### 11.3.14 Visual Basic Conventions

Enterprise Architect supports the round trip engineering of Visual Basic 5 and 6, where the following conventions are used.

Visual Basic .Net is supported as a different language.

#### Stereotypes

Stereotype	Applies To	Corresponds To
<b>global</b>	Attribute	The <i>Global</i> keyword.
<b>import</b>	Operation	An operation to be imported from another library.
<b>property get</b>	Operation	A property <i>get</i> .
<b>property set</b>	Operation	A property <i>set</i> .
<b>property let</b>	Operation	A property <i>let</i> .
<b>with events</b>	Attribute	The <i>WithEvents</i> keyword.

#### Tagged Values

Tag	Applies To	Corresponds To
<b>Alias</b>	Operation with stereotype <i>import</i>	The alias for this imported operation.
<b>attribute_name</b>	Operation with stereotype <i>property get</i> , <i>property set</i> or <i>property let</i>	The name of the variable behind this property.
<b>Lib</b>	Operation with stereotype <i>import</i>	The library this import comes from.
<b>New</b>	Attribute	The <i>New</i> keyword.

### Other Conventions

- The value of *in* for the *Kind* property of a parameter corresponds to the *ByVal* keyword
- The value of *inout* or *out* for the *Kind* property of a parameter corresponds to the *ByRef* keyword

## 11.4 Generate Source Code

Generating source code (forward engineering) takes the UML Class or Interface model elements and creates a source code equivalent for future elaboration and compilation. By forward engineering code from the model, the mundane work involved with having to key in Classes and attributes and methods is avoided, and symmetry between model and code is ensured.

### Topics

Topic	Detail	See also
<b>Languages</b>	Enterprise Architect supports code generation in each of the following languages: <ul style="list-style-type: none"> <li>• Action Script</li> <li>• C</li> <li>• C# (for .NET 1.1, .NET 2.0 and .NET 4.0)</li> <li>• C++ (standard, plus .NET managed C++ extensions)</li> <li>• Delphi</li> <li>• Java (including Java 1.5, Aspects and Generics)</li> <li>• PHP</li> <li>• Python</li> <li>• Visual Basic</li> <li>• Visual Basic .NET</li> </ul>	
<b>Elements</b>	Code is generated from Class or Interface model elements, so you must create the required Class and Interface elements to generate from.  Add attributes (which become variables) and operations (which become methods).	
<b>Settings</b>	Before you generate code, you should ensure the default settings for code generation match your requirements; set up the defaults to match your required language and preferences.  Preferences that you can define include default constructors and destructors, methods for interfaces and the Unicode options for created languages.  Languages such as Java support 'namespaces' and can be configured to specify a namespace root.	<a href="#">Source Code Options</a> <sup>[2247]</sup> <a href="#">Namespaces</a> <sup>[2120]</sup> <a href="#">ActionScript Options</a> <sup>[2081]</sup> <a href="#">C Options</a> <sup>[2266]</sup> <a href="#">C# Options</a> <sup>[2268]</sup> <a href="#">C++ Options</a> <sup>[2269]</sup> <a href="#">Delphi Options</a> <sup>[2271]</sup>

	In addition to the default settings for generating code, Enterprise Architect facilitates setting specific generation options for each of the supported languages.	<a href="#">Java Options</a> <sup>[2272]</sup> <a href="#">PHP Options</a> <sup>[2274]</sup> <a href="#">Python Options</a> <sup>[2273]</sup> <a href="#">Visual Basic Options</a> <sup>[2277]</sup> <a href="#">Visual Basic .NET Options</a> <sup>[2275]</sup>
<b>Code Template Framework</b>	The Code Template Framework (CTF) enables you to customize the way Enterprise Architect generates source code and also enables generation of languages that are not specifically supported by Enterprise Architect.	<a href="#">Code Template Framework Tool</a> <sup>[2281]</sup>
<b>Local Paths</b>	Local path names enable you to substitute tags for directory names	<a href="#">Local Paths</a> <sup>[2255]</sup> <a href="#">Local Paths Dialog</a> <sup>[2256]</sup>
<b>Behavioral Code</b>	You can also generate code from three UML behavioral modeling paradigms: <ul style="list-style-type: none"> <li>• State Machine diagrams (SW &amp; HW)</li> <li>• Interaction (Sequence) diagrams (SW)</li> <li>• Activity diagrams (SW)</li> </ul>	<a href="#">Legacy State Machine Templates</a> <sup>[2126]</sup> <a href="#">Interaction (Sequence) diagrams</a> <sup>[2133]</sup> <a href="#">Activity diagrams</a> <sup>[2134]</sup>
<b>Live Code Generation</b>	On the <b>Code Engineering</b> submenu, you have the option to update your source code instantly as you make changes to your model.	<a href="#">Code Engineering Options</a> <sup>[657]</sup>
<b>Tasks</b>	When you generate code, you perform one or more of the following tasks: <ul style="list-style-type: none"> <li>• Generate a Single Class</li> <li>• Generate a Group of Classes</li> <li>• Generate a Package</li> <li>• Update Package Contents</li> </ul>	<a href="#">Generate a Single Class</a> <sup>[2113]</sup> <a href="#">Generate a Group of Classes</a> <sup>[2114]</sup> <a href="#">Generate a Package</a> <sup>[2115]</sup> <a href="#">Update Package Contents</a> <sup>[2117]</sup>

**Notes**

- The tools provided by Enterprise Architect for code engineering and debugging are available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- When security is enabled there are permissions for Generate Source Code and DDL and Reverse Engineer from DDL and Source Code

### 11.4.1 Generate a Single Class

Before you generate code for a single Class, you:

- Complete the design of the model element (Class or Interface)
- Create Inheritance connectors to parents and Associations to other Classes that are used
- Create Inheritance connectors to Interfaces that your Class implements; the system provides an option to generate function stubs for all interface methods that a Class implements

#### Generate code for a single Class

Step	Action	See also
1	Open the diagram containing the Class or Interface for which to generate code.	
2	Right-click on the required Class or Interface and select the <b>Generate Code</b> context menu option, or press <b>F11</b> .  The Generate Code dialog displays, through which you can control how and where your source code is generated.	
3	In the <b>Path</b> field, click on the ( ... ) (Browse) button and select a path name for your source code to be generated to.	
4	In the <b>Target Language</b> field, click on the drop-down arrow and select the language to generate; this becomes the permanent option for that Class, so change it back if you are only doing one pass in another language.	
5	Click on the <b>Advanced</b> button.  The Object Options dialog displays, providing subsets of the Source Code Engineering and code language options pages on the Options dialog.	<a href="#">Source Code Options</a>   <a href="#">Language Options</a> 
6	Set any custom options (for this Class alone), then click on the <b>Close</b> button to return to the Generate Code dialog.	
7	If you are generating Java, C++, C# or C code, the <b>Use the New State Machine Template</b> option displays with the checkbox selected.	<a href="#">Legacy State</a>

Step	Action	See also
	If you want to use the Legacy Statemachine code generation templates, deselect the checkbox.	<a href="#">Machine Templates</a> <sup>[2126]</sup>
<b>8</b>	In the <b>Import(s) / Header(s)</b> fields, type any import statements, <i>#includes</i> or other header information.  Note that in the case of Visual Basic this information is ignored; in the case of Java the two import text boxes are merged; and in the case of C++ the first import text area is placed in the header file and the second in the body (.cpp) file.	
<b>9</b>	Click on the <b>Generate</b> button to create the source code.	
<b>10</b>	When complete, click on the <b>View</b> button to see what has been generated.  Note that you should set up your default viewer/editor for each language type first; you can also set up the default editor on the Code Editors page of the Options dialog ( <b>Tools   Options   Source Code Engineering   Code Editors</b> ).	<a href="#">Editing Source Code</a> <sup>[2146]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Software Engineering | Generate Code | Generate a Single Class**

### 11.4.2 Generate a Group of Classes

In addition to being able to generate code for an individual Class, you can also select a group of Classes for batch code generation. When you do this, you accept all the default code generation options for each Class in the set.

#### Generate Class Group

Step	Detail	See also
<b>1</b>	Select a group of Classes and/or interfaces in a diagram.	
<b>2</b>	Right-click on an element in the group to display the context menu.	
<b>3</b>	Select the <b>Code Generation   Generate Selected elements</b> menu option.  If no code exists for the selected elements, the Save As dialog displays on which you specify the file path and name for each code file; enter this information and click on the <b>Save</b> button.	
<b>4</b>	The Batch Generation dialog displays, showing the status of the process as it executes (the process might be too fast to see this dialog).  If code already exists for the selected Class elements, and changes have been made to the Class name or structure, the Synchronize Element <package name>	<a href="#">Synchronize</a>

	.<element name> dialog might also display; this dialog helps synchronize the model and code.	<a href="#">Model and Code</a> [2118]
--	--	--

**Notes**

- If any of the elements selected are not Classes or interfaces the option to generate code is not available

**Learning Center**

- (Alt+F1) | **Enterprise Architect | Software Engineering | Generate Code | Generate Multiple Classes**

**11.4.3 Generate a Package**

In addition to generating source code from single Classes and groups of Classes, you can also generate code from a package. This feature provides options to recursively generate code from child packages and automatically generate directory structures based on the package hierarchy. This enables you to generate code for a whole branch of your project model in one step.

**Access** **Project Browser package context menu | Code Engineering | Generate Source Code**

**Generate code from a Package, on the Generate Package Source Code dialog**

Step	Action	See also
1	<p>In the <b>Synchronize</b> field, click on the drop-down arrow and select the appropriate synchronize option:</p> <ul style="list-style-type: none"> <li>• <b>Synchronize model and code:</b> Code for Classes with existing files is forward synchronized with that file; code for Classes with no existing file is generated to the displayed target file</li> <li>• <b>Overwrite code:</b> All selected target files are overwritten (forward generated)</li> <li>• <b>Do not generate:</b> Generate code for only those selected Classes that do not have an existing file; all other Classes are ignored</li> </ul>	
2	<p>Highlight the Classes for which to generate code; leave unselected any to not generate code for.</p> <p>If you want to display more of the information within the layout, you can resize the dialog and its columns.</p>	
3	<p>To make Enterprise Architect automatically generate directories and filenames based on the package hierarchy, select the <b>Auto Generate Files</b> checkbox; this enables the <b>Root Directory</b> field, in which you select a root directory under which the source directories are to be generated.</p> <p>By default, the <b>Auto Generate Files</b> feature <i>ignores</i> any file paths that are already associated with a Class; you can change this behavior by also selecting the <b>Retain Existing File Paths</b> checkbox.</p>	

Step	Action	See also
4	To include code for all sub-packages in the output, select the <b>Include Child Packages</b> checkbox.	
5	Click on the <b>Generate</b> button to start generating code.	

As code generation proceeds Enterprise Architect displays progress messages. If a Class requires an output filename Enterprise Architect prompts you to enter one at the appropriate time (assuming **Auto Generate Files** is not selected). For example, if the selected Classes include partial Classes, a prompt displays to enter the filename into which to generate code for the second partial Class.

For additional information on the options on the Generate Package Source Code dialog, see the following table:

Option	Action	See also
<b>Root Package</b>	Check the name of the package for which code is to be generated.	
<b>Synchronize</b>	Select options that specify how existing files should be regenerated.	
<b>Auto Generate Files</b>	Specify whether Enterprise Architect should automatically generate file names and directories, based on the package hierarchy.	
<b>Root Directory</b>	If <b>Auto Generate Files</b> is selected, display the path under which the generated directory structures are created.	
<b>Retain Existing File Paths</b>	If <b>Auto Generate Files</b> is selected, specify whether to use existing file paths associated with Classes.  If <b>Auto Generate Files</b> is unselected, Enterprise Architect generates Class code to automatically determined paths, regardless of whether source files are already associated with the Classes.	
<b>Include all Child Packages</b>	Also generate code for all Classes in all sub-packages of the target package in the list.  This option facilitates recursive generation of code for a given package and its sub-packages.	
<b>Select Objects to Generate</b>	List all Classes that are available for code generation under the target packages; only code for selected (highlighted) Classes is generated.	

Option	Action	See also
	Classes are listed with their target source file.	
<b>Select All</b>	Mark all Classes in the list as selected.	
<b>Select None</b>	Mark all Classes in the list as unselected.	
<b>Generate</b>	Start the generation of code for all selected Classes.	
<b>Cancel</b>	Exit the Generate Package Source Code dialog; no Class code is generated.	

#### Learning Center topics

- (Alt+F1) | [Enterprise Architect | Software Engineering | Generate Code | Generate a Package](#)

### 11.4.4 Update Package Contents

In addition to generating and importing code, Enterprise Architect provides the option to synchronize the model and source code, creating a model that represents the latest changes in the source code and vice versa. You can use either the model as the source, or the code as the source.

The behavior and actions of synchronization depend on the settings you have selected on the Attributes and Operations page of the Options dialog. These settings enable you to either protect or automatically discard information in the model that is not present in the code, and to prompt for a decision on code features that are not in the model. In the following two examples, the appropriate checkboxes have been selected for maximum protection of data:

- You generated some source code, but made subsequent changes to the model. When you generate code again, Enterprise Architect *adds* any new attributes or methods to the existing source code, leaving intact what already exists. This means developers can work on the source code and then generate *additional* methods as required from the model, without having their code overwritten or destroyed.
- You might have made changes to a source code file, but the model has detailed notes and characteristics you do not want to lose. By synchronizing from the source code into the model, you import additional attributes and methods but do not change other model elements.

Using the synchronization methods, it is simple to keep source code and model elements up to date and synchronized.

**Access** [Project Browser Package context menu | Code Engineering | Synchronize Package With Code \(Ctrl+Alt+M\)](#) or [Tools | Source Code Engineering | Synchronize Package Contents](#)

#### Synchronize package contents against source code

Field/Button	Action	See also
<b>Update Type</b>	Select the radio button to either <b>Forward Engineer</b> or <b>Reverse Engineer</b> the package Classes, as appropriate.	
<b>Include child packages in generation</b>	Select the checkbox to include child packages in the synchronization.	
<b>OK</b>	<p>Click on the button to start synchronization.</p> <p>Enterprise Architect uses the directory names specified when the project source was first imported/generated and updates either the model or the source code depending on the option chosen. IF:</p> <ul style="list-style-type: none"> <li>Performing forward synchronization AND</li> <li>There are differences between the model and code AND</li> <li>The <b>On forward synch, prompt to delete code features not in model</b> checkbox is selected in the Options - Attributes and Operations dialog</li> </ul> <p>THEN the Synchronize Element &lt;package name&gt;.&lt;element name&gt; dialog displays.</p> <p>Otherwise, no further action is required.</p>	<a href="#">Synchronize Model and Code</a> <small>[2118]</small>

### Notes

- Code synchronization does not change method bodies; behavioral code cannot be synchronized, and code generation only works when generating the entire file
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to synchronize source code with model elements

### Learn more

#### 11.4.4.1 Synchronize Model and Code

You might either:

- Synchronize the code for a package of Classes against the model in the Project Browser, or
- Regenerate code from a batch of Classes in the model

In such processes, there might be items in the code that are not present in the model.

If you want to trap those items and resolve them manually, select the **On forward synch, prompt to delete code features not in model** checkbox in the Options - Attributes and Operations dialog, so that the Synchronize Element <package name> .<element name> dialog displays, providing options to respond to each item.

### Reference

On the Synchronize Element <package name> .<element name> dialog, select one or more items and process them as indicated below:

Button	Detail	See also
<b>Select All</b>	Highlight and select all items in the <b>Feature</b> column.	
<b>Clear All</b>	Deselect and remove highlighting from all items in the <b>Feature</b> column.	
<b>Delete</b>	Mark the selected code features to be removed from the code (the value in the <b>Action</b> column changes to <b>Delete</b> ).	
<b>Reassign</b>	Mark the selected code features to be reassigned to elements in the model.  This is only possible when an appropriate model element is present that is not already defined in the code.  The Select the Corresponding Class Feature dialog displays, from which you select the Class to reassign the feature to. Click on the <b>OK</b> button to mark the feature for reassignment.	
<b>Ignore</b>	Mark the selected code elements not present in the model to be ignored completely (the default; the value in the <b>Action</b> column remains as or changes to <b>&lt;none&gt;</b> ).	
<b>Reset to Default</b>	Reset the selected items to <b>Ignore</b> (the value in the <b>Action</b> column changes to <b>&lt;none&gt;</b> ).	
<b>OK</b>	Make the assigned changes to the items, and close the dialog.

### 11.4.5 Namespaces

Languages such as Java support Package structures or **namespaces**. In Enterprise Architect you can specify a Package as a **namespace root**, which denotes where the namespace structure for your Class model starts; all subordinate Packages below a namespace root will form the namespace hierarchy for contained Classes and Interfaces.

To define a Package as a namespace root, right-click on the Package in the Project Browser and select the **Code Engineering | Set as Namespace Root** context menu option; the Package icon in the Project Browser changes to show a colored corner indicating this Package as a namespace root ().

Generated Java source code, for example, will automatically add a Package declaration at the beginning of the generated file, indicating the location of this Class in the Package hierarchy below the namespace root.

To clear an existing namespace root, right-click on a namespace root Package in the Project Browser and select the **Code Engineering | Clear Namespace Root**.

To view a list of namespaces, select the **Settings | Namespace Roots** menu option; the **Namespaces** dialog displays. If you double-click on a namespace in the list, the Package is highlighted in the Project Browser; alternatively, right-click on the namespace to display a context menu, and select the **Locate Package in Browser** menu option. You can also clear the selected namespace root by selecting the **Clear Namespace Attribute** option.

To omit a Package from a namespace definition, select the **Code Engineering | Suppress Namespace** context menu option; to include the Package in the namespace again, select the **Code Engineering | Show Namespace** context menu option.

#### Notes

- When performing code generation, any Package name that contains whitespace characters is automatically treated as a namespace root

#### Learning Center topics

## 11.5 Generate From Behavioral Models

Using Enterprise Architect's system engineering capability, you can generate code in various **software** (SW) and **hardware** (HW) languages, including C(OO), C++, C#, Java, VB.Net, VHDL, Verilog and SystemC, from these UML behavioral diagrams:

- State Machine diagrams (SW & HW)
- Interaction (Sequence) diagrams (SW)
- Activity diagrams (SW)

### Generate code from behavioral diagrams using the EAExample project

Step	Action	See also
1	Open the <i>EAExample.eap</i> file by selecting the <b>Help   Open Example Model</b> menu option.	
2	<p>From the Project Browser, select any of the following packages:</p> <p><b>Software Language Examples:</b></p> <ul style="list-style-type: none"> <li>• Project Models &gt; System Model &gt; Implementation Model (PSM) &gt; Java Model With Behaviors Generate the Account and Order classes</li> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; C# Generate the DataProcessor Class</li> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; C++ Generate the IO Class</li> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; Java Generate the IO Class</li> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; VBNet Generate the IO Class</li> </ul> <p><b>Hardware Language Examples:</b></p> <ul style="list-style-type: none"> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Hardware &gt; SystemC Generate the PlayBack Class</li> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Hardware &gt; VHDL Generate the PlayBack Class</li> <li>• Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Hardware &gt; Verilog Generate the PlayBack Class</li> </ul>	
3	When completed, press ( <b>Ctrl+E</b> ) to open the generated source code.	

Step	Action	See also
	You should see methods generated in the code.	

### Notes

- Software code generation from behavioral models is available in the Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- Hardware code generation from State Machine models is available in the Systems Engineering and Ultimate editions of Enterprise Architect
- For C(OO), on the C Specifications page of the Options dialog set the **Object Oriented Support** option to **True**
- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- Code synchronization is not supported for behavioral code

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Software Engineering | Behavioral Code Generation**

## 11.5.1 Code Generation - State Machines

A **State Machine** illustrates how an **object** (represented by a **Class**) can change **state**, each change of state being a **transition** initiated by a **trigger** arising from an **event**, often under conditions or constraints defined as **guards**. As you model how the object changes state, you can **generate** and **build** (compile) code from it in the appropriate language and **execute** the code, visualizing the execution via the **model Simulator**.

It is also possible, in Enterprise Architect, to **combine** the State Machines of separate but related objects to see how they interact (via Broadcast Events), and to quickly create and generate code from **variants** of the model. For example, you might model the behavior of:

- The rear off-side wheel of a vehicle in rear-wheel drive and front-wheel drive modes (one State Machine)
- The steering wheel and all four drive wheels of a vehicle in 4-wheel drive mode (five State Machines)
- The wheels of an off-road vehicle and of a sports car (two Artifacts, instances of a combination of State Machines)

Of critical importance in generating and testing code for all of these options is the **Executable State Machine Artifact** element. This acts as the container and code generation unit for your State Machine

models.

### Prerequisites

- Select **Tools | Options | Objects** and select the **Port and Part type visible by default** checkbox
- Select **Tools | Options | Source Code Engineering** and, for the appropriate coding language (**Java**, **C**, **C#** or **ANSI C++**), set the **Use the new StateMachine Template** option to **True**
- If working in **C++**, select **Tools | Options | Source Code Engineering | C++** and set the **C++ Version** option to **ANSI**

This code generation method does not apply to the Legacy State Machine code generation templates developed prior to Enterprise Architect Release 11.

**Access**    **Diagram | Diagram Toolbox > Artifacts**

### Prepare your State Machine diagram(s)

Step	Action	See also
1	For each State Machine you want to model, create a Class diagram.	<a href="#">Add New Diagrams</a> 
2	From the Class Elements page of the Diagram Toolbox, drag the <b>Class</b> icon onto your diagram and give the element an appropriate name.	<a href="#">Create Elements</a> 
3	Right-click on the Class element and select the <b>New Child Diagram   State Machine</b> menu option.  Give the State Machine diagram an appropriate name.	
4	Create the State Machine model to reflect the appropriate transitions between States.	<a href="#">State Machines</a> 

### Set up the Executable State Machine Artifact

Step	Action	See also
1	Create a new Class diagram to contain the modeled State Machine(s) from which you intend to generate code.	<a href="#">Add New Diagrams</a> 
2	From the Artifacts page of the Diagram Toolbox, drag the <b>Executable StateMachine</b> icon onto the diagram to create the Artifact element. Name the element and drag its borders out to enlarge it.	<a href="#">Artifact</a> 

Step	Action	See also
3	<p>From the Project Browser, drag the (first) <b>Class</b> element containing a State Machine diagram onto the Artifact element on the diagram.</p> <p>The &lt;element name&gt;: Paste As dialog displays, with the <b>Paste as</b> field defaulted to <b>Property</b>.</p> <p>(If the dialog does not display, press <b>Ctrl</b> as you drag the Class element from the Project Browser.)</p>	<a href="#">Paste from Project Browser</a> <sup>[833]</sup>
4	Click on the <b>OK</b> button. The Class element is pasted inside the Artifact as a Part.	<a href="#">Part</a> <sup>[1383]</sup>
5	<p>Repeat steps 3 and 4 for any other Classes with State Machines that you want to combine and generate code for. These might be:</p> <ul style="list-style-type: none"> <li>• Repeat 'drops' of the same Class and State Machine, modeling parallel objects</li> <li>• Different Classes and State Machines, modeling separate interacting objects</li> </ul>	
6	<p>Right-click on the Artifact element and select the <b>Properties</b> option, and in the <b>Language</b> field click on the drop-down arrow and set the code language to the same language as is defined for the Class elements.</p> <p>You can now drag this <b>Executable StateMachine Artifact</b> element from the Project Browser onto the diagram any number of times, and modify the Parts to model variations of the system or process, or the same system or process with different programming languages.</p>	

#### Generate Code From Artifact

Step	Action	See also
1	<p>Right-click on the Executable StateMachine Artifact element and select the <b>Code Engineering   Executable StateMachine   Generate</b> menu option.</p> <p>The Executable StateMachine Code Generation dialog displays.</p>	
2	<p>In the <b>Project output directory</b> field, type or browse for the directory pathname under which to create the output files.</p> <p>During code generation, <b>all existing files in this directory are deleted</b>.</p>	
3	<p>In the <b>Location of &lt;compiler&gt; installation directory</b> field, type or browse for the path of the compiler installation directory, to be automatically mapped to the local path (displayed to the left of the field). For each programming language, these might resemble the following:</p> <ul style="list-style-type: none"> <li>• Java</li> </ul>	

Step	Action	See also
	<p>JAVA_HOME    <i>C:\Program Files (x86)\Java\jdk1.7.0_17</i></p> <ul style="list-style-type: none"> <li>• C/C++ VC_HOME    <i>C:\Program Files (x86)\Microsoft Visual Studio 9.0</i></li> <li>• C# CS_HOME    <i>C:\Windows\Microsoft.NET\Framework\v3.5</i></li> </ul>	
4	<p>Click on the <b>Generate</b> button. The code files are created appropriate to the programming language.</p> <p>The System Output window displays with an Executable State Machine Output tab, showing the progress and status of the generation.</p> <p>During code generation, an automatic <b>validation</b> function is executed to check for diagram or model errors against the UML constraints. Any errors are identified by error messages on the Executable State Machine Output tab.</p> <p>Double-click on an error message to display the modeling structure in which the error occurs, and correct the mistake before re-generating the code.</p>	
5	<p>When the code generates without error, right-click on the Artifact element and select the <b>Code Engineering   Executable Statemachine   Build</b> menu option to compile the code.</p> <p>The System Output window displays with a Build tab, showing the progress and status of the compilation. Notice that the compilation includes configuration of the simulation operation (below).</p>	

#### Execute/Simulate Code From Artifact

Step	Action	See also
1	<p>Select the two menu options:</p> <ul style="list-style-type: none"> <li>• <b>Analyzer   Simulator</b> to display the Simulation window</li> <li>• <b>Analyzer   Simulation Events</b> to display the Simulation Events window</li> </ul> <p>Dock the two windows in a convenient area of the screen.</p>	<p><a href="#">Simulation Windows</a>  <sup>[2469]</sup></p> <p><a href="#">Simulation Events Window</a>  <sup>[2504]</sup></p>
2	<p>On the diagram or Project Browser, right-click on the Artifact element and select the <b>Code Engineering   Executable Statemachine   Run</b> menu option.</p> <p>The first State Machine diagram in the series displays with the simulation of the process already started. In the Simulation window, the processing steps are indicated in this format:</p> <p>[ 03516677]      Part 1[ Class1] . 	[ 03516684]      Part 1[ Class1] . StateMachine_State4 DO [ 03518375]      Blocked	
3	Click on the appropriate Simulation window toolbar buttons to step through the simulation as you prefer.  When the simulation finishes at the Exit or Terminate element, click on the <b>Stop</b> button in the Simulation window toolbar.	<a href="#">Run Model Simulation</a>  [2475]
4	Where the trace shows <b>Blocked</b> , the simulation has reached a point where a Trigger event has to occur before processing can continue. On the Simulation Events window, in the <b>Waiting Triggers</b> column, double-click on the appropriate Trigger.  When the Trigger is fired, the simulation continues to the next pause point, Trigger or exit.  <a href="http://www.sparxsystems.com/enterprise_architect_user_guide/9.3/domain_based_models/spem_toolbox_pages.html">http://www.sparxsystems.com/enterprise_architect_user_guide/9.3/domain_based_models/spem_toolbox_pages.html</a>	<a href="#">Triggers</a>  [2494] <a href="#">Waiting Triggers</a>  [2508]

**Notes**

- If you are making small changes to an existing State Machine model, you can combine the code generation, build and run operations by selecting the **Code Engineering | Executable Statemachine | Generate, Build and Run** option
- You can also generate code in **JavaScript** and **System C**

**Learn more**

- [Broadcast Events](#)  [3029]

**11.5.1.1 Legacy State Machine Templates**

Code generation operates using a set of generation templates. From Release 11.0 of Enterprise Architect, a different set of templates are available as the default for software code generation from a State Machine diagram into Java, C, ANSI C++ or C# code. You can still use the original templates, as described here, for models developed in earlier releases of Enterprise Architect, if you do not want to upgrade them for the new template facilities.

**Switch Between Legacy and Release 11 templates**

**Access**    **Tools | Options | Source Code Engineering | <language name>**

If necessary, expand the *Statemachine Engineering (for current model)* grouping and set the **Use the new Statemachine Template** option to **True** (to use the later templates) or **False** (to use the Legacy templates).

**Legacy Template Transformations**

A State Machine in a *Class* internally generates a number of constructs in software languages to provide effective execution of the States' behaviors (**do**, **entry** and **exit**) and also to code the appropriate transition's effect when necessary.

Model Objects	Code Objects	See also
<b>Enumerations</b>	<ul style="list-style-type: none"> <li>• <b>StateType</b> - comprises an enumeration for each of the States contained within the State Machine</li> <li>• <b>TransitionType</b> – comprises an enumeration for each transition that has a valid effect associated with it; for example: <i>ProcessOrder_Delivered_to_ProcessOrder_Closed</i></li> <li>• <b>CommandType</b> – comprises an enumeration for each of the behavior types that a State can contain (Do, Entry, Exit)</li> </ul>	
<b>Attributes</b>	<ul style="list-style-type: none"> <li>• <b>currState:StateType</b> - a variable to hold the current State's information</li> <li>• <b>nextState:StateType</b> - a variable to hold the next State's information, set by each State's transitions accordingly</li> <li>• <b>currTransition:TransitionType</b> - a variable to hold the current transition information; this is set if the transition has a valid effect associated with it</li> <li>• <b>transcend:Boolean</b> - a flag used to advise if a transition is involved in transcending between different State Machines (or Submachine states)</li> <li>• <b>xx_history:StateType</b> - a history variable for each State Machine/ Submachine State, to hold information about the last State from which the transition took place</li> </ul>	
<b>Operations</b>	<ul style="list-style-type: none"> <li>• <b>StatesProc</b> - a States procedure, containing a map between a State's enumeration and its operation; it de-references the current State's information to invoke the respective State's function</li> <li>• <b>TransitionsProc</b> - a Transitions procedure, containing a map between the Transition's enumeration and its effect; it invokes the Transition's effect</li> <li>• <b>&lt;&lt;State&gt;&gt;</b> - an operation for each of the States contained within the State Machine; this renders a State's behaviors based on the input CommandType, and also executes its transitions</li> <li>• <b>initializeStateMachine</b> - a function that initializes all the framework-related attributes</li> <li>• <b>runStateMachine</b> - a function that iterates through each State, and executes their behaviors and transitions accordingly</li> </ul>	<a href="#">Operation Behavior</a> <sup>[1018]</sup>

#### Notes

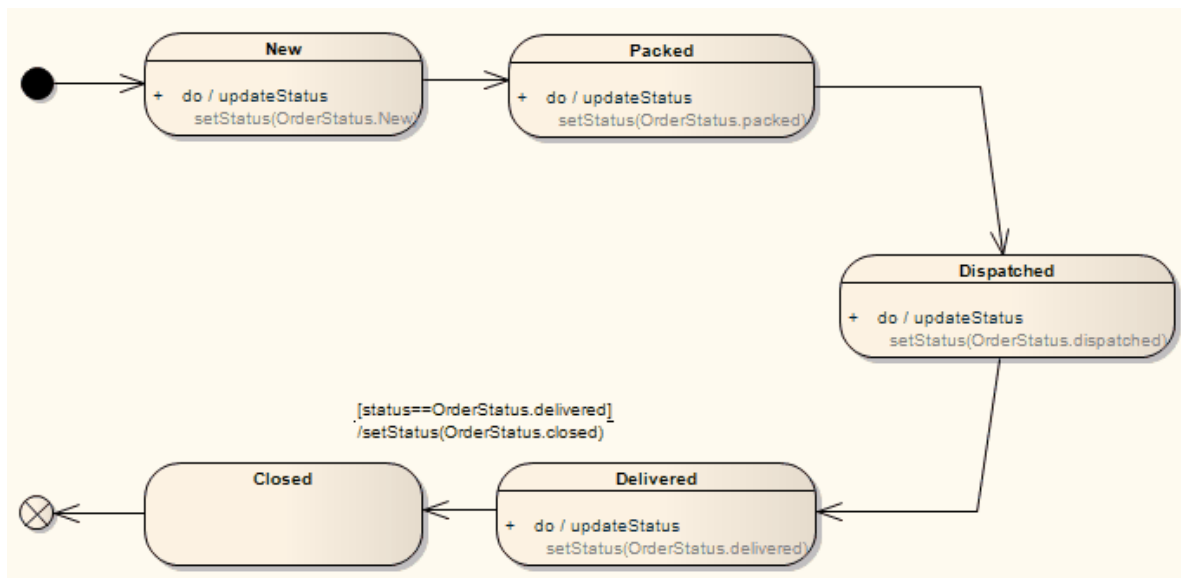

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

### 11.5.2 State Machine Modeling For HDLs

For efficient code generation from State Machine models into Hardware Description Languages (HDL) such as VHDL, Verilog and SystemC, apply these design practices.

In an HDL State Machine model, the following are expected:

- Designate Driving Triggers
- Establish Port–Trigger Mapping
- Active State Logic

#### How to

Topic	Detail	See also
<b>Designate Driving Triggers</b>	<ul style="list-style-type: none"> <li>• A 'change' trigger is deemed as an asynchronous trigger if the following two conditions are satisfied:</li> </ul>	<a href="#">State Machine Diagrams</a>

	<div><div><div>1203</div><div>Trigger</div><div>1350</div></div><div><div><div>1. There is a transition from the actual submachine state (which encapsulates the actual logic) triggered by it</div><div>2. The target state of that transition has a self transition triggered by the same trigger</div></div><div><div>• Asynchronous triggers should be modeled according to the following pattern:<div><div>1. The trigger should be of type Change (specification: true / false)</div><div>2. The active state (Submachine State) should have a transition trigger by it.</div><div>3. The target state of the triggered transition should have a self transition with the same trigger</div></div></div><div>• A trigger of type <i>time</i>, which triggers the transitions to the active state (Submachine State) is deemed as the <i>Clock</i>; the specification of this trigger should be specific to the target language:</div></div><table><tr><th rowspan="2">Trigger Type</th><th rowspan="2">Language</th><th colspan="2">Specification</th></tr><tr><th>Positive Edge Triggered</th><th>Negative Edge</th></tr><tr><td rowspan="3">Time</td><td>VHDL</td><td>rising_edge</td><td>falling_edge</td></tr><tr><td>Verilog</td><td>posedge</td><td>negedge</td></tr><tr><td>SystemC</td><td>positive</td><td>negative</td></tr></table></div></div>	Trigger Type	Language	Specification		Positive Edge Triggered	Negative Edge	Time	VHDL	rising_edge	falling_edge	Verilog	posedge	negedge	SystemC	positive	negative
Trigger Type	Language			Specification													
		Positive Edge Triggered	Negative Edge														
Time	VHDL	rising_edge	falling_edge														
	Verilog	posedge	negedge														
	SystemC	positive	negative														
<div>Establish Port-Trigger Mapping</div>	<div><div>After successfully modeling the different operating modes of the component, and the triggers associated with them, you must associate the triggers with the component's ports</div><div>A Dependency relationship from the Port to the associated trigger is used to signify their association</div><div><div><div>class HDL</div><div><div><div><div><div>reset</div><div>clear</div><div>clock</div></div><div><div><div>A dependency relationship is used to represent association between ports and their triggers.</div></div></div></div><div><div><div>ActiveClass</div><div><div>reset</div><div>clear</div><div>clock</div></div></div></div></div></div></div></div></div>																
<div>Active State Logic</div>	<div><div>The first two aspects, above, put in place the preliminaries required for efficient interpretation of the hardware components.</div><div>The actual State Machine logic is now modeled within the Active (Submachine) state.</div></div>																

**Notes**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- The current code generation engine supports only one clock trigger for a component

**Learn more**

- [Legacy State Machine Templates](#) 
- [Transition](#) 

**11.5.3 Code Generation - Interaction Diagrams**

During code generation from Interaction (Sequence) diagrams in a Class, Enterprise Architect applies its system engineering graph optimizer to transform the Class constructs into programmatic paradigms. Messages and Fragments are identified as one of the several action types based on their functionality, and Enterprise Architect uses the *code generation templates* to render their behavior accordingly.

**Topics**

Topic	Detail	See also
<b>Action Call</b>	A Message that invokes an operation.	<a href="#">Message (Sequence Diagram)</a>  <a href="#">Call</a>  <a href="#">Message Examples</a> 
<b>Action Create</b>	A Message with <i>Lifecycle = New</i> .	<a href="#">Message (Sequence Diagram)</a>  <a href="#">Message Properties</a> 
<b>Action Destroy</b>	A Message with Lifecycle = Delete.	<a href="#">Message (Sequence Diagram)</a>  <a href="#">Message Properties</a> 
<b>Action Loop</b>	A Combined Fragment with Type = Alt.	<a href="#">Combined Fragment</a>  <a href="#">Interaction Operators</a> 
<b>Action If</b>	A Combined Fragment with Type = loop.	<a href="#">Combined Fragment</a>  <a href="#">Interaction Operators</a> 
<b>Assign To</b>	A call message with a valid target attribute set using the <b>Assign To</b> field is rendered in the code as the target attribute of a call action.	<a href="#">Call</a>  <a href="#">Message Properties</a> 

**Notes**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- For an Interaction (Sequence) diagram, the behavioral code generation engine expects the Sequence diagram and all its associated messages and interaction fragments to be encapsulated within an interaction element

**Learning Center topics**

- (Alt+F1) | **Enterprise Architect | Software Engineering | Behavioral Code Generation | Interaction Diagrams**

**11.5.4 Code Generation - Activity Diagrams**

Code generation from Activity diagrams in a Class requires a validation phase, during which Enterprise Architect uses the system engineering graph optimizer to analyze the diagram and render it into various constructs from which code can be generated. Enterprise Architect also transforms the constructs into one of the various action types (if appropriate), similar to the Interaction diagram constructs.

**Topics**

Topic	Detail	See also
<b>Call Actions (Invocation Actions)</b>	<p>Used to invoke operations or behaviors in an Activity diagram; the two main variants of Call Actions supported in behavioral code generation are:</p> <ul style="list-style-type: none"> <li>• CallOperation Action - used to invoke operations, which can be within the same Class or in other Classes within the same package; if referencing operations from other Classes within the same package, you must have a target to which the request is passed</li> <li>• CallBehavior Action - used to invoke another Activity in an activity flow; the referenced Activity is expected to be within the same Class</li> </ul> <p><b>Arguments</b></p> <p>Call Actions can specify argument values corresponding to the parameters in the associated behavior or behavioral feature.</p> <p>You can add the arguments manually or create them automatically using the <b>Synchronize</b> button of the Arguments dialog.</p>	<p><a href="#">Assign Action Pins</a> <sup>[1278]</sup></p> <p><a href="#">Behavior Calls</a> <sup>[1026]</sup></p> <p><a href="#">Synchronize Arguments</a> <sup>[1027]</sup></p>

<b>CreateObjectAction</b>	Used to denote an object creation in the activity flow; you can set the result Pin of the CreateObjectAction as the object to be created, using the Assign Action Pins dialog.  The Classifier of the CreateObjectAction signifies the Classifier for which an instance is to be created.	<a href="#">Assign Action Pins</a> 
<b>DestroyObjectAction</b>	Used to denote an object deletion in the activity flow; you can set the target Pin of the DestroyObjectAction as the object to be destroyed, using the Assign Action Pins dialog.	<a href="#">Assign Action Pins</a> 
<b>Loops</b>	Enterprise Architect's system engineering graph optimizer is also capable of analyzing and identifying loops; an identified loop is internally rendered as an Action Loop, which is translated by the EASL code generation macros to generate the required code.  You can have a single loop, nested loops, and multiple levels of nested loops.	
<b>Conditional Statements</b>	To model a conditional statement, you use Decision/Merge nodes.  Alternatively, you can imply Decisions/Merges internally; the graph optimizer expects an associated Merge node for each Decision node, to facilitate efficient tracking of various branches and analysis of the code constructs within them.	

**Notes**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

## 11.6 Importing Source Code

When modeling in Enterprise Architect, it is possible to **import - reverse engineer** - existing **source code** as a single directory or a directory structure, in a variety of code languages, into your **UML model**. By reverse engineering code you can examine, for example, the functionality of code libraries for reuse, or bring the UML model up to date with new code from outside the model; that is, **synchronize** the code and model. The code structures are mapped into their UML representations; for example, a Java Class is mapped into a UML Class element, variables are defined as attributes, methods modeled as operations, and interactions between the Java Classes represented by the appropriate connectors.

By examining the code in a UML model, you can identify the critical modules containing the code, providing a starting point for understanding the business and system requirements of the existing application and a framework for gaining a better overall understanding of the source code.

You have several options in performing reverse engineering, including:

- Whether comments are reverse engineered into **Notes** fields, and how they are formatted if they are
- How property methods are recognized
- Whether dependencies should be created for operation return and parameter types

It is important to note that if a system is not well designed, simply importing the source into Enterprise Architect does not turn it into an easily understandable UML model. When working with a poorly designed system it is useful to assess the code in manageable units by examining the individual model packages or elements generated from the code; for example, dragging a specific Class of interest onto a diagram and then using the **Insert Related Elements** option at one level to determine the Class's immediate relationships to other Classes. From this point it is possible to create Use Cases that identify the interaction between the source code Classes, providing an overview of the application's operation.

### Copyright Ownership

Situations that typically lend themselves to reverse engineering tend to operate on source code that:

- You have already developed
- Is part of a third-party library that you have obtained permission to use
- Is part of a framework that your organization uses
- Is being developed on a daily basis by your developers

If you are examining code that you or your organization do not own or do not have specific permission to copy and edit, you must ensure that you understand and comply with the copyright restrictions on that code before beginning the process of reverse engineering.

### Notes

- Reverse Engineering is supported in the Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- If security is enabled you must have **Reverse Engineer From DDL And Source Code** permission to reverse engineer source code and synchronize model elements against code
- Using Enterprise Architect, you can also import certain types of binary files, such as Java .jar files and .

NET PE files

- Reverse Engineering of other languages is currently available through the use of MDG Technologies listed on the MDG Technology pages of the Sparx Systems website

### 11.6.1 Import Source Code

#### Import source code (reverse engineer)

Step	Action	See also
1	In the Project Browser, select (or add) a diagram into which to import the Classes.	
2	Right-click on the diagram background to open the context menu and either: <ul style="list-style-type: none"> <li>Select the language to import from the <b>Import from source file(s)</b> submenu</li> <li>Click on the <b>Import Language</b> drop-down arrow in the Code Generation toolbar and select the <b>Import   Import xxx files</b> menu option, where xxx represents the language to import</li> </ul>	
3	From the file browser that appears, select one or more source code files to import.	<a href="#">Notes on Source Code Import</a> <sup>[2139]</sup>
4	Click on the <b>Open</b> button to start the import process.	

As the import proceeds, Enterprise Architect provides progress information. When all files are imported, Enterprise Architect makes a second pass to resolve associations and inheritance relationships between the imported Classes.

<b>Introduction</b>	Enterprise Architect supports most constructs and keywords for each coding language.  If there is a particular feature you require support for that you feel is missing, please contact Sparx Systems.  You must select the appropriate type of source file for the language, as the source code to import.	<a href="#">Sparx Systems</a> (Online resource)
<b>ActionScript</b>	Appropriate type of source file: <b>.as</b> code file.	<a href="#">ActionScript</a> [2081]
<b>C</b>	Appropriate type of source file: <b>.h</b> header files and/or <b>.c</b> files.  When you select a header file, Enterprise Architect automatically searches for the corresponding <b>.c</b> implementation file to import, based on the options for extension and search path specified in the C options.  Enterprise Architect does not expand macros that have been used, these must be added into the internal list of Language Macros.	<a href="#">C</a> [2084]  <a href="#">C options</a> [2266]  <a href="#">Language Macros</a> [2257]
<b>C++</b>	Appropriate type of source file: <b>.h</b> header file.  Enterprise Architect automatically searches for the <b>.cpp</b> implementation file based on the extension and search path set in the C++ options; when it finds the implementation file, it can use it to resolve parameter names and method notes as necessary.  When importing C++ source code, Enterprise Architect ignores function pointer declarations.  To import them into your model you could create a <i>typedef</i> to define a function pointer type, then declare function pointers using that type; function pointers declared in this way are imported as attributes of the function pointer type.  Enterprise Architect does not expand macros that have been used; these must be added into the internal list of Language Macros.	<a href="#">C++</a> [2090]  <a href="#">C++ options</a> [2269]  <a href="#">Language Macros</a> [2257]
<b>C#</b>	Appropriate type of source file: <b>.cs</b> .	<a href="#">C#</a> [2088]  <a href="#">C# Options</a> [2268]
<b>Delphi</b>	Appropriate type of source file: <b>.pas</b> .	<a href="#">Delphi</a> [2095]

<b>Java</b>	<p>Appropriate type of source file: <b>.java</b>.</p> <p>Enterprise Architect supports the <b>AspectJ</b> language extensions.</p>  <p>Aspects are modeled using Classes with the stereotype <i>aspect</i>; these aspects can then contain attributes and methods as for a normal Class.</p> <p>If an <i>intertype</i> attribute or operation is required, you can add a tag <i>className</i> with the value being the name of the Class it belongs to.</p> <p><i>Pointcuts</i> are defined as operations with the stereotype <i>pointcut</i>, and can occur in any Java Class, Interface or aspect; the details of the <i>pointcut</i> are included in the behavior field of the method.</p> <p><i>Advice</i> is defined as an operation with the stereotype <i>advice</i>; the <i>pointcut</i> this advice operates on is in the <b>behavior</b> field and acts as part of the method's unique signature.</p> <p><i>afterAdvice</i> can also have one of the Tagged Values <b>returning</b> or <b>throwing</b>.</p>	<a href="#">Java</a> <sup>[2096]</sup> <a href="#">Java Options</a> <sup>[2272]</sup>
<b>PHP</b>	<p>Appropriate type of source file: <b>.php, .php4, or .inc</b>.</p> <p>Nested if condition syntax is enabled.</p>	<a href="#">PHP</a> <sup>[2099]</sup>
<b>Python</b>	<p>Appropriate type of source file: <b>.py</b>.</p>	<a href="#">Python</a> <sup>[2100]</sup>
<b>Visual Basic</b>	<p>Appropriate type of source file: <b>.cls</b> Class file.</p>	<a href="#">Visual Basic</a> <sup>[2109]</sup>
<b>Visual Basic .NET</b>	<p>Appropriate type of source file: <b>.vb</b> Class file.</p>	<a href="#">Visual Basic .NET</a> <sup>[2102]</sup>

### Notes

- When reverse engineering attributes with parameter substitutions (templated attributes):
  - If a Class with proper template parameter definitions is found, an Association connector is created and its parameter substitutions are configured
  - An Association connector is also created if a matching entry is defined as a Collection Class or in

the **Additional Collection Classes** option (for C#, C++ and Java); for an example, see *Example Use of Collection Classes*

#### Learn more

- [Import Source Code](#) <sup>[2138]</sup>
- [Parameterized Classes \(Templates\)](#) <sup>[1365]</sup>
- [Set Collection Classes](#) <sup>[2259]</sup>
- [Example Use of Collection Classes](#) <sup>[2260]</sup>

### 11.6.3 Import Resource Script

Enterprise Architect supports the import and export of Microsoft Windows™ **Resource Scripts** (as **.rc** files), which contain the Win32 dialog definitions (those with the stereotype «*win32Dialog*») for an application's graphical user interface. Dialog resources are imported and exported for a specific location, which defaults to the location of the current computer system.

**Access**    **Right-click on a Package | Code Engineering | Import Resource Script**  
**Right-click on a Screen element | Code Engineering | Synchronize with Code (F7)**

#### Import dialog resources from a .rc file

Field/Button/Option	Action	See also
<b>Resource File</b>	Click on the ( ... ) Browse button and locate the .rc file to import the screen elements(s) from.	
<b>Resource ID</b>	Either: <ul style="list-style-type: none"> <li>• Leave the default value <b>All</b> to import all screen elements from the file, or</li> <li>• Click on the drop-down arrow and select the <b>screen ID</b> of a specific dialog to import</li> </ul>	
<b>Language</b>	Click on the drop-down arrow and select the language version (such as <b>English - United States</b> ) of the dialog(s) to import.	
<b>Import</b>	Click on this button to import the screens from the resource file.  The progress of the import is reported in the field underneath the <b>Language</b> field.	

#### Export a dialog to a .rc file

Field/Button/ Option	Action	See also
<b>Screen ID</b>	Defaults from the Win32UI <b>ID</b> Tagged Value of the selected Screen element.  (If the dialog does not have this ID, open the Win32UI page of the element's Properties dialog and provide a value for the <b>ID</b> tag.)	
<b>Resource File</b>	Click on the ( ... ) Browse button and locate the .rc file into which to export the screen elements(s).  If the element was previously imported, this field defaults to the source file.	
<b>Language</b>	Click on the drop-down arrow and select the language version (such as <b>English - United States</b> ) of the exported dialog.	
<b>Export</b>	Click on this button to export the screens from the resource file.  The progress of the export is reported in the field underneath the <b>Language</b> field.	

**Notes**

- New dialogs are exported to an **existing** .rc file
- In an export to an existing .rc file, no dialogs are ever deleted from the file, even when they are deleted from the model
- In an import, no dialogs are deleted from the model even when omitted from the original .rc file

**11.6.4 Import a Directory Structure**

You can import from all source files in a complete directory structure, which enables you to import or synchronize multiple files in a directory tree in one pass.

Enterprise Architect creates the necessary packages and diagrams during the import process.

**Access** [Project Browser package context menu | Code Engineering | Import Source Directory](#)

**Import a directory structure, using the Import Source Directory dialog**

Step	Action	See also
<b>1</b>	Select the options you require; you can configure: <ul style="list-style-type: none"> <li>• The source directory</li> <li>• The source type</li> <li>• The file extensions to look at</li> <li>• Whether to recurse sub directories</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Whether to create a diagram for each package</li> <li>Whether to import additional files as described in the Import Component Types dialog</li> <li>Whether to exclude private members from libraries being imported from the model</li> <li>Whether to <b>Synchronize</b> or <b>Overwrite</b> existing Classes when found; if a model Class is found matching the one in code: <ul style="list-style-type: none"> <li><b>Synchronize</b> updates the model Class to include the details from the one in code, which preserves information not represented in code, such as the location of Classes in diagrams</li> <li><b>Overwrite</b> deletes the model Class and generates a new one from code, which deletes and does not replace the additional information</li> </ul> </li> <li>Whether to create a package for every directory, namespace or file; this might be restricted depending on the source type selected</li> <li>How to handle Classes not found during the import (prompt for action enables you to review Classes individually)</li> <li>What is shown on diagrams created by the import</li> </ul>	<a href="#">Classes not found during Import</a> <sup>[2144]</sup>
2	Click on the <b>OK</b> button to start.

- (Alt+F1) | **Enterprise Architect | Software Engineering | Import Code | Import from .Net Assemblies**

### 11.6.6 Classes Not Found During Import

When reverse engineering from your code, there might be times when Classes are deliberately removed from your source code.

The **Import Source Directory** functionality keeps track of the Classes it expects to synchronize with and, on the Import Directory Structure dialog, provides options for how to handle the Classes that weren't found.

You can select the appropriate option to make Enterprise Architect, at the end of the import, ignore the missing Classes, automatically delete them or prompt you to manage them.

On the Import Directory Structure dialog, if you select the **Prompt For Action** radio button to manually review missing Classes, a dialog displays on which you specify the handling for each Class that was missing in the imported code.

By default, all Classes are marked for deletion; to keep one or more Classes, select them and click on the **Ignore** button.

[Learn more](#)

- [Import a Directory Structure](#) 

## 11.7 Editing Source Code

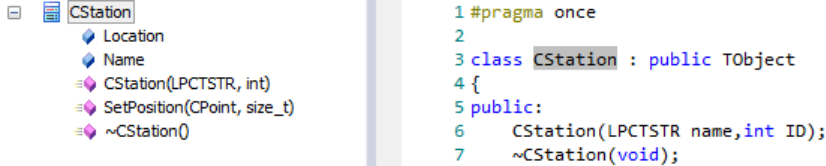

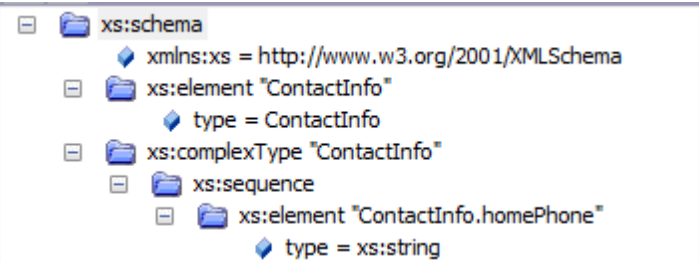

Use the Source Code editors to view and edit any source code files for an element. If a Class is selected in a diagram or the Project Browser, the Source Code editor shows the source code for that Class, provided it has already been *generated*. For C++ two tabs display, to show the implementation and header files.

A number of options change the way the Source Code editor works. They can be altered using the Options dialog (select the **Tools | Options | Source Code Engineering | Code Editors** menu option). There are also many options for developing the code, available through the Code Editor context menu, Toolbar or function keys.

There are several variations on the Source Code editor, with different access methods. The variants are discussed in the *Compare Editors* topic.

**Access** **Project Browser element context menu | View Source Code (F12)** or **(Ctrl+E)**  
**Diagram element context menu | View Source Code (F12)**  
**Element | Show Source Viewer (Alt+7)**  
**Tools | Open Source File (Ctrl+Alt+O)** (files not imported to or created in Enterprise Architect)

### Topics

Topic	Detail	See also
<b>Source Code editor</b>	<p>By default the Source Code editor is set to:</p> <ul style="list-style-type: none"> <li>• Parse all opened files, and show a tree of the results</li> <li>• Show line numbers</li> </ul>  <p>If you are editing an XML file, the structure tree is presented in a folder hierarchy rather than a Class structure hierarchy, as follows:</p> 	
<b>File Parsing</b>	<p>The Source Code editor parses files for a number of reasons; the first is to enable it to jump to the location in the file at which the currently selected item is found (but not when editing external files).</p> <p>Additionally, parsing displays a structure tree showing an overview of the file in a similar fashion to the main Project Browser; you can also select anything</p>	

Topic	Detail	See also
	in that and jump to the appropriate line in the editor.	

### Notes

- There are no *context menu options* to display XML or DDL.sql files; select the appropriate object and use the keyboard keys (**F12**, **Alt+7**)
- When you select an element to view source code, if the element does not have a generation file (that is, code has not been or cannot be generated, such as for a Use Case), Enterprise Architect checks whether the element has a link to either an operation or an attribute of another element - if such a link exists, and that other element has source code, the code for *that* element displays
- You can also locate the directory containing a source file that has been created in or imported to Enterprise Architect, and edit it or its related files using an *external* editor such as Notepad or Visual Studio; right-click on the element in the Project Browser and select the **Open Source Directory** context menu option (**Ctrl+Alt+Y**)

## 11.7.1 Languages Supported

The Source Code Editors can display code in a wide range of languages, as listed here. For each language, the editor highlights - in colored text - the standard code syntax.

- Ada (.ada, .ads, .adb)
- ActionScript (.as)
- BPEL Document (.bpel)
- C++ (.h, .hh, .hpp, .c, .cpp, .cxx)
- C# (.cs)
- DDL Structured Query Language (.sql)
- Delphi/Pascal (.pas)
- Diff/Patch Files (.diff, .patch)
- Document Type Definition (.dtd)

- DOS Batch Files (.bat)
- DOS Command Scripts (.cmd)
- HTML (.html)
- Interface Definition Language (.idl, .odl)
- Java (.java)
- Javascript (.javascript)
- JScript (.js)
- Modified Backus-Naur Form Grammar (.mbnf)
- PHP (.php, .php4, .inc)
- Python (.py)
- Standard Generalized Markup Language (.sgml)
- SystemC (.sc)
- Visual Basic 6 (.bas)
- VB.NET (.vb)
- VBScript (.vbs)
- Verilog (.v)
- VHDL Hardware Description Language (.vhd)
- Visual Studio Resource Configuration (.rc)
- XML (eXtensible Markup Language) (.xml)

### 11.7.2 Compare Editors

Enterprise Architect provides four principal code editor variants, available through a number of access paths. The most direct access options are identified in the descriptions below.

The first three code editor variants listed have the same display format, option toolbar, context menu options and internal function keys. They differ in their method of access and display mechanism.

#### Editor Variants

Variant	Function Key/ Menu Option	Description
<b>Source Code</b>	<b>Alt+7</b>	Displays the contents of the source file for a selected Class

Variant	Function Key/ Menu Option	Description
<b>window (Dockable)</b>	<b>Element   Show Source Viewer</b>	(except if the language is C++, when the window displays a tab for the Header file and a tab for the Implementation file).  If you select a different Class, the window <b>changes</b> to show the code for the new Class (unless the first Class calls the second, in which case the window scrolls down to the second Class's code instead).
<b>Source Code View</b>	<b>F12</b> <b>Ctrl+E</b> <b>Class context menu   View Source Code</b>	Displays the code on a tab of the Diagram View; the tab label shows the file name and extension (such as .java); again, for C++, there are two tabs for the Header and Implementation files.  You can display the source code for other Classes on <b>additional</b> tabs, by reselecting the menu option/keys on the next Class.
<b>Internal Editor, External Source Code</b>	<b>Ctrl+Alt+O</b> <b>Tools   Open Source File</b>	Use this option if you intend to edit external code, XML or DDL files (that is, code not imported to or generated in Enterprise Architect).  Displays an external browser, then opens the specific selected code file as a tab of the Diagram View (for C++, <b>not</b> two code files); otherwise this is identical to the <b>F12</b> option.
<b>External Editor, Internal or External Source Code</b>	<b>Ctrl+Alt+Y</b> <b>Class context menu   Open Source Directory</b>	Displays an external file browser, open to the directory containing the selected Class's source files; you can open the files in Notepad, Visual Studio or other tools you might have on your system.

### 11.7.3 Code Editor Toolbar

When you are reviewing the code for a part of your model in the Source Code editor, you can access a wide range of display and editing functions from the editor toolbar.

#### Code Editor Toolbar

Toolbar Options

Icon/Option	Action	See also
<b>Structure Tree</b>	Click on this icon to show or hide the element hierarchy panel (the left panel of the Source Code editor).	
<b>Line Numbers</b>	Click on this icon to show or hide the line numbers against the lines of code.	
<b>Source Code Engineering Properties</b>	<p>Click on the drop-down arrow to display a menu of options to select individual Source Code Engineering pages of the Options dialog, from which you can configure display and behavior options for source code engineering:</p> <ul style="list-style-type: none"> <li>• <b>Syntax Highlighting Options</b></li> <li>• <b>Code Editor Options</b></li> <li>• <b>Code Engineering Options</b></li> <li>• <b>Code Editor Key Bindings</b></li> </ul>	<p><a href="#">Editor Language Properties</a>  <sup>[2251]</sup></p> <p><a href="#">Options - Code Editors</a>  <sup>[2250]</sup></p> <p><a href="#">Source Code Options</a>  <sup>[2247]</sup></p> <p><a href="#">Code Editor Key Bindings</a>  <sup>[2167]</sup></p>
<b>Editor Functions</b>	<p>Click on the drop-down arrow to display a menu providing access to a range of code editing functions:</p> <ul style="list-style-type: none"> <li>• <b>Open Corresponding File (Ctrl+Shift+O)</b> - opens the header or implementation file associated with the currently-open file</li> <li>• <b>Go to Matching Brace (Ctrl+E)</b> - for a selected opening or closing brace, highlights the corresponding closing or opening brace in the pair</li> <li>• <b>Go to Line (Ctrl+G)</b> - displays a dialog on which you select the number of the line to highlight; click on the <b>OK</b> button to move the cursor to that line</li> <li>• <b>Cursor History Previous (Ctrl+-)</b> - the Source Code viewer keeps a history of the previous 50 cursor positions, creating a record when the cursor is moved either more than 10 lines away from its previous position, or in a find-and-replace operation; the menu option moves the cursor to the position in the immediately-previous cursor history record</li> <li>• <b>Cursor History Next (Ctrl+Shift+-)</b> - if you have moved to an earlier cursor position, this option moves the cursor to the position in the immediately-following cursor history record</li> <li>• <b>Find (Ctrl+F)</b> - displays a dialog in which you define a text string and search options to locate that text string in the code</li> <li>• <b>Replace (Ctrl+R)</b> - displays a dialog in which you define a text string and search options to locate that text string in the code and replace it with another text string; the dialog has options to locate and replace each occurrence as you decide, or to replace all occurrences immediately</li> <li>• <b>Record Macro</b> - records your next keystrokes to be saved as a macro</li> </ul>	

Icon/Option	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Stop Recording and Save Macro</b> - stops recording the keystrokes and displays the Save Macro dialog on which you specify a name for the macro</li> <li>• <b>Play Macro</b> - displays the Open Macro dialog from which you select and execute a saved macro, to repeat the saved keystrokes</li> <li>• <b>Toggle Line Comment (Ctrl+Shift+C)</b> - comments out (//) or re-establishes the code for each <b>full line</b> in which text is highlighted</li> <li>• <b>Toggle Stream Comment (Ctrl+Shift+X)</b> - inserts a stream comment (<i>/* */</i>) at the cursor position (comments out only the <b>highlighted characters and lines</b>), or re-establishes the commented text as code</li> <li>• <b>Toggle Whitespace Characters (Ctrl+Shift+W)</b> - shows or hides the spacing characters: --&gt; (tab space) and . (character space)</li> <li>• <b>Toggle EOL Characters (Ctrl+Shift+L)</b> - shows or hides the end-of-line characters: CR (carriage return) and LF (line feed)</li> <li>• <b>Open Containing Folder</b> - opens the file browser at the folder containing the code file; you can open other files in your default external editor for comparison and parallel work</li> </ul>	
<b>Save Source and Resynchronize Class</b>	Click on this icon to save the source code and resynchronize the code and the Class in the model.	
<b>Code Templates</b>	Click on this icon to access the Code Templates Editor, to edit or create code templates for code generation.	<a href="#">Code Templates Editor</a> 
<b>Find in Project Browser</b>	For a selected line of code, click on this icon to highlight the corresponding structure in the Project Browser. If there is more than one possibility the Possible Matches dialog displays, listing the occurrences of the structure from which you can select the required one.	
<b>Search in Files</b>	Click on this icon to search for the selected object name in associated files, and display the results of the search in the File Search window. You can refine and refresh the search by specifying criteria on the Find in Files window toolbar.	<a href="#">Search in Files</a> 
<b>Search in Model</b>	Click on this icon to search for the selected text throughout the model, and display the results of the search in the Model Search window.	<a href="#">Model Search</a> 
<b>Go to Declaration</b>	Click on this icon to locate the <b>declaration</b> of a symbol in the source code.	

Icon/Option	Action	See also
<b>Go to Definition</b>	Click on this icon to locate the <b>definition</b> of a symbol in the source code (applicable to languages such as C++ and Delphi, where symbols are declared and defined in separate files).	
<b>Autocomplete List</b>	Click on this icon to display the autocompletion list of possible values; double-click on a value to select it.	
<b>Parameter Information</b>	When the cursor is between the parentheses of an operation's parameter list, click on this icon to display the operation's signature, highlighting the current parameter.	
<b>Find Current Class in Project Browser</b>	Click on this icon to display the name of the currently-selected Class in the code, and highlight that name in the Project Browser; if there is more than one possibility the Possible Matches dialog displays, listing the occurrences of the Class from which you can select the required one.	
<b>Find Member</b>	Click on this icon to display the name of the currently-selected attribute or method in the code, and highlight that name in the Project Browser; if there is more than one possibility the Possible Matches dialog displays, listing the occurrences of the feature from which you can select the required one.	

### Notes

- The **Record Macro** option disables Intelli-sense while the macro is being recorded
- You can **assign key strokes** to execute the macro, instead of using the toolbar drop-down and Open Macro dialog

	<b>Wikipedia</b>	Display any entry on the object on the Wikipedia web site.	
	<b>Koders</b>	Display the results of a search for the text string on <i>Koders.com</i> .	
<b>Search Intelli-sense   &lt;list of query names&gt;</b>	Perform a search on the specified string in any Intelli-sense libraries listed in the active Execution Analyzer script, and display the results in the Find in Files window, Intelli-sense Search tab.  Shortcut key: <b>Shift + F12</b>		<a href="#">Search Intelli-sense</a> <sup>[2166]</sup>
<b>Set Debugger to Line</b>	(If the debugger is executing and has reached a breakpoint.) Move the execution point to the current line. Check that you do not skip over any code or declarations that affect the next section of code being debugged.		
<b>Display Variable</b>	(If the debugger is executing.) Open the Locals window and highlight the local variable for the current point in the code.		<a href="#">View the Local Variables</a> <sup>[2234]</sup>
<b>Show in String Viewer</b>	Display the full contents of a variable string in the String Viewer.		<a href="#">View Content Of Long Strings</a> <sup>[2235]</sup>
<b>Create Use Case for '&lt;string&gt;'</b>	Display the Create Use Case For Method dialog, through which you create a Use Case for the method containing the text string.		<a href="#">Create Use Case For Method</a> <sup>[2155]</sup>
<b>Breakpoint</b>	Display a submenu of options for creating a recording marker on the selected line of code. The recording markers you can add include: <ul style="list-style-type: none"> <li>• Breakpoint</li> <li>• Start Recording Marker</li> <li>• End Recording Marker</li> <li>• Stack Auto Capture Marker</li> <li>• Method Auto Record Marker</li> <li>• Tracepoint</li> </ul>		<a href="#">Set Record Markers</a> <sup>[2537]</sup>

Option	Action	See also
<b>Testpoints</b>	Display options to add a new <b>Testpoint</b> , show the Testpoints Manager ( <b>Testpoints window</b> ) or edit an existing Testpoint if one or more are already defined at the selected location.  (The sub-options depend on the type of code file you are reviewing.)	<a href="#">Testpoint Editor</a> <sup>[2564]</sup>  <a href="#">The Testpoints Window</a> <sup>[2578]</sup>
<b>Open (Close) IME</b>	Open (or close) the Input Method Editor, so that you can enter text in a selected foreign language script, such as Japanese. You set the keyboard language using the <b>Windows Control Panel - Regional and Language Options</b> facility.	
<b>Line Numbers</b>	(Script Editor only.) Show or hide the code line numbers on the left hand side of the editor screen.	
<b>Undo</b> <b>Cut</b> <b>Copy</b> <b>Paste</b> <b>Delete</b> <b>Select All</b>	These six options provide simple functions for editing the code.	

### Notes

- The options in the lower half of the **Search for '<string>'** submenu (after **Search in Scripts**) are configurable; you can add new search tools or remove existing ones by editing the *searchProviders.xml* file in the *Sparx Systems > EA > Config* folder - this file is in OpenSearch description document format

#### 11.7.4.1 Create Use Case for Method

Using the code editor context menu, you can create a Use Case element for a method that you select from the code. You can also:

- Link the Use Case directly to the method
- Add the parent Class to a diagram (if it is not already in the selected diagram) and/or add the Use Case element to the diagram
- Block from display any attributes or methods that are not also the targets of feature links

Create a Use Case for a method, through the code editor

Step	Action	See also
1	(If you want to depict the Use Case and its link to the method <i>in a diagram</i> ) click on the diagram name in the Project Browser.	
2	In the code editor, right click on either the method name or any part of the method body, and select the <b>Create Method for &lt;methodname&gt;</b> context menu option.  The Create Use Case for Method dialog displays.	<a href="#">Code Editor Context Menu</a> [2152]
3	The basic function of this dialog is to create a Use Case for the selected method: <ul style="list-style-type: none"> <li>If this is all that is required, click on the <b>OK</b> button; the Use Case element is created in the Project Browser, in the same package as the parent Class for the method, and with the same name as the method</li> <li>If you intend to make the relationship tangible, continue with the procedure</li> </ul>	
4	To create a Trace connector linking the Use Case to the method, select the <b>Link Use Case to Method</b> check box.	
5	To add the method's parent Class to the diagram, if it is not already there, select the <b>Add Class to Diagram</b> check box.	
6	To add the newly-created Use Case to the diagram, select the <b>Add Use Case to Diagram</b> check box; this would now show the Use Case, Class and Trace connector on the diagram.	
7	To only show the features (attributes and methods) of the parent Class that are the targets of 'link to feature' relationships, select the <b>Display only linked features in Class</b> checkbox.  The Class might contain any number of attributes and methods, but those without a 'link to feature' relationship are hidden.	<a href="#">Connect to Element Feature</a> [1110]
8	Click on the <b>OK</b> button to create and depict the Use Case and relationship; if you selected all options, the diagram now contains linked elements resembling the following: <div data-bbox="319 1765 1117 2004" data-label="Diagram"> <pre> classDiagram     usecase memoryCancel     class ClassLib {         memoryCancel(bool*)     }     memoryCancel --&gt; ClassLib : «trace»   </pre> </div>	

Step	Action	See also

### 11.7.5 Code Editor Functions

The common Code Editor provides a variety of functions to assist with the code editing process, including:

- Syntax Highlighting
- Bookmarks
- Cursor History
- Brace Matching
- Automatic Indentation
- Commenting Selections
- Scope Guides
- Zooming
- Line Selection
- intelli-sense
- Find and Replace
- Find in Files

A range of these functions is available through keyboard key combinations and/or context menu options.

You can customize several of the Code Editor features by setting properties in the Code Editor configuration files; for example, by default the line containing the cursor is always highlighted, but you can turn the highlighting off.

#### 11.7.5.1 Function Details

Topic	Detail	See also
<b>Syntax Highlighting</b>	The Code Editor highlights - in colored text - the standard code syntax of all language file formats supported by Enterprise Architect	<a href="#">Languages Supported</a> <sup>[2147]</sup>

Topic	Detail	See also
	<pre> 1 #pragma once 2 #include "afxwin.h" 3 #include "afxcmn.h" 4 5 6 // CToolBox dialog 7 8 class CToolBox : public CDialog 9 { 10     DECLARE_DYNAMIC(CToolBox) 11     CRect m_rect; 12     int m_offset; </pre> <p>You can define how the Code Editor implements syntax highlighting for each language, through the Code Editors page of the Options dialog.</p>	<a href="#">Options - Code Editors</a> <a href="#">Editor Language Properties</a> <a href="#">Language Options</a>
<b>Bookmarks</b>	<p>Bookmarks denote a line of interest in the document; you can toggle them on and off for a particular line by pressing <b>Ctrl+F2</b>.</p> <p>Additionally, you can press <b>F2</b> and <b>Shift+F2</b> to navigate to the next or previous bookmark in the document.</p> <p>To clear all bookmarks in the code file, press <b>Ctrl+Shift+F2</b>.</p>	
<b>Cursor History</b>	<p>The Code Editor Control keeps a history of the previous 50 cursor positions; an entry in the history list is created when:</p> <ul style="list-style-type: none"> <li>The cursor is moved more than 10 lines from its previous position</li> <li>The cursor is moved in a <i>find/replace</i> operation</li> </ul> <p>You can navigate to an earlier point in the cursor history by pressing <b>Ctrl+-</b>, and to a later point by pressing <b>Ctrl+Shift+-</b>.</p>	
<b>Brace Matching</b>	<p>When you place the cursor over a brace or bracket, the Code Editor highlights its corresponding partner; you can then navigate to the matching brace by pressing <b>Ctrl+E</b>.</p> <pre> 28     function ProtectedFunctionTest: boolean; 29     procedure ProtectedProcedureTest(a: WideString); </pre>	
<b>Automatic Indentation</b>	<p>For each supported language, the Code Editor adjusts the indentation of a new line according to the presence of control statements or scope block tokens in the lines leading up to the cursor position.</p> <pre> 358 { 359     for(size_t t = 0; t &lt; Stations.size(); t++) 360     { 361         if(Stations[t]-&gt;Location == loc) 362             return Stations[t]; 363     } 364     return NULL; 365 } </pre>	

Topic	Detail	See also
	<p>The levels of indent are indicated by pale horizontal lines.</p> <p>You can also manually indent selected lines and blocks of code by pressing <b>Tab</b>; to unindent the selected code, press <b>Shift+Tab</b>.</p>	
<b>Commenting Selections</b>	<p>For languages that support comments, the Code Editor can comment entire selections of code.</p> <p>The Code Editor recognizes two types of commenting:</p> <ul style="list-style-type: none"> <li>Line Commenting - entire lines are commented from the start (for example:  <code>// This is a comment</code>)</li> <li>Stream Commenting - sections of a line are commented from a specified start point to a specified end point (for example:  <code>/* This is a comment */</code>)</li> </ul> <p>You can toggle comments on the current line or selection by pressing:</p> <ul style="list-style-type: none"> <li><b>Ctrl+Shift+C</b> for line comments, or</li> <li><b>Ctrl+Shift+X</b> for stream comments</li> </ul>	
<b>Scope Guides</b>	<p>If the cursor is placed over an indentation marker, the Code Editor performs a 'look back' to find the line that started the scope at that indentation level; if the line is found and is currently on screen, it is highlighted in light blue.</p>  <pre> 93 // If there were any answers, then return a packet, if not then just return null 94 // to indicate the server has no response 95 if ( answers.size() &gt; 0 ) 96 { 97     DNSPacket responsePacket = Helpers.createResponsePacket( answers, this.theS 98     responsePacket.queryID = receivedPacket.queryID; 99 100     return responsePacket; 101 } </pre> <p>Alternatively if the line is off screen, a calltip is displayed advising of the line number and contents:</p>  <pre> 93 // If there were any answers, then return a packet, if not then just return null 94 // to indicate the server has no response 95 if ( answers.size() &gt; 0 ) 96 Line 73: private DNSPacket processQuery(DNSPacket receivedPacket) 97     DNSPacket responsePacket = Helpers.createResponsePacket( answers, this.theS 98     responsePacket.queryID = receivedPacket.queryID; 99 100     return responsePacket; 101 } </pre>	
<b>Zooming</b>	<p>You can zoom into and out of the contents of the Code Editor using:</p> <ul style="list-style-type: none"> <li><b>Ctrl + keypad +</b> and</li> <li><b>Ctrl + keypad -</b></li> </ul> <p>Zoom can be restored to 100% using <b>Ctrl + keypad /</b>.</p>	

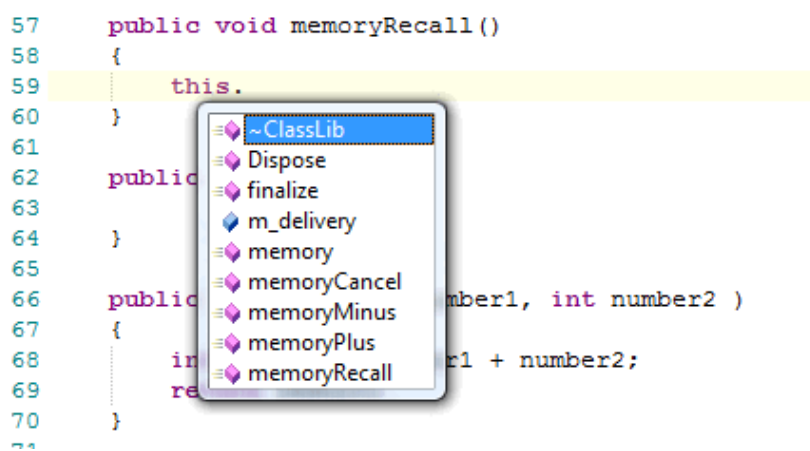

Topic	Detail	See also
<b>Line Selection</b>	<p>If you want to move the cursor to a specific line of code, press <b>Ctrl+G</b> and, in response to the prompt, type in the line number.</p> <p>Press the <b>OK</b> button; the editor displays the specified line of code with the cursor at the left.</p>	

### 11.7.5.2 Intelli-sense

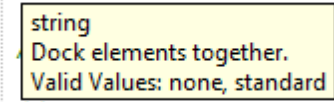

Intelli-sense is a feature that provides choices of code items and values as you type. Not all code editors use Intelli-sense; for example, Intelli-sense is disabled while you record a macro in the Source Code Viewer.

Intelli-sense provides you with context-based assistance through autocompletion lists, calltips and mouseover information.

#### Topics

Topic	Detail	See also
<b>Autocompletion List</b>	<p>An autocompletion list provides a list of possible completions for the current text; the list is automatically invoked when you enter an accessor token (such as a period or pointer accessor) after an object or type that contains members.</p>  <p>You can also invoke the autocompletion list manually by pressing (<b>Ctrl+Space</b>); the Code Editor then searches for matches for the word leading up to the invocation point.</p> <p>Select an item from the list and press (<b>Enter</b>) or (<b>Tab</b>) to insert the item into the code; to dismiss the autocompletion list, press (<b>Escape</b>).</p>	
<b>Calltips</b>	<p>Calltips display the current method's signature when you type the parameter list token (for example, opening parenthesis); if the method is overloaded, the calltip displays arrows that you can use to navigate through the different method signatures</p>	

Topic	Detail	See also
	<pre> 20      //PostDraw Adornments 21      //Stereotyped Static Adornments 22      //Add Stakeholder's STAKE 23      setpenwidth( 24      // Add a the 25      startpath( 26      moveto(25,37); 27      lineto(25,52); 28      endpath(); 29      strokepath(); 30      //Add tip </pre> 	
<b>Mouseover Information</b>	<p>You can display supporting documentation for code elements (for example, attributes and methods) by hovering the cursor over the element in question.</p> <pre> 11      dockable = "none"; 12      string 13      Dock elements together. 14      Valid Values: none, standard 15      //PreDraw Derived Attribute 1 </pre>

### 11.7.5.3 Find and Replace

Each of Enterprise Architect's code editors facilitates searching for and replacing terms in the editor, through the Find and Replace dialog.

#### Access

Highlight the required text string and press:

- **(Ctrl+F)** for the *find* controls only, or
- **(Ctrl+R)** for both *find* and *replace* controls

In each instance, the **Find what** field is populated with the text currently selected in the editor. If no text is selected in the editor, the **Find what** field is populated with the word at the current cursor position. If no word exists at the current cursor position, the last searched-for term is used.

#### Basic Operations

##### Commands

Command	Action	See also
<b>Find Next</b>	Locate and highlight the next instance (relative to the current cursor position) of the text specified in the <b>Find what</b> field.	
<b>Replace</b>	Replace the current instance of the text specified in the <b>Find what</b> field with the text specified in the <b>Replace with</b> field, and then locate and highlight the next instance (relative to the current cursor position) of the text specified in the <b>Find what</b> field.	
<b>Replace All</b>	Automatically replace all instances of the text specified in the <b>Find what</b> field with the text specified in the <b>Replace with</b> field.	

### Options

Option	Action	See also
<b>Match Case</b>	Specify that the case of each character in the text string in the <b>Find what</b> field is significant when searching for matches in the code.	
<b>Match whole word</b>	Specify that the text string in the <b>Find what</b> field is a complete word and should not be matched with instances of the text that form part of a longer string.  For example, searches for ARE should not match those letters in instances of the words AREA or ARENA.	
<b>Search up</b>	Perform the search from the current cursor position up to the start of the file, rather than in the default direction of current cursor position to end of file.	
<b>Use Regular Expressions</b>	Evaluate specific character sequences in the <b>Find what</b> and <b>Replace with</b> fields as <i>Regular Expressions</i> (see below).	

