represented in the Intermediary language as:</p> <pre> TemplateParameterSubstitution {     Formal { FormalProperties }     Actual { ActualProperties } } </pre> <p>For example:</p> <pre> TemplateParameterSubstitution {     Formal     {         name=%qt%%parameterSubstitutionFormal%%qt%     }     Actual     {         name=%qt%%parameterSubstitutionActual%%qt%         %TRANSFORM_CLASSIFIER("Class", parameterSubstitutionAc     } } </pre>	
<b>Formal Propertie</b>	<b>FormalProperties</b> and <b>ActualProperties</b> are zero, or one instance of one of the following properties:	

Factor	Detail	See also

## 11 Software Engineering

Software Engineering is the process of designing, implementing and maintaining software. This section describes how Enterprise Architect can assist in this process by providing a design environment and tools including **automated code generation**, **reverse engineering** of source code and **synchronization** between the source code and model.

<b>Use Local Path</b>	Enable the selection of an existing local path to place the source code under; changes the <b>Destination folder</b> field to a drop-down selection.	
<b>Compiler command</b>	Displays the default compiler command path for the selected technology; you must either: <ul style="list-style-type: none"> <li>• Confirm that the compiler can be found at this path, or</li> <li>• Edit the path to the compiler location</li> </ul>	<a href="#">Local Paths</a>  <a href="#">Local Paths Dialog</a> 
<b>Edit Local Paths</b>	Many application patterns specify their compiler using a local path.  The first time you use any pattern you must click on this button to ensure the local path points to the correct location.  The Local Paths dialog displays.	

### Notes

- If required, you can define custom application patterns by adding files to the *AppPatterns* directory where Enterprise Architect is installed; top level directories are listed as Technologies and can contain an icon file to customize the icon displayed for the technology

Directories below this are defined as groups in the patterns list; the patterns are defined by the presence of four files with a matching name: a zip file (.zip), XML file (.xml), config file (.cfg) and optional icon (.ico)

- The *config* file supports the following fields:
  - [provider], [language], [platform], [url], [description], [version] - all displayed in the description field
  - [xmrootpaths] - the root path of the source code in the exported xmi; this is replaced with the selected destination folder when the user applies the application pattern

## 11.2 MDG Integration and Code Engineering

### Topics

Topic	Detail	See also
<b>Abstract/Usage</b>	<p>MDG Integration for Eclipse and MDG Integration for Visual Studio are standalone products that provide an enhanced code engineering functionality between Enterprise Architect and the development environments.</p> <p>The MDG Integration programs provide a lightweight bridge between Enterprise Architect and the development environment, offering enhanced code generation, reverse engineering and synchronization between code and the UML model; merging changes can be achieved with minimal effort, and navigation between model and source code is significantly enhanced.</p> <p>Trial versions of MDG Integration for Eclipse and MDG Integration for Visual Studio can be downloaded from the Sparx Systems website.</p>	<p><a href="http://www.sparxsystems.com/products/mdg/int/eclipse/index.html">www.sparxsystems.com/products/mdg/int/eclipse/index.html</a> (Online Resource)</p> <p><a href="http://www.sparxsystems.com/products/mdg/int/vs/index.html">www.sparxsystems.com/products/mdg/int/vs/index.html</a> (Online Resource)</p>

## 11.3 Modeling Conventions

In order to get the most out of the round trip engineering in Enterprise Architect, you must be familiar with the modeling conventions used when generating and reverse engineering the languages you use. This topic describes the stereotypes, Tagged Values and other conventions used in code engineering in Enterprise Architect for the following supported languages:

Topic	Link
Action Script	<a href="#">ActionScript</a> <sup>[2081]</sup>
Ada 2005 (Systems Engineering and Ultimate editions)	<a href="#">Ada 2005</a> <sup>[2082]</sup>
C	<a href="#">C</a> <sup>[2084]</sup>
C#	<a href="#">C#</a> <sup>[2088]</sup>
C++	<a href="#">C++</a> <sup>[2090]</sup>
Delphi	<a href="#">Delphi</a> <sup>[2095]</sup>
Java	<a href="#">Java</a> <sup>[2096]</sup>
PHP	<a href="#">PHP</a> <sup>[2099]</sup>
Python	<a href="#">Python</a> <sup>[2100]</sup>
SystemC (Systems Engineering and Ultimate editions)	<a href="#">SystemC</a> <sup>[2100]</sup>
Verilog (Systems Engineering and Ultimate editions)	<a href="#">Verilog</a> <sup>[2105]</sup>
VHDL (Systems Engineering and Ultimate editions)	<a href="#">VHDL</a> <sup>[2106]</sup>
Visual Basic	<a href="#">Visual Basic</a> <sup>[2109]</sup>
Visual Basic .NET	<a href="#">Visual Basic .NET</a> <sup>[2102]</sup>