### Topics

Topic	Detail	See also
<b>Regular Expressions</b>	A Regular Expression is a formal definition of a search pattern, which can be used to match specific characters, words or patterns of characters.  For the sake of simplicity, the Code Editor's 'find and replace' mechanism supports only a subset of the standard Regular Expression grammar.  Text in the <b>Find what</b> and <b>Replace with</b> fields is only interpreted as a Regular Expression if the <b>Use Regular Expressions</b> checkbox is selected	

Topic	Detail	See also																		
	in the Find and Replace dialog.																			
<b>Meta sequences</b>	<p>If the <b>Use Regular Expressions</b> checkbox is selected, most characters in the <b>Find what</b> field are treated as literals (that is, they match only themselves).</p> <p>The exceptions are called <i>metasequences</i>; each <i>metasequence</i> recognized in the Code Editor <b>Find and Replace</b> dialog is described in the following table:</p> <table><tr><th>Metasequence</th><th>Description</th></tr><tr><td>.</td><td>Represents any single character. For example: <b>.at</b> is matched to <b>cat</b>, <b>hat</b>, <b>bat</b> and <b>rat</b>.</td></tr><tr><td>\&lt;</td><td>Indicates that the text is the start of a word. For example: <b>\&lt;cat</b> is matched to <b>catastrophe</b> and <b>concatenate</b>.</td></tr><tr><td>\&gt;</td><td>Indicates that the text is the end of a word. For example: <b>hat\&gt;</b> is matched to <b>that</b> and <b>chat</b>, but not <b>hat</b>.</td></tr><tr><td>( ... )</td><td>Indicates alternative single characters that can be match can be specific - ( <b>chr</b> ) - or in an alphabetical or numerical range - ( <b>a-m</b> ). For example: ( <b>hc</b> ) at is matched to <b>hat</b> and <b>cat</b> but not <b>bat</b>. For example: ( <b>a-m</b> ) Class is matched to any name in the <b>mClass</b>.</td></tr><tr><td>( ^... )</td><td>Indicates alternative single characters that should be excluded from the match. The characters can be specific - ( <b>^chr</b> ) - or in an alphabetical or numerical range - ( <b>^a-m</b> ). For example: ( <b>^hc</b> ) at is matched to <b>rat</b> and <b>bat</b> but <b>hat</b> is excluded. For example: ( <b>^a-m</b> ) Class is matched to any name in the <b>zClass</b> but <b>aClass</b> to <b>mClass</b> are excluded.</td></tr><tr><td>^</td><td>Matches the start of a line.</td></tr><tr><td>\$</td><td>Matches the end of a line.</td></tr><tr><td>*</td><td>Matches the preceding character (or character set) 0 or more times. For example: <b>ba*t</b> is matched to <b>bt</b>, <b>bat</b>, <b>baat</b>, <b>baaat</b> and <b>baaaat</b>.</td></tr></table>	Metasequence	Description	.	Represents any single character. For example: <b>.at</b> is matched to <b>cat</b> , <b>hat</b> , <b>bat</b> and <b>rat</b> .	\<	Indicates that the text is the start of a word. For example: <b>\&lt;cat</b> is matched to <b>catastrophe</b> and <b>concatenate</b> .	\>	Indicates that the text is the end of a word. For example: <b>hat\&gt;</b> is matched to <b>that</b> and <b>chat</b> , but not <b>hat</b> .	( ... )	Indicates alternative single characters that can be match can be specific - ( <b>chr</b> ) - or in an alphabetical or numerical range - ( <b>a-m</b> ). For example: ( <b>hc</b> ) at is matched to <b>hat</b> and <b>cat</b> but not <b>bat</b> . For example: ( <b>a-m</b> ) Class is matched to any name in the <b>mClass</b> .	( ^... )	Indicates alternative single characters that should be excluded from the match. The characters can be specific - ( <b>^chr</b> ) - or in an alphabetical or numerical range - ( <b>^a-m</b> ). For example: ( <b>^hc</b> ) at is matched to <b>rat</b> and <b>bat</b> but <b>hat</b> is excluded. For example: ( <b>^a-m</b> ) Class is matched to any name in the <b>zClass</b> but <b>aClass</b> to <b>mClass</b> are excluded.	^	Matches the start of a line.	\$	Matches the end of a line.	*	Matches the preceding character (or character set) 0 or more times. For example: <b>ba*t</b> is matched to <b>bt</b> , <b>bat</b> , <b>baat</b> , <b>baaat</b> and <b>baaaat</b> .	
Metasequence	Description																			
.	Represents any single character. For example: <b>.at</b> is matched to <b>cat</b> , <b>hat</b> , <b>bat</b> and <b>rat</b> .																			
\<	Indicates that the text is the start of a word. For example: <b>\&lt;cat</b> is matched to <b>catastrophe</b> and <b>concatenate</b> .																			
\>	Indicates that the text is the end of a word. For example: <b>hat\&gt;</b> is matched to <b>that</b> and <b>chat</b> , but not <b>hat</b> .																			
( ... )	Indicates alternative single characters that can be match can be specific - ( <b>chr</b> ) - or in an alphabetical or numerical range - ( <b>a-m</b> ). For example: ( <b>hc</b> ) at is matched to <b>hat</b> and <b>cat</b> but not <b>bat</b> . For example: ( <b>a-m</b> ) Class is matched to any name in the <b>mClass</b> .																			
( ^... )	Indicates alternative single characters that should be excluded from the match. The characters can be specific - ( <b>^chr</b> ) - or in an alphabetical or numerical range - ( <b>^a-m</b> ). For example: ( <b>^hc</b> ) at is matched to <b>rat</b> and <b>bat</b> but <b>hat</b> is excluded. For example: ( <b>^a-m</b> ) Class is matched to any name in the <b>zClass</b> but <b>aClass</b> to <b>mClass</b> are excluded.																			
^	Matches the start of a line.																			
\$	Matches the end of a line.																			
*	Matches the preceding character (or character set) 0 or more times. For example: <b>ba*t</b> is matched to <b>bt</b> , <b>bat</b> , <b>baat</b> , <b>baaat</b> and <b>baaaat</b> .																			

Topic	Detail	See also								
	<table><tr><th>Metasequence</th><th>Description</th></tr><tr><td></td><td>For example: <b>b( ea ) *t</b> is matched to <b>bt, bet, bat, beat, be</b></td></tr><tr><td><b>+</b></td><td>Matches the preceding character (or character set) 1 or more times. For example: <b>ba+t</b> is matched to <b>bat, baat</b> and <b>baaat</b> but not <b>ba</b>. <b>Replace with</b>	<b>i t e m s t h a t b e l o n g t o \1</b>									
Original text:	These are all Michael's things.									
Replaced text:	These are all items that belong to Michael									

#### 11.7.5.4 Search in Files

File Text Searches are provided by the Search window and from within the Code Editors, to search files for data names and structures.

You can use the Search window to search for text in code files and scripts; you can select to display the results of the search in one of two formats:

- List View - each result line consists of the file path and line number, followed by the line text; multiple lines from one file are listed as separate entries
- Tree View - each result line consists of the file path that matches the search criteria, and the number of lines matching the search text within that file; you can expand the entry to show the line number and text of each line

**Access** **Edit | Find in Files** (Ctrl+Shift+Alt+F) > **File Search**

### Search Toolbar

You can use the toolbar options in the Search window to control the search operation. The state of all buttons persists over time to always reflect your previous search criteria.

### Options

Field/Option	Action	See also
<b>Search Path</b> list box	<p>Specify the folder to search.</p> <p>You can type the path to search directly into the text box, or click on the folder icon to browse for the path.</p> <p>Any paths you enter are automatically saved in the drop-down list, up to a maximum of ten; paths added after that overwrite the oldest path in the list.</p> <p>A fixed option in the drop-down list is <b>Search in Scripts</b>, which sets the search to operate on all local and user-defined scripts in the Scripts tab of the Scripting window; this option disables the <b>Search File Types</b> list box.</p>	
<b>Search Text</b> list box	<p>Specify the text to look for.</p> <p>You can type the text directly into the text box or click on the drop-down arrow to select from a previous entry in the list. The search text you enter is automatically saved in the list when you click on the <b>Search</b> button.</p> <p>The list box saves up to ten search queries. Search queries added after that overwrite the oldest query in the list.</p>	
<b>Search File Types</b> list box	<p>Limit the search to specific types of files. You can select multiple file types in a string, separated by either a comma or a semi-colon as shown in the image above.</p>	
<b>Search</b> button	<p>Begin the search.</p> <p>During the course of the search all other buttons in the toolbar are disabled. You can cancel the search at any time by clicking on the <b>Search</b> button again.</p> <p>If you switch any of the toggle buttons below, you must run the search again to change the output.</p>	
<b>Case Sensitivity</b> button	<p>Toggle the case sensitivity of the search. The tooltip message identifies the current status of the button.</p>	

Field/Option	Action	See also
<b>Word Match</b> button	Toggle between searching for any match and searching for only those matches that form an entire word. The tooltip message identifies the current status of the button.	
<b>SubFolders</b> button	Toggle between limiting the search to a single path and including all subfolders under that path. The tooltip message identifies the current status of the button.	
<b>Result View</b> button	Select the presentation format of the search results - List View or Tree View format.	
<b>Clear Results</b> button	Clear the results.	
<b>Clear Search Criteria</b> button	Remove all the entries in the <b>Search Path</b> , <b>Search Text</b> and <b>Search File Types</b> list boxes, if required.	
<b>Help</b> button	Display this Help topic.	

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Software Engineering** | **Code Editor** | **Search for Options**

#### 11.7.5.4.1 Search Intelli-sense

When editing a code file with the **code editor**, you can perform a search for a text string in any **Intelli-sense libraries** listed in the active Execution Analyzer script.

**Access**   **Edit** | **Find in Files** (Ctrl+Shift+Alt+F) > **Intelli-sense Search**

#### Intelli-sense Libraries

Intelli-sense libraries are information databases that can be used to perform searches and queries on a code base. The databases are created from source code directories using a specific language such as C++, Java or C#, and are available using shortcut keys and context menus in Enterprise Architect code editors.

The libraries are created, updated, removed or added in the **Analyzer Script Editor**. A typical scenario for using this feature would be create libraries for your source code and that of any libraries you are referencing. The libraries for your source can then be updated frequently with code changes, while the external libraries that remain mostly static will not get updated often. Libraries can be searched in a similar way to the File Search tool, but with the following differences:

- Multiple directories can be searched at once by having multiple libraries
- A query can be run in a fraction of the time required for a File Search
- All files are indexed based on equivalent UML constructs, allowing intelligent searches producing

meaningful results in a modeling setting

### **The Intelli-sense Search Control**

The Search Control is located as a tab of the Find in Files window. From this control you view the results of Intelli-sense searches initiated from within the code editor. This control can be used to run, create and maintain queries. Each query is named and the names of all queries become available as sub-menu items in the **Search Intelli-sense** context menu displayed in the code editors.

Using the Intelli-sense Search tab toolbar you can run, create and maintain Intelli-sense queries. Queries are saved as either **Personal** or **Model** queries. Model queries are available to all users of the model; currently, a set of common Model queries are supplied by Sparx Systems and it is not expected that you will have to create others. All queries work on any Intelli-sense **library** created by users.

To view a query, select it from the list and use the gray arrow button at the far right of the toolbar to open the query editor.

### **11.7.6 Code Editor Key Bindings**

Key	Description
<b>Ctrl+G</b>	Move cursor to a specified line
↓	Move cursor down one line
<b>Shift+↓</b>	Extend selection down one line
<b>Ctrl+↓</b>	Scroll down one line
<b>Alt+Shift+↓</b>	Extend rectangular selection down one line
↑	Move cursor up one line
<b>Shift+↑</b>	Extend selection up one line
<b>Ctrl+↑</b>	Scroll up one line
<b>Alt+Shift+↑</b>	Extend rectangular selection up one line
<b>Ctrl+ (</b>	Move cursor up one paragraph
<b>Ctrl+Shift+ (</b>	Extend selection up one paragraph
<b>Ctrl+ )</b>	Move cursor down one paragraph
<b>Ctrl+Shift+ )</b>	Extend selection down one paragraph
←	Move cursor left one character
<b>Shift+←</b>	Extend selection left one character
<b>Ctrl+←</b>	Move cursor left one word
<b>Ctrl+Shift+←</b>	Extend selection left one word

Key	Description
<b>Alt+Shift+←</b>	Extend rectangular selection left one character
<b>→</b>	Move cursor right one character.
<b>Shift+→</b>	Extend selection right one character
<b>Ctrl+→</b>	Move cursor right one word
<b>Ctrl+Shift+→</b>	Extend selection right one word
<b>Alt+Shift+→</b>	Extend rectangular selection right one character
<b>Ctrl+/<b></b></b>	Move cursor left one word part
<b>Ctrl+Shift+/<b></b></b>	Extend selection left one word part
<b>Ctrl+\<b></b></b>	Move cursor right one word part
<b>Ctrl+Shift+\<b></b></b>	Extend selection right one word part
<b>Home</b>	Move cursor to the start of the current line
<b>Shift+Home</b>	Extend selection to the start of the current line
<b>Ctrl+Home</b>	Move cursor to the start of the document
<b>Ctrl+Shift+Home</b>	Extend selection to the start of the document
<b>Alt+Home</b>	Move cursor to the absolute start of the line
<b>Alt+Shift+Home</b>	Extend rectangular selection to the start of the line
<b>End</b>	Move cursor to the end of the current line
<b>Shift+End</b>	Extend selection to the end of the current line
<b>Ctrl+End</b>	Move cursor to the end of the document
<b>Ctrl+Shift+End</b>	Extend selection to the end of the document
<b>Alt+End</b>	Move cursor to the absolute end of the line
<b>Alt+Shift+End</b>	Extend rectangular selection to the end of the line
<b>Page Up</b>	Move cursor up a page
<b>Shift+Page Up</b>	Extend selection up a page
<b>Alt+Shift+Page Up</b>	Extend rectangular selection up a page
<b>Page Down</b>	Move cursor down a page

Key	Description
<b>Shift+Page Down</b>	Extend selection down a page
<b>Alt+Shift+Page Down</b>	Extend rectangular selection down a page
<b>Delete</b>	Delete character to the right of the cursor
<b>Shift+Delete</b>	Cut selection
<b>Ctrl+Delete</b>	Delete word to the right of the cursor
<b>Ctrl+Shift+Delete</b>	Delete until the end of the line
<b>Insert</b>	Toggle overtype
<b>Shift+Insert</b>	Paste
<b>Ctrl+Insert</b>	Copy selection
<b>Backspace</b>	Delete character to the left of the cursor
<b>Shift+Backspace</b>	Delete character to the left of the cursor
<b>Ctrl+Backspace</b>	Delete word to the left of the cursor
<b>Ctrl+Shift+Backspace</b>	Delete from the start of the line to the cursor
<b>Alt+Backspace</b>	Undo delete
<b>Tab</b>	Indent cursor one tab
<b>Ctrl+Shift+I</b>	Indent cursor one tab
<b>Shift+Tab</b>	Unindent cursor one tab
<b>Ctrl+keypad( + )</b>	Zoom in
<b>Ctrl+keypad( - )</b>	Zoom out
<b>Ctrl+keypad( / )</b>	Restore Zoom
<b>Ctrl+Z</b>	Undo
<b>Ctrl+Y</b>	Redo
<b>Ctrl+X</b>	Cut selection
<b>Ctrl+C</b>	Copy selection
<b>Ctrl+V</b>	Paste

Key	Description
<b>Ctrl+L</b>	Cut line
<b>Ctrl+Shift+L</b>	Delete line
<b>Ctrl+T</b>	Transpose line
<b>Ctrl+Shift+T</b>	Copy line
<b>Ctrl+A</b>	Select entire document
<b>Ctrl+D</b>	Duplicate selection
<b>Ctrl+U</b>	Convert selection to lowercase
<b>Ctrl+Shift+U</b>	Convert selection to uppercase
<b>Ctrl+E</b>	Move cursor to matching brace
<b>Ctrl+Shift+E</b>	Extend selection to matching brace
<b>Ctrl+Shift+C</b>	Toggle line comment on selection
<b>Ctrl+Shift+X</b>	Toggle stream comment on selection
<b>Ctrl+F2</b>	Toggle bookmark
<b>F2</b>	Go to next bookmark
<b>Shift+F2</b>	Go to previous bookmark
<b>Ctrl+Shift+F2</b>	Clear all bookmarks in current file
<b>Ctrl+Shift+W</b>	Toggle whitespace characters
<b>Ctrl+Shift+L</b>	Toggle EOL characters
<b>Ctrl+Spacebar</b>	Invoke autocomplete
<b>Ctrl+-</b>	Go backwards in cursor history
<b>Ctrl+Shift+-</b>	Go forwards in cursor history
<b>F12</b>	Start/Cancel search for keyword in file(s).
<b>Ctrl+F</b>	Find text
<b>Ctrl+R</b>	Replace text

**Notes**

- In addition to these keys, you can assign (**Ctrl+Alt+<n>**) key combinations to macros that you define within the Source Code Editor

## 11.8 Code Build & Debug

This section discusses the integrated Model Driven Development Environment (MDDE).

### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>Model Driven Development provides a more robust, accessible and faster development cycle than traditional coding-driven cycles.</p> <p>A well constructed model, intimately linked with source code build, run, debug, test and deploy capabilities provides a rich, easily navigated and easily understood target architecture.</p> <p>Traceability, linkage to Use Cases, Components and other model artifacts, plus the ability to readily record and document pre-existing or recently developed code, make Enterprise Architect's development environment uniquely powerful.</p> <p>Enterprise Architect incorporates industry standard intelligent editing, debuggers and modeling languages.</p>	<a href="#">Getting Started</a> <sup>[2173]</sup> <a href="#">Analyzer Scripts</a> <sup>[2175]</sup> <a href="#">Editing Source Code</a> <sup>[2146]</sup>
<b>The MDDE</b>	<p>The MDDE provides tools to design, build and debug an application:</p> <ul style="list-style-type: none"> <li>• UML technologies and tools to model software</li> <li>• Code generation tools to generate/reverse engineer source code</li> <li>• Tools to import source code and binaries</li> <li>• Code editors that support different programming languages</li> <li>• Intelli-sense to aid coding</li> <li>• Analyzer scripts that enable a user to describe how to build, debug, test and deploy the application</li> </ul> <pre> pApp = new CBCGPAAppointmentDemo (     ▲ 2 of 2 ▼ CBCGPAAppointmentDemo::CBCGPAAppointmentDemo(COleDateTime&amp; dtStart,     COleDateTime&amp; dtFinish, CString&amp; strText, COLORREF clrBackground, COLORREF     clrForeground, COLORREF clrDuration)     RGB (165, 222, 99),     CLR_DEFAULT,     RGB(128, 0, 128) ); </pre>	<a href="#">Development Tools</a> <sup>[2074]</sup> <a href="#">MDG Technologies</a> <sup>[1475]</sup> <a href="#">Modeling Basics</a> <sup>[750]</sup> <a href="#">Generate Source Code</a> <sup>[2111]</sup> <a href="#">Import Source Code</a> <sup>[2138]</sup> <a href="#">Import Binary Module</a> <sup>[2143]</sup> <a href="#">Editing Source Code</a> <sup>[2146]</sup> <a href="#">Intelli-sense</a> <sup>[2160]</sup> <a href="#">Managing Analyzer Scripts</a> <sup>[2175]</sup>

### Notes

- The Enterprise Architect debugger cannot attach to 64-bit processes; you can only debug 32-bit

processes

## 11.8.1 Getting Started

To quickly start development in the Model Driven Development Environment, check through the following topics:

- [Prerequisites](#) <sup>[2173]</sup>
- [General Workflow](#) <sup>[2173]</sup>
- [Workspace Layout and Tools](#) <sup>[2174]</sup>

### 11.8.1.1 Prerequisites

Before using the Model Driven Development Environment:

- You should be using the correct edition: Enterprise Architect Professional, Corporate or extended editions
- You should be connected to the required model
- Relevant source code files should be linked to Classes in the model (sufficient to be editable from the internal code editors) either:
  - Using MDA Transforms to generate stub code files, and internal editing to write code
  - Reverse engineering source code from existing files, or
  - Importing existing source code from external files
- Required External Frameworks or compilers should be installed and operable
- An Analyzer Script should be configured to link to the compilers in the External Framework

#### Learn more

- [Analyzer Scripts](#) <sup>[2175]</sup>
- [Importing Source Code](#) <sup>[2136]</sup>
- [Editing Source Code](#) <sup>[2146]</sup>
- [Add Build Commands](#) <sup>[2180]</sup>
- [Debugging](#) <sup>[2222]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Software Engineering | Import Code**
- (Alt+F1) | **Enterprise Architect | Software Engineering | Code Editor | Using Intelli-sense**
- (Alt+F1) | **Enterprise Architect | Software Engineering | Code Editor | Browse to Source File**

### 11.8.1.2 General Workflow

In working with the Model Driven Development Environment, the build-debug workflow is a cyclic process. Beginning with configuring and setting up scripts, each iteration of the cycle can include:

- Model - Edit - Build - Debug - Test - Visual Analysis - Profile

When the cycle is complete, you document and deploy the solution.

#### Code Synchronization:

It is important that the model and source code are kept synchronized for the Visual Execution Analyzer to

produce useful results; use the Code Generation tools to synchronize your model after any design changes or code editing.

Always build the application prior to any Execution Analysis session - debugging, recording or profiling.

#### Learn more

- [Managing Analyzer Scripts](#) 
- [Build Application](#) 
- [Update Package Contents](#) 

### **11.8.1.3 Workspace Layout and Tools**

This topic identifies the workspace layouts that you can select for debugging and Visual Execution Analysis, and the tools these layouts make available in the Model Driven Development Environment.

#### Workspace Layouts

You can choose from many predefined workspace layouts, depending on the tasks you perform. When you are familiar with the environment and controls available to you, you can also define your own workspace layouts.

You can select from the following debug/execution analysis layouts:

- Dev - Debug
- VEA - Profile
- VEA - Record
- VEA - Simulation
- VEA - Test Points

You select the workspace layout from either the:

- Workspace Toolbar or
- Workspaces tab of the Workspaces and Commands dialog

#### Tools

Whether you open the appropriate windows through a workspace layout or select them individually through their menu options, the following tools and facilities are of particular relevance to coding, building and debugging:

- Code engineering
- Source Code Editors
- Breakpoints and Markers
- Intelli-sense
- Execution Analyzer
- Debug window
- Locals window

- Call Stack window

#### Learn more

- [Workspace Layouts Toolbar](#)<sup>[149]</sup>
- [Manage Workspace Layout](#)<sup>[163]</sup>
- [Code Engineering](#)<sup>[2073]</sup>
- [Editing Source Code](#)<sup>[2146]</sup>
- [Intelli-sense](#)<sup>[2160]</sup>
- [Analyzer Scripts](#)<sup>[2175]</sup>
- [Build Application](#)<sup>[2221]</sup>
- [Breakpoint and Marker Management](#)<sup>[2224]</sup>
- [Debugger Facilities](#)<sup>[2231]</sup>

### 11.8.2 Analyzer Scripts

*Analyzer Scripts* are used to record information on compiling and running the application under development.

An Analyzer Script can be defined for a package-tree containing Classes with links to the code. The information you provide in a script controls the actions in, and provides support for:

- Building
- Debugging
- Testing
- Execution
- Deployment

#### Learn more

- [Configure Recording Detail](#)<sup>[2219]</sup>
- [Set Up Simulation Script](#)<sup>[2472]</sup>
- [Visual Execution Analyzer](#)<sup>[2527]</sup>

#### 11.8.2.1 Managing Analyzer Scripts

The Execution Analyzer window enables you to manage all Analyzer scripts in the model. You use the window toolbar buttons or script context menu options to control script tasks. Scripts are listed by package; the list only shows packages that have Analyzer scripts defined against them.

Each user can activate one script at any time, independent of other users of the same model; one user

activating a script does not impact the currently active scripts for other users or affect the scripts available to them.

**Access** **Analyzer | Execution Analyzer (Shift+F12)**

**Toolbar Options:**

Toolbar Button	Action	See also
	List the Analyzer windows; select and display the required window.	<a href="#">Debugging</a> <sup>[2222]</sup> <a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup> <a href="#">View the Call Stack</a> <sup>[2239]</sup> <a href="#">View the Local Variables</a> <sup>[2234]</sup> <a href="#">View Variables in Other Scopes</a> <sup>[2237]</sup> <a href="#">Inspect Process Memory</a> <sup>[2242]</sup> <a href="#">The Recording History</a> <sup>[2533]</sup> <a href="#">The Testpoints Window</a> <sup>[2578]</sup> <a href="#">Profiling</a> <sup>[2555]</sup> <a href="#">Model Simulation</a> <sup>[2463]</sup>
	Add new Analyzer Script.  A prompt displays to browse for and select the parent package, followed by the Analyzer Script Editor.	<a href="#">Analyzer Script Editor</a> <sup>[2179]</sup>
	Export Scripts.  Export one or more Analyzer Scripts to an XML file, which can be used to import the scripts into another model.  The Execution Analyzer: Export dialog displays, from which you select the script or scripts to export, followed by a prompt for the target file name and location.	
	Import Scripts.  Import one or more Analyzer Scripts into the current model from a previously exported XML file.  The Browse Project dialog displays, on which you select the package into which to import the scripts, followed by a prompt for the source file name and location.	

Toolbar Button	Action	See also
	Execute the Build command of the active script.	<a href="#">Add Commands</a> <sup>[2180]</sup>
	Cancel the Build command currently in progress.	
	Execute the Run command of the active script.	<a href="#">Add Run Command</a> <sup>[2217]</sup>
	Execute the Test command of the active script.	<a href="#">Add Testing Command</a> <sup>[2182]</sup>
	Execute the Deploy command of the active script.	<a href="#">Add Deploy Command</a> <sup>[2218]</sup>
	Display the Help topic for this window.	

#### Context Menu Options:

Right-click on the required script or package to display the context menus.

Option	Action	See also
<b>Add New Script</b>	Add a new script to the selected package. The Analyzer Scripts Editor displays, showing the Build page.	<a href="#">Analyzer Script Editor</a> <sup>[2179]</sup>
<b>Paste Script</b>	Paste a copied script from the Enterprise Architect clipboard into the selected package. You can paste the copied script several times; each copy has the suffix <b>Copy</b> . To rename the copied script, press <b>(F2)</b> and overwrite the script name.	
<b>Export Scripts</b>	Export scripts from the selected package. The Execution Analyzer: Export dialog displays, from which you select the script or scripts to export, followed by a prompt for the target file name and location.	
<b>Import Scripts</b>	Import scripts from a .XML file into the selected package. A prompt displays for the source file name and location.	

Option	Action	See also
<b>Select In Project Browser</b>	Highlight the selected package in the Project Browser. Display the Project Browser, which is now expanded to show the highlighted package.	
<b>Build</b>	Execute the Build command of the selected script.	<a href="#">Build Application</a> <sup>[2221]</sup>
<b>Clean</b>	Execute the Clean command of the selected script.	<a href="#">Clean</a> <sup>[2181]</sup>
<b>Rebuild</b>	Execute the Clean and Build commands of the selected script.	<a href="#">Build Application</a> <sup>[2221]</sup>
<b>Debug</b>	Execute the Debug command of the selected script.	<a href="#">Set up a Debug script</a> <sup>[2185]</sup>
<b>Run</b>	Execute the Run command of the selected script.	<a href="#">Add Run Command</a> <sup>[2217]</sup>
<b>Test</b>	Execute the Test command of the selected script.	<a href="#">Add Testing Command</a> <sup>[2182]</sup>
<b>Deploy</b>	Execute the Deploy command of the selected script.	<a href="#">Add Deploy Command</a> <sup>[2218]</sup>
<b>Start Simulation</b>		
<b>Edit</b>	Open the selected script in the Analyzer Scripts Editor.	<a href="#">Analyzer Script Editor</a> <sup>[2179]</sup>
<b>Copy</b>	Copy the selected script to the Enterprise Architect clipboard.	
<b>Paste</b>	Paste the most-recently copied script to the same package as the selected script.  You can paste the copied script several times; each copy has the suffix <b>Copy</b> .  To rename the copied script, press <b>(F2)</b> and overwrite the script name.	
<b>Delete</b>	Delete the selected script; there is no prompt for confirmation.  To delete a <i>package</i> from the Execution Analyzer window, delete the scripts from the package; when the last script is deleted, the package is no longer listed.	

Option	Action	See also
<b>Set as Model Default</b>	Set the selected script as the default script for the model. The icon to the left of the script changes color; any previously-set default script reverts to normal.	
<b>Help</b>	Display the Help topic for this window.	

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Build and Debug | Overview | Analyzer Scripts**

#### 11.8.2.2 Analyzer Script Editor

Analyzer Scripts are associated with a Package. When you create an Analyzer Script you can define a number of actions - many features, such as Debugging, Testing, Profiling and Simulation, depend on and function according to how the active script has been configured.

The Execution Analyzer Script Editor has a number of pages for configuring various scripts; if you plan to use any of the features of the Execution Analyzer, you must complete at least the Build and Debug pages.

Task	Page	Actions	See also
<b>Build</b>	Build	Enter script or command to build the application.	<a href="#">Add Build Commands</a> <sup>[2180]</sup>
	Clean	Enter script or command to clean the previous build .	<a href="#">Clean</a> <sup>[2181]</sup>
<b>Test</b>	Test	Enter script or command to test the application.	<a href="#">Test</a> <sup>[2182]</sup>
	Testpoints	Specify where the output from a Testpoint run is sent.	<a href="#">Testpoint Output</a> <sup>[2184]</sup>
<b>Debug</b>	Platform	Specify the debugging platform, the application to be debugged, and the mode of debugging (attach to process or run ).	<a href="#">Debug</a> <sup>[2222]</sup>
	Tracepoints	Specify where the output from Tracepoints encountered during a debug session are sent.	<a href="#">Tracepoint Output</a> <sup>[2215]</sup>
	Workbench	Specify required information for using the Object Workbench control.	<a href="#">Workbench Setup</a> <sup>[2216]</sup>
<b>Run</b>	Run	Enter a script or command to run the application.	<a href="#">Add Run Command</a> <sup>[2217]</sup>
<b>Deploy</b>	Deploy	Enter a script or command to deploy the project.	<a href="#">Add Deploy Command</a> <sup>[2218]</sup>
<b>Recording</b>	Recording	Exclude areas of the application from being recorded; you can specify wildcard expressions to exclude operations, Classes and modules.  Here you can also enable recording of instances.	<a href="#">Configure Recording Detail</a> <sup>[2219]</sup>

Task	Page	Actions	See also
<b>Simulation</b>	Simulation	Complete the configuration for Simulation Control.	<a href="#">Model Simulation</a> 

### 11.8.2.3 Add Build Commands

This topic describes how you specify the commands to build the project or package, using the Execution Analyzer Script Editor.

The Build page enables you to enter commands to build your project. You can use Enterprise Architect Local Paths and environment variables in composing your command line(s).

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Build > Build Analyzer | Execution Analyzer (Shift+F12)** : locate and double-click on required script > **Build > Build**

#### Reference

On the Execution Analyzer Script Editor:

Field	Action	See also
<b>Execute Command As:</b>	<p><b>Batch File</b></p> <p>Use this option to create a build script. The script is executed in a system command window. Environment variables can be accessed by commands in this script.</p> <p><b>Process</b></p> <p>Use this option to run a single program.</p> <p>The command should specify the path to the program, plus any command line arguments; if the executable path or any arguments contain spaces, they must be surrounded by quotes.</p> <p>When this option is selected for Java, you can build all java files in child directories by adding the <code>%r</code> token. The token should immediately precede the files to be built. Enterprise Architect will then execute the command in each child directory. (see example below)</p>	<a href="#">Analyzer Script Editor</a> 
<b>Build Script</b>	Write your script in the large text box, using the standard Windows Command Line commands; the format and content of this section depends on the actual compiler, make system, linker and so on that you use to build your project.	<a href="#">Local Paths</a> 

Field	Action	See also
	<p>You can specify, for example, compiler and linker options, and the names of output files; you can also wrap up all these commands into a convenient batch file and call that here instead.</p> <p><b>Examples:</b></p> <p><b>Visual Studio:</b></p> <pre>"C:\Program Files (x86)\Microsoft Visual Studio 9.0\Common7\IDE\devenv.com" /Rebuild Debug RentalSystem.sln</pre> <p><b>Using a Local Path:</b></p> <pre>"%VsCompPath%\devenv.exe" /build Debug Subway.sln</pre> <p><b>Java:</b></p> <pre>C:\Program Files (x86)\Java\jdk1.6.0_22\bin\javac.exe -g -cp "%classpath%" %*.java</pre> <p><b>Using a Local Path:</b></p> <pre>"%JAVA%\bin\javac.exe" -g -cp "%classpath%" %*.java</pre>	
<b>Default Directory</b>	Type in or browse for the default directory path into which the Build commands are to load the built application files.	
<b>Parse Output</b>	<p>This enables you to select a method for automatically parsing the compiler output.</p> <p>If you select this option, output from the script is logged in the System Output window; Enterprise Architect parses the output according to the syntax you specify.</p>	<a href="#">The Output Window</a> <sup>169</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Build and Debug | Overview | Build**
- (Alt+F1) | **Enterprise Architect | Build and Debug | Build and Run | Build Scripts - Native**
- (Alt+F1) | **Enterprise Architect | Build and Debug | Build and Run | Build Scripts - .NET**
- (Alt+F1) | **Enterprise Architect | Build and Debug | Build and Run | Build Scripts - Java**

#### 11.8.2.4 Clean

This topic explains how you enter a command to clean your project prior to a build; for example, to delete cached items used for building the project so that the next build recreates from scratch.

In Java you might delete all Class files, jar files and .war files in the project; Visual Studio projects, however, might issue a call to the Visual Studio Clean operation instead.

When you execute the **Rebuild** menu option on a script, the command you specify here is executed followed by the Build command.

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Build > Clean**  
**Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Build > Clean**

### Topics

Topic	Detail	See also
<b>Usage</b>	Enter the command to be executed when you select <b>Clean</b> from the script context menu.	
<b>Example</b>	<code>devenv.com / Clean Debug MyProject.sln</code>	

### Learn more

- [Add Build Commands](#) 

## 11.8.2.5 Testing

The Execution Analyzer supports testing using xUnit testing applications and Testpoints.

This section describes how to create commands for performing unit testing and Testpoint testing on your code.

### Learn more

- [Add Testing Command](#) 
- [Testpoints Output](#) 

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Execution Analysis | Testpoint Testing**

### 11.8.2.5.1 Add Testing Command

This topic explains how to configure the Test Page of an Analyzer Script for performing unit testing on your code.

In order for this to be possible, you must first create a Build script for the appropriate package.

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Test > Test**  
**Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Test > Test**

Topics

Topic	Detail	See also
<b>Usage</b>	<p>A sample script would contain a line to execute the testing tool of your choice, with the filename of the executable produced by the <b>Build</b> command as the option.</p> <p>Testing could be integrated with any test tool using the command line provided, but in these examples you can see how to integrate <i>NUnit</i> and <i>JUnit</i> testing with your source code.</p> <p>Enterprise Architect provides inbuilt MDA Transforms from source to Test Case, plus the ability to capture <i>xUnit</i> output and use it to go directly to a test failure; <i>xUnit</i> integration with your model is a powerful means of delivering solid and well-tested code as part of the complete model-build-test-execute-deploy life-cycle.</p> <p>NUnit and JUnit must be downloaded and installed prior to their use; Enterprise Architect does not include these products in the base installer.</p>	<p><a href="#">Managing Analyzer Scripts</a>  [2175]</p> <p><a href="#">Add Build Commands</a>  [2180]</p> <p><a href="#">JUnit Transformation</a>  [2037]</p> <p><a href="#">NUnit Transformation</a>  [2038]</p> <p><a href="#">Unit Testing</a>  [2573]</p>
<b>Execute Command As:</b>	<p><b>Process</b></p> <p>Enter the path to a program or batch file to run followed by any parameters.</p> <p><b>Batch File</b></p> <p>When using this option you can enter multiple commands, which are then executed as a single script in a command console; you have access to any environment variables available in a standard command console.</p>	
<b>Example</b>	<p><b>NUnit</b></p> <pre>" C: \ P r o g r a m F i l e s \ N U n i t \ b i n \ n u n i t - c o n s o l e . e x e " p i n \ d e b u g \ C a l c u l a t o r . e x e "</pre> <p><b>JUnit</b></p> <pre>j a v a j u n i t . t e x t u i . T e s t r u n n e r %N</pre> <p>The command listed in this field is executed as if from the command prompt; as a result, if the executable path or any arguments contain spaces, they must be surrounded in quotes.</p>	
<b>Default Directory</b>	Preset to the Build default directory.	<a href="#">Add Commands</a>  [2180]
<b>Parse Output</b>	<p>Selecting an Output Parser causes output from the command(s) to be captured to the Output window; the <b>Output Parser</b> field specifies the syntax to be expected.</p> <p>Double-clicking on a result in the Output window opens the corresponding code segment in Enterprise Architect's code</p>	<a href="#">Locate Compiler</a>

Topic	Detail	See also
	window.	<a href="#">Errors in Code</a> <sup>[2221]</sup>
<b>Build First</b>	Select to ensure that the package is recompiled each time you run the test.  If you include the string %N in your test script it is replaced by the fully namespace-qualified name of the currently selected Class when the script is executed.	

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Build and Debug | Test**

#### 11.8.2.5.2 Testpoints Output

The Testpoints page of the Analyzer Script allows you to configure the output of a Testpoint run.

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Test > Testpoints**  
**Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Test > Testpoints**

Topic	Detail	See also
<b>Output</b>	You can select from two options: <ul style="list-style-type: none"> <li>• <b>Screen</b> (Default) - The output is directed to the Testpoints tab of the System Output window</li> <li>• <b>File</b> - The output is directed to file</li> </ul>	<a href="#">Testpoint Management</a> <sup>[2577]</sup>
<b>Folder</b>	Enter the folder to use for Testpoint log files.	
<b>Filename</b>	Enter the name to use for the Testpoints log files.	
<b>Overwrite</b>	When this option is selected, the file specified is overwritten each time a Testpoint run is performed.	
<b>Auto Number</b>	When this option is selected, the Testpoint output is composed of the filename you specify and the number of the Test run; each time you perform a Test run the number is incremented.	
<b>Prefix trace output with function</b>	When this option is selected, any trace statements executed during the Testpoint run are prefixed with the current function call.

**11.8.2.6 Set up a Debug script**

The process of configuring the Debug section of an Analyzer Script is quick and easily accomplished, yet provides access to all the features of Enterprise Architect's Visual Execution Analyzer, namely:

- Debugging
- Sequence diagram recording
- Testpoint management and
- Process profiling

All you need to do is select the appropriate platform for your project and enter some basic details. The debugger platforms you can use include:

- Java
- Java Debug Wire Protocol (JDWP)
- Microsoft .NET Debugger
- Microsoft C++ and Native Code (C, VB) Debugger
- The PHP Debugger
- The GNU Debugger (GDB)

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Debug > Platform Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Debug > Platform**

Notes

- An Analyzer script is not necessary for debugging script languages such as JavaScript (Mozilla), VBScript and JScript (Microsoft)

### 11.8.2.6.1 Operating System Specific Requirements

The Enterprise Architect debugger is able to operate on a number of different platforms. Each of these has different requirements before debugging will be successful. The following table describes the different requirements.

#### Topics

Topic	Detail	See also
<b>Prerequisites</b>	Creation of an Analyzer script and configuration of the <b>Debug</b> command in that script.	
<b>Supported Platforms</b>	<p>Enterprise Architect supports debugging on these platforms:</p> <p><b>.NET</b></p> <ul style="list-style-type: none"> <li>Microsoft™ .NET Framework 1.1 and later, including .NET 4</li> <li>Language support: C, C#, C++, J#, Visual Basic</li> <li>Target Platform on 64 bit systems must be either x86 or x64; do not use the <b>Any CPU</b> configuration</li> </ul> <p><b>Java</b></p> <ul style="list-style-type: none"> <li>Java SE Development Kit from Oracle™. (version 5.0 minimum) (either 32-bit or 64-bit JDK)</li> <li>Java EE Development Kit from Oracle™. (version 5.0 minimum) (either 32-bit or 64-bit JDK)</li> </ul> <p>Debugging is implemented through the Java Virtual Machine Tools Interface (JVMTI), which is part of the Java Platform Debugger Architecture (JPDA); the JPDA was introduced in Java SE version 5.0.</p> <p><b>Windows for Native Applications</b></p> <p>Enterprise Architect supports debugging native code (C, C++ and Visual Basic) compiled with the Microsoft™ compiler where an associated PDB file is available.</p> <p><b>PHP</b></p> <p>Enterprise Architect enables you to perform local and remote debugging with PHP.exe.</p> <p><b>GNU Debugger (GDB)</b></p> <p>Enterprise Architect supports debugging using the GNU Debugger, which enables you to debug your applications under Linux either locally or remotely.</p> <p>Requires GDB version 7.0 or above.</p> <p>Source code file path must not contain spaces.</p>	<p><a href="#">.NET</a>  [2200]</p> <p><a href="#">Java</a>  [2191]</p> <p><a href="#">Microsoft C++ and Native (C, VB)</a>  [2189]</p> <p><a href="#">The PHP Debugger</a>  [2204]</p> <p><a href="#">The GNU Debugger</a>  [2209]</p>

### Notes

- Debugging under Windows Vista (x64) - if you encounter problems debugging with Enterprise Architect on a 64-bit platform, you should build a Win32 platform configuration in Visual Studio; that is, do not specify **ANY-CPU**, specify **WIN32**

#### 11.8.2.6.1.1 UAC-Enabled Operating Systems

The Microsoft operating systems *Windows Vista* and *Windows 7* provide User Account Control (UAC) to manage security for applications.

The Enterprise Architect Visual Execution Analyser is UAC-compliant, and users of UAC-enabled systems can perform operations with the Visual Execution Analyser and related facilities under accounts that are members of only the *Users* group.

However, when attaching to processes running as services on a UAC-enabled operating system, it might be necessary to log in as an Administrator.

### How to

To log in as an Administrator, follow the step below:

Step	Action	See also
1	Before you run Enterprise Architect, right-click on the Enterprise Architect icon on the desktop and select the <b>Run as administrator</b> option.	

Alternatively, to edit or create a link to Enterprise Architect and configure the link to run as an Administrator

Step	Action	See also
1	Right-click on the Enterprise Architect icon and select the <b>Properties</b> menu option. The Enterprise Architect Properties dialog displays.	
2	Click on the <b>Advanced</b> button. The Advanced Properties dialog displays.	
3	Select the <b>Run as administrator</b> checkbox.	
4	Click on the <b>OK</b> button, and again on the Enterprise Architect Properties dialog.	

### 11.8.2.6.1.2 WINE Debugging

#### Configure Enterprise Architect to debug under WINE

Step	Action	See also
1	At the command line, run <code>\$ winecfg</code> .	
2	Set the library overrides for <code>dbghelp</code> to <b>(native, builtin)</b> , and accept the warning about overriding this DLL.	
3	Set <code>dbghelp</code> to <b>native</b> by using <code>winecfg</code> .	
4	Copy the application source code plus executable(s) to your bottle. The path must be the same as the compiled version; that is:  If Windows source = <code>C: \ Sour ce\ Sampl eApp</code> , under Crossover it must be <code>C: \ Sour ce\ Sampl eApp</code>	
5	Copy any Side-By-Side assemblies that are used by the application.	
6	Import the source code into Enterprise Architect (optional).	
7	Create a build script on a package. Set the path of the application on the Debug tab, and set the <b>Use Debugger</b> field to <b>Microsoft Native</b> .	<a href="#">Add Build Commands</a>  <sup>[2180]</sup>
8	Open the Profiler ( <b>Analyzer   Profiler</b> ).	<a href="#">Profiling</a>  <sup>[2555]</sup>
9	Click on the <b>Launch</b> button (first button on the Profiler window).	
10	If the sample didn't start, click on the <b>Sampling</b> button (third button on the Profiler window).	
11	Once you have finished profiling, shut down the application ( <i>not</i> Enterprise Architect).	
12	View the Sampler report by clicking the <b>View Report</b> button (fifth button on the Profiler window).	

### Access Violation Exceptions

Due to the manner in which WINE handles direct drawing and access to DIB data, an additional option is provided on the drop-down menu on the Debug window toolbar to ignore or process access violation exceptions thrown when your program directly accesses DIB data.

Select this option to catch genuine (unexpected) access violations; deselect it to ignore expected violations.

As the debugger cannot distinguish between expected and unexpected violations, you might have to use trial and error to capture and inspect genuine program crashes.

### Notes

- If WINE crashes, the back traces might not be correct
- If you are using MFC remember to copy the debug side-by-side assemblies to the `C:\windows\winsxs` directory
- To add a windows path to WINE, modify the Registry entry:

```
HKEY_LOCAL_MACHINE\System\Current Control Set\Control\Session  
Manager\Environment
```

#### **11.8.2.6.2 Microsoft C++ and Native (C, VB)**

You can debug native code only if there is a corresponding PDB file for the executable; you normally create the PDB file as a result of building the application.

The build should include full debug information and there should be no optimizations set.

The script must specify two things to support debugging:

- The path to the executable
- Microsoft Native as the debugging platform

### Learn more

- [General Setup](#) 

### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Build and Debug** | **Debug** | **Microsoft Native**

#### **11.8.2.6.2.1 General Setup**

This is the general setup for debugging Microsoft Native Applications (C++, C, Visual Basic). You have two options when debugging:

- Debug an application
- Attach to an application that is running

### Option 1 - Debug an application

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft Native</b> as the debugging platform.	
<b>x64</b>	Select this checkbox if you are debugging a <b>64-bit</b> application. Deselect the checkbox if you are debugging a <b>32-bit</b> application.	
<b>Mode</b>	Select the <b>Run</b> radio button.	
<b>Default Directory</b>	This is set as the default directory for the process being debugged.	
<b>Application Path</b>	Select and enter either the full or the relative path to the application executable. <ul style="list-style-type: none"> <li>If the path contains spaces, specify the full path; do not use a relative path</li> <li>If the path contains spaces, the path must be enclosed by quotes</li> </ul>	
<b>Command Line Arguments</b>	Parameters to pass to the application at startup	
<b>Show Console</b>	Create a console window for the debugger; not applicable for attaching to a process.	
<b>Symbol Search Paths</b>	Specify any additional paths to locate debug symbols for the debugger; separate the paths with a semi-colon.	

#### Option 2 - Attach to an application that is running

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft Native</b> as the debugging platform.	
<b>x64</b>	Select this checkbox if you are debugging a <b>64-bit</b> application. Deselect the checkbox if you are debugging a <b>32-bit</b> application.	
<b>Mode</b>	Select the <b>Attach to Process</b> radio button.	<a href="#">Debug Another Process</a>  2243

Field	Action	See also
<b>Symbol Search Paths</b>	Specify any additional paths to locate debug symbols for the debugger.  You could specify a symbol server here if you prefer; separate the paths with a semi-colon or comma.	

#### 11.8.2.6.2.2 Debug Symbols

##### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>For applications built using <i>Microsoft Platform SDK</i>, Debug Symbols are written to an application PDB file when the application is built.</p> <p>The <i>Debugging Tools for Windows</i>, an API used by the Visual Execution Debugger, uses these symbols to present meaningful information to Execution Analyzer controls.</p> <p>These symbols can easily get out of date and cause errant behaviour - the debugger might highlight the wrong line of code in the editor whilst at a breakpoint; it is therefore best to ensure the application is built prior to any debugging or recording session.</p> <p>The debugger must inform the API how to reconcile addresses in the image being debugged; it does this by specifying a number of paths to the API that tell it where to look for PDB files.</p> <p>For system DLLs (<i>kernel32</i>, <i>mfc90ud</i>) for which no debug symbols are found, the Call Stack shows some frames with module names and addresses only.</p> <p>You can supplement the symbols translated by passing additional paths to the API; you pass additional symbol paths in a semi-colon separated list in the Debug tab.</p>	

#### 11.8.2.6.3 Java

This section describes how to set up Enterprise Architect for debugging Java applications and Web Servers.

##### Learn more

- [General Setup for Java](#) <sup>2191</sup>
- [Advanced Techniques](#) <sup>2194</sup>
- [Working with Java Web Servers](#) <sup>2195</sup>

#### 11.8.2.6.3.1 General Setup for Java

The general setup for debugging Java Applications supports two options:

- Debug an Application
- Attach to an application that is running

Option 1 - Debug an Application

Field	Action	See also
Debugger	Select <b>Java</b> .	
x64	Select this checkbox if you are debugging a <b>64-bit</b> application. Deselect the checkbox if you are debugging a <b>32-bit</b> application.	
Mode	Select <b>Run</b> .	
Default Directory	This path is added to the class path property when the Java Virtual Machine is created.	
Application Class	Identify the fully qualified Class name to debug; the Class must have a method declared with the following signature:  <pre>public static void main( String( ) );</pre> <div><div>Application Class</div><div>samples.Collector</div></div> <div><div>Command Line Arguments:</div><div>"param1" param2 "param3" param4</div></div>	
Command Line Arguments	Specify any parameters to be passed to the main method of the Application Class above.  Parameters containing spaces should be surrounded with double quotes.	
Java Virtual Machine Options	Specify command line options for Virtual Machine creation.  You also must provide a parameter ( <b>JRE</b> ) as the path to be searched for the <i>jvm.dll</i> ; this is the DLL supplied as part of the Java runtime environment or Java JDK from Sun Microsystems™.  The JRE parameter can be either: <ul style="list-style-type: none"><li>• An Enterprise Architect-defined <b>Local Path</b></li><li>• An <b>absolute file path</b> (with no double quotes) to the installation folder of the Java JDK to be used for debugging</li></ul> The JRE parameter must point to the installation folder for the Java JDK. A JDK installation is necessary for debugging to succeed. The JRE should not point to the installation of the public Java Runtime Environment, if that is installed. Environment variables can be used when specifying the VM startup options, such as <b>classpath</b> .  For example, using:	

Field	Action	See also
	<ul style="list-style-type: none"> <li>An Enterprise Architect <b>Local Path</b> <i>JAVA</i> and an environment variable <i>classpath</i>:   <div>Java Virtual Machine Options:</div> <pre>JRE=%JAVA%,-Djava.class.path=%classpath%;;</pre> </li> <li>Or an <b>absolute path</b> to the JDK installation directory and an environment variable <i>classpath</i>:   <div>Java Virtual Machine Options:</div> <pre>JRE=C:\Program Files (x86)\Java\jdk1.7.0,-Djava.class.path=%classpath%</pre> </li> </ul> <p>In these two examples, the debugger will create a virtual machine using the JDK located at the value of the <b>JRE</b> parameter.</p> <p>If no classpath is specified, the debugger always creates the virtual machine with a class path property equal to any path contained in the environment variable plus the path entered in the default working directory of this script.</p> <p>If source files and .class files are located under different directory trees, the classpath property <b>MUST</b> include both root path(s) to the source and root path(s) to binary class files.</p>	

### Option 2 - Attach to Virtual Machine

There is very little to specify when attaching to a VM; however, the VM must have the Sparx Systems debugging agent loaded.

Field	Action	See also
<b>Debugger</b>	Select <b>Java</b>	<a href="#">Attach to Virtual Machine</a> <sup>[2194]</sup> <a href="#">Debug Tomcat Server</a> <sup>[2195]</sup>
<b>Mode</b>	Select <b>Attach to Virtual Machine</b>	<a href="#">Debug Another Process</a> <sup>[2243]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Build and Debug** | **Debug** | **Java**

### 11.8.2.6.3.2 Advanced Techniques

In addition to the standard Java debugging techniques, you can:

- [Attach to a Virtual Machine](#) <sup>[2194]</sup>
- [Debug Internet Browser Java Applets](#) <sup>[2194]</sup>

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>You can debug a Java application by attaching to process that is hosting a Java Virtual Machine; you might want to do this for attaching to a webserver such as Tomcat or JBOSS.</p> <p>The <i>Java Virtual Machine Tools Interface</i> from Sun Microsystems, is the API used by Enterprise Architect; it allows a debugging agent to be specified when the JVM is created.</p> <p>To debug a running JVM from Enterprise Architect, the Sparx Systems' debugging agent must have been specified as a startup option to the JVM when it was started; how this accomplished for products such as Tomcat and JBOSS should be researched from that product's own documentation.</p> <p>For <i>java.exe</i>, the command line option to load the Enterprise Architect debugging agent depending on your environment could be:</p> <ul style="list-style-type: none"> <li>• - agent path: "c:\program files\sparx systems\ea\VEA\x86\SSJavaProfiler32"</li> <li>• - agent path: "c:\program files (x86)\sparx systems\ea\VEA\x86\SSJavaProfiler32"</li> <li>• - agent path: "c:\program files (x86)\sparx systems\ea\VEA\x64\SSJavaProfiler64"</li> </ul> <p>The the appropriate option will depend on your operating system and whether you are working on a 32-bit application or a 64-bit application.</p> <p>Alternatively, if you add the appropriate VEA directory to your PATH environment variable you can choose to use:</p> <ul style="list-style-type: none"> <li>• - agent lib: SSJavaProfiler32</li> <li>• - agent lib: SSJavaProfiler64</li> </ul> <p>It is not necessary to configure an Analyzer Script when you attach to a Virtual Machine; you can just use the <b>Attach</b> button on one of the Analyzer toolbars.</p> <p>If you configure an Analyzer Script, there are only two things that must be selected:</p> <ul style="list-style-type: none"> <li>• Select <b>Java</b> as the debugging platform</li> <li>• Choose the <b>Attach to Virtual Machine</b> option</li> </ul>	<a href="#">Debug Another Process</a> <sup>[2243]</sup>

This topic describes the configuration requirements and procedure for debugging Java Applets running in a browser from Enterprise Architect.

#### Attach to the browser process hosting the Java Virtual Machine (JVM) from Enterprise Architect

Step	Action	See also
1	Ensure binaries for the applet code to be debugged have been built with debug information.	
2	Configure the JVM using the Java Control Panel.	
3	In the Java Applet Runtime Settings panel, click on the <b>View</b> button.	
4	On the installed version to use, include one of the following options in the <b>Runtime Parameters</b> field depending on your environment and whether you are working on a 32-bit application or a 64-bit application: <ul style="list-style-type: none"> <li>- agent path: "c:\program files\sparx systems\ea\VEA\x86\SSJavaProfiler32"</li> <li>- agent path: "c:\program files (x86)\sparx systems\ea\VEA\x86\SSJavaProfiler32"</li> <li>- agent path: "c:\program files (x86)\sparx systems\ea\VEA\x64\SSJavaProfiler64"</li> </ul>	
5	In this field add the required Class paths.  At least one of these paths should include the root path of the source files to use in debugging.	
6	Set breakpoints.	<a href="#">Breakpoint and Marker Management</a> 
7	Launch the browser.	
8	Attach to the browser process from Enterprise Architect.	

#### 11.8.2.6.3.3 Working with Java Web Servers

If you are debugging **Java web servers** such as **JBOSS** and **Apache Tomcat** (both Server configuration and Windows Service configuration) in Enterprise Architect, apply these configuration requirements and procedures.

##### Attach to process hosting the Java Virtual Machine from Enterprise Architect

Step	Action	See also
1	Build binaries for the web server code to be debugged, with debug information.	
2	Launch the server with the Virtual Machine startup option described in <i>Server Configuration</i> , below.	

Step	Action	See also
3	Import source code into the Enterprise Architect Model, or synchronize existing code.	
4	Set breakpoints.	<a href="#">Breakpoint and Marker Management</a>
5	Launch the client.	
6	Attach to the process from Enterprise Architect.	

### Server Configuration

The configuration necessary for the web servers to interact with Enterprise Architect must address the following two essential points:

- Any VM to be debugged, created or hosted by the server must have the Sparx Systems Agent command line option specified or in the VM startup option (that is:
  - agent l i b: SSJavaPr of i l e r 32 or - agent l i b: SSJavaPr of i l e r 64)
- The CLASSPATH, however it is passed to the VM, must specify the root path to the Package source files

The Enterprise Architect debugger uses the `java.class.path` property in the VM being debugged, to locate the source file corresponding to a breakpoint occurring in a Class during execution; for example, a Class to be debugged is called:

a . b . C

This is located in physical directory:

C: \ s o u r c e \ a \ b

So, for debugging to be successful, the CLASSPATH must contain the root path:

c : \ s o u r c e

### Analyzer Script Configuration

Using the Debug tab of the Build Script dialog, create a script for the code you have imported and:

- Select the **Attach to process** radio button and, in the field below it, type **attach**
- In the **Use Debugger** field, click on the drop-down arrow and select **Java**

All other fields are unimportant; the **Directory** field is normally used in the absence of any Class path property.

**Run the Debugger**

Step	Action	See also
1	Run the server and check that the server process has loaded the Sparx Systems Agent:  DLL SSJavaPr of i l e r 32. DLL or SSJavaPr of i l e r 64  Use <b>Process Explorer</b> or similar tools to prove that the server process has loaded the agent.	
2	In Enterprise Architect, open the source code and set some breakpoints.	<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup>
3	Click on the <b>Run Debug</b> button in Enterprise Architect. The Attach To Process dialog displays.	<a href="#">Debug Another Process</a> <sup>[2243]</sup>
4	Select the server process hosting the application.	
5	Click on the <b>OK</b> button. A confirmation message displays in the Debug window, stating that the process has been attached.	

The breakpoints could show a question mark. In this case the Class might not have been loaded yet by the VM. If the question mark remains even after you are sure the Class containing the breakpoint has been loaded, then either:

- The binaries being executed by the server are not based on the source code
- The debugger cannot reconcile the breakpoint to a source file (check Class paths), or
- The JVM has not loaded the Sparx Systems agent

**Learn more**

- [General Setup for Java](#) <sup>[2191]</sup>
- [JBoss Server](#) <sup>[2198]</sup>
- [Apache Tomcat Server](#) <sup>[2199]</sup>
- [Apache Tomcat Windows Service](#) <sup>[2199]</sup>

In this JBoss example, for a 32-bit application, the source code for a simple servlet is located in the directory location:

```
C:\Benchmark\Java\JBoss\Inventory
```

The binaries executed by JBoss are located in the JAW.EAR file in this location:

```
C:\JBoss\03b-dao\build\distribution
```

The Enterprise Architect debugger has to be able to locate source files during debugging; to do this it also uses the CLASSPATH, searching in any listed path for a matching JAVA source file, so the CLASSPATH must include a path to the root of the Package for Enterprise Architect to find the source during debugging.

This is an excerpt from the command file that executes the JBoss server; the Class to be debugged is at:

```
com/Inventory/dto/carDTO
```

Therefore, the root of this path is included in the **JBoss\_CLASSPATH**.

### Example Code

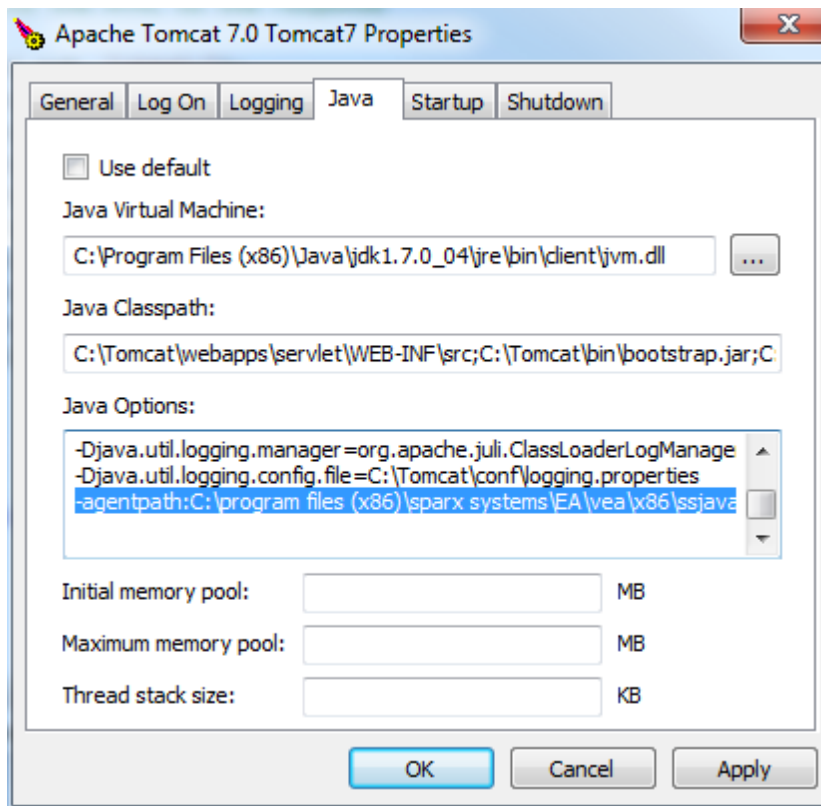

```
RUN. BAT
-----
set SOURCE=C:\Benchmark\Java\JBoss\Inventory

set JAVAC_JAR=%JAVA_HOME%\lib\tools.jar

if "%JBoss_CLASSPATH%" == ""
(
    set JBoss_CLASSPATH=%SOURCE%; %JAVAC_JAR%; %RUNJAR%;
)
else
(
    set JBoss_CLASSPATH=%SOURCE%; %JBoss_CLASSPATH%; %JAVAC_JAR%; %
    RUNJAR%;
)

set JAVA_OPTS=%JAVA_OPTS% -agent path: "c:\program files\sparx
systems\vea\x86\ssjavaprofiler32"
```

The Apache Tomcat Server can be configured for debugging using the Java debugger in Enterprise Architect. This example shows the configuration dialog for Apache Tomcat 7.0 on a PC running Windows 7.

These three points are important:

- The **Java Virtual Machine** specifies the runtime from an installation of the Java JDK
- The source path to any servlet to be debugged is added to **Java Classpath**; in this case we add the path to the Tomcat servlet:

```
c:\tomcat\webapps\servlet\WEB-INF\src
```

- The **Java Options** include the path to the Sparx Systems debugging agent:

```
-agentpath:c:\program files (x86)\sparx systems\vea\x86\ssjavaProfiler32
```

### Learn more

- [Apache Tomcat Windows Service](#) <sup>2199</sup>

### Configuration

For users running Apache Tomcat as a Windows™ service, it is important to configure the service to enable interaction with the Desktop; failure to do so causes debugging to fail within Enterprise Architect.

Log on as:

- ☒ Local System account
- ☒ Allow service to interact with desktop

Select the **Allow service to interact with desktop** checkbox.

### 11.8.2.6.4 .NET

This section describes how to configure Enterprise Architect for debugging .NET applications. It covers:

- [General Setup](#) <sup>[2200]</sup>
- [Debugging Managed code in an Unmanaged Application](#) <sup>[2201]</sup>
- [Debug COM Interop](#) <sup>[2202]</sup>
- [Debug ASP .NET](#) <sup>[2203]</sup>

#### 11.8.2.6.4.1 General Setup for .NET

This is the general setup for debugging Microsoft .NET applications. You have two options when debugging:

- Debug an Application
- Attach to an application that is running

#### Option 1 - Debug an application

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft .NET</b> as the debugging platform.	<a href="#">Debugging an Unmanaged Application</a> <sup>[2201]</sup> <a href="#">Debug ASP.NET</a> <sup>[2203]</sup>
<b>x64</b>	Select this checkbox if you are debugging a <b>64-bit</b> application. Deselect the checkbox if you are debugging a <b>32-bit</b> application.	
<b>Mode</b>	Select the <b>Run</b> radio button.	
<b>Default Directory</b>	This is set as the default directory for the process being debugged.	
<b>Application Path</b>	Select and enter either the full or the relative path to the application executable. <ul style="list-style-type: none"> <li>• If the path contains spaces, specify the full path; do not</li> </ul>	

Field	Action	See also
	use a relative path <ul style="list-style-type: none"> <li>If the path contains spaces, the path must be enclosed by quotes</li> </ul>	
<b>Command Line Arguments</b>	Parameters to pass to the application at startup.	
<b>Show Console</b>	Create a console window for the debugger; not applicable to attaching to a process.	
<b>Symbol Search Paths</b>	Specify any additional paths to locate debug symbols for the debugger; separate the paths with a semi-colon.	

#### Option 2 - Attach to an application that is running

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft .NET</b> as the debugging platform.	<a href="#">Debugging an Unmanaged Application</a> [2201]
<b>x64</b>	Select this checkbox if you are debugging a <b>64-bit</b> application. Deselect the checkbox if you are debugging a <b>32-bit</b> application.	<a href="#">Debug ASP.NET</a> [2203] <a href="#">Debug Another Process</a> [2243]
<b>Mode</b>	Select the <b>Attach to Process</b> radio button.	

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Build and Debug** | **Debug** | **Microsoft .NET**

#### **11.8.2.6.4.2 Debugging an Unmanaged Application**

##### Topics

Topic	Detail	See also
<b>Usage</b>	If you are debugging managed code using an unmanaged application, the debugger might fail to detect the correct version of the Common Language Runtime (CLR) to load.  You should specify a config file if you don't already have one for the debug application specified in the <b>Debug</b> command of your script.	<a href="http://www.msdn2.microsoft.com/en-us/library/9w519wzk.aspx">http://www.msdn2.microsoft.com/en-us/library/9w519wzk.aspx</a> (Online Resource)

Topic	Detail	See also
	<p>The config file should reside in the same directory as your application, and take the format:</p> <pre>name.exe.config</pre> <p>where <i>name</i> is the name of your application.</p> <p>The version of the CLR you specify should match the version loaded by the managed code invoked by the debuggee.</p> <p>The following is a sample config file:</p> <pre>&lt;configuration&gt;   &lt;startup&gt;     &lt;requiredRuntime       version="version" /&gt;   &lt;/startup&gt; &lt;/configuration&gt;</pre> <p><i>Version</i> is the version of the CLR targeted by your plugin or COM code.</p>	

#### 11.8.2.6.4.3 Debug COM Interop

Enterprise Architect enables you to debug .NET managed code executed using COM in either a Local or an In-Process server.

This feature is useful for debugging Plugins and ActiveX components.

#### How to

Step	Action	See also
1	Create a package in Enterprise Architect and import the code to debug.	<a href="#">Software Engineering</a> 
2	Ensure the COM component is built with debug information.	
3	Create a Script for the Package.	
4	In the Debug   Platform page, you can select to either attach to an unmanaged process or specify the path to an unmanaged application to call your managed code.	
5	Add breakpoints in the source code to debug.

<b>Attach to an Unmanaged Process</b>	<p>If you are using:</p> <ul style="list-style-type: none"> <li>• An In-Process COM server, attach to the client process</li> <li>• A Local COM Server, attach to the server process</li> </ul> <p>Click on the Debug window <b>Run</b> button (or press ( <b>F6</b> ) ) to display a list of processes from which you can choose.</p>	<a href="#">Debug Another Process</a> <sup>[2243]</sup>

**Notes**

- Detaching from a COMinterop process you have been debugging terminates the process; this is a known issue for Microsoft .NET Framework, and information on it can be found on many of the MSDN .NET blogs

**11.8.2.6.4.4 Debug ASP .NET****Topics**

Topic	Detail	See also
<b>Usage</b>	<p>Debugging for web services such as ASP requires that the Enterprise Architect debugger is able to attach to a running service.</p> <p>Begin by ensuring that the directory containing the ASP .NET service project has been imported into Enterprise Architect and, if required, the web folder containing the client web pages.</p> <p>If your web project directory resides under the website hosting directory, you can import from the root and include both ASP code and web pages at the same time.</p> <p>It is necessary to launch the client first, as the ASP .NET service process might not already be running; load the client using your browser - this ensures that the web server is running.</p> <p>In the debug setup you must select the <b>Attach to process</b> radio button, and then type the keyword <b>Attach</b> in the script; this keyword causes the debugger to prompt you for a process at runtime.</p> <p>Click on the Debug window <b>Run</b> button to start the debugger; the Attach To Process dialog displays.</p> <p>The name of the process varies across Microsoft operating systems, as explained in the <i>ASP .NET SDK</i>; for example, under Windows Vista the name of the IIS process is <i>w3wp.exe</i>.</p> <p>On Windows XP, the name of the process resembles <i>aspnet_wp.exe</i>, although the name could reflect the version of the .NET framework that it is supporting.</p> <p>There can be multiple ASP.NET processes running under XP; you must ensure that you attach to the correct version, which would be the one hosting the .NET framework</p>	<a href="#">Run the Debugger</a> <sup>[2231]</sup> <a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup> <a href="#">Debug Another Process</a> <sup>[2243]</sup>

Topic	Detail	See also
	<p>version that your application runs on; check the <i>web.config</i> file for your web service to verify the version of .NET framework it is tied to.</p> <p>The Debug window <b>Stop</b> button should be enabled and any breakpoints should be red, indicating they have been bound.</p>	

You can set breakpoints at any time in the web server code. You can also set breakpoints in the ASP web page(s) if you imported them.

#### Notes

- Some breakpoints might not have bound successfully, but if none at all are bound (indicated by being dark red with question marks) something has gone out of sync; try rebuilding and re-importing source code

#### 11.8.2.6.5 The PHP Debugger

The Enterprise Architect PHP Debugger enables you to debug PHP.exe scripts. This section discusses basic setup and the various debugging scenarios that are commonly encountered; the scenarios concern themselves with the mapping of file paths, which is critical to the success of a remote debugging session.

- Script Setup
- Local Windows Machine (Apache Server)
- Local Windows Machine (PHP.exe)
- Remote Linux Machine (Apache Server)
- Remote Linux Machine (PHP.exe)

#### Topics

#### 11.8.2.6.6 The GNU Debugger (GDB)

When debugging your applications you can use the **GNU Debugger (GDB)**, which is portable and runs on Unix-like systems such as Linux, as well as on Windows. The GDB works for many programming languages including Ada, Java, C, C++ and Objective-C. Using the GDB, you can debug your applications either locally or remotely.

**Access** **Analyzer** | **Execution Analyzer (Shift+F12)** : **New** (Toolbar icon) > **Debug** > **Platform Analyzer** | **Execution Analyzer (Shift+F12)** : locate and double-click on required script > **Debug** > **Platform**

#### Set up the GNU Debugger

Task	Details	See also												
<b>Set up Script</b>	<p>An Analyzer Script is a basic requirement for debugging in Enterprise Architect; you create a script using the Execution Analyzer toolbar.</p> <p>On the Platform page of the Execution Analyzer Script Editor, in the <b>Debugger</b> field click on the drop-down arrow and select <b>GDB</b>.</p>	<a href="#">Managing Analyzer Scripts</a> <small>2175</small>												
<b>Define Connection Settings</b>	<p>The property panel displays a number of connection settings for which you provide values.</p> <table> <tr> <th>Field</th><th>Value</th><th>Meaning</th></tr> <tr> <td><b>path</b></td><td><b>&lt;path&gt;</b></td><td>The complete file path of the GDB executable; you only specify this if the GDB cannot be found in the system path.</td></tr> <tr> <td><b>source</b></td><td><b>&lt;path&gt;, &lt;path&gt;</b></td><td>The path in which the debugger will search for source files, if they do not reside in the executable directory.</td></tr> <tr> <td><b>remote</b></td><td><b>F</b></td><td>Set for remote debugging; otherwise leave blank.</td></tr> </table>	Field	Value	Meaning	<b>path</b>	<b>&lt;path&gt;</b>	The complete file path of the GDB executable; you only specify this if the GDB cannot be found in the system path.	<b>source</b>	<b>&lt;path&gt;, &lt;path&gt;</b>	The path in which the debugger will search for source files, if they do not reside in the executable directory.	<b>remote</b>	<b>F</b>	Set for remote debugging; otherwise leave blank.	
Field	Value	Meaning												
<b>path</b>	<b>&lt;path&gt;</b>	The complete file path of the GDB executable; you only specify this if the GDB cannot be found in the system path.												
<b>source</b>	<b>&lt;path&gt;, &lt;path&gt;</b>	The path in which the debugger will search for source files, if they do not reside in the executable directory.												
<b>remote</b>	<b>F</b>	Set for remote debugging; otherwise leave blank.												

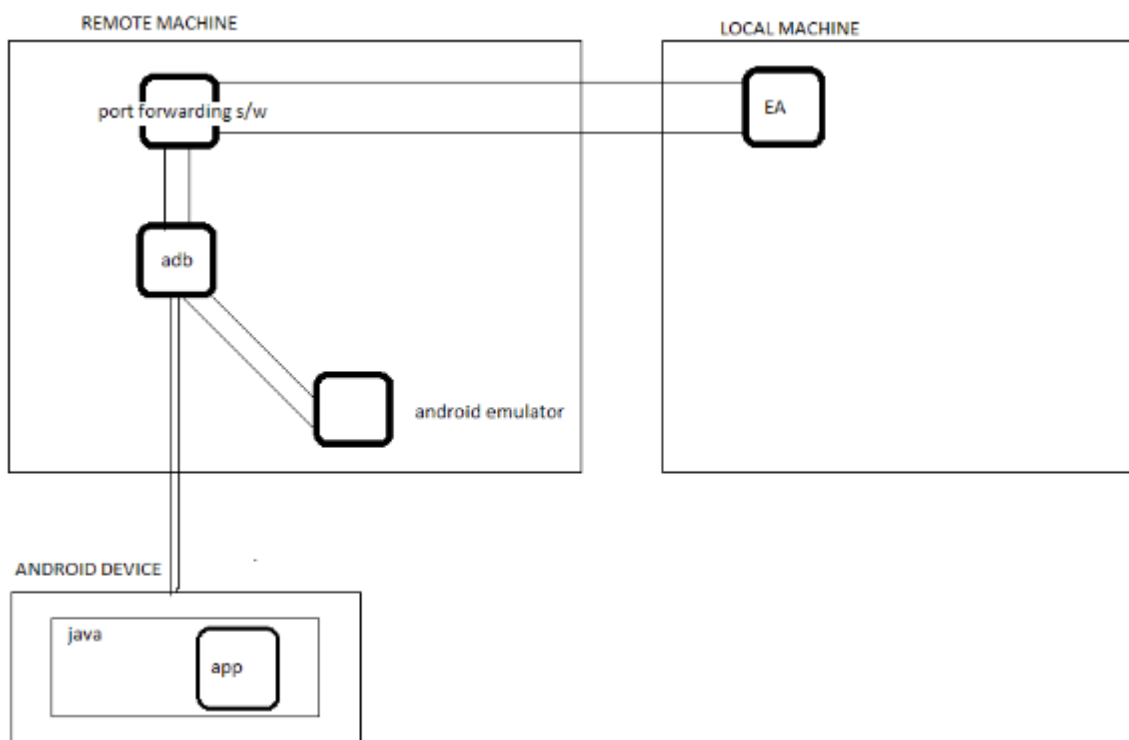

Task	Details			See also
	<b>port</b>	<b>&lt;nnnnn&gt;</b>	The port to connect to on the remote server.	
	<b>host</b>	<b>localhost</b>	The host name to connect to.	
	<b>fetch</b>	<b>T</b>	Set to retrieve the binary from the remote system.	
	<b>dumpgdb</b>	<b>&lt;path&gt;</b>	The filename to write the GDB output to.	
	<b>initpath</b>	<b>&lt;path&gt;</b>	The complete file path to the <i>gbin</i> file.	

#### Notes

- A requirement of the GDB is that your source code file path does not contain spaces; the debugger will not run correctly with spaces in the file path

#### 11.8.2.6.7 The Android Debugger

If you are developing **Java** applications running on **Android** devices or emulators, you can also debug them. The Local and Remote machines can be on either a 32-bit platform or a 64-bit platform.

**System Requirements**

On the Remote machine, this software is required:

- Android SDK, which includes the android debug ridge, ADB (you need to be familiar with the SDK and its tools)
- Java JDK (32 and 64 bit support)
- Port Forwarding software (3rd party)

On the Local machine, this software is required:

- Enterprise Architect Version 10

**Analyzer Script Settings**

Field/Button	Action	See also
Debugger	Click on the drop-down arrow and select <b>Java (JDWP)</b> .	
Run	Click on this radio button.	
Default Directory	Not applicable - leave blank.	
Application path		
Command Line Arguments		
Build first		
Show console		
Show diagnostic messages		
Connection		
Port	This is the application port forward-assigned using adb or other means, that connects to the Virtual Machine (VM) process on Android.	<a href="#">Port Forwarding</a>  2212

Field/Button	Action	See also
<b>Host</b>	<p>Host computer (defaults to localhost)</p> <p>If Android is running on an emulator on a device attached to a networked computer, enter the network name here.</p> <p>By default, debugging will attempt to connect to the port you specify on the local machine.</p>	
<b>Source</b>	<p>This is the source equivalent of the classpath setting in Java.</p> <p>The root to each source tree should be listed. If more than one is specified, they should be separated by a semi-colon; that is:</p> <pre>c:\myapp\src;c:\myserver\src</pre> <p>You must specify at least one root source path.</p> <p>When a breakpoint occurs the debugger searches for the java source in each of the source trees listed here.</p>	
<b>Logging</b>	<p>Enables logging additional information from debugger</p> <p>possible values: true,false,1,0,yes,no</p>	
<b>Output</b>	<p>Specifies the full name of the local log file to be written.</p> <p>The folder must exist or no log will be created.</p> <p>The log file typically contains a dump of bytes sent between debugger and VM.</p>	
<b>Platform</b>	<p>If you are debugging Java running under any android scenario, select <b>Android</b>.</p> <p>For all other scenarios, select <b>Java</b>.</p>	

### Configure Ports for Debugging - Port Forwarding (Local)

The debugger can only debug one VM at a time; it uses a single port for communication with the VM. The port for the application to be debugged can be assigned using ADB.

Before debugging, start the application once in the device. When the app starts, perform the following to discover its process id:

```
adb j dwp
```

The last number listed is the process identifier (pid) of the last application launched; note the pid and use it as follows to allow the debugger to connect to the VM:

- `adb forward tcp:port j dwp:pid`
  - `port` = port number listed in analyzer script
  - `pid` = process id of the application on the device

### Configure Ports for Debugging - Port Forwarding (Remote)

To debug remotely the same procedure should be followed as for the local machine, but the communication requires additional forwarding as the socket created using the `abd forward` command above will only listen on the local adapter. The socket is bound to the localhost and attempts to connect to this port will be met with connection refused messages.

In order to achieve remote debugging it is necessary to have a proxy running on the remote machine that listens to all incoming connections and forwards all traffic to the adb port.; there are numerous software products available to do this.

Remote debugging with Enterprise Architect will not work unless a proxy port forwarder has been configured by the user.

#### **11.8.2.6.8 Java JDWP Debugger**

If you are developing **Java** applications running on either 32-bit or 64-bit virtual machines, you can debug them either locally or remotely using the Java Debug Wire Protocol (JDWP).

### System Requirements

On the Remote machine, this software is required:

- Java JDK (32-bit and 64-bit support)

On the Local machine, this software is required:

- Enterprise Architect Version 10

### Analyzer Script Settings

Field/Button	Action	See also
<b>Debugger</b>	Click on the drop-down arrow and select <b>Java (JDWP)</b> .	
<b>Run</b>	Click on this radio button to run the debugger when the script is executed.	
<b>Default Directory</b>	Not applicable - leave blank.	
<b>Application path</b>		
<b>Command Line Arguments</b>		

Field/Button	Action	See also
Build first		
Show console		
Show diagnostic messages		
Connection		
Port	Set the application port forward-assigned to the VM process during start-up, in the Java command-line options.	<a href="#">Java Command Line Options</a>
Host	Set the host computer (defaults to <b>localhost</b> )  If VM is running on a networked computer, enter the network name or url here.  By default debugging will attempt to connect to the port you specify on the local machine.	
Source	This is the source equivalent of the <code>classpath</code> setting in Java.  List the root to each source tree; specify at least one root source path. If you specify more than one, separate them with a semi-colon; for example:  c: \ my app \ s r c ; c: \ m y s e r v e r \ s r c  When a breakpoint occurs the debugger searches for the Java source in each of the source trees listed here.	
Logging	Enable or disable logging of additional information from the debugger.  Possible values include: <ul style="list-style-type: none"><li>• <b>true</b></li><li>• <b>false</b></li><li>• <b>1</b></li><li>• <b>0</b></li><li>• <b>yes</b></li><li>• <b>no</b></li></ul>	
Output	Specify the full name of the local log file to be written. If the folder does not already exist, no log will be created.	