### Notes

- Enterprise Architect incorporates a number of visibility indicators or scope values for its supported languages; these include, for:
  - All languages - Public (+), Protected (#) and Private (-)
  - Java - Package (~)
  - Delphi - Published (^)
  - C# - Internal (~), Protected Internal (^)
  - ActionScript - Internal (~)
  - VB.NET - Friend (~), Protected Friend (^)
  - PHP - Package (~)

- Python - Package (~)
- C - Package (~)
- C++ - Package (~)

### 11.3.1 ActionScript Conventions

Enterprise Architect supports round trip engineering of ActionScript 2 and 3, where the following conventions are used.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>literal</b>	Operation	A literal method referred to by a variable.
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>dynamic</b>	Class or Interface	The <i>dynamic</i> keyword.
<b>final</b>	ActionScript 3: Operation	The <i>final</i> keyword.
<b>intrinsic</b>	ActionScript 2: Class	The <i>intrinsic</i> keyword.
<b>namespace</b>	ActionScript 3: Class, Interface, Attribute, Operation	The namespace of the current element.
<b>override</b>	ActionScript 3: Operation	The <i>override</i> keyword.
<b>prototype</b>	ActionScript 3: Attribute	The <i>prototype</i> keyword.
<b>rest</b>	ActionScript 3: Parameter	The <i>rest</i> parameter ( ... ).

### Common Conventions

- Package qualifiers (ActionScript 2) and Packages (ActionScript 3) are generated when the current Package is not a **namespace root**
- An unspecified type is modeled as *var* or an empty **Type** field

### ActionScript 3 Conventions

- The *Is Leaf* property of a Class corresponds to the sealed keyword
- If a *namespace* tag is specified it overrides the *Scope* that is specified

### Learn more

- [Import Source Code](#) <sup>[2138]</sup>
- [Generate Source Code](#) <sup>[2117]</sup>
- [ActionScript Options](#) <sup>[2264]</sup>
- [Namespaces](#) <sup>[2120]</sup>

## 11.3.2 Ada 2005 Conventions

Enterprise Architect supports round trip engineering of Ada 2005, where the following conventions are used.

### Stereotypes

Stereotype	Applies To	Corresponds To
<b>adaPackage</b>	Class	A package specification in Ada 2005 without a tagged record.
<b>adaProcedure</b>	Class	A procedure specification in Ada 2005.
<b>delegate</b>	Operation	Access to a subprogram.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>struct</b>	Inner Class	A record definition.
<b>typedef</b>	Inner Class	A type definition, subtype definition, access type definition, renaming.

### Tagged Values

Tag	Applies To	Corresponds To
<b>Discriminant</b>	Inner Class with stereotype <i>typedef</i>	The type's discriminant.
<b>IsAccess</b>	Parameter	Determination of whether the parameter is an access variable.
<b>InstantiatedUnitType</b>	Inner Class with stereotype <i>typedef</i>	The instantiated unit's type ( <i>Package / Procedure / Function</i> ).
<b>PartType</b>	Inner Class with stereotype <i>typedef</i>	The part type ( <i>renames</i> or <i>new</i> ).
<b>Type</b>	Inner Class with stereotype <i>typedef</i>	If Value = <i>Sub Type</i> , set subtype If Value = <i>Access</i> , set access type.

### Other Conventions

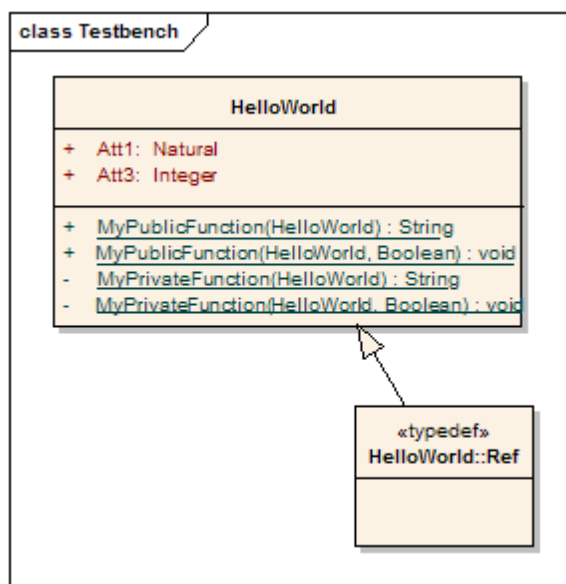

- Appropriate type of source files: Ada specification file, **.ads**
- Ada 2005 imports Packages defined as either <<adaPackage>>Class or Class, based on the settings in the **Ada 2005 options**
- A Package in the Ada specification file is imported as a Class if it contains a Tagged Record, the name of which is governed by the options **Use Class Name for Tagged Record** and **Alternate Tagged Record Name**; all attributes defined in that Tagged Record are absorbed as the Class's attributes
- A procedure / function in an Ada specification file is considered as the Class's member function if its first parameter satisfies the conditions specified in the options **Ref Param Style, Ignore Reference parameter name** and **Ref parameter name**
- The option **Define Reference for Tagged Record**, if enabled, creates a reference type for the Class, the name of which is determined by the option **Reference Type Name**; for example:

```

HelloWorld.ads
package HelloWorld is
    type HelloWorld is tagged record
        Att1: Natural;
        Att3: Integer;
    end record;

    -- Public Functions
    function MyPublicFunction (P: HelloWorld) return String;
    procedure MyPublicFunction (P1: in out HelloWorld; AFlag:
Boolean);
private
    -- Private Functions
    function MyPrivateFunction (P: HelloWorld) return String;
    procedure MyPrivateFunction (P1: in out HelloWorld; AFlag:
Boolean);

end HelloWorld;
```

### Notes

- Ada 2005 support is available in the System Engineering and Ultimate editions of Enterprise Architect

### Learn more

- [Import Source Code](#) <sup>[2138]</sup>
- [Generate Source Code](#) <sup>[2111]</sup>
- [Ada 2005 Options](#) <sup>[2264]</sup>

## 11.3.3 C Conventions

Enterprise Architect supports round trip engineering of C, where the following conventions are used:

### Stereotype

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>struct</b>	Inner Class	A <i>struct</i> type.
	Attribute	A keyword <i>struct</i> in variable definition.
<b>typedef</b>	Inner Class	A <i>typedef</i> statement, where the parent is the original type name.
<b>union</b>	Inner Class	A <i>union</i> type.

Stereotype	Applies To	Corresponds To
	Attribute	A keyword <i>union</i> in variable definition.

### Tagged Values

Tag	Applies To	Corresponds To
<b>anonymous</b>	Class also containing the Tagged Value <i>typedef</i>	The name of this class being defined only by the <i>typedef</i> statement.
<b>bodyLocation</b>	Operation	The location the method body is generated to; expected values are <b>header</b> , <b>classDec</b> or <b>classBody</b> .
<b>typedef</b>	Class with stereotype other than <i>typedef</i>	This Class being defined in a <i>typedef</i> statement.
<b>typeSynonyms</b>	Class	The <i>typedef</i> name and/or fields of this type.

### C Code Generation for UML Model

UML	C Code	Notes
A Class	A pair of C files (.h + .c)	File name is the same as Class name.
Operation (public & protected)	Function declaration in .h file and definition in .c file	
Operation (private)	Function definition in .c file only	
Operation (static)	Function definition in .c file only	Static functions will only appear in the .c file regardless of their scope.
Attribute (public & protected)	Variable definition in .h file	
Attribute (private)	Variable definition in .c file	

UML	C Code	Notes
Inner Class (without stereotype)	(N/A)	This inner Class would be ignored

### Capture #define value to be generated in C code

For example, `#define PI 3.14`.

Step	Process	See also
1	Add an attribute to the Class, with <b>Name = PI</b> and <b>Initial Value = 3.14</b> .	<a href="#">Attributes</a> <sup>[999]</sup>
2	In the General page of the Attribute Properties dialog, select the <b>Static</b> and <b>Const</b> checkboxes.	<a href="#">General Properties of Attributes</a> <sup>[100]</sup>
3	On the Tagged Values page of the Attribute Properties dialog, add a tag called <i>define</i> with the value <b>true</b> .	<a href="#">Attribute Tagged Values</a> <sup>[1005]</sup>

### Notes

- Separate conventions apply to Object Oriented programming in C

### Learn more

- [Import Source Code](#) <sup>[2138]</sup>
- [Generate Source Code](#) <sup>[211]</sup>
- [C Options](#) <sup>[2266]</sup>
- [Object Oriented Programming in C](#) <sup>[2086]</sup>

### 11.3.3.1 Object Oriented Programming In C

The following conventions are used for Object-Oriented programming in C.

To configure Enterprise Architect to support Object-Oriented programming using C, you must set the **Object Oriented Support** option to **True** on the C Specifications page of the Options dialog.

### Reference

#### **Stereotype**

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>struct</b>	Class	A <i>struct</i> type.

Stereotype	Applies To	Corresponds To
	Attribute	A keyword <i>struct</i> in variable definition.
<b>typedef</b>	Class	A <i>typedef</i> statement, where the parent is the original type name.
<b>union</b>	Class	A <i>union</i> type.
	Attribute	A keyword <i>union</i> in variable definition.

### Tagged Values

Tag	Applies To	Corresponds To
<b>anonymous</b>	Class with stereotype of <i>enumeration, struct or union</i>	The name of this Class being defined only by the <i>typedef</i> statement.
<b>bodyLocation</b>	Operation	The location the method body is generated to; expected values are <b>header</b> , <b>classDec</b> or <b>classBody</b> .
<b>define</b>	Attribute	<i>#define</i> statement.
<b>typedef</b>	Class with stereotype of <i>enumeration, struct or union</i>	This Class being defined in a <i>typedef</i> statement.