Field/Button	Action	See also
	The log file typically contains a dump of bytes sent between the debugger and VM.	
<b>Platform</b>	Select <b>Java</b> .	

### Configure Ports for Debugging

The debugger can only debug one VM at a time; it uses a single port for communication with the VM. The port for the application to be debugged is assigned when the VM is created.

### Local Debugging

Where both Enterprise Architect and the Java VM are running on the same machine, you can perform local debugging. It is necessary to launch the VM with the JDWP transport enabled - see the documentation on Java Platform Debugger Architecture (JPDA) at Oracle for the command line option specifications.

For example:

```
java -agentlib:jdwp=transport=dt_socket,address=localhost:9000,server=y,
suspend=n -cp "c:\samples\java\myapp;%classpath%" samples.MyApp "param1"
"param2"
```

In this example the values for the Analyzer script are **host = localhost** and **port = 9000**.

### Remote Debugging

Where Enterprise Architect is running on the local machine and the Java VM is running on a remote machine, you can perform remote debugging. It is necessary to launch the VM with the JDWP transport enabled - see the documentation on JPDA at Oracle for the command line option specifications.

For example (where the remote computer has the network name **test01**) :

```
java -agentlib:jdwp=transport=dt_socket,address=9000,server=y,suspend=n
-cp "c:\samples\java\myapp;%classpath%" samples.MyApp "param1" "param2"
```

No host name is defined in the **address**, so VM will listen for any connection on any adaptor. In this example the values for the Analyzer script are **host = test01** and **port = 9000**.

#### 11.8.2.6.9 Tracepoint Output

The Tracepoints page of the Analyzer Script enables you to direct where the output from any Trace statements goes during a debug session.

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Debug > Tracepoints**  
**Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Debug > Tracepoints**

Field	Detail	See also
<b>Output</b>	You can select from two options: <ul style="list-style-type: none"> <li>• <b>Screen</b> (Default) - The output is directed to the Debug window</li> <li>• <b>File</b> - The output is directed to file</li> </ul>	
<b>Folder</b>	Enter the folder to use for Trace statement log files.	
<b>Filename</b>	Enter the name to use for the Trace statement log files.	
<b>Overwrite</b>	If selected, the specified file is overwritten each time a debug session is started.	
<b>Auto Number</b>	If selected, the Trace log file is composed of the filename you specify and a number.  Each time you start a debug session, the number is incremented.	
<b>Prefix trace output with function</b>	If selected, any Trace statements executed during the debug session run are prefixed with the current function call.	

#### 11.8.2.6.10 Workbench Setup

This topic describes the requirements for setting up the Object Workbench on Java and Microsoft .NET.

**Access** [Analyzer](#) | [Execution Analyzer](#) | [double-click on script](#) | [Debug](#) | [Workbench](#)

#### Topics

Topic	Detail	See also
<b>Platforms Supported</b>	The Workbench supports the following workbench platforms: <ul style="list-style-type: none"> <li>• Microsoft .NET (version 2.0 or later) excluding native C++, C and VB</li> <li>• Java (JDK 1.4 or later)</li> </ul> <p>The Execution Analysis script for the package must have a debugger configured.</p>	<a href="#">Set up a Debug script</a> <small>2185</small>
<b>Microsoft .NET Workbench</b>	The .NET workbench requires an assembly, which is used to create the workbench items.	<a href="#">General Setup for.</a>

Topic	Detail	See also
	<p>You specify the path to the assembly on the Workbench page of the Analyzer Script.</p> <p>There are two constraints in using the .NET workbench:</p> <ul style="list-style-type: none"> <li>Members defined as <i>struct</i> in managed code are not supported</li> <li>Classes defined as <i>internal</i> are not supported</li> </ul>	<a href="#">NET</a> <sup>[2200]</sup>
<b>Java Workbench</b>	The Java workbench uses the Virtual Machine settings configured in the Analyzer Script Debug page to create the JVM.	<a href="#">General Setup for Java</a> <sup>[2191]</sup>

**11.8.2.7 Add Run Command**

This topic describes how to create a **command for running** your executable code.

**Access** **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon) > **Run Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Run**

Topics

Topic	Detail	See also
<b>Usage</b>	This is the command that is executed when you select the <b>Analyzer   Run</b> menu option; at its simplest, the script would contain the location and name of the file to be run.	
<b>Example</b>	<p>The following two examples show scripts configured to run a .Net and a Java application in Enterprise Architect.</p> <p><b>.Net:</b></p> <pre>C: \ benchmark \ cpp \ example_net _1 \ release \ example.exe</pre> <p><b>Java:</b></p> <pre>customer</pre> <p>The command listed in this field is executed as if from the command prompt; as a result, if the executable path or any arguments contain spaces, they must be surrounded in quotes.</p>	

Notes

- Enterprise Architect provides the ability to start your application normally OR with debugging from the same script; the **Analyzer** menu has separate options for starting a normal run and a debug run

Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Build and Debug** | **Overview** | **Run**

**11.8.2.8 Add Deploy Command**

This topic explains how to how to create a **command for deploying** the current package.

**Access** **Analyzer** | **Execution Analyzer (Shift+F12)** : **New** (Toolbar icon) > **Deploy**  
**Analyzer** | **Execution Analyzer (Shift+F12)** : locate and double-click on required script > **Deploy**

Topics

Topic	Detail	See also
<b>Usage</b>	You create a script that is executed when you select the <b>Analyzer</b>   <b>Deploy</b> menu option or when you press <b>Ctrl+Shift+Alt+F12</b> .	
<b>Execute Command as:</b>	<p><b>Process</b></p> <p>If the deployment is handled externally, enter the path to the program or batch file to run followed by any parameters; the program is launched in a separate process.</p> <p>Example:</p> <pre>C:\apache-ant-1.7.1\bin\ant.cmd myproject deploy</pre> <p><b>Batch File</b></p> <p>When using this option, you can enter multiple commands that are then executed as a single script in a command console; you have access to any environment variables available in a standard command console.</p> <p>Example:</p> <pre>@echo on IF NOT EXIST "%1%" GOTO DEPLOY_NOWAR IF "%APACHE_HOME%" == "" GOTO DEPLOY_NOAPACHE xcopy /L "%1%" "%APACHE_HOME%\webapps" GOTO DEPLOY_END rem rem NO WAR FILE rem :DEPLOY_NOWAR echo "%1% WAR file not found" GOTO DEPLOY_END rem rem NO APACHE ENVIRONMENT VARIABLE rem :DEPLOY_NOAPACHE echo "APACHE_HOME environment variable not found"</pre>	

Topic	Detail	See also
	<pre>:DEPLOY_END pause</pre>	
<b>Parse Output</b>	<p>Selecting a Parser from the list causes output of the deploy script to be captured; the output is parsed according to the syntax selected from the list.</p> <p>The output window can be displayed by selecting <b>View   System Output</b>.</p>	

### 11.8.2.9 Configure Recording Detail

To avoid generating too complex a Sequence diagram, you must control the scope of what is being recorded by:

- Filtering - using the Analyzer Script you can exclude specific modules, Classes and functions from the recording

**Access** **Analyzer | Execution Analyzer (Shift+F12)** **Double-click on required Analyzer Script > Recording**

#### Topics

Topic	Detail	See also
<b>Filtering</b>	<p>If the <b>Enable Filter</b> checkbox is selected on the Recording page of the Execution Analyzer Script Editor, the debugger excludes calls to matching methods from the generated Sequence history and diagram; the comparison is case-sensitive.</p> <p>To add a value, click on the <b>New (Insert)</b> icon in the right corner of the Exclusion Filters box, and type in the comparison string; each filter string takes the form:</p> <pre>class_name_token::method_name_token</pre> <p>The <i>class_name_token</i> excludes calls to all methods of a Class or Classes that have a name matching the token; the string can contain the wildcard character * (asterisk).</p> <p>The <i>method_name_token</i> excludes calls to methods having a name that matches the token; again, the string can contain the wildcard character *.</p> <p>Both tokens are optional; if no Class token is present, the filter is applied only to global or public functions (that is, methods not belonging to any Class).</p>	<a href="#">Managing Analyzer Scripts</a> <sup>[2175]</sup> <a href="#">Analyzer Script Editor</a> <sup>[2176]</sup>
<b>Example</b>	<p>In the Java example below, the debugger would exclude:</p> <ul style="list-style-type: none"> <li>• Calls to the <i>OnDraw</i> method for the Class <i>Example.common.draw.DrawPane</i></li> <li>• Calls to any method of any Class having a name beginning with <i>Example.source.Collection</i></li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Calls to any constructor for any Class (such as <i>&lt;clint&gt;</i> and <i>&lt;init&gt;</i>)</li> </ul> <div> Filters <pre> Example.common.draw.DrawPane::OnDraw Example.source.Collection* *::init* </pre> </div> <p>In the Native Code example below, the debugger would exclude:</p> <ul style="list-style-type: none"> <li>• Calls made to Standard Template Library namespace</li> <li>• Calls to any Class beginning with <i>TOb</i></li> <li>• Calls to any method of Class <i>CLock</i></li> <li>• Calls to any Global or Public Function with a name beginning with <i>Get</i></li> <li>• Calls to the method <i>GetLocation</i> for Class <i>Ctrain</i></li> </ul> <div> Filters <pre> std* TOb* CLock CTrain::GetLocation ::Get* </pre> </div>	

### Reference

To Filter	Use Filter Entry
All public functions having a name beginning with <b>Get</b> from the recording session (for example, <i>GetClientRect</i> in Windows API).	<code>:: Get *</code>
All methods beginning with <b>Get</b> for every Class member method.	<code>* :: Get *</code>
All methods beginning with <b>Get</b> from the Class <i>CClass</i> .	<code>CCl ass :: Get *</code>
All methods for Class <i>CClass</i> .	<code>CCl ass :: *</code>
All methods for Classes belonging to Standard Template and Active Template Libraries.	<code>ATL * st d *</code>
The specific method <i>GetName</i> for Class <i>CClass</i> .	<code>CCl ass :: Get Name</code>

## 11.8.3 Build Application

This topic explains how to execute a Build script on your application, within Enterprise Architect.

**Access** **Analyzer | Execution Analyzer (Shift+F12) : select required script, then:**

- 
- **(Ctrl+Shift+F12)**
- **Analyzer | Build**
- Right-click and select either **Build** or **Rebuild** context menu option, **or**
- **Analyzer | Debugger:**  **> Build**

### Guide

When you select the **Build** option, it executes the Build command in the script selected in the Execution Analyzer window. The progress and outcome of the build operation are displayed in the Build tab of the Output window.

Locate any compilation errors and correct the code, and repeat the build-correct cycle until the compilation log on the Output window Build tab shows no compile errors.

### Learn more

- [Add Build Commands](#)<sup>[2180]</sup>
- [Analyzer Script Editor](#)<sup>[2179]</sup>
- [Locate Compiler Errors in Code](#)<sup>[2221]</sup>

### 11.8.3.1 Locate Compiler Errors in Code

When you build an application using a Build script, the compiler output is logged in the System Output window. The output includes any compilation error messages that were generated.

**Access** **View | System Output (Ctrl+Shift+8)**

If you double-click on a compiler error message, the system loads the appropriate source file and positions the cursor on the line in the code at which the error was reported, as illustrated below:

```

61
62 if(PeopleOFF > 0)
63 re turn PeopleOFF * 20;
64
65 return 0;

```

**Output**

```

Running Analyzer Script - CityLoop
Microsoft (R) Visual Studio Version 10.0.30319.1.
Copyright (C) Microsoft Corp. All rights reserved.
1>----- Build started: Project: CityLoop, Configuration: Debug Win32 -----
1> Train.cpp
1> c:\data\vea\microsoft native\cityloop\train.cpp(63): error C2065: 're' : undeclared identifier
1> c:\data\vea\microsoft native\cityloop\train.cpp(63): error C2146: syntax error : missing ';' before identifier 'turn'
1> c:\data\vea\microsoft native\cityloop\train.cpp(63): error C2065: 'turn' : undeclared identifier

```

### 11.8.4 Debugging

This section describes how you define and execute the debugging actions:

- [Before Starting](#)<sup>[2222]</sup>
- [Set up a Debug script](#)<sup>[2185]</sup>
- [Breakpoint and Marker Management](#)<sup>[2224]</sup>
- [Debugger Facilities](#)<sup>[2231]</sup>

#### Notes

- You can register the Enterprise Architect debugger as the operating system just-in-time debugger, to be invoked when an application running outside Enterprise Architect on the system either encounters an exception or crashes

#### Learn more

- [Debug Menu](#)<sup>[114]</sup>

#### 11.8.4.1 Before Starting

The Model Driven Development Environment provides Debuggers for the following frameworks:

- Microsoft Native Code applications
- Microsoft .NET applications
- Java applications
- PHP applications
- Scripting languages: JavaScript (Mozilla), VBScript and JScript (Microsoft)

#### Checklist

Step	Action	See also
1	A model must be open.	
2	Ensure any source code for the areas of interest has been generated or imported into the model, synchronized with the model and, if necessary, compiled.	<a href="#">Generate Source Code</a> <sup>[2117]</sup> <a href="#">Importing Source Code</a> <sup>[2136]</sup> <a href="#">Update Package Contents</a> <sup>[2117]</sup>

### Option 1 - No Analyzer Script

If you have *not* configured an Analyzer Script, you can still debug a process that is running.

Step	Action	See also
1	Optionally set breakpoints before debugging.	<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup>
2	Use the <b>Attach</b> button on the Debug toolbar <ul style="list-style-type: none"> <li>Select the debugging platform</li> <li>Select the process to debug</li> </ul>	

### Option 2 - Analyzer Script, with Debug Page Configured

Step	Action	See also
1	Ensure the application has been built.  You can do this internally using a Build Script, or you can build the application externally; the important thing is that the application is built on the latest versions of the source.	<a href="#">Build Application</a> <sup>[2227]</sup> <a href="#">Add Build Commands</a> <sup>[2180]</sup> (script)
2	Create an appropriate debug script on the Debug page of the Analyzer Script Editor.	<a href="#">Set up a Debug script</a> <sup>[2185]</sup>
3	Set breakpoints in the code.	<a href="#">Set Code Breakpoints</a> <sup>[2226]</sup>
4	Start the debugger.	<a href="#">Run the Debugger</a> <sup>[2237]</sup>

### 11.8.4.2 Breakpoint and Marker Management

Breakpoints work in Enterprise Architect much like in any other debugger. Adding a breakpoint notifies the debugger to trap code execution at the point you have specified. When a breakpoint is encountered by a thread of the application being debugged, the source code is displayed in the Source Code Editor, and the line of code where the breakpoint occurred is highlighted.

Selecting a different package in the project affects which breakpoints are displayed. An Enterprise Architect model maintains breakpoints for every package having a *Build Script - Debug* command.

Access    **Analyzer | Breakpoints & Events**

#### Breakpoint and Marker Options

Option	Detail	See also
<b>Delete a breakpoint or marker</b>	<p>To delete a specific breakpoint:</p> <ul style="list-style-type: none"> <li>• If the breakpoint is enabled, click on the red breakpoint circle in the left margin of the Source Code Editor, or</li> <li>• Right-click on the breakpoint or marker in the Source Code Editor, the <i>Breakpoints</i> folder or the Breakpoints &amp; Events window and select the <b>Delete</b> context menu option, or</li> <li>• Select the breakpoint in the Debug Breakpoints tab and press ( <b>Delete</b> )</li> </ul>	<a href="#">Setting Code Breakpoints</a> <small>[2226]</small>
<b>Delete all breakpoints</b>	Click on the <b>Delete all breakpoints</b> button on the Breakpoints & Events window toolbar (  ).	
<b>Convert breakpoint to Start Recording marker or End Recording marker</b>	<p>(For Visual Execution Analysis, when recording execution to generate a Sequence diagram).</p> <p>In the <i>Breakpoints</i> folder or the Breakpoints &amp; Events window, right-click on the breakpoint and select the context menu option to convert it to either a <b>Start Recording</b> marker or an <b>End Recording</b> marker.</p>	<a href="#">Recording Sequence Diagrams</a> <small>[2531]</small>
<b>Disable a breakpoint</b>	<p>Deselect the checkbox against the breakpoint or marker, on the Breakpoints &amp; Events window.</p> <p>The breakpoint is then shown as an empty grey circle.</p>	
<b>Enable a breakpoint or marker</b>	Select the checkbox against the breakpoint or marker, on the Breakpoints & Events window.	
<b>Disable all breakpoints</b>	Click on the <b>Disable all breakpoints</b> button in the Breakpoints & Events window toolbar (  ).	
<b>Enable all</b>	Click on the <b>Enable all breakpoints</b> button in the Breakpoints & Events	

Option	Detail	See also
<b>breakpoints</b>	window toolbar (  ).	
<b>Change the stack depth</b>	Set the number of stack levels to record to, relative to the level at which recording starts.	<a href="#">Control Stack Depth</a> <sup>[2536]</sup>
<b>Identify or change the marker set</b>	<p>Check the <b>Default</b>  field in the Breakpoints &amp; Events window toolbar.</p> <p>If necessary, click on the drop down arrow and select a different marker set.</p> <p>The Default set is normally used for debugging and is personal to your user ID; other marker sets are shared between all users within the model.</p>	<a href="#">Working with Marker Sets</a> <sup>[2541]</sup>
<b>Change how breakpoints and markers are grouped on the Breakpoints &amp; Events window</b>	<p>The breakpoints and markers can be grouped by Class or by code file.</p> <p>To group the items, click on the down arrow on the  icon in the toolbar, and click on the appropriate option.</p> <p>If you do not want to group the items, click on the selected option to deselect it; the breakpoints and markers are line listed by line number.</p>	

### Breakpoint States

DEBUGGER STATE			
	Running	Not running	See also
	Bound.	Enabled	
	Disabled.	Disabled	
	Not bound - this usually means that the DLL is not yet loaded or was not built with debug information.	N/a	
	Failed - this usually means a break could not be set at this time.	N/a	<a href="#">Failure to Bind Breakpoint</a> <sup>[2229]</sup>

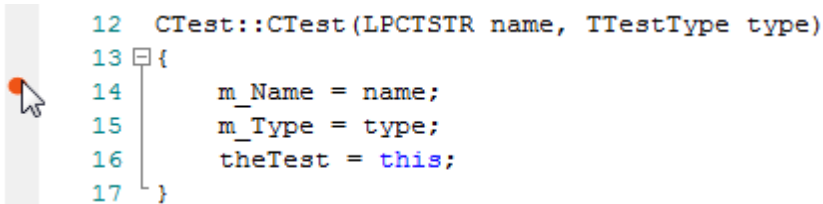

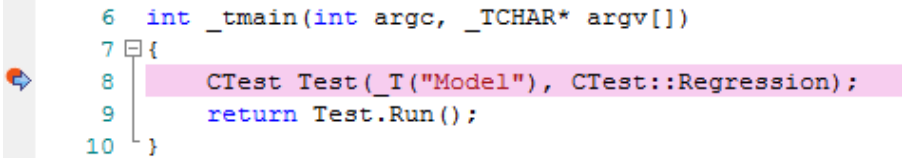

### Learn more

- [Break When a Variable Changes Value](#) <sup>[2229]</sup>
- [Trace When Variable Changes Value](#) <sup>[2230]</sup>

### 11.8.4.2.1 Setting Code Breakpoints

Normal Breakpoints are typically set on a line of source code. When the Debugger hits the indicated line during normal execution, the Debugger halts execution and displays the local variables, call stack, threads and other run-time information.

#### Set a breakpoint on a line of code

Step	Action	See also
1	Open the source code to debug in the integrated source code editor.	
2	<p>Find the appropriate code line and click in the left margin column - a solid red circle in the margin indicates that a breakpoint has been set at that position.</p>  <p>If the code is currently halted at a breakpoint, that point is indicated by a blue arrow next to the marker.</p>  <p>Alternatively, you can set the Breakpoint marker (or other marker) by right-clicking on the left margin on the required line, to display the breakpoint/marker context menu; select the appropriate marker type.</p>	<a href="#">Set Record Markers</a> <sup>2537</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Build and Debug | Debug | Add Breakpoint**

### 11.8.4.2.2 Breakpoint Properties

Breakpoints have a number of additional properties that change the point at which the breakpoint is hit, and determine what happens at that point. These properties define:

- The action to be performed
- The line of code that the breakpoint applies to
- Constraints to restrict when the breakpoint is hit
- Trace information to be output when the breakpoint is hit

**Access**   **Breakpoint Context Menu | Properties**

Options

Field	Details	See also
<b>Action</b>	The behavior when the breakpoint is hit.	<a href="#">Marker Types</a> [2538]
<b>Line</b>	The line of source code that this breakpoint applies to.	
<b>Stack Height</b>	For Stack Capture markers, the number of caller frames to record. To record the entire Stack, set the value to <b>0</b> .	
<b>Constraints</b>	Defines a condition required for this breakpoint to be hit.  The program is allowed to continue normal execution if this condition is <b>not</b> met when the breakpoint is encountered.	<a href="#">Constraint Composition</a> [2581]
<b>Trace statement</b>	A message output to the Debug window when the breakpoint is hit. Variables currently in scope can be included in a trace statement output by prefixing the variable name with a <b>\$</b> token for string variables, or a <b>@</b> token for primitive types such as int or long.	<a href="#">Specifying a Trace Statement</a> [2228]  <a href="#">Run the Debugger</a> [2231]

Learning Center topics

- (Alt+F1) | **Enterprise Architect | Build and Debug | Debug | Breakpoint Properties**

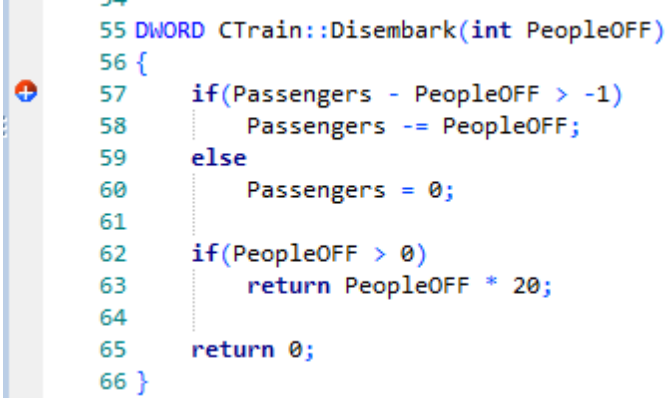

**11.8.4.2.3 Trace Statements**

A **Trace Statement** is a message that is output during execution of a debug session. Trace statements can be defined in Enterprise Architect without requiring any changes to your application source code.

**Tracepoint Markers** are set in the code editor. Like breakpoints, they are placed on a line of code. When that line of code executes, the Execution Analyzer evaluates and prints the statement either to the Debug window or to file, as configured in the Analyzer script.

Add a Tracepoint Marker

Step	Action	See also
<b>1</b>	Open the source code to debug in the source code editor.	<a href="#">Editing Source Code</a> [2146]
<b>2</b>	Find the appropriate code line, right-click in the left margin and select the <b>Add Tracepoint Marker</b> option. The <b>Breakpoint Properties</b> window is displayed.	<a href="#">Breakpoint Properties</a> [2226]

Step	Action	See also
3	Ensure the <b>Trace statement</b> checkbox is selected.	
4	In the text field below the <b>Trace statement</b> checkbox, type the required Trace statement.	<a href="#">Specifying a Trace Statement</a> <sup>[2228]</sup>
5	Click <b>OK</b> . A <b>Tracepoint Marker</b> is shown in the left margin of the code editor.   <pre> 55 DWORD CTrain::Disembark(int PeopleOFF) 56 { 57     if(Passengers - PeopleOFF &gt; -1) 58         Passengers -= PeopleOFF; 59     else 60         Passengers = 0; 61 62     if(PeopleOFF &gt; 0) 63         return PeopleOFF * 20; 64 65     return 0; 66 } </pre>	

### Specifying a Trace Statement

A trace statement can be any freeform text. The value of any variables currently in scope can also be included in a trace statement by prefixing the variable name with a special token. The available tokens are:

- **\$** - when the variable is to be interpreted or printed as a string
- **@** - when the variable is a primitive type (int, double, char)

Using the example in the image above, we could output the number of people getting off a train by using the following statement:

```
There were @Passengers before @PeopleOFF got off the train at $Arriving.
Name Station
```

### Notes

- Trace statements can be included on any type of breakpoint or marker.

### Learn more

#### 11.8.4.2.4 Failure to Bind Breakpoint

##### Topics

Topic	Detail	See also
<b>Breakpoint Failures</b>	<p>A breakpoint failure occurs if there is a problem in binding the breakpoint.</p> <p>A warning message displays in the <b>Details</b> column of the Breakpoints &amp; Events window, identifying the type of problem</p> <ul style="list-style-type: none"> <li>The source file for the breakpoint does not match the source file used to build the application image</li> <li>The time date stamp on the file is greater than that of the image</li> </ul> <p>A warning message is also output to the Debug window.</p>	<a href="#">Run the Debugger</a> <sup>[2231]</sup>

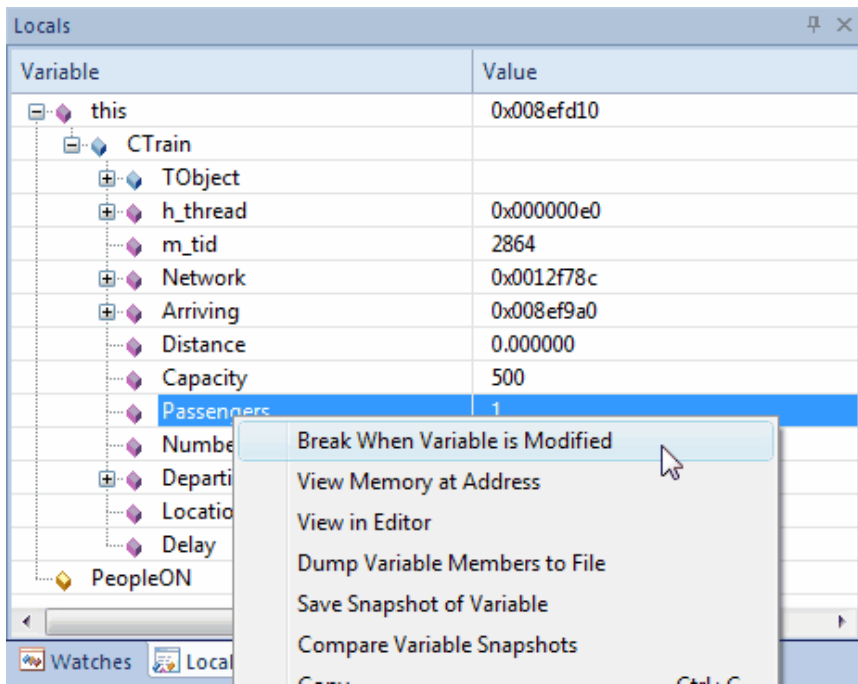

#### 11.8.4.2.5 Break When a Variable Changes Value

Data breakpoints can be set on a pre-determined memory variable to cause the debugger to halt execution at the line of code that has just caused the value of the variable to change. This can be useful when trying to track down the point at which a variable is modified during program execution, especially if it is not clear how program execution is affecting a particular object state.

**Access**    **Analyzer | Locals: right-click on variable | Break When Variable is Modified, or**  
**Analyzer | Watches: right-click on variable | Break When Variable is Modified**

##### Set a data breakpoint

Steps	Detail	See also
<b>1</b>	First set a <b>normal breakpoint</b> at a point in the code that presents the required scope of local variables to choose from.	<a href="#">Setting Code Breakpoints</a> <sup>[2226]</sup>
<b>2</b>	<p>Press <b>F6</b> to execute the debugger; once the program has halted execution, right-click on the variable of interest and select the <b>Break When Variable is Modified</b> context menu option.</p> <p>This example creates a notification on the <b>Passengers</b> integer member of the <i>CTrain</i> Class, in the Locals window.</p>	<a href="#">View the Local Variables</a> <sup>[2234]</sup>

Steps	Detail	See also
		
3	<p>There is no breakpoint indicator in the code, but in the Breakpoints &amp; Events window, the data breakpoint displays as a blue circle in the <b>Enabled</b> column.</p> <p>Continue to execute the debugger; when the variable changes and the debugger halts, the line of code is highlighted in the Source Code Editor and the log in the Debug window prints a statement reporting the effect.</p>	<a href="#">View Variables in Other Scopes</a> <sup>2237</sup>

### Notes

- This feature is not presently supported by the Microsoft .NET platform

### Learning Center topics

- (Alt+F1) | [Enterprise Architect](#) | [Build and Debug](#) | [Debug](#) | [Add Data Breakpoint](#)

#### 11.8.4.2.6 Trace When Variable Changes Value

When your code executes, it might change the value of a variable. It is possible to capture such changes and the variable's new value, on the Debug window. You can then double-click on the change record to display the line of code that caused the change, in the Code Editor.

**Access**    [Right-click on variable](#) | [Trace When Variable Modified](#)

### Set up Trace

The variable you are tracing has to be in scope, so to identify and select it set a normal breakpoint on the line of code where you know that the variable will exist. When the debugger reaches this breakpoint, check either

the Locals window or the Watches window (if examining public and static scopes) and locate the variable. Right-click on it and select the menu option.

Now disable the normal breakpoint and run the program. Each time the variable changes value, it will be logged to the output tab of the debugger. Check the change in value and double-click on the line to display the code in the Code Editor.

### Notes

- The debugger does not halt when the change event occurs, it only logs the change
- This facility is available on the Microsoft Native and Java platforms
- Microsoft .NET does not support breakpoints on values

### Learn more

## 11.8.4.3 Debugger Facilities

This section describes the facilities available while running a debug session. It covers:

- [Run the Debugger](#) <sup>[2231]</sup>
- [View the Local Variables](#) <sup>[2234]</sup>
- [View Variables in Other Scopes](#) <sup>[2237]</sup>
- [View the Call Stack](#) <sup>[2239]</sup> (and [Create Sequence Diagram of Call Stack](#)) <sup>[2241]</sup>
- [Inspect Process Memory](#) <sup>[2242]</sup>
- [Show Loaded Modules](#) <sup>[2243]</sup>
- [Debug Another Process](#) <sup>[2243]</sup>
- [Script Debugging](#) <sup>[2801]</sup>
- [Process First Chance Exceptions](#) <sup>[2244]</sup>

### 11.8.4.3.1 Run the Debugger

The debugger provides a number of ways to start and control a debug session. Many of these facilities are also available through the Debugger toolbar (**View | Toolbars | Debug**).

**Access** **Analyzer | Debugger** (Alt+8)  
**Analyzer Function keys**

### Using the Debug window

Action	Detail	See also
<b>Start the Debugger</b>	<p>If you have configured an Analyzer script for your target application and you have made it the default script, you can start debugging the application immediately in the following ways:</p> <ul style="list-style-type: none"> <li>• Click on the  button</li> </ul>	<p><a href="#">Before Starting</a> <sup>[2227]</sup></p> <p><a href="#">Analyzer Script Editor</a> <sup>[2179]</sup></p>

Action	Detail	See also
	<ul style="list-style-type: none"> <li>Press ( <b>F6</b> ), or</li> <li>Select the <b>Analyzer   Debug   Debug Run</b> menu option</li> </ul> <p>If you have not made your target application the default script it is possible to start any Execution Analysis script by right clicking on it in the Execution Analysis window and selecting the <b>Debug</b> option.</p> <p>If you have no Analyzer Script, it is still possible to debug a running application by attaching to that process directly:</p> <ul style="list-style-type: none"> <li>Click on the  (<b>Attach</b>) button and choose the debugging platform to use</li> </ul>	<a href="#">Debug Another Process</a> <sup>[2243]</sup>
<b>Pause/Resume Debugging</b>	To pause a debugging session, or to resume the session after pausing, click on the  button.	
<b>Stop the Debugger</b>	<p>To stop debugging, either:</p> <ul style="list-style-type: none"> <li>Click on the  (<b>Stop</b>) button</li> <li>Press ( <b>Ctrl+Alt+F6</b> ), or</li> <li>Select the <b>Analyzer   Debug   Debug Stop</b> menu option</li> </ul> <p>The debugger normally ends when the current debug process terminates, however some applications and services (e.g. Java Virtual Machine) may require the debugger to be manually <b>Stopped</b>.</p>	<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup>
<b>Step Over Lines of Code</b>	<p>To step over the next line of code:</p> <ul style="list-style-type: none"> <li>Click on the  (<b>Step Over</b>) button</li> <li>Press ( <b>Alt+F6</b> ), or</li> <li>Select the <b>Analyzer   Debug   Step Over</b> menu option</li> </ul>	
<b>Step Into Function Calls</b>	<p>To step into a function call:</p> <ul style="list-style-type: none"> <li>Click on the  (<b>Step In</b>) button</li> <li>Press ( <b>Shift+F6</b> ), or</li> <li>Select the <b>Analyzer   Debug   Step In</b> menu option</li> </ul> <p>If no source is available for the target function then the debugger returns immediately to the caller.</p>	
<b>Step Out Of Functions</b>	<p>To step out of a function:</p> <ul style="list-style-type: none"> <li>Click on the  (<b>Step Out</b>) button</li> <li>Press ( <b>Ctrl+F6</b> ), or</li> </ul>	

Action	Detail	See also
	<ul style="list-style-type: none"> <li>Select the <b>Analyzer   Debug   Step Out</b> menu option</li> </ul> <p>If the debugger steps out into a function with no source code, it will continue to step out until a point is found that has source code.</p>	
<b>Show Execution Point</b>	<p>To return to the source file and line of code that the debugger is currently executing, click on the  (<b>Show Execution Point</b>) button.</p> <p>The appropriate line is highlighted, with a pink arrow in the left margin of the screen.</p>	
<b>Output</b>	<p>During a debug session, messages display in the Debug window detailing:</p> <ul style="list-style-type: none"> <li>Startup of session</li> <li>Termination of session</li> <li>Exceptions</li> <li>Errors</li> <li>Trace messages, such as those output using <i>Java System.out</i> or <i>.NET System.Diagnostics.Debug</i></li> </ul> <p>If you double-click on a debug message, either:</p> <ul style="list-style-type: none"> <li>A pop-up displays with more complete message text, or</li> <li>If there has been a memory leak, the file is displayed at the point at which the error occurred</li> </ul>	
<b>Save Output (and Clear Output)</b>	<p>You can save the entire contents of the Debug output to an external .txt file, or you can save selected lines from the output to the Enterprise Architect clipboard.</p> <p>To save all of the output to file, click on the  (<b>Save output to file</b>) button.</p> <p>To save selected lines to the clipboard, right-click on the selection and select the <b>Copy Selected to Clipboard</b> context menu option.</p> <p>When you have saved the output or otherwise do not want to display it any more, right-click on the current output and select the <b>Clear Results</b> context menu option.</p>	
<b>Switch to Profiler</b>	<p>If you are running a debug session on code, you can stop the debug session and immediately switch to a Profiling session.</p> <p>To switch from the debugger to the Profiler, click on the  <b>Switch to Profiler</b> option. The Profiler attaches to the currently-running process.</p> <p>This facility is available on Microsoft Native and Microsoft .NET</p>	<a href="#">Getting Started</a>  2558

Action	Detail	See also
	platforms.

**11.8.4.3.2.1 View Content Of Long Strings**

For efficiency, the Locals window only shows partial strings. However, the size of any variable value displayed in the window can be up to 256 characters.

You can display the entire content of long strings on the String Viewer dialog.

**Access**    **Element | Show Source Viewer (Alt+7): right-click on variable | Show in String Viewer Analyzer | Locals: right-click on variable | Show in String Viewer, or**

**Analyzer | Execution Analyzer:**  | **Locals: right-click on variable | Show in String Viewer**

#### 11.8.4.3.2.2 View Debug Variables in Code Editors

During debugging, whenever a thread is suspended at a line of execution, you can inspect member variables in the Source Code Editor. To evaluate a member variable, use the mouse to move the cursor over the variable in the Editor, as shown in the following examples:

```
public void Print()
{
    int n = 0;
    while(names[n].Length > 0)
    {
        names = {[4] names[0]=book, names[0]=book, names[1]=novel, names[2]=film}, ...}
        Document d = new Document(names[n++]);
        d.Print();
    }
}
```

```
public void Print()
{
    int n = 0;
    while(32-bit signed integer n=0 0)
    {
        Document d = new Document(names[n++]);
        d.Print();
    }
}
```

- [View the Local Variables](#) <sup>2234</sup>
- [View Variables in Other Scopes](#) <sup>2237</sup>

#### 11.8.4.3.2.3 Variable Snapshots

It is possible to take a 'snapshot' of a variable when your program is at a breakpoint, and use this snapshot to see how the value of the variable changes at different points in its life. The debugger does not copy the value of the selected variable only; for complex variables it copies the values of the selected variable and of each of its hierarchy of members until it can find no debug information for a member or no more members can be found.

#### Capture variable snapshots

Step	Action	See also
1	In the Code Editor, set two breakpoints: <b>start</b> at the start of a function and <b>end</b> at the end of the function.	<a href="#">Setting Code Breakpoints</a> <small>[2226]</small>
2	At the <b>start</b> breakpoint, right-click on a variable in the Locals window and select the <b>Save Variable Snapshot</b> context menu option.	<a href="#">View the Local Variables</a> <small>[2234]</small>
3	Run the application.	
4	<p>When the <b>end</b> breakpoint is reached, right-click on the variable in the Locals window and select the <b>Compare Variable Snapshots</b> context menu option.</p> <p>A dialog displays that shows the original value from the first snapshot and the current value from the second snapshot, as illustrated below (this example is taken from the <i>EA.Example</i> model).</p> 	

**Notes**

- This facility compares the values of a variable by address; be aware that if there are different threads with different instances of the same variable name, these are not comparable

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Build and Debug | Debug | View Global Variable**

#### **11.8.4.3.3.1 View Elements of Array**

##### Access **Analyzer | Watches**

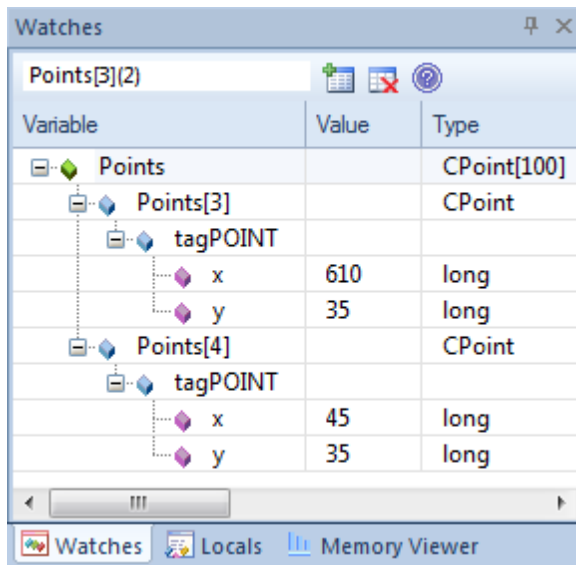

You can use the Watches window to inspect one or more specific elements of an array.

In the field to the left of the Watches window toolbar, type the name of the variable (the array) followed by the start element and, optionally, the number of elements to display. The start element is enclosed in square brackets and the count of elements is enclosed in parentheses; that is:

```
var i abl e[ st ar t _el ement ] ( co unt _of _el ement s )
```

For example:

Poi nt s[ 3] ( 2) displays the fourth and fifth elements of the Points array, as illustrated below.

If you entered `Points[3]` the Watches window would show the third array element only.

#### 11.8.4.3.4 View the Call Stack

The Call Stack window is used to display all currently running threads in a process. It can be used to identify which thread is operational immediately before program failure occurs.

When a **Simulation** is active, the Call Stack will show the current execution context for the running simulation. This will include a separate context stack for each concurrent simulation "thread".

A stack trace is displayed whenever a thread is suspended, through one of the step actions or through encountering a breakpoint. The Call Stack window can record a history of stack changes, and enables you to generate Sequence diagrams from this history.

#### Access **Analyzer | Call Stack**

#### Use to

- View stack history to understand the execution of a process
- View threads
- Save a call stack for later use
- Record call stack changes for Sequence diagram generation
- Generate a Sequence diagram from the call stack
- View the related code line in the Source Code Editor

**11.8.4.3.6 Show Loaded Modules**

For .NET and native Windows applications, you can list the **DLL's** loaded by the debugged process, using the **Modules window**. This list can also include associated **symbolic files** (**PDB** files) used by the debugger.

Access **Analyzer** | **Modules**

Modules Window display

Column	Description
<b>Path</b>	Shows the file path of the loaded module.
<b>Load Address</b>	Shows the base memory address of the loaded module.
<b>Modified Date</b>	Shows the local file date and the time the module was modified.
<b>Debug Symbols</b>	Shows: <ul style="list-style-type: none"><li>• The debug symbols type</li><li>• Whether debug information is present in the module, and</li><li>• Whether line information is present for the module (required for debugging)</li></ul>
<b>Symbol File Match</b>	Indicates the validity of the symbol file; if the value is false, the symbol file is out of date.
<b>Symbol Path</b>	Shows the file path of the symbol file, which must be present for debugging to work.
<b>Modified Date</b>	Shows the local file date and time the symbol file was created.

**11.8.4.3.7 Debug Another Process**

Rather than starting a process explicitly from within Enterprise Architect, you might want to debug an application (process) that is already running on your system.

In this case you can use the debugging capability to 'attach' to the process that is already running. Provided you have the appropriate debug information written into the running process, and/or associated debug files (such as .PDB files), the debugger binds to that process and initiates a debug session.

You can also 'detach' from the process after you have completed your inspection and leave the process to run as normal.

**Access** **Analyzer | Debugger > Debug window toolbar:** 

### Topics

Topic	Detail	See also
<b>Show Processes</b>	When you select to debug another process, the Attach To Process dialog displays.  You can limit the processes displayed using the radio buttons at the top of the dialog; to find a service such as Apache Tomcat or ASP.NET, select the <b>System</b> radio button.	
<b>Select Debugger</b>	When you select a process, you may need to choose the debugger from the <b>Debugger</b> dropdown list; however, if the selected package has already been configured in an Analyzer Script, then the debugger listed in the script is preset on the dialog.	
<b>Process Selection</b>	Once you double-click on a process containing debug information, and Enterprise Architect is attached to the process: <ul style="list-style-type: none"> <li>Any breakpoints encountered are detected by the debugger</li> <li>The process is halted when a breakpoint is encountered, and</li> <li>The information is available in the Debug window</li> </ul>	
<b>Detach From Process</b>	To detach from a process, click on the  ( <b>Debug Stop</b> ) button.	<a href="#">Debugger Facilities</a>  2231

#### 11.8.4.3.8 Process First Chance Exceptions

**Access** **Debug & Record Toolbar:**  | **Process First Chance Exceptions**

### Topics

Topic	Detail	See also
<b>Debug Process</b>	When an application is being debugged and the debugger is notified of an exception, the application is paused and the debugger responds in the way it is configured to do; it either: <ul style="list-style-type: none"> <li>Resumes the application and leaves the exception to the application to</li> </ul>	

Topic	Detail	See also
	<p>manage, or</p> <ul style="list-style-type: none"><li>• Keeps the application suspended and passes the exception to the appropriate routines for automatic resolution or manual intervention</li></ul>	
<b>Second Chance Exceptions</b>	<p>The Enterprise Architect debugger defaults to the first behavior, above.</p> <p>If the application can handle the exception, it continues to process; if it cannot handle the exception, the debugger is notified again and this time it must suspend the application and resolve the exception condition.</p> <p>In this behavior, because the debugger has encountered the exception twice, it is known as a <i>second-chance exception</i>; in this case, if the exception does not halt execution, it is ignored and you avoid spending time on conditions that do not impact the overall outcome of processing.</p> <p>You might work this way on large or complex systems that invariably involve exception conditions somewhere in the processing paths.</p>	
<b>First Chance Exceptions</b>	<p>However, if you want to examine every exception that occurs as soon as it occurs, you can set the debugger to adopt the second behavior.</p> <p>Because the debugger responds to the exception on first contact, it is known as a <i>first-chance exception</i>.</p> <p>You might work this way with individual functions or routines that must work cleanly or not at all.</p>	
<b>Selection</b>	<p>Select the <b>Process First Chance Exceptions</b> option to debug exceptions on first contact.</p> <p>Deselect the option to process exceptions only if the application fails when they occur.</p>	

## 11.9 Other Settings

You can set the default code options such as the editors for each of the programming languages available for Enterprise Architect and special options for how source code is generated or reverse engineered.

### Learn more

Topic	Details	Link
<b>General Options</b>	Describes the general options that apply to all languages when generating code from Enterprise Architect.	<a href="#">Source Code Engineering Options</a> <small>[2246]</small>
<b>Local Paths</b>	Describes how to define local paths for each Enterprise Architect user, using the Local Paths settings.	<a href="#">Local Paths</a> <small>[2255]</small>
<b>Local Path Dialog</b>	Enables you to set up local paths for a single user on a particular machine.	<a href="#">Local Path Dialog</a> <small>[2256]</small>
<b>Language Macros</b>	Describes how to define macros, which is helpful for reverse engineering.	<a href="#">Language Macros</a> <small>[2257]</small>
<b>Language Options</b>	Describes the options for generating and reverse-engineering code in each of the supported languages.	<a href="#">Language Options</a> <small>[2262]</small>
<b>Set Collection Classes</b>	Describes how to define Collection Classes.	<a href="#">Set Collection Classes</a> <small>[2259]</small>

### 11.9.1 Source Code Engineering Options

The following topics describe general options that apply to all languages when generating code from Enterprise Architect. These options are all available under the Source Code Engineering section of the Options dialog.

**Access** [Tools | Options | Source Code Engineering](#)

Topic	Detail	Link
<b>Source Code Options</b>	You can set certain defined options for a particular language while generating the code.	<a href="#">Source Code Options</a> <small>[2247]</small>

Topic	Detail	Link
<b>Options - Code Editors</b>	Describes how to access and configure the source code editor.	<a href="#">Options - Code Editors</a> [2250]
<b>Options - Object Lifetimes</b>	Describes configuring various options concerning Object Lifetimes.	<a href="#">Options - Object Lifetimes</a> [2253]
<b>Options - Attributes/Operations</b>	Describes configuring Attributes/Operations.	<a href="#">Options - Attribute/Operations</a> [2253]
<b>Code Page for Source Editing</b>	Provides an option to define the Unicode character set for code generation.	<a href="#">Code Page for Source Editing</a> [2255]

### 11.9.1.1 Source Code Options

When you generate code for a particular language, you can set certain options. These include:

- Create a default constructor
- Create a destructor
- Generate copy constructor
- Select default language
- Generate methods for implemented interfaces
- Set the Unicode options for code generation

**Access**   **Tools | Options | Source Code Engineering**

#### Configure code generation options

Field	Action	See also
<b>Always synchronize with existing file (recommended)</b>	Select the radio button to synchronize imported code with an existing file.	
<b>Replace (overwrite) existing source file</b>	Select the radio button to overwrite the existing source file with imported code .	
<b>Component Types</b>	Click on this button to open the Import component types dialog, to set up the importation of component types.	<a href="#">Import Component Types</a> [2249]
<b>Default Language for Code Generation</b>	Click on the drop-down arrow and select the default coding language for code generation.	

<b>Wrap long comment lines at</b>	Type in the number of characters to allow in a comment line before wrapping the text to the next line.	
<b>Auto Layout Diagram on Import</b>	Click on the drop-down arrow and select if and when a diagram is automatically generated on code import.	
<b>Output file use both CR &amp; LF</b>	Select the checkbox to include carriage returns and line feeds; set this option according to what operating system is currently in use, as code might not render correctly.	
<b>Prompt when synchronizing (reversing)</b>	Select the checkbox to display a prompt when synchronization occurs.	
<b>Remove hard breaks from comments on import</b>	Select the checkbox to remove hard breaks from commented sections on importation.	
<b>Auto generate role names when creating code</b>	Select the checkbox to generate role names when creating code.	
<b>Do not generate members where association direction is "Unspecified"</b>	Select the checkbox to prevent generation of members if the Association direction is <b>unspecified</b> .	
<b>Create dependencies for operation returns and parameter types</b>	Select the checkbox to generate dependencies for operation returns and parameter types.	
<b>Comments: Generate</b>	Select the checkbox to generate comments.	
<b>Comments: Reverse</b>	Select the checkbox to generate reverse comments.	
<b>Remove prefixes when generating Get/Set properties</b>	Type in the prefixes, separated by semi-colons, used in your variable naming conventions, to be removed in the variables' corresponding get/set functions.	
<b>Treat as suffixes</b>	Select the checkbox to use the prefixes defined in the <b>Remove prefixes when generating Get/Set properties</b> field as suffixes.	

<b>Capitalized Attribute Name for properties</b>	Select the checkbox to capitalize Attribute names for properties.	
<b>Use "Is" for Boolean property Get()</b>	Select the checkbox to use the /s keyword for the Boolean property <b>Get()</b> .	
<b>Code page for source editing</b>	Click on the drop-down arrow and select the character embedding format to apply.	

**Notes**

- It is worthwhile to configure these settings, as they serve as the defaults for all Classes in the model; you can override most of these on a per-Class basis using the custom settings (from the Code Generation dialog)

**Learn more**

- [Generate a Single Class](#) 

**11.9.1.1.1 Import Component Types**

The Import Component Types dialog enables you to configure what elements you would like to be created for files of any extension found while importing a source code directory.

**Access**   **Tools | Options | Source Code Engineering: Component Types**

**Use to**

- Configure what elements are to be created for files of any extension found while importing a source code directory

**Reference**

Field	Usage	See also
<b>Extension</b>	Indicates the extension name for a component type.	
<b>Type</b>	Indicates the type for a component.	
<b>Stereotype</b>	Indicates the stereotype name given to a component.	
<b>Component List</b>	The defined list of component types.	
<b>Save</b>	Saves a component definition and adds it to the component list.	

<b>New</b>	Allows a new component type to be defined.	
<b>Delete</b>	Deletes a highlighted component from the component list.	

#### Notes

- You can transport these import component types between models, using the Export Reference Data and Import Reference Data options

#### Learn more

- [Export Reference Data](#)<sup>[376]</sup>

### 11.9.1.2 Options - Code Editors

You access the source code editor options via the Code Editors page of the Options dialog. They enable you to configure options for Enterprise Architect's internal editor, as well as the default editor for DDL scripts. You can configure external editors for code languages on each language options page.

**Access**    **Tools | Options | Source Code Engineering | Code Editors**

#### Use to

- Configure options for Enterprise Architect's internal editor
- Configure the default editor for DDL Scripts
- Configure DDL Name Templates

#### Reference

Field	Usage	See also
<b>DDL Editor</b>	Defaults to blank, indicating that the Enterprise Architect code editor is the DDL editor in use.  You can select a different default editor if necessary: click on the (...) button to browse for and select the the required DDL editor. The editor name then displays in the <b>DDL Editor</b> field.	
<b>Default Database</b>	Indicates the default database used.	
<b>MySQL Storage Engine</b>	Indicates the storage engine used.	

Field	Usage	See also
<b>DDL Name Templates</b>	Specifies the Foreign Key, Primary Key and Unique Constraint Name templates; the (...) button enables you to specify template names.	<a href="#">Define Primary Key Name Template</a> <sup>[2357]</sup> <a href="#">Define Foreign Key Name Template</a> <sup>[2362]</sup>
<b>Use inbuilt editor if no external editor set</b>	Specifies the editor for code in a language if no external editor is defined for that language.	
<b>Show Line Numbers</b>	Shows line numbers in the editor.	
<b>Show Structure Tree</b>	Shows a tree with the results of parsing the open file (requires that the file is parsed successfully).	
<b>Don't parse files larger than</b>	Specifies an upper limit on file size for parsing. Use this to prevent performance decrease due to parsing very large files.	
<b>Syntax Highlighting Options</b>	Specifies both global and language-specific editor language properties.	<a href="#">Editor language properties</a> <sup>[2257]</sup>
<b>Automatically Reverse Engineer on File Save</b>	When this is checked, pressing <b>(Ctrl) + (S)</b> to save in the source code editor automatically reverse engineers the code in the same way as the <b>Save Source and Re-Synchronize Class</b> button does.	

#### 11.9.1.2.1 Editor Language Properties

Enterprise Architect enables you to specify syntax highlighting properties for all the programming languages that Enterprise Architect supports at installation.

**Access** **Tools | Options | Source Code Engineering | Code Editors: Syntax Highlighting Options (...)**  
**Project Browser element context menu | View Source Code:**  **| Syntax Highlighting Options**

#### Use to

- Configure Syntax highlighting for various coding languages

#### Reference

On the Editor Language properties dialog:

Topic	Detail	See also
<b>General Features</b>	<p>The panel on the left of the dialog lists the languages for which you can set properties.</p> <p>The <i>(Global)</i> item at the top of the list enables you to set properties that apply to all programming languages; however, you can reset a global property to a different value for a specific language, on the page for that language.</p> <p>Resetting a global property for one language does not affect that property's value for the other languages.</p> <p>Click on the required language in the list, to display the properties for that language:</p> <ul style="list-style-type: none"> <li>Properties shown in bold indicate that this is the highest level at which this property can be defined (for most language options other than <i>Global</i>, this is effectively the only point at which the property is defined)</li> <li>Properties shown in normal font are generally the global properties that you can reset just for the current language</li> </ul> <p>Scroll through the property categories and individual properties for the language; you can collapse and expand categories as necessary, using the expansion box next to the category name (☐).</p> <p>When you click on a property name, an explanation of that property displays in the panel at the bottom right of the dialog.</p>	
<b>Define Properties</b>	<p>To define a property, click on the value field following the property name; depending on the type of property, either the field is enabled for direct editing or a drop-down arrow or <b>Browse</b> button displays (as described for the Tagged Values window) to enable you to select the values to define the property.</p> <p>Select or type in the required values.</p> <p>The Toolbar icons enable you to:</p> <ul style="list-style-type: none"> <li>Save your changes to the properties</li> <li>Reset ALL properties fields to the default settings shipped with Enterprise Architect</li> <li>Reset the current style field to the default setting (not enabled for non-style fields)</li> </ul>	<a href="#">Tagged Values</a> <small>[1138]</small>
<b>Assign Keys to Macros</b>	<p>The Macros category enables you to assign <b>(Ctrl+Alt+&lt;n&gt;)</b> keystroke combinations to coding macros that you have created yourself in the Source Code Viewer.</p> <p>When you click on the <b>Browse</b> button in a selected <b>Macro</b> field, the Open Macro dialog displays; this dialog lists the existing macros and, if a key combination has been assigned to a macro, what that key combination is.</p> <p>Click on the name of the macro and on the <b>Open</b> button to assign the selected keys to the macro.</p>	<a href="#">Source Code Viewer</a> <small>[2149]</small>

### Notes

- You cannot currently set properties for any additional languages you include through an MDG Technology
- You can resize this dialog, if required

### Learn more

## 11.9.1.3 Options - Object Lifetimes

This set of options enables you to configure various options concerning Object Lifetimes.

**Access**   **Tools | Options | Source Code Engineering | Object Lifetimes**

### Use to

- Define constructor details when generating code
- Specify whether to create a copy constructor
- Destructor details

### Reference

Field	Usage	See also
<b>Constructor</b>	This set of options specify if a constructor is generated, if a constructor is in-line and the visibility of the default constructor.	
<b>Copy Constructor</b>	This set of options specify if a copy constructor is generated, if a copy constructor is in-line and the visibility of the default copy constructor.	
<b>Destructor</b>	This set of options specify if a destructor is generated, if a destructor is in-line, if a destructor is defined as <i>virtual</i> and the visibility of the default constructor.	

### Notes

- Some options are related to C++ only

## 11.9.1.4 Options - Attribute/Operations

Your use of attributes and operations can be configured in a number of ways. You can set options to:

- Set the default name generated from imported attributes
- Generate methods for implemented interfaces

- Delete model attributes not included in the code during reverse synchronization
- Delete model methods not included in the code during reverse synchronization
- Delete code from features contained in the model during forward synchronization
- Delete model associations and aggregations that correspond to attributes not included in the code during reverse synchronization
- Define whether or not the bodies of methods are included and saved in the model when reverse engineering
- Create attributes in quick succession, clearing the Attributes dialog when you click on **Save** so that you can enter another attribute name

You configure these options on the Attribute/Operations page of the Options dialog.

Access   **Tools | Options | Source Code Engineering | Attribute/Operations**

### Options

Field	Usage	See also
<b>Attribute Specifications: Default name for associated attrib</b>	Specify the default name generated from imported attributes.	
<b>Attribute Specifications: On reverse synch, delete model attributes not in code</b>	Set to indicate that on reverse synchronization, attributes in the model that are not included within code are automatically removed from the model.	<a href="#">Update Package Contents</a> <sup>[211]</sup>
<b>Attribute Specifications: On reverse synch, delete model associations not in code</b>	Set to indicate that on reverse synchronization, associations in the model that are not included within code are automatically removed from the model.	
<b>Operation Specifications: Generate methods for implemented interface</b>	Set to indicate that methods are generated for an implemented interface.	
<b>Operation Specifications: On reverse synch, delete model methods not in code</b>	Set to indicate that on reverse synchronization, methods in the model that are not included within code are automatically removed from the model.	<a href="#">Update Package Contents</a> <sup>[211]</sup>
<b>Operation Specifications: Include method bodies in model when reverse engineering</b>	Set to indicate that on reverse engineering code, method bodies in the code are included within your model.	
<b>Options: After Save, re-select edited item</b>	Set to indicate that after saving an attribute or operation, the Properties dialog continues to display the details of the selected feature.	<a href="#">General Properties of Attributes</a> <sup>[100]</sup>

Field	Usage	See also
	If deselected, indicates that the fields of the Properties dialog will clear so that you can enter another attribute or operation name and details immediately.	<a href="#">General Properties of Operations</a> <sup>[1015]</sup>
<b>On forward synch, prompt to delete code features not in model</b>	Set to indicate that, during forward synchronization, the Synchronize Element <package name>.<element name> dialog displays, so that you can either ignore, reassign or delete features in the code that are not in the model.	<a href="#">Synchronize Model and Code</a> <sup>[2118]</sup>

### 11.9.1.5 Code Page for Source Editing

Enterprise Architect enables you to define the Unicode character set for code generation.

**Access** [Tools | Options | Source Code Engineering](#)

#### Set the Unicode character set

Step	Action	See also
<b>1</b>	Select the <b>Source Code Engineering</b> option. The Source Code Engineering page of the Options dialog displays.	
<b>2</b>	In the <b>Code page for source editing</b> field, click on the drop-down arrow and select the appropriate Unicode character set.	
<b>3</b>	Click on the <b>Close</b> button.	

## 11.9.2 Local Paths

When a team of developers are working on the same Enterprise Architect model, each developer might store their version of the source code in their local file system, but not always at the same location as their fellow developers. To manage this scenario in Enterprise Architect, you can define local paths for each user, on the Local Paths dialog.

You can use local paths in generating code and reverse engineering, and in version control, developing XML schemas and generating document and web reports.

Local paths might take a little time to set up, but if you want to work collaboratively on source and model concurrently, the effort is well worth while.

For example, if:

- Developer A stores her .java files in a C:\Java\Source directory, while developer B stores his in D:

\Source, and

- Both developers want to generate and reverse engineer into the same Enterprise Architect model located on a shared (or replicated) network drive

Developer A might define a local path of:

```
JAVA_SOURCE = " C: \ Java \ Source "
```

All Classes generated and stored in the Enterprise Architect project are stored as:

```
%JAVA_SOURCE% <xxx. java>
```

Developer B defines a local path as:

```
JAVA_SOURCE = " D: \ Source "
```

Now, Enterprise Architect stores all java files in these directories as:

```
%JAVA_SOURCE% <filename>
```

On each developer's machine, the filename is expanded to the correct local version.

Access   **Settings | Local Directories and Paths**

- [Local Paths Dialog](#) 

### 11.9.3 Local Paths Dialog

Using the Local Paths dialog, you can set up local paths for a single user on a particular machine. For a description of the use of Local Paths, see the *Local Paths* topic.

Access   **Settings | Local Directories and Paths**

Options

Field/Option/ Button	Action	See also
<b>Path</b>	Enter the path of the local directory in the file system (for example, <b>d:\java\source</b> ).	
<b>ID</b>	Enter the shared ID that is substituted for the Local Path (for example, <b>JAVA_SRC</b> ).	
<b>Type</b>	Enter the type of path to apply to (for example, <b>Java</b> ).	
<b>Apply Path</b>	Select a path and click on this button to update any existing full path names in the model to the shared relative path name. For example:	

Field/Option/ Button	Action	See also
	<code>d:\java\source\main.java</code> might become <code>%JAVA_SRC%\main.java</code>	
<b>Expand Path</b>	Click on this button to remove a relative path and substitute the full path name (the opposite effect of the <b>Apply Path</b> button).	

**Notes**

- You can also set up a hyperlink on a diagram to access the Local Paths dialog, to switch, update or expand your current Local Path
- If the act of Expanding or Applying a path for a linked file will create a duplicate record, the process will skip that record and display a message at the end of the process

**Learn more**

- [Local Paths](#)<sup>[2255]</sup>
- [Hyperlink](#)<sup>[2002]</sup>

**11.9.4 Language Macros**

When reverse engineering a language such as C++, you might find preprocessor directives scattered throughout the code. This can make code management easier, but can hamper parsing of the underlying C++ language.

To help remedy this, you can include any number of *macro* definitions, which are ignored during the parsing phase of the reverse engineering. It is still preferable, if you have the facility, to preprocess the code using the appropriate compiler first; this way, complex macro definitions and defines are expanded out and can be readily parsed. If you don't have this facility, then this option provides a convenient substitute.

**Access**   **Settings | Preprocessor Macros****Define a macro**

Step	Action	See also
<b>1</b>	Select the <b>Preprocessor Macros</b> menu option. The Language Macros dialog displays.	
<b>2</b>	Click on the <b>Add New</b> button.	
<b>3</b>	Enter details for your macro.	

Step	Action	See also
4	Click on the <b>OK</b> button.	

### Topics

Topic	Detail	See also
<b>Macros Embedded Within Declarations</b>	<p>Macros are sometimes used within the declaration of Classes and operations, as in the following examples:</p> <pre>class __declspec Foo {     int __declspec Bar (int p); };</pre> <p>If <i>declspec</i> is defined as a C++ macro, as outlined above, the imported Class and operation contain a Tagged Value called <i>DeclMacro1</i> with value <i>__declspec</i> (subsequent macros would be defined as <i>DeclMacro2</i>, <i>DeclMacro3</i> and so on).</p> <p>During forward engineering, these Tagged Values are used to regenerate the macros in code.</p>	
<b>Define Complex Macros</b>	<p>It is sometimes useful to define rules for complex macros that can span multiple lines; Enterprise Architect ignores the entire code section defined by the rule.</p> <p>Such macros can be defined in Enterprise Architect as in the following two examples; both types can be combined in one definition.</p> <p><b>Block Macros</b></p> <pre>BEGIN_INTERFACE_PART ^ END_INTERFACE_PART</pre> <p>The ^ symbol represents the body of the macro - this enables skipping from one macro to another; the spaces surrounding the ^ symbol are required.</p> <p><b>Function Macros</b></p> <pre>RTTI_EMULATION( )</pre> <p>Enterprise Architect skips over the token including everything inside the parentheses.</p>	

### Notes

- You can transport these language macro (or preprocessor macro) definitions between models, using the **Export Reference Data** and **Import Reference Data** options; the macros are exported as a Macro List

### Learn more

- [Export Reference Data](#) <sup>378</sup>

- [Import Reference Data](#) <sup>[380]</sup>

### 11.9.5 Set Collection Classes

Enterprise Architect enables you to define *Collection Classes* for generating code from Association connectors where the target role has a multiplicity setting greater than 1.

Topic	Detail	See also
<b>Defining Collection Classes</b>	<p>On the Source Code Engineering section of the Options dialog (select the <b>Tools   Options   Source Code Engineering</b> option), on each language page click on the <b>Collection Classes</b> button.</p> <p>The Collection Classes for Association Roles dialog displays.</p> <p>On this dialog, you can define:</p> <ul style="list-style-type: none"> <li>• The default Collection Class for 1..* roles</li> <li>• The ordered Collection Class to use for 1..* roles</li> <li>• The qualified Collection Class to use for 1..* roles</li> </ul>	<a href="#">Source Code Options</a> <sup>[224]</sup>
<b>Defining Collection Classes for a specific Class</b>	Class-specific Collection classes can be defined by clicking the <b>Collection Classes</b> button in the Class Properties dialog of the element.	<a href="#">Element Details</a> <sup>[959]</sup>
<b>Code Generation Precedence</b>	<p>When Enterprise Architect generates code for a connector that has a multiplicity role &gt;1:</p> <ol style="list-style-type: none"> <li>1. If the Qualifier is set use the qualified collection: <ul style="list-style-type: none"> <li>• for the Class if set</li> <li>• else use the code language qualified collection</li> </ul> </li> <li>2. If the Order option is set use the ordered collection: <ul style="list-style-type: none"> <li>• for the Class if set</li> <li>• else use the code language ordered collection</li> </ul> </li> <li>3. Else use the default collection: <ul style="list-style-type: none"> <li>• for the Class if set</li> <li>• else use the code language default collection</li> </ul> </li> </ol>	
<b>Using Markers</b>	You can include the marker <b>#TYPE#</b> in the collection name; Enterprise Architect replaces this with the name of the Class being collected at source generation time (for example, <i>Vector&lt;#TYPE#&gt;</i> would become <i>Vector&lt;foo&gt;</i> ).	

Topic	Detail	See also
	Conversely, when reverse engineering, an Association connector is also created if a matching entry (e.g. <i>foo</i> if <i>foo</i> is found in the model) is defined as a Collection Class.	
<b>Additional Collection Classes</b>	Additional Collection Classes can be defined in the language options page (C#, C++, Java).	<a href="#">Example Use of Collection Classes</a>  <a href="#">C# Options</a>  <a href="#">C++ Options</a>  <a href="#">Java Options</a> 
<b>Member Type</b>	<p>On both the Source Role and Target Role tabs of the Association Property dialog (accessible from the right-click context menu of any Association) there is a <b>Member Type</b> field.</p> <p>If you set this, the value you enter overrides all the above options.</p>	<a href="#">Source Role</a>  <a href="#">Target Role</a>

- [Generate Source Code](#) 
- [Importing Source Code](#) 
- [Source Code Options](#) 

### 11.9.5.1 Example Use of Collection Classes

Consider the following source code:

```

class Class1
{
public:
    Class1();
    virtual ~Class1();
    CMap<CString, LPCTSTR, Class3*, Class3*> att;
    Vector<Class2> *att1;
    TemplatedClass<class1, class2> *att2;
    CList<Class4> *att3;
};

class Class2
{
public:
    Class2();
    virtual ~Class2();
};

class Class3
{
public:

```

```

    Class3();
    virtual ~Class3();

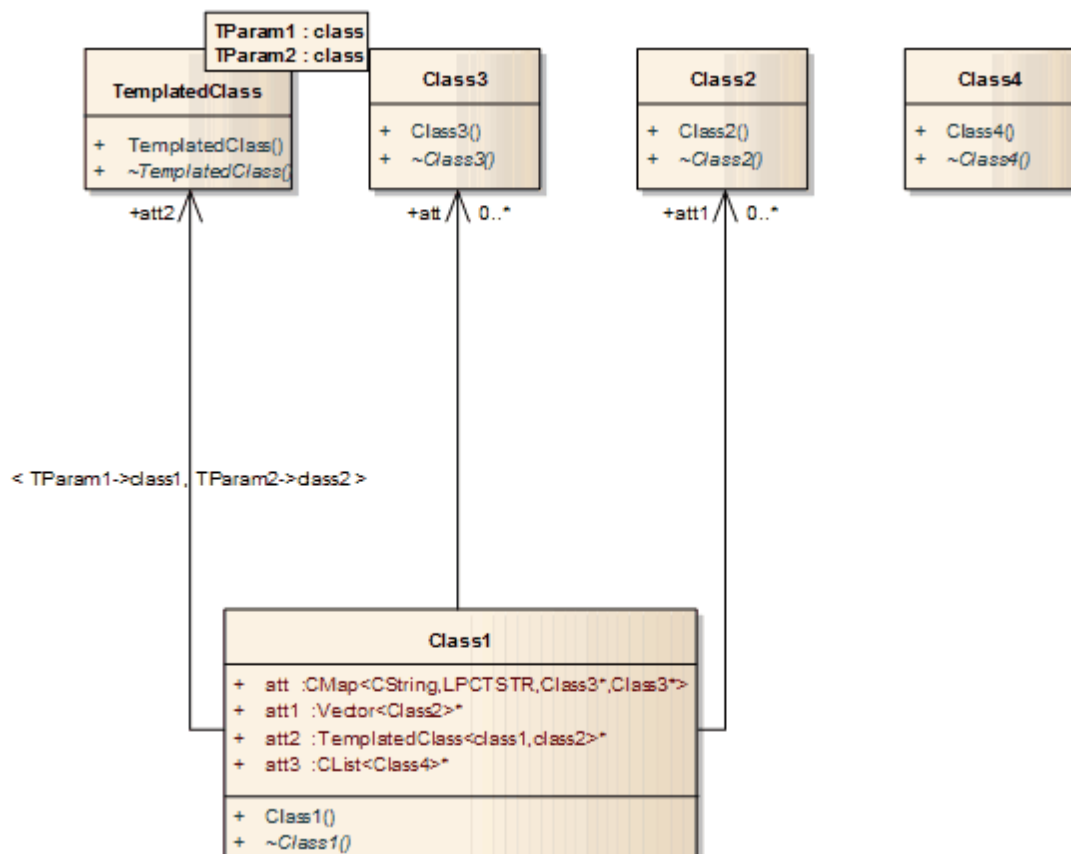

};

class Class4
{
public:
    Class4();
    virtual ~Class4();
};

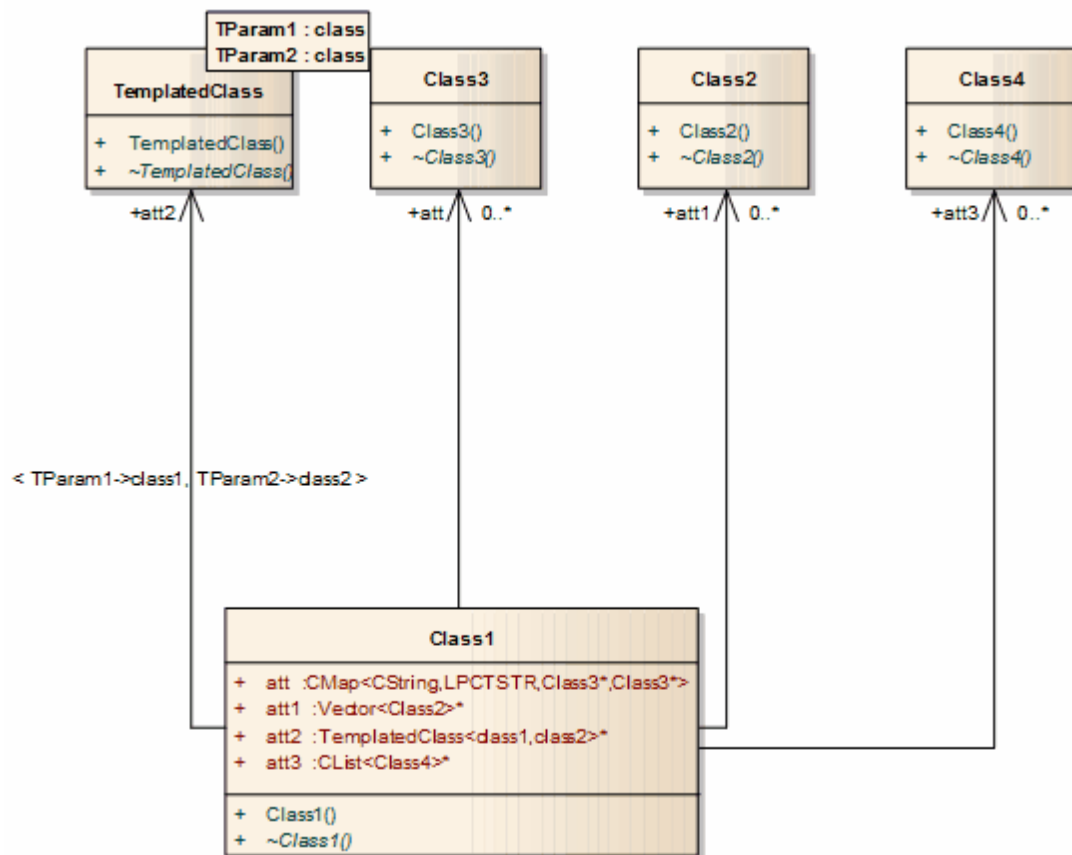

template<class TParam1, class TParam2>
class TemplatedClass
{
public:
    TemplatedClass() {
    }
    virtual ~TemplatedClass() {
    }
};

```

If this code is imported into the system with default import options, this diagram is generated:

If, however, you enter the value **CList<#Type#>** in the **Additional Collection Classes** field in the language options page (**C#**, **Java**, **C++**), an Association connector is also created to **Class 4**:

### 11.9.6.1 ActionScript Options

If you intend to generate **ActionScript** code from your model, you can configure the code generation options using the **ActionScript Specifications** page of the Options dialog to:

- Specify default ActionScript version to generate (AS2.0 or AS3.0)
- Specify default file extensions (header and source)
- Specify default source directory
- Specify the editor for ActionScript code

**Access**   **Tools | Options | Source Code Engineering | ActionScript**

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support ActionScript code generation.  Select this check box to <b>disable</b> ActionScript code support.	
<b>Options for the current model</b>	Specifies the options used in the current model.  These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> [2259]

### 11.9.6.2 Ada 2005 Options

If you intend to generate **Ada 2005** code from your model, you can configure the code generation options using the **Ada** page of the Options dialog to:

- Inform the reverse engineering process whether the name of the Tagged Record is the same as the package name
- Advise the engine of the alternate Tagged Record name to locate
- Specify whether the engine should create a reference type for the Tagged Record (if one is not defined)
- Supply the name of the reference type to be created (default is Ref)
- To specify the reference parameter of a Reference / Access type
- Tell the engine to ignore the name of the reference parameter
- Indicate the name of the reference parameter to locate

**Access** [Tools](#) | [Options](#) | [Source Code Engineering](#) | [Ada](#)

### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support Ada 2005 code generation. Select this check box to <b>disable</b> Ada 2005 code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> 

### Notes

- Ada 2005 support is available in the System Engineering and Ultimate editions of Enterprise Architect

### 11.9.6.3 *ArcGIS Options*

If you intend to generate **ArcGIS** code from your model, you can configure the code generation options using the **ArcGIS** page of the Options dialog to:

- Specify default file extensions
- Specify default source directory
- Specify the editor for ArcGIS code

**Access** [Tools](#) | [Options](#) | [Source Code Engineering](#) | [ArcGIS](#)

### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support ArcGIS code generation. Select this check box to <b>disable</b> ArcGIS code support.	
<b>Options for the current model</b>	Specifies the options used in the current model.	

	These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> 

#### 11.9.6.4 C Options

If you intend to generate **C** code from your model, you can configure the code generation options using the **C Specifications** page of the Options dialog to:

- Support Object Oriented coding
- Indicate default file extensions (header and source)
- Indicate default source directory
- Indicate an editor for C code
- Specify a path that Enterprise Architect uses to search for the implementation file; the first path in the list is the default path when generating

Access   **Tools | Options | Source Code Engineering | C**

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support C code generation. Select this option to <b>disable</b> C code support.	
<b>Options for the current model</b>	In the value fields, specify the options that affect all users of the <b>current</b> model: <ul style="list-style-type: none"> <li>• The default header and source file extensions for the code files</li> <li>• Support for Object Oriented programming; if this is <b>True</b>, then set: <ul style="list-style-type: none"> <li>• The Namespace delimiter character</li> <li>• Whether the first parameter of an operation is a Class reference</li> <li>• The parameter reference style in generated C code</li> <li>• The reference parameter name in generated code</li> <li>• The default Constructor name in generated code</li> <li>• The default Destructor name in generated code</li> </ul> </li> </ul>	

	These options do not apply to <b>other</b> models.	
<b>Options for the current user</b>	<p>In the value fields, specify the options that apply under your own user ID in <b>all</b> models that you access:</p> <ul style="list-style-type: none"> <li>• The default attribute type to create (fixed as <b>int</b>)</li> <li>• Whether a <b>#define</b> constant is imported as an attribute in imported C code (if Object Oriented programming is set to <b>True</b>)</li> <li>• Whether to generate comments for C methods to the declaration, and to reverse engineer comments from the declaration</li> <li>• Whether to generate comments for C methods to the implementation, and to reverse engineer comments from the implementation</li> <li>• Whether to update comments in regenerating code from the model</li> <li>• Whether to update the implementation file in re-generating code from the model</li> <li>• The default source code directory location (click on the <b>Browse</b> button - ( ... ))</li> <li>• The default file extensions to read when importing a directory of C code</li> <li>• The Code Editor to use (click on the <b>Browse</b> button - ( ... ))</li> <li>• The search path for the implementation file relative to the header file path</li> </ul>	
<b>Statemachine Engineering</b>	<p>In the value fields, use the drop-down arrows to set the options to <b>True</b> or <b>False</b>; these options apply to generating code from State Machine models in the <b>current</b> model only:</p> <ul style="list-style-type: none"> <li>• <b>Use the new Statemachine Template</b> - set to <b>True</b> to use the code generation templates from Enterprise Architect Release 11 and later, set to <b>False</b> to apply the EASL Legacy templates</li> <li>• <b>Generate Trace Code</b> - set to <b>True</b> to generate Trace code, <b>False</b> to omit it</li> </ul>	<a href="#">Legacy State Machine Templates</a>  <sup>[2126]</sup>
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a>  <sup>[2259]</sup>

- [Object Oriented Programming In C](#)  <sup>[2086]</sup>

### 11.9.6.5 C# Options

If you intend to generate **C#** code from your model, you can configure the code generation options using the **C# Specifications** page of the Options dialog to:

- Indicate the default File extension
- Specify a directory for opening and saving C# source code
- Indicate additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as `CArray<#TYPE#>`) or a mix of other strings and substitutions (such as `Cmap<CString,LPCTSTR,#TYPE#*,#TYPE#*>`); the following collection classes are defined by default:
  - `List<#TYPE#>;Stack<#TYPE#>;Queue<#TYPE#>;`

**Access**   **Tools | Options | Source Code Engineering | C#**

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support C# code generation. Select this check box to <b>disable</b> C# code support.	
<b>Options for the current model</b>	In the value fields, specify the options that affect all users of the <b>current</b> model: <ul style="list-style-type: none"> <li>• The default source file extensions for the code files</li> <li>• The additional Collection Classes</li> </ul> <p>These options do not apply to <b>other</b> models.</p>	
<b>Options for the current user</b>	In the value fields, specify the options that apply under your own user ID in <b>all</b> models that you access: <ul style="list-style-type: none"> <li>• The default attribute type to create</li> <li>• Whether Namespaces should be generated when generating C# Classes</li> <li>• Whether to remove new lines (hard carriage returns) from the summary tag when importing XML.NET style comments</li> <li>• Whether to generate a Finalizer method when generating code for a C# Class</li> <li>• Whether to generate a Dispose method when generating code for a C# Class</li> <li>• The default source code directory location (click on the <b>Browse</b> button - ( ... ))</li> <li>• The Code Editor to use (click on the <b>Browse</b> button - ( ... ))</li> </ul>	
<b>Statemachine Engineering</b>	In the value fields, use the drop-down arrows to set the options to <b>True</b> or <b>False</b> ; these options apply to generating code from State Machine models in the <b>current</b> model only.	