### Topics

Topic	Detail	See also
<b>Object-Oriented C Code Generation for UML Model</b>	<p>The basic idea of implementing a UML Class in C code is to group the data variable (UML attributes) into a structure type; this structure is defined in a .h file so that it can be shared by other classes and by the client that referred to it.</p> <p>An operation in a UML Class is implemented in C code as a function; the name of the function must be a fully qualified name that consists of the operation name, as well as the Class name to indicate that the operation is for that Class.</p> <p>A delimiter (specified in the <b>Namespace Delimiter</b> option on the C Specifications page) is used to join the Class name and function (operation) name.</p> <p>The function in C code must also have a reference parameter to the Class object - you can modify the <b>Reference as Operation Parameter</b>, <b>Reference Parameter Style</b> and <b>Reference Parameter Name</b> options on the C Specifications page to support this reference parameter.</p>	<a href="#">C Specification</a> s [2266]
<b>Limitations of Object-Oriented Programming in C</b>	<ul style="list-style-type: none"> <li>No scope mapping for an attribute: an attribute in a UML Class is mapped to a structure variable in C code, and its scope (private, protected or public) is ignored</li> <li>Currently an inner Class is ignored: if a UML Class is the inner Class of another UML Class, it is ignored when generating C code</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>Initial value is ignored: the initial value of an attribute in a UML Class is ignored in generated C code</li> </ul>

### 11.3.4 C# Conventions

Enterprise Architect supports the round trip engineering of C#, where the following conventions are used.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>event</b>	Operation	An event.
<b>extension</b>	Operation	A Class extension method, represented in code by a <i>this</i> parameter in the signature.
<b>indexer</b>	Operation	A property acting as an index for this Class.
<b>partial</b>	Operation	The <i>partial</i> keyword on an operation.
<b>property</b>	Operation	A property possibly containing both read and write code.
<b>struct</b>	Class	A <i>struct</i> type.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>argumentName</b>	Operation with stereotype <i>extension</i>	The name given to <i>this</i> parameter.

Tag	Applies To	Corresponds To
<b>attribute_name</b>	Operation with stereotype <i>property</i> or <i>event</i>	The name of the variable behind this property or event.
<b>className</b>	Operation with stereotype <i>extension</i>	The Class that this method is being added to.
<b>const</b>	Attribute	The <i>const</i> keyword.
<b>definition</b>	Operation with stereotype <i>partial</i>	Whether this is the declaration of the method, or the definition.
<b>delegate</b>	Operation	The <i>delegate</i> keyword.
<b>enumType</b>	Operation with stereotype <i>property</i>	The datatype that the property is represented as.
<b>extern</b>	Operation	The <i>extern</i> keyword.
<b>fixed</b>	Attribute	The <i>fixed</i> keyword.
<b>generic</b>	Operation	The generic parameters for this Operation.
<b>genericConstraints</b>	Templated Class or Interface, Operation with tag <i>generic</i>	The constraints on the generic parameters of this type or operation.
<b>Implements</b>	Operation	The name of the method this implements, including the interface name.
<b>ImplementsExplicit</b>	Operation	The presence of the source interface name in this method declaration.
<b>initializer</b>	Operation	A constructor initialization list.
<b>new</b>	Class, Interface, Operation	The <i>new</i> keyword.
<b>override</b>	Operation	The <i>override</i> keyword.

Tag	Applies To	Corresponds To
<b>params</b>	Parameter	A parameter list using the <code>params</code> keyword.
<b>partial</b>	Class, Interface	The <i>partial</i> keyword.
<b>readonly</b>	Operation with stereotype <i>property</i>	This property only defining read code.
<b>sealed</b>	Operation	The <i>sealed</i> keyword.
<b>static</b>	Class	The <i>static</i> keyword.
<b>unsafe</b>	Class, Interface, Operation	The <i>unsafe</i> keyword.
<b>virtual</b>	Operation	The <i>virtual</i> keyword.
<b>writeonly</b>	Operation with stereotype <i>property</i>	This property only defining write code.

#### Other Conventions

- Namespaces are generated for each package below a **namespace root**
- The *Const* property of an attribute corresponds to the *readonly* keyword, while the tag *const* corresponds to the *const* keyword
- The value of *inout* for the *Kind* property of a parameter corresponds to the *ref* keyword
- The value of *out* for the *Kind* property of a parameter corresponds to the *out* keyword
- Partial Classes can be modeled as two separate Classes with the *partial* tag
- The *Is Leaf* property of a Class corresponds to the *sealed* keyword

#### Learn more

- [Generate Source Code](#) <sup>[2111]</sup>
- [C# Options](#) <sup>[2268]</sup>
- [Namespaces](#) <sup>[2120]</sup>