	<ul style="list-style-type: none"> <li>• <b>Use the new StateMachine Template</b> - set to <b>True</b> to use the code generation templates from Enterprise Architect Release 11 and later, set to <b>False</b> to apply the EASL Legacy templates</li> <li>• <b>Generate Trace Code</b> - set to <b>True</b> to generate Trace code, <b>False</b> to omit it</li> </ul>	<a href="#">Legacy State Machine Templates</a> <sup>[2126]</sup>
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> <sup>[2259]</sup>

- [C# Conventions](#) <sup>[2088]</sup>

### 11.9.6.6 C++ Options

If you intend to generate **C++** code from your model, you can configure the code generation options using the **C++ Specifications** page of the Options dialog to:

- Indicate the version of C++ to generate; this controls the set of templates used and how properties are created
- Specify the default reference type used when a type is specified by reference
- Specify the default file extensions
- Specify default Get/Set prefixes
- Define additional Collection Classes - to define custom Collection Classes, which can be simple substitutions (such as `CArray<#TYPE#>`) or a mix of other strings and substitutions (such as `Cmap<CString,LPCTSTR,#TYPE#*,#TYPE#*>`); the following Collection Classes are defined by default:
  - `CArray<#TYPE#>;CMap<CString,LPCTSTR,#TYPE#*,#TYPE#*>;`
- Specify a default source directory
- Specify the path that the system uses to search for the implementation file; the first path in the list is the default path when generating new implementation files and parsing existing files - if you add further directories, the system also searches these when parsing existing files

Access   **Tools | Options | Source Code Engineering | C++**

Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support C++ code generation. Select this option to <b>disable</b> C++ code support.	
<b>Options for the current model</b>	In the value fields, specify the options that affect all users of the <b>current</b> model:	

	<ul style="list-style-type: none"> <li>• The version of C++ you are using (which determines which templates to use when generating code)</li> <li>• The default reference type to use when creating properties for C++ attributes by reference</li> <li>• The default header and source file extensions for the code files</li> <li>• The default 'Get' prefix</li> <li>• The default 'Set' prefix</li> <li>• The additional Collection Classes</li> </ul> <p>These options do not apply to <b>other</b> models.</p>	
<b>Options for the current user</b>	<p>In the value fields, specify the options that apply under your own user ID in <b>all</b> models that you access:</p> <ul style="list-style-type: none"> <li>• The default attribute type to create</li> <li>• Whether Namespaces should be generated when generating C++ Classes</li> <li>• What style to apply when generating and processing comments for C++</li> <li>• Whether to generate comments for C++ methods to the declaration, or reverse engineer comments from the declaration</li> <li>• Whether to generate comments for C++ methods to the implementation, or reverse engineer comments from the implementation</li> <li>• Whether to update comments in re-generating code from the model</li> <li>• Whether to update the implementation file in re-generating code from the model</li> <li>• The default source code directory location (click on the <b>Browse</b> button - ( ... ))</li> <li>• The default file extensions to read when importing a directory of C++ code</li> <li>• The Code Editor to use (click on the <b>Browse</b> button - ( ... ))</li> <li>• The search path for the implementation file relative to the header file path</li> </ul>	
<b>Statemachine Engineering</b>	<p>In the value fields, use the drop-down arrows to set the options to <b>True</b> or <b>False</b>; these options apply to generating code from State Machine models in the <b>current</b> model only:</p> <ul style="list-style-type: none"> <li>• <b>Use the new Statemachine Template</b> - set to <b>True</b> to use the code generation templates from Enterprise Architect Release 11 and later, set to <b>False</b> to apply the EASL Legacy templates; also set the <b>C++ Version</b> to <b>ANSI</b></li> <li>• <b>Generate Trace Code</b> - set to <b>True</b> to generate Trace code, <b>False</b> to omit it</li> </ul>	<a href="#">Legacy State Machine Templates</a> <sup>2126</sup>

- [Delphi Properties](#) 

### 11.9.6.7.1 Delphi Properties

Enterprise Architect has comprehensive support for Delphi properties. These are implemented as Tagged Values, with a specialized property editor to help create and modify Class properties. By using the **Feature Visibility** element context menu option, you can display the 'tags' compartment that contains the properties. Imported Delphi Classes with properties have this feature automatically made visible for your convenience.

#### Manually activate the property editor

- In the selected Class set the code generation language to **Delphi**
- Right-click on the Class and select the **Delphi Properties** context menu option to open the editor

Using the Delphi Properties editor, you can build properties quickly and simply; from here you can:

- Change the name and scope (only **Public** and **Published** are currently supported)
- Change the property type (the drop-down list includes all defined Classes in the project)
- Set the Read and Write information (the drop-down lists have all the attributes and operations from the current Class; you can also enter free text)
- Set **Stored** to **True** or **False**
- Set the Implements information
- Set the default value, if one exists

#### Notes

- When you use the Create Property dialog from the Attribute screen, the system generates a pair of Get and Set functions together with the required property definition as Tagged Values; you can manually edit these Tagged Values if required
- Public properties are displayed with a '+' symbol prefix and published with a '^'
- When creating a property in the Create Property Implementation dialog (accessed through the Attributes dialog), you can set the scope to **Published** if the property type is **Delphi**
- Only **Public** and **Published** are supported
- If you change the name of a property and forward engineer, a new property is added, but you must manually delete the old one from the source file

### 11.9.6.8 Java Options

If you intend to generate **Java** code from your model, you can configure the code generation options using the **Java Specifications** page of the Options dialog to:

- Set a default directory for opening and saving Java source code
- Indicate a default file extension
- Specify a default 'Get' prefix
- Specify a default 'Set' prefix
- Define additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as `CArray<#TYPE#>`) or a mix of other strings and substitutions (such as `Cmap<CString,LPCTSTR,#TYPE#*,#TYPE#*>`); the following collection classes are defined by default:
  - `HashSet<#TYPE#>;Map<String,#TYPE#>;`

**11.9.6.9 Python Options**

If you intend to generate **Python** code from your model, you can configure the code generation options using the **Python Specifications** page of the Options dialog to:

- Indicate the default file extension(s)
- Specify the default source directory to be used

- Specify the editor used to write code

**Access**   **Tools | Options | Source Code Engineering > Python**

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support Python code generation. Select this option to <b>disable</b> Python code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	

#### 11.9.6.10 *PHP Options*

If you intend to generate **PHP** code from your model, you can configure the code generation options using the **PHP Specifications** page of the Options dialog to:

- Specify the extension to be used when creating files for PHP source
  - Define a semi-colon separated list of extensions to look at when doing a directory code import for PHP
  - Set a default directory for opening and saving PHP source code
  - Specify the version of PHP to generate

**Access**   **Tools | Options | Source Code Engineering | PHP**

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support PHP code generation. Select this option to <b>disable</b> PHP code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.

## 11.9.6.11 SystemC Options

If you intend to generate **SystemC** code from your model, you can configure the code generation options using the **SystemC** page of the Options dialog to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Access**   **Tools | Options | Source Code Engineering | SystemC**

### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support SystemC code generation. Select this option to <b>disable</b> SystemC code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> <sup>[2258]</sup>

## 11.9.6.12 VB.NET Options

If you intend to generate **VB.NET** code from your model, you can configure the code generation options using the **VB.NET Specifications** page of the Options dialog to:

**Access**   **Tools | Options | Source Code Engineering | VB.Net**

### Use to

- Indicate default file extension(s)

- Specify a default source directory
- Specify an editor for changing code

### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support VB.NET code generation. Select this option to <b>disable</b> VB.NET code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> <small>2259</small>

### 11.9.6.13 Verilog Options

If you intend to generate **Verilog** code from your model, you can configure the code generation options using the **Verilog** page of the Options dialog to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Access**   [Tools](#) | [Options](#) | [Source Code Engineering](#) | [Verilog](#)

### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support Verilog code generation. Select this option to <b>disable</b> Verilog code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however, they do not apply to other models.	

<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> <small>[2259]</small>

#### 11.9.6.14 VHDL Options

If you intend to generate **VHDL** code from your model, you can configure the code generation options using the **VHDL** page of the Options dialog to:

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Access** [Tools | Options | Source Code Engineering | VHDL](#)

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support VHDL code generation. Select this option to <b>disable</b> VHDL code support.	
<b>Options for the current model</b>	Specifies the options used in the current model. These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> <small>[2259]</small>

#### 11.9.6.15 Visual Basic Options

If you intend to generate **Visual Basic** code from your model, you can configure the code generation options using the **VB Specifications** page of the Options dialog to:

- Indicate the default file extension when reading/writing
- Specify the default Visual Basic version
- Indicate the MTS transaction mode for MTS objects

- Specify if a Class uses Multi use (**true** or **false**)
- Specify if a Class uses the **Persistable** property
- Indicate data binding behaviours
- Set the global namespace
- Set the *Exposed* attribute
- Indicate if the *Creatable* attribute is **true** or **false**

**Access**   **Tools | Options | Source Code Engineering | Visual Basic**

#### Options

Field	Action	See also
<b>Disable Language</b>	Leave this checkbox unselected to support Visual Basic code generation.  Select this option to <b>disable</b> Visual Basic code support.	
<b>Options for the current model</b>	Specifies the options used in the current model.  These options affect all users of the current model; however, they do not apply to other models.	
<b>Options for the current user</b>	Specifies the options used for the current use; these options apply to all models that are accessed by the user.	
<b>Collection Classes</b>	Click on this button to open the Collection Classes for Association Roles dialog, through which you specify the collection class definitions for Association connectors.	<a href="#">Collection Classes</a> 

#### 11.9.6.16 MDG Technology Language Options

If you have loaded an MDG Technology that specifies a code module into your *Sparx Systems > EA > MDG Technologies* folder, the language is included in the Source Code Engineering list on the Options dialog. The language is only listed on the Options dialog if an MDG Technology file actually uses it in your model.

**Access**   **Tools | Options | Source Code Engineering | MDG**

#### Options

Field	Action	See also
<b>Default Extension</b>	Default extension for generated source files; shown if the option is in the technology.  This is saved per project.	

<b>Import File Extensions</b>	Default folder to import source files from; shown if the technology supports namespaces. This is saved once for all projects.	
<b>Generate Namespaces</b>	Indicates if namespaces are generated or not.	
<b>Default Source Directory</b>	The default directory to save generated source files. This is always shown.	
<b>Editor</b>	Indicates the editor that is used to edit source files.	
<b>Att Type</b>	Indicates the default attribute type.	

**Notes**

- These options are set in the technology inside the `<CodeOptions>` tag of a code module, as follows:

```
<CodeOption name="DefaultExtension">.rb</CodeOption>
```

**11.9.6.17 Reset Options**

Enterprise Architect stores some of the options for a Class when it is first created. Some are global; for example, `$LinkClass` is stored when you first create the Class, so it won't automatically pick up the global change in the Options dialog in existing Classes. You must modify the options for the existing Class.

**Modify options for a single Class**

Step	Action	See also
1	Right-click on the Class to change, and select the <b>Generate Code</b> context menu option. The Generate Code dialog displays.	
2	Click on the <b>Advanced</b> button. The Object Options dialog displays.	
3	Click on the <b>Attributes/Operations</b> button.	

Step	Action	See also
4	Change the options, and click on the <b>Close</b> button to apply the changes.	

**Modify options for all Classes within a Package**

Step	Action	See also
1	Right-click on the package in the Project Browser. The context menu displays.	
2	Select the <b>Code Engineering   Reset Options for this Package</b> menu option. The Manage Code Generation dialog displays.	
3	Reset the required defaults for each existing Class.	
4	Click on the <b>OK</b> button to apply the changes.	

## 11.10 Code Template Framework Tool

The Code Template Framework (CTF) is used during forward engineering of UML models. The CTF enables you to:

- Generate source code from UML models
- Customize the way in which Enterprise Architect generates source code
- Forward engineer languages not specifically supported by Enterprise Architect

### Topics

Topic	Detail	See also
<b>Default Templates</b>	Default Code Templates are built into Enterprise Architect for forward engineering supported languages.	<a href="#">Code and Transform Templates</a> <sup>[1632]</sup> <a href="#">Base Templates</a> <sup>[1633]</sup>
<b>Code Template Editor</b>	A Code Template Editor is provided for creating and maintaining user-defined Code Templates.	<a href="#">Code Template Editor</a> <sup>[1641]</sup>
<b>Customizing Code Templates</b>	Descriptions of the template syntax and the macros and functions you can use to control the effects of the templates.	<a href="#">Code Template Framework</a> <sup>[1631]</sup>
<b>Synchronize Code</b>	A subset of the default Code Templates to synchronize code.	<a href="#">Synchronize Code</a> <sup>[1638]</sup>

## 11.11 ICONIX

### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>The following text is derived from the <b>ICONIX</b> entry in the online Wikipedia:</p> <p><i>The ICONIX Process is a minimalist, streamlined approach to Use Case driven UML modeling that uses a core subset of UML diagrams and techniques to provide thorough coverage of object-oriented analysis and design. Its main activity is robustness analysis, a method for bridging the gap between analysis and design. Robustness analysis reduces the ambiguity in use case descriptions, by ensuring that they are written in the context of an accompanying domain model. This process makes the use cases much easier to design, test and estimate.</i></p> <p>The ICONIX Process was developed by Doug Rosenberg; for more information on ICONIX, refer to <i>ICONIX Software Engineering Inc.</i></p>	<a href="#">ICONIX</a> (Online Resource)
<b>ICONIX in Enterprise Architect</b>	<p>Enterprise Architect enables you to develop models under ICONIX quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer.</p> <p>The ICONIX facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• A set of ICONIX pages in the Toolbox</li> <li>• ICONIX element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul> <p>To further help you develop and manage a project under ICONIX, Enterprise Architect also provides a white paper on the ICONIX Roadmap.</p> <p>In addition, Enterprise Architect has an alternative visual layout specific to ICONIX.</p>	<a href="#">Toolbox Shortcut Menu</a> <sup>[799]</sup> <a href="#">Quick Linker</a> <sup>[896]</sup> <a href="#">ICONIX Roadmap</a> (Online Resource)
<b>ICONIX Toolbox Pages</b>	<p>Within the Toolbox, Enterprise Architect provides ICONIX versions of the pages for UML Analysis, Use Case, Class, Interaction (Sequence), Activity and Custom diagrams (which often form the basis for <i>Robustness diagrams</i>).</p> <p>Compared to the standard Toolbox pages, these have slightly different element and relationship sets; you can access them by either:</p> <ul style="list-style-type: none"> <li>• Selecting the <b>More tools   ICONIX   &lt;Diagram Type&gt;</b> menu option for a specific Toolbox page</li> <li>• Selecting the <b>ICONIX</b> option in the drop-down field of the Default Tools toolbar, which adds all six pages to the Toolbox; the first page and the Common page are expanded, and the others are closed up</li> </ul>	<a href="#">Analysis Diagram</a> <sup>[1807]</sup> <a href="#">Use Case Diagram</a> <sup>[1207]</sup> <a href="#">Class Diagram</a> <sup>[1184]</sup> <a href="#">Sequence Diagram</a> <sup>[1249]</sup> <a href="#">Activity Diagram</a> <sup>[1199]</sup> <a href="#">Custom Diagram</a> <sup>[1796]</sup>

Topic	Detail	See also
		
<b>ICONIX Layout</b>	<p>The ICONIX layout re-organizes the Enterprise Architect work area, opening the:</p> <ul style="list-style-type: none"> <li>• Toolbox on the right hand side of the screen (follow the instructions above to display the ICONIX pages)</li> <li>• The Learning Center window auto-hidden in the top right of the screen</li> <li>• Project Browser window in the top left of the screen, and</li> <li>• Notes, Properties and Tagged Values windows nested on the bottom left of the screen</li> </ul>	<a href="#">Workspace Layout Toolbar</a> <sup>[149]</sup>

Topic	Detail	See also
	To apply this layout, select the <b>Basic - Reversed</b> option in the drop-down list in the Workspace Layout toolbar.	
<b>Disable ICONIX</b>	<p>If you prefer not to use ICONIX in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p> <p>This does not affect the ICONIX layout, which you can switch back to your own layout or the Enterprise Architect default layout using the <b>View   Workspaces and Commands</b> menu option.</p>	<a href="#">MDG Technologies</a> 

## 11.12 GoF Patterns

You can develop diagrams from GoF patterns quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer.

*Gang of Four (GoF) Patterns are 23 classic software design patterns providing recurring solutions to common problems in software design. They were developed by Erich Gamma, Richard Helm, Ralph Johnson and John Vlissides, often referred to as the Gang of Four. The patterns are defined in the book Design Patterns: Elements of Reusable Object-Oriented Software (Gamma et al., ISBN 0-201-63361-2).*

The above text is derived from the *Design Patterns* entry in the online Wikipedia. For further information on the concepts of GoF Patterns, refer to the Wikipedia item and its linked sources.

### GoF Patterns in Enterprise Architect

Topic	Detail	See also
<b>GoF Pattern Facilities</b>	<p>The GoF Patterns are provided in the form of:</p> <ul style="list-style-type: none"><li>• GoF Behavioral Patterns, GoF Creational Patterns and GoF Structural Patterns pages in the Toolbox</li><li>• Gang of Four Pattern entries in the Toolbox Shortcut Menu</li></ul> <p><b>GoF Toolbox Pages</b></p> <p>You can access the GoF Pattern pages of the Toolbox through the <b>More tools   GoF Patterns</b> menu option; the following icons are available:</p>	<a href="#">Toolbox Shortcut Menu</a> <sup>[79]</sup>

Topic	Detail	See also
	 <p>When you drag one of the pattern elements onto a new diagram, the Add Pattern GoF &lt;pattern group&gt;&lt;pattern type&gt; dialog displays; if necessary, modify the action and/or default for the component elements, then click on the <b>OK</b> button to create a diagram based on the pattern.</p>	
<b>Disable GoF Patterns</b>	<p>If you prefer not to use the GoF Patterns technology in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p>	<a href="#">MDG Technologies</a> <small>147</small>

## 12 Systems Engineering

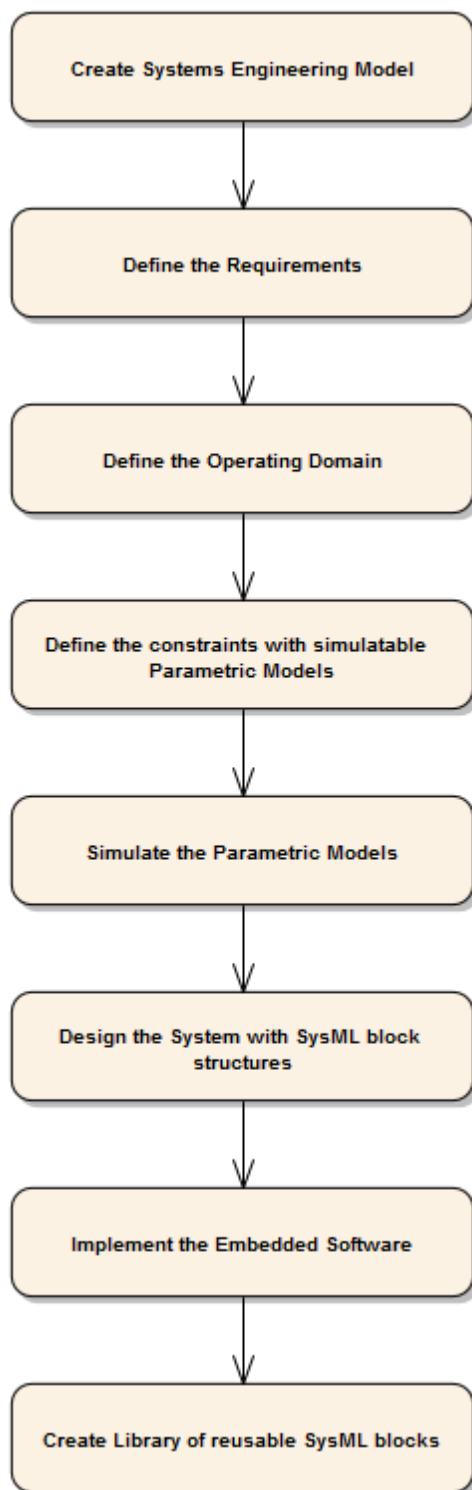

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>To model Systems using <b>SysML</b> in Enterprise Architect, you work through the following steps:</p> <ul style="list-style-type: none"> <li>• <b>Create a Systems Engineering model</b> to develop your system</li> <li>• <b>Create a Requirements model</b> to define the systems requirements and expectations</li> <li>• Create an <b>Operational Domain model</b>, which describes the environment that the system operates within, and the entities it interacts with</li> <li>• <b>Create Constraint models</b> to describe the systems operating characteristics using parametric models</li> <li>• <b>Simulate the parametric models</b> to verify their correctness and obtain the desired characteristic</li> <li>• <b>Design the system's composition</b> using SysML Blocks and Parts</li> <li>• <b>Implement the embedded software</b> using UML Classes and behavioral models</li> <li>• <b>Create a Library of reusable SysML blocks</b>, representing subsystems that can be reused on other projects, and other common Type definitions</li> </ul>	<p><a href="#">SysML</a> <sup>[2294]</sup></p> <p><a href="#">Create a Systems Engineering Model</a> <sup>[2289]</sup></p> <p><a href="#">A SysML Requirements Model</a> <sup>[2325]</sup></p> <p><a href="#">A SysML Operational Domain Model</a> <sup>[2326]</sup></p> <p><a href="#">SysML Parametric Models</a> <sup>[2320]</sup></p> <p><a href="#">Simulating a SysML Model</a> <sup>[2322]</sup></p> <p><a href="#">Compose System Design</a> <sup>[2328]</sup></p> <p><a href="#">Generate from Behaviour Models</a> <sup>[2127]</sup></p> <p><a href="#">Create Re-usable Subsystems</a> <sup>[2330]</sup></p>

### Example

These steps are represented graphically in the following flow:

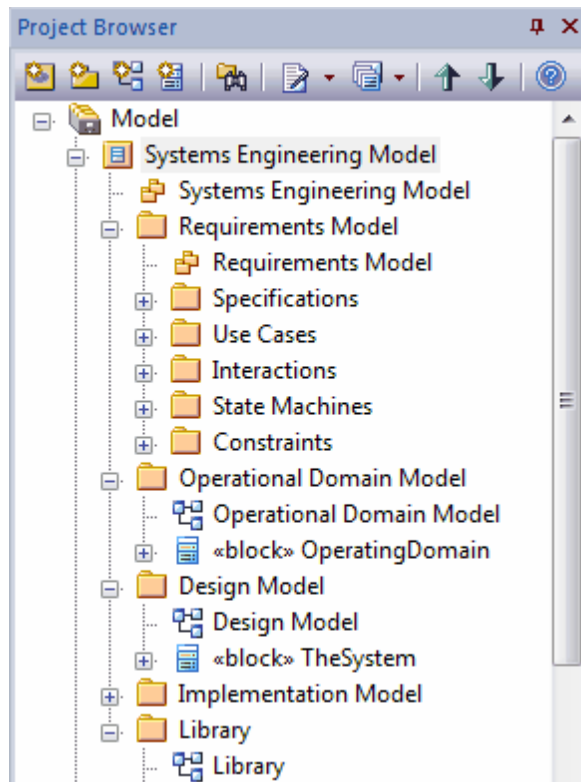

Create a Systems Engineering Model from a template

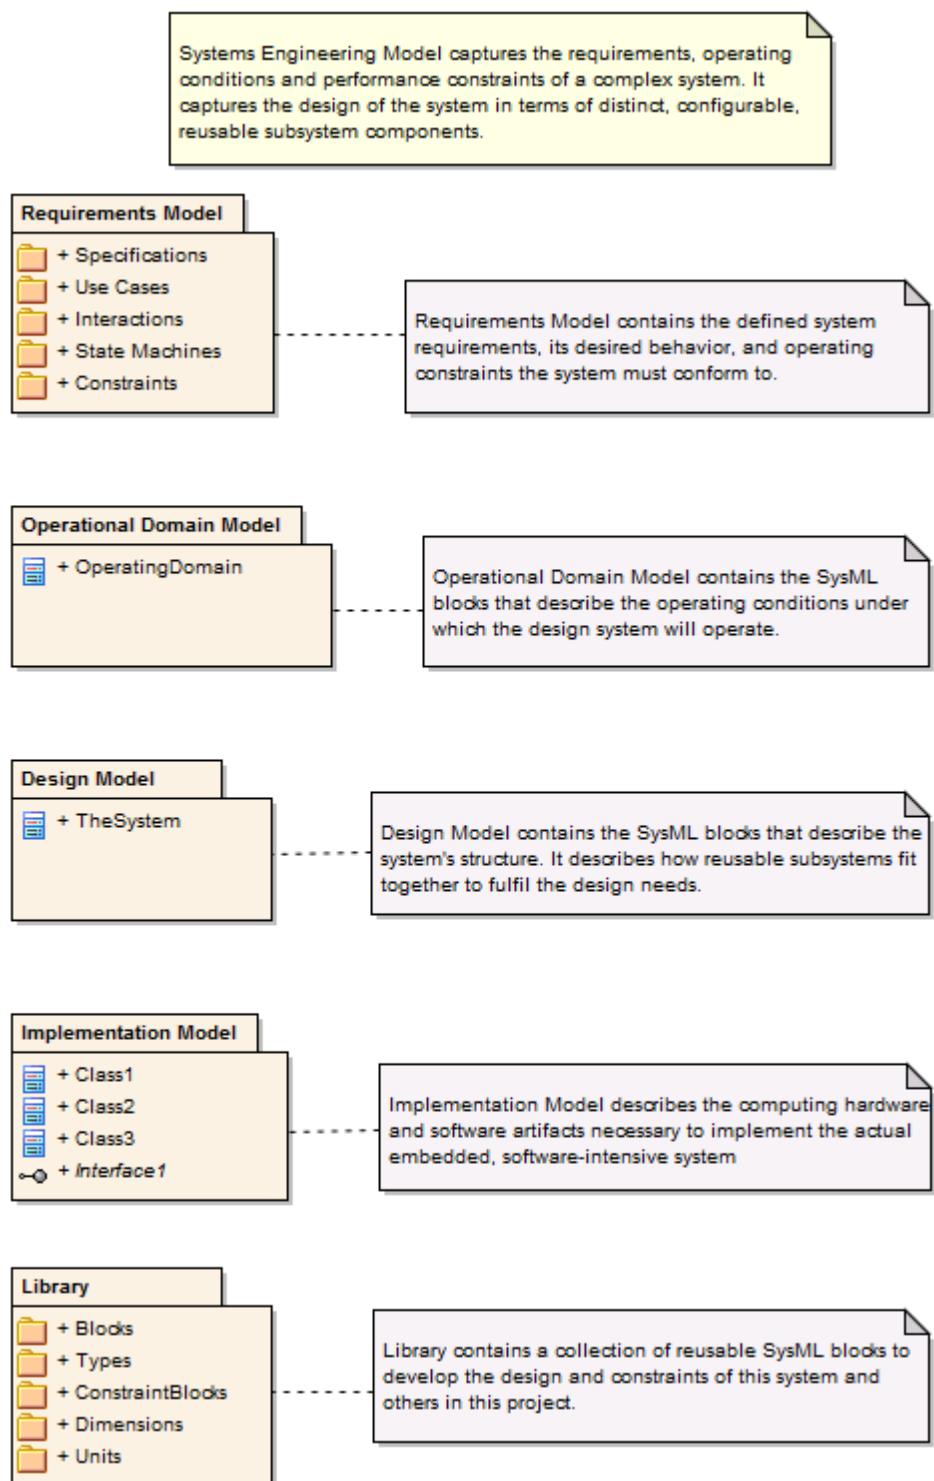

Step	Action	See also
1	<p>In the Project Browser, either:</p> <ul style="list-style-type: none"><li>Click on the <b>New Model From Pattern</b> icon in the toolbar</li><li>Right-click on a model root node and select the <b>Add a New Model using Wizard</b> context menu option, or</li><li>Right-click on a package and select the <b>Add   Add a New Model using Wizard</b> context menu option</li></ul> <p>The Select Model(s) dialog displays.</p>	
2	<p>In the <b>Select From</b> field, click on the drop-down arrow and select <b>Systems Engineering Model</b>.</p> <p>Alternatively, if it is listed in the Technology panel, select the <b>Systems Engineering Model</b> item.</p>	
3	<p>In the Name panel, select the checkbox next to the <b>Systems Engineering Model</b> icon.</p>	
4	<p>Click on the <b>OK</b> button.</p>	

### Example

The following model structure is created in the Project Browser:

The *Systems Engineering Model* diagram, shown below, encapsulates the key components of the Systems Engineering model.

### Notes

- Systems Modeling Language (SysML) is provided with the Systems Engineering edition and Ultimate edition of Enterprise Architect

Learning Center topics

- (Alt+F1) | **Enterprise Architect | Systems Engineering**

## 12.1 Systems Modeling Language (SysML)

To develop SysML models quickly and simply, you can use one of three versions of the **MDG Technology for SysML**, integrated with Enterprise Architect. The three available versions correspond to **SysML 1.1**, **SysML 1.2** and **SysML 1.3**; to avoid confusion, you only need to have **more than** one of these technologies enabled at a time if you are **migrating** your model from an earlier version to a later one.

The following text is derived from the official OMG SysML site of the Object Management Group.

'The OMG Systems Modeling Language (OMG SysML™) is a general-purpose graphical modeling language for specifying, analyzing, designing, and verifying complex systems that may include hardware, software, information, personnel, procedures, and facilities. The language provides graphical representations with a semantic foundation for modeling system requirements, behavior, structure, and parametrics, which is used to integrate with other engineering analysis models. SysML was developed in response to requirements developed jointly by the OMG and the International Council on Systems Engineering (INCOSE) by the diverse group of tool vendors, end users, academia, and government representatives.'

## 12.1.1 SysML Activity Toolbox

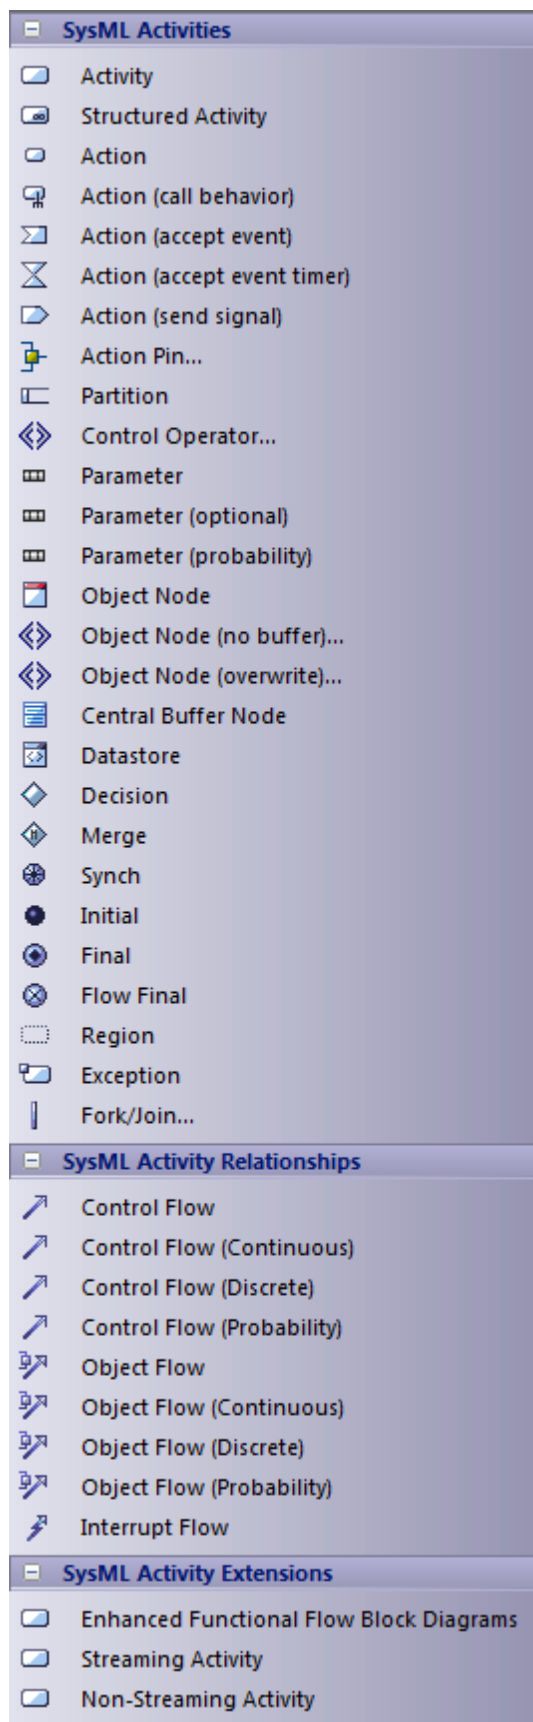

When you are constructing SysML models, you can populate the Activity diagrams using the icons on the SysML Activity pages of the Diagram Toolbox.

The Block that owns the Activity diagram is automatically represented by a diagram frame enclosing the Activity diagram elements. You can:

- Hide the frame by right-clicking on the diagram and selecting the **Hide Diagram Frame** context menu option
- Make the frame selectable to move or resize it, by right-clicking on it and selecting the **Selectable** context menu option
- Create Ports and Parts on the frame and create connectors between them

[Access](#) [Diagram](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.3](#) | [SysML 1.3 Activity](#)

SysML Activity Objects

Page	Item	Action
<b>SysML Activities</b>	<b>Activity</b>	Defines a SysML Block of executable behavior as a UML Activity.
	<b>Structured Activity</b>	Defines a SysML Block of executable behavior as a UML Structured Activity.
	<b>Action</b>	Declares a unit of execution in an Activity as a UML Action.
	<b>Action (call behavior)</b>	Declares a unit of execution that calls another behavior.
	<b>Action (accept event)</b>	Declares a unit of execution that accepts an event raised by the system.
	<b>Action (accept event timer)</b>	Declares a unit of execution that accepts an event raised by a time epoch.
	<b>Action (send signal)</b>	Declares a unit of execution that sends a signal as an event.
	<b>Action Pin</b>	Defines the data values passed out of and into an Action. (See also: <a href="#">Action Pin</a>  )
	<b>Partition</b>	Creates an Activity Partition to group execution elements according to the node responsible for their execution.
	<b>Control Operator</b>	Controls the execution of an Activity.
	<b>Parameter</b>	Provides access to input and output objects within the Activity.
	<b>Parameter (optional)</b>	Defines a parameter whose contents are optional in the Activity's execution.
	<b>Parameter (probability)</b>	Tags a parameter with the probability of the parameter being in use in the Activity.
	<b>Object Node</b>	Declares a variable in the Activity, typed by a ValueType, DataType or Block.

Page	Item	Action
	<b>Object Node (no buffer)</b>	Declares an ObjectNode in an Activity that discards unconsumed tokens.
	<b>Object Node (overwrite)</b>	Declares an ObjectNode in an Activity that overwrites tokens.
	<b>Central Buffer Node</b>	Declares an ObjectNode that stores tokens for consumption throughout the Activity.
	<b>Datastore</b>	Defines permanently stored data. (See also: <a href="#">Datastore</a> <sup>[1293]</sup> .)
	<b>Decision</b>	Creates a branch of control in an Activity, based on a decision.
	<b>Merge</b>	Merges two or more Activity control branches.
	<b>Synch</b>	Establishes a rendezvous point for two or more Activity flows, in order to synchronize their execution in the Activity.
	<b>Initial</b>	Declares the start of an Activity's execution.
	<b>Final</b>	Declares the end of an Activity's execution, and the termination of the Activity.
	<b>Flow Final</b>	Declares the end of an Activity's execution path without terminating the Activity.
	<b>Region</b>	Groups a subset of an Activity into a common execution context.
	<b>Exception</b>	Declares a node of execution that happens outside the normal flow of execution of an Activity.
	<b>Fork/Join</b>	Simultaneously branches / joins a set of Control or Object Flows.
<b>SysML Activity Relationships</b>	<b>Control Flow</b>	Establishes a flow of logic between two Activity nodes.
	<b>Control Flow (Continuous)</b>	Declares a continuous control flow.
	<b>Control Flow</b>	Declares a discrete control flow.

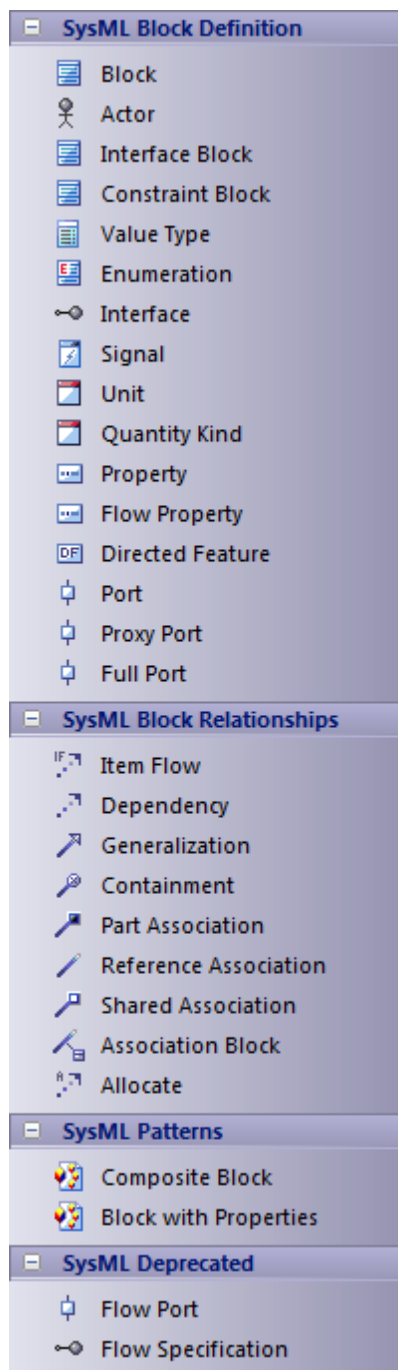

Page	Item	Action
	<b>(Discrete)</b>	
	<b>Control Flow (Probability)</b>	Tags a control flow with a probability of the likelihood of the flow's traversal.
	<b>Object Flow</b>	Establishes a flow of objects (data) between two Activity nodes.
	<b>Object Flow (Continuous)</b>	Declares a continuous object flow.
	<b>Object Flow (Discrete)</b>	Declares a discrete object flow.
	<b>Object Flow (Probability)</b>	Tags an object flow with the probability of the flow's traversal.
	<b>Interrupt Flow</b>	Declares a control flow that interrupts flow within a Region.
<b>SysML Activity Extensions</b>	<b>Enhanced Functional Flow Block Diagrams</b>	Declares an Activity used to contain an Enhanced Functional Flow Block Diagram (EFFBD).
	<b>Streaming Activity</b>	Declares an Activity where the flow of tokens passes through its parameters continuously throughout the Activity's execution.
	<b>Non-Streaming Activity</b>	Declares an Activity where the flow of tokens passes through its parameters at the start of the Activity's execution.

### 12.1.2 SysML Block Definition Toolbox

When you are constructing SysML models, you can populate the Block Definition diagrams using the icons on the SysML Block Definition pages of the Diagram Toolbox.

You can also generate **Property** elements on the Block, based on the Association relationships created for the Block element. These Properties (or Parts) are initially created in the **Project Browser**, but you can quickly render them on the **Internal Block diagram** for the Block.

[Access](#) [Diagram](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.3](#) | [SysML 1.3 Block Definition](#)

### SysML Block Definition Objects

Page	Item	Action
<b>SysML Block Definition</b>	<b>Block</b>	Defines a composite system entity in SysML.
	<b>Actor</b>	Represents a user that interacts with one or more SysML systems.

Page	Item	Action
	<b>Interface Block</b>	A specialized kind of block that has no behaviors or internal parts, which is used to type Proxy Ports (below).
	<b>Constraint Block</b>	Defines a composite constraint as a system of parametric equations.
	<b>ValueType</b>	Defines a SysML quantity, expressed as a measurable dimension with specific units.
	<b>Enumeration</b>	Defines a data type as a set of symbols or values.
	<b>Interface</b>	Defines an element that describes a specification of an interaction point with properties and methods.
	<b>Signal</b>	Defines a SysML message, containing attributes, exchanged between system blocks in an interaction.
	<b>Unit</b>	Represents a standard unit of measure in SysML.
	<b>QuantityKind</b>	Identifies a measurable quantity in SysML.
	<b>Property</b>	Describes the decomposition of a SysML Block in the context of its whole, using instances of reusable SysML Blocks.
	<b>Flow Property</b>	Creates a single kind of Flow element that can flow to or from a block.
	<b>Directed Feature</b>	<p>Generates an <b>operation</b> if dropped on a Block, or a <b>DirectedFeature</b> (Property) element if dropped on the diagram, both of which indicate that the associated Block either owns (<b>provided</b>) the feature, uses (<b>required</b>) the feature owned by another Block, or both (<b>providedrequired</b>).</p> <p>The direction value is defined in the SysML1.3 page of the element Properties dialog, or the Tagged Values page of the Operation Properties dialog.</p>
	<b>Port</b>	Describes a structural interaction point of a SysML Block, which in turn connects interacting parts of a block.
	<b>Proxy Port</b>	Exposes features of the owning Block or its internal parts.

Page	Item	Action
	<b>Full Port</b>	Specifies an element of the system separate from the owning Block or its internal parts.
<b>SysML Block Relationships</b>	<b>Item Flow</b>	Specifies the items that flow across a connector in an interaction point. Used in the same way as UML Information Flows. See <a href="#">Using Information Flows</a> <sup>[141]</sup>
	<b>Dependency</b>	Establishes a traceable relationship describing how one element is dependant upon another.
	<b>Generalization</b>	Describes an element as a specialized descendant of another element, containing additional properties and behavior.
	<b>Containment</b>	Graphically displays ownership of one element within a parent element.
	<b>Part Association</b>	Describes the characteristics of a connection between a SysML Block and its internal parts, such as the multiplicity and type.
	<b>Reference Association</b>	Describes the characteristics of a connection between separate SysML Blocks, such as the multiplicity and type.
	<b>Shared Association</b>	Describes the characteristics of a common connection between SysML Blocks, such as the multiplicity and type.
	<b>Allocate</b>	Connects model elements to formalize a refinement of behavior, structure, constraints or design expectations.
<b>SysML Patterns</b>	<b>Composite Block</b>	A pattern that creates a Composite Block, made up of Blocks related by Aggregation relationships.
	<b>Block with Parts</b>	A pattern that creates a Composite Block made up of nested parts.
<b>SysML Deprecated</b>	<b>Flow Port</b>	Describes what flows in and out of interacting SysML Blocks. See <a href="#">Show Direction on SysML 1.3 Ports</a> <sup>[2306]</sup>
	<b>Flow Specification</b>	Defines a set of flow properties that correspond to individual pieces of a common interaction point.

Page	Item	Action
		See <a href="#">Show Direction on SysML 1.3 Ports</a> <sup>[2306]</sup> .

### Learn more

- [SysML Internal Block Toolbox](#) <sup>[2308]</sup>
- [Generate Properties from Block Associations](#) <sup>[2304]</sup>
- [Block Element Compartments](#) <sup>[2305]</sup>

#### 12.1.2.1 Generate Properties From Block Associations

On a SysML Block diagram, an **Association** between two Block elements has ends that are represented by **properties**. If an Association end is navigable, the property that represents it is owned by the Block element at the other end of the Association.

In Enterprise Architect you can automatically create **Part** elements to represent these owned properties, in one of two ways:

- Create a **directed** Association (**Tools | Options | Links > select Association default = source --> target** checkbox), which generates an anonymous Part on the source Block element
- Open the source Block's internal block diagram, right-click on the diagram and select **Synchronize Structural Elements**

In both cases, the **Part** property is considered to be **bound** to the **Association End** property – they represent the same property, so changing one updates the other, either automatically or at the next synchronization; that is: if you change the Association Source Role name, multiplicity or Aggregation setting, the Part name, multiplicity and isReference setting are updated; if you change the Part details, the Association properties are updated.

If you want to **change** the binding of a Property to an Association, or bind existing Associations and Properties that are not yet bound to each other, right click on the Property in:

- The Project Browser, and select **Add | Bind to Connector Role**, or
- The Internal Block Diagram and select **Advanced | Bind to Connector Role**

In each case the Choose Connector Role to Bind dialog displays, listing the Associations issuing from the parent Block element. Select the Association to bind the Property to, and click on the **OK** button.

If you subsequently **delete** an Association that is bound to a property, when you save the diagram you are prompted to confirm whether to also **Delete** the property or **Keep** it, unbound to a connector. If the property element is locked, it cannot be deleted.

### Notes

- You can create an Association connector on a SysML Block diagram by dragging the **Reference Association** icon from the Toolbox or selecting the **Association** option from the Quick Linker arrow drop-down list
- Associations have direction when it is explicitly selected on the connector Properties, when the connector has assigned Source and Target roles, and/or when the **Association default = source --> target** checkbox is selected on the Options dialog

### 12.1.2.2 Block Element Compartments

On a **SysML Block diagram**, SysML 1.3 **Block** and **Constraint Block** elements can display any of a number of element **compartments** that list their child elements that are not already shown on the diagram. You can select to display or hide these compartments using the Feature Visibility dialog (press **Ctrl+Shift+Y** on the **element**); however, if there are no child elements corresponding to a type of compartment, that compartment is not shown.

#### SysML 1.3 Block element compartments

Compartment Name	Child Element Types Listed
<b>values</b>	Parts that are typed by a « <i>valueType</i> » element.
<b>participants</b>	Parts with the « <i>participantProperty</i> » stereotype.
<b>flow properties</b>	Parts with the « <i>flowProperty</i> » stereotype.
<b>references</b>	Parts for which the <b>isReference</b> Tagged Value is set to <b>true</b> .
<b>constraints</b>	Parts with the « <i>constraintProperty</i> » stereotype.
<b>properties</b>	Parts without a stereotype.
<b>«stereotype»</b>	Parts with stereotypes other than those identified above.
<b>flow ports</b>	Ports with the « <i>flowPort</i> » stereotype.
<b>full ports</b>	Ports with the « <i>fullPort</i> » stereotype.
<b>proxy ports</b>	Ports with the « <i>proxyPort</i> » stereotype.
<b>ports</b>	Any other Ports not listed in the previous compartments.

#### SysML 1.3 Constraint Block element compartments

Compartment Name	Child Element Types Listed
<b>constraint properties</b>	Parts with the « <i>constraintProperty</i> » stereotype.

Compartment Name	Child Element Types Listed
<b>parameters</b>	Any other types of Part.

### 12.1.2.3 Show Direction on SysML 1.3 Ports

In SysML 1.3 you can show Ports, Full Ports and Proxy Ports with arrows indicating the flow direction.

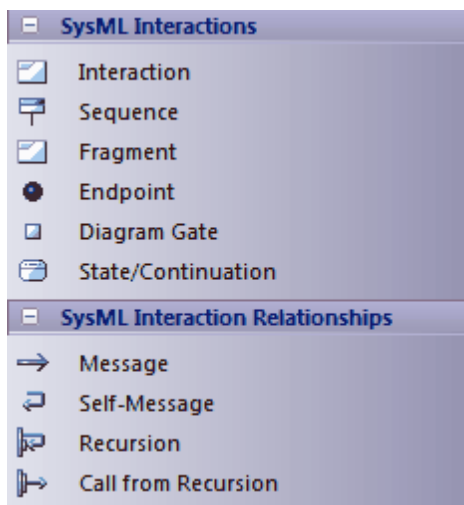

#### Create a new port with direction arrows

Step	Action	See Also
1	Create a <b>Port</b> , <b>Full Port</b> or <b>Proxy Port</b> from the <b>Block Definition</b> toolbox for SysML 1.3.	<a href="#">SysML Block Definition Toolbox</a> <sup>[2300]</sup>
2	Right-click on the Port, select <b>Advanced   Set Property Type</b> . The <b>Select &lt;Item&gt; Dialog</b> opens.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>
3	Select a <b>Block</b> or <b>Interface Block</b> that owns one or more <b>Flow Property</b> elements. Click <b>OK</b> .  The Port will automatically display arrows based upon the aggregated 'direction' Tagged Values of all the Flow Property elements owned by the Block or Interface Block that is set as the Property Type.  For example, if the Block contains an 'in' Flow Property and an 'out' Flow Property, the Port typed with this Block will display an 'inout' arrow.	

### 12.1.3 SysML Interaction Toolbox

When you are constructing SysML models, you can populate the Interaction and Sequence diagrams using the icons on the SysML Interaction pages of the Diagram Toolbox.

Access   **Diagram | Diagram Toolbox: More Tools | SysML 1.3 | SysML1.3 Interaction**

### SysML Interaction Objects

Page	Item	Action
<b>SysML Interactions</b>	<b>Interaction</b>	Defines a SysML Block of executable behavior as a UML Interaction.
	<b>Sequence</b>	References an instance of a SysML Block as a Lifeline in the Interaction.
	<b>Fragment</b>	Declares a portion of an interaction as a group with specific behavior semantics.
	<b>Endpoint</b>	Creates an exit point for the Interaction.
	<b>Diagram Gate</b>	Creates an endpoint for the interaction, which bridges between nested interactions.
	<b>State/Continuation</b>	Constrains the Interaction with assertions of the state that the lifeline is expected to be in.
<b>SysML Interactions Relationships</b>	<b>Message</b>	Describes a message exchange between two lifelines in an Interaction.
	<b>Self-Message</b>	Describes a message exchange between a lifeline and itself in an Interaction.
	<b>Recursion</b>	Describes a recursive message exchange between a lifeline and

Page	Item	Action
		itself in an Interaction.
	<b>Call from Recursion</b>	Describes a message exchange between two lifelines within a recursive exchange.

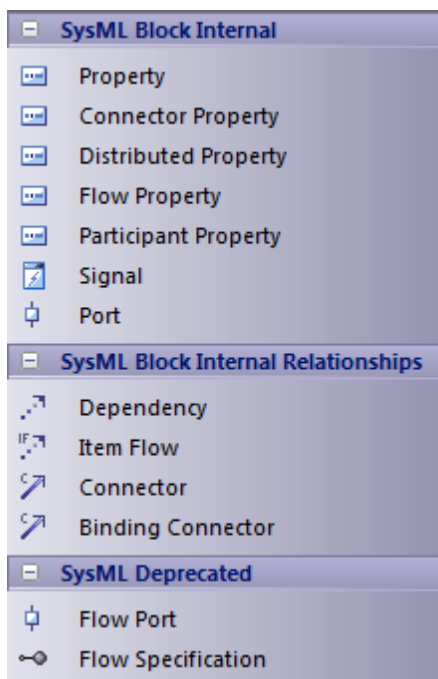

### 12.1.4 SysML Internal Block Toolbox

When you are constructing SysML models, you can populate the Internal Block diagrams using the icons on the SysML Block Internal pages of the Diagram Toolbox.

The Block that owns the Internal Block diagram is automatically represented by a diagram frame enclosing the Internal Block diagram elements. You can:

- Hide the frame by right-clicking on the diagram and selecting the **Hide Diagram Frame** context menu option
- Make the frame selectable to move or resize it, by right-clicking on it and selecting the **Selectable** context menu option
- Create Ports and Parts on the frame and create connectors between them
- Generate **Property elements** on the diagram inside the Block frame, based on the **Associations** that the **Block element** has on the **Block diagram**

**Access** [Diagram](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.3](#) | [SysML 1.3 Internal Block](#)

#### SysML Internal Block Objects

Page	Item	Action
<b>SysML Block Internal</b>	<b>Property</b>	Describes the decomposition of a SysML Block in the context of its whole using instances of reusable SysML Blocks.
	<b>Connector Property</b>	Creates an instance of an Association Block.
	<b>Distributed Property</b>	Creates a stereotype of Property, to apply a probability distribution to the values of the property.
	<b>Flow Property</b>	Creates a single kind of Flow element that can flow to or from a block.
	<b>Participant Property</b>	Creates the end of a connector owned by an Association Block.
	<b>Signal</b>	Defines a SysML message, containing attributes, exchanged between system Blocks in an interaction.
	<b>Port</b>	Describes a structural interaction point of a SysML Block which, in turn, connects between interacting parts of a block.
<b>SysML Block Internal Relationships</b>	<b>Dependency</b>	Establishes a traceable relationship describing how one element is dependant upon another.
	<b>Item Flow</b>	Specifies the items that flow across a connector in an interaction point. Used in the same way as UML Information Flows. See <a href="#">Using Information Flows</a> <sup>[141]</sup>
	<b>Connector</b>	Establishes Communication links between parts. (See also: <a href="#">Connector</a> <sup>[1402]</sup> .)
	<b>Binding Connector</b>	Establishes a connection between two parts in a system decomposition.
<b>SysML Deprecated</b>	<b>Flow Port</b>	Describes what flows in and out of interacting SysML Blocks.
	<b>Flow Specification</b>	Defines a set of flow properties that correspond to individual pieces of a common interaction point.

- [Generate Properties From Block Associations](#) <sup>[2304]</sup>

### 12.1.5 SysML Model Elements Toolbox

When you are constructing SysML models, you can populate the diagrams with Model, Package and View elements using the icons on the **SysML Model** pages of the Diagram Toolbox.

The SysML Model toolbox includes a page of **SysML Common** element and relationship icons. You can add this page to all Diagram Toolboxes so that it is always available regardless of what type of diagram you are using; to do this, set the SysML 1.3 Technology to Active (**Settings | MDG Technologies: SysML 1.3: Set Active**).

**Access**   **Diagram | Diagram Toolbox: More Tools | SysML 1.3 | SysML 1.3 Model Elements**

#### SysML Model Element Objects

Page	Item	Action
<b>SysML Model</b>	<b>Model</b>	Creates a Package containing a SysML Model.
	<b>Package</b>	Groups model constructs in a single unit of containment.
	<b>View</b>	Creates a stereotyped Package that defines a SysML View of a system, from the perspective of a SysML View Point.
	<b>View Point</b>	Creates a stereotyped Class that defines a SysML View Point, which specifies the rules and conventions for the construction and use of Views.
<b>SysML Model Relationships</b>	<b>Conform</b>	Establishes a conformance dependency of a View to the defining View Point.
	<b>Dependency</b>	Establishes a traceable relationship describing how one element is dependant upon another.
	<b>Import</b>	Represents a reuse of elements from one model package in another.
	<b>Containment</b>	Graphically displays ownership of one element within a parent one.
	<b>Realization</b>	Identifies a design fulfillment of a specification between elements.
	<b>Refine</b>	Represents a refinement of one element by another.
<b>SysML Common</b>	<b>Comment</b>	Creates a textual annotation that can be attached to a set of elements of any other type.  The attachment is created separately, using a Notelink connector.
	<b>Document Artifact</b>	Attaches a linked document to the diagram by associating this element with the document.
	<b>Problem</b>	A stereotyped Comment that documents the failure of model elements to satisfy a requirement.
	<b>Rationale</b>	A stereotyped Comment that documents the justification for decisions.

Page	Item	Action
	<b>Boundary</b>	Defines a conceptual boundary, to visually group logically related elements.
	<b>Allocate Partition</b>	A stereotyped Activity Partition that contains elements deemed to be allocated to the classifier of the partition.
	<b>Requirement</b>	Specifies the capabilities of the system, or the conditions that it should satisfy.
	<b>Allocated</b>	A stereotyped Comment that defines the source element being allocated to the target element in an Allocate relationship.
	<b>Allocate</b>	<p>A stereotyped Abstraction that relates model elements to formalize a refinement of behavior, structure, constraints or design expectations.</p> <p>The Allocate relationship points from the element being allocated to the element that is the target of the allocation.</p> <p>The system provides an Allocations search that lists all Allocate abstractions in tabular format, showing the 'To' and 'From' elements. Select <b>Edit   Find in Project   SysML 1.3   Allocations</b>.</p>
	<b>Containment</b>	Graphically displays ownership of one element within a parent one.
	<b>Dependency</b>	Establishes a traceable relationship describing how one element is dependant upon another.
	<b>Binding Connector</b>	A stereotyped Connector that establishes a connection between two parts in a system decomposition.
	<b>Item Flow</b>	<p>A stereotyped Information Flow that specifies the items that flow across a connector in an interaction point.</p> <p>See <a href="#">Using Information Flows</a> <sup>[141]</sup></p>

### 12.1.6 SysML Parametrics Toolbox

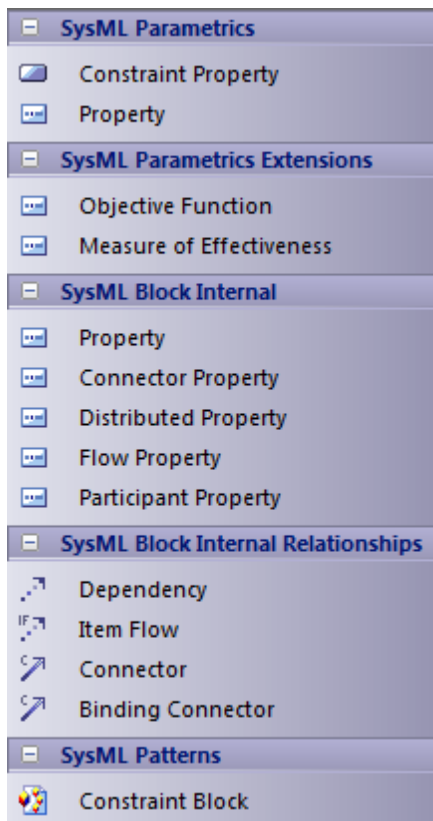

When you are constructing SysML models, you can populate the SysML Parametric diagrams with constraint blocks, using the icons on the SysML Parametrics pages of the Diagram Toolbox.

The Block that owns the Parametric diagram is automatically represented by a diagram frame enclosing the Parametric diagram elements. You can:

- Hide the frame by right-clicking on the diagram and selecting the **Hide Diagram Frame** context menu option
- Make the frame selectable to move or resize it, by right-clicking on it and selecting the **Selectable** context menu option
- Create Ports and Parts on the frame and create connectors between them

**Access**   **Diagram** | **Diagram Toolbox: More Tools** | **SysML 1.3** | **SysML 1.3 Parametrics**

### SysML Parametrics Objects

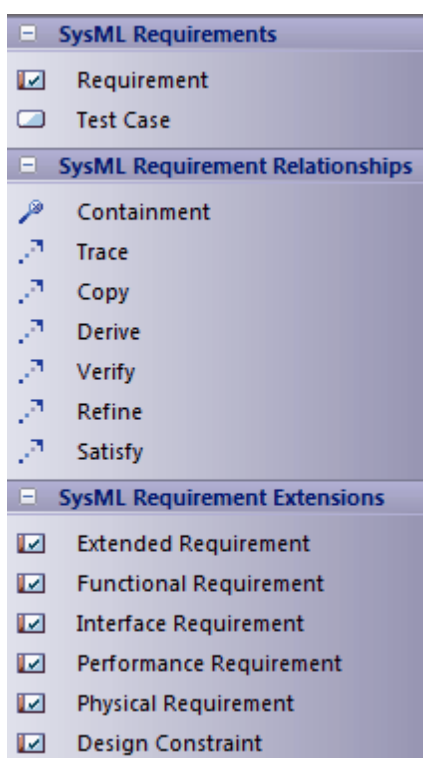

Page	Item	Action
<b>SysML Parametrics</b>	<b>Constraint Property</b>	Instantiates a Constraint Block for use in a Parametric diagram.
	<b>Property</b>	Defines a SysML property typed by a DataType, ValueType or Block.
<b>SysML Parametrics Extensions</b>	<b>Objective Function</b>	Defines a SysML Constraint Block for use as an objective function to evaluate Measures of Effectiveness (MOEs).
	<b>Measure of Effectiveness</b>	Defines a SysML property for use as a Measure of Effectiveness (MOE).

Page	Item	Action
<b>SysML Block Internal</b>	<b>Property</b>	Describes the decomposition of a SysML Block in the context of its whole using instances of reusable SysML Blocks.
	<b>Connector Property</b>	Creates an instance of an Association Block.
	<b>Distributed Property</b>	Creates a stereotype of Property, to apply a probability distribution to the values of the property.
	<b>Flow Property</b>	Creates a single kind of Flow element that can flow to or from a block.
	<b>Participant Property</b>	Creates the end of a connector owned by an Association Block.
<b>SysML Block Internal Relationships</b>	<b>Dependency</b>	Establishes a traceable relationship describing how one element is dependant upon another.
	<b>Item Flow</b>	Specifies the items that flow across a connector in an interaction point. Used in the same way as UML Information Flows. See <a href="#">Using Information Flows</a> <sup>[1411]</sup>
	<b>Connector</b>	Establishes Communication links between parts. (See also: <a href="#">Connector</a> <sup>[1402]</sup> .)
	<b>Binding Connector</b>	Establishes a connection between two Parts in a system decomposition.
<b>SysML Patterns</b>	<b>Constraint Block</b>	A pattern that creates a typical Constraint property that owns two Parts.

### 12.1.7 SysML Requirements Toolbox

When you are constructing SysML models, you can populate the Requirements diagrams using the icons on the SysML Requirements pages of the Diagram Toolbox.

[Access](#) [Diagram](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.3](#) | [SysML 1.3 Requirements](#)

### SysML Requirement Objects

Page	Item	Action
<b>SysML Requirement s</b>	<b>Requirement</b>	Specifies the capabilities of the system, or the conditions that it should satisfy.
	<b>Test Case</b>	Describes the verification of a Requirement through methods of inspection, analysis, demonstration or testing.
<b>SysML Requirement Relationships</b>	<b>Containment</b>	Graphically displays ownership of one element within a parent element.
	<b>Trace</b>	Declares a trace relationship between a SysML Requirement and another SysML element.
	<b>Copy</b>	Declares a copy of one SysML Requirement by another.
	<b>Derive</b>	Derives a SysML Requirement from another.
	<b>Verify</b>	Declares a verification of a SysML Requirement by another SysML element.

Page	Item	Action
	<b>Refine</b>	Declares a refinement of a SysML Requirement by another SysML element.
	<b>Satisfy</b>	Declares that the SysML Requirement is satisfied by another SysML element.
<b>SysML Requirement Extensions</b>	<b>Extended Requirement</b>	Extends a SysML Requirement with additional Tag properties.
	<b>Functional Requirement</b>	Declares a SysML Requirement that describes the operation, or behavior, that the system must perform.
	<b>Interface Requirement</b>	Declares a SysML Requirement that describes how the system connects, or interfaces with, other systems.
	<b>Performance Requirement</b>	Declares a SysML Requirement that describes how the system performs against defined capabilities or conditions.
	<b>Physical Requirement</b>	Declares a SysML Requirement that describes the physical characteristics, or physical constraints, of the system.
	<b>Design Requirement</b>	Declares a SysML Requirement that specifies a constraint on the implementation of the system.

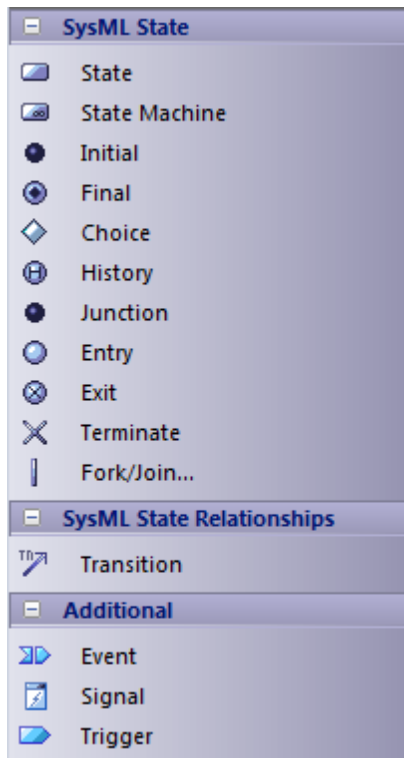

### 12.1.8 SysML State Machine Toolbox

When you are constructing SysML models, you can populate the State Machine diagrams using the icons on the SysML State Machine pages of the Diagram Toolbox.

The Block that owns the State Machine diagram is automatically represented by a diagram frame enclosing the State Machine diagram elements. You can:

- Hide the frame by right-clicking on the diagram and selecting the **Hide Diagram Frame** context menu option
- Make the frame selectable to move or resize it, by right-clicking on it and selecting the **Selectable** context menu option
- Create Ports and Parts on the frame and create connectors between them

**Access** [Diagram](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.3](#) | [SysML 1.3 State Machine](#)

### SysML State Machine Objects

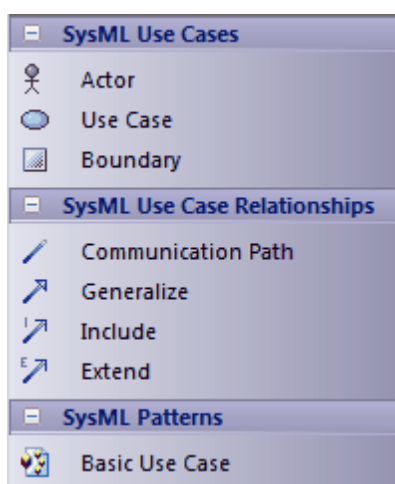

Page	Item	Action
<b>SysML State</b>	<b>State</b>	Declares a significant condition in the life of a SysML Block within its State Machine.
	<b>State Machine</b>	Describes the life-cycle behavior of a SysML Block in terms of its states and transitions.
	<b>Initial</b>	Declares the starting state of the State Machine.
	<b>Final</b>	Declares the ending state of the State Machine, and its completion.
	<b>Choice</b>	Declares a Junction with a mandatory 'else' transition.
	<b>History</b>	Represents the last active State of the State Machine prior to its interruption.
	<b>Junction</b>	Declares a decision point at which a Transition branches out into multiple guarded, alternative paths.

Page	Item	Action
	<b>Entry</b>	Declares an Entry point between State Machines, Substate Machines and Regions.
	<b>Exit</b>	Declares an Exit point between State Machines, Substate Machines and Regions.
	<b>Terminate</b>	Declares a termination State in which the State Machine no longer operates.
	<b>Fork/Join</b>	Simultaneously branches and joins a set of Transitions.
<b>SysML State Relationships</b>	<b>Transition</b>	Establishes a life-cycle path between one State and another, based on its operational conditions.
<b>Additional</b>	<b>Event</b>	Depicts the action of sending a signal.
	<b>Signal</b>	A specification of Send request instances communicated between objects.
	<b>Trigger</b>	Indicates an event that initiates an action (and might arise from completion of a previous action).

### 12.1.9 SysML Use Case Toolbox

When you are constructing SysML models, you can populate the Use Case diagrams using the icons on the SysML Use Cases pages of the Diagram Toolbox.

[Access](#) [Diagram](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.3](#) | [SysML 1.3 Use Cases](#)

### SysML Use Case Objects

Page	Item	Action
<b>SysML Use Cases</b>	<b>Actor</b>	Represents a user that interacts with one or more SysML systems.
	<b>Use Case</b>	Describes the expected functionality of a system as a UML Use Case.
	<b>Boundary</b>	Graphically binds elements in a diagram within a border.
<b>SysML Use Case Relationships</b>	<b>Communication Path</b>	Declares which Actors perform in the Use Case.
	<b>Generalize</b>	Describes an element as a specialized descendant of another element, containing additional properties and behavior.
	<b>Include</b>	Describes one Use Case as a subset of another.
	<b>Extend</b>	Describes one Use Case as an extension of another.
<b>SysML Patterns</b>	<b>Basic Use Case</b>	A pattern that creates a typical simple Use Case diagram of Actor, Use Case and System Boundary elements.

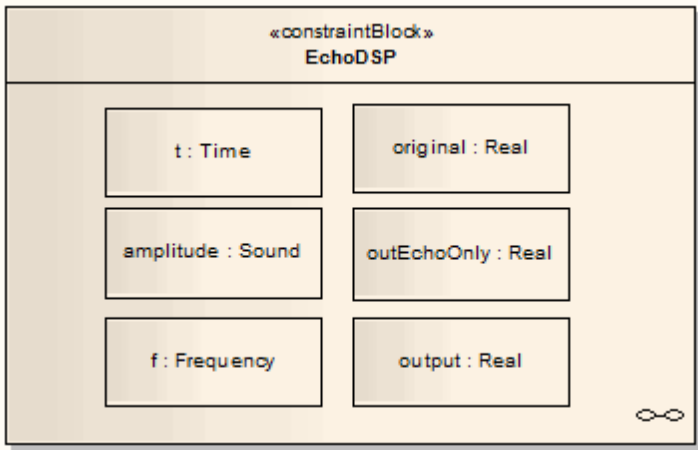

## 12.2 SysML Parametric Models

SysML Parametric models support the engineering analysis of critical system parameters, including the evaluation of key metrics such as performance, reliability and other physical characteristics.

### Topics

Topic	Detail	See also
<b>SysML Parametric Models - Concept</b>	<p>SysML Parametric Models unite requirements models with system design models by capturing executable constraints based on complex mathematical relationships.</p> <p>The following text is derived from the SysML entry in the online Wikipedia.</p> <p><i>The advantages of SysML over UML for systems engineering become obvious if you consider a concrete example, such as modeling an automotive system. With SysML you can use Parametric diagrams to precisely define performance and mechanical constraints such as maximum acceleration, curb weight, air conditioning capacity, and interior cabin noise management.</i></p> <p>For further information on the concepts of SysML Parametric models, refer to the official OMG SysML website and its linked sources.</p> <p>Enterprise Architect enables you to develop SysML Parametric models quickly and simply; these models can also be simulated.</p>	<p><a href="#">SysML</a> (Online Resource)</p> <p><a href="#">OMG SysML</a> (Online Resource)</p>

### Create a Parametric model

Step	Action	See also
1	<p>Create a collection of <i>SysML Constraint Blocks</i> that formally describe the function of a constraint in a simulation model.</p> <p>Each Constraint Block contains properties that describe its input and output parameters, as well as <i>Element Script</i> that describes the constraint's executable component.</p>  <p>The diagram shows a SysML Constraint Block named «constraintBlock» EchoDSP. It contains six properties arranged in two columns: t : Time, original : Real, amplitude : Sound, outEchoOnly : Real, f : Frequency, and output : Real. An infinity symbol is located in the bottom right corner of the block.</p>	

Step	Action	See also
2	<p>Right-click on each of the <i>constraintBlocks</i> and select the <b>SysML   Add Element Script</b> context menu option to add script to the constraint block.</p> <p>This is where you express the relationship / behavior of the constraint block as an executable script.</p>	
3	<p>Create a SysML Constraint Block to contain the Parametric model to simulate; the Parametric model contains properties and occurrences of constraint blocks as Constraint Property elements, connected in a Parametric Diagram.</p>	
4	<p>Right-click within a Parametric Diagram and select the <b>SysML   Simulate Diagram...</b> context menu option.</p>	
5	<p>Depending on your <b>configuration selections</b>, the simulation's results are either written to a comma-separated CSV file or graphed in a 2-dimensional plot.</p>	

### Notes

- Systems Modeling Language (SysML) Parametric Model Simulation is available in the Systems Engineering and Ultimate editions of Enterprise Architect

### Learn more

## 12.2.1 Simulate a SysML Model

You simulate a SysML model from a Parametric diagram, using the Simulation Configuration dialog.

**Access** [Parametric Diagram Context Menu | SysML | Simulate Diagram..](#)

### Simulate a SysML model

Step	Action	See also
1	The Parameters panel lists all of the parameters that can be assigned input. Select each of the required parameters and click on the right <b>Arrow</b> button to assign them as input.	

Step	Action	See also
	<p>Parameters designated as input parameters are listed in the Inputs panel on the right.</p> <p>There must be at least one input parameter assigned for the simulation to execute.</p>	
2	<p>Assign a set of values for each of the designated input parameters.</p> <p>For each input parameter, in the Input Values panel select one of the two possible value kinds:</p> <ul style="list-style-type: none"> <li>• <b>Discrete</b> - To enter a constant or a comma-separated range of discrete values</li> <li>• <b>Range</b> - To enter a range of values beginning at the <b>From</b> value and ending at the <b>To</b> value; the input values are incremented by the <b>Step</b> value</li> </ul>	
3	<p>Specify the classes of output value:</p> <ul style="list-style-type: none"> <li>• <b>Parameters</b> - To output the parameters' data, select the checkbox</li> <li>• <b>Variables</b> - To output the data generated within each internal variable, select the checkbox; internal variables are automatically generated by the simulator</li> </ul>	
4	<p>Specify how the simulation results are to be reported.</p> <p>The Output Format panel enables you to choose how the simulation outputs the simulation data:</p> <ul style="list-style-type: none"> <li>• <b>Plot To Graph</b>: To plot the results on a 2-dimensional graph, select the checkbox; if you select this option, you must specify an input parameter for the plot's <b>X Axis</b></li> <li>• <b>Title</b> - To enter a title for the graph, type in the title text</li> <li>• <b>Output to File</b> - To output the results to a CSV text file, select the checkbox and type or browse ( ... ) for the file name</li> </ul>	
5	Click on the <b>OK</b> button to execute the simulation.	

### Notes

- Systems Modeling Language (SysML) Parametric Model Simulation is available in the Systems Engineering and Ultimate editions of Enterprise Architect

## 12.3 A SysML Requirements Model

### Topics

Topic	Detail	See also
<b>Example</b>	<p>The SysML <i>Requirements Model</i> provides the system requirements, the expected abstract behavior and the operating constraints that the designed system must conform to.</p> <p>The following diagram shows an example requirements model for a <i>Portable Audio Player</i>.</p>  <p>In the example Requirements Model, each of the child packages contains child models that capture the following aspects of the system's requirements:</p> <ul style="list-style-type: none"> <li>• The <i>Specifications</i> package contains SysML Requirements describing the overall expectations of the designed system</li> <li>• The <i>Use Cases</i> package contains SysML Use Cases that describe the general interaction between the system and its users</li> <li>• The <i>Interactions</i> package contains SysML Interactions that describe a detailed sequence of interactions between the system and its users</li> <li>• The <i>State Machines</i> package contains SysML State Machines that describe each of the operational states the designed system has</li> <li>• The <i>Constraint Blocks</i> package contains SysML ConstraintBlocks that describe the expected performance and operating boundaries of the system</li> </ul>	

## 12.4 A SysML Operational Domain Model

### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>The SysML <i>Operational Domain Model</i> defines the system's operating environment, which describes the operating conditions that the system is intended to operate within.</p> <p>The following diagram shows an example Operational Domain model for a <i>Portable Audio Player</i>; the SysML Block Definition Diagram describes the Operational Domain (in this example - the <i>ListeningDomain</i>) as a system composition.</p>  <p>The diagram is a SysML Block Definition Diagram (bdd) titled "ListeningDomain [ListeningDomain]". It shows a composition of blocks. At the top is the "«block» ListeningDomain" block, which contains three sub-blocks: "«block» Portable Audio Player", "«block» Clothing", and "«block» Environment". The "«block» Portable Audio Player" block is connected to a "Listener" actor. The "«block» Environment" block contains two sub-blocks: "«block» Environment:: Noise" and "«block» Environment:: Weather". Two callout boxes provide additional information: one for the "«block» Portable Audio Player" stating "The SysML block which describes the design of the Portable Audio Player. Double-click on it to view the Internal Block Diagram", and another for the "«block» ListeningDomain" stating "The SysML block which describes the operating context of the Portable Audio Player. Double-click on it to view the Internal Block Diagram".</p> <p>In this example, the <i>ListeningDomain</i> is defined as a system containing other subsystems within it; the domain contains subsystems that define the Listener (i.e. User), the Portable Audio Player, Clothing (which the user wears), and the External Environment.</p> <p>Details of the <i>ListeningDomain</i> system are further detailed in the <i>ListeningDomain</i>'s Internal Block Diagram:</p>	

Topic	Detail	See also
	<div><div><div>ibd [SysML Internal Block] ListeningDomain [ListeningDomain]</div><div><p>The diagram shows an internal block definition for 'ListeningDomain'. It contains four components: a stick figure labeled ':Listener', a portable audio player labeled 'portableAudioPlayer', a black t-shirt labeled 'listenerClothing', and a landscape with a sun and clouds labeled 'weather'. The 'portableAudioPlayer' is connected to the ':Listener' and 'listenerClothing'. The 'weather' component is connected to the 'portableAudioPlayer' and 'listenerClothing'. The 'externalNoise' component is also connected to the 'portableAudioPlayer'.</p></div></div><p>In this example, the <i>ListeningDomain</i>'s system's detailed composition shows how the Portable Audio Player and other sub-systems fit together to form the Listening Domain; it also describes the binding relationships between the parts, which describe how the parts are functionally bound to one another.</p></div>	

## 12.5 Compose System Design

### Topics

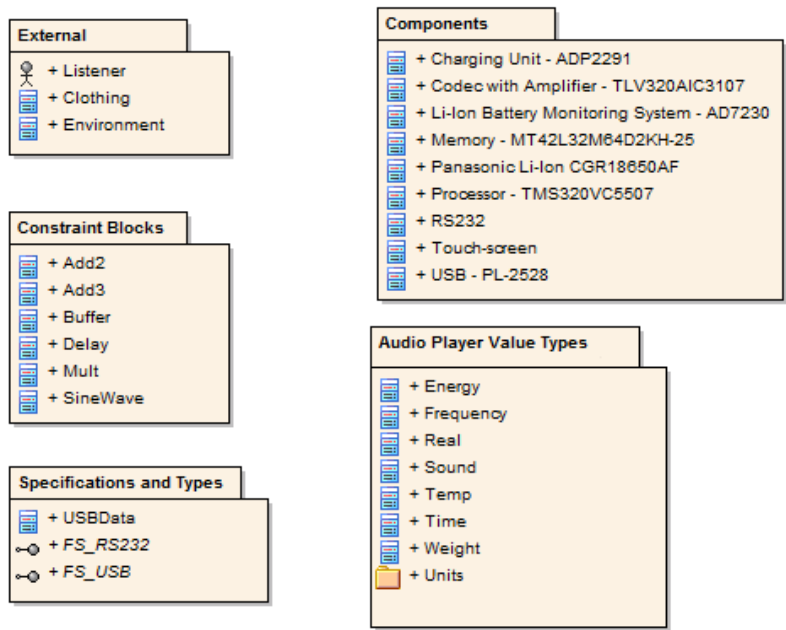

Topic	Detail	See also
<b>SysML Design Model</b>	<p>The <i>SysML Design Model</i> contains the blocks that define the system's composition; it describes the manner in which reusable subsystems fit together to fulfill the design requirements.</p> <p>The following diagram shows an example Design Model for a <i>Portable Audio Player</i>; the <i>SysML Block Definition Diagram</i> describes the <i>Portable Audio Player</i> as a composition of various reusable off-the-shelf subsystems and in-house designed ones.</p> <pre> graph TD     subgraph "bdd [SysML Block Definition] Design [Design]"         direction TB         PAA["«block» Portable Audio Player"]         PPS["«block» Portable Audio Player:: PowerSubsystem"]         PPRS["«block» Portable Audio Player:: ProcessingSubsystem"]         PUI["«block» Portable Audio Player::User Interface"]         PTS["«block» Portable Audio Player::Transport Subsystem"]                  PAA --&gt; PPS         PAA --&gt; PPRS         PAA --&gt; PUI         PAA --&gt; PTS                  PPS --&gt; BAT["«block» Panasonic Li-Ion CGR18650AF"]         PPS --&gt; CHG["«block» Charging Unit - ADP2291"]         PPS --&gt; PMON["«block» Li-Ion Battery Monitoring System - AD7230"]                  PPRS --&gt; CPU["«block» Processor - TMS320VC5507"]         PPRS --&gt; COD["«block» Codec with Amplifier - TLV320AIC3107"]         PPRS --&gt; MEM["«block» Memory - MT42L32M64D2KH-25"]                  PUI --&gt; TSC["«block» Touch-screen"]         PUI --&gt; BTN["«block» Portable Audio Player::User Interface::Buttons"]                  PTS --&gt; RST["«block» RS232"]         PTS --&gt; USB["«block» USB - PL-2528"]     end </pre> <p>In the example above, the <i>Portable Audio Player</i> is defined as a SysML system containing subsystems that perform specific tasks; the design contains subsystems for supplying power, performing playback and audio processing, interfacing with other devices and the user interface.</p> <p>Details of the <i>Portable Audio Player</i>'s composition are further described in detail within the <i>Portable Audio Player's Internal Block Diagram</i>:</p>

## 12.6 Create Reusable Subsystems

### Topics

Topic	Detail	See also
<b>SysML Design Model</b>	<p>Model Based Systems Engineering provides the flexibility and expressiveness to define complex systems quickly and effectively, by reusing common entities across design projects.</p> <p>A <i>Library</i> is a package containing many reusable subsystems, parametric constraints, common data types and common value types, dimensions and units.</p> <p>The following diagram shows an example library model:</p>  <p>The diagram illustrates a library model with five packages:</p> <ul style="list-style-type: none"> <li><b>External</b>: Contains + Listener, + Clothing, and + Environment.</li> <li><b>Components</b>: Contains + Charging Unit - ADP2291, + Codec with Amplifier - TLV320AIC3107, + Li-Ion Battery Monitoring System - AD7230, + Memory - MT42L32M64D2KH-25, + Panasonic Li-Ion CGR18650AF, + Processor - TMS320VC5507, + RS232, + Touch-screen, and + USB - PL-2528.</li> <li><b>Constraint Blocks</b>: Contains + Add2, + Add3, + Buffer, + Delay, + Mult, and + SineWave.</li> <li><b>Specifications and Types</b>: Contains + USBData, + FS_RS232, and + FS_USB.</li> <li><b>Audio Player Value Types</b>: Contains + Energy, + Frequency, + Real, + Sound, + Temp, + Time, + Weight, and + Units.</li> </ul> <p>In the example Library, each of the child packages contains child models that capture the following reusable entities:</p> <ul style="list-style-type: none"> <li><i>Blocks</i> defining systems such as those listed in the <i>Components</i> package, or those defined in the <i>External</i> package</li> <li><i>ConstraintBlocks</i> defining parametric constraints for use in parametric models.</li> <li><i>Value Types</i> describing quantities, expressed as measurable dimensions in specific units</li> <li><i>Data Types</i> and <i>Flow Specifications</i> describing data structures and <i>Flows</i></li> </ul>	

## 12.7 Migrate SysML Model to Later SysML Version

If you have created a model (or part of a model) under an older release of SysML, you can migrate it to the next release (that is, 1.1 to 1.2, or 1.2 to 1.3). using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to the later release for all elements, attributes, connectors and diagrams under the selected package or element.

### Example Script for Migrating SysML 1.1 to SysML 1.2

The following VB script calls the *Migrate()* function to migrate the SysML 1.1 package or element to SysML 1.2:

```
Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "SysML1.1", "SysML1.2"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "SysML Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "SysML Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "SysML Migration"
    End If
End Sub

Sub Main
    MigrateSelectedItem
End Sub

Main
```

### Migrate SysML 1.1 to SysML 1.3

Migrate from SysML 1.1 to SysML 1.2, as above, then migrate from SysML 1.2 to SysML 1.3, as below.

### Migrate SysML 1.2 to SysML 1.3

The MDG Technology for SysML 1.3 has a built-in script for migrating 1.2 models to 1.3. You need to enable both the MDG Technology for SysML 1.2 and the MDG Technology for SysML 1.3. Firstly, you select the SysML 1.2 package in the Project Browser, Then you open the Scripting window and open the *SysML 1.3* script group, and execute the *Migrate* script.

**Notes**

- When migrating from SysML1.1 to SysML1.2:
  - The stereotype *dimension* is changed to *quantitykind*
  - The stereotype *dataType* is removed from SysML1.2
  - The Tagged Value *dimension* is migrated to *quantitykind*; this applies to stereotypes *unit* and *valueType*
  - The Tagged Value *isConjugated* of stereotype *flowport* is migrated to custom properties

**Learn more**

**Part**

## 13 Database Engineering

Enterprise Architect supports Data Modeling on different levels of abstraction to develop the standard Conceptual, Logical and Physical models. It supports:

- Interconnecting models across the three levels
- Using MDA transforms to generate the Physical model from the Logical model
- The ability to generate schema scripts from the Physical model for loading to a DBMS
- Features for remodeling legacy systems, including Reverse Engineering an existing DBMS structure

This section describes database engineering, explaining:

- How to create a Physical Data Model
- How to import database schema, and
- How to generate DDL for the model

## 13.1 Physical Data Model

The Physical data model visually represents the structure of the data as implemented by a relational database schema.

### Topics

Topic	Detail	See also
<b>Benefit</b>	<p>In addition to providing a visual abstraction of the database structure, an important benefit of defining a Physical data model is that you can automatically derive the database schema from the model.</p> <p>This is possible due to the richness of meta-data captured by a Physical data model and its close mapping to aspects of the database schema, such as tables, columns, primary and foreign keys.</p>	<a href="#">Data Models</a> [1937]
<b>Example</b>	<p>The following is an example of a Physical data model that could be used to automatically generate a database schema.</p> <p>Each table is represented by a UML Class; columns, including Primary and Foreign Keys, are modeled using UML attributes and operations.</p>  <p>A Physical data model defined using a UML Profile and the Information Engineering notation</p>	
<b>Notation</b>	<p>The above model is defined using Enterprise Architect's <i>UML Profile for Data Modeling</i>; the relationship between the tables uses the Information Engineering notation.</p> <p>Information Engineering is one of three notations that Enterprise Architect supports to help Data Modelers distinguish cardinality in relationships.</p>	<a href="#">Data Modeling Notations</a> [2384] <a href="#">Connectors Tab</a> [831]
<b>Set Default DBMS</b>	<p>Prior to creating a Physical data model it is advisable to set the default DBMS. This pre-sets the default database when you create any new Table elements.</p> <p>If the DBMS is not set, Tables are created without a DBMS type and field typing cannot be allocated when creating new fields in the table.</p> <p>You can set the default DBMS type using either:</p> <ul style="list-style-type: none"> <li>The <b>Settings   Database Datatypes</b> menu option or</li> <li>The Code Generation Toolbar</li> </ul>	<a href="#">Add New Datatypes</a> [2350] <a href="#">Set the Database Type</a> [2347] <a href="#">Code Generation Toolbar</a> [144]

**13.1.1 Create a Data Model Diagram**

Data Modeling diagrams are extended Class diagrams, and are used for modeling the structure of a relational database. These diagrams can include Tables, Views and Procedures, and can be set to use the connector notations *UML DDL Profile*, *IDEF1X* or *Information Engineering*.

**Access** **Project Browser package context menu | Add Diagram**

Create a Data Modeling diagram

Field/Button	Action	See also
<b>Name</b>	This field defaults to the package name. If required, overwrite the default name with your preferred name.	
<b>Select From</b>	Click on <b>Extended</b> .	<a href="#">Add New Diagrams</a> <sup>[822]</sup>
<b>Diagram Types</b>	Click on <b>Data Modeling</b> .	
<b>OK</b>	Click on this button. The Diagram View displays the blank diagram, and the Data Modeling pages display in the Diagram Toolbox.	<a href="#">Data Modeling Toolbox</a> <sup>[818]</sup>

Field/Button	Action	See also
	Drag elements and connectors from the Toolbox onto your diagram, to create your data model.	

### Notes

- The new diagram connector notation defaults to **Information Engineering**; If you want to change this, display the Connectors tab of the diagram Properties dialog (**Diagram | Properties > Connectors**) and select the required option from the **Connector Notation** drop-down list

#### 13.1.1.1 Example Data Model Diagram

An example of a *Data Model* diagram is provided below, showing three tables that are linked on *primary to foreign* key pairs with associated multiplicity.

### Example

### 13.1.2 Tables and Columns

Tables and columns form the basis of Physical data models.

#### Topics

Topic	Detail	See also
<b>Rows and Columns</b>	<p>The basic structural element of a relational database is the <i>table</i>, which represents a set of records, or rows, that have the same structure.</p> <p>Each row contains one or more <i>columns</i>.</p> <p>Every individual item of data entered into a relational database is represented by a value in a column of a row in a table.</p> <p>Enterprise Architect's <i>UML Profile for Data Modeling</i> represents:</p> <ul style="list-style-type: none"> <li>Database tables as Classes with a stereotype of &lt;&lt;table&gt;&gt;</li> <li>Columns by Attributes with a stereotype of &lt;&lt;column&gt;&gt;</li> </ul>	<a href="#">Create a Table</a> <sup>2339</sup> <a href="#">Create Columns</a> <sup>2345</sup>
<b>Example</b>	A simple example of a Physical data model in Enterprise Architect is shown below. The example consists of two tables represented by UML Classes, named <i>SalesPerson</i> and <i>Customer</i> . The table	<a href="#">Add New Datatypes</a> <sup>2350</sup>

Topic	Detail	See also
	<p>stereotype is denoted by the icon in the top-right corner of each Class.</p> <p>The tables each define three columns using UML Attributes typed appropriately for the target DBMS, which happens to be MySQL.</p> <div data-bbox="432 517 1114 696"> </div> <p>A simple Data model consisting of two tables, represented by UML Classes</p>	
<b>Default DBMS</b>	<p>Prior to creating a tables in a Physical data model it is advisable to set the default DBMS. This pre-sets the default database when you create any new Table elements.</p> <p>If the DBMS is not set, Tables are created without a DBMS type and field typing cannot be allocated when creating new fields in the table.</p> <p>You can set the default DBMS type using either:</p> <ul style="list-style-type: none"> <li>The <b>Settings   Database Datatypes</b> menu option or</li> <li>The Code Generation Toolbar</li> </ul>	<a href="#">Add New Datatypes</a> <sup>[2350]</sup>
<b>Attribute/Field Mapping</b>	To help you map Class Attributes to Table fields, you can create connectors between specific attributes (features) in the Class element and the column Attributes in the Table element.	<a href="#">Connect to Element Feature</a> <sup>[1110]</sup>
<b>Model Driven Architecture</b>	Enterprise Architect can generate simple DDL scripts to create the tables in your model. You can also perform Model Driven Architecture (MDA) Transformations to DDL - Enterprise Architect provides a template specifically for DDL transformations.	<a href="#">Model Transformation</a> <sup>[2013]</sup> <a href="#">DDL Transformation</a> <sup>[2025]</sup>
<b>Primary and Foreign Keys</b>	Primary Key and Foreign Key information modeling is considered in later topics.	<a href="#">Primary and Foreign Keys</a> <sup>[2354]</sup>

### 13.1.2.1 Create a Table

Fundamental to data modeling is the creation of Tables within the model.

#### Add a Table to your data model

Step	Action	See also
1	Create and/or open a Data Modeling diagram.	<a href="#">Create a Data Model Diagram</a> <sup>[2336]</sup>
2	Click on the <i>Table</i> element in the Diagram Toolbox, then click on the diagram. The Table element is displayed on the diagram.	<a href="#">Data Modeling Toolbox</a> <sup>[818]</sup>
3	Use the Table Properties dialog to set the table name and other properties as required.	<a href="#">Working with Table Properties</a> <sup>[2340]</sup>
4	Use the Quicklinker to add related Table elements.	<a href="#">The Quick Linker</a> <sup>[896]</sup>

#### Learn more

- [Working with Table Properties](#) <sup>[2340]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Database Engineering | Physical Data Model | Create Table**

#### **13.1.2.1.1 Working with Table Properties**

Once you have created a table, you must set its properties to define database-specific information that can be used to generate the schema in DDL. Table properties are set using the Properties dialog.

It is recommended that you set the DBMS you are using as a *default*, to automatically apply that DBMS definition to all tables you create. However, if you do not set a default, or want to change the value for specific tables for any reason, you can also identify the DBMS on the Table Properties dialog for each Table.

For MySQL and Oracle, some additional properties are defined using Tagged Values, such as the Table Owner and DBMS-specific options. For other DBMSs, additional table properties are not yet supported.

#### Topics

Topic	Link
<p><b>Set the Database type for a table</b> - other than the table name, the most important property to set for a table is the database type, which defines:</p> <ul style="list-style-type: none"> <li>• The list of data types that are available for defining columns, and</li> <li>• Which dialect of DDL is generated</li> </ul> <p>You can either set the DBMS as a default for all tables, or within the Table Properties for each individual Table.</p>	<p><a href="#">Add New Datatypes</a> <sup>[2350]</sup></p> <p><a href="#">Set the Database Type</a> <sup>[2341]</sup></p>

Topic	Link
<b>Set the Table Owner</b> - Some relational databases enable you to assign a table to one of several owners within the database; Enterprise Architect enables you to model this using the <i>Owner</i> Tagged Value, so that in the generated DDL script the table name is prefixed by the owner name.	<a href="#">Set Table Owner/Schema</a> <sup>[2342]</sup>
<b>Example MySQL options</b> - To make use of foreign keys in MySQL, you must declare the table type as InnoDB.	<a href="#">Set MySQL Options</a> <sup>[2342]</sup>
<b>Example Oracle options</b> - To set additional Oracle table properties, use the table's Tagged Values.	<a href="#">Set Oracle Table Properties</a> <sup>[2343]</sup>

Once the table properties are defined, you are ready to add columns.

#### Learn more

- [Create Columns](#) <sup>[2345]</sup>

#### 13.1.2.1.1.1 *Set the Database Type*

The most important property to set for a table (after its name) is the database type. This defines the list of data types that are available for defining columns, and also declares which dialect of DDL is generated.

If this is not set, tables are created without a DBMS type and field typing cannot be allocated when creating new fields in the table.

You can set the database type to default to the required DBMS. However, if you have not set a default or want to change the value for specific tables, you can set the DBMS for each table individually.

**Access** **Table element | Element | Properties | General**

#### Reference

Field/Button	Action	See also
<b>Database</b>	Click on the drop-down button and select the required database type from the list.	
<b>Apply</b>	Save your changes.	
<b>OK</b>		

#### Learn more

- [Add New Datatypes](#) <sup>[2350]</sup> (to set *default* DBMS)

- [Code Generation Toolbar](#)<sup>[144]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Database Engineering | Physical Data Model | DBMS Datatypes**

#### **13.1.2.1.1.2 Set Table Owner/Schema**

Some relational databases enable you to assign a table to one of several schemas (or *owners*) within the same database. Enterprise Architect enables you to model this information using the *Owner* Tagged Value. By setting this optional value, you can tailor the generated DDL script, causing the table name to be prefixed by its assigned owner name.

#### How to

To set the table owner Tagged Value

Step	Action	See also
1	Add a Tagged Value named <i>Owner</i> , to the Table element.	<a href="#">How to Add a Tagged Value</a> <sup>[1137]</sup>
2	Type the owner name for this table in the <b>Value</b> field of the Tagged Value.  Changes are automatically saved.	

#### Notes

- For a PostgreSQL database, you should instead create a Tagged Value named OWNER TO with the corresponding value

#### **13.1.2.1.1.3 Set MySQL Options**

To make use of foreign keys in MySQL, you must declare the table type as InnoDB.

#### How to

To declare the table type as InnoDB

Step	Action	See also
1	Add a Tagged Value named <b>Type</b> to the table.	<a href="#">How to Add a Tagged Value</a> <sup>[1137]</sup>
2	Set the <b>Value</b> field to <b>InnoDB</b> .	

When you generate DDL for this table, the table type is included in the SQL script.

To allow for later versions of MySQL, additional table options that can be added in the same manner include:

Tag	Value (Example)
ENGINE	InnoDB
CHARACTER SET	latin1
CHARSET	latin1
COLLATE	latin1_german2_ci

#### 13.1.2.1.1.4 Set Oracle Table Properties

To set additional Oracle table properties, you use the table's Tagged Values

##### How to

Step	Action	See also
1	Add one or more Tagged Values to the table, using the names provided in the <b>Property/Tag</b> column of the reference table below.	<a href="#">How to Add a Tagged Value</a> <sup>[1137]</sup>
2	Specify the appropriate value for each tag. Examples are provided in the <b>Value</b> column of the reference table below.	

The same properties can be added to indexes and constraints, by highlighting the index or constraint Operation and adding the appropriate Tagged Values.

##### Reference

Property/Tag	Value
<b>BUFFER_POOL</b>	DEFAULT

### 13.1.2.2 Create Columns

Columns are represented in the UML Data Modeling Profile as a stereotyped attribute; that is, an attribute with the *Column* stereotype.

#### Create columns in a table

Step	Action	See also															
1	Right-click on the required Table in a diagram, and select the <b>Attributes</b> context menu option.  The Attributes dialog displays, showing the columns of the selected Table.																
2	In the <b>Name</b> field, type the column name.																
3	In the <b>Data Type</b> field, click on the drop-down arrow and select the data type (ensure the Table's target database is set first; this populates the <b>Data Type</b> drop-down list).  Click on the <b>Save</b> button.	<a href="#">Set the Database Type</a> <sup>[2341]</sup>  <a href="#">Oracle Data Types</a> <sup>[2352]</sup>															
4	Complete the required optional fields, listed in the reference table below.																
5	Click on the <b>Column Properties</b> button.  The Database Columns Properties dialog displays.  Supported column properties are identified below; it is assumed that you understand which data types these properties apply to:																
<table> <tr> <th>Property</th><th>DBMS</th><th>Notes</th></tr> <tr> <td><b>Autonum</b></td><td>Oracle MySQL SQL Server DB2 PostgreSQL Sybase ASA Sybase ASE</td><td>If you require a sequence, select the Autonum value to <b>True</b> and, if necessary, define the start increment</td></tr> <tr> <td><b>Zerofill</b></td><td>MySQL</td><td></td></tr> <tr> <td><b>Unsigned</b></td><td>MySQL</td><td></td></tr> <tr> <td><b>LengthType</b></td><td>Oracle</td><td>Character semantics</td></tr> </table>			Property	DBMS	Notes	<b>Autonum</b>	Oracle MySQL SQL Server DB2 PostgreSQL Sybase ASA Sybase ASE	If you require a sequence, select the Autonum value to <b>True</b> and, if necessary, define the start increment	<b>Zerofill</b>	MySQL		<b>Unsigned</b>	MySQL		<b>LengthType</b>	Oracle	Character semantics
Property	DBMS	Notes															
<b>Autonum</b>	Oracle MySQL SQL Server DB2 PostgreSQL Sybase ASA Sybase ASE	If you require a sequence, select the Autonum value to <b>True</b> and, if necessary, define the start increment															
<b>Zerofill</b>	MySQL																
<b>Unsigned</b>	MySQL																
<b>LengthType</b>	Oracle	Character semantics															

Step	Action	See also
6	Click on the <b>OK</b> button to return to the Attributes dialog, and then click on the <b>Save</b> button.	
7	Click on the: <ul style="list-style-type: none"> <li>• <b>New</b> button to define another column or</li> <li>• <b>Close</b> button to exit from the dialog</li> </ul>	

### Options

Field/Option/ Button	Description	See also
<b>Primary Key</b>	Indicates whether the column is the primary key for this table.	<a href="#">Primary Key</a> 
<b>Not Null</b>	Indicates whether empty values are forbidden for this column.	
<b>Participates in Unique</b>	Indicates whether the column participates in any Unique constraints.  A Unique constraint can be applied to either a single column or multiple columns. When a Unique constraint is applied to: <ul style="list-style-type: none"> <li>• A single column, each row in the table must have a unique value</li> <li>• Multiple columns, the combination of all columns involved must be unique in each record</li> </ul>	
<b>Initial</b>	A value that can be used as a default value for this column, if required.	
<b>Access</b>	Determines the column's scope ( <b>Private</b> , <b>Protected</b> or <b>Public</b> ). The default value is <b>Public</b> .	
<b>Alias</b>	An alternative name for the field for display and documentation purposes.	
<b>Notes</b>	Additional information necessary to document the column. You can format the text using the Notes toolbar at the top of the field.	

### Notes

- For MySQL, before creating columns you must first add ENUM and SET datatypes

- [MySQL Data Types](#) <sup>[2352]</sup>
- [Options - Code Editors](#) <sup>[2250]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Database Engineering | Physical Data Model | Add Column**

### 13.1.2.2.1 Reorder Columns

You can change the order in which columns are listed in a table, to define the order in which columns appear in the generated DDL that defines your database schema.

#### Change the column order

Step	Action	See also
1	In the Columns dialog, highlight a column name in the Columns panel.	
2	Click on the: <ul style="list-style-type: none"> <li> button to move the column up one position</li> <li> button to move the column down one position</li> </ul>	

### 13.1.3 Manage DBMS Settings

Using the Manage DBMS Options dialog, you can change the owner of a selected table or all of the tables in a package. With the same dialog, you can add an index on the columns participating in a Foreign Key, provided that those columns are not already indexed.

Access **Project Browser Package context menu | Code Engineering | Reset DBMS Options**

#### Change Table Owner

Field/Button	Action	See also
<b>Change Table Owner</b>	Select this checkbox.	
<b>Current Owner</b>	Click on the drop-down arrow and select either:	

Field/Button	Action	See also
	<ul style="list-style-type: none"> <li>The current owner to change, or</li> <li><b>&lt;All&gt;</b> to change the ownership of all tables in the package to the name you type in the <b>New Owner</b> field</li> </ul>	
<b>New Owner</b>	Type the name of the new table owner.	
<b>Process Child Packages</b>	If there are child packages that also require changing, select the checkbox.	
<b>OK</b>	Click on this button to change the ownership of the selected Table, or all Tables in the selected packages that have the specified current owner.	

#### Create Indexes for Foreign Keys

Field/Button	Action	See also
<b>Create Indexes on Foreign Keys</b>	Select this checkbox to create an index on all Foreign Keys (if one does not already exist).	
<b>Process Child Packages</b>	If there are child packages that also require changing, select the checkbox.	
<b>OK</b>	Click on this button to create the Foreign Key indexes.	

#### Notes

- Existing data models may not contain indexes on Foreign Key columns

#### Learn more

- [Define a Foreign Key Name Template](#)  <sup>[2362]</sup>
- [Define a Foreign Key Index Template](#)  <sup>[2363]</sup>

### 13.1.4 Data Types

Each column that you define in your data model has a data type that is appropriate to the information being stored by that column.

Enterprise Architect contains definitions of the core datatypes for a number of standard DBMS products. However, data types vary from one DBMS product to another, and they also vary between versions of a given database product. Therefore Enterprise Architect provides you with tools to:

- Define new data types for a new version of your DBMS product
- Define data types for a new, non-standard database product
- Automatically convert data types from one defined DBMS product to another
- Define how the automatic conversion should proceed from or to a non-standard DBMS product.

#### Learn more

- [Supported Databases](#) <sup>[2375]</sup>
- [DBMS Product Conversion for a Package](#) <sup>[2349]</sup>
- [Data Type Conversion For a Table](#) <sup>[2350]</sup>
- [Add New Datatypes](#) <sup>[2350]</sup>
- [Map Data Types Between DBMS Products](#) <sup>[2353]</sup>

#### **13.1.4.1 DBMS Product Conversion for a Package**

Using the DBMS Package mapper, you can automatically convert a package of database tables from one supported DBMS type to another supported DBMS type. You can also change the DBMS type for individual tables.

If one of the DBMS types is non-standard or otherwise not supported by Enterprise Architect, you should ensure that the mapping of datatypes from one DBMS type to the other has been defined.

**Access** [Project Browser Package context menu](#) | [Code Engineering](#) | [Reset DBMS Options](#)

#### Map the DBMS data types of a package to the data types of another DBMS

Field/Button	Action	See also
<b>Convert DBMS Type</b>	Select the checkbox.	
<b>Current DBMS</b>	Click on the drop-down arrow and select the current DBMS.	
<b>New DBMS</b>	Click on the drop-down arrow and select the target DBMS.	
<b>Process Child Packages</b>	If there are child packages that also require changing, select the checkbox.	
<b>OK</b>	Click on this button to map all tables in the selected packages to the new DBMS.	

#### Learn more

- [Data Type Conversion For a Table](#) <sup>[2350]</sup>
- [Map Data Types Between DBMS Products](#) <sup>[2353]</sup>
- [Manage DBMS Settings](#) <sup>[2347]</sup>

### 13.1.4.2 Data Type Conversion For a Table

Once a database schema has been set up on an Enterprise Architect diagram (either by importing through ODBC or manually setting up the tables), the DBMS can be changed to another type and the column datatypes are mapped accordingly.

You might follow this procedure if you have copied a small number of tables into the project from elsewhere, but if you have many tables you can also convert all of them at once within their parent package.

If one of the DBMS types is non-standard or otherwise not supported by Enterprise Architect, you should ensure that the mapping of datatypes from one DBMS type to the other has been defined.

#### Map the DBMS type of a table to another DBMS type

Step	Action	See also
1	Double-click on the Table element in a diagram.  The Table Properties dialog displays, with the <b>Database</b> field showing the current DBMS for this table.	
2	To map the datatypes to another DBMS, click on the <b>Database</b> drop-down arrow and select the target DBMS.	
3	Click on the <b>Apply</b> button.  The datatypes are converted to match those of the new DBMS, and these are reflected in any DDL generated from this table.	

#### Learn more

- [DBMS Product Conversion for a Package](#)  <sup>2349</sup>
- [Map Data Types Between DBMS Products](#)  <sup>2353</sup>

### 13.1.4.3 Add New Datatypes

Using Enterprise Architect's Database Datatypes dialog, you can add to the set of data types that are available for a particular DBMS.

#### Access **Settings | Database Datatypes**

#### Use to

- Identify the DBMS in use and, if required, set this as the model default
- Include any new datatypes that are supported by later versions of the DBMS and not yet included with Enterprise Architect
- Remove any datatypes that are no longer relevant
- Add a new DBMS product and its built-in data types if, for example, you want to create a physical data model for a DBMS product that is not yet supported natively by Enterprise Architect

- Change the DBMS in use and begin to map the datatypes to the new DBMS

### Reference

Use the Database Datatypes dialog to add a new datatype to a DBMS product, as described below:

Field/Button	Action	See also
<b>Product Name</b>	Click on the drop-down arrow and select an existing DBMS.	
<b>Add Product</b>	If your DBMS is not listed, click on this button to add it. An Input prompt displays, in which you type the DBMS name; click on the <b>OK</b> button to add the name to the drop-down list.	
<b>Set as Default</b>	Select the checkbox to set the selected DBMS as the default for your database engineering and modeling.  Once you set the default database, when you create any new Table element the Database type is automatically pre-set to this default.  You can also set the default database type through the Code Generation Toolbar.	<a href="#">Physical Data Model</a> <sup>[2335]</sup>  <a href="#">Code Generation Toolbar</a> <sup>[144]</sup>
<b>Datatype</b>	Type a name for the data type.	
<b>Size</b>	Select the appropriate radio button and, if appropriate, specify the default and maximum values.	
<b>Common Type</b>	Click on the drop-down arrow and select a common type to which your data type applies.	
<b>Save</b>	Click on the button to create your data type and add it to the <b>Defined Datatypes for Databases</b> list.	
<b>Delete</b>	Select a data type in the <b>Defined Datatypes for Databases</b> list and click on this button to remove the data type.	
<b>Datatype Map</b>	If you have changed the DBMS or technology for which you have defined the data types from or to an unsupported DBMS type, click on this button to define how to automatically remap the data types to your new DBMS or technology.	<a href="#">Map Data Types Between DBMS Products</a> <sup>[2353]</sup>

You can transport these data types between models as Enterprise Architect Reference Data.

Learn more

- [Add MySQL Data Types](#) <sup>[2352]</sup>
- [Customize Oracle Data Types](#) <sup>[2352]</sup>
- [Export Data Types as Reference Data](#) <sup>[376]</sup>
- [Import Data Types as Reference Data](#) <sup>[380]</sup>

Learning Center topics

- (Alt+F1) | **Enterprise Architect | Database Engineering | Physical Data Model | Data Type Map**

**13.1.4.3.1 MySQL Data Types**

MySQL supports the **ENUM** and **SET** data types, which must be added to your Enterprise Architect model before you can use them as the types for columns.

Access   **Settings | Database Datatypes**

How to

To add the ENUM and SET data types for MySQL

Step	Action	See also
<b>1</b>	Select the <b>Database Datatypes</b> menu option. The Database Datatypes dialog displays.	
<b>2</b>	In the <b>Product Name</b> field select <b>MySQL</b> .	
<b>3</b>	Add the data types <b>ENUM</b> and <b>SET</b> .	

When using these data types later in a Column's **Initial** field, type the values as a comma-separated list, in the format:

*('one','two','three')*

If one value is the default, use the format:

*('one','two','three') default 'three'*

**13.1.4.3.2 Oracle Data Types**

The Oracle data types **NUMBER** and **VARCHAR** have additional properties that you can model.

Reference

Data Type	Detail	See also
<b>NUMBER</b>	<p>The <b>NUMBER</b> data type requires precision and scale properties.</p> <p>The <b>Precision</b> and <b>Scale</b> fields are displayed on the Attributes dialog when the data type is set to <b>NUMBER</b>; if you enter information into these fields, it is displayed on your diagrams.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>create NUMBER by setting Precision = <b>0</b> and Scale = <b>0</b></li> <li>create NUMBER(8) by setting Precision = <b>8</b> and Scale = <b>0</b></li> <li>create NUMBER(8,2) by setting Precision = <b>8</b> and Scale = <b>2</b></li> </ul>	
<b>VARCHAR</b>	<p>Oracle <b>VARCHAR2(15 CHAR)</b> and <b>VARCHAR2(50 BYTE)</b> data types can be created by adding the Tagged Value <b>LengthType</b> with the value <b>CHAR</b> or <b>BYTE</b>.</p>	

#### Learn more

- [How to Add a Tagged Value](#) 

### 13.1.4.4 Map Data Types Between DBMS Products

One of the advantages of using visual physical data models to hide implementation details is that you can more easily change the target technology or platform when required.

After reverse engineering your database into a physical data model, you must remap the data types before generating the schema for the new DBMS product. Enterprise Architect provides a set of default mappings for standard, supported DBMS products, to help you automate the conversion process.

However, you might want to customize the default mappings to suit your specific project requirements, or where the mapping of one data type to another is not currently defined. For example, in your migration from one DBMS platform to another, one of the platforms might be non-standard or otherwise not supported by Enterprise Architect.

**Access**    **Settings | Database Datatypes: Datatype Map**

#### Use to

- Streamline conversion of one implementation-specific database product to another
- Map data types from one DBMS product to another
- Maximize portability of your database designs
- Customize default mappings

#### Reference

On the Database Datatypes Mapping dialog, map the data types between databases as indicated below:

Field/Button	Action	See also
<b>From Product Name</b>	Click on the drop-down arrow and select the DBMS product to map data types from.	

Field/Button	Action	See also
<b>Defined Datatypes for Databases</b>	Displays all the defined data types for the product and, where appropriate, their sizes and values.  Click on the data type to map - this must have a defined size unit and value.  The <b>Datatype</b> and <b>Common Type</b> fields under the <b>From Product Name</b> field display this data type.	
<b>To Product Name</b>	Click on the drop-down arrow and select the DBMS product to map data types to.  The <b>Datatype</b> and <b>Common Type</b> fields under this field display the values corresponding to those in the fields for the 'From' product.	
<b>Size</b>	Click on the radio button for the appropriate size unit and type the default values in the corresponding data fields.	
<b>Save</b>	Click on this button to save the mapping.	

Repeat this process for all the data types to map.

Once you are satisfied with the data type mappings, you can convert either individual tables or an entire package of tables to the new target DBMS product.

### 13.1.5 Database Keys

Two types of key are used to access tables in a relational database: *Primary Keys* and *Foreign Keys*.

- A Primary Key uniquely identifies a record in a table
- A Foreign Key accesses data in some other related table via its Primary Key

#### Topics

Topic	Detail	See also
<b>General Usage</b>	In Enterprise Architect, Primary Keys and Foreign Keys are represented by stereotyped UML attributes and operations.	

Topic	Detail	See also
<b>Example</b>	<p>The following example shows a data model that includes both Primary Key and Foreign Key columns.</p> <p>A Physical data model defined using a UML Profile that includes Primary and Foreign Keys</p>	
<b>Primary Key</b>	In each table, one of the columns is designated as the Primary Key, indicated by the <i>PK</i> label beside the column, and a corresponding Primary Key Operation.	<a href="#">Primary Key</a> <sup>[2355]</sup>
<b>Foreign Keys</b>	Foreign Keys are shown denoted by the <i>FK</i> labels.	<a href="#">Foreign Key</a> <sup>[2355]</sup>
<b>Association Notation</b>	<p>The Association that defines a Foreign Key relationship between <i>SalesPerson</i> and <i>Customer</i> uses the <b>Information Engineering</b> notation; this is one of three notations that Enterprise Architect supports to help Data Modelers distinguish cardinality in relationships.</p> <p>Enterprise Architect also supports:</p> <ul style="list-style-type: none"> <li>• IDEF1X notation</li> <li>• UML notation</li> </ul>	<a href="#">Data Modeling Notations</a> <sup>[2354]</sup>

#### Learn more

- [Primary Keys](#)<sup>[2355]</sup>
- [Foreign Keys](#)<sup>[2355]</sup>

### 13.1.5.1 Primary Key

A Primary Key uniquely identifies a record in a table and can consist of one or more columns. In Enterprise Architect, a:

- **Simple** Primary Key (single column) is defined as the **attribute** of a stereotyped operation
- **Complex** Primary Key (several columns) is defined as the **stereotyped operation** itself; for example, a column *LastName* might not be unique within a table, so a Primary Key is created from the *LastName*, *FirstName* and *DateOfBirth* columns
- **SQL Server** Primary Key **Fill Factor** is defined as the **Tagged Value FILLFACTOR** with a numerical value, within the Primary Key operation

Learn more

- [Create a Primary Key](#)<sup>[2356]</sup>
- [Indexes](#)<sup>[2365]</sup>
- [Define a Primary Key Name Template](#)<sup>[2357]</sup>

Learning Center topics

- (Alt+F1) | [Enterprise Architect](#) | [Database Engineering](#) | [Physical Data Model](#) | [Add Primary Key](#)

**13.1.5.1.1 Create a Primary Key**How to

To define a simple Primary Key consisting of a single column

Step	Action	See also
1	Right-click on the table in a diagram and select the <b>Attributes</b> context menu option.  The Attributes dialog displays.	
2	Select the column that makes up the Primary Key.	
3	Select the <b>Primary Key</b> checkbox and click on the <b>Save</b> button.  A stereotyped operation is automatically created; it is this operation that defines the Primary Key for the table.  To remove a Primary Key, simply delete this operation.	

To define a complex Primary Key, consisting of more than one column

Step	Action	See also
1	Follow the steps above to create a Simple Primary Key; it doesn't matter which column you choose.	
2	Right-click on the table in a diagram and select the <b>Operations</b> context menu option.  The Operations dialog displays.	
3	Select the Primary Key operation (its name begins with <b>PK_</b> ) and then click on the <b>Column</b> tab.	

Step	Action	See also
4	Click on the <b>New</b> button to add a column to the Primary Key, select a column from the <b>Column Name</b> list box, and then click on the <b>Save</b> button.	
5	Click on the <b>Hand</b> buttons (up and down arrow) to change the order of columns in the Primary Key, if necessary.	

#### Learn more

- [Creating Non-Clustered Primary Keys for SQL Server](#)<sup>[2358]</sup>

#### 13.1.5.1.2 Define a Primary Key Name Template

If you have specific modeling conventions that stipulate how Primary Keys are documented, you can customize the way in which Primary Keys are named by default. By changing the **Primary Key Name Template**, you adjust the name that the system assigns to the UML Operation representing the Primary Key.

Access   **Tools | Options | Source Code Engineering | Code Editors: DDL Name Templates**

#### Define the name template for a Primary Key

Step	Action	See also
1	Click on the <b>DDL Name Templates</b> button. The DDL Name Template dialog displays, showing the default name templates.	
2	Edit or replace the template in the <b>Primary Key Name</b> field. For example, if you want to display the Primary Key description as <i>PK_tablename_columnname</i> then change the <b>Primary Key Name</b> field to <i>PK_%tablename%_%columnname%.</i>	
3	Click on the <b>Save</b> button.	

### 13.1.5.1.3 SQL Server Non Clustered Keys

When you create a primary key in SQL Server, it is created with a 'clustered index' by default. Therefore when you model a primary key for SQL Server in an Enterprise Architect data model, the corresponding DDL creates a clustered index for that primary key by default.

Clustered indexes provide improved performance for accessing the column(s) involved, but only one clustered index is allowed per table.

In some situations, you might be more interested in the performance of columns other than the Primary Key, and therefore must change the default assignment of the clustered index. Enterprise Architect allows you to model this.

#### How to

To define a Primary Key as non-clustered for a SQL Server table

Step	Action	See also
1	Right-click on the table in a diagram and select the <b>Operations</b> context menu option. The Table Operations dialog displays.	
2	Highlight the Primary Key Operation and click on the <b>Extended Properties</b> button. The Database Operation Properties dialog displays.	
3	Select the <b>SQL Server Non Clustered Primary Key</b> checkbox.	
4	Click on the <b>Save &amp; Close</b> button.	

Subsequently, you can model an index for that table and define it as clustered instead.

#### Learn more

- [Indexes](#) 

### 13.1.5.2 Foreign Key

A Foreign Key consists of a collection of columns (UML Attributes) that together have some operational meaning - they enforce a relationship to access data in a related table via its Primary Key.

Foreign keys are modeled in Enterprise Architect as operations with the stereotype **FK**. The operation's parameters become the columns involved in the key.

It is not necessary to define a Foreign Key **just** to access another table through its Primary Key. Foreign Keys are a feature of some database management systems, providing 'extras' such as referential integrity checking that prevents the deletion of a record if its Primary Key value exists in some other table's Foreign Key. The same thing can be achieved programmatically.

Learn more

- [Create a Foreign Key](#)<sup>[2359]</sup>
- [Composite Foreign Key](#)<sup>[2361]</sup>

**13.1.5.2.1 Create a Foreign Key**Create a Foreign Key

Step	Action	See also
1	Locate the required Tables in a diagram. Both tables must have <b>defined database types</b> .	<a href="#">Set The Database Type</a> <sup>[2341]</sup>
2	Select an <i>Associate</i> connector in the Class Relationships page of the Toolbox.	
3	Click on the Table to contain the Foreign Key (source) and draw the connector to the target Table.	
4	Right-click on the connector and select the <b>Foreign Keys</b> context menu option. The Foreign Key Constraint dialog displays.	
5	The default foreign key name is set by the Foreign Key Name Template. To change the name to something other than the default provided by the template, select the <b>Override Template</b> checkbox and edit the foreign key name. Optionally, you can create a Foreign Key Index automatically using the <b>Create Index on Foreign Key</b> field. You can control the name of the automatically generated Foreign Key Index by setting the template.	<a href="#">Define Foreign Key Name Template</a> <sup>[2362]</sup>  <a href="#">Define Foreign Key Index template</a> <sup>[2363]</sup>
6	In the <b>Source:</b> panel and the <b>Target:</b> panel, click on the name of each of the two columns involved in the Foreign Key relationship.	
7	From the <b>On Delete</b> and/or <b>On Update</b> combo boxes, select the appropriate referential integrity constraint.	
8	Click on the <b>Apply</b> or <b>OK</b> buttons to automatically generate the Foreign Key	

Step	Action	See also
	operations.	

### Example

This example shows what a Foreign Key looks like in a diagram:

### Notes

- For MySQL databases, Foreign Keys are supported for InnoDB tables only

InnoDB is the default MySQL storage engine as of version 5.5; if you are modeling a MySQL database that is earlier than version 5.5 and you want to use Foreign Keys, you must set the **Engine** Tagged Value to **InnoDB**

#### Learn more

- [Set MySQL Options](#) <sup>[2342]</sup>

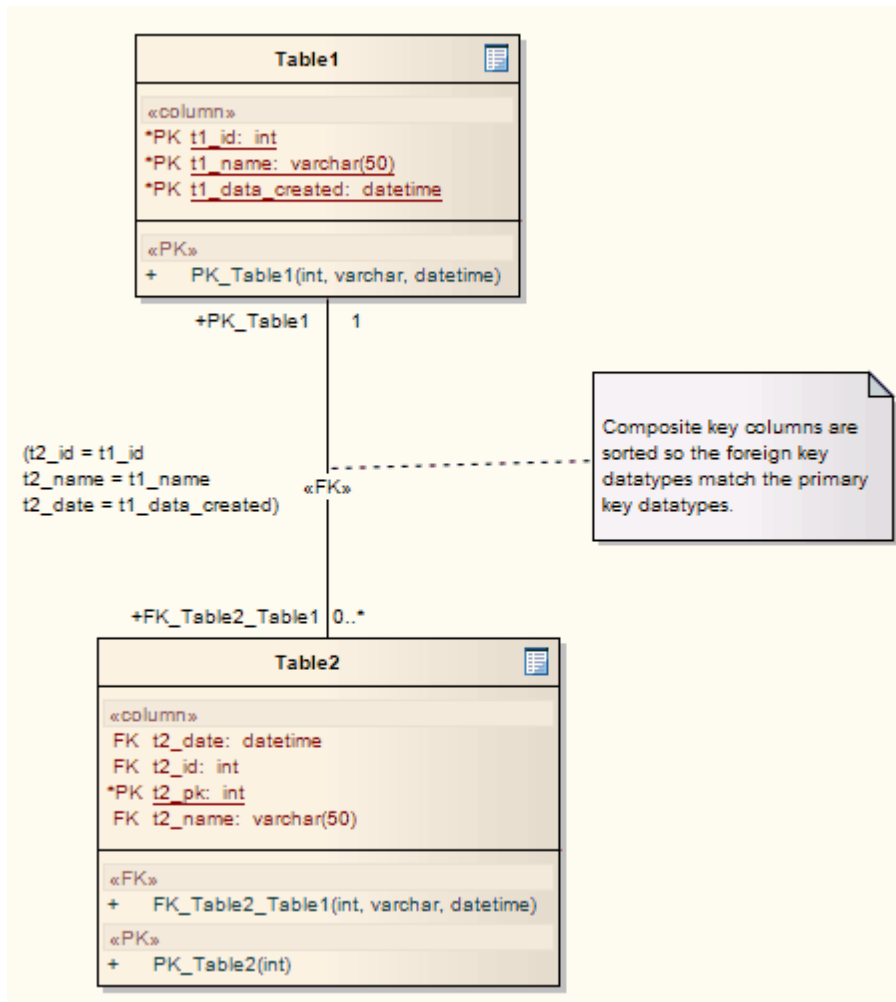

### 13.1.5.2.2 Composite Foreign Key

#### Create a composite Foreign Key

Step	Action	See also
1	Locate the required Tables in a diagram. Both tables must have <b>defined database types</b> .	<a href="#">Set The Database Type</a> <sup>[2341]</sup>
2	Select an <i>Associate</i> connector in the Class Relationships page of the Toolbox.	
3	Click on the Table to contain the Foreign Key (source) and draw the connector to the other Table (target).	
4	Right-click on the connector and select the <b>Foreign Keys</b> context menu option. The Foreign Key Constraint dialog displays.	
5	The default foreign key name is set by the Foreign Key Name Template. To change the name to something other than the default provided by the template, select the <b>Override Template</b> checkbox and edit the foreign key name.	<a href="#">Define Foreign Key Name Template</a> <sup>[2362]</sup>
6	In the <b>Source:</b> panel and the <b>Target:</b> panel, click on the names of the required columns in each panel.	
7	Click on the <b>OK</b> button. The Foreign Key columns are sorted according to data type to match the data types of the targeted composite Primary Key.	
8	If required, you can change the order of the key columns by clicking on the  and  buttons.	

### Example

This example shows what a Composite Foreign Key looks like in a diagram:

#### 13.1.5.2.3 Define a Foreign Key Name Template

If you have specific modeling conventions that stipulate how Foreign Keys are documented, you can customize the way Foreign Key relationships are named by default.

By changing the **Foreign Key Name Template**, you adjust the name that the system assigns to the Association connector and Operation that define the Foreign Key relationship.

**Access** [Tools | Options | Source Code Engineering | Code Editors: DDL Name Template](#)

#### Define the name template for a Foreign Key

Step	Action	See also
1	Click on the <b>DDL Name Template</b> button.	

Step	Action	See also
	The DDL Name Template dialog displays, showing the default name templates.	
<b>2</b>	Edit or replace the name template in the <b>Foreign Key Index</b> field. For example, if you want to display the Foreign Key description as: <i>FK_foreigntablename_FKcolumnname_primarytablename_PKcolumnname</i> then change the <b>Foreign Key Name</b> field to: <i>FK_%foreigntablename%_%fkcolumnname%_%primarytablename%_%pkcolumnname%</i>	
<b>3</b>	Click on the <b>Save</b> button.	

#### 13.1.5.2.4 Define a Foreign Key Index Template

If you have specific modeling conventions that stipulate how **Foreign Key Indexes** are documented, you can customize the way the indexes are named by default.

By changing the **Foreign Key Index Template**, you adjust the name the system assigns to the Index Operation that you can optionally define within the Foreign Key relationship.

**Access** [Tools](#) | [Options](#) | [Source Code Engineering](#) | [Code Editors](#): DDL Name Template

#### Define the Index template for a Foreign Key

Step	Action	See also
<b>1</b>	Click on the <b>DDL Name Template</b> button. The DDL Name Template dialog displays, showing the default name templates.	
<b>2</b>	Edit or replace the name template in the <b>Foreign Key Index</b> field. For example, if you want to create Foreign Key Indexes with the same name as the Foreign Keys, but include a prefix of <b>IX</b> , then change the <b>Foreign Key Index</b> field to: <i>IX%foreignkeyname%</i>	
<b>3</b>	Click on the <b>Save</b> button.	

#### Learn more

- [Define a Foreign Key Name Template](#) <sup>[2362]</sup>

### 13.1.6 Stored Procedures

Stored Procedures are subroutines for processing table data on the DBMS server. These routines can be called from an external application.

#### Topics

Topic	Detail	See also
<b>What is a Stored Procedure?</b>	<p>A stored procedure is a group of SQL statements that perform a specific task; they are used to group a set of operations or queries that can be executed on a database server.</p> <p>Stored Procedures are often used where there is a need to reduce network usage between clients and the DBMS servers.</p> <p>Enterprise Architect models stored procedures using stereotyped UML Classes and Operations. These can be generated with a schema for loading onto the DBMS server.</p>	<p><a href="#">Import Database Schema</a> <sup>[2377]</sup></p> <p><a href="#">Create a Stored Procedure</a> <sup>[2364]</sup></p> <p><a href="#">DBMS Product Conversion for a Package</a> <sup>[2349]</sup></p>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Database Engineering | Physical Data Model | Stored Procedures**

#### 13.1.6.1 Create a Stored Procedure

##### How to

To create a stored procedure as a UML Class, follow the steps below.

Step	Action	See also
1	Open the required diagram.	
2	From the Data Modeling page of the Toolbox ( <b>More tools   Data Modeling</b> ) drag the <i>Procedure</i> icon onto the diagram.	
3	If the Properties dialog does not automatically display, double-click on the element.	
4	<p>In the <b>Database</b> field click on the drop-down arrow and select the target DBMS to model.</p> <p>The field displays the default database if it has already been set.</p>	<a href="#">Set the Database Type</a> <sup>[2341]</sup>

Step	Action	See also
5	In the <b>Procedure definition</b> field, type the entire procedure text.	<a href="#">Languages supported</a> <sup>[2147]</sup> <a href="#">Options - Code Editors</a> <sup>[2250]</sup>
6	Click on the <b>OK</b> button.	
7	To rename the stored procedure, select the element, press <b>(F2)</b> and type the new name.	

### Example

### Notes

- Stored Procedures can also be defined under a single Class with the stereotype set to <<Stored Procedures>>, where each Stored Procedure is created as an operation under that Class; the scripting of these Stored Procedures can be viewed in the Operations dialog under **Behavior**

### Learn more

- [Generate DDL](#) <sup>[2380]</sup>
- [Import Database Schema](#) <sup>[2377]</sup>

## 13.1.7 Indexes

An **index** on a table is used to improve performance of lookups and sort operations on the table at the expense of additional storage. An index can be:

- (For all DBMSs) Column-based, for fast queries on table entries, using the columns specified in the index (the columns having already been defined in the table), or
- (For Oracle), function-based, as defined in a behavior expression
- (For SQL Server), include one or more columns in addition to the specified column, and a fill factor

An index is modeled as a stereotyped operation; on generating DDL, the necessary instructions for generating indexes are written to the DDL output.

**Access** **Project Browser | Right-click Table element | Operations Diagram | Right-click Table element | Features and Properties | Operations**

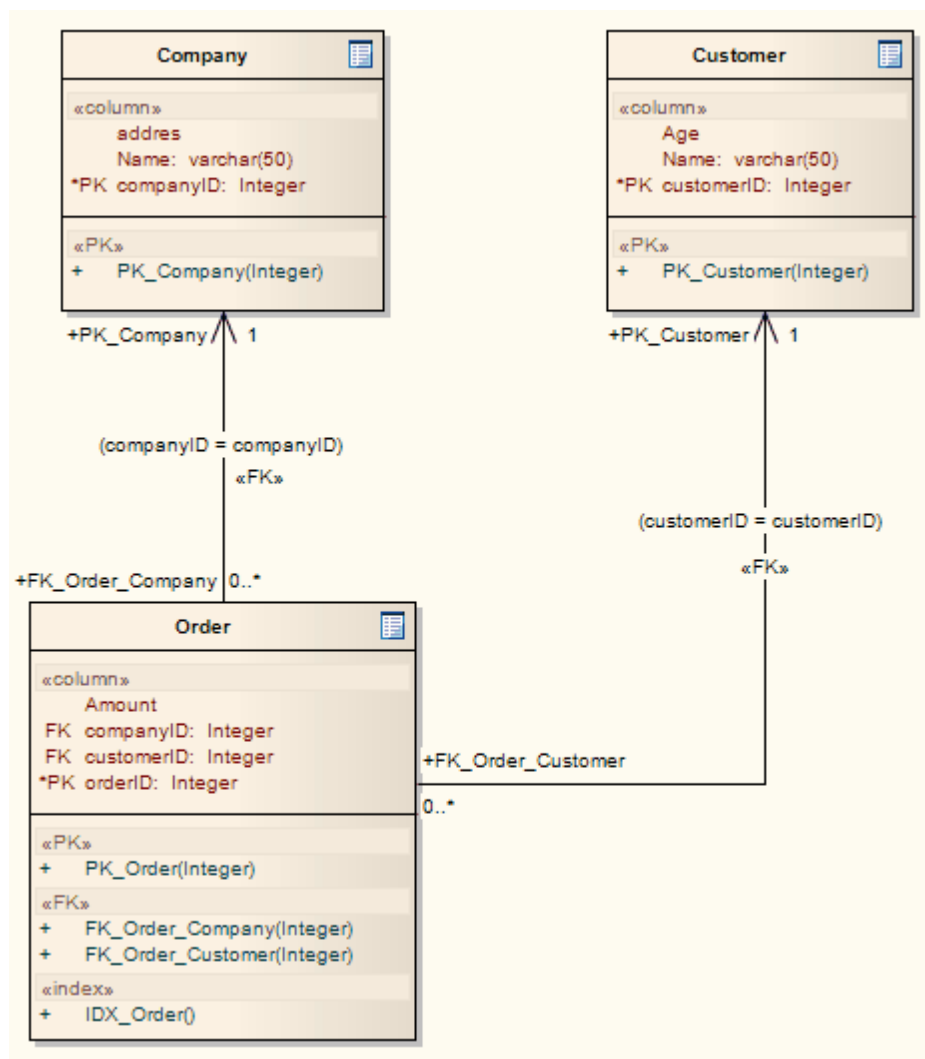

**Create an index**

Step	Action	See also
1	On the Operation dialog, add an operation with a name such as <i>IDX_CustomerID</i> . The <i>IDX_</i> prefix is optional, but helps to identify the operation.	
2	In the <b>Stereotype</b> field for the operation, click on the drop-down arrow and select <b>index</b> .	
3	Click on the <b>Save</b> button.	
4	By default, indexes are not created as <b>clustered</b> or <b>unique</b> , and are sorted in ascending order. If this is appropriate for your purposes, go to step 8.  Otherwise, click on the newly-created index operation in the <b>Operations</b> list and click on the <b>Extended Properties</b> button.  The Database Operation Properties dialog displays.	
5	Select the <b>Unique</b> and/or <b>Clustered</b> checkboxes as appropriate. <ul style="list-style-type: none"> <li>A Unique index cannot contain more than one instance of a combination of values across a set of columns</li> <li>Clustered indexes provide improved performance for accessing the columns; you can have one clustered index per table</li> </ul>	
6	Set the index sort order by selecting the <b>Ascending</b> or <b>Descending</b> radio button, as appropriate.	
7	Click on the <b>Save &amp; Close</b> button to return to the Operation dialog.	
8	If you prefer (and if the DBMS you are using supports it), you can type an index comment in the <b>Notes</b> field of the Operation dialog.	
9	It is not necessary to add any columns to an Oracle <b>function-based</b> index.  To model function-based indexes, click on the index operation in the <b>Operations</b> list and click on the Behavior page in the Properties list in the left hand panel of the dialog.  In the <b>Initial Code</b> field, type the index behavior expression, and click on the <b>Save</b> button.  Go to step 12.	
10	To add columns to a <b>column-based</b> index, click on the index operation in the <b>Operations</b> list and click on the Column page in the Properties list in the left hand	

Step	Action	See also												
	<p>panel of the dialog.</p> <p>Select the required columns from the <b>Column Name</b> drop-down list, in the required order. Click on the <b>Save</b> button after selecting each column from the drop-down list.</p> <p>If you prefer, you can adjust the sequence of columns using the 'up hand' and 'down hand' buttons.</p>													
11	<p>For SQL Server, to add included columns select the Tagged Values page from the Properties list and add the Tagged Values:</p> <ul style="list-style-type: none"><li>• <b>INCLUDE</b>, and in the <b>Value</b> field type the column names as a comma-separated list</li><li>• <b>FILLFACTOR</b>, and in the <b>Value</b> field type the numerical fill factor</li></ul> <p>For example:</p> <table><tr><th>Property</th><th>Value</th></tr><tr><td> <b>Constraint (IDX_CustomerID)</b></td><td></td></tr><tr><td>Is Unique</td><td>False</td></tr><tr><td>Is Clustered</td><td>False</td></tr><tr><td>Fill Factor</td><td>85</td></tr><tr><td>Include</td><td>Name, Address</td></tr></table>	Property	Value	 <b>Constraint (IDX_CustomerID)</b>		Is Unique	False	Is Clustered	False	Fill Factor	85	Include	Name, Address	
Property	Value													
 <b>Constraint (IDX_CustomerID)</b>														
Is Unique	False													
Is Clustered	False													
Fill Factor	85													
Include	Name, Address													
12	Click on the <b>Close</b> button.													

### Example

In the example below, the *Order* element shows what an index looks like in a diagram:

### 13.1.8.1 Create a Trigger

#### How to

To create a Trigger

Step	Action	See also
1	Locate the required table in either a diagram or the Project Browser.	
2	Right-click on the table and select the <b>Operations</b> context menu option. The Operations dialog displays.	
3	Add an operation with a name such as <i>TRG_OnCustomerUpdate</i> . The <i>TRG_</i> prefix is optional, but helps to identify the operation.	
4	In the <b>Stereotype</b> field select <b>trigger</b> .	
5	Click the <b>Save</b> button.	
6	Select the trigger operation, then the Behavior tab.	
7	In the <b>Initial Code</b> field, enter the entire trigger code including the <i>CREATE_TRIGGER</i> statement.	<a href="#">Languages supported</a>  <a href="#">Options - Code Editors</a> 

Step	Action	See also
8	Click on the <b>Save</b> button.	

### 13.1.9 Create a Check Constraint

A **Check Constraint** enforces domain integrity by limiting the values that are accepted by a column.

**Access** [Project Browser or diagram](#) | [Table context menu](#) | [Operations](#)

#### Create a Constraint

Step	Action	See also
1	On the Operations dialog, add an operation with a name such as <i>CHK_ColumnName</i> . The <i>CHK_</i> prefix is optional, but helps to identify the operation.	
2	In the <b>Stereotype</b> field select <b>check</b> .	
3	Click on the <b>Save</b> button.	
4	Optionally, in the <b>Notes</b> field you can type a check constraint comment.	
5	Click on the check constraint operation in the <b>Operations</b> list, then select the Behavior tab from the Properties panel on the left of the dialog.	
6	In the <b>Initial Code</b> field, enter the entire check constraint clause. For example, <b>col1 &lt; 1000</b> .	
7	Click on the <b>Save</b> button.	

#### Learning Center topics

- (Alt+F1) | [Enterprise Architect](#) | [Database Engineering](#) | [Physical Data Model](#) | [Check Constraint](#)

### 13.1.10 Default Constraints

*Default Constraints* apply to SQL Server only, and are supported to maintain compatibility with earlier versions.

**Access**   **Right-click on Table | Operations**

#### Create a Default Constraint

Step	Action
1	On the Operations Properties dialog, in the <b>Name</b> field, type the new operation name in the format <b>DF_&lt;ColumnName&gt;</b> . The <b>DF_</b> is optional, but helps to identify the operation.
2	In the <b>Stereotype</b> field type or select the value <b>default</b> .
3	Click on the <b>Save</b> button.
4	In the <b>Operations</b> list, click on the default operation name, then click on <b>Column</b> in the left-hand panel.
5	Select the appropriate column from the <b>Column Name</b> drop down list.
6	Click on <b>Behavior</b> in the left-hand panel.
7	In the <b>Initial Code</b> field, type the default value.
8	Click on the <b>Save</b> button.

### 13.1.11 Views

A **Database View** defines a subset of the database, aggregated into a dynamic 'virtual' table. The information presented by a Database View is not physically replicated, rather it is automatically derived based on the query that defines the view.

In Enterprise Architect, you model Database Views as stereotyped UML Classes.

#### Learn more

- [Create a View](#)<sup>[2372]</sup>

Learning Center topics

- (Alt+F1) | **Enterprise Architect | Database Engineering | Physical Data Model | Create View**

**13.1.11.1 Create a View**Create a Database View

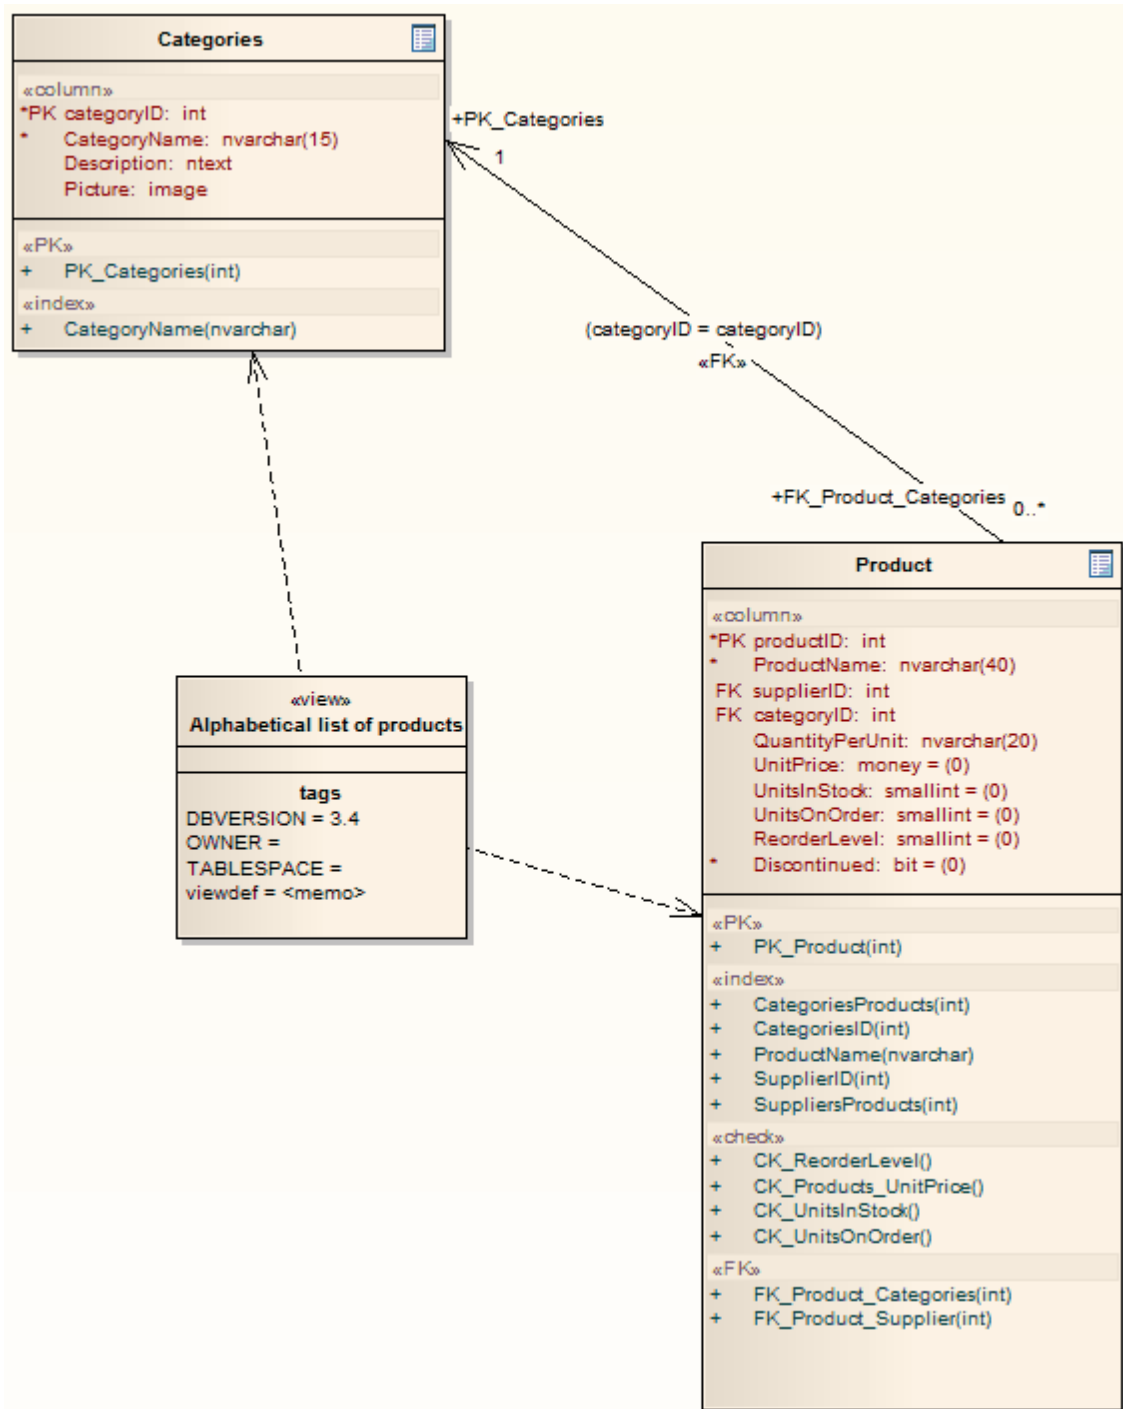

Step	Action	See also
1	On the Data Modeling page of the Toolbox ( <b>More tools</b>   Data Modeling), drag the View icon onto your Data Modeling diagram.	
2	If the View Properties dialog does not immediately display, double-click on the element.	
3	From the Database drop-down list, select the target DBMS to model. The default database displays if it has already been set.	<a href="#">Set the Database Type</a> [2341]
4	Click on the OK button.	
5	To rename the View, select the element, press (F2) and type the new name.	

Create a View definition

Step	Action	See also
1	Create a Dependency connector from the View to the table or tables on which the View depends.	
2	Double-click on the View to display the Properties dialog. The tables are now listed in the <b>Dependencies</b> field.	
3	In the <b>View definition</b> field, type the full view definition. The code editor provides intelli-sense for basic SQL keywords and functions.	<a href="#">Options - Code Editors</a> [2250] <a href="#">Intelli-sense</a> [2160]
4	Click on the <b>OK</b> button to save your definition.	

Step	Action	See also

### Example

### Notes

- The View definition and certain other parameters are held as Tagged Values; the View definition is held in the *viewdef* memo Tagged Value

You can select and view the *viewdef* Tagged Value in the Tagged Values window, and include it in document reports by inserting the **valueOf(viewdef)** field in the *Package::Package Element* or *Package::Element* sections.

#### Learn more

- [Tagged Values](#) <sup>[1134]</sup>
- [Report on Tagged Values](#) <sup>[2698]</sup>

### 13.1.12 Oracle Packages

#### Create an Oracle package

Step	Action	See also
1	Add a Class element to your data model.	
2	Open the Properties dialog for the element and, in the <b>Stereotype</b> field, type the value <b>Package</b> .	
3	For the package specification, create an Operation with the name <i>Specification</i> and with no return type.	
4	Open the Properties dialog for the <i>Specification Operation</i> and, on the Behavior tab, type the entire package specification into the <b>Initial Code</b> field.	
5	For the package body, create an Operation with the name <i>Body</i> and with no return type.	
6	Open the Properties dialog for the <i>Body Operation</i> and, on the Behavior tab, type the entire package body into the <b>Initial Code</b> field.	

#### Learn more

- [Initial Code](#) <sup>[1019]</sup>

## 13.2 Supported Databases

Modeling and reverse engineering of database schema is supported for the following DBMS products:

- DB2
- Firebird/InterBase\*
- Informix
- Ingres
- MS Access 97, 2000, 2003
- Access 2007
- MS SQL Server 2000, 2005, 2008, 2012
- SQL Server Express 2005 and 2008
- MySQL
- SQLite
- Oracle 9i, 10g and 11g
- PostgreSQL
- Sybase Adaptive Server Anywhere (Sybase ASA)
- Sybase Adaptive Server Enterprise (Sybase ASE)

### Notes

- \* Firebird 1.5 database tables can be modeled and generated as InterBase tables; Firebird tables can be imported, but are treated as InterBase tables
- You can download data types for SQL Server (2005, 2008, 2012) Informix and MS Access 2007 from the Resources page of the Sparx Systems web site

### Learn more

- [Online Resources](#)

## 13.3 Import Database Schema

Enterprise Architect provides facilities for reverse engineering DBMS schemas, enabling you to analyze and remodel legacy database systems and then export them to the existing or an alternative DBMS.

By connecting to a live database via ODBC, you can import the database schema into a standard UML model. Subsequent imports enable you to update your model from the live database.

Enterprise Architect supports importing database tables, stored procedures and views from an ODBC data source. Tables are imported as stereotyped Classes with suitable data definitions for the source DBMS.

### Import database schema and objects

Step	Action	See also
1	<p>Select a package in the Project Browser, into which to import the database schema.</p> <p>Create a data modeling diagram in this package.</p>	<a href="#">Create a Data Model Diagram</a> <sup>2336</sup>
2	<p>To import, either:</p> <ul style="list-style-type: none"> <li>• Right-click on the package and select the <b>Code Engineering   Import DB Schema from ODBC</b> context menu option</li> <li>• Right-click on the diagram and select the <b>Import DB schema from ODBC</b> context menu option, or</li> <li>• Select the <b>Tools   Database Engineering   Import DB schema from ODBC</b> menu option</li> </ul> <p>The Import DB Schema from ODBC Source dialog displays.</p>	
3	<p>In the <b>Database</b> field, click on the ( ... ) (<b>Browse</b>) button and select a suitable ODBC data source from the ODBC dialog (ODBC must be installed and configured on your machine for this to work correctly).</p> <p>When you have selected the data source, the <b>Database</b> field shows the DBMS, the database server ID and the database name, separated by full stops; that is:</p> <p><i>dbms.dbserver.database.</i></p>	<a href="#">Select a Suitable Data Source</a> <sup>2378</sup> See <i>Notes</i> below, concerning 32-bit ODBC drivers.
4	<p>You can filter objects to be retrieved from the database by schema or owner.</p> <p>In the <b>Schema/Owner</b> field, type the schema/owner as a single entry, or as a comma-separated list.</p> <p>The filter is useful for databases that support multiple schemas or owners, such as SQL Server 2005/2008/2012, Oracle, PostgreSQL and DB2 Express.</p> <p>By default, when importing database objects from Oracle, Enterprise Architect inserts the Oracle user name in this field to avoid unnecessary retrieval of large numbers of objects not owned by that user.</p>	

Step	Action	See also
5	Select the appropriate checkboxes to import system tables and views, user views, triggers and/or Oracle packages.	<a href="#">Tables and Columns</a> <sup>[2338]</sup> <a href="#">Views</a> <sup>[2371]</sup> <a href="#">Triggers</a> <sup>[2368]</sup>
6	<p>Select the appropriate checkboxes to import:</p> <ul style="list-style-type: none"> <li>• Stored Procedures</li> <li>• User Functions</li> <li>• User Sequences</li> </ul> <p>These items can be imported as a Class for each Stored Procedure, User Function or User Sequence. Alternatively, all Stored Procedures can be imported as a set of operations contained under a Class. A similar Class can be created for all User Functions and User Sequences.</p> <p><b>Import as individual Classes</b></p> <p>The script is imported into separate Classes. The Properties dialog for each of these Classes supports a context sensitive editor for editing the script.</p> <p><b>Import as Operations</b></p> <p>The selected items are imported to a single Class as Operations (methods); you can view and edit them through the Operations Properties dialog of the parent Class.</p>	<a href="#">Stored Procedures</a> <sup>[2364]</sup>
7	<p>In the Synchronization panel, select the appropriate option to determine whether the existing Classes are to be updated, or the database objects imported as new objects.</p> <p>If you select the <b>Synchronize existing classes</b> option, also select the appropriate checkboxes to determine whether model comments, column default values and/or table constraints are to be retained or overwritten with the comments, values and constraints of the imported objects.</p>	
8	Click on the <b>Import</b> button to start the import.	
9	Select the database objects to import.	<a href="#">Select Tables</a> <sup>[2378]</sup> <a href="#">Imported Class Elements</a> <sup>[2379]</sup>

**Notes**

- Enterprise Architect requires **32-bit ODBC** drivers to connect to a repository through ODBC; to set up

the ODBC configuration on **64-bit** clients, run the 32-bit ODBC Data Source Administrator from `C:\Windows\SysWOW64\odbcad32.exe`

- The ODBC connection should use the ODBC driver available from the DBMS vendor, such as MySQL's ODBC driver for MySQL, and Oracle's ODBC driver for Oracle; drivers provided by third-party vendors are not supported, including the Microsoft ODBC driver for Oracle
- You can import a suitable ODBC driver for SQLite from <http://www.ch-werner.de/sqliteodbc/>
- If setting up a ODBC connection for reverse engineering, the default settings are sufficient
- If you are importing database schema from an MS Access Jet 4.0 database, please ensure that you have selected the **Use Jet 4.0** checkbox on the General page of the Options dialog, otherwise the Jet 3.5 routines are loaded; you must restart Enterprise Architect after selecting the checkbox
- Additional data types are available from the *Data Modeling Data Types* section of the Resources page on the Sparx Systems website
- If no diagram is open, the **Package Only** radio button defaults to selected and the options are disabled; if the open diagram is in the selected package, you can select either option

### 13.3.1 Select a Data Source

#### Topics

Topic	Detail	See also
<b>General Usage</b>	<p>To import DDL from existing data sources, you must have a suitable ODBC connection installed and configured.</p> <p>From the Import DB Schema from ODBC Source dialog you can select the ODBC data source using the standard windows ODBC set-up dialog; click on the data source name and then click on the <b>OK</b> button.</p>	

### 13.3.2 Select Tables

When you have opened the ODBC data source, Enterprise Architect acquires a list of database objects suitable for importing. This is presented in a list form for you to select from.

Highlight the schema to import from the top list. Alternatively, select individual objects from the lower list.

#### Topics

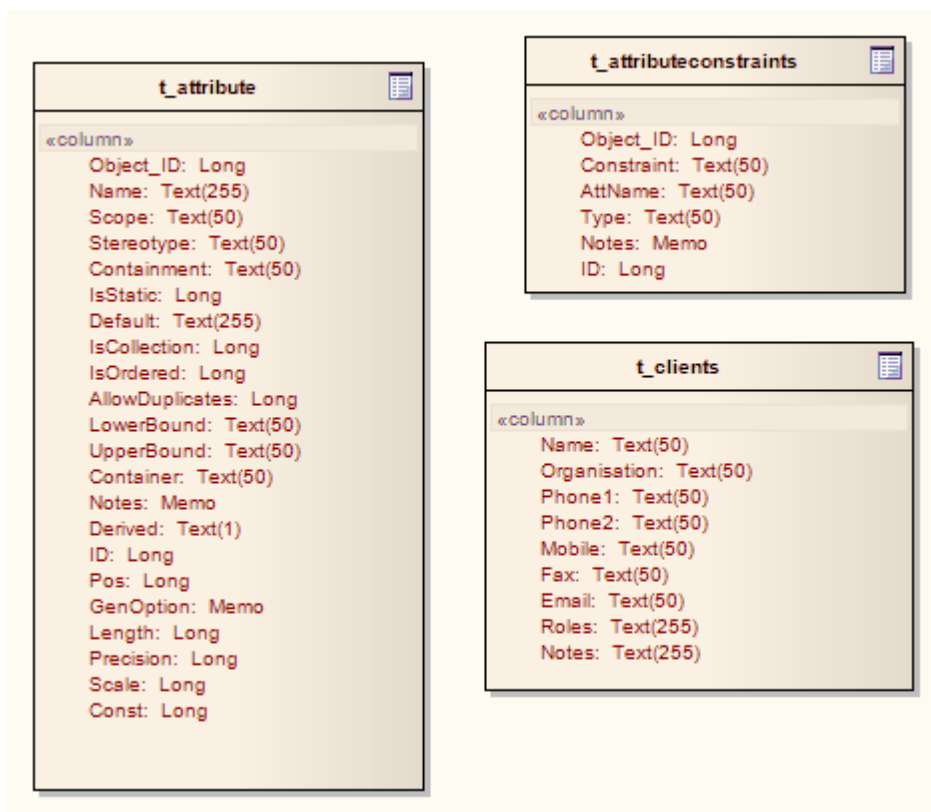

Topic	Detail	See also
<b>Selection Shortcuts</b>	<ul style="list-style-type: none"> <li>To select all objects, click on the <b>Select All</b> button</li> <li>To clear all objects, click on the <b>Select None</b> button</li> <li>Hold down ( <b>Ctrl</b> ) while clicking to select multiple objects</li> <li>Hold down ( <b>Shift</b> ) and click on the first and last objects in a range to select that range</li> </ul> <p>When you have selected the objects, click on the <b>OK</b> button.</p>	

### 13.3.3 The Imported Class Elements

When you import DDL table definitions they are converted to stereotyped Classes according the *UML Data Modeling Profile*.

The image below shows some example tables imported into the model using an ODBC data connection.

#### Example

## 13.4 Generate DDL

Enterprise Architect enables you to generate DDL from your model for Tables, Stored Procedures and Views. SQL script can be generated for a single element (a Table) or for a whole package.

Having generated DDL, you can view it using the Source Code editors, by clicking on the table or package in the Project Browser or a diagram, and pressing **(F12)**, **(Ctrl+E)** or **(Alt+7)**.

The editor cannot parse DDL, and therefore does not show a structure tree for a DDL file in the left-hand panel of the Source Code window or view.

### Learn more

- [Generate DDL for Tables](#)<sup>[2380]</sup>
- [Generate DDL for Packages](#)<sup>[2381]</sup>
- [Editing Source Code](#)<sup>[2146]</sup>

### Learning Center topics

- **(Alt+F1) | Enterprise Architect | Database Engineering | Generate DDL**

### 13.4.1 Generate DDL For a Table

**Access** **Diagram Table element context menu | Generate DDL**

### Reference

On the Generate DDL dialog, generate DDL for a table as indicated below:

Step	Action	See also
<b>Path</b>	Click on the ( ... ) (Browse) button to set up the file location and file name of the script to create.	
<b>Comment Level</b>	To include comments in the DDL, select the appropriate level. For example, select <b>Column</b> to include comments on columns, or <b>All</b> to include comments on all structures.	
<b>Option Checkboxes</b>	Select the checkbox for each type of inclusion you require; for example, to include a 'drop table'. command in the script, select the <b>Create Drop SQL</b> checkbox.  Deselect the checkboxes for inclusions you do not require.	
<b>Generate</b>	Click on this button to create the DDL.	
<b>View</b>	Click on this button to view the output.	<a href="#">Editing Source Code</a>

Step	Action	See also
	The viewer defaults to the Enterprise Architect default code editor. However, you can define an alternative default DDL editor on the Options dialog ( <b>Tools   Options   Source Code Engineering   Code Editors</b> ).	 <a href="#">Options - Code Editors</a> 

**Notes**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to generate DDL
- Some checkboxes display only if the appropriate database is defined for the table; for example, **IF EXISTS** displays only if the database for the table is PostgreSQL, and **SEQ\_** and **\_SEQ** radio buttons display only if the database for the table is Oracle
- For a PostgreSQL database, you must select the **Generate Sequences** checkbox to enable auto increment columns to be created
- If generating Oracle sequences, you must always select the **Generate Triggers** and **Generate Sequences** checkboxes - this ensures that a pre-insert trigger is generated to select the next sequence value to populate the column; also set the **AutoNum** property to **True** in the column properties
- If generating Oracle sequences, to generate the sequence name and trigger name with the syntax **SEQ\_<sequence\_name>** and **TRG\_<trigger\_name>**, select the **SEQ\_** option; conversely, to generate them with the syntax **<sequence\_name>\_SEQ** and **SET\_<trigger\_name>**, select the **\_SEQ** option

**Learn more**

- [Permission List](#)

**13.4.2 Generate DDL for a Package**

When you have defined a package in your database model, you can generate DDL for that package, and also compare the DDL with the database.