### 11.3.5 C++ Conventions

Enterprise Architect supports round trip engineering of C++, including the **Managed C++** and **C++/CLI** extensions, where the following conventions are used.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>friend</b>	Operation	The <i>friend</i> keyword.
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.
<b>struct</b>	Class	A <i>struct</i> type.
<b>typedef</b>	Class	A <i>typedef</i> statement, where the parent is the original type name.
<b>union</b>	Class	A <i>union</i> type.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>afx_msg</b>	Operation	The <i>afx_msg</i> keyword.
<b>anonymous</b>	Class also containing the Tagged Value <i>typedef</i>	The name of this Class being only defined by the <i>typedef</i> statement.
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>bitfield</b>	Attribute	The size, in bits, allowed for storage of this attribute.
<b>bodyLocation</b>	Operation	The location the method body is generated to; expected values are <b>header</b> , <b>classDec</b> or <b>classBody</b> .
<b>callback</b>	Operation	A reference to the <b>CALLBACK</b> macro.
<b>explicit</b>	Operation	The <i>explicit</i> keyword.
<b>initializer</b>	Operation	A constructor initialization list.

Tag	Applies To	Corresponds To
<b>inline</b>	Operation	The <i>inline</i> keyword and inline generation of the method body.
<b>mutable</b>	Attribute	The <i>mutable</i> keyword.
<b>throws</b>	Operation	The exceptions that are thrown by this method.
<b>typedef</b>	Class with stereotype other than <i>typedef</i>	This Class being defined in a <i>typedef</i> statement.
<b>typeSynonyms</b>	Class	The <i>typedef</i> name and/or fields of this type.
<b>volatile</b>	Operation	The <i>volatile</i> keyword.

### Other Conventions

- Namespaces are generated for each package below a **namespace root**
- By Reference* attributes correspond to a pointer to the type specified
- The *Transient* property of an attribute corresponds to the *volatile* keyword
- The *Abstract* property of an attribute corresponds to the *virtual* keyword
- The *Const* property of an operation corresponds to the *const* keyword, specifying a constant return type
- The *Is Query* property of an operation corresponds to the *const* keyword, specifying the method doesn't modify any fields
- The *Pure* property of an operation corresponds to a pure *virtual* method using the "**0**" syntax
- The *Fixed* property of a parameter corresponds to the *const* keyword

### Learn more

- [Generate Source Code](#) <sup>[2111]</sup>
- [Namespaces](#) <sup>[2120]</sup>
- [C++ Options](#) <sup>[2269]</sup>

### 11.3.5.1 Managed C++ Conventions

The following conventions are used for managed extensions to C++ prior to C++/CLI. In order to set the system to generate managed C++ you must modify the C++ version in the **C++ Options**.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>property</b>	Operation	The <code>__property</code> keyword.
<b>property get</b>	Operation	The <code>__property</code> keyword and a read property.
<b>property set</b>	Operation	The <code>__property</code> keyword and a write property.
<b>reference</b>	Class	The <code>__gc</code> keyword.
<b>value</b>	Class	The <code>__value</code> keyword.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>managedType</b>	Class with stereotype <i>reference</i> , <i>value</i> or <i>enumeration</i> ; Interface	The keyword used in declaration of this type; expected values are <i>class</i> or <i>struct</i> .

#### Other Conventions

- The *typedef* and anonymous tags from native C++ are not supported
- The *Pure* property of an operation corresponds to the keyword `__abstract`

#### Learn more

- [C++/CLI Conventions](#) <sup>[2094]</sup>
- [C++ Options](#) <sup>[2269]</sup>
- [Import Source Code](#) <sup>[2138]</sup>

### 11.3.5.2 C++/CLI Conventions

The following conventions are used for modeling **C++/CLI** extensions to **C++**. In order to set the system to generate managed C++/CLI you must modify the C++ version in the **C++ Options**.

#### Stereotypes

Stereotype	Applies To	Description
<b>event</b>	Operation	Defines an event to provide access to the event handler for this Class.
<b>property</b>	Operation, Attribute	This is a property possibly containing both read and write code.
<b>reference</b>	Class	Corresponds to the <i>ref class</i> or <i>ref struct</i> keyword.
<b>value</b>	Class	Corresponds to the <i>value class</i> or <i>value struct</i> keyword.

#### Tagged Values

Tag	Applies To	Description
<b>attribute_name</b>	Operation with stereotype <i>property</i> or <i>event</i>	The name of the variable behind this property or event.
<b>generic</b>	Operation	Defines the generic parameters for this Operation.
<b>genericConstraints</b>	Templated Class or Interface, Operation with tag <i>generic</i>	Defines the constraints on the generic parameters for this Operation.
<b>initonly</b>	Attribute	Corresponds to the <i>initonly</i> keyword.
<b>literal</b>	Attribute	Corresponds to the <i>literal</i> keyword.
<b>managedType</b>	Class with stereotype <i>reference</i> , <i>value</i> or <i>enumeration</i> ; Interface	Corresponds to either the <i>class</i> or <i>struct</i> keyword.