**Access** **Project Browser package context menu | Code Engineering | Generate DDL**, or **Select package Tools | Database Engineering | Generate Package DDL**

**Generate DDL for a package**

Step	Action	See also
<b>1</b>	On the Generate Package DDL dialog, select the checkbox against each inclusion required.  Deselect the checkboxes for inclusions you do not require.	
<b>2</b>	To recursively generate DDL, select the <b>Include All Child Packages</b> checkbox.	

Step	Action	See also
3	<p>Select the <b>Save Generated Order</b> checkbox to save the order in which the objects are generated.</p> <p>This is useful where the order is changed to resolve object dependencies; the order is saved when you click on the <b>Generate</b> button.</p>	
4	If you click the <b>Refresh</b> button with the <b>Save Generated Order</b> checkbox <i>un</i> checked, the objects are restored to their original order.	
5	<p>Click on the <b>Generate</b> button to proceed.</p> <p>Enterprise Architect prompts you for file names as the process executes.</p>	
6	<p>To view the output, click on the <b>View</b> button.</p> <p>The viewer defaults to the Enterprise Architect default code editor. However, you can define an alternative default DDL editor on the Options dialog (<b>Tools   Options   Source Code Engineering   Code Editors</b>).</p>	<a href="#">Editing Source Code</a> <sup>[2146]</sup> <a href="#">Options - Code Editors</a> <sup>[2250]</sup>

#### Compare the generated DDL with the database

Step	Action	See also
1	<p>On the Generate Package DDL dialog, click on the <b>Compare</b> button.</p> <p>The Compare With Database dialog displays.</p>	
2	Click on the <b>Browse ( ... )</b> button and locate the required database on the Select Data Source dialog.	
3	For an Oracle database, if required you can also specify the Owner in the <b>Schema/Owner</b> field.	<a href="#">Set up an Oracle ODBC Driver</a> <sup>[254]</sup>
4	<p>Click on the <b>OK</b> button to perform the comparison.</p> <p>The Comparison Database dialog displays with the results of the comparison.</p> <p>Click on each table name to review information on that table.</p>	
5	<p>Click on the:</p> <ul style="list-style-type: none"> <li>• <b>Save</b> button to save the altered DDL statements to a file</li> <li>• <b>View</b> button to open the saved file in a text editor</li> <li>• <b>Copy</b> button to copy the altered DDL statements to the clipboard</li> </ul>	

--	--	--

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to generate DDL
- Some checkboxes display only if the appropriate database is defined for the table; for example, **IF EXISTS** displays only if the database for the table is PostgreSQL, and **SEQ\_** and **\_SEQ** radio buttons display only if the database for the table is Oracle
- For a PostgreSQL database, you must select the **Generate Sequences** checkbox to enable auto increment columns to be created

## 14 SOA and XML

Service Oriented Architecture (SOA) is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results.

A service is an offer of value to another through a well-defined interface and available to a community (which may be the general public). A service results in work provided to one by another.

Service Oriented Architecture (SOA) is a way of organizing and understanding ( representations of ) organizations, communities and systems to maximize agility, scale and interoperability. The SOA approach is simple - people, organizations and systems provide services to each other. These services allow us to get something done without doing it ourselves or even without knowing how to do it - enabling us to be more efficient and agile. Services also enable us to offer our capabilities to others in exchange for some value - thus establishing a community, process or marketplace. The SOA paradigm works equally well for integrating existing capabilities as for creating and integrating new capabilities.

(Derived from *Service oriented architecture Modeling Language (SoaML) - Specification for the UML Profile and Metamodel for Services (UPMS)* (OMG document ad/2008-11-01); pp. 25-26.)

In modeling and developing a complete Service Oriented Architecture in Enterprise Architect, you can work with any or all of:

- **XML Schema Definition (XSD)**, also known as **XML Schema** - an XML technology that is used to specify the rules to which an XML document must adhere
- **Web Services Description Language 1.1 (WSDL)** - a key XML-based language for describing **web** services
- **Service oriented architecture Modeling Language (SoaML)** - a standard method of designing and modeling SOA solutions using the Unified Modeling Language (UML)
- **Service-Oriented Modeling Framework (SOMF)** - a service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to successful service-oriented life cycle management and modeling

### Learn more

- [SOMF 2.1](#) <sup>[2454]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | SOA and XML Engineering**

## 14.1 XML Schema - XSD

**XML Schema Definition** (XSD), also known as **XML Schema**, is a World Wide Web Consortium (**W3C**) XML technology that is used to specify the rules to which an XML document must adhere. XSD support is critical for the development of a complete **Service Oriented Architecture** (SOA), and the coupling of UML 2.4.1 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization.

The **UML Profile for XSD** specifies a set of stereotypes, Tagged Values and constraints that can be applied to the UML model in order to change specific aspects of the resulting schema. Enterprise Architect provides native support for the XSD Profile through the **XML Schema** page of the **Diagram Toolbox**. The XSD Profile supported by Enterprise Architect is an adaptation of the profile defined in the publication *Modeling XML Applications with UML*.

Working with the XSD Profile through Enterprise Architect, you can rapidly model, forward engineer and reverse engineer XML Schema.

- *Modeling XML Applications with UML - Practical e-Business Applications*, Object Technology Series, David Carlson, UK, April 2001

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | SOA and XML Engineering | XSD | Getting Started**

### 14.1.1 Model XSD

You can model XML schemas at two levels, using UML Class diagrams that:

- Have no XML schema-specific implementation details, to be generated directly by Enterprise Architect's **Schema Generator**; the generator applies a set of **default mappings** to convert the abstract model package to a **W3C XML Schema** (XSD) file
- Are refined with XML schema-specific definitions using the XML Schema pages of the Diagram Toolbox, which provides the structures of the **UML profile for XSD**

### Model an XML Schema

Step	Action	See also
1	In the Project Browser, create the top-level project structure you need (Model and Views), and click on the appropriate View.	<a href="#">Models</a> <sup>[753]</sup> <a href="#">Views</a> <sup>[769]</sup>

2	Click on the <b>New Package</b> icon in the Project Browser toolbar. The New Model Package dialog displays.	<a href="#">Project Browser Toolbar</a> 
3	In the <b>Name</b> field type the name of the new package, and select the <b>Automatically add new diagram</b> and <b>Open new diagram</b> checkboxes. Click on the <b>OK</b> button. The New Diagram dialog displays.	<a href="#">Add a Package</a> 
4	In the <b>Name</b> field type the name of the new diagram. In the Select From panel select <b>UML Structural</b> , and in the Diagram Types panel select <b>Class</b> .	<a href="#">Add New Diagrams</a> 
5	Click on the <b>OK</b> button. The new Class diagram opens in the Diagram View, with the Class pages displaying in the Diagram Toolbox. At this point you can either: <ul style="list-style-type: none"> <li>Create a Class diagram using the Class toolbox icons (click on the link to the right), or</li> <li>Create a tailored XML Schema diagram using the XML Schema pages of the Diagram Toolbox (continue to step 6)</li> </ul>	<a href="#">Diagram Toolbox</a>  <a href="#">Class Toolbox</a>  <a href="#">XML from Abstract Class Models</a> 
6	Click on the <b>More tools</b> option in the Toolbox and select <b>Extended   XML Schema</b> to display the XML Schema Toolbox pages.	<a href="#">XML Schema Toolbox</a> 
7	Click on the <b>Schema</b> icon from the Toolbox and drag it into the Class diagram. The XSD schema Properties dialog displays. Complete this dialog, and click on the <b>OK</b> button. The New Diagram dialog displays.	<a href="#">Schema Package</a> 
8	Again, in the <b>Name</b> field type the name of the new diagram. In the Select From panel select <b>UML Structural</b> , and in the Diagram Types panel select <b>Class</b> . Click on the <b>OK</b> button.	
9	An <i>XSDschema</i> stereotyped package is created in the Project Browser and on the diagram, with a child Class diagram. Double-click on the Package on the diagram to open the child Class diagram, and use the constructs from the XML Schema Toolbox to model the XML Schema.	<a href="#">Global Element</a>  <a href="#">Local Element</a>  <a href="#">Global Attribute</a>  <a href="#">Local Attribute</a>  <a href="#">Attribute Group</a>  <a href="#">Complex Type</a>  <a href="#">Model Group</a>  <a href="#">Group</a> 

		<a href="#">Simple Type</a>  <sup>[2402]</sup> <a href="#">Union</a>  <sup>[2408]</sup> <a href="#">Enumeration</a>  <sup>[2412]</sup> <a href="#">Any</a>  <sup>[2405]</sup> <a href="#">Any Attribute</a>  <sup>[2407]</sup>
--	--	---

### Notes

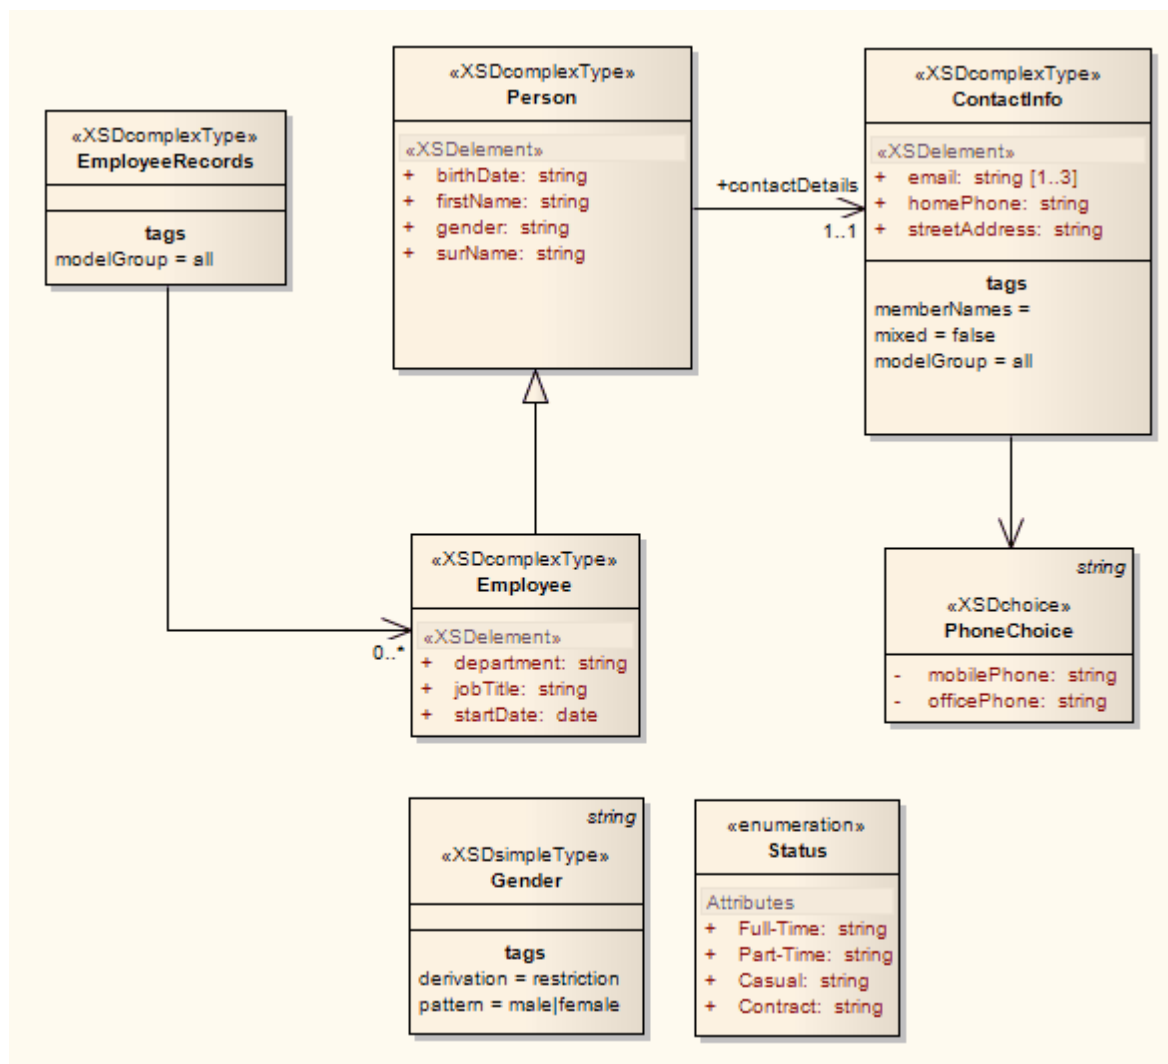

- The UML attributes of the Classes map directly to XML elements or attributes
- Classes in an XML Schema model have no methods since there is no meaningful correspondence between Class methods and XSD constructs
- **Modeling Restrictions** - the following XML Schema constructs cannot be modeled in Enterprise Architect:
  - appinfo
  - field
  - key
  - keyref
  - notation
  - redefine
  - selector
  - substitutionGroup
  - unique

#### 14.1.1.2 Schema Package

An **«XSDschema»** stereotyped package acts as a container for the XSD constructs, from which XML Schema can be generated. All Classes in the package are defined within one schema; the Schema element provides the default schema-wide settings. You can create an **«XSDschema»** package by dragging the **Schema** icon from the XML Schema Toolbox and dropping it directly onto a diagram.

#### Toolbox Icon

**Access** **Drag icon onto diagram**, or  
**Project Browser | Double-click on «XSDschema» stereotyped Package**, or  
**Diagram | Right-click on «XSDschema» stereotyped Package | Properties**

#### Define Properties

Field/Button	Action	See also										
Schema Name	If you do not want to use the default name of the schema package, overtype it with another name.											
Target Namespace	(Optional) Type in the target namespace for this Schema package.											
Prefix	(Optional) Type in the abbreviated text to represent the Target Namespace.											
Default Namespace	(Optional) Type in the default namespace for all non-prefixed XSDelements and XSDattributes.											
Schema File	Type in or browse for (click on ( ... )) the file path where the XML Schema file for this package is to be generated.											
XMLNS	<div>Identify the additional namespace or namespace-prefix pairs used in this Schema package.</div> <div>To <b>add</b> a namespace or namespace-prefix pair, click on the <b>New</b> button; to <b>edit</b> an existing entry, double-click on it. In either case, the Namespace Details dialog displays.</div> <table><tr><th>Field</th><th>Action</th></tr><tr><td>Prefix</td><td>Type in the abbreviated text to represent the Na</td></tr><tr><td>Namespace</td><td>Type in the name of the Namespace.</td></tr><tr><td>OK</td><td>Click on this button to <b>save</b> the new information Namespace Details dialog.</td></tr><tr><td>Cancel</td><td>Click on this button to <b>discard</b> the new informa Namespace Details dialog.</td></tr></table>	Field	Action	Prefix	Type in the abbreviated text to represent the Na	Namespace	Type in the name of the Namespace. 	<div> <div>Help</div> <div>Click on this button to display this Help topic.</div> </div>	
	To remove an entry from the list, click on it and click on the <b>Delete</b> button.	
OK	Click on this button to <b>save</b> the schema data entered and close the XSD schema Properties dialog.	
Cancel	Click on this button to <b>discard</b> the schema data entered and close the XSD schema Properties dialog.	
Help	Click on this button to display this Help topic.	
UML	<p>This button is displayed when you are <b>editing</b> existing Schema package information.</p> <p>Click on the button to open the UML element Properties dialog for the Schema element.</p>	<a href="#">Properties</a> 

#### Notes

- The default schema-wide settings are defined by Tagged Values, which you can review on the Tagged Values page of the schema element Properties dialog, or the Tagged Values window for the element; you can edit the schema-wide settings if you need to, or provide element-specific overrides in the properties and Tagged Values of the **individual XSD construct elements**

#### Learn more

- [Tagged Values](#)  (as you click on each Tagged Value, check the text field at the bottom of the Tagged Values window)

#### 14.1.1.3 Global Element

An «XSDtopLevelElement» stereotyped Class acts as a XSD global **element**. You can create it by dragging the **Element** icon from the XML Schema Toolbox and dropping it **directly** onto a diagram.

#### Toolbox Icon

**Access** Drag icon onto diagram, or Project Browser | Double-click on «XSDtopLevelElement» stereotyped Class, or Diagram | Right-click on «XSDtopLevelElement» stereotyped Class | Properties

**Define Properties**

Field/Button	Action	See also
<b>Name</b>	If you do not want to use the default name of the global element, overtype it with another name.	
<b>Type</b>	Either: <ul style="list-style-type: none"> <li>Type the name of a data type, or</li> <li>Click on the drop-down arrow and select an <b>XSD built-in dataType</b> from the list, or</li> <li>Click on the browse ( <b>...</b> ) button and browse for an existing <b>XSD classifier</b> element, or</li> <li>Select one of the two checkboxes below</li> </ul>	
<b>Nested complexType</b>	Select this checkbox to create an <b>XSDcomplexType</b> as a child of this global element.	<a href="#">Complex Type</a> <small>[2401]</small>
<b>Nested simpleType</b>	Select this checkbox to create an <b>XSDsimpleType</b> as a child of this global element.	<a href="#">Simple Type</a> <small>[2402]</small>
<b>Value</b>	(Optional) If you have entered an XSD built-in data type in the <b>Type</b> field, type in a value.	
<b>Default</b>	Select this radio button to set the <b>Value</b> as a default value.	
<b>Fixed</b>	Select this radio button to set the <b>Value</b> as a fixed value.	
<b>Annotation</b>	(Optional) Type in any notes you need for this element.	
<b>OK</b>	Click on this button to <b>save</b> the element data entered and close the XSD element Properties dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the element data entered and close the XSD element Properties dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	This button is displayed when you are <b>editing</b> existing XSD element information.  Click on the button to open the UML element Properties dialog for the global element.	<a href="#">Properties</a> <small>[956]</small>

--	--	--

### Notes

- The fields **Type**, **Nested complexType** and **Nested simpleType** are mutually exclusive; selecting one disables the others
- The fields **Nested complexType** and **Nested simpleType** are available in the dialog only when **creating** a new global element (and not when **editing** the global element)
- A Global element
  - Cannot contain any UML **attributes**
  - Cannot be the **source** of an Association connector
  - **Can** be the **target** of an Association connector from a Complex Type Class or Group Class element
  - Cannot be the **target** of a Generalization connector
  - Can be the **source** of **one** Generalization connector to a Complex Type Class or Simple Type Class

### Learn more

- [Local Element](#)<sup>2394</sup>

#### 14.1.1.4 Local Element

A **Local element** is an «*XSDelement*» stereotyped UML **attribute** that acts as a local XSD **element**. You can create it by dragging the **Element** icon from the XML Schema Toolbox and dropping it onto an «*XSDcomplexType*» or «*XSDgroup*» stereotyped **Class**.

### Toolbox Icon

**Access** **Drag icon onto «XSDcomplexType» or «XSDgroup» stereotyped Class**, or **Project Browser | Double-click on «XSDelement» stereotyped attribute**, or **Diagram | Highlight element | Highlight «XSDelement» stereotyped attribute | double-click on attribute**

### Define Properties

Field/Button	Action	See also
<b>Name</b>	If you do not want to use the default name of the local element, overwrite it with another name.	
<b>Type</b>	Either: <ul style="list-style-type: none"> <li>• Type the name of a data type, or</li> <li>• Click on the drop-down arrow and select an <b>XSD built-in dataType</b> from the list, or</li> </ul>	

	<ul style="list-style-type: none"> <li>Click on the browse ( <b>( ... )</b> ) button and browse for an existing <b>XSDcomplexType</b> or <b>XSDsimpleType</b> element as a classifier</li> </ul>	
<b>Reference</b>	(Optional) Specify whether to use the <i>ref</i> attribute (instead of the <i>type</i> attribute) to refer to the <b>XSDcomplexType</b> or <b>XSDsimpleType</b> element you selected in the <b>Type</b> field, in the generated XSD.	
<b>Value</b>	(Optional) If you have entered an XSD built-in data type in the <b>Type</b> field, type in a value.	
<b>Default</b>	Select this radio button to set the <b>Value</b> as a default value.	
<b>Fixed</b>	Select this radio button to set the <b>Value</b> as a fixed value.	
<b>MinOccurs</b>	(Optional) Type the minimum number of times this element must occur in the Class.  Type <b>0</b> to indicate that the element is optional.  The default value is <b>1</b> .	
<b>MaxOccurs</b>	(Optional) Type the maximum number of times this element can occur in the Class.  Type <b>unbounded</b> to indicate that there is no limit to the number of times the element can occur.  The default value is <b>1</b> .	
<b>Form</b>	(Optional) Click on the drop-down arrow and select whether or not to qualify the element: <ul style="list-style-type: none"> <li><b>qualified</b> - Use the <b>Prefix</b> defined in the Schema package to qualify this element</li> <li><b>unqualified</b> - Do not qualify this element</li> </ul>	<a href="#">Schema Package</a> <small>[2390]</small>
<b>Annotation</b>	(Optional) Type in any notes you need for this local element.	
<b>OK</b>	Click on this button to <b>save</b> the element data entered and close the XSD element Properties dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the element data entered and close the XSD element Properties dialog.	
<b>Help</b>	Click on this button to display this Help topic.	

<b>UML</b>	<p>This button is displayed when you are <b>editing</b> existing XSD element information.</p> <p>Click on the button to open the UML attribute Properties dialog for the local element.</p>	<a href="#">General Properties of Attributes</a> <sup>[1001]</sup>
------------	---	--

### Notes

- Only «*Complex Type*», «*Group*» and «*Model Group*» stereotyped elements can have this UML Attribute

#### 14.1.1.5 Global Attribute

A **Global Attribute** is an «*XSDtopLevelAttribute*» stereotyped Class. You can create it by dragging the **Attribute** icon from the XML Schema Toolbox and dropping it **directly** onto a diagram.

### Toolbox Icon

**Access** **Drag icon onto diagram**, or  
**Project Browser | Double-click on «XSDtopLevelAttribute» stereotyped element**, or  
**Diagram | right-click on «XSDtopLevelAttribute» stereotyped element | Properties**

### Define Properties

Field/Button	Action	See also
<b>Name</b>	If you do not want to use the default name of the global attribute, overwrite it with another name.	
<b>Type</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Type the name of a data type, or</li> <li>Click on the drop-down arrow and select an <b>XSD built-in dataType</b> from the list, or</li> <li>Click on the browse ( ( ... ) ) button and browse for an existing <b>XSDsimpleType</b> element as a classifier</li> </ul> <p>Alternatively, select the <b>Nested simpleType</b> checkbox (below).</p>	
<b>Nested</b>	Select this checkbox to create an <b>XSDsimpleType</b> element as a child of	<a href="#">Simple Type</a>

<b>simpleType</b>	this global attribute element.	
<b>Value</b>	(Optional) If you have selected an XSD built-in dataType in the <b>Type</b> field, type in a value.	
<b>Default</b>	Select this radio button to set the <b>Value</b> field as a <b>default</b> value.	
<b>Fixed</b>	Select this radio button to set the <b>Value</b> field as a <b>fixed</b> value.	
<b>Form</b>	(Optional) Click on the drop-down arrow and select: <ul style="list-style-type: none"> <li><b>qualified</b> to use any <b>Prefix</b> supplied on the Schema package to qualify this attribute, or</li> <li><b>unqualified</b> to show no qualifying prefix on the attribute name</li> </ul>	<a href="#">Schema Package</a> 
<b>Annotation</b>	(Optional) Type in any notes you need for this attribute.	
<b>OK</b>	Click on this button to <b>save</b> the attribute data entered and close the XSD attribute Properties dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the attribute data entered and close the XSD attribute Properties dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	This button is displayed when you are <b>editing</b> existing XSD element information.  Click on the button to open the UML element Properties dialog for the global attribute Class.	<a href="#">Properties</a> 

### Notes

- The field **Nested simpleType** is available in the dialog only when creating a new global attribute (and not when editing the global attribute)
- The fields **Type** and **Nested simpleType** are mutually exclusive; selecting one disables the other
- A Global attribute:
  - Cannot contain any UML attributes
  - Cannot be the **source** of an Association connector
  - **Can** be the **target** of an Association connector from a Complex Type Class
  - Cannot be the **target** of a Generalization connector
  - **Can** be the **source** of one Generalization connector to a Simple Type Class

### 14.1.1.8 Complex Type

An «XSDcomplexType» stereotype is applied to a generic UML Class, to tailor the generation of a *complexType* definition in the Schema. You can create an «XSDcomplexType» stereotyped Class by dragging the **Complex Type** icon from the XML Schema Toolbox and dropping it **directly** onto a diagram.

#### Toolbox Icon

**Access**    **Drag icon onto diagram**, or  
**Project Browser | Double-click on «XSDcomplexType» stereotyped element**, or  
**Diagram | right-click on «XSDcomplexType» stereotyped element | Properties**

#### Define Properties

Field/Button	Action	See also
<b>Name</b>	If you do not want to use the default name of the complexType Class, overtype it with another name.	
<b>Model Group</b>	Click on the down-arrow and select the option that defines how the child elements of this complexType should occur in the Schema. <ul style="list-style-type: none"> <li>• <b>sequence</b> - the child elements must occur in the specified order</li> <li>• <b>choice</b> - only one of the child elements can occur</li> <li>• <b>all</b> - the child elements can occur in any order</li> </ul>	
<b>MinOccurs</b>	(Optional) Type the minimum number of times this element must occur in the Class.  Type <b>0</b> to indicate that the element is optional.  The default value is <b>1</b> .	
<b>MaxOccurs</b>	(Optional) Type the maximum number of times this element can occur in the Class.  Type <b>unbounded</b> to indicate that there is no limit to the number of times the element can occur.  The default value is <b>1</b> .	
<b>Annotation</b>	(Optional) Type any notes you need for this element.	
<b>Abstract</b>	(Optional) Select this checkbox to use this complexType in an <b>instance XML</b> file.	

<b>Mixed</b>	(Optional) Select this checkbox to allow character data to display among the child elements.	
<b>OK</b>	Click on this button to <b>save</b> the complexType data entered and close the XSD complexType Properties dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the complexType data entered and close the XSD complexType Properties dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	<p>This button is displayed when you are <b>editing</b> existing XSD complexType information.</p> <p>Click on the button to open the UML element Properties dialog for the complexType Class.</p>	<a href="#">Properties</a> [956]

#### Notes

- A complexType can:
  - Contain both *XSDelement* and *XSDattribute* stereotyped UML attributes
  - Contain other complexTypes as child elements
  - Be a child of a Global Element
  - Be the **source** of Association connectors to other complexTypes, Simple Types, Attribute Groups, Groups and Model Groups
  - Be the **source** of a maximum of **one** Generalization connector to either another complexType or a Simple Type Class

### Notes

- An Any Class:
  - Cannot **contain** any UML Attributes or child XSD Classes
  - Cannot be the **child** of any XSD Class
  - Cannot be the **target** of a Generalization connector
  - Cannot be the **source** of an Association or Generalization connector
  - Can be the **target** of Association connectors from Complex Types, Groups and Model Groups
  - **Must** be the **target** of at least **one** incoming Association connector

#### 14.1.1.12 Any Attribute

The «XSDany» stereotyped UML **attribute** allows a Complex Type element or an Attribute Group element to contain **attributes** that are not specified in the Schema package. You can create it by dragging the **Any Attribute** icon from the XML Schema Toolbox and dropping it onto an «XSDcomplexType» or «XSDataAttributeGroup» stereotyped Class.

##### Toolbox Icon

**Access** Drag icon onto «XSDcomplexType» or «XSDataAttributeGroup» stereotyped Class, or Project Browser | Double-click on «XSDany» stereotyped attribute, or Diagram | Highlight element | Highlight «XSDany» stereotyped attribute | double-click on attribute

##### Define Properties

## 14.1.1.13 Union

A **Union** Class is a Simple Type element that defines a **collection** of Simple Types. You can create it by dragging the **Union** icon from the XML Schema Toolbox and dropping it **directly** on a diagram.

### Toolbox Icon

**Access** **Drag icon onto diagram, or Project Browser | Double-click on «XSDunion» stereotyped element, or Diagram | right-click on «XSDunion» stereotyped element | Properties**

### Define Properties

Field/Button	Action	See also				
<b>Name</b>	If you do not want to use the default name of the Union, overtype it with another name.					
<b>Member Types</b>	<div><div>Click on the <b>Browse</b> button (( ... )) to display the XSD Union Members dialog, and select built-in XSD datatypes and Simple Type elements to be members of the collection.</div><table><tr><th>Field/Button</th><th>Action</th></tr><tr><td><b>Class Name</b></td><td>Either:<ul style="list-style-type: none"><li>Type in an existing or proposed Class name</li></ul></td></tr></table></div>	Field/Button	Action	<b>Class Name</b>	Either: <ul style="list-style-type: none"><li>Type in an existing or proposed Class name</li></ul>	<a href="#">Simple Type</a> <sup>[2402]</sup>
Field/Button	Action					
<b>Class Name</b>	Either: <ul style="list-style-type: none"><li>Type in an existing or proposed Class name</li></ul>					

	Field/Button	Action
		<ul style="list-style-type: none"> <li>Click on the down arrow and select an XSD d</li> </ul> <p>Select the <b>Accept classifier even if not in model</b> checkbox and click the <b>Add</b> button.</p> <p>These options are generally used to specify objects to the same package as the Union element.</p>
	<b>Choose</b>	<p>Instead of typing or selecting values in the <b>Class Name</b> field, click the <b>Choose</b> button to display the Select Classifier browser and locate the Simple Type element.</p> <p>Click on the <b>OK</b> button to close the browser and immediately add the selected element to the <b>Type Details</b> list.</p> <p>This option is generally used to specify objects that are in the same package as the Union element, but you can select objects from a different package also.</p>
	<b>Add</b>	Click on this button to add the data type or element selected in the <b>Name</b> field to the <b>Type Details</b> list.
	<b>Accept classifier even if not in model</b>	Select this checkbox to include elements or data types that are named but that are not present in the same model package as the Union element.
	<b>Type Details</b>	Review the list of selected elements or data types. If you want to remove an object from the list, highlight it and click on the <b>Selected</b> button (below).
	<b>Delete Selected</b>	Click on this button to remove the currently-selected object from the <b>Type Details</b> list.
	<b>Close</b>	Click on this button to close the XSD Union Members dialog. This will remove the selected elements and data types in the <b>Member</b> list.
<b>Annotation</b>	(Optional) Type any notes you need for this element.	
<b>OK</b>	Click on this button to <b>save</b> the attribute data entered and close the XSD union Properties dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the attribute data entered and close the XSD union Properties dialog.	

<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	<p>This button is displayed when you are <b>editing</b> existing «XSDunion» element information.</p> <p>Click on the button to open the UML element Properties dialog for the «XSDunion» element.</p>	<a href="#">Properties</a> 

### Notes

- When you click on the **Close** button on the XSD union Properties dialog, a Generalization connector is added to the diagram from the XSD Union element to each of the member elements on the same diagram; any elements **not** on the same diagram are listed in the top right corner of the XSD Union element
- If the Member Types that are not on the same diagram as the Union element are **not** listed, select **Tools | Options | Diagram | Behavior** and select the **Show 'Hidden' Parents** checkbox
- A Union element:
  - Cannot contain any child Classes
  - Cannot contain any «XSDelement» or «XSDattribute» stereotyped UML attributes
  - Cannot be the **source** of an Association connector
  - Can be the **target** of an Association connector from a Complex Type element
  - Can be the **target** of a Generalization connector from a Simple Type element

- [Complex Type](#) 

#### 14.1.1.14 Model Group

You can create an «XSDsequence», «XSDchoice» or «XSDall» stereotyped Class by dragging the **Model Group** icon from the XML Schema Toolbox and dropping it **directly** onto a diagram.

An «XSDsequence» model group (the default model group type) is a container for the attributes and associations owned by the Class. The model group is in turn added to the model groups of the Class's respective owners. Tagged Values specified by owners of the Class persist through to the child elements of the model group; if **memberNames** are unqualified for a **complexType**, so are the children of this model group when added to that complexType.

### Toolbox Icon

**Access** **Drag icon onto diagram**, or  
**Project Browser | Double-click on «XSDsequence», «XSDchoice» or «XSDall» stereotyped element**, or  
**Diagram | right-click on «XSDsequence», «XSDchoice» or «XSDall» stereotyped element | Properties**

**Define Properties**

Field/Button	Action	See also
<b>Name</b>	If you do not want to use the default name of the Model Group, overwrite it with another name.	
<b>Model Group</b>	<p>Click on the drop-down arrow and select the value that defines how the child elements of this group should occur in the Complex Type Class:</p> <ul style="list-style-type: none"> <li>• <b>sequence</b> - to specify that the child elements must occur in the specified order; creates an «<i>XSDsequence</i>» stereotyped Class</li> <li>• <b>choice</b> - to specify that only one of the child elements can occur; creates an «<i>XSDchoice</i>» stereotyped Class</li> <li>• <b>all</b> - to specify that the child elements can occur in any order; creates an «<i>XSDall</i>» stereotyped Class</li> </ul>	<a href="#">Complex Type</a> <small>[240]</small>
<b>MinOccurs</b>	<p>(Optional) Type the minimum number of times this element must occur in the Class.</p> <p>Type <b>0</b> to indicate that the element is optional.</p> <p>The default value is <b>1</b>.</p>	
<b>MaxOccurs</b>	<p>(Optional) Type the maximum number of times this element can occur in the Class.</p> <p>Type <b>unbounded</b> to indicate that there is no limit to the number of times the element can occur.</p> <p>The default value is <b>1</b>.</p>	
<b>Annotation</b>	(Optional) Type any notes you need for this element.	
<b>OK</b>	Click on this button to <b>save</b> the Model Group data entered and close the XSD element Properties dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the Model Group data entered and close the XSD element Properties dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	<p>This button is displayed when you are <b>editing</b> existing Model Group element information.</p> <p>Click on the button to open the UML element Properties dialog for the Model Group Class.</p>	<a href="#">Properties</a> <small>[956]</small>

**Notes**

- A Model Group:
  - Can contain only «*XSDelement*» stereotyped UML attributes
  - Can contain Complex Types and Simple Types as child elements
  - Can be the **source** of Association connectors to Complex Type, Simple Type, Group and Model Group elements
  - Must be the **target** of least **one** incoming Association connector from a Complex Type

## 14.1.2 XML from Abstract Class Models

You can model XML schemas using only simple, abstract Class models. This makes it possible for an architect, for example, to start working at a higher level of abstraction without concern for the implementation details of a Schema. Whilst such an abstract model can subsequently be refined using the XML Schema pages of the Toolbox, it can be also be generated **directly** by Enterprise Architect's **Schema Generator**, in which case the Schema Generator applies a set of **default mappings** to convert the abstract model to an XSD file.

### Example

Structure	Detail
<b>Diagram</b>	<p>This is a simple Class element version of the earlier <i>Employee Details</i> example model. It does not use XSD-specific stereotypes or Tagged Values.</p>  <pre> classDiagram     class EmployeeRecords     class Person {         - birthDate: string         - firstName: string         - gender: string         - surName: string     }     class Employee {         - department: string         - jobTitle: string         - startDate: Date         - status: Status     }     class ContactInfo {         - email: string         - homePhone: string         - mobilePhone: string         - officePhone: string         - streetAddress: string     }     class Status {         «enumeration»         Full-Time         Part-Time         Casual         Contract     }     EmployeeRecords "0..*" --&gt; Employee     Employee &lt; -- Person     Person "1" --&gt; ContactInfo : +contactDetails   </pre>
<b>Schema</b>	<p>This schema fragment can be generated from the above model:</p> <pre> &lt;?xml version="1.0"?&gt; &lt;xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"&gt;   &lt;xs:simpleType name="Status"&gt;     &lt;xs:restriction base="xs:string"&gt;       &lt;xs:enumeration value="Full-Time"/&gt;       &lt;xs:enumeration value="Part-Time"/&gt;       &lt;xs:enumeration value="Casual"/&gt;       &lt;xs:enumeration value="Contract"/&gt;     &lt;/xs:restriction&gt;   &lt;/xs:simpleType&gt;   &lt;xs:element name="Person" type="Person"/&gt;   &lt;xs:complexType name="Person"&gt;     &lt;xs:sequence&gt;       &lt;xs:element name="firstName" type="xs:string"/&gt;       &lt;xs:element name="surName" type="xs:string"/&gt;       &lt;xs:element name="birthDate" type="xs:string"/&gt;       &lt;xs:element name="gender" type="xs:string"/&gt;       &lt;xs:element name="contactDetails" type="ContactInfo"/&gt;     &lt;/xs:sequence&gt;   &lt;/xs:complexType&gt;   &lt;xs:element name="Employee" type="Employee"/&gt;   &lt;xs:complexType name="Employee"&gt;     &lt;xs:complexContent&gt;       &lt;xs:extension base="Person"&gt;         &lt;xs:sequence&gt;           &lt;xs:element name="status" type="Status"/&gt;           &lt;xs:element name="jobTitle"   </pre>

Structure	Detail
	<pre> type="xs:string"/&gt;                                 &lt;xs:element name="startDate" type="xs:date"/&gt;                                 &lt;xs:element name="department" type="xs:string"/&gt;                                 &lt;/xs:sequence&gt;                                 &lt;/xs:extension&gt;                                 &lt;/xs:complexContent&gt; &lt;/xs:complexType&gt; &lt;xs:element name="EmployeeRecords" type="EmployeeRecords"/&gt; &lt;xs:complexType name="EmployeeRecords"&gt;   &lt;xs:sequence&gt;     &lt;xs:element name="Employee" type="Employee" minOccurs="0" maxOccurs="unbounded"/&gt;   &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;xs:element name="ContactInfo" type="ContactInfo"/&gt; &lt;xs:complexType name="ContactInfo"&gt;   &lt;xs:sequence&gt;     &lt;xs:element name="homePhone" type="xs:string"/&gt;     &lt;xs:element name="mobilePhone" type="xs:string"/&gt;   &gt;     &lt;xs:element name="officePhone" type="xs:string"/&gt;   &gt;     &lt;xs:element name="email" type="xs:string"/&gt;     &lt;xs:element name="streetAddress" type="xs: string"/&gt;   &lt;/xs:sequence&gt; &lt;/xs:complexType&gt; &lt;/xs:schema&gt; </pre>

#### 14.1.2.1 Default UML to XSD Mappings

When you are defining simple schemas using **abstract Class models**, the Enterprise Architect Schema Generator translates the UML information to XSD using a **default mapping of UML to XSD constructs**. These defaults are also used by the Schema Generator to generate **unstereotyped** elements in an abstract model.

When you model XML Schema using the XML Schema pages of the Diagram Toolbox, the stereotypes and Tagged Values of the Toolbox elements override the default mappings.

#### Constructs

UML Construct	Default XSD Production Rules
<b>Package</b>	A <b>Schema</b> element is generated for the target package. If the target package includes Classes from another package, which has the Tagged Values <b>targetNamespace</b> and <b>targetNamespacePrefix</b> set, these are included as attributes of the Schema element.

UML Construct	Default XSD Production Rules
	<p>In addition, an <b>import</b> or <b>include</b> element is created for each referenced package:</p> <ul style="list-style-type: none"> <li>An <b>include</b> element is used if the external package shares the same <b>targetNamespace</b> Tagged Value as the target package</li> <li>An <b>import</b> element is used where the <b>targetNamespaces</b> differ</li> </ul>
<b>Class</b>	A root-level element declaration and <b>complexType</b> definition are generated. The element name and type are the same as the Class name. An XSD <b>sequence Model Group</b> is also generated, to contain UML attributes generated as elements.
<b>Attribute</b>	<p>An <b>element</b> is declared for each Class attribute. The element name is set to that of the UML attribute name. This is prefixed with the <b>Class</b> name to make the element unique. The <b>minOccurs</b> and <b>maxOccurs</b> attributes are set to reflect the attribute cardinality.</p> <p>If the attribute refers to another Class, the element declaration is followed by a <b>complexType</b> definition, which contains a reference to the appropriate complexType.</p>
<b>Association</b>	An <b>element</b> is declared for each Association owned by a Class. The element name is set to that of the Association <b>role</b> . The <b>minOccurs</b> and <b>maxOccurs</b> attributes reflect the cardinality of the Association.
<b>Generalization (Inheritance)</b>	For single inheritances, an <b>extension element</b> is generated with the base attribute set to the base Class name. The UML attributes of the child Class are then appended to an <b>XSDall Model Group</b> within the extension element.
<b>Enumeration</b>	A <b>simpleType</b> element is declared for the Enumeration with the name attribute set to the Enumeration name. A Restriction element is generated with base set to <b>string</b> . Each of the Enumeration attributes is appended to the Restriction element as XSD Enumeration elements with value set to the UML attribute name. Any type specification for the UML attributes is ignored by the schema generator.

#### Notes

- If left unspecified, the **minOccurs** and **maxOccurs** attributes default to **1**
- If the direction of the Association is unspecified, the owner is assumed to be the source

### 14.1.3 Generate XSD

When you have developed your XML Schema model, either as an abstract Class model or a tailored XSD Class model, you can forward-engineer it into W3C XML Schema (XSD) files using the **Generate XML Schema** feature. As an XML Schema corresponds to a UML package in Enterprise Architect, XML Schema generation is a package-level operation.

You define the location of the file into which the XML Schema is to be generated, in the Schema Package element in your model.

**Access** [Project Browser](#) | [Click on source Package](#) | [Tools](#) | [XML Schema](#) | [Generate XML Schema](#), or [Project Browser](#) | [Right-click source Package](#) | [Code Engineering](#) | [Generate XML Schema](#)

#### Generate Schema files

Field/Option/Button	Action	See also
<b>Encoding</b>	Either: <ul style="list-style-type: none"> <li>Click on the drop-down arrow and select the XML encoding scheme to use, or</li> <li>Click on the <b>Default</b> button to apply the default encoding scheme (UTF-8)</li> </ul>	
<b>Generate global element for all global ComplexTypes ('Garden of Eden' style)</b>	Selected by default to generate Schema in the <b>Garden of Eden</b> style, containing a global element.  Clear the checkbox if you want to omit the global element.	<a href="#">Generate Global Element</a> <sup>[2418]</sup>
<b>Generate XSD for Referenced packages</b>	Select the checkbox to generate Schema for packages that are <b>referenced</b> by any of the packages selected on this dialog.	
<b>Prompt when missing Filename</b>	Select the checkbox to prompt, during Schema generation, for a filename for a referenced package if the path into which to generate the Schema file is missing.  This option is not available if the <b>Generate XSD for Referenced packages</b> option is not selected.	
<b>Use relative-path to reference XSDs (if 'schemaLocation' tag is empty)</b>	Select the checkbox to use a relative-path in the <i>XSD import</i> (or <i>XSD include</i> ) statement when referencing external packages, provided that the <i>schemaLocation</i> tag is empty on the referenced packages.  You set the <b>Schema File</b> field on the XSD Schema Properties dialog (the element Properties dialog for a Schema element) for the referenced and referencing <i>XSDschema</i> stereotyped packages, so that the relative-path is correctly determined.	<a href="#">Schema Package</a> <sup>[2390]</sup>

Field/Option/Button	Action	See also
<b>Generate XSD for Child packages</b>	<p>Select the checkbox to generate schema for child packages of the selected package, and then select either:</p> <ul style="list-style-type: none"> <li>• <b>Include all packages</b> - to list all child packages under the parent package in the list box, or</li> <li>• <b>Include &lt;XSDschema&gt; packages</b> - to list only those packages that have the stereotype «<i>XSDschema</i>»</li> </ul> <p>The list-box shows, for each package, the package name and the file path into which the Schema file can be generated.</p> <p>To change the file path for a package, double-click on the entry in the list-box, and type in or browse for the new file path in the prompt field.</p> <p>Select the checkbox against each package for which to generate Schema.</p>	
<b>Generate</b>	Click on this button to generate the Schema for each of the packages selected in the list-box.	
<b>Close</b>	Click on this button to close the dialog, without saving your option selections.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>View Schema</b>	Click on this button to view the generated Schema for a package highlighted in the list-box.	
<b>Progress</b>	Check the progress of Schema generation.

### 14.1.3.1 Generate Global Element

Enterprise Architect, by default, generates XML Schema in the **Garden of Eden** style. For every global *XSDcomplexType* stereotyped Class, the system generates a global element.

#### Example

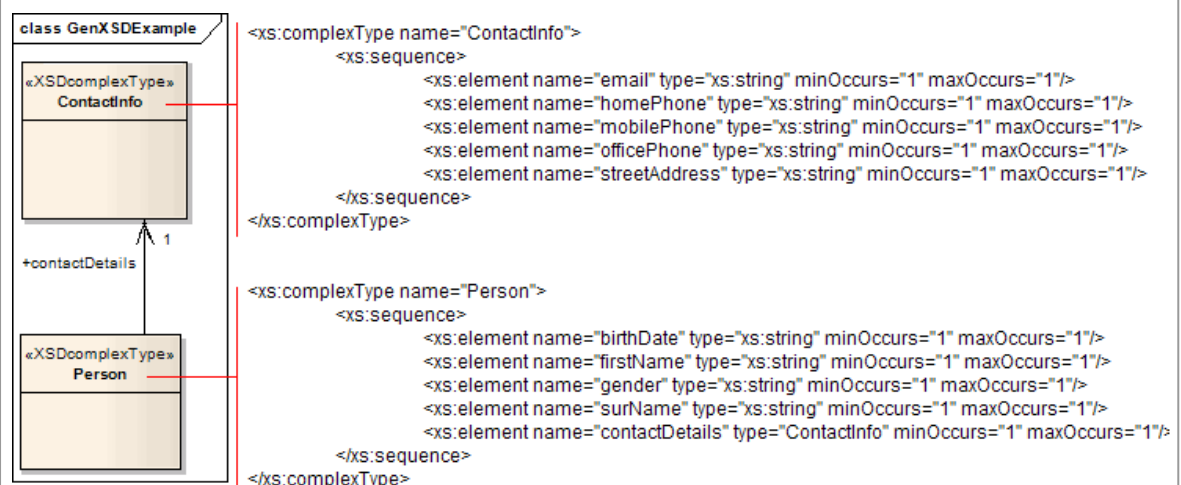

## Diagram

You can change the above specified default behaviour by de-selecting the **Generate global element for all global ComplexTypes** checkbox on the Generate XML Schema dialog. Then, the generated XSD no longer contains the global element; that is, it no longer has the lines:

- `<xs:element name="ContactInfo" type="ContactInfo"/>` and
- `<xs:element name="Person" type="Person"/>`

## Diagram

### 14.1.4 Import XSD

To reverse engineer a W3C XML Schema (XSD) file to create or overwrite a package of your UML Class model, you can use the **XML Schema Import** facility.

Access   **Project Browser | Click on target Package | Tools | XML Schema | Import XML Schema**, or  
**Project Browser | Right-click target Package | Code Engineering | Import XML Schema**

Import Schema files

Field/Option/ Button	Action	See also
<b>Root Package</b>	Displays the name of the selected package.	
<b>Directory</b>	Type in or browse for (click on ( ... )) the directory containing the source XSD file(s).	
<b>Selected File(s)</b>	Lists the XML Schema(s) currently available for import. <ul style="list-style-type: none"> <li>• To select a single file, click on it</li> <li>• To select several individual files ( <b>Ctrl</b> ) + <b>click</b> on each file</li> <li>• To select a range of files, press ( <b>Shift</b> ) and select the first and last file in the range</li> </ul>	
<b>Import global elements with "Type" postfix</b>	Select this checkbox to treat the global element and the <i>ComplexType</i> it is referring to as two separate entities.	<a href="#">Global Element and ComplexType</a> 
<b>Import referenced XML Schema(s)</b>	Select this checkbox to import any XML Schema that is being referenced by any of the files selected in the <b>Selected File(s)</b> field.	
<b>Create Diagram for XML Schema(s)</b>	Select this checkbox to create a <b>Class</b> diagram under each imported <i>XSDschema</i> package.	
<b>Import XSD Elements/ Attributes as</b>	Select the appropriate radio button to indicate how the inline <i>XSDelements</i> and <i>XSDattributes</i> are to be imported into a Class, either as: <ul style="list-style-type: none"> <li>• UML Associations or</li> <li>• UML attributes</li> </ul>	

<b>Import</b>	Click on this button to begin the XSD import.	
<b>Close</b>	Click on this button to close the dialog, without saving your option selections.	
<b>Help</b>	Click on this button to display this Help topic	
<b>Progress</b>	<p>Displays system messages indicating the progress of the Schema import.</p> <p>On imports containing a large number of external references, it can be useful to capture the progress messages to check exactly what has been imported. To do this, right-click on the messages and:</p> <ul style="list-style-type: none"> <li>• Copy the selected messages to the clipboard (select the <b>Copy Selected to Clipboard</b> menu option)</li> <li>• Copy all the messages to the clipboard (select the <b>Copy All to Clipboard</b> menu option), or</li> <li>• Save all the messages to a file (select the <b>Save to File</b> menu option)</li> </ul>	

### Notes

- If an XML Schema file being imported already exists in the model, Enterprise Architect skips importing the file
- References to XSD *Primitive Types* are always imported as UML attributes
- References to XSD constructs in external Schema files are always imported as UML attributes
- Enterprise Architect uses the *schemaLocation* attribute in the *XSD Import* and *XSD Include* elements of an XML Schema to determine the dependencies between the files; this attribute must be set to a valid file path (and not a URL) for the dependent XML Schema(s) to be imported correctly

#### 14.1.4.1 Global Element and ComplexType

Some XML Schemas have **ComplexType** elements with the same name as the referring global elements, but with the suffix *Type*, as shown below:

```
<xs:element name="Address" type="AddressType" />
<xs:complexType name="AddressType">
  <xs:sequence/>
</xs:complexType>
```

On XSD import, by default, Enterprise Architect treats this global element and its bounding ComplexType as a single entity, and creates a single **XSDcomplexType** stereotyped Class with the same name as the global element, as shown below:

You can change this default behaviour by selecting the **Import global elements with "Type" postfix** checkbox on the Import XML Schema dialog. When you select this option, the system treats the global element and the ComplexType it is referring to as two separate entities. For the above example, the system creates an «XSDtopLevelElement» stereotyped Class for the global element and an «XSDcomplexType» stereotyped Class for the ComplexType, connected as shown:

### Notes

- Enterprise Architect treats the following as two separate entities irrespective of whether the **Import global elements with "Type" postfix** checkbox is selected or unselected:

```

<xs:element name="HomeAddress" type="AddressType" />
<xs:complexType name="AddressType">
  <xs:sequence />
</xs:complexType>
  
```

## 14.2 Web Services - WSDL

**Web Services Description Language 1.1 (WSDL)** is a key XML-based, World Wide Web Consortium (**W3C**) language for describing web services. WSDL support is critical for the development of a complete **Service Oriented Architecture (SOA)**, and the coupling of UML 2.4.1 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization.

Using Enterprise Architect, you can rapidly model, forward engineer and reverse engineer WSDL files.

### 14.2.1 WSDL 1.1 Model Structure

A Web Service Description Language (WSDL), under specification 1.1, is defined within a «*WSDLnamespace*» stereotyped Package, which represents the top-level container for the WSDL elements. Conceptually it maps to the *targetNamespace* in a WSDL definition element.

When you create a WSDL model, Enterprise Architect creates the Namespace and provides a set of sub-packages, each containing a diagram on which to define the constituent elements of the model, with an Overview diagram to navigate between the sub-packages. You work through the sub-packages in sequence, to define the objects that are used by later objects, themselves called into still later objects.

### WSDL Structure Development

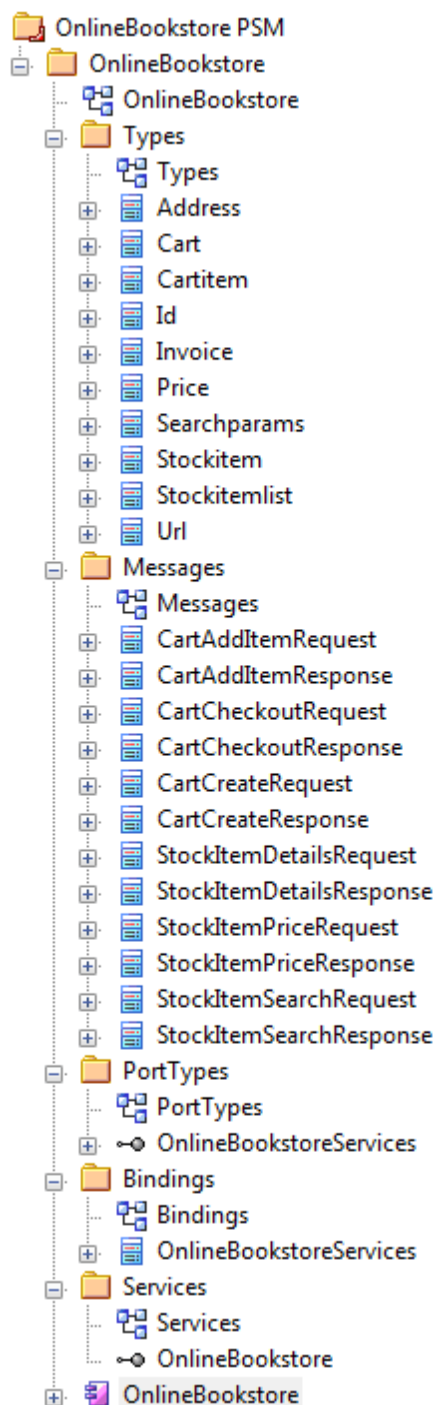

WSDL Element Type	Description	See also
<b>Types</b>	Defined in an <b>XSD Schema</b> , these are the <b>XSD data types</b> used by the web service and communicated by WSDL <b>Messages</b> ; you drag « <i>XSDElement</i> », « <i>XSDsimpleType</i> » and « <i>XSDcomplexType</i> » stereotyped elements onto the Types diagram from the XML Schema page of the Diagram Toolbox.	<a href="#">Model XSD</a> <sup>[2387]</sup>
<b>Messages</b>	WSDL <b>Messages</b> identify the data being communicated by a web service. Each Message element contains one or more <b>Message Parts</b> , which are attributes that each identify an XSD <b>data type</b> being communicated.	<a href="#">WSDL Message</a> <sup>[2430]</sup> <a href="#">WSDL Message Part</a> <sup>[2431]</sup>

<b>Port Types</b>	WSDL <b>Port Types</b> are the essential core of the web service, defining the <b>interfaces</b> of the service. Each Port Type consists of a set of <b>Port Type Operations</b> , each of which identifies an exchange of Messages (data input to and output from the interface as that operation). The Port Type Operation can also identify Messages acting as <b>Fault</b> indicators.	<a href="#">WSDL Port Type</a> <sup>[2433]</sup> <a href="#">WSDL Port Type Operation</a> <sup>[2434]</sup>
<b>Bindings</b>	A <b>Binding</b> specifies the protocol and data format for the operations and messages defined for of a particular <b>Port Type</b> . Each « <i>WSDLbinding</i> » Class implements (realizes) the operations specified by the « <i>WSDLportType</i> » Interface - the <b>Port Type Operations</b> in the Port Type element are automatically copied into the Binding element as <b>Binding operations</b> .	<a href="#">WSDL Binding</a> <sup>[2437]</sup> <a href="#">WSDL Binding Operation</a> <sup>[2438]</sup>
<b>Services</b>	A WSDL <b>Service</b> defines a formal interface of the web service. It describes the collection of <b>Port Types</b> that expose a particular <b>Binding</b> , having an Association to each exposed Binding. It therefore encapsulates a set of the other data structures - if not all the data structures - defined in the model.	<a href="#">WSDL Service</a> <sup>[2441]</sup>
<b>Documents</b>	WSDL Documents are represented by <b>Components</b> having the stereotype « <i>WSDL</i> ». This is the element from which you <b>generate</b> the <b>WSDL file</b> .  You can create more than one Document to re-use the schema Types, Messages, Port Types, Bindings and Services of a Namespace across multiple physical WSDL documents, either in the same configuration or in different configurations.	<a href="#">WSDL Document</a> <sup>[2443]</sup>

### Example

This figure shows an example WSDL namespace, *OnlineBookstore PSM*, which includes a single WSDL document, *OnlineBookstore* (at the bottom of the hierarchy).

### Notes

- You can also generate a WSDL Package structure from a UML Interface using the **WSDL Model Transformation**

## 14.2.2 Model WSDL

You can quickly and easily model the elements in a Web Service Definition using the **WSDL page** of the Diagram Toolbox. As a first step, you can create an example **WSDL Package** structure in the Project Browser, using the **Namespace** icon from the WSDL page. You can use this example package structure as a template for developing your WSDL.

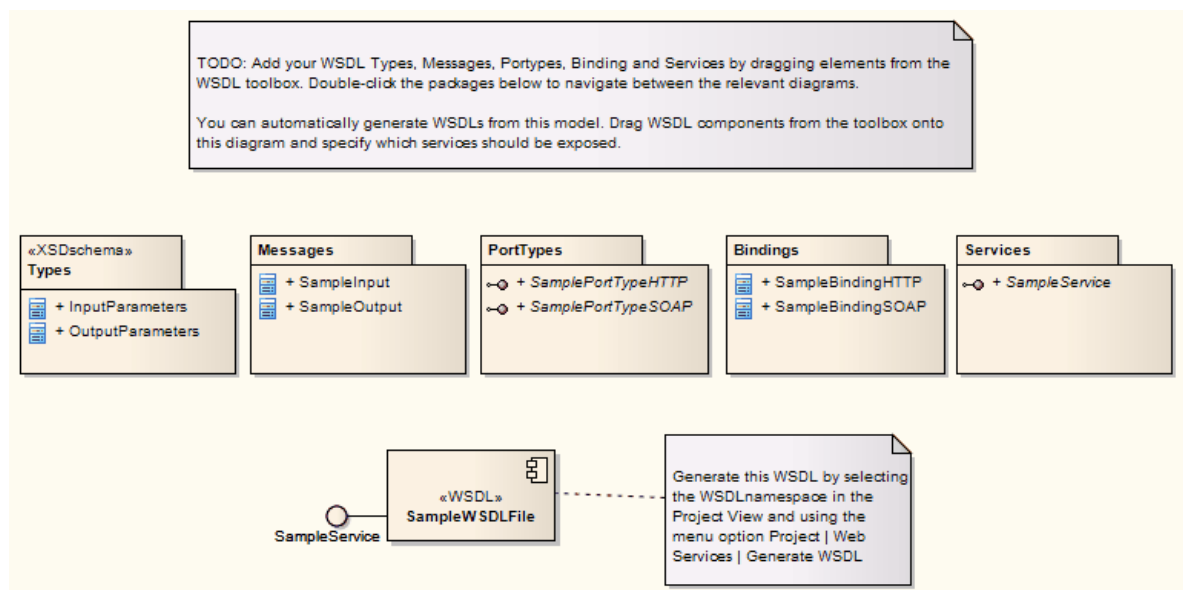

#### Create a new WSDL Package structure

Step	Action	See also
1	In the Project Browser, create the top-level project structure you need (Model and Views), and click on the appropriate View.	<a href="#">Models</a> <sup>[753]</sup> <a href="#">Views</a> <sup>[769]</sup>
2	Click on the <b>New Package</b> icon in the Project Browser toolbar. The New Model Package dialog displays.	<a href="#">Project Browser Toolbar</a> <sup>[669]</sup>
3	In the <b>Name</b> field type the name of the new package, and select the <b>Automatically add new diagram</b> and <b>Open new diagram</b> checkboxes.	<a href="#">Add a Package</a> <sup>[772]</sup>
4	Click on the <b>OK</b> button. The New Diagram dialog displays.	
5	In the <b>Name</b> field type the name of the new diagram. In the Select From panel select <b>UML Structural</b> , and in the Diagram Types panel select <b>Class</b> .	<a href="#">Add New Diagrams</a> <sup>[822]</sup>
6	Click on the <b>OK</b> button. The new Class diagram opens in the Diagram View, with the Class pages displaying in the Diagram Toolbox.	<a href="#">Diagram Toolbox</a> <sup>[792]</sup>
7	Click on the <b>More tools</b> option in the Toolbox and select <b>Extended   WSDL</b> . The WSDL Toolbox page displays.	<a href="#">WSDL Toolbox</a> <sup>[817]</sup>

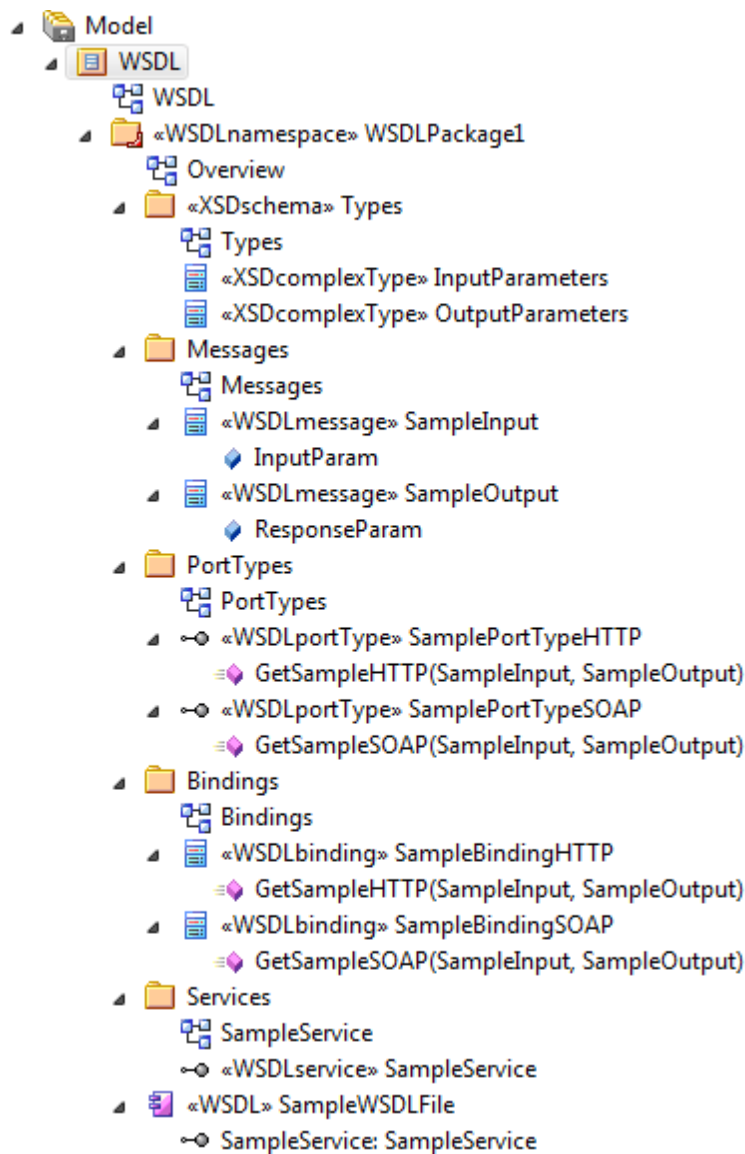

8	<p>Click on the <b>Namespace</b> icon from the Toolbox and drag it into the Class diagram.</p> <p>The WSDL Namespace Properties dialog displays.</p> <p>Type in a <b>WSDL Package Name</b> and the URL of the <b>Target Namespace</b>. You can edit these values later.</p>	<a href="#">WSDL Namespace</a>  [2428]
9	<p>Click on the <b>OK</b> button.</p> <p>The sample «<i>WSDLnamespace</i>» stereotyped package structure is created on the diagram, and the full model structure is displayed, expanded, in the Project Browser (see below).</p> <p>The model structure consists of the following sub-packages, with an Overview diagram to navigate between the sub-packages:</p> <ul style="list-style-type: none"> <li>• <b>Types</b>: Contains the XSD types for the data communicated by the web service, on a <b>Types</b> diagram</li> <li>• <b>Messages</b>: Contains the WSDL <b>Messages</b>, modeled as UML Classes marked with the stereotype «<i>WSDLmessage</i>»</li> <li>• <b>PortTypes</b>: Contains the WSDL <b>Port Types</b>, modeled as UML interfaces marked with the stereotype «<i>WSDLportType</i>»</li> <li>• <b>Bindings</b>: Contains the WSDL <b>Bindings</b>, modeled as UML Classes that realize the PortTypes</li> <li>• <b>Services</b>: Contains the WSDL <b>Services</b>, modeled as UML interfaces with Associations to each exposed Binding</li> </ul>	<a href="#">WSDL 1.1 Model Structure</a>  [2423] <a href="#">Model XSD</a>  [2387]
10	<p>Model each of the WSDL constructs in their corresponding Packages.</p>	<a href="#">WSDL Message</a>  [2430] <a href="#">WSDL Message Part</a>  [2431] <a href="#">WSDL Port Type</a>  [2433] <a href="#">WSDL Port Type Operation</a>  [2434] <a href="#">WSDL Binding</a>  [2437] <a href="#">WSDL Binding Operation</a>  [2438] <a href="#">WSDL Service</a>  [2441] <a href="#">WSDL Document</a>  [2443]

### Template WSDL Model - Diagram

The *WSDLnamespace* Package acts as a container for the WSDL structure.

### Template WSDL Model - Project Browser Hierarchy

### 14.2.2.1 WSDL Namespace

A «WSDLnamespace» stereotyped Package represents the top-level container for the WSDL constructs in Enterprise Architect. You can create the Namespace package by dragging the **Namespace** icon from the WSDL Toolbox page and dropping it directly onto a diagram.

#### Toolbox Icon

**Access**    **Drag icon onto diagram** or  
**Project Browser | Double-click on «WSDLnamespace» stereotyped Package element**

#### Define Properties

Field/Option/ Button	Action	See also
<b>WSDL Package Name</b>	Type in the name of the WSDL Namespace Package element.	
<b>Target Namespace</b>	(Optional) Type in the URL for the WSDL Namespace package.	
<b>OK</b>	Click on this button to save the values entered and close the WSDL Namespace Properties dialog.  If you have just created the Namespace, a new Package diagram opens containing the sample template WSDL model.	<a href="#">Model WSDL</a> <sup>[2426]</sup>
<b>Cancel</b>	Click on this button to <b>discard</b> the data entered and close the WSDL Namespace Properties dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	This button is displayed when you are <b>editing</b> existing WSDL Namespace element information.  Click on the button to open the UML element Properties dialog for the Namespace Package element.	<a href="#">Properties</a> <sup>[956]</sup>

- [WSDL 1.1 Model Structure](#) <sup>[2423]</sup>

### 14.2.2.2 WSDL Message

A «WSDLmessage» stereotyped Class represents a WSDL **Message** and acts as a container for one or more WSDL **Message Parts**. You can create WSDL Messages by dragging the **Message** icon from the WSDL Toolbox and dropping it directly onto the Messages diagram (under the **Messages package** in the WSDL Package structure).

#### Toolbox Icon

**Access** Drag icon onto diagram, or  
Project Browser | Double-click on «WSDLmessage» stereotyped element, or  
Diagram | right-click on «WSDLmessage» stereotyped element | Properties

#### Define Properties

Field/Option/ Button	Action	See also
<b>Name</b>	Type in the name of the WSDL Message.	
<b>Documentation</b>	(Optional) Type in any notes you need for this element.	
<b>OK</b>	Click on this button to <b>save</b> the data entered and close the WSDL Message dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the data entered and close the WSDL Message dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	This button is displayed when you are <b>editing</b> existing WSDL Message element information.  Click on the button to open the UML Class Properties dialog for the element.	<a href="#">Properties</a> 956

### Notes

- WSDL Messages can only be created under the *Messages* package in the WSDL Package structure
- The name of the WSDL Message should be unique amongst all WSDL Messages within the WSDL

### Learn more

- [WSDL 1.1 Model Structure](#) <sup>[2423]</sup>
- [Model WSDL](#) <sup>[2426]</sup>

#### 14.2.2.2.1 WSDL Message Part

A **WSDL Message Part** is the segment of a **WSDL Message** that identifies the XSD data type of the data communicated by the Message. If a Message communicates data of more than one data type, each data type is identified in a **separate** Message Part.

In Enterprise Architect, a WSDL Message Part is represented by a UML **attribute** of the WSDL Message Class. You can create the Message Part attribute by dragging the **Message Part** icon from the WSDL Toolbox and dropping it onto a «WSDLmessage» stereotyped Class.

### Toolbox Icon

**Access** **Drag icon onto «WSDLmessage» stereotyped element**, or  
**Project Browser | Double-click on Message Part attribute**, or  
**Diagram | Highlight Message element | Highlight Message Part attribute | double-click on attribute**

#### Define Properties

Field/Option/ Button	Action	See also
<b>Name</b>	Type in the name of the WSDL Message Part attribute.	
<b>Type</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Type the name of a data type, or</li> <li>Click on the drop-down arrow and select an <b>XSD built-in dataType</b> from the list, or</li> <li>Click on the browse ( ( ... ) ) button and browse for an existing «<i>XSDelement</i>», «<i>XSDcomplexType</i>» or «<i>XSDsimpleType</i>» element as a classifier</li> </ul> <p>The XSD Types can be defined in:</p> <ul style="list-style-type: none"> <li>The <b>Types</b> package under the WSDL Package Structure or</li> <li>Any other package in the model</li> </ul>	<p><a href="#">XML Schema</a> <small>[2387]</small></p> <p><a href="#">WSDL Package Structure</a> <small>[2429]</small></p>
<b>OK</b>	Click on this button to <b>save</b> the data entered and close the WSDL Message Part dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the data entered and close the WSDL Message Part dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	<p>This button is displayed when you are <b>editing</b> existing WSDL Message Part attribute information.</p> <p>Click on the button to open the UML Attribute Properties dialog for the Message Part.</p>	<a href="#">General Properties of Attributes</a> <small>[1001]</small>

#### Notes

- WSDLmessage* stereotyped Classes can effectively contain Message Part attributes only; if you add other attributes to the Class element, they are re-cast as Message Parts

#### Learn more

**14.2.2.4 WSDL Binding**

A **WSDLbinding** element implements the operations specified by a particular «*WSDLportType*» stereotyped Interface and describes the message format and protocol details for the operations and messages defined by this WSDL PortType. A WSDL Binding element is represented by a «*WSDLbinding*» stereotyped Class.

You create a WSDL Binding element by dragging the **Binding** icon from the WSDL Toolbox directly onto the Bindings diagram under the Bindings package in the WSDL Package structure.

Toolbox Icon

Access    **Drag icon onto diagram**, or  
**Project Browser | Double-click on «WSDLbinding» stereotyped element**, or  
**Diagram | right-click on «WSDLbinding» stereotyped element | Properties**

Define Properties

Field/Option/ Button	Action	See also
<b>Name</b>	Type in the name of the WSDL Binding element.	
<b>PortType</b>	Click on the drop-down arrow and select the WSDL PortType to be implemented by this WSDL Binding.	<a href="#">Port Type</a> <sup>[2433]</sup>
<b>Protocol</b>	Click on the drop-down arrow and select the protocol for the transmission of the selected WSDL PortType's operations. The supported protocols are: <ul style="list-style-type: none"> <li>• <b>SOAP</b></li> <li>• <b>HTTP</b></li> </ul>	
<b>Transport</b>	This field is disabled if you have selected the <b>HTTP</b> protocol. Defaults to <b>http://schemas.xmlsoap.org/soap/http</b> . If necessary, type in an alternative URL for the SOAP protocol.	
<b>Style</b>	This field is disabled if you have selected the <b>HTTP</b> protocol. Click on the drop-down arrow and select the style of SOAP protocol.	

<b>Verb</b>	<p>This field is disabled if you have selected the <b>SOAP</b> protocol.</p> <p>Click on the drop-down arrow and select the appropriate HTTP verb. The supported verbs are:</p> <ul style="list-style-type: none"> <li>• <b>GET</b></li> <li>• <b>POST</b></li> </ul>	
<b>Documentation</b>	(Optional) Type in any notes you need for this element.	
<b>OK</b>	Click on this button to <b>save</b> the data entered and close the WSDL Binding dialog.	
<b>Cancel</b>	Click on this button to <b>discard</b> the data entered and close the WSDL Binding dialog.	
<b>Help</b>	Click on this button to display this Help topic.	
<b>UML</b>	<p>This button is displayed when you are <b>editing</b> existing WSDL Binding element information.</p> <p>Click on the button to open the UML element Properties dialog for the element.</p>	<a href="#">Properties</a> <small>956</small>

#### Notes

- A WSDL Binding must implement a WSDL PortType; therefore, WSDL PortTypes should be defined before you create WSDL Bindings
- WSDL Bindings can only be created under the **Bindings** package in the WSDL Package structure
- The name of the WSDL Binding should be unique amongst all the WSDL Bindings within the WSDL

#### Learn more

- [WSDL Binding Operation](#) 2438
- [WSDL 1.1 Model Structure](#) 2423
- [Model WSDL](#) 2426

#### 14.2.2.4.1 WSDL Binding Operation

When you save a newly-created «WSDLbinding» stereotyped Class, the system:

1. Adds the **WSDL Port Type** element implemented by the **WSDL Binding** to the Binding diagram.
2. Draws a **Realization** connector from the Binding to the PortType.
3. Automatically populates the Binding with all the **UML operations** from the PortType, as the **WSDL Binding Operations**.

**Access** **Project Browser | Double-click on WSDL Binding operation**, or  
**Diagram | Highlight Binding element | Highlight Binding operation | double-click on operation**

### Define Properties

Field/Option/ Button	Action	See also				
<b>Operation Name</b>	Displays the name of the Operation copied from the WSDL PortType element.  The value in this field cannot be edited.

#### 14.2.2.5 WSDL Service

A **WSDL Service** is represented by a «*WSDLservice*» stereotyped Interface; it describes a collection of Ports that expose a particular Binding. You can create a WSDL Service element by dragging the **Service** icon from the WSDL Toolbox and dropping it **directly** onto a diagram in the *Services* package of your WSDL model.

When you save a newly-created «*WSDLservice*» stereotyped Interface, the system:

1. Adds the **WSDL Binding** elements exposed by the **WSDL Service** to the Service diagram.
2. Draws an **Association** connector from the Service element to each Binding element.
3. Labels each connector with the corresponding **Port** name.

### Toolbox Icon

**Access** **Drag icon onto diagram**, or  
**Project Browser | Double-click on «WSDLservice» stereotyped element**, or  
**Diagram | right-click on «WSDLservice» stereotyped element | Properties**

## 14.2.2.6 WSDL Document

A **WSDL Document** encapsulates a Web Service defined within the «*WSDLnamespace*» stereotyped Package, and is the source from which the WSDL file is generated. It is represented by a «*WSDL*» stereotyped **Component** element as a direct child element of the «*WSDLnamespace*» stereotyped Package. You can have multiple WSDL Documents under a single WSDL Namespace, to reuse and expose the WSDL Services for that namespace across multiple WSDLs.

One «*WSDL*» stereotyped Component element is automatically created when you create the Namespace package structure. You can add further WSDL elements by dragging the **WSDL** icon from the WSDL Toolbox and dropping it directly onto the namespace Overview diagram.

### Toolbox Icon

**Access**    **Drag icon onto diagram**, or  
**Project Browser | Double-click on «WSDL» stereotyped Component element**, or  
**Diagram | right-click on «WSDL» stereotyped Component element | Properties**

### 14.2.3 Generate WSDL

If you have developed a WSDL model in UML, you can forward-engineer it into WSDL 1.1 files using the **Generate WSDL** feature. This feature acts on either a «*WSDLnamespace*» stereotyped Package or a «*WSDL*» stereotyped Component (**Document**), and generates any or all of the WSDL Components owned by the target «*WSDLnamespace*» structure.

**Access**    **Tools | Web Services | Generate WSDL**, or  
**Right-click «WSDL» stereotyped Component | Generate WSDL**

#### Generate WSDL 1.1 files

Field/Option/ Button	Action	See also								
<b>WSDL Package</b>	Displays the name of the WSDL Namespace containing the source Component(s) from which the WSDL file is to be generated.	<a href="#">WSDL Namespace</a> [2429]								
<b>Encoding</b>	Either: <ul style="list-style-type: none"><li>Click on the drop-down arrow and select the XML encoding scheme you need, or</li><li>Click on the <b>Default</b> button to apply the default encoding scheme (<b>UTF-8</b>)</li></ul>

### 14.2.4 Import WSDL

If you have WSDL 1.1 files external to Enterprise Architect that you want to reverse engineer into UML Class models, you can import them into the system using the **WSDL Import** facility.

**Access** **Project Browser** | **Click on root package to contain imported file**, then:  
**Tools** | **Web Services** | **Import WSDL**, or  
**Right-click on package** | **Code Engineering** | **Import WSDL**

#### Import a WSDL File

Field/Option/ Button	Action
<b>Filename</b>	Type in or browse for (click on ( ... )) the name and path of the WSDL file to import.
<b>Root Package</b>	Displays the name of the root Package under which the WSDL file is to be imported.
<b>Target Package</b>	Defaults to the name of the WSDL file being imported, as the name of the package to represent the imported file.  If you do not want to use the default name, type in a different name.
<b>Import</b>	Click on this button to start the WSDL Import.  A message displays when the import is complete; click on the <b>OK</b> button on the message to close it.
<b>Close</b>	Click on this button to close this dialog.
<b>Help</b>	Click on this button to display this Help topic.
<b>Progress</b>	Monitor the progress of the WSDL Import.

#### Notes

- Enterprise Architect cannot import a WSDL file that references WSDL constructs existing outside that file; if there are referenced constructs in other files, combine all files into a single file and import that combined file
  - Example of an importable file: [http://www.w3.org/TR/wsdl.html#\\_wsdl](http://www.w3.org/TR/wsdl.html#_wsdl)
  - Example of a non-importable file: [http://www.w3.org/TR/wsdl.html#\\_style](http://www.w3.org/TR/wsdl.html#_style); attempts to import this file result in the error message *Cannot Import Split Files*

## 14.3 SoaML

**Service oriented architecture Modeling Language (SoaML)** is a standard method of designing and modeling **SOA** solutions using the Unified Modeling Language (**UML**).

The following text is derived from *Service oriented architecture Modeling Language (SoaML) - Specification for the UML Profile and metamodel for Services (UPMS)* (OMG document ad/2008-11-01); pp. 25-26:

A service is an offer of value to another through a well-defined interface and available to a community (which may be the general public). A service results in work provided to one by another.

Service Oriented Architecture (SOA) is a way of organizing and understanding (representations of) organizations, communities and systems to maximize agility, scale and interoperability. The SOA approach is simple - people, organizations and systems provide services to each other. These services allow us to get something done without doing it ourselves or even without knowing how to do it - enabling us to be more efficient and agile. Services also enable us to offer our capabilities to others in exchange for some value - thus establishing a community, process or marketplace. The SOA paradigm works equally well for integrating existing capabilities as for creating and integrating new capabilities.

SOA ... is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results. SoaML ... provides a standard way to architect and model SOA solutions using the Unified Modeling Language (UML). The profile uses the built-in extension mechanisms of UML to define SOA concepts in terms of existing UML concepts.

... the highest leverage of employing SOA comes from understanding a community, process or enterprise as a set of interrelated services and ... supporting that service oriented enterprise with service-enabled systems. SoaML enables business oriented and systems oriented services architectures to mutually and collaboratively support the enterprise mission. ... SoaML depends on Model Driven Architecture® (MDA®) to help map business and systems architectures, the design of the enterprise, to the technologies that support SOA, like web services and CORBA®.

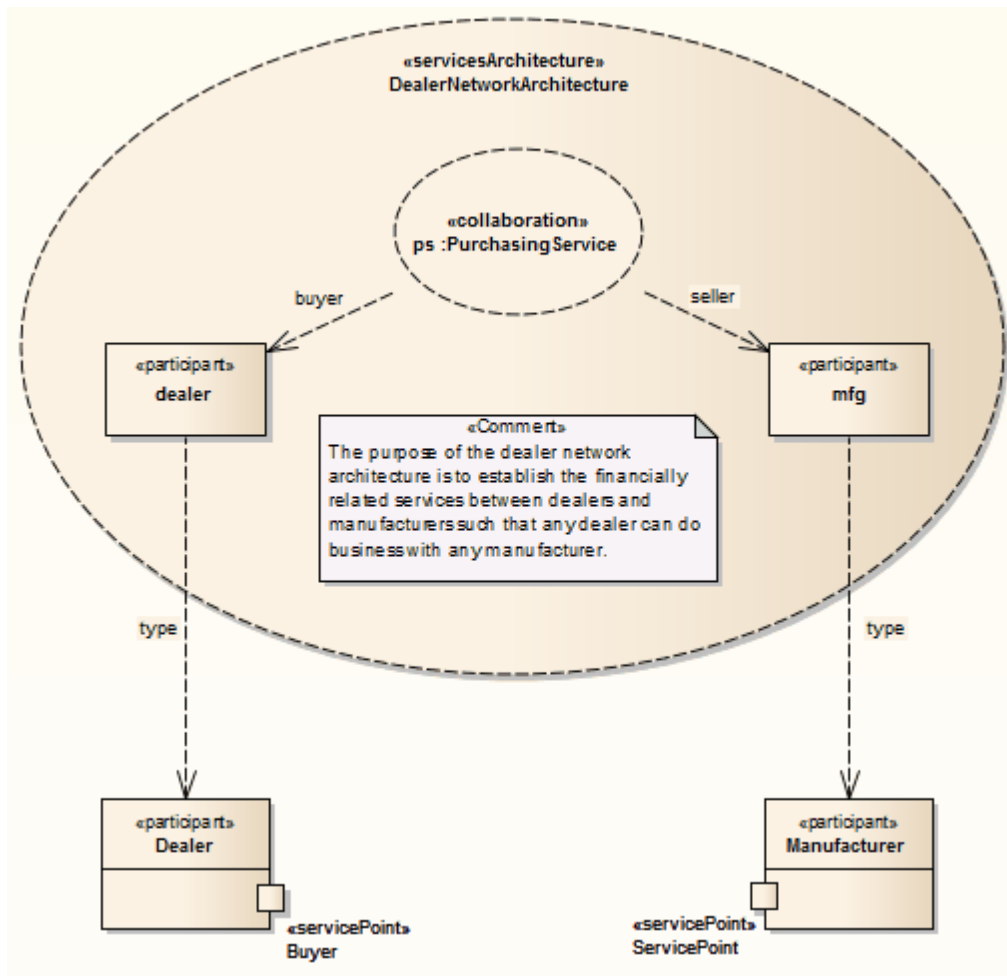

For further information on the concepts of SoaML, see the specification document on the OMG website [SoaML document page](#).

### SoaML in Enterprise Architect

In Enterprise Architect you can model **services architectures** quickly and simply through use of an **MDG Technology** integrated with the Enterprise Architect installer. The **SoaML** facilities are provided in the form of:

- Two SoaML **diagram types** - *SoaML Component Diagram* and *SoaML Sequence Diagram* - accessed through the New Diagram dialog
- SoaML pages in the **Diagram Toolbox**
- SoaML element and relationship entries in the **Toolbox Shortcut** menu and **Quick Linker**

### Example SoaML Diagram

### Disable SoaML

If you prefer not to use SoaML in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

### Notes

- Service Oriented Architecture Modeling Language (SoaML) is supported in the Corporate, Systems Engineering, Business and Software Engineering and Ultimate editions of Enterprise Architect

### Learn more

## 14.4 SOMF 2.1

The **Service-Oriented Modeling Framework (SOMF)** is a service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to successful service-oriented life cycle management and modeling. The following text is derived from the extensive Wikipedia entry on Service Oriented Modeling:

The Service-Oriented Modeling Framework (SOMF) has been proposed by author Michael Bell as a holistic and anthropomorphic modeling language for software development that employs disciplines and a universal language to provide tactical and strategic solutions to enterprise problems. The term "holistic language" pertains to a modeling language that can be employed to design any application, business and technological environment, either local or distributed. This universality may include design of application-level and enterprise-level solutions, including SOA landscapes or Cloud Computing environments. The term "anthropomorphic", on the other hand, affiliates the SOMF language with intuitiveness of implementation and simplicity of usage.

SOMF ... illustrates the major elements that identify the "what to do" aspects of a service development scheme. These are the modeling pillars that will enable practitioners to craft an effective project plan and to identify the milestones of a service-oriented initiative- either a small or large-scale business or a technological venture.

### SOMF in Enterprise Architect

In Enterprise Architect, SOMF 2.1 is implemented as a profile within an MDG Technology that is integrated with the Enterprise Architect installer. The SOMF 2.1 facilities are provided in the form of:

- Eleven SOMF diagram types, accessed through the New Diagram dialog:

*Conceptual  
Analysis  
Cloud Computing  
Logical Design Relationship  
Logical Design Composition  
Business Integration  
Conceptual Architecture  
Asset Utilization  
Transaction  
Transaction Directory  
Reference Architecture*

- **SOMF pages in the Toolbox** - Enterprise Architect includes several Toolbox pages of modeling structures for each SOMF 2.1 diagram type, through the **More tools | SOMF 2.1** menu option; these provide a wide breadth of SOMF modeling capabilities
- SOMF element and relationship entries in the **Toolbox Shortcut** menu and **Quick Linker**

### Disable SOMF

If you prefer not to use SOMF in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

## 14.5 MOF

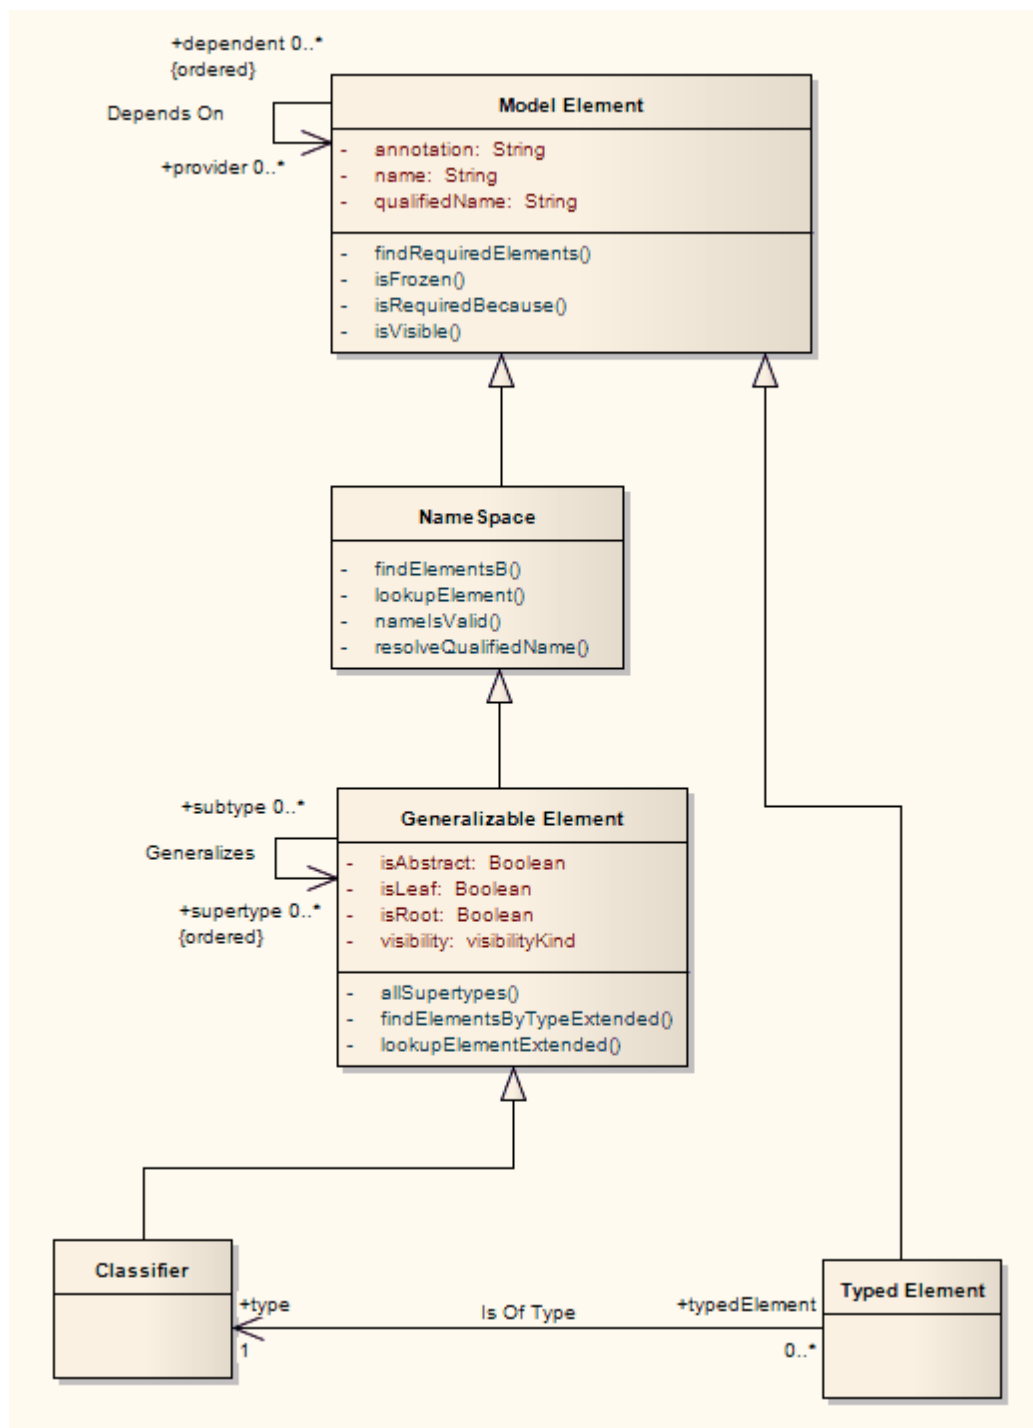

The **Meta-Object Facility (MOF)** is an Object Management Group (OMG) standard developed as a meta-modeling architecture to define the UML, and so provides a means to define the structure or abstract syntax of a language or of data. The MOF is designed as a **four-layered architecture**; being a **closed, strict meta-modeling** architecture, every model element on every layer is strictly an instance of a model element of the layer above.

Simplified, the MOF uses Classes to define concepts (model elements) on a meta-layer. These Classes (concepts) can then be instantiated through objects (instances) of the model layer below. Because an element on the M2 layer is an object (instance of an M3 model element) as well as a Class (an M2 layer concept) the notion of a **clabject** is used - a merge of the words *Class* and *Object*.

Because of the similarities between the MOF model and UML structure models, the MOF meta-models are usually modeled as UML Class diagrams. You can also use the **Metamodel** page of the Diagram Toolbox (**More tools | UML | Metamodel**) to create MOF model elements and connectors.

The layered architecture of the Meta Object Facility is illustrated in this diagram.

### Notes

- A supporting standard of MOF is **XMI**, which defines an XML-based exchange format
- From Enterprise Architect, you can **export** packages to XMI under the **MOF 1.3** or **MOF 1.4 XMI file specifications**
- A related standard is the **Object Constraint Language (OCL)**, which describes a formal language that can be used to define model constraints by means of predicate logic; OCL makes a MOF model more precise by associating assertions with its meta-elements

### 14.5.1 Create MOF Diagrams

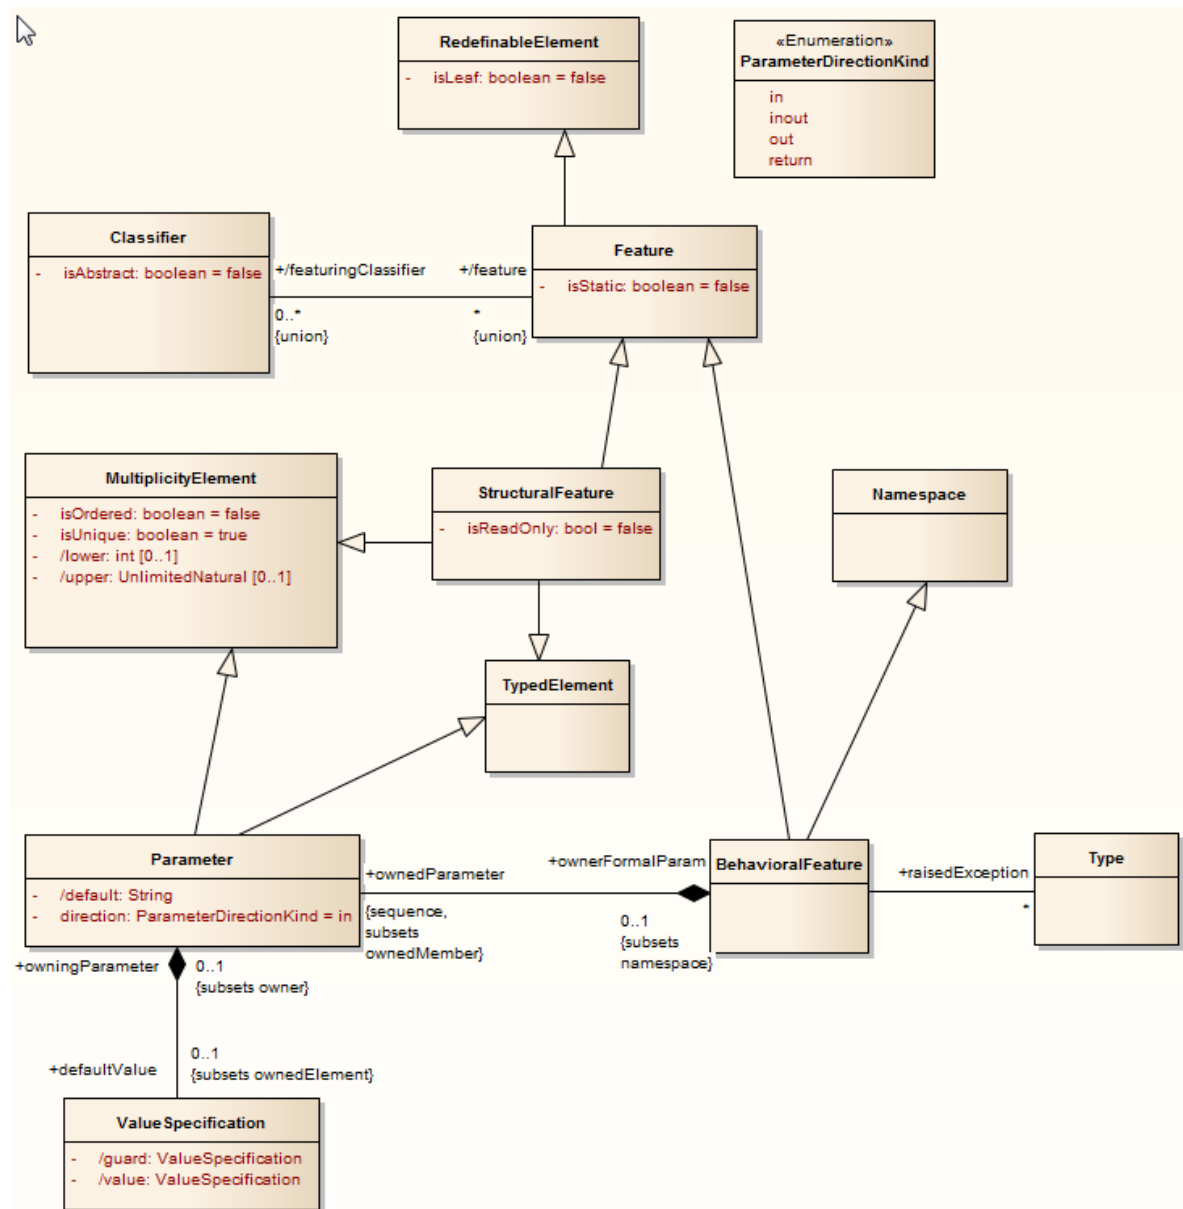

You can model the structure or abstract syntax of a language or of data using a **Meta Object Facility (MOF)** diagram. This is a **Class** diagram that is contained in a Package to which you assign a «*metamodel*» stereotype.

Create a MOF diagram

Step	Action	See also
1	Create or select the appropriate root Model Package and View for the MOF package.	<a href="#">Model Wizard</a> <sup>[753]</sup> <a href="#">Views</a> <sup>[769]</sup>
2	Create a package to contain your MOF elements. As part of this process, create a child <b>Class</b> diagram for this package.	<a href="#">Add a Package</a> <sup>[772]</sup>
3	In the Project Browser, double-click on the package name to display the Properties dialog.	<a href="#">Properties Dialog</a> <sup>[956]</sup>
4	In the <b>Stereotype</b> field type the value <b>metamodel</b> . Click on the <b>OK</b> button.	<a href="#">General Settings</a> <sup>[958]</sup>
5	Open the child Class diagram and begin to construct your model. In the Diagram Toolbox you can use either the: <ul style="list-style-type: none"> <li>• Class pages (<b>More tools   UML   Class</b>) or the</li> <li>• Metamodel pages (<b>More tools   UML   Metamodel</b>)</li> </ul> <p>A MOF diagram typically contains Class, Enumeration and Primitive elements (the Primitive elements from the Class Toolbox pages), and Generalization, Association, Compose and Aggregate relationships.</p>	<a href="#">Class Toolbox</a> <sup>[803]</sup> <a href="#">Metamodel Toolbox</a> <sup>[812]</sup>

Step	Action	See also

## 14.5.2 Export MOF Model to XMI

When you have created a MOF model, you can export it to an XMI file in either MOF 1.3 or MOF 1.4 XMI file specification format, to use in other applications or to transfer into other projects.

Access [Project Browser](#) | [Right-click MOF Root Package](#) | [Import/Export](#) | [Export Package to XMI file](#)  
(Ctrl+Alt+E): Publish

### Export MOF Model to XMI

Field/Option/ Button	Action	See also
<b>Root Package</b>	Displays the name of the selected model root package.	
<b>Filename</b>	Type in or browse for (click on ( ... )) the file path and name of the target XML file.	
<b>XML Type</b>	Scroll down to the end of the list and click on the format you want to use, either <b>MOF 1.3</b> or <b>MOF 1.4</b> .	
<b>Format XML Output</b>	(Optional) Select this checkbox to format the output into readable XML (this takes a few more seconds at the end of the run).	
<b>Write Log File</b>	(Optional, but recommended) Select this checkbox to write a log of the export activity.  The log file is saved to the directory into which the XML file is exported.	
<b>Exclude EA Extensions</b>	(Optional) Select the checkbox to exclude tool-specific information from the export.	
<b>Generate Diagram Images</b>	Pre-set to selected, to generate the exported diagrams into a package called <i>Images</i> in the directory into which the XML file is exported.  You specify the graphics format for these diagram images in the <b>Format</b> field, below.	
<b>Format</b>	Click on the drop-down arrow and select the graphics format you want to use for the exported diagram images.	
<b>Stylesheet</b>	(Optional) Click on the drop-down arrow and select an XSL Stylesheet to post-process the XML content before saving the package to file, using an XSLT to convert the output to HTML, XSL, code or other versions of XML.  The XSL style sheet should previously have been imported into the	<a href="#">Resources</a> 1173

Field/Option/ Button	Action	See also
	project through the Resources window.	
<b>Export</b>	Click on this button to initiate the export.	
<b>Progress</b>	Monitor the progress of the export - the indicator on the right of this field is completely filled with green when the export is complete.	
<b>View XML</b>	Click on this button to view the file you have created.	

### Notes

- MOF models exported to XML can be imported into an Enterprise Architect project using the standard import XML features of the system

## 15 Model Simulation

Model Simulation brings your behavioral models to life with instant, real-time behavioral model execution. Coupled with tools to manage triggers, events, guards, effects, breakpoints and simulation variables, plus the ability to visually track execution at run-time, the Simulator is a powerful means of "watching the wheels turn" and verifying the correctness of your behavioral models. With Simulation you can explore and test the dynamic behavior of models. In the Corporate and above editions, you can also use Javascript as a run-time execution language for evaluating guards, effects and other script-able pieces of behavior.

Extensive support for triggers, trigger sets, nested states, concurrency, dynamic effects and other advanced simulation capabilities, provides a remarkable environment in which to build interactive and working models which help explore, test and visually trace complex business, software and system behavior. With Javascript enabled, it is also possible to create embedded COM objects which will do the work of evaluating guards and executing effects - allowing the simulation to be tied into a much larger set of dependent processes. For example, a COM object evaluating a guard condition on a State Transition might query a locally running process, read and use a set of test data - or even connect to an SOA web service to obtain some current information.

As Enterprise Architect uses a dynamic, script driven Simulation mechanism there is no need to generate code or compile your model before running a simulation. It is even possible to update simulation variables in real time using the Simulation console window. This is useful for testing alternate branches and conditions "on the fly", either at a set Simulation break point, or when the Simulation reaches a point of stability (for example, when the Simulation is 'blocked').

In the Professional version of Enterprise Architect, you can manually walk through simulations - although no Javascript will execute - so all choices are manual decisions. This is useful for testing the flow of a behavioral model and highlighting possible choices and processing paths.

- (Alt+F1) | **Enterprise Architect | Simulation | Simulation | Define a Simulation Model**

## 15.1 How It Works

The Model Simulator enables you to simulate the execution of conceptual model designs containing behavior. When you start a simulation, the current model package is analyzed and a dynamic simulation process spawned to execute the model. As the simulator analyzes and works with UML constructs directly, there is no requirement to generate intermediary code or compile simulation 'executables'. This results in a very rapid and dynamic simulation environment in which changes can be made and tested very rapidly.

To get up and running with simulation the only steps required are:

- Build a behavioral diagram (state or activity for manual or dynamic execution, sequence for manual interaction only)
- Optional: load the Simulation Workspace layout ... a fast way of bringing up all the frequently used Simulation windows
- Press the simulator **Play** button!

The Professional edition provides a quick and simple way to verify your design's behavior for logical correctness by manually stepping through a diagram. In the Corporate edition and above it is possible to:

- Dynamically execute your behavioral models
- Assess guards and effects written in standard Javascript
- Define and fire triggers into running simulations
- Define and use sets of triggers to simulate different event sequences
- Auto-fire trigger sets to simulate complex event histories without user intervention
- Update simulation variables "on the fly" to change how simulations proceed
- Create and call COM objects during Simulation to extend the Simulation's reach and input/output possibilities
- Inspect Simulation variables at run time
- Set a script 'prologue' for defining variables, constants and functions prior to execution
- Use multiple Analyzer Scripts with differing 'prologues' for running the Simulation under widely differing conditions
- In the Business and Software Engineering and Ultimate Editions it is also possible to simulate BPMN models

### Platforms and Editions Available

## 15.2 How it Looks

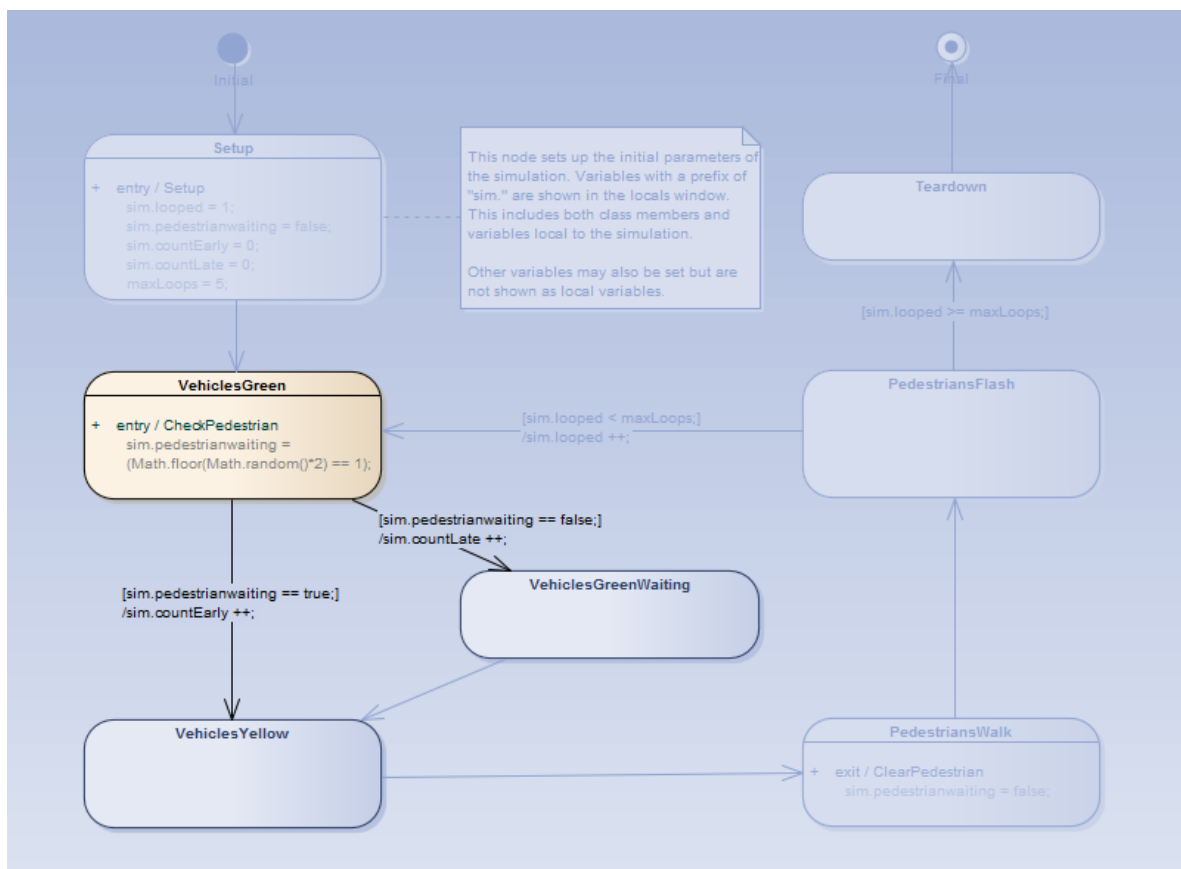

Enterprise Architect has a **special way of displaying model information during simulation**. This helps focus attention on the executing or active nodes.

During a Simulation, Enterprise Architect will **dynamically track and highlight the active nodes** within your model. If a node in another diagram is activated, that diagram will be automatically loaded and the current node highlighted. It is possible to modify the diagram while the simulation is running, however, the changes made are not recognized until the current simulation is ended and a new one begun.

### Highlighting of the active node (s) during simulation

- In the example below the currently active node ("VehiclesGreen") is highlighted in normal Enterprise Architect colors
- All possible **transitions out of the current node are rendered at full strength**
- The elements that are **possible targets** of the current active node's outgoing transitions are **rendered in a semi-faded style** so they are readable and clearly different to the other elements within the diagram
- All other elements are rendered in a **"fully faded"** style to show they are not targets of the next Simulation step.

As the Simulation progresses (especially if automatically run), this **highlighting helps focus the attention on the current item and its visual context**.

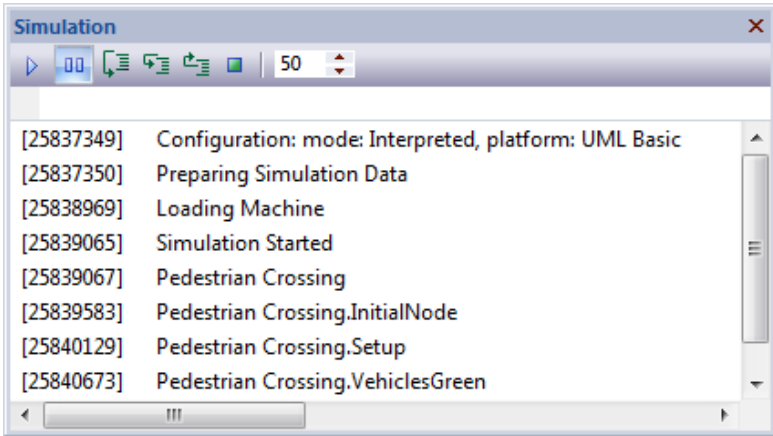

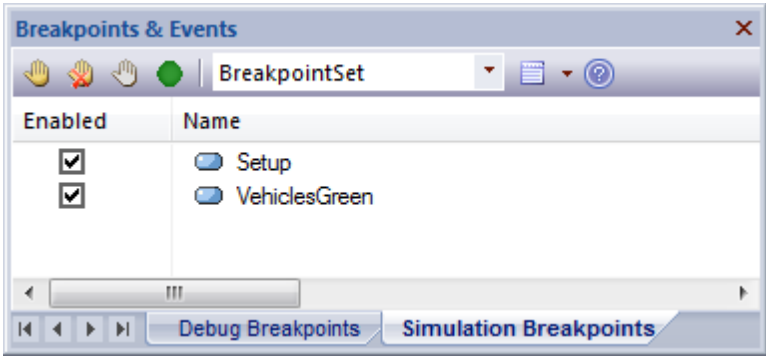

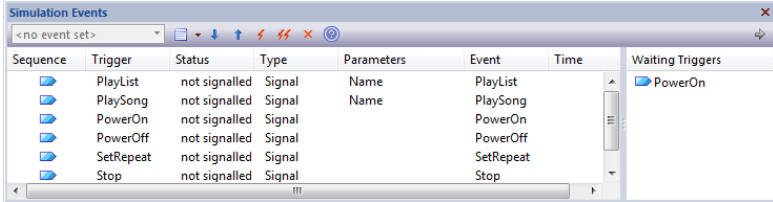

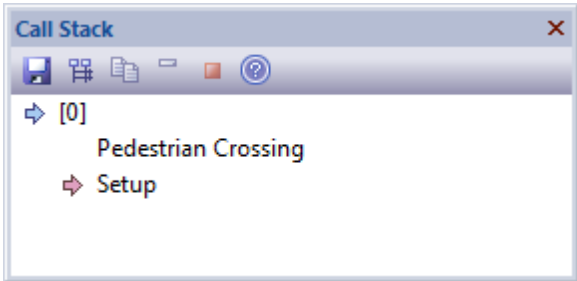

## 15.3 Simulation Windows

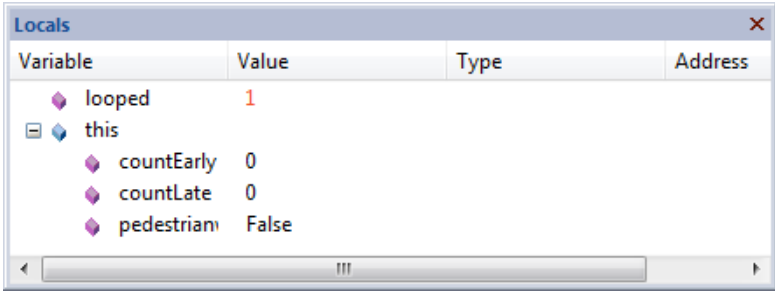

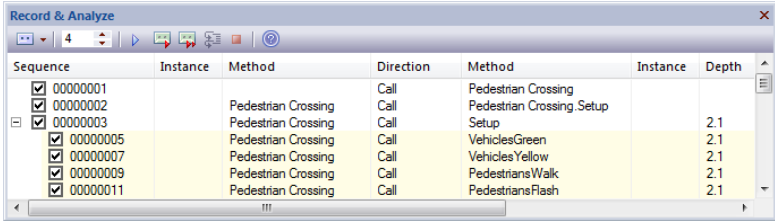

When executing a Simulation in Enterprise Architect it is possible to set **break-points**, fire **triggers**, examine **variables**, record a **trace** of execution, set simulation **speed**, view the **call stack** and **visually** trace the active nodes as the simulation proceeds.

When a Simulation runs, some aspects such as the output and console input are found in the Simulator window itself, while others such as the local variables and call-stack use the standard Execution Analyzer windows. The table below provides an overview of the main Windows used during Simulation.

**Access** [Analyzer](#) | [Simulator](#)

Window	Purpose	See also
<b>Execution and Console</b>	<p>The <b>Simulation window</b> provides the main interface for starting, stopping and stepping your Simulation. During execution it displays output relating to the currently executing step and other important information. See the <i>Run Model Simulation</i> topic for more information on the toolbar commands.</p> <p>Note the text entry box just underneath the toolbar. This is the <b>Console input area</b> - in here you can type simple <b>javascript</b> commands such as: <code>this.count = 4</code>; to dynamically change a Simulation variable named "count" to 4. In this way you can dynamically influence simulation at run-time.</p> 	<a href="#">Run Model Simulation</a> <sup>[2475]</sup>
<b>Breakpoints &amp; Events Window</b>	<p>The Simulation process also makes use of the <b>Simulation Breakpoints tab</b> of the <b>Breakpoints &amp; Events</b> window (<b>Analyzer   Breakpoints &amp; Events</b>). In here you set execution breakpoints on specific elements and messages in a Simulation. See the <i>Simulation Breakpoints</i> topic for more details.</p>	<a href="#">Simulation Breakpoints</a> <sup>[2477]</sup>

		
<b>Simulation Events Window</b>	<p>The <b>Simulation Events</b> window (<b>Analyzer   Simulation Events</b>) provides tools to manage and execute triggers. Triggers are used to <b>control the execution of State machines</b> transitions.</p> 	<a href="#">Simulation Events Window</a> <sup>[2504]</sup> <a href="#">Triggers</a> <sup>[2494]</sup> <a href="#">Waiting Triggers</a> <sup>[2508]</sup>
<b>Call Stack Window</b>	<p>During the Simulation the <b>Call Stack</b> window (<b>Analyzer   Call Stack</b>) displays information about the <b>Threads</b> and current execution context of the Simulation.</p> <p>The Simulator supports <b>multi-threaded Simulations</b> and will include a Thread entry for every active and paused thread of execution. For each thread, the Call Stack window will show the start or entry context (eg. a State Machine element) plus the current active element within that thread. If the current active element is the entry point of a composite activity or sub-machine state, the stack will also include the current active element within that sub-context (and all further nested, active composite, sub-states as well).</p> 	<a href="#">View the Call Stack</a> <sup>[2238]</sup>
<b>Simulation Local Variable Window</b>	<p>The Simulator uses the standard <b>Locals</b> window (<b>Analyzer   Locals</b>) to show all current Simulation <b>variables</b> when the simulation is <b>paused</b> at a <b>break point</b> or <b>single stepping</b>. Note that it is possible to dynamically update these variables using the Simulator Console described above.</p>	<a href="#">View the Local Variables</a> <sup>[2234]</sup>

		
<b>Recording</b>	<p>During execution of your Simulation, a <b>recording</b> is kept of all activity and displayed in the <b>Record &amp; Analyze</b> window (<b>Analyzer   Recorder</b>). This is similar to how the normal call recording works in the Visual Execution analyzer - although at this time, no ability to generate Sequence diagrams from recordings is possible.</p> 	<p><a href="#">The Recording History</a><sup>[2533]</sup></p>

## 15.4 Set Up Simulation Script

You **can** use **Simulation scripts** to provide fine control over how a simulation starts. In general, you do **not** need to set up a Simulation script unless:

- You want to run an **interpreted** simulation that requires variables to be **initialized** before the simulation commences; this is useful for setting up global variables and defining functions
- (In the Corporate Edition and above) You do not want to apply the default behavior of interpreting the Guards (that is, you prefer to use a **Manual** execution), or
- You want to have **multiple** ways of running the same diagram

For most diagrams it is possible to initialize a script for a simulation simply by setting variables in the first element or connector after the Start element. For **State Charts**, this is the **Transit** connector exiting the initial element, and for **Activity** models this is the first **Action** element.

As an alternative, you can use Simulation scripts to initialize settings before a simulation starts. This is useful for setting up different sets of initial values using multiple Analyzer Scripts, so that you can run your simulation under a range of pre-set conditions.

To **configure** a simulation execution script, first select the **Package** in the Project Browser, Package Browser, Diagram List or Model Search. You can then use the Execution Analyzer window to add a new Script for that selected package. You will use the Simulation page of the Execution Analyzer dialog to configure the relevant properties.

**Access**    **Analyzer | Execution Analyzer (Shift+F12) : New** (Toolbar icon)  
**Analyzer | Execution Analyzer (Shift+F12) : locate and double-click on required script > Simulation**

### Configure a Simulation Script

Field/Option	Action	See also
<b>Entry Point</b>	Click on the ( ... ) button and select the: <ul style="list-style-type: none"> <li>• <b>Entry point</b> for the simulation, and</li> <li>• Activity, Interaction or State Machine to simulate</li> </ul> <p>If you do not specify an entry point, the simulator attempts to work through the entire Package.</p>	
<b>Platform</b>	For UML Activity, Interaction or State Machine simulation, click on the drop-down arrow and select <b>UML Basic</b> .  For BPMN diagrams, click on the drop-down arrow and select <b>BPMN</b> .	
<b>Evaluate Guards and Effects using JavaScript</b>	(In Corporate and higher editions) <b>Leave</b> the checkbox unselected to perform a manual simulation, where you select the next State to transition to and the point where a decision must be made.  <b>Select</b> the checkbox to execute the code for Effect behavior in the simulation. The simulation executes <b>JavaScript</b> code in the following places: <ul style="list-style-type: none"> <li>• State <b>entry/exit/do</b> operations</li> </ul>	<a href="#">State Machine Table Conventions</a>

	<ul style="list-style-type: none"> <li>• <b>Transition guard/effect</b></li> <li>• BPMN Activity <b>Loop Conditions</b> and <b>Sequence Flow Condition Expressions</b></li> </ul> <p>With the exception of the guard, all of these should be one or more valid <b>JavaScript</b> statements, <b>including the semi-colon</b>.</p> <p>The guard must be a valid <b>boolean</b> expression, also terminated with a semi-colon.</p> <p>Variables that are members of of <b>sim</b> or <b>this</b> are listed in the Locals window when a simulation breakpoint is reached.</p> <pre>sim.count = 0;</pre>	 <a href="#">Transition</a>   <a href="#">View the Local Variables</a>

## 15.6 Run Model Simulation

The simulation executes the model step-by-step, enabling you to validate the logic of your behavioral model. The current execution step is automatically highlighted in the model's diagram to make it easy to understand the various processes and state changes as they occur during the simulation.

There are several ways to **start a model simulation**

- When the active diagram can be simulated the **Run** button on the main Simulation window will run the current diagram, either by running an existing script or defining a new temporary one.
- When the active diagram can not be simulated the **Run** button on the main Simulation window will run the simulation for the active Execution Analyzer script.
- By right clicking on a Simulation script in the Execution Analyzer window and selecting the "Start Simulation" option;
- By right clicking on a suitable diagram and selecting one of the Execute Simulation options from the context menu.

**Visual cues during execution.** When the simulation is running, Enterprise Architect will **actively highlight each active node for each executed step**. In addition, all outgoing transitions, control flows & etc. will be highlighted, showing the possible paths forward. Elements at the end of possible paths forward will be de-emphasized to half-strength and any other remaining elements will be 90% "grayed out". This provides a very dynamic and easy to follow execution that continually refocuses attention on the execution 'context'.

Access **Analyzer | Simulator**

### Running a Simulation

Topic	Detail	See also
<b>Edition Specific Details</b>	<p>In the <b>Professional edition</b>, if a branch is encountered in the execution, the simulator prompts you to choose the appropriate path to take in your execution.</p> <p>In the <b>Corporate and above editions</b>, in which <b>Javascript</b> is enabled, the Simulation will automatically evaluate all guards, effects &amp; etc. and dynamically execute the Simulation without user intervention. If the Simulation becomes <b>blocked</b> due to no possibly paths forward evaluating to true (or multiple paths evaluating to true) you can <b>modify Simulation variables</b> on the fly using the console input of the Simulation Execution window.</p>	<a href="#">Activate Simulation Script</a> <sup>[2474]</sup>

## 15.7 Simulation Breakpoints

The **Simulation Breakpoints** tab of the **Breakpoints & Events** window enables you to **interrupt** and **inspect** the simulation process.

When **dynamically** executing a simulation, the process will proceed **automatically** (in the Corporate and above editions) - if you want to stop execution at some point to examine variables, inspect call stacks or otherwise interact with the simulator, you can set a **breakpoint** on a model element in much the same way as you would with a line of source code. When the simulator reaches the breakpoint execution is **halted** and control returned to Enterprise Architect.

**Access** [Analyzer | Breakpoints & Events > Simulation Breakpoints](#)

### Breakpoints

Topic	Detail	See also

## 15.8 Objects and Instances in Simulation

As a given business, system or mechanical process executes, the Activities and Actions within it might generate **objects** of a specific type and perform operations **on those objects**, perhaps even consuming or destroying them. You can simulate the creation, use and consumption of such objects using a simulation model that represents the objects and actions with model elements such as Classes, Instance Objects, attributes, operations and Ports (ActionPins and ObjectNodes). The model can also create, act on and destroy several different objects at different stages as part of the same process. Representing model data or objects in simulation makes the simulation more accurately reflect the real process.

### Object Concepts

Term	Description	See Also
<b>SimType</b>	The <b>type</b> of simulation element, such as Class, Enumeration or Interface. These can be classifiers of objects in a simulation.	
<b>SimObject</b>	An object that is an <b>instance</b> of (is classified by) a SimType element.	
<b>Attribute</b>	A <b>property</b> of a SimType element, or of a specified node such as an ActivityNode.	
<b>Operation</b>	A <b>behavior</b> of a SimType element, or of a specified node such as an ActivityNode.	
<b>Port</b>	A Port of a Class or Object, an ActionPin of an Action, or an ObjectNode of an Activity. Ports of classifiers are a <b>type</b> , whilst a Port of an object is a <b>realization</b> of the type.	
<b>Parameter / Activity Parameter</b>	<b>Parameters</b> of Operations; <b>Activity Parameters</b> are, specifically, parameters of ActivityNodes.	
<b>Slot</b>	A <b>realization</b> of an <b>attribute</b> in an object. A Slot has a <b>run time</b> value that can be initialized by the <b>run state</b> value of the Slot. If these values don't exist, the system uses the initial values of the attributes.	
<b>Runtime Environment</b>	All objects exist in the JavaScript runtime environment, so you can use JavaScript to create or change simulation objects and simulation variables.	
<b>Display Variables</b>	All simulation objects, simulation variables or events are identified on the Locals window while they are in effect. In some cases, to show the variables you might need to add break points to the model to pause processing while the variable exists.  As <b>all</b> objects and variables are shown, global variables that exist outside the	

Term	Description	See Also
	simulation but that are significant to it - such as the parent Class and Activity elements within which a process is defined - are automatically also represented as <b>default object variables</b> . So too is the anticipated output of the Activity, as a <b>return</b> variable.	

#### Learn more

- [Create Objects in a Simulation](#) <sup>[2480]</sup>
- [Destroy Objects in a Simulation](#) <sup>[2483]</sup>
- [Call Behaviors](#) <sup>[2489]</sup>

### 15.8.1 Create Objects in a Simulation

In a simulation model, you can create Classes and either create instances of them (Global Objects) to represent objects that exist in the process, or define Actions to generate one or more Objects at any point during the process.

You have three options for creating Objects in a simulation model:

- Manually create the Object
- Dynamically create an Object through a CreateObject Action element
- Use the JavaScript function `sim.CreateObject("name")` as the Effect of an Action element, to again create an Object dynamically

Having created an Object dynamically you can also instantiate any inner objects of that Object, such as an Activity on a Class, and act on the properties of that inner object.

#### Manually Create an Object

Simply create an Object element on a diagram in the model, either by:

- Dragging an Object element from the Object pages of the Diagram Toolbox and setting its classifier, or
- Dragging a classifier element from the Project Browser and pasting it into the diagram as an instance

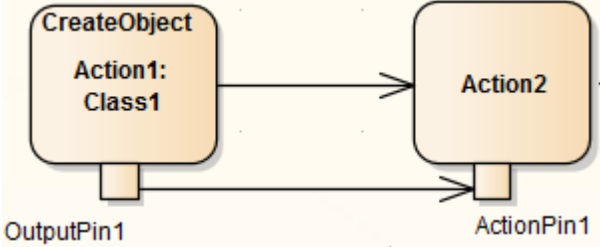

In the simulation model you can then set up the Object properties themselves (such as setting run-states to re-set the initial value of an attribute) or the behaviors of Actions to act on the Object (such as passing it along a process flow) and observe what happens to the Object in a simulation.

#### Create an Object through a CreateObject Action

If your process generates objects in runtime, you can simulate this using a **CreateObject Action**.

Step	Action	See also
1	On your Activity diagram, drag an Action icon from the Diagram Toolbox, and select the <b>Other   CreateObject</b> context menu option to define it as a	<a href="#">Action</a> <sup>[1266]</sup>

Step	Action	See also
	CreateObject Action element.	
2	<p>Set the classifier of the CreateObject Action to the Class of which the Object will be an instance.  <b>(Advanced   Set Classifier).</b></p> <p>Create an Action Pin on the CreateObject Action, of <b>kind</b> output.</p>	<a href="#">Action Pin</a> <sup>[1277]</sup>
3	<p>Create or select the next Action in the processing sequence, and add an Action Pin of <b>kind</b> input.</p> <p>Connect the two Actions with a Control Flow connector, and the two Action Pins with an Object Flow connector.</p> 	<a href="#">Control Flow</a> <sup>[1403]</sup> <a href="#">Object Flow</a> <sup>[1435]</sup>
4	<p>Perform a Simulation on the diagram. When the CreateObject Action is executed, it <b>creates an Object</b> having the properties of the classifier, and stores it in its Output Pin. The Object itself is <b>passed through the Object Flow connection</b> to the Input Pin of Action 2, where its properties can be listed in the Locals window for the simulation.</p>	

### Create Object Using JavaScript

You also can create simulation objects dynamically using a Javascript command in the **Effect** field of the Action element. The command is:

```
sim.newObject = sim.CreateObject( "ClassName" );
```

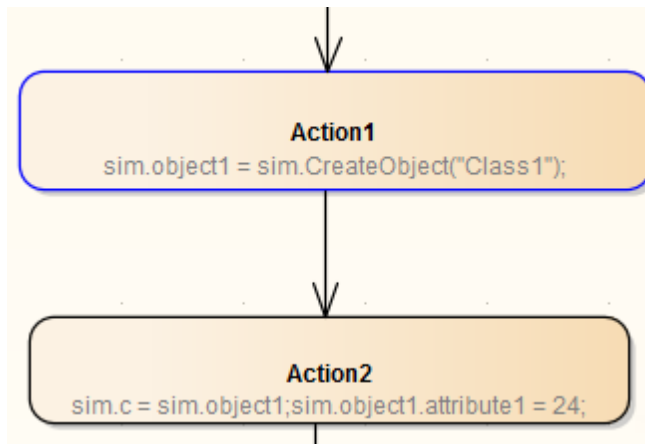

or

```
sim.newObject = new SimObject( "ClassName" ); (natural JavaScript)
```

That is: 'Simulate the creation of an Object based on Class <name>'. The classifying Class would exist in the same Package as the Action.

As for the CreateObject Action element, the Object is created during the simulation and can be passed down to and processed by 'downstream' elements. In this example, the created Object is identified as **sim.object1** and in **Action 2** it is accessed and one of its attributes given a different value (also by JavaScript as an Effect

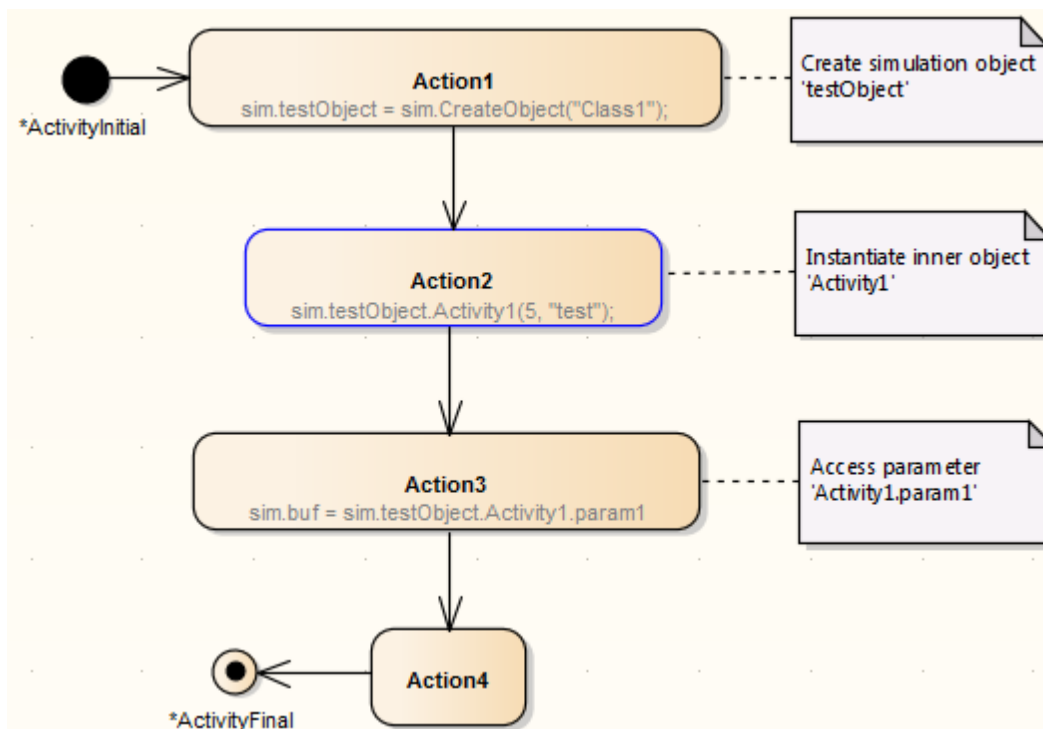

of the Action).

### Instantiate Inner Objects

As described above, you can create an Object using either JavaScript or a CreateObject Action. Similarly, you can **instantiate inner objects** using Javascript or a CallBehavior Action.

In this example, using **JavaScript**, the simulation first creates a test object based on Class1. Class 1 has an Activity element and diagram, with an Activity Parameter 1 set to the integer 5 and an Activity Parameter 2 set to the string "test". The value of Activity Parameter 1 is captured as a buffer value 'buf'

### 15.8.2 Destroy Objects in a Simulation

Having created or generated Objects in your simulation model, you can define Actions to **destroy** those objects at any point **during** the process. All simulation objects are destroyed automatically when the simulation **completes**.

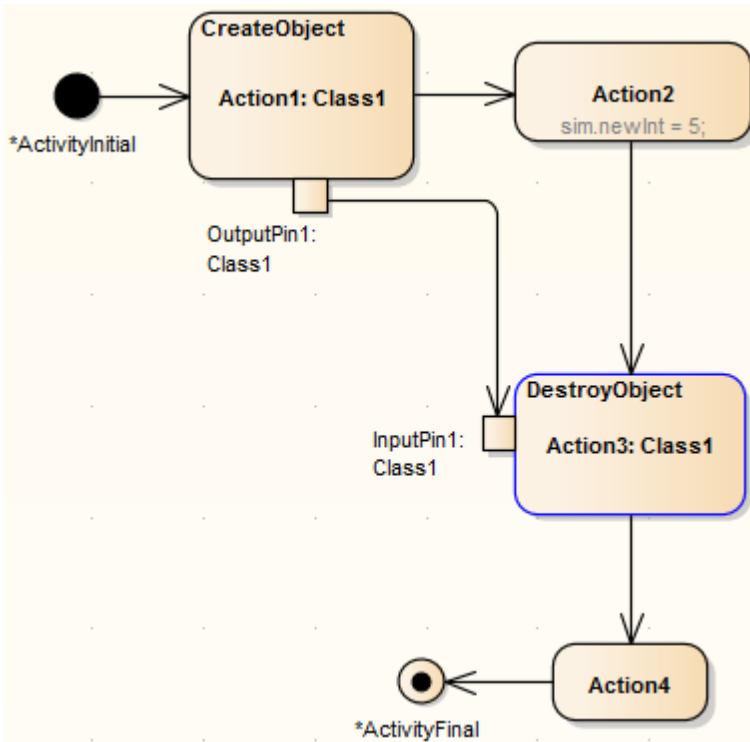

You have two options for destroying the Objects in your simulation model:

- Dynamically destroy the Objects through a **DestroyObject** Action element
- Dynamically destroy the Objects using **Javascript** in an Action element

The result of the deletion can be observed in the change of local variables, on the Local window.

Destroy an Object through a DestroyObject Action

Step	Action	See also
1	On your Activity diagram, drag an Action icon from the Diagram Toolbox, and select the <b>Other   DestroyObject</b> context menu option to define it as a DestroyObject Action element.	<a href="#">Action</a> <sup>[1266]</sup>
2	Set the classifier of the DestroyObject Action to the Class of which the Object is an instance. <b>(Advanced   Set Classifier)</b> . Create an Action Pin on the DestroyObject Action, of <b>kind</b> input.	<a href="#">Action Pin</a> <sup>[1277]</sup>
3	Connect the Input Action Pin to an Object Flow connector from the last Action that operated on the Object. In this example, the last Action <b>that operated on the Object</b> is the Action that created it.	<a href="#">Object Flow</a> <sup>[1435]</sup>

Step	Action	See also
	 <pre> graph TD     Start(( *ActivityInitial )) --&gt; Action1[Action1: Class1 CreateObject]     Action1 --&gt; Action2[Action2 sim.newInt = 5;]     Action1 -- OutputPin1: Class1 --&gt; Action3[Action3: Class1 DestroyObject]     Action2 --&gt; Action3     Action3 --&gt; Action4[Action4]     Action4 --&gt; End((( *ActivityFinal )))   </pre>	
4	<p>Perform a Simulation on the diagram. The process passes the Object name or value into the Input Action Pin as a parameter. When the DestroyObject Action is executed, it deletes the <b>Object</b> having that name or value from the model.</p> <p>In the example, the instance of Class1 is specifically destroyed before Action4 is processed, but the results of Action2 are unaffected.</p>	

#### Destroy an Object using Javascript

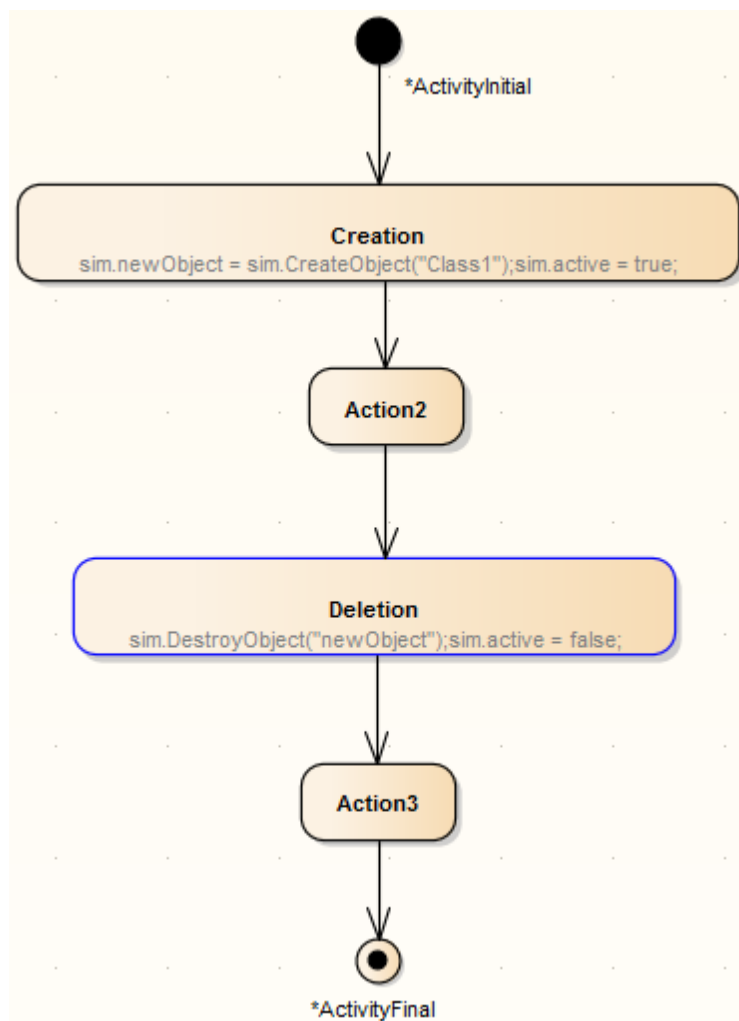

On the Properties Effect page of the Action element, in the **Effect** field, type either:

```
sim.DestroyObject ( "object name" )
```

or

```
delete sim.objectFullName
```

For example:

### Notes

- In either case, you can also destroy a **global** object (one that is created outside the process flow) by identifying the Object to the Action performing the destruction; in the case of the DestroyObject Action, by passing the Object name from a Port on the Object to the Input Pin on the Action through an Object Flow connector

## 15.9 Dynamic Simulation with Javascript

The Corporate and suite editions of Enterprise Architect have the capability of using **Javascript** to **evaluate guards, effects** and other aspects of **behavior** within the Simulation context. This provides for a **fully automated, intelligent execution** of your State or Activity model, with fine control over breakpoints, execution speed and simulation variables.

Javascript can be written that uses any variables. To enable you to display the variable values to the user interface two objects are defined that have their members shown in the **Local Variables** window. These are **sim** and **this**; for example:

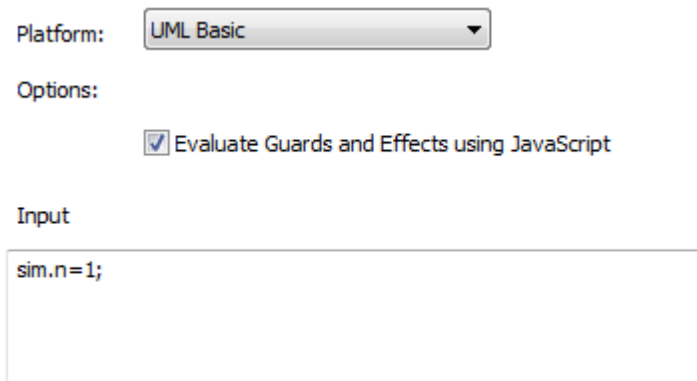

- `sim.logger`
- `sim.Customer.name`
- `this.count`
- `this.Account.amount`

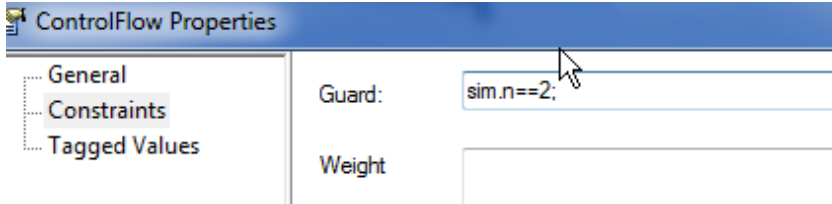

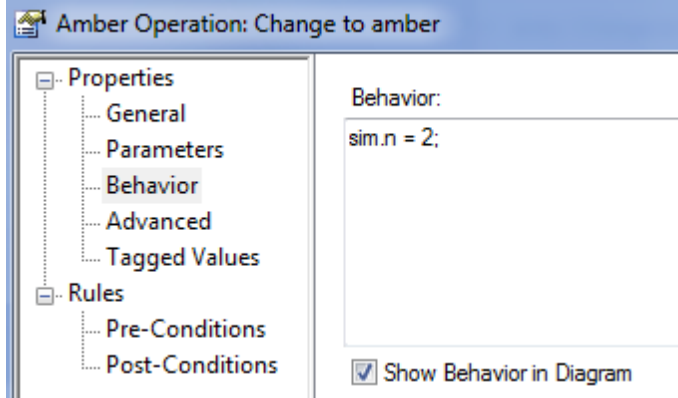

All the above variables will be shown in the **Locals** window.

The recommended convention is to add any global or control variables not declared in the owning Class to the **sim** object. In contrast it would be normal to add attributes of the owning classifier to the **this** object.

Some examples of where and how you can set Simulation behavior using Javascript are shown below. See the **EAExample.eap** model that comes with Enterprise Architect for some more examples. Also see the **Learning Center** for further information on setting up and working with Javascript in Simulations.

### Using Javascript

Setting	Action	See also
<b>Analyzer Script Input</b>	<p>If you enter <b>Javascript</b> code into the Execution Analyzer window <b>Input</b> field, this code will be <b>injected</b> into the Simulation and executed before the Simulation starts. This is useful for establishing COM variables, global counters, functions and other initialization.</p> 	
<b>Transition and Control Flow Guards</b>	<p>This is the <b>workhorse</b> of the Simulation functionality. As Enterprise Architect <b>evaluates</b> possible paths forward at each node in a Simulation, it tests the <b>Guards</b> on outgoing transitions and control flows and will only move forward if there is a <b>single true path</b> to follow - otherwise the Simulation is considered "blocked" and manual intervention is required. You must use the <b>"=="</b> operator to test for equality.</p>	

Setting	Action	See also
		
<b>Element Behavior</b>	<p><b>Entry and Exit behavior</b> may be defined for States. Such code will execute at the appropriate time and is useful for updating Simulation variables and making other assignments.</p>  <p>You can also simulate the behavior of Classes, via their Object Instances, and Activities in your model.</p>	<p><a href="#">Call Behaviors</a></p> <p>[2489]</p>
<b>Using COM</b>	<p>One very important feature of the implementation of Javascript in Enterprise Architect's simulator is that it supports the creation of <b>COM objects</b>. This provides the ability to <b>connect the running Simulation with almost any other local or remote process</b> and either influence the Simulation based on external data, or potentially change data or behavior in the external world based on the current Simulation state (eg. update a mechanical model or software simulation external to Enterprise Architect). <b>The syntax</b> for creating COM objects is shown below.</p> <pre> this.name=" Odd Even"; var logger = new COMObject ( " My Si m. Logger " ); logger.Show(); logger.Log( " Si mul a ti on s t a r t e d " ); </pre>	
<b>Signalled Actions</b>	<p>It is possible to raise a <b>signalled event (trigger)</b> directly using <b>Javascript</b>. The <b>BroadcastSignal()</b> command is used to raise a named trigger which may influence the current state of a simulation. For example the following fragment raises the signal (trigger) named "CancelPressed".</p> <pre> Broadcast Signal ( " Cancel P r e s s e d " ); </pre>	

Setting	Action	See also
	<p>Note that a trigger named <b>CancelPressed</b> must exist within the current simulation environment and must <b>uniquely have that name</b>.</p> <p>You can also call the signal using its GUID. For example:</p> <pre>Broadcast Signal ( "{ 996EAF52- 6843- 41f 7- 8966- BCAA0ABEC41F} " );</pre>	
<b>IS_IN()</b>	<p>The <b>IS_IN(state)</b> operator returns true if the current simulation has an <b>active state</b> in any thread <b>matching</b> the passed in <b>name</b>. For example it is possible to write code such as the following to conditionally control execution:</p> <pre>if ( IS_IN( " WaitingForInput " ) )     Broadcast Signal ( " Cancel Pressed " )</pre> <p>Note that the name must be <b>unique</b> within all contexts.</p>	
<b>Trace()</b>	<p>The Trace(statement) method allows you to print out trace statements at any arbitrary point in your simulation. This is an excellent means of <b>supplementing</b> the <b>Simulation log</b> with additional output information during execution.</p>

### 15.9.1 Call Behaviors

In the course of simulating a process, you can enact the behaviors defined in an operation of either a Class (through its simulation Object) or an Activity in the model. In each case, you use JavaScript to call the behaviour.

#### Invoke the Behavior of a Class

A Class in your model defines a behavior that you want to simulate. This behavior is defined in the Behavior page of an Operation of the Class.

For example, the Class is intended to add two integers, through the Operation **add**. The integers in this case are parameters of the operation, defined by attributes of the Class, **operand1** and **operand2**.

Step	Action	See also
1	<p>In the Properties dialog for the Operation, select the Behavior page and edit the <b>Behavior</b> field to apply the JavaScript simulation objects (<b>this</b> or <b>sim</b>) to the behavior definition.</p> <p>In the example:</p> <pre> this.operand1=operand1; this.operand2=operand2; return operand1+operand2           </pre>	<a href="#">Dynamic Simulation with Javascript<sup>[2486]</sup></a>
2	<p>Drag the Class onto your simulation Activity diagram and paste it as an <b>Instance</b>.</p> <p>In the example, the Object is called <b>calculator</b>. For clarity, the element shown here is set to display inherited attributes and operations, and the behavior code, on the diagram.</p> <pre> classDiagram     class calculator {         &lt;&lt;instance&gt;&gt;         ..Class1         - operand1: int         - operand2: int         ..Class1         + add(int, int): int         this.operand1= operand1;         this.operand2 = operand2;         return operand1+ operand2;     }   </pre>	
3	<p>On the simulation diagram, for the appropriate Action element, open the Properties dialog and on the Effect page type in the JavaScript to capture and</p>	

Step	Action	See also
	<p>simulate the Object's behavior.</p> <p>In the example, the JavaScript defines a value that will be provided by simulating the behavior of the operation from the Object, as performed on two provided integers. That is:</p> <pre>sim.result=sim.calculator.add(7,9)</pre>	
4	<p>Run the simulation, and observe its progress in the Locals window. Ultimately the Class behavior is reflected in the result of the simulation.</p> <p>In the example: <code>result = 16</code>.</p>	

#### Invoke the Behavior of an Activity

An Activity element can have a behavior, defined by an operation in that element. As a simple example, an Activity might have an operation called **Get Result**, with the behavior `return "ON"` ; .

You can simulate this behavior in the Activity's child diagram (that is, internal to the Activity), with a JavaScript statement in the appropriate Action element's **Effect** field. In the example, this might be:

```
sim.result=this.GetResult();
```

The statement invokes the parent Activity's operation **GetResult** and assigns the outcome of that operation's behavior to **sim.result**. You can observe the progress of the simulation and the result of simulating the behavior in the Locals window, where (in this example) the value **result "ON"** will ultimately display.

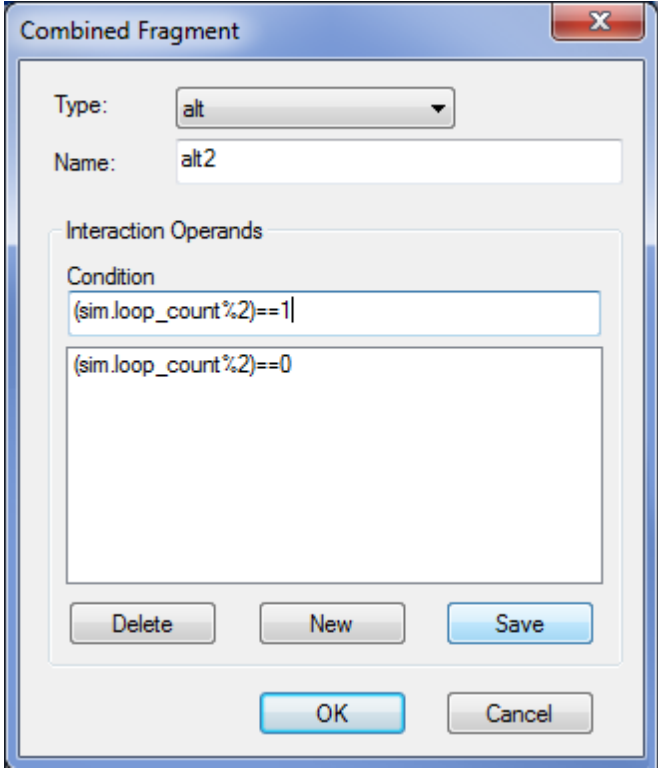

### 15.9.2 Interaction Operand Condition and Message Behavior

When you simulate the behavior of a Sequence diagram, you can use a Condition for the *CombinedFragment* Interaction Operand, to control the flow during the course of the simulation.

A Message in Sequence diagram can link to an Operation, so the behavior of the Operation can also be used during the course of the simulation.

#### Interaction Operand Conditions

Field/Column	Description	See also
<b>Operand Condition</b>	<p><b>Interaction Operand Conditions</b> are conditional statements that are evaluated whenever the simulator has to determine which path to take next. Operand Conditions typically have the following characteristics:</p> <ul style="list-style-type: none"> <li>• Defined in the Combined Fragment dialog</li> <li>• Written in <b>Javascript</b></li> <li>• Can refer to variables defined during simulation</li> </ul>	
<b>Adding</b>	To add an Operand <b>Condition</b> :	

Field/Column	Description	See also
<b>Operand Conditions</b>	<ol style="list-style-type: none"> <li>1. Double-click on the CombinedFragment element to open the Combined Fragment dialog.</li> <li>2. Click on the <b>New</b> button.</li> <li>3. In the <b>Condition</b> field, type the Javascript for the condition.</li> <li>4. Click on the <b>Save</b> button.</li> </ol> 	
<b>Evaluation Semantics</b>	During execution the Simulator evaluates any Operand Condition within the CombinedFragment; the CombinedFragment type and the outcome of the evaluation can determine the path that the simulation continues on.

- [Triggers](#)<sup>[2494]</sup>

### 15.9.3 Guards and Effects

**Guards and Effects** are used to **control the flow** of the simulation and to **execute additional actions** or effects during the course of a simulation.

#### Guards and Effects

Concept	Detail	See also
<b>Guards</b>	<p>Guards are <b>conditional statements</b> that are evaluated anytime the simulator needs to decide which path to take next. Guards typically have the following characteristics:</p> <ul style="list-style-type: none"> <li>Defined on <b>transitions</b> and <b>control flows</b> to govern how simulation proceeds</li> <li>Written in <b>Javascript</b></li> <li>May refer to <b>variables</b> defined during simulation</li> </ul>	<a href="#">Dynamic Simulation with Javascript</a> <sup>[2486]</sup>
<b>Adding Guards</b>	<p>Guards are defined on the <b>Transition</b> or <b>Control Flow</b> in the Properties dialog for the selected connector. A Guard is typically a piece of Javascript that will evaluate to either <b>true</b> or <b>false</b>. For example, the following is a conditional statement that refers to a current variable (Balance) being greater than zero. Note the use of the prefix <i>this</i> to indicate that the variable is a member of the current Class context.</p> <div> <p>Guard: <input type="text" value="this.Balance &gt; 0;"/></p> <p>Effect: <input type="checkbox"/> Effect is a Behavior</p> </div>	
<b>Evaluation Semantics</b>	<p>During execution the Simulator will examine all possible paths forward and <b>evaluate</b> any <b>guard conditions</b>. Based on this evaluation the following can occur:</p> <ul style="list-style-type: none"> <li><b>A single valid path</b> forward evaluates to <b>true</b>; the simulator will follow that path</li> <li><b>Two valid paths</b> are found; the simulator will <b>block</b>, waiting for some manual input via the console window to resolve the deadlock</li> <li><b>No valid path exists</b>; the same response as when two paths are found - wait for the user to change the execution context using the console window</li> <li>No paths evaluate to true but a <b>default (unguarded path)</b> exists; the Simulator will take the <b>unguarded path</b></li> </ul>	
<b>Effects</b>	<p>Effects are defined behaviors that are executed at special times:</p> <ul style="list-style-type: none"> <li>On <b>entry</b> to a state</li> <li>On <b>exit</b> from a state</li> <li>When <b>transitioning</b> from one state to another (transition <b>effect</b>)</li> </ul>	

Concept	Detail	See also
	<p>Effects can either be a section of Javascript code or a call to another Behavior element in the current simulation.</p>	
<b>Javascript Effects</b>	<p>A Javascript effect might resemble this example, in which the Balance variable is decremented:</p> <p>Guard: <input type="text"/></p> <p><input type="checkbox"/> Effect is a Behavior</p> <p>Effect: <input type="text" value="this.Balance--;"/> <input type="button" value="..."/></p>	
<b>Call Behavior Effects</b>	<p>In this example the effect is a <b>call behavior</b> effect. In this case, it calls into a model the Activity named <i>Decrement Balance</i> that is defined elsewhere. The simulation will then <b>enter into that diagram/behavior</b> and continue to execute until returning to the point at which the effect was invoked.</p> <p>Guard: <input type="text"/></p> <p><input checked="" type="checkbox"/> Effect is a Behavior</p> <p>Effect: <input type="text" value="Decrement Balance"/> <input type="button" value="..."/></p>	
<b>Order of Execution of Effects</b>	<p>In <b>complex simulations</b> that might involve transitioning out of <b>deeply nested states</b> into other deeply nested states in a different parent context, it is important to consider the following rules concerning the order of execution:</p> <ul style="list-style-type: none"> <li>• <b>All exit actions (effects) encountered leaving a nested context</b> are executed in order of most deeply nested to least deeply nested</li> <li>• All <b>actions (effects)</b> defined on <b>transitions</b> are executed next</li> <li>• <b>Finally</b>, all <b>entry effects are executed</b> from the least deeply nested context to the most deeply nested</li> </ul> <p>So the basic rule is: all exit actions, followed by all transition actions, and finally all entry actions.</p>	
<b>Note on Javascript Variables</b>	<p><b>Javascript variables</b> to be accessed and referred to during Simulation execution belong to either:</p> <ul style="list-style-type: none"> <li>• <b>sim</b> e.g. <code>sim.pedestrianwaiting</code> - typically used for global simulation variables, or</li> <li>• <b>this</b> e.g. <code>this.CustomerNumber</code> - typically used to refer to owning Class attributes</li> </ul> <p>This is important to let the Javascript engine know you are referring to</p>	

Concept	Detail	See also
	a <b>Simulation variable</b> and not a simple local variable used during, for example, basic calculations. You can create Simulation variables of arbitrary scope and depth - for example, <i>this.customer.name</i> is a legitimate qualified name.	

#### Learn more

- [Interaction Operand Condition and Message Behavior](#)  <sup>[2490]</sup>
- [Triggers](#)  <sup>[2494]</sup>

### 15.9.4 Triggers

**Triggers represent signals** and events that can **activate transitions** leaving the current state(s). A trigger may represent a **real world signal** or event such as:

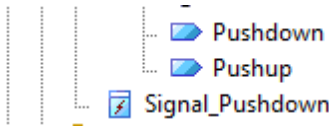

- A **button** being pressed
- A **message** being received
- A **pedal** being depressed
- A **switch** being thrown
- A **state** in a concurrent region being entered or exited

#### For a trigger to have an effect

- Transitions have to be defined which **will fire** when the simulation **receives** the **signal/event**
- The current simulation state(s) or its parent(s) must have an **outgoing transition** that **accepts** that **trigger**
- The transition activated must be **unguarded** or have a **guard** which will **evaluate** to **true**

#### Managing Triggers

Action	Detail	See also
<b>Creating Triggers</b>	<p>Triggers are <b>either</b> created as an <b>instance of a Signal</b> element or as an <b>anonymous event</b>. Triggers are connected to Transitions in the Transition Properties dialog as shown below. In this example a Trigger named 'Pushdown' has been defined based on the Signal 'Signal_Pushdown'.</p> <ul style="list-style-type: none"> <li>• <b>Omitting the Type and Specification</b> details results in a simple anonymous Trigger.</li> <li>• If <b>parameters</b> are needed, these are <b>defined on the Signal</b> and must be supplied at the time the event fires</li> </ul>	<a href="#">Trigger</a>  <sup>[1350]</sup> <a href="#">Transition</a>  <sup>[1446]</sup> <a href="#">Simulation Events Window</a>  <sup>[2504]</sup>

Action	Detail	See also						
	<p>Triggers</p> <p>Name: <input type="text" value="Pushdown"/> ...</p> <p>Type: <input type="text" value="Signal"/> Specification: <input type="text" value="Signal_Pushdown"/> ...</p> <p><input type="button" value="New"/> <input type="button" value="Save"/> <input type="button" value="Delete"/></p> <table border="1"> <thead> <tr> <th>Name</th><th>Type</th><th>Specification</th></tr> </thead> <tbody> <tr> <td>Pushdown</td><td>Signal</td><td>Signal_Pushdown</td></tr> </tbody> </table> <p>A trigger will appear in the <b>Project Browser</b> like the image below:</p> 	Name	Type	Specification	Pushdown	Signal	Signal_Pushdown	
Name	Type	Specification						
Pushdown	Signal	Signal_Pushdown						
<b>Using Triggers</b>	<p>Triggers are <b>deployed by connecting</b> them to transitions as in the example above and used during simulation by 'firing' them into the running simulation as required.</p> <p>When using triggers the following should be taken into account:</p> <ul style="list-style-type: none"> <li>• A 'triggered' transition can not take place until its <b>effective trigger is signalled</b> or fired</li> <li>• When a trigger is received it will <b>activate all current waiting transitions dependent on that trigger</b> (i.e. the trigger is broadcast)</li> <li>• Triggers are evaluated on <b>all transitions for all parents of a current child state</b>. This allows a parent state to exit all child states if necessary</li> <li>• Once used in a simulation, a trigger is <b>consumed</b> and must be re-fired if needed again</li> <li>• <b>Sets of triggers</b> may be saved and either manually or automatically fired to facilitate automated model simulation under different event models</li> </ul>	<p><a href="#">Re-Signal Triggers</a> <sup>[2509]</sup></p> <p><a href="#">Connector Type-Specific Options</a> <sup>[1103]</sup></p>						
<b>Firing Triggers</b>	<p><b>Firing triggers</b> means to <b>signal</b> or <b>activate</b> a trigger within the current simulation. This may activate zero, one or many waiting transitions depending on the state and concurrency of the current simulation.</p> <p>Firing triggers can be achieved in many ways. The most efficient is the <b>Waiting Triggers</b> list.</p> <p>During the course of model simulation, if the simulator reaches an <b>impasse</b> due to required triggers not being available (fired), the <b>list of all possible candidate triggers</b> is shown in the 'Waiting Triggers' list of the Simulation Events window.</p>	<p><a href="#">Simulation Events Window</a> <sup>[2504]</sup></p> <p><a href="#">Connector Type-Specific Options</a> <sup>[1103]</sup></p>						

Action	Detail	See also															
	<div><div>Waiting Triggers</div><div> Hold</div><div> Pushdown</div></div> <p><b>Double clicking a trigger</b> in this list will fire it into the simulation. Other ways to fire a trigger include:</p> <ol style="list-style-type: none"><li>1. <b>Double click an un-signalled trigger</b> in the Events window</li></ol> <table><thead><tr><th>Sequence</th><th>Trigger</th><th>Status</th><th>Type</th><th>Parameters</th></tr></thead><tbody><tr><td></td><td>Pushdown</td><td>not signalled</td><td>Signal</td><td></td></tr><tr><td></td><td>Pushup</td><td>not signalled</td><td>Simple</td><td></td></tr></tbody></table> <p>You can also use the context menu on the events above to either signal an un-signalled event, or to re-signal an event which has already been fired previously.</p> <ol style="list-style-type: none"><li>2. Use the <b>context menu</b> of the <b>Transition required</b> to fire and select the <b>Signal Trigger in Simulation</b> menu option.</li></ol>	Sequence	Trigger	Status	Type	Parameters		Pushdown	not signalled	Signal			Pushup	not signalled	Simple

## 15.10 Action Behavior By Type

You can vary the behavior initiated by an Action element by defining (or even redefining) its type. In simulation, you can apply and observe a number of different behaviors using the Actions in the types and groups described in this table.