**Other Conventions**

- The *typedef* and anonymous tags are not used
- The *property get/property set* stereotypes are not used
- The *Pure* property of an operation corresponds to the keyword *abstract*

**Learn more**

- [C++ Options](#)<sup>[2269]</sup>
- [Import Source Code](#)<sup>[2138]</sup>
- [Generate Source Code](#)<sup>[2111]</sup>

**11.3.6 Delphi Conventions**

Enterprise Architect supports round trip engineering of Delphi, where the following conventions are used.

**Stereotypes**

Stereotype	Applies To	Corresponds To
<b>constructor</b>	Operation	A constructor.
<b>destructor</b>	Operation	A destructor.
<b>dispinterface</b>	Class, Interface	A dispatch interface.
<b>enumeration</b>	Class	An enumerated type.
<b>metaclass</b>	Class	A metaclass type.
<b>object</b>	Class	An object type.
<b>operator</b>	Operation	An operator.
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.
<b>struct</b>	Class	A record type.

Tagged Values

Tag	Applies To	Corresponds To
<b>attribute_name</b>	Operation with stereotype <i>property</i> <i>get</i> or <i>property set</i>	The name of the variable behind this property.
<b>overload</b>	Operation	The <i>overload</i> keyword.
<b>override</b>	Operation	The <i>override</i> keyword.
<b>packed</b>	Class	The <i>packed</i> keyword.
<b>property</b>	Class	A property; see <i>Delphi Properties</i> for more information.
<b>reintroduce</b>	Operation	The <i>reintroduce</i> keyword.

Other Conventions

- The *Static* property of an attribute or operation corresponds to the *class* keyword
- The *Fixed* property of a parameter corresponds to the *const* keyword
- The value of *inout* for the *Kind* property of a parameter corresponds to the *Var* keyword
- The value of *out* for the *Kind* property of a parameter corresponds to the *Out* keyword

Learn more

- [Generate Source Code](#) <sup>[2117]</sup>
- [Delphi Options](#) <sup>[2271]</sup>
- [Delphi Properties](#) <sup>[2272]</sup>

### 11.3.7 Java Conventions

Enterprise Architect supports round trip engineering of Java - including **AspectJ** extensions - where the following conventions are used.

Stereotypes

Stereotype	Applies To	Corresponds To
<b>annotation</b>	Interface	An <i>annotation</i> type.
<b>enum</b>	Attributes within a Class stereotyped <i>enumeration</i>	An <i>enumerated</i> option, distinguished from other attributes that have no stereotype.
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>operator</b>	Operation	An operator.
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.
<b>static</b>	Class or Interface	The <i>static</i> keyword.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>annotations</b>	Anything	The annotations on the current code feature.
<b>arguments</b>	Attribute with stereotype <i>enum</i>	The arguments that apply to this enumerated value.
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>dynamic</b>	Class or Interface	The <i>dynamic</i> keyword.
<b>generic</b>	Operation	The generic parameters to this operation.
<b>parameterList</b>	Parameter	A parameter list with the ... syntax.
<b>throws</b>	Operation	The exceptions that are thrown by this method.

Tag	Applies To	Corresponds To
<b>transient</b>	Attribute	The transient keyword.

#### Other Conventions

- Package statements are generated when the current package is not a **namespace root**
- The *Const* property of an attribute or operation corresponds to the final keyword
- The *Transient* property of an attribute corresponds to the volatile keyword
- The *Fixed* property of a parameter corresponds to the final keyword

#### Learn more

- [AspectJ Conventions](#) <sup>[2098]</sup>
- [Import Source Code](#) <sup>[2138]</sup>
- [Generate Source Code](#) <sup>[2117]</sup>
- [Java Options](#) <sup>[2272]</sup>
- [Namespaces](#) <sup>[2120]</sup>

### 11.3.7.1 *AspectJ Conventions*

The following are the conventions used for supporting AspectJ extensions to Java.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>advice</b>	Operation	A piece of advice in an AspectJ aspect.
<b>aspect</b>	Class	An AspectJ aspect.
<b>pointcut</b>	Operation	A pointcut in an AspectJ aspect.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>className</b>	Attribute or operation within a Class stereotyped <i>aspect</i>	The Classes this AspectJ intertype member belongs to.

#### Other Conventions

- The specifications of a pointcut are included in the **Behavior** field of the method

Learn more

- [Java Conventions](#) <sup>[2096]</sup>
- [Import Source Code](#) <sup>[2138]</sup>
- [Generate Source Code](#) <sup>[2117]</sup>

### 11.3.8 PHP Conventions

Enterprise Architect supports the round trip engineering of PHP 4 and 5, where the following conventions are used.

Stereotypes

Stereotype	Applies To	Corresponds To
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.

Tagged Values

Tag	Applies To	Corresponds To
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>final</b>	Operations in PHP 5	The final keyword.

Common Conventions

- An unspecified type is modeled as *var*
- Methods returning a reference are generated by setting the *Return Type* to *var\**
- Reference parameters are generated from parameters with the parameter *Kind* set to *inout* or *out*

PHP 5 Conventions

- The *final* Class modifier corresponds to the *Is Leaf* property
- The *abstract* Class modifier corresponds to the *Abstract* property
- Parameter type hinting is supported by setting the *Type* of a parameter
- The value of *inout* or *out* for the *Kind* property of a parameter corresponds to a *reference* parameter

### 11.3.9 Python Conventions

Enterprise Architect supports the round trip engineering of Python, where the following conventions are used.

Tagged Values

Tag	Applies To	Corresponds To
<b>Decorators</b>	Class, Operation	The decorators applied to this element in the source.

Other Conventions

- Model members with *Private Scope* correspond to code members with two leading underscores
- Attributes are only generated when the Initial value is not empty
- All types are reverse engineered as *var*

### 11.3.10 SystemC Conventions

Enterprise Architect supports round-trip engineering of **SystemC**, where the following conventions are used.

Stereotypes

Stereotype	Applies To	Corresponds To
<b>delegate</b>	Method	A delegate.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>friend</b>	Method	A <i>friend</i> method.
<b>property</b>	Method	A property definition.

Stereotype	Applies To	Corresponds To
<b>sc_ctor</b>	Method	A SystemC constructor.
<b>sc_module</b>	Class	A SystemC module.
<b>sc_port</b>	Attribute	A port.
<b>sc_signal</b>	Attribute	A signal.
<b>struct</b>	Inner Class	A <i>struct</i> or <i>union</i> .

#### Tagged Values

Tag	Applies To	Corresponds To
<b>kind</b>	Attribute (Port)	Port kind ( <i>clocked</i> , <i>fifo</i> , <i>master</i> , <i>slave</i> , <i>resolved</i> , <i>vector</i> ).
<b>mode</b>	Attribute (Port)	Port mode ( <i>in</i> , <i>out</i> , <i>inout</i> ).
<b>overrides</b>	Method	The <i>Inheritance</i> list of a method declaration.
<b>throw</b>	Method	The exception specification of a method.

#### Other Conventions

- SystemC also inherits most of the stereotypes and Tagged Values of C++

#### SystemC Toolbox Pages

Access **Diagram | Diagram Toolbox: More tools | HDL | SystemC Constructs**

Drag these icons onto a diagram to model a SystemC design.

Page	Icon	Action
<b>SystemC</b>	<b>Module</b>	Defines a SystemC Module.

Page	Icon	Action
		An <i>sc_module</i> -stereotyped Class element.
	<b>Enumeration</b>	Defines an Enumerated Type. An Enumeration element.
	<b>Struct</b>	Defines a Structure. A <i>struct</i> -stereotyped Class element.
<b>SystemC Features</b>	<b>Port</b>	Defines a SystemC Port. An <i>sc_port</i> -stereotyped attribute.
	<b>Signal</b>	Defines a SystemC Signal. An <i>sc_signal</i> -stereotyped attribute.
	<b>Constructor</b>	Defines a SystemC Constructor. An <i>sc_ctor</i> -stereotyped method.

- [Generate Source Code](#)  <sup>[2117]</sup>
- [C++ Conventions](#)  <sup>[2090]</sup>
- [SystemC Options](#)  <sup>[2275]</sup>

### 11.3.11 VB.NET Conventions

Enterprise Architect supports round-trip engineering of Visual Basic.NET, where the following conventions are used. Earlier versions of Visual Basic are supported as a different language.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>event</b>	Operation	An event declaration.
<b>import</b>	Operation	An operation to be imported from another library.
<b>module</b>	Class	A module.

Stereotype	Applies To	Corresponds To
<b>operator</b>	Operation	An operator overload definition.
<b>partial</b>	Operation	The <i>partial</i> keyword on an operation.
<b>property</b>	Operation	A property possibly containing both read and write code.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>Alias</b>	Operation with stereotype <i>import</i>	The alias for this imported operation.
<b>attribute_name</b>	Operation with stereotype <i>property</i>	The name of the variable behind this property.
<b>Charset</b>	Operation with stereotype <i>import</i>	The <i>character set</i> clause for this import - one of the values <i>Ansi</i> , <i>Unicode</i> or <i>Auto</i> .
<b>delegate</b>	Operation	The <i>Delegate</i> keyword.
<b>enumTag</b>	Operation with stereotype <i>property</i>	The datatype that this property is represented as.
<b>Handles</b>	Operation	The <i>handles</i> clause on this operation.
<b>Implements</b>	Operation	The <i>implements</i> clause on this operation.
<b>Lib</b>	Operation with stereotype <i>import</i>	The library this import comes from.
<b>MustOverride</b>	Operation	The <i>MustOverride</i> keyword.
<b>Narrowing</b>	Operation with stereotype <i>operator</i>	The <i>Narrowing</i> keyword.
<b>NotOverrideable</b>	Operation	The <i>NotOverrideable</i> keyword.
<b>Overloads</b>	Operation	The <i>Overloads</i> keyword.

Tag	Applies To	Corresponds To
<b>Overrides</b>	Operation	The <i>Overrides</i> keyword.
<b>parameterArray</b>	Parameter	A parameter list using the <i>ParamArray</i> keyword.
<b>partial</b>	Class, Interface	The <i>Partial</i> keyword.
<b>readonly</b>	Operation with stereotype <i>property</i>	This property only defining read code.
<b>shadows</b>	Class, Interface, Operation	The <i>Shadows</i> keyword.
<b>Shared</b>	Attribute	The <i>Shared</i> keyword.
<b>Widening</b>	Operation with stereotype <i>operator</i>	The <i>Widening</i> keyword.
<b>writeonly</b>	Operation with stereotype <i>property</i>	This property only defining write code.

### Other Conventions

- Namespaces are generated for each package below a **namespace root**
- The *Is Leaf* property of a Class corresponds to the *NotInheritable* keyword
- The *Abstract* property of a Class corresponds to the *MustInherit* keyword
- The *Static* property of an attribute or operation corresponds to the *Shared* keyword
- The *Abstract* property of an operation corresponds to the *MustOverride* keyword
- The value of *in* for the *Kind* property of a parameter corresponds to the *ByVal* keyword
- The value of *inout* or *out* for the *Kind* property of a parameter corresponds to the *ByRef* keyword

### 11.3.12 Verilog Conventions

Enterprise Architect supports round-trip engineering of Verilog, where the following conventions are used.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>asynchronous</b>	Method	A concurrent process.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>initializer</b>	Method	An initializer process.
<b>module</b>	Class	A module.
<b>part</b>	Attribute	A component instantiation.
<b>port</b>	Attribute	A port.
<b>synchronous</b>	Method	A sequential process.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>kind</b>	Attribute (signal)	The signal kind (such as <i>register</i> , <i>bus</i> ).
<b>mode</b>	Attribute (port)	The port mode ( <i>in</i> , <i>out</i> , <i>inout</i> ).
<b>Portmap</b>	Attribute (part)	The generic / port map of the component instantiated.
<b>sensitivity</b>	Method	The sensitivity list of a sequential process.
<b>type</b>	Attribute	The range or type value of an attribute.

### Verilog Toolbox Pages

**Access** [Diagram](#) | [Diagram Toolbox: More tools](#) | [HDL](#) | [Verilog Constructs](#)

Drag these icons onto a diagram to model a Verilog design.

Page	Item	Action
<b>Verilog</b>	Module	Defines a Verilog Module. A <i>module</i> -stereotyped Class element.
	Enumeration	Defines an Enumerated Type. An enumeration element.
<b>Verilog Features</b>	Port	Defines a Verilog Port. A <i>port</i> -stereotyped attribute.
	Part	Defines a Verilog component instantiation. A <i>part</i> -stereotyped attribute.
	Attribute	Defines an attribute.
	Procedure <ul style="list-style-type: none"> <li>• Concurrent</li> <li>• Sequential</li> <li>• Initializer</li> </ul>	Defines a Verilog process: <ul style="list-style-type: none"> <li>• An <i>asynchronous</i>-stereotyped method</li> <li>• A <i>synchronous</i>-stereotyped method</li> <li>• An <i>initializer</i>-stereotyped method</li> </ul>

## 11.3.13 VHDL Conventions

Enterprise Architect supports round-trip engineering of VHDL, where the following conventions are used.

### Stereotypes

Stereotype	Applies To	Corresponds To
<b>architecture</b>	Class	An architecture.
<b>asynchronous</b>	Method	An asynchronous process.

Stereotype	Applies To	Corresponds To
<b>configuration</b>	Method	A configuration.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>entity</b>	Interface	An entity.
<b>part</b>	Attribute	A component instantiation.
<b>port</b>	Attribute	A port.
<b>signal</b>	Attribute	A signal declaration.
<b>struct</b>	Inner Class	A record definition.
<b>synchronous</b>	Method	A synchronous process.
<b>typedef</b>	Inner Class	A <i>type</i> or <i>subtype</i> definition.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>isGeneric</b>	Attribute (port)	The port declaration in a generic interface.
<b>isSubType</b>	Inner Class (typedef)	A subtype definition.
<b>kind</b>	Attribute (signal)	The signal kind (such as <i>register</i> , <i>bus</i> ).
<b>mode</b>	Attribute (port)	The port mode ( <i>in</i> , <i>out</i> , <i>inout</i> , <i>buffer</i> , <i>linkage</i> ).
<b>portmap</b>	Attribute (part)	The generic / port map of the component instantiated.
<b>sensitivity</b>	Method (synchronous)	The sensitivity list of a synchronous process.

Tag	Applies To	Corresponds To
<b>type</b>	Inner Class (typedef)	The type indication of a type declaration.
<b>typeNameSpace</b>	Attribute (part)	The type namespace of the instantiated component.