Action Type	Description	See also
<b>Object Actions</b>	Object Actions operate on an object in a specific way, such as creating, destroying or reading the object. They include: <ul style="list-style-type: none"> <li>• <b>CreateObject</b></li> <li>• <b>DestroyObject</b> and</li> <li>• <b>Read Self</b></li> </ul>	<a href="#">Create Objects in a Simulation</a> <small>[2480]</small> <a href="#">Destroy Objects in a Simulation</a> <small>[2483]</small> <a href="#">Action Types</a> <small>[1272]</small>
<b>Variable Actions</b>	Variable Actions have an association variable in the form of the Tagged Value variable with the value of the name of an object in run-time. They provide the variable not only as an object but also as a property (such as an attribute or Port) of an object. They include: <ul style="list-style-type: none"> <li>• <b>ReadVariable</b></li> <li>• <b>WriteVariable</b></li> <li>• <b>ClearVariable</b></li> <li>• <b>AddVariableValue</b></li> <li>• <b>RemoveVariable</b></li> </ul>	<a href="#">Variable Actions</a> <small>[1273]</small>
<b>StructuralFeature Actions</b>	StructuralFeature Actions operate on a structural feature, namely an attribute of an Activity or of the classifier of an object. They include: <ul style="list-style-type: none"> <li>• <b>ReadStructuralFeature</b></li> <li>• <b>WriteStructuralFeature</b></li> <li>• <b>ClearStructuralFeature</b></li> <li>• <b>AddStructuralFeatureValue</b></li> <li>• <b>RemoveStructuralFeatureValue</b></li> </ul>	<a href="#">StructuralFeature Actions</a> <small>[1271]</small>
<b>Invocation and Accept Event Actions</b>	Invocation and Accept Event actions define the Triggers and Signals of an event. They include: <ul style="list-style-type: none"> <li>• <b>SendSignal</b></li> <li>• <b>BroadcastSignal</b></li> <li>• <b>AcceptEvent</b></li> <li>• <b>SendObject</b></li> <li>• <b>CallBehavior</b></li> <li>• <b>CallOperation</b></li> <li>• <b>AcceptCall</b></li> </ul>	<a href="#">SendSignal Action &amp; BroadcastSignal Action</a> <small>[1270]</small> <a href="#">AcceptEvent Actions</a> <small>[1269]</small> <a href="#">CallBehavior Action</a> <small>[1271]</small> <a href="#">SendObject Action</a> <small>[1271]</small>

Action Type	Description	See also
<b>Miscellaneous Actions</b>	The <b>ValueSpecificationAction</b> evaluates a value; it must have an input value and some evaluating code as its behavior or effect.

## 15.11 Structured Activity Simulation

One of the more complex structures in a behavioral model is a **Structured Activity**, which models a series of actions either in a nested structure or in a process of assessment and execution. The assessment types of Structured Activity are the **Conditional Node** and **Loop Node**, both of which you can simulate quite easily.

### Conditional Node

A Conditional Node essentially consists of one or more pairs of **Test/Body** partitions, each pair being referred to as a **Clause**. The Test partition is composed of Activity diagram elements that test a condition, and if that condition is met further Activity diagram elements in the Body partition are executed to produce a result.

If there is one Clause, the Conditional Node either outputs the result of the Body partition, or no result. If there is more than one Clause, control flows from one Test to the next until either a condition is met and a Body partition is executed to produce a result, or all Tests fail.

Simulation currently supports use of the **Is Assured** checkbox setting in the Condition page of the Properties dialog. The other two checkbox settings are ignored. If the **Is Assured** checkbox is:

- **Selected**, at least one Test must be satisfied, so its Body is executed and a result output; if no Test is satisfied and no result output, the Conditional Node is blocked and processing cannot continue beyond it
- **Not selected**, a Test can be satisfied and a result output, but if no Test is satisfied and no result output, processing can still continue beyond the Condition Node

You can simulate a range of possible paths and outcomes by typing JavaScript **sim.** statements that define or lead to specific Test results and Body results, in the **Effect** fields of the Action elements within each partition of each Clause. These **sim.** statements must identify the full path of the Conditional Node, Clause and Output Pin being set. For example, in a **test** to see if a person qualifies as a senior citizen:

```
if (sim.Person.age >=65)
sim.AgeCondition.Clause1.Decider1=true;
else
sim.AgeCondition.Clause1.Decider1=false;
```

The Condition Node is called **AgeCondition**, the test is in **Clause1** and the OutputPin for that test is **Decider1**.

### Loop Node

A Loop Structured Activity Node commonly represents the modeling equivalents of **While**, **Repeat** and **For** loop statements. Each Loop Node has three partitions:

- **Setup** - which initiates variables to be used in the loop's exit-condition; it is executed once on entry to the loop
- **Test** - which defines the loop exit-condition
- **Body** - which is executed **repeatedly** until the Test produces a false value

You define the Loop Nodes by dragging Activity diagram elements from the Toolbox pages into the Setup, Test and Body partitions. The Body partition can contain quite complex element structures, defining what the Loop Node actually produces in the process.

The Loop Node has a number of Action Pins:

- **Loop Variable (Input)** - the initial value to be processed through the Loop
- **Loop Variable (Output)** - the changing variable on which the Test is performed
- **Decider** - an Output Pin within the **Test** partition, the value of which is examined after each execution of the Test to determine whether to execute the loop Body
- **Body Output** - the output value of the processing in the Body partition, which updates the Loop Variable Output Pin for the next iteration of the loop, and
- **Result** - the value of the final execution of the Test partition (which is the value passed back from the last execution of the Body partition)

You can simulate the effects of different actions and outputs through the loop, by typing JavaScript **sim.** statements that define or lead to specific Test results and Body results, in the **Effect** fields of the Action elements within each partition. These sim. statements must identify the path of the Loop Node and Output Pin being set. For example, in an Action in the Test partition:

```
sim.LoopNode1.decider = (sim.LoopNode1.loopVariable>0);
```

## 15.12 Activity Return Value Simulation

An **Activity** is likely to produce a **return value** as the output of the process it represents. You can simulate how that return value is passed on to the next stage in the process, under three scenarios:.

- The Activity simply produces a return value, which is passed directly to the next Action
- The Activity has one or more Activity Parameters - represented on a diagram by Activity Nodes - that accept input values to or hold output values from the child Actions of the Activity, and the output Activity Parameter collects and passes on the return value
- The Activity is instantiated by a CallBehavior Action that replicates the behavior of the Activity and passes the return value onwards

### Activity Return Value Pass Out

(This method is unique to Enterprise Architect simulation, mimicking the effect of an Activity Parameter without one having to exist.)

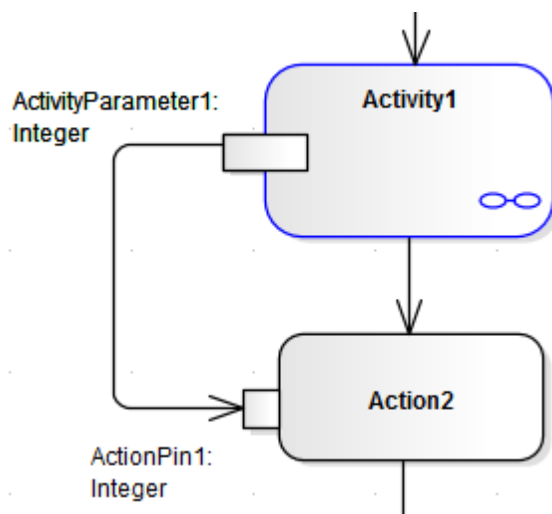

The Activity has a return value, which is transferred from the Activity element to an Action Pin on the next Action in the process via an **Object Flow** connector.

You can simulate this by setting a simple JavaScript statement to set the return value in the Activity's child element (such as `this.return=12;`) and, running the simulation, see the value transferred to the Action Pin in the Locals window.

### Activity Parameter Pass Out

If the Activity has an Activity Parameter, its value passes to the corresponding ActivityNode and then, via an Object Flow connector, to the Input ActionPin of the next Action in the process, as shown:

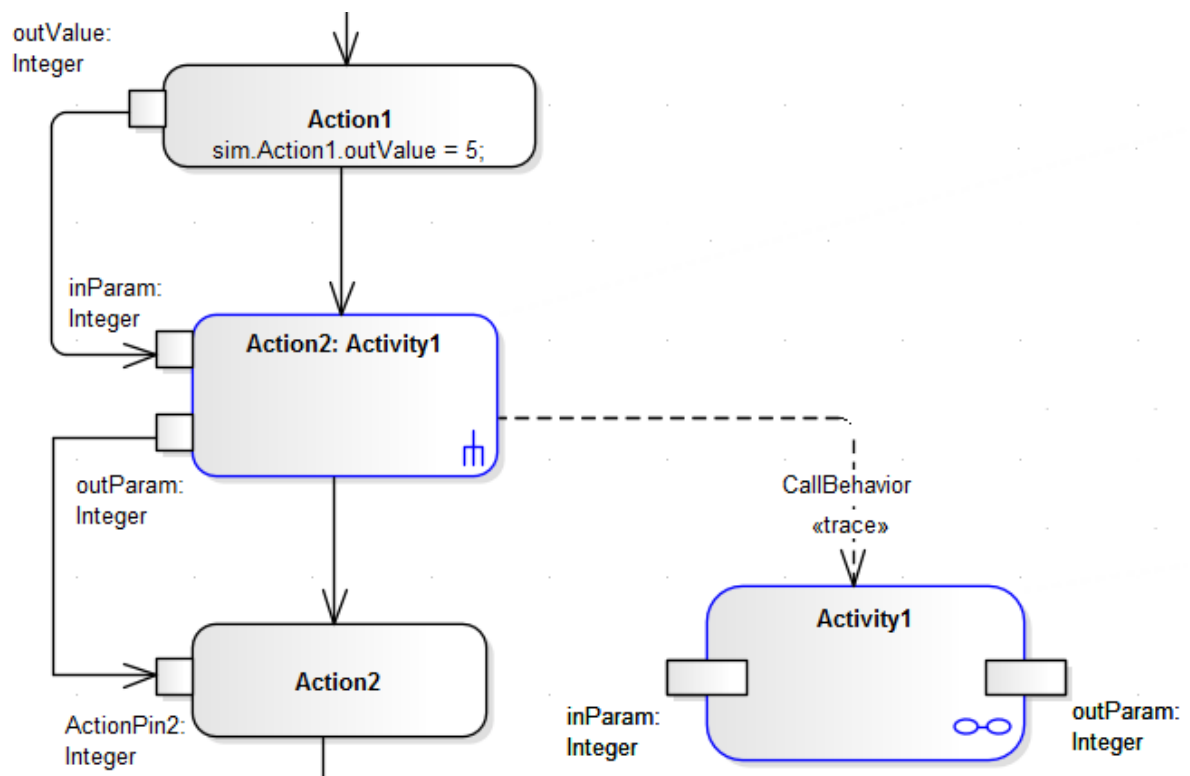

In the Locals window, you can either observe the Parameter's default value pass through to the ActionPin, or you can use JavaScript in the Activity's child Actions to simulate an update of the value within the Activity. For example:

```
this.ActivityParameter1=20;
```

#### CallBehavior Action

An Activity might be used a number of times in a process, in which case you might want to generate a separate instance of the Activity each time. You can do this using a **CallBehavior Action** to create an **object** of the Activity and execute its behavior. The input and output **Activity Parameters** are bound to corresponding input and output **Action Pins (arguments)** on the CallBehavior Action.

When you simulate the part of the process containing the Activity, you provide an input value (as in Action 1) that passes into the input Action Pin on the CallBehavior Action, which creates an Object of the Activity. The CallBehavior executes the behavior of the Activity, using the input Action Pin to act as the input Activity Parameter, and the Output Action Pin to receive the return as the output Activity Parameter. The Activity return value is then passed to an Action Pin on the next Action, as above, using an Object Flow connector. You can provide JavaScript statements in the Actions of the Activity to act on the input value and generate a return value, such as:

```

sim.buf=this.inParam;      and

this.outParam=sim.buf + 11;

```

## 15.13 Simulation Events Window

The **Simulation Events** window is where you **manage triggers** and sets of events in a simulation. Its main functions are to:

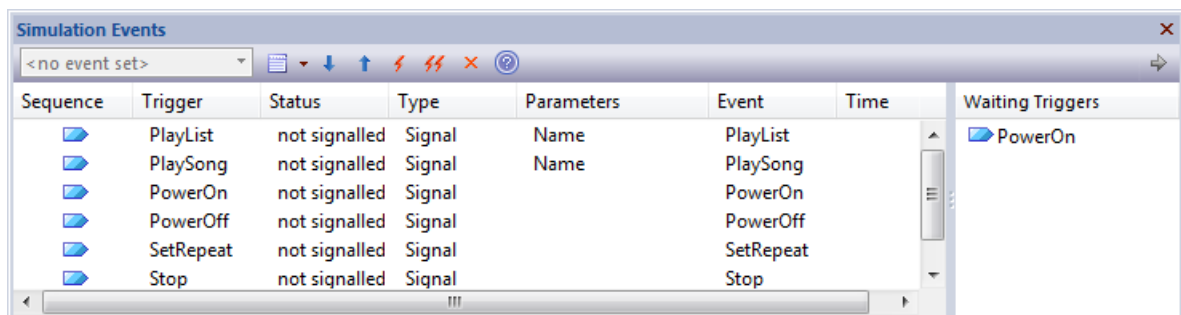

- **Add, delete and re-sequence** a set of triggers for a simulation
- **Display a list of fired, lost and waiting** events for the current running simulation
- Provide options to **fire any arbitrary trigger** into the current simulation
- Provides a convenient '**Waiting Triggers**' list of triggers that the simulation is waiting on
- Ability to **save trigger sets** for later use in both manual and automated simulations
- **Accept triggers dragged** from the Project Browser into the current list
- Enter **trigger parameters** for a waiting trigger prior to firing.

As **triggers are consumed** in the simulation, their status and position is logged in the main body of the Simulation Events window.

You can **save the log of fired triggers** as a trigger set or event set to reapply in another Simulation run, which you can execute manually or automatically. See the topic *Trigger Sets and Auto-Firing* for more information on building and using Trigger sets.

**Access** [Analyzer | Simulation Events](#)

The following image illustrates the Simulation Events window during execution.

### Column Details

Field/Column	Action	See also
<b>Sequence</b>	During and after the simulation, indicates the position in the sequence in which a trigger was fired or is expected to be fired. Note that if a trigger is fired out of sequence, it will be moved to the bottom of the signalled events section.	
<b>Trigger</b>	The name of the trigger - identifies the Trigger used to initiate the event.	<a href="#">Triggers</a> <sup>2494</sup>
<b>Status</b>	Indicates the status of the Trigger. Values can be:	

Field/Column	Action	See also
	<ul style="list-style-type: none"> <li><b>used</b> - the trigger has been fired and processing has passed on</li> <li><b>lost</b> - the trigger has been fired in the list, but it had no effect</li> <li><b>signalled</b> - a trigger was fired and consumed by one or more transitions</li> <li><b>not signalled</b> - the trigger has not yet been fired</li> </ul>	
<b>Type</b>	<p>Indicates the type of trigger. Currently only the following are supported:</p> <ul style="list-style-type: none"> <li><b>Signal</b></li> <li><b>(no type) an anonymous trigger</b></li> </ul>	<a href="#">Trigger</a> 
<b>Parameters</b>	<p>For a Signal Trigger, initially shows the parameters required for firing by the Signal specification. For example a "Login" signal might include username and password parameters - and each triggered invocation can use different parameters.</p> <p>Each time the simulation fires the trigger, the system will prompt you for values. You can also edit the values directly in the list when the trigger is set to <b>not signalled</b>.</p> <p>Parameters are very useful for testing the conditional logic in your simulation and to simulate a variety of inputs and data coming in from outside the simulation.</p>	<a href="#">Trigger Parameters</a> 
<b>Event</b>	<p>For a:</p> <ul style="list-style-type: none"> <li>Signal Trigger, identifies the Signal specification.</li> <li>For anonymous Triggers has no value</li> </ul>	
<b>Time</b>	<p>The simulation time at which the trigger was signalled. Note that this is an absolute (real world) time, and not a relative simulation event time.</p>	
<b>Waiting Triggers</b>	<p>Lists the Triggers available for selection from the current state(s), including those where more than one trigger is possible at a single transition. Double-click on a trigger to add and signal it as the next trigger in the current event sequence.</p> <p>You can show and hide this panel by clicking on the gray arrow just above the panel.</p>	<a href="#">Waiting Triggers</a> 

Toolbar Options

Option	Action	See also
	Use this drop list to select and work with previously defined trigger sets.  Before running a simulation, select a previously-defined trigger set to use for the next simulation run. You elect to not use a trigger set by selecting the <b>&lt;no event set&gt;</b> option.	
	Click to create and delete trigger sets: <ul style="list-style-type: none"> <li>• <b>Save Set</b> - Save the current trigger list as a new trigger set; the system prompts you for a name for the new set</li> <li>• <b>Save Set As</b> - Create a copy of the current set under a new set name</li> <li>• <b>Delete Selected Set</b> - Delete the current trigger set</li> <li>• <b>Delete All Sets for Diagram</b> - Delete all saved trigger sets for the current diagram</li> </ul>	<a href="#">Trigger Sets and Auto-Firing</a> [2512]
	Move the selected trigger one line down in the firing sequence of triggers.  This option is not available if there are no <b>not signalled</b> triggers below the selected line.	
	Move the selected trigger entry one line up in the firing sequence of triggers.  This option is not available if there are no <b>not signalled</b> triggers above the selected line.	
	Click to fire the selected trigger. You can also fire the trigger by double-clicking on it.	
	Click to toggle auto-firing on and off.  Auto-firing will fire the un-signalled triggers in your trigger set sequentially. If your set matches a valid execution path, then the simulation will run automatically. Out of sequence or unused triggers will be 'lost'.  A breakpoint pauses the auto-firing and you will need to click on the next trigger to resume auto-firing the simulation.	<a href="#">Trigger Sets and Auto-Firing</a> [2512]
	Delete the selected trigger(s) from the list.	

#### Context Menu Options

Options	Action	See also
<b>Signal Selected</b>	Signal, or fire, the selected <b>not signalled</b> trigger.	
<b>Remove Selected</b>	Remove a <b>not signalled</b> trigger from the sequence.	
<b>Re-Signal Selected</b>	Fire a used or signalled trigger again.	
<b>Set All to Unsignalled</b>	Set all used or signalled triggers to <b>not signalled</b> .	
<b>Clear Trigger List</b>	Clear all triggers from the window, regardless of their status.

## 15.14 Waiting Triggers

When a simulation reaches a point where any change of state (for any thread) **requires a Trigger to proceed**, the simulation is effectively **paused** and control returns to the system. The simulation is now effectively waiting for some form of event (a real world signal) to proceed. The **Waiting Triggers list** is useful in helping to determine which Trigger should be manually signalled.

Access **Analyzer | Simulation Events**

The **Waiting Triggers** list on the **Simulation Events** tab is:

- **Populated on each Simulation cycle** with any Triggers that would have an immediate effect if signalled
- Populated with a **discrete set** (any duplicates are not shown as a Trigger is effectively **broadcast** to all transitions at once)
- Activated by **double clicking** on the Trigger of interest
- Includes **all possible triggers** - including those activating transitions on **parents** of currently nested states

This example shows that the current simulation has hit a point where two possible Triggers can influence the flow of execution.

Due to the nature of Triggers and their effects, the list can refer to the following example situations equally validly:

- A single state has two outgoing transitions which are respectively waiting for Hold and Pushdown; firing one of these will activate the associated transition in the simulation
- A single state has two or more possible triggers for the same transition, such as a security camera being switched on by a motion detector, sound detector or heat detector
- Two (or more) threads (concurrent regions) each have a state waiting on either Hold or Pushdown; firing one of these triggers will result in the thread(s) waiting on that trigger to proceed while the other thread(s) will remain blocked
- A child state is waiting on one of the triggers while a parent state is waiting on the other; firing a trigger will result in the associated transition being fired and either the child or parent proceeding accordingly
- Any combination of the above

Learn more

- [Connector Type-Specific Options](#) 

## 15.15 Re-Signal Triggers

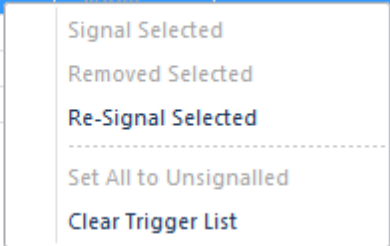

It is possible to **re-signal a Trigger** as a shortcut of dragging in additional Trigger instances for signalling.

**Access** [Analyzer](#) | [Simulation Events](#)

The Simulation Events window contains a list of Triggers which have **already fired**. By **right clicking on a Trigger** that you wish to signal again, you can use the context menu to cause the **re-signal** to happen.

The image below demonstrates this in action. When a signal is re-signalled, a new copy is made and placed at the end of the signalled triggers list, where it is automatically fired again.

Sequence	Trigger	Status	Type	Parameters
1	Pushdown	used	Signal	
2	Pushup	used		
3	Pushdown	used		
4	Pushup	used

## 15.16 Trigger Parameters

Trigger parameters are **arguments passed into the simulation along with a trigger** when it is fired. They allow for **complex behavior** to be specified decision to be made based on variables and data passed into a simulation at run-time by a fired trigger (event).

Topic	Detail								
<b>Introduction</b>	<p>To use <b>trigger parameters</b> you</p> <ul style="list-style-type: none"> <li>First create a <b>Signal</b> element with the appropriate attributes that will become your parameters at run time</li> <li>On a suitable transition in your diagram, <b>create a trigger</b> that is based on the signal created earlier</li> <li>Now at run-time you will be prompted to <b>enter suitable parameters</b> - they are then passed in along with the trigger.</li> </ul>								
<b>Signals</b>	<p>A Signal element is a template or <b>specification</b> from which actual <b>triggers</b> can be built. The example below has two arguments, a Name and a Password. These will be filled in at execution time either manually or as part of a pre-defined trigger set.</p>  <pre> classDiagram     class LoginSignal["«signal» Login"] {         - Name :String         - Password :String     }   </pre>								
	<p>The Trigger parameters '<b>prompt</b>' that asks for suitable values for each parameter. <b>Note that you need to enclose strings in double quotes</b>, otherwise the interpreter will think you are referring to other <b>variables</b>.</p>  <table border="1"> <thead> <tr> <th>Property</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>[-] Login</td> <td></td> </tr> <tr> <td>    Name</td> <td>"Joe"</td> </tr> <tr> <td>    Password</td> <td>"secret"</td> </tr> </tbody> </table>	Property	Value	[-] Login		Name	"Joe"	Password	"secret"
Property	Value								
[-] Login									
Name	"Joe"								
Password	"secret"								
	<p>Below is an example diagram that makes use of trigger <b>parameters</b>. At the <b>Evaluate Login</b> state, the simulation examines the variables passed in as trigger <b>parameters</b> and makes a decision to either accept the credentials or deny them.</p>

## 15.17 Trigger Sets and Auto-Firing

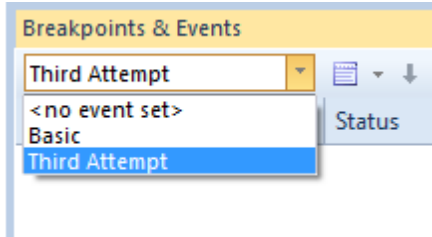

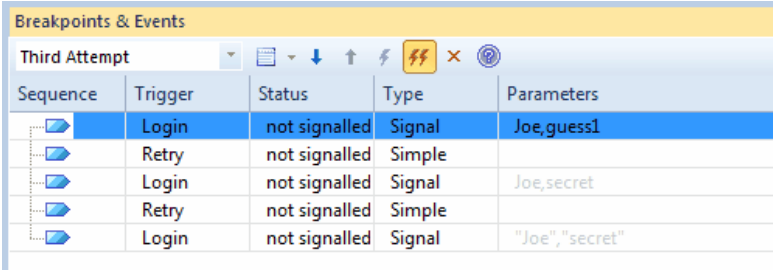

**Trigger Sets** are a powerful means of **automating and streamlining the execution**, testing and validation of simulation models. By **re-using sets of triggers** (with or without parameters) it is possible to quickly and efficiently walk through many simulation scenarios, either manually or automatically using the 'auto-firing' tool.

**Access** [Analyzer | Breakpoints & Events > Simulation Breakpoints](#)

### About Trigger Sets

Topic	Detail	See also
<b>Trigger Sets</b>	<ul style="list-style-type: none"> <li>Stored with an <b>associated diagram</b></li> <li>Made up of a <b>list of Triggers</b> in a set sequence</li> <li>May include Trigger <b>parameters</b> where necessary</li> <li>May be used <b>manually</b> by double clicking Triggers to fire as required</li> <li>May be used as part of the "<b>auto-fire</b>" behavior to automate execution</li> <li><b>Managed</b> from the Simulation Events Window</li> </ul>	
<b>Managing Sets</b>	<p>Trigger sets can be created by manually dragging triggers into the active triggers list and then using the Manage Trigger Sets drop menu to save a new set.</p> <p>It is also possible to save a set of triggers built up during a single simulation setting as a new set. This is convenient for creating multiple test paths through a simulation, based on saving the manually fired triggers for each test case.</p> <p><b><u>The Manage Triggers Menu</u></b></p>  <p>You can also delete a set and delete all sets for the current diagram.</p> <p>It is also possible to load a set, modify parameters and/or order of firing and save the set with a new name. This is a convenient method for rapidly creating a suite of simulation test scripts.</p>	
<b>Using Sets</b>	To use a trigger set you first select it by name from the trigger set drop	

Topic	Detail	See also
	<p>list as in the example image below. Once selected it loads the trigger list window with the defined trigger set.</p> <p>Note that the special item <b>&lt;no event set&gt;</b> means no set is currently selected. At the start of each simulation, if a set is selected, it will be loaded afresh for the next run. If <b>&lt;no event set&gt;</b> is selected, the trigger list will be cleared.</p>  <p>Once you have selected a trigger set and the list of triggers loaded you have two options:</p> <ul style="list-style-type: none"> <li>• Fire the triggers as required manually</li> <li>• Use the auto-fire feature to fully automate the simulation (see below)</li> </ul> 	
<b>Auto-Firing</b>	<p>Auto-firing is a convenient way of streamlining your simulations. Once you have loaded a trigger set, if you select the auto-fire button (below) then Enterprise Architect will automatically pick up waiting triggers when it reaches an impasse in the simulation. In practice, this means that trigger sets matching exactly a path through the simulation will automatically run without your intervention.</p> <p>As you can save any number of trigger sets with different pathways and trigger parameters, you can effectively and quickly test and work with many different scenarios.</p> 	
<b>Auto-Firing Rules</b>	<p>When a simulation runs with auto-firing enabled, Enterprise Architect will wait until a point is reached where the simulation is 'blocked' or stable, waiting on one or more triggers to advance the simulation. At</p>	

Topic	Detail	See also
	<p>that time, the first unfired trigger in the list will be picked up and fired into the simulation. The outcome depends on the relevance and perhaps on the parameters of the trigger.</p> <ul style="list-style-type: none"><li>• If the trigger matches a 'waiting' trigger it is immediately consumed and the simulation advances</li><li>• If the trigger matches no 'waiting' trigger or possible parent transition, then the trigger is 'lost' and the simulation remains in the current state. This corresponds to a scenario such as a user pressing an 'on' button several times in succession - there is no effect other than that occasioned by the first press.</li></ul>	

## 15.18 Using Trigger Sets to Simulate an Event Sequence

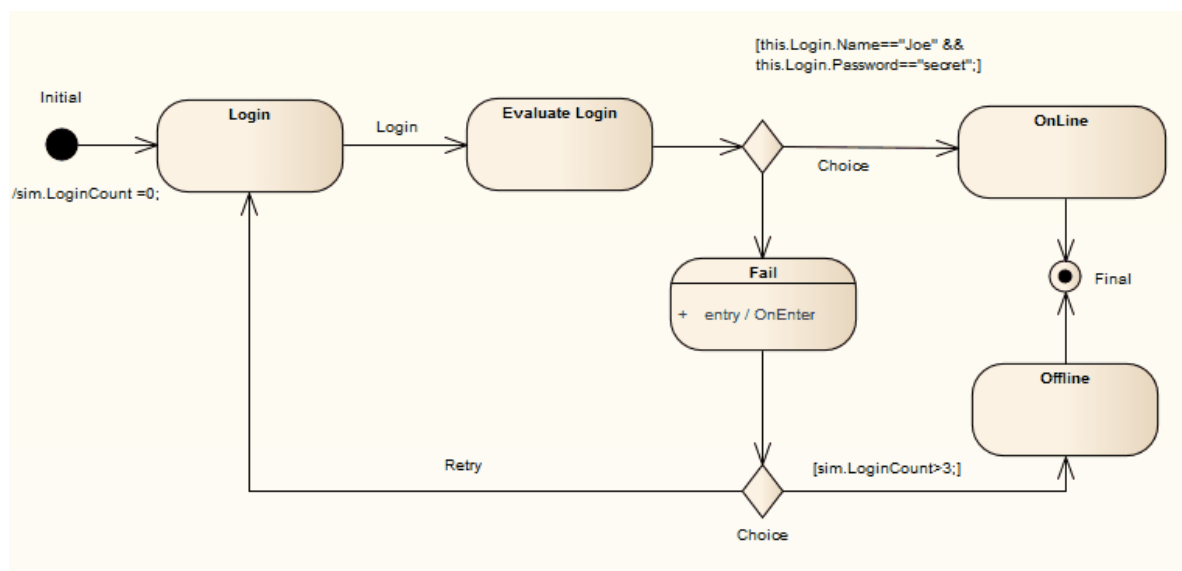

As a simple example of how useful **trigger sets** are, consider the following trigger set and associated diagram.

In this example we **simulate** a simple "three strikes and you are out" login process, taking a user name and password. The success path is waiting for the name "Joe" and the password "secret" (note - it is very important that parameters referencing strings are enclosed in quotes - otherwise the interpreter thinks the name refers to another variable within the simulation).

- Pass 1 tries Joe and guess1 - which fails
- Pass 2 tries Joe and secret, but as they are referring to variables, not strings - this fails as well
- Pass 3 shows the correct way of referencing trigger parameters and the simulation will succeed

Breakpoints & Events				
Third Attempt				
Sequence	Trigger	Status	Type	Parameters
1	Login	not signalled	Signal	Joe,guess1
2	Retry	not signalled	Simple	
3	Login	not signalled	Signal	Joe,secret
4	Retry	not signalled	Simple	
5	Login	not signalled	Signal	"Joe","secret"

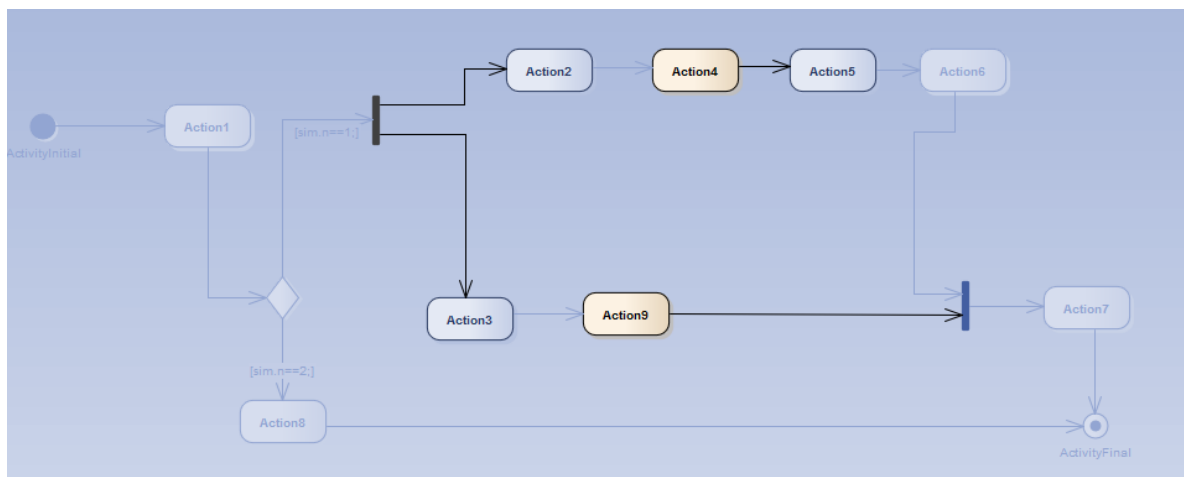

The simple diagram simulating a login process **requiring a username and password pair**.

## 15.19 Multi-threading - Forks and Joins

The Model Simulator provides the ability to handle **multi-threaded simulations** using **Fork** and **Join** nodes.

- In the example below, the current **execution point** has forked into **two threads**, each with its own active node.
- As this example progresses, the lower branch will **wait** at the **Join** node until the top branch has completed all its Actions.
- Once the two threads **merge back into one**, the Simulation will continue as a **single thread** until completion.
- When automatically stepping, each thread will be seen to execute a single step during one simulation "cycle" - although when single stepping or at a breakpoint, the behavior is to alternate step between threads as each thread receives processing time.
- Note that the **Call Stack** window will show **two active threads** and one "paused" thread in the example below. Once the threads merge there will be a return to single threaded execution.
- Also note that the **Local variables are shared (global) between all threads**. If you want to Simulate private variables on a thread you must create new Simulation variables at the start of each thread - pre-loading such variables with existing global data.

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Simulation | Multithreading | Multithreading Activity Diagram**

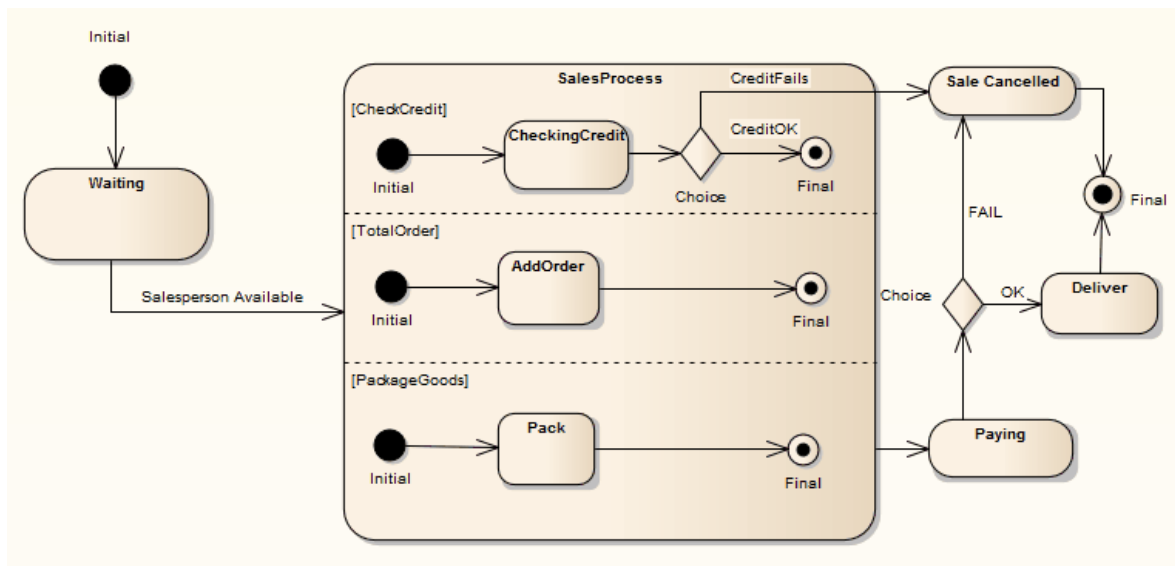

## 15.20 Multi-threading - Concurrent State Regions

**Concurrent regions** within a state represent state changes and processing that occurs in **parallel** inside one overall parent state. This is especially useful when **one region raises events** or modifies simulation variables that another region is dependent on. For example, one region could contain a simulated timer which raised events on set intervals that invoked state changes in the states within other regions.

**Concurrent regions are essentially the same as Forks and Joins** with similar logic and processing rules.

In the example below,

- When the transition to SalesProcess is taken, each region is **concurrently activated**.
- Credit is checked, the order totalled and the goods required packed up.
- However, in the event that the CreditCheck fails, this triggers the transition to the Sale Cancelled state. Note that when this occurs, the entire parent state and all owned regions are immediately exited, regardless of their processing state.
- If the Credit Check succeeds, the region moves to the final state and once the other regions have all reached their own final state, the parent state can then be exited.

## 15.21 Using Composite Diagrams

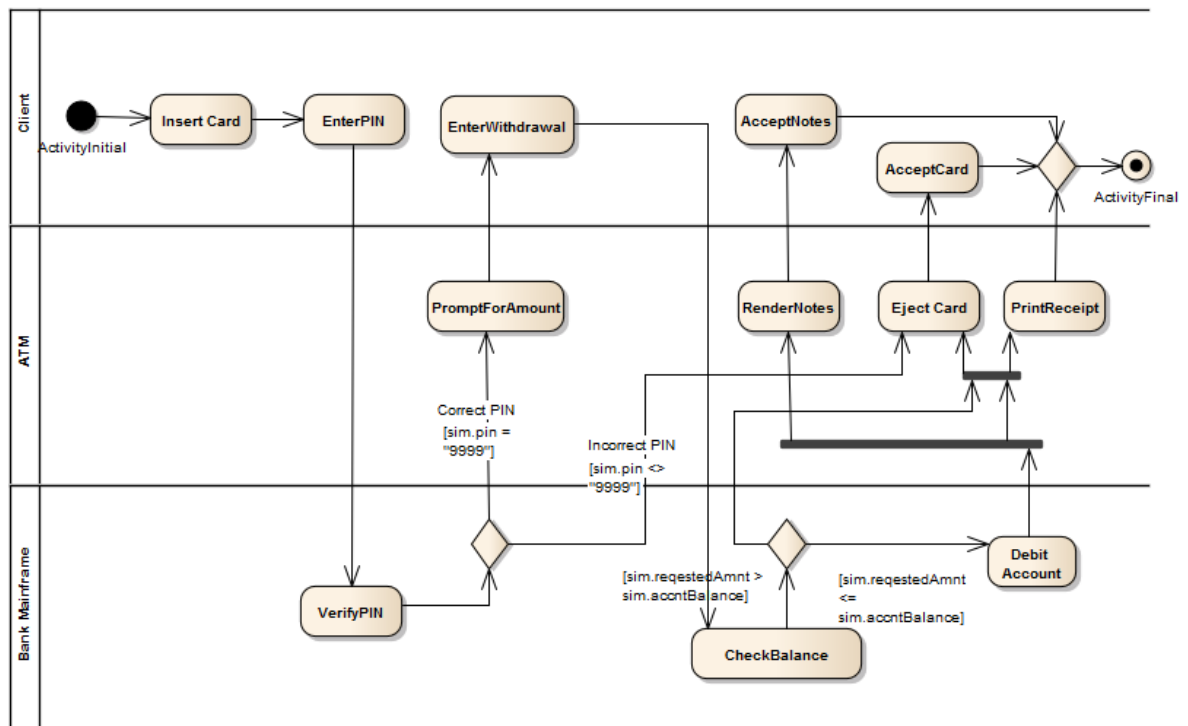

If you want to simulate processing that includes a branch represented on a different diagram (for example, to reduce complexity on the main diagram, or to hide areas of processing that are only actioned under an exception), you can use a **Composite element** to represent and access the branch on its child **Composite diagram**. When you run the simulation and it reaches the Composite element, it opens the child diagram and processes it before returning (if appropriate) to the main processing path. This is an excellent way of following the processing path in a complex process, representing sections of the process with Composite Activity elements that expand the actual processing in their respective child diagrams. You can have several Composite elements representing different stages or branches of the process.

One aspect to watch for (and that would be revealed by a failure in the simulation) is to have multiple threads that process simultaneously on separate diagrams. The simulation cannot pass to a new diagram if it is also following another thread on the current diagram.

This diagram provides an overview of an ATM cash withdrawal process:

The *ATM Withdrawal* Activity is a Composite element. If you double-click on it, you open and display the child diagram, which is a more detailed breakdown of the withdrawal process. Similarly, a simulation will open and **process** the child diagram.

## 15.22 Win32 Dialog Simulation

Enterprise Architect supports the simulation of dialogs and screens created with the Win32 Dialog profile to integrate user interface design with system behavior. Dialogs can be programmatically accessed and invoked using Javascript, providing a fully customizable execution of your model.

To interact with the dialogs at runtime the 'dialog' simulation level keyword is used; this can be used for accessing or setting text variables on child controls or showing and hiding of the dialog; for example:

- dialog.Login.Show=true;
- dialog.Login.Username;
- dialog.Login.Username.Text="";

Win32 Dialog buttons can be used to trigger signals, firing off events when the button is clicked. Signal arguments can be filled from the dialog input fields, for example, to capture and send a username and password for evaluation.

## 15.23 BPMN Simulation

**BPMN simulation** is a method for visualizing and validating the behavior of your **BPMN Business Process** diagrams. With visual indications of all **currently** executing activities **and** the possible activities that can be executed **next**, you will easily be able to identify and resolve potential issues with the process you have modeled.

Simulating BPMN models is similar to simulating standard UML Behavioral models, except that BPMN:

- Uses some different element types (such as **Gateway** instead of **Decision**) and
- Operates on scripting placed, generally, in the appropriate **Tagged Value** field associated with the connectors and elements, instead of in the **Properties** fields (and, if you prefer, rather than in the Execution Analyzer Build Scripts dialog); the scripting is written in JavaScript

### Working with BPMN Simulation

Activity	Detail	See also
<b>Create a BPMN Simulation Model</b>	When you create a BPMN model suitable for simulation, you take into consideration how you represent the start point, the flow and the conditions to be tested.	<a href="#">Create a BPMN Simulation Model</a>  <sup>[2521]</sup>
<b>Compare UML Activities to BPMN Processes</b>	The simulation of BPMN Business Process models has a number of differences to the simulation of UML Activity diagrams.	<a href="#">Compare UML Activities to BPMN Processes</a>  <sup>[2524]</sup>

### Notes

- BPMN simulation is available in the Business & Software Engineering edition and Ultimate edition of Enterprise Architect

### Learn more

- [BPMN Models](#)  <sup>[1845]</sup>
- [BPEL Models](#)  <sup>[1870]</sup>

### 15.23.1 Create a BPMN Simulation Model

As part of the process of developing a simulation model, consider which of the three options for performing the simulation you prefer to apply:

- Execute a simulation script to initialize the variables for the diagram - select **BPMN** as the **Platform**, execute the simulation as **As Script** and select the script; you would then define the conditions and decisions as JavaScript declarations within the Tagged Values of the elements and connectors on the diagram, either before you start the simulation or during the simulation
- Do not use a script, but initialize the variables within the first **Activity** and, again, modify the conditions and decisions within the Tagged Values of the elements and connectors, then execute the simulation as **Interpreted**; you can then re-initialize the variables during simulation, as well as the conditions
- Execute the simulation as **Manual** and manage the flow and conditions manually at each step

Create a BPMN diagram suitable for simulation

Step	Action	See also
1	Create a <b>Business Process</b> or <b>BPEL</b> diagram from the <b>BPMN 2.0</b> technology. If you create a BPEL diagram Enterprise Architect displays specialized dialogs to streamline the creation of compliant models.	<a href="#">Add New Diagrams</a> <sup>[822]</sup>
2	We recommend that you create a <b>Start Event</b> to clearly show where your simulation starts. You have several choices for the <b>Event Type</b> ; the choice does not influence the simulation of your model. If no Start Events are defined, the simulation will start from an <b>Activity</b> that has no incoming <b>Sequence Flows</b> .	<a href="#">Start Event</a> <sup>[1900]</sup>
3	Add all of the Activities that are involved in the Process being modeled. You have several choices for the <b>Task Type</b> ; the choice does not influence the simulation of your model. The behavior of Activities can be further decomposed by specifying an <b>Activity Type</b> of <b>Sub-Process</b> and selecting <b>Embedded</b> or <b>CallActivity</b> . Standard Loops are also supported.	<a href="#">Activity</a> <sup>[1904]</sup> <a href="#">Initialize Variables and Conditions</a> <sup>[2523]</sup>
4	Add <b>Sequence Flows</b> between your activities. In the BPEL properties dialog you can enter the condition that must be satisfied (true) before the Sequence Flow will be followed. You can also set the <b>conditionType</b> to <b>Default</b> to ensure that this flow will be taken if all other branches fail the condition specified.  If you are not working with a BPEL diagram, you use the <b>conditionExpression</b> and <b>conditionType</b> Tagged Values.	<a href="#">Sequence Flow</a> <sup>[1910]</sup> <a href="#">Initialize Variables and Conditions</a> <sup>[2523]</sup>
5	Add <b>End Events</b> for any conditions that will cause the process or active execution path to end. You have several choices for the <b>Event Type</b> ; of these only the <b>Terminate</b> type will influence the execution. In simulations with multiple active nodes, it causes the entire process to terminate instead of just the thread that reaches that node.	<a href="#">End Event</a> <sup>[1907]</sup>

### 15.23.1.1 Initialize Variables and Conditions

For a BPMN simulation model, you can **initialize your variables** in an Execution Analyzer script. You can **also** initialize these variables in the **Tagged Values** of the first **Activity** element of the process, which gives you greater flexibility in adding and changing variables as the simulation proceeds. Similarly, you can define the **conditions** and values to apply at the various decision points (Gateways) in the process, in the Tagged Values of the **Sequence Flow** connectors.

If you want to incorporate a **user-interface** into your simulation process, using **Win32**, you again use Tagged Values to identify the dialog or prompt to display, in the Activity element just prior to the point at which the value or decision is processed.

As for the simulation of UML diagrams, variables inside the **sim** object and **this** object are displayed in the **Local Variables** window.

**Access** **View | Tagged Values** (Ctrl+Shift+6)

#### Initialize Variables

1. On the diagram, click on the first Activity element in the process.
2. In the Tagged Values window, click on the drop-down arrow of the **taskType** value field, and select **Script**.
3. In the **script** value field, type in the appropriate JavaScript code, such as:

```
si m.loan=true; si m.status="undefined";
```

#### Define Conditions

1. On the diagram, click on a Sequence Flow connector that issues from a Gateway element.
2. In the Tagged Values window, click on the drop-down arrow of the **conditionType** value field, and select **Expression**.
3. In the **conditionExpression** value field (<memo>\*) click on the **Select** button ( ...) to display the Tagged Value Note window. Type in the appropriate JavaScript code, such as:

```
si m.status=="Hold"
```

4. Click on the **OK** button. The statement text displays as a label of the connector.

#### Incorporate Win32 User Interface

1. On the diagram, click on the Activity element that represents where the decision is made
2. In the Tagged Values window, click on the drop-down arrow of the **taskType** value field, and select **Script**.
3. In the **script** value field, type in the appropriate JavaScript code, such as:

```
di al og. Screen1. Show=true;
```

(This statement displays the dialog **Screen1**. You can temporarily hide the dialog by changing **Show** to **false**.)

### 15.23.2 Compare UML Activities to BPMN Processes

The execution and simulation of BPMN models have a number of differences from the execution and simulation of UML Activity diagrams. The mapping of similar concepts, and the differences between the two methods of expressing the behavior of a system, are presented here.

#### Comparison of UML Activities and BPMN Processes

UML Activity	BPMN Business Process	See also
The starting point is defined by an <b>Initial Node</b> . No method of specifying <b>why</b> the Activity was started is available.	The starting point is defined by a <b>Start Event</b> . This implies a specific cause for the Activity to start, although it may be unspecified.	<a href="#">Initial Node</a> <sup>[1313]</sup> <a href="#">Start Event</a> <sup>[1900]</sup>
The basic behavior unit in an Activity is the <b>Action</b> element. UML provides many different forms of Actions, although the simulation makes use of a small subset of these.	The basic behavior unit in an Activity is the <b>Activity</b> element. A number of different <b>Task Types</b> are available. These typically describe different methods of execution (for example <b>Manual</b> ) as opposed to what happens.	<a href="#">UML Action</a> <sup>[1266]</sup> <a href="#">BPMN Activity</a> <sup>[1904]</sup>
A <b>Control Flow</b> is used to connect the elements on an Activity diagram. A distinguishing feature is that only a single Control Flow can be followed from any node, except for an explicit Fork Node. To restrict flow on a Control Flow, add a <b>Guard</b> .	A <b>Sequence Flow</b> is used to connect the elements on a Business Process diagram. These differ from UML Activity diagrams in that all valid sequence flows are taken by default. To restrict flow on a Sequence Flow set the <b>conditionType</b> Tagged Value to <b>Expression</b> and create the script in the <b>conditionExpression</b> Tagged Value.	<a href="#">Control Flow</a> <sup>[1403]</sup> <a href="#">Sequence Flow</a> <sup>[1910]</sup>
A <b>Decision</b> node is used to explicitly model a decision being made. A <b>Merge</b> node, which uses the same syntax is used when the potential flows are combined back into one.	A <b>Gateway</b> node set to <b>Exclusive</b> is used when a single path must be selected. It is also used to combine the potential flows again. A direction may be specified as <b>Converging</b> or <b>Diverging</b> to explicitly select between the two modes.	<a href="#">Decision</a> <sup>[1294]</sup> <a href="#">Gateway</a> <sup>[1906]</sup>
A <b>Fork</b> node is used to concurrently execute multiple nodes, while a <b>Join</b> node, using the same syntax is used to wait for all incoming flows to become available and leave with a single flow.	A <b>Gateway</b> node set to <b>Parallel</b> is used to explicitly model concurrent execution of multiple nodes. It is also used to wait for all incoming flows to become available and leave with a single flow. A direction may be specified as <b>Converging</b> or <b>Diverging</b> to explicitly select between the two modes.	<a href="#">Fork/Join</a> <sup>[1307]</sup> <a href="#">Gateway</a> <sup>[1906]</sup>
There is no allowance for concurrently executing only some outputs from a node for UML Activities. If you needed this you add later Control Flows with the appropriate Guards.	A <b>Gateway</b> node set to <b>Inclusive</b> is used to explicitly model the situation where all outgoing flows with a true condition are executed concurrently.	<a href="#">Gateway</a> <sup>[1906]</sup>

UML Activity	BPMN Business Process	See also
A <b>Call Behavior Action</b> is used when behavior needs to be further decomposed by referring to an external activity.	<b>Activity</b> elements are set as an <b>CallActivity Sub-Process</b> when behavior needs to be further decomposed by referring to an external activity.	<a href="#">UML Action</a> [1266] <a href="#">BPMN Activity</a> [1904]
<b>Activity elements are sometimes directly on a diagram in place of an Action when behavior needs to be further decomposed and an external external activity is not desired. However, a strict UML model requires the use of a Call Behavior Action referencing an activity.</b>	<b>Activity</b> elements are set as an <b>Embedded Sub-Process</b> when behavior needs to be further decomposed without referring to an external activity.	<a href="#">UML Activity</a> [1279] <a href="#">BPMN Activity</a> [1904]

## 16 Execution Analyzer

Whilst you are modeling the code of an application, you can perform test executions of the code and record and generate visual displays of the progress of execution for analysis, using the Visual Execution Analyzer. This builds on and processes the structures and operations of the Model Driven Development Environment (MDDE), which provides tools to design, build and debug an application, as a part of the Debugger facilities of Enterprise Architect.

One of the primary objectives of the Visual Execution Analysis feature is to provide the facility to generate Sequence, Test Domain Class and Collaborative Class diagrams from the stack traces you captured in debugging your application. This is a great way to document and understand what your program is doing during its execution phase, and to:

- Optimize existing system resources and understand resource allocation
- Verify that the system is following the rules as designed
- Produce high quality documentation that more accurately reflects system behavior
- Understand how and why systems work
- Train new employees in the structure and function of a system
- Provide a comprehensive understanding of how existing code works
- Identify costly or unnecessary function calls
- Illustrate interactions, data structures and important relationships within a system
- Trace problems to a specific line of code, system interaction or event
- Visualize why a sequence of events is important
- Establish the sequence of events that occur immediately prior to system failure
- Simulate the execution of behavior models including State Machines, Activities and Interactions

**Access** **Analyzer**  
**Project Browser | Right-click on package | Execution Analyzer**

### Operations

Operation	See
Create a sample model for your language compiler, on which to examine the facilities of the Visual Execution Analyzer.	<a href="#">Visual Execution Analyzer Samples</a> <sup>[2529]</sup>
Record executing programs and represent the behavior as a UML Sequence diagram; recording is supported for: <ul style="list-style-type: none"> <li>• Microsoft Windows Native C</li> <li>• Microsoft Windows Native C++</li> <li>• Microsoft Windows Visual Basic</li> </ul>	<a href="#">Recording Sequence Diagrams</a> <sup>[2531]</sup>

## 16.1 Visual Execution Analyzer Samples

Enterprise Architect enables you to easily import complete sample models (packages), including all necessary model information, code and build scripts. These sample patterns make it simple to explore and try out the Visual Execution Analyzer. You can generate an example model for:

- Java
- Microsoft.NET
- Microsoft C++
- PHP Apache

**Access** **Project | New Model (Ctrl+Shift+M) > VEA Examples**  
**Project Browser | Package context menu | Add a Model using Wizard > VEA Examples**

### Reference

Field	Action	See also
<b>Technology</b>	Select the appropriate technology.	
<b>Name</b>	Displays the samples available for the selected technology; select the required sample to import.	
description field	Displays a description of the selected sample.	
<b>Destination folder</b>	Browse for and select the directory in which to load the source code for the sample.	
<b>Use Local Path</b>	Enable the selection of an existing local path to place the source code under; changes the <b>Destination folder</b> field to a drop-down selection.	
<b>Compiler command</b>	Displays the default compiler command path for the selected technology; you must either: <ul style="list-style-type: none"> <li>• Confirm that the compiler can be found at this path, or</li> <li>• Edit the path to the compiler location</li> </ul>	<a href="#">Local Paths</a> 
<b>Edit Local Paths</b>	Many VEA examples specify their compiler using a local path.  The first time you use any sample you must click on this button to ensure the local path points to the correct location.  The Local Paths dialog displays.	<a href="#">Local Paths Dialog</a> 

### Notes

- If required, you can define custom samples by adding files to the *AppSamples* directory where Enterprise Architect is installed; top-level directories are listed as Technologies and can contain an icon file to customize the icon displayed for the technology
  - Directories below this are defined as groups in the patterns list; the patterns are defined by the presence of four files with a matching name: a zip file (.zip), XMI file (.xmi), config file (.cfg) and optional icon (.ico)
- The *config* file supports the following fields:
  - [provider], [language], [platform], [url], [description], [version] - all displayed in the description field
  - [xmrootpaths] - the root path of the source code in the exported xmi; this is replaced with the selected destination folder when the user applies the application pattern

## 16.2 Recording Sequence Diagrams

This section explains how to use the Visual Execution Analyzer to record execution flow in the form of a Sequence diagram.

A Sequence diagram provides easy to understand visual information including:

- A representation of how information is passed through a system
- The sequence of various functions and their corresponding parameters
- A clear view of how different Classes interact to create behavior
- A visual overview of how data structures are used to produce results

A Sequence diagram extends traditional analysis to help identify errors in logic, explain unexpected system behavior and identify data flow inconsistencies; the Visual Execution Analyzer extends analysis through the use of a comprehensive array of reports that detail everything from state transitions through to the contents of the stack at a given time.

**Access**    **Analyzer | Recorder**

### Use to

- Set up and control the recording of code execution
- Interpret the results of recording
- Generate Sequence diagrams from the recording, and moderate the contents of the diagram

### Topics

Review the following topics in sequence:

## 16.2.1 How it Works

This topic explains how the Visual Execution Analyzer generates Sequence diagrams.

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The Visual Execution Analyzer enables you to generate a Sequence Diagram by recording the live execution of an application. As the application runs, a history of function calls is recorded. This history can be used to generate Sequence Diagrams.</p> <p>The diagram creates a visual representation of the execution of an application, outlining what functions are being called, the types of messages being sent, the key data structures used and the relationships between different Classes; that is, how information is moved throughout the system and what values are being passed by various functions. .</p> <p>The diagram below illustrates the Sequence Diagram output for a program that calculates the price of books.</p>	<p><a href="#">The Recording History</a>  <small>[2533]</small></p> <p><a href="#">Diagram Features</a>  <small>[2535]</small></p>

Topic	Detail	See also
	<div><pre>sequenceDiagram     participant Test     participant BookDB     participant vltitude Book     participant PriceTotaler      Test-&gt;&gt;Main()     activate Test     Test-&gt;&gt;BookDB: BookDB()     activate BookDB     BookDB-&gt;&gt;Test: AddBook(BookDB)     deactivate BookDB     loop 1 (4)         Test-&gt;&gt;BookDB: AddBook(string, decimal, bool)         activate BookDB         BookDB-&gt;&gt;vltitude Book: Book(string, decimal, bool)         activate vltitude Book         vltitude Book-&gt;&gt;Test:          deactivate vltitude Book     end     Test-&gt;&gt;PriceTotaler: ProcessPaperbackBooks(ProcessBookDelegate)     activate PriceTotaler     loop 2 (3)         Test-&gt;&gt;BookDB: PrintTitle(Book)         activate BookDB         BookDB-&gt;&gt;Test: Print(string)         deactivate BookDB     end     Test-&gt;&gt;PriceTotaler: PriceTotaler()     activate PriceTotaler     loop 3 (3)         Test-&gt;&gt;PriceTotaler: AddBookToTotal(Book)         activate PriceTotaler         PriceTotaler-&gt;&gt;Test: AveragePrice() decimal         deactivate PriceTotaler     end     deactivate PriceTotaler     deactivate Test</pre></div> <p>Enterprise Architect will record arguments to functions, and can optionally capture state transitions for a given State Machine. Calls to functions are aggregated on the class by default, but lifelines can also be created for each instance of an object.</p> <p>This information can be integrated with existing system knowledge and test data to optimize code execution, reduce errors and determine why application failure and system crashes occur.</p> <p>If an application crashes, data corruption such as a stack overflow can prevent you from diagnosing and rectifying the problem; however, the Visual Execution Analyzer enables you to record a given execution sequence to provide a reliable source of information that might further explain why a crash occurred.</p> <p>A Sequence diagram can convey more detail and provide greater understanding than reading unfamiliar code that might have been written by someone else; it also makes it easier to document existing code when the Sequence diagram illustrates functions that are being called and the specific sequence of events that occur to produce a particular type of system behavior.</p>	

**Learn more**

- [Setup for Recording](#)<sup>[2535]</sup>

**16.2.1.1 The Recording History**

All information recorded when the execution analysis of an application encounters user-defined recording markers is held in the Record & Analyze window.

**Access**    **Analyzer | Recorder**

Facilities

Facility	Information/Options	See also
<b>Information Display</b>	<p>The columns in the Record &amp; Analyze window are as follows:</p> <ul style="list-style-type: none"> <li>• <b>Sequence</b> - The unique sequence number</li> <li>• <b>Threads</b> - The operating system thread ID</li> <li>• <b>Delta</b> - The elapsed thread CPU time since the start of the sequence</li> <li>• <b>Method</b> - There are two <b>Method</b> columns: the first shows the caller for a call or for a current frame if a return; the second shows the function called or the function it is returning to</li> <li>• <b>Direction</b> - <i>Stack Frame Movement</i>, can be <i>Call</i>, <i>Return</i>, <i>State</i>, <i>Breakpoint</i> or <i>Escape</i> (<i>Escape</i> is used internally when producing a Sequence diagram, to mark the end of an iteration)</li> <li>• <b>Depth</b> - The stack depth at the time of a call; used in the generation of Sequence diagrams</li> <li>• <b>State</b> - The state between sequences</li> <li>• <b>Source</b> - There are two <b>Source</b> columns: the first shows the source filename and line number of the caller for a call or, if a return, for a current frame; the second shows the source filename and line number of the function called or function returning</li> <li>• <b>Instance</b> - There are two <b>Instance</b> columns, which only have values when the Sequence diagram produced contains State Transitions; the values consist of two items separated by a comma - the first item is a unique number for the instance of the Class that was captured, and the second is the actual instance of the Class</li> </ul> <p>For example: supposing a Class <i>CName</i> has an internal value of 4567 and the program created two instances of that Class; the values might be:</p> <ul style="list-style-type: none"> <li>• 4567,1</li> <li>• 4567,2</li> </ul> <p>The first entry shows the first instance of the Class and the second entry shows the second instance.</p>	
<b>Operations on Information</b>	<p>The Record &amp; Analyze window toolbar provides a range of facilities for controlling the recording of the execution of an Analyzer script.</p> <p>You can perform a number of operations on the results of a recording, using the Record &amp; Analyze window context menu, once the recording is complete.</p>	<p><a href="#">Recorder Toolbar</a> [2544]</p> <p><a href="#">Working With Recording History</a> [2546]</p>

Notes

- The checkbox against each operation is used to control whether or not this call can be used to create

a Sequence, Test Domain Class or Collaborative Class diagram from this history

- In addition to enabling or disabling the call using the checkbox, you can use context menu options to enable or disable an entire call, all calls to a given method, or all calls to a given Class

### 16.2.1.2 Diagram Features

When you generate a Sequence diagram, it includes the following features:

Feature	Detail	See also
<b>References</b>	When the Visual Execution Analyzer cannot match a function call to an operation within the model, it still creates the sequence but also creates a reference for any Class that it cannot locate.  It does this for all languages.	<a href="#">Generating Sequence Diagrams</a> <sup>[2549]</sup>
<b>Fragments</b>	Fragments displayed in the Sequence diagram represent loops or iterations of a section(s) of code.  The Visual Execution Analyzer attempts to match function scope with method calls to as accurately as possible represent the execution visually.	
<b>States</b>	If a State Machine has been used during the recording process, any transitions in State are presented after the method call that caused the transition to occur.  States are calculated on the return of every method to its caller.	<a href="#">Reporting State Transitions</a> <sup>[2550]</sup>

### 16.2.2 Setup for Recording

This section explains how you prepare to record execution of the application.

Topic	Link
Prerequisites - To set up the environment for recording Sequence diagrams you must: <ul style="list-style-type: none"> <li>• Have completed the basic setup for Build &amp; Debug and created Execution Analysis scripts for the package</li> <li>• Be able to successfully debug the application</li> </ul>	<a href="#">Prerequisites</a> <sup>[2173]</sup> <a href="#">Analyzer Scripts</a> <sup>[2175]</sup> <a href="#">Debugging</a> <sup>[2222]</sup>
Narrow the focus of a recording by applying filters.	<a href="#">Configuring Recording Detail</a> <sup>[2219]</sup>
Control the detail of a recording by adjusting the stack depth.	<a href="#">Control Stack Depth</a> <sup>[2536]</sup>

### 16.2.2.1 Control Stack Depth

When recording particularly high-level points in an application, the stack frame count can result in a lot of information being collected; to achieve a quicker and clearer picture, it is better to limit the stack depth on the toolbar of either:

- The Breakpoint and Markers window or
- The Record & Analyze window

Access **Analyzer | Recorder**

#### Set the recording stack depth

You set the recording stack depth in the numerical field on the toolbar of the Breakpoints & Markers window or the Record & Analyze window:

By default, the stack depth is set to three frames. The maximum depth that can be entered is **30** frames.

The depth is relative to the stack frame where a recording marker is encountered; so, when recording begins, if the stack frame is **6** and the stack depth is set to **3**, the Debugger records the frames **6** through **8**.

For situations where the stack is very large, it is recommended that you first use a low stack depth of 2 or 3. From there you can gradually increase the stack recording depth and insert additional recording markers to expand the picture so that all the necessary information is displayed.

#### Learn more

- [Recorder Toolbar](#)<sup>[2544]</sup>
- [Breakpoint & Markers](#)<sup>[2540]</sup>
- [Control the Recording Session](#)<sup>[2543]</sup>

### 16.2.3 Place Recording Markers

This section explains how to place record markers, which enable you to silently record code execution between two points. The recording can be used to generate a Sequence diagram.

As this process records the execution of multiple threads, it can be particularly useful in capturing event driven sequences (such as mouse and timer events).

Access **Analyzer | Breakpoints & Events**

#### Use to

- Set recording markers, to define what is to be recorded during code execution in order to generate a Sequence diagram

#### Topics

Topic	Link
Different recording markers can be used for recording the execution flow; see the related links for information on the properties and usage of these markers.	<a href="#">Marker Types</a> <sup>[2538]</sup> <a href="#">Set Record Markers</a> <sup>[2537]</sup>
How to manage breakpoints in the Breakpoint & Markers window.	<a href="#">The Breakpoint &amp; Events Window</a> <sup>[2540]</sup>
How to activate and deactivate markers.	<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup>
Working with Marker Sets - when you create a breakpoint or marker, it is automatically added to a marker set, either the Default set or a set that you create for a specific purpose.	<a href="#">Working with Marker Sets</a> <sup>[2541]</sup> <a href="#">Recording Activity for a Class</a> <sup>[2542]</sup>

**Notes**

- The *Breakpoint and Marker Management* topic (Software Engineering) covers a different perspective

**Learning Center topics**

- (Alt+F1) | **Enterprise Architect | Execution Analysis | Recording Execution**

**16.2.3.1 Set Record Markers**

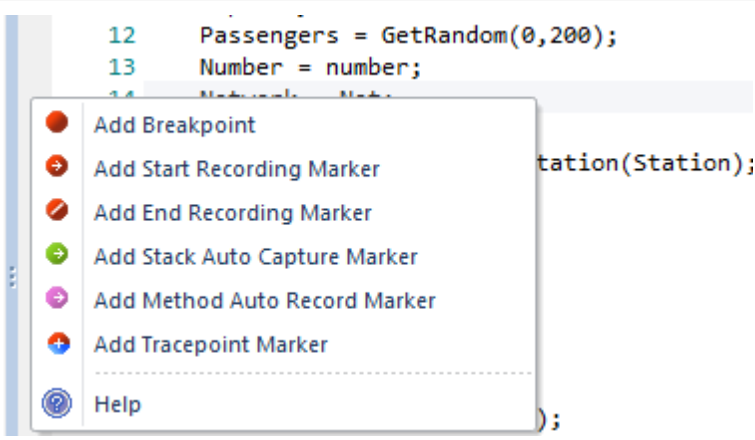

Markers are set in the source code editor. Like breakpoints, they are placed on a line of code; when that line of code executes, the Execution Analyzer performs the code execution recording action appropriate to the marker.

**Access** Click on the Class containing code: **F12**

**How to**

To set a recording marker

Step	Action	See also
1	Press <b>F12</b> to open the source code to debug, in the integrated source code editor.	<a href="#">Editing Source Code</a> <sup>[2146]</sup>
2	Find the appropriate code line and right click in the left (Breakpoint) margin to bring up the breakpoint/marker context menu; select the required marker type:	<a href="#">Marker Types</a> <sup>[2538]</sup>

		
3	If a <b>Start Recording Marker</b> has been set, you must also set an <b>End Recording Marker</b> .	

### 16.2.3.2 Marker Types

Recording markers are similar to breakpoints; however, instead of breaking execution as it does at a breakpoint, the debugger takes the action defined by the type of marker. If the marker is denoted as a recording *start point*, the debugger immediately begins to trace all executed calls from that point for the breaking thread. Recording is stopped again when either the thread that is being captured terminates or the thread encounters a recording *end point*.

Recording markers are set in the source code editor. If you right-click on the breakpoint margin at the point to begin recording, a context menu displays that enables you to select the type of a marker.

#### Use to

- Set Start and End points for recording
- Set Markers for a Single Method
- Set Stack Trace Markers

#### Reference

Marker	Detail	See also
<b>Start Recording marker</b>	Select the <b>Add Start Recording Marker</b> option, then right-click on the breakpoint margin at the point to stop recording and select the <b>Add End Recording Marker</b> context menu option; the markers are shown below:	<a href="#">The Breakpoints &amp; Events Window</a> <sup>[2540]</sup>
<b>End Recording marker</b>		<a href="#">Analyzer</a>

© 1998-2014 Sparx Systems Pty Ltd

- (Alt+F1) | Enterprise Architect | Execution Analysis | Recording Execution

### 16.2.3.4 Working with Marker Sets

Marker sets enable you to create markers as a named group, which you can reapply to a code file for specific purposes.

You can perform certain operations from the Breakpoints & Events window alone, but to understand and use markers and marker sets you should also display the appropriate code file in the Source Code Viewer (click on the Class element and press **(F12)**).

**Access** **Analyzer | Breakpoints & Events: Set Options toolbar icon**

#### Topics

Topic	Detail	See also
<b>Example of Use</b>	<p>You might create a set of Method Auto Record markers to record the action of various functions in the code, and a set of Stack Capture markers to record the sequence of calls that cause those functions to be called.</p> <p>You could then create Sequence diagrams from the recordings under each set.</p>	<a href="#">Marker Types</a> <sup>[2538]</sup>
<b>Create a Marker Set</b>	<p>To create a marker set from the Breakpoints &amp; Events window, click on the drop-down arrow on the <b>Set Options</b> icon (  ) and select the <b>New Set</b> option.</p> <p>The New Breakpoint Marker Set dialog displays; in the <b>Enter New Set Name</b> field, type a name for the set, and click on the <b>Save</b> button.</p> <p>The set name displays in the text field to the left of the <i>Set Options</i> icon.</p> <p><i>Alternatively</i>, you can either:</p> <ul style="list-style-type: none"> <li>• Create a Class Activity marker set or</li> <li>• Select the <b>Save as Set</b> option from the <b>Set Options</b> drop-down, to make an exact copy of the currently-selected set, which you can then edit</li> </ul>	<a href="#">Recording Activity for a Class</a> <sup>[2542]</sup>
<b>Accessing Sets</b>	<p>To access a marker set, click on the drop-down arrow on the text field to the left of the <b>Set Options</b> icon, and select the required set from the list.</p> <p>The markers in the set are listed in the Breakpoints &amp; Events window.</p> <p>You would normally load a marker set prior to the point at which an action is to be captured.</p> <p>For example, to record a sequence involving a particular dialog, when you begin debugging you would load the set prior to invoking the dialog; once you bring up the dialog in the application, the operations you have marked are recorded.</p>	
<b>Add Markers to Set</b>	<p>To add markers to a marker set, add each required marker to the appropriate line of code in the Source Code Viewer.</p> <p>The marker is immediately added to whichever set is currently listed in</p>	<a href="#">Set Record Markers</a> <sup>[2537]</sup>

Topic	Detail	See also
	<p>the Breakpoints &amp; Events window.</p> <p>Each marker listed on the dialog has a checkbox in the <b>Enabled</b> column; newly-added markers are automatically enabled, but you can disable and re-enable the markers quickly as you check the code.</p>	
<b>Storage of Sets</b>	<p>When you create a marker set it is immediately saved within the model; any user using the model has access to that set.</p> <p>However, the <b>Default</b> set, which always exists for a model, is a personal workspace, is not shared and is stored external to the model.</p>	
<b>Delete a Marker from a Set</b>	Right-click on the marker and select the <b>Delete Breakpoint</b> context menu option.	
<b>Delete a Set</b>	<p>If you no longer require a marker set, access it on the Breakpoints &amp; Events window and select the <b>Delete Selected Set</b> option from the <b>Set Options</b> drop-down list.</p> <p>You can also clear <i>all</i> user-defined marker sets by selecting the <b>Delete all sets</b> option; a prompt displays to confirm the deletion.</p>	

### Notes

- Marker Sets are very simple and flexible but, as they are available for use by any user of the model, they can be easily corrupted; consider the following guidelines:
  - When naming a set, use your initials in the name and try to indicate its use, so that other model users can recognize its owner and purpose
  - When using a set other than **Default**, avoid excessive experimentation so that you don't add lots of ad-hoc markers to the set
  - Make sure you are aware of which marker set is exposed in the Breakpoints & Events window, as you can easily inadvertently add markers to the set that are not relevant to the code file the set was created for
  - In any set, if you have added markers that don't have to be kept, delete them to maintain the purpose of the set; this is especially true of the Default set, which can quickly accumulate redundant ad-hoc markers

#### 16.2.3.5 Recording Activity for a Class

In addition to setting breakpoints and markers in the code editor, or creating a *marker set* through the Breakpoints & Events window, you can record all the operations of a Class or a subset using the Class Markup Selection dialog to create a marker set of record markers for those operations. These marker sets are also available to all users of the model.

**Access** [Project Browser Class context menu](#) | [Execution Analyzer](#) | [Markup Class For Recording](#)

### Reference

Field	Usage	See also
<b>Existing marker set</b>	Select to change the operations, marker types or stack depth of an existing marker set.	
<b>New marker set</b>	Select to create a new marker set.	
<b>Name</b>	Type the name of the marker set to create or edit.	
<b>Operation check boxes</b>	All checkboxes default to selected; click on the checkbox against each operation that you <i>do not</i> want to record.  Click again on the checkbox against any excluded operation that you do now want to record, to re-select it.	
<b>Include disabled operations</b>	Select this option to set a recording marker against all operations, but disable all those that you have not specifically selected above.  In the Breakpoints & Events window, you can then enable these markers individually or as a whole, rather than enabling them by editing the marker set.	<a href="#">Working with Marker Sets</a> <sup>[2541]</sup>
<b>Marker Type</b>	Click on the drop-down arrow and select the type of marker to set against each of the selected operations.  The marker type specifies the action to take when the process encounters that marker on each operation: <ul style="list-style-type: none"> <li>• Record function</li> <li>• Record stack trace</li> <li>• Break execution</li> </ul>	<a href="#">Marker Types</a> <sup>[2538]</sup>
<b>Limit recording frame depth</b>	Set the stack depth to limit the recording, to avoid ultimately producing Sequence diagrams that are too complicated to read.	<a href="#">Control Stack Depth</a> <sup>[2536]</sup>
<b>OK</b>	Click to store the marker set under the name you have specified; the set can then be loaded either before or during a session, from the Breakpoint & Markers window toolbar.	<a href="#">Breakpoint and Marker Management</a> <sup>[2224]</sup>

### 16.2.4 Control the Recording Session

The Record & Analyze window enables you to control a recording session. The control has a toolbar, and a history window that displays the recording history as it is captured. Each entry in this window represents a call sequence made up of one or more function calls.

**Access** [Analyzer | Recorder](#)

You must also open the Execution Analyzer window (**Analyzer | Execution Analyzer**), which lists all the scripts in the model; you must select and activate the appropriate script for the recording.

Option	Action	See also
<b>Disable All Calls Outside This Call</b>	Disable every call listed in the Record & Analyze window <i>except for</i> the selected call.	
<b>Enable All Calls</b>	Enable every call listed in the Record & Analyze window.	
<b>Enable This Call</b>	Enable the selected call.	
<b>Enable This Method</b>	Enable the selected method.	
<b>Enable This Class</b>	Enable the selected Class.	
<b>Help</b>	Display the Help topic for the Record & Analyze window.	<a href="#">The Recording History</a> <sup>[2533]</sup>

### 16.2.4.3 Start Recording

When you are recording execution flow as a Sequence diagram, you start the recording by selecting the **Recording** icon on the Record & Analyse window toolbar. The Record dialog displays with the recording options set to the defaults; that is, the current Breakpoint and Markers Set, the filters defined in the current Analyzer Script and the recording mode as basic.

**Access** **Analyzer | Recorder: Recording**

#### Record Dialog Options

Field/Button	Detail	See also
<b>Recording Set</b>	Recording markers determine what is recorded. If you have a recording set to use, click on the drop-down arrow and select it.	<a href="#">Working with Marker Sets</a> <sup>[2541]</sup>
<b>Additional Filters</b>	Filters are used by the debugger to exclude matching function calls from the recording history. Recording filters are defined in the Analyzer Script.  In the <b>Additional Filters</b> field you can add other filters for this specific run. if you specify more than one filter, separate them with a semi-colon.	<a href="#">Configure Recording Detail</a> <sup>[2219]</sup>
<b>Basic Recording Mode</b>	In basic mode the debugger records a history of the function calls made by the program whenever it encounters an appropriate recording marker.	

Field/Button	Detail	See also
<b>Track Instances of Named Classes</b>	In Track Instances mode the debugger also captures the creation of instances of the Classes you specify. It then includes that information in the history. The resulting Sequence diagram can then show lifelines for each instance of that Class with, where appropriate, function calls linked to the lifeline.	
<b>Track State Transitions</b>	The recording can also capture changes in State using a specified State Machine diagram. The State Machine diagram must exist as a child of a Class.  The Execution Analyzer captures instances of that Class and calculates the State of each instance whenever a function in the current recording sequence returns.	<a href="#">Reporting State Transitions</a> <sup>[2550]</sup>
<b>OK</b>	Click on this button to start the debugger.	<a href="#">Generating Sequence Diagrams</a> <sup>[2549]</sup>

#### 16.2.4.4 Step Through Function Calls

##### Topics

Topic	Detail	See also
<b>Stepping Through</b>	<p>The Step Through function can be executed by clicking on the <b>Step Through</b> button on the Record &amp; Analyze window toolbar.</p> <p>Alternatively, press ( <b>Shift+F6</b> ) or select the <b>Analyzer   Debug   Step Into</b> menu option.</p> <p>The <i>Step Through</i> command causes a <i>Step Into</i> command to be executed; if any function is detected, then that function call is recorded in the History window.</p> <p>The debugger then steps out, and the process can be repeated.</p> <p>This button enables you to record a call without having to actually step into a function; the button is only enabled when at a breakpoint and in manual recording mode.</p>	

#### 16.2.4.5 Nested Recording Markers

When a recording marker is first encountered, recording starts at the current stack frame and continues until the frame pops, recording additional frames up to the depth defined on the Recording toolbar. Consider this call sequence:

A -> B -> C -> D -> E -> F -> G -> H -> I -> J -> K -> L -> M -> N -> O -> P -> Q -> R -> S ->

If you set a recording marker at **K** and set the recording depth to **3**, this would record the call sequence:

**K -> L -> M**

If you also wanted to record the calls **X**, **Y** and **Z** as part of the Sequence diagram, you would place another recording marker at **X** and the analyzer would record:

**K -> L -> M -> X -> Y -> Z**

However, when recording ends for the **X-Y-Z** component (frame **X** is popped), recording will **resume** when frame **M** of the **K-L-M** sequence is re-entered. Using this technique can help where information from the recorded diagram would be excluded due to the stack depth, and it lets you focus on the particular areas to be captured.

## 16.2.5 Generating Sequence Diagrams

This topic describes what you might do with the recording of an execution analysis session.

**Access** **Analyzer | Recorder**

#### Use to

- Generate a Sequence diagram from a recorded execution analysis session, for:
  - all recorded sequences or
  - a single sequence in the session
- Save the recorded sequence to file
- Retrieve the saved recording and load it into the Record & Analyze window

#### Reference

Action	Detail	See also
<b>Generate a diagram</b>	<p>Select the appropriate package in the Project Browser, in which to store the Sequence diagram.</p> <p>To create the diagram from all recorded sequences, either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>Recorder Menu</b> icon (  ) in the Record &amp; Analyze window toolbar, and select the <b>Generate Sequence Diagram from Recording</b> option, or</li> <li>• Right-click on the body of the window and select the <b>Generate Sequence Diagram</b> context menu option</li> </ul> <p>To create the diagram from a single sequence, either:</p>	<p><a href="#">The Recording History</a> <sup>[2533]</sup></p> <p><a href="#">Recorder Toolbar</a> <sup>[2544]</sup></p> <p><a href="#">Working With Recording History</a> <sup>[2546]</sup></p>

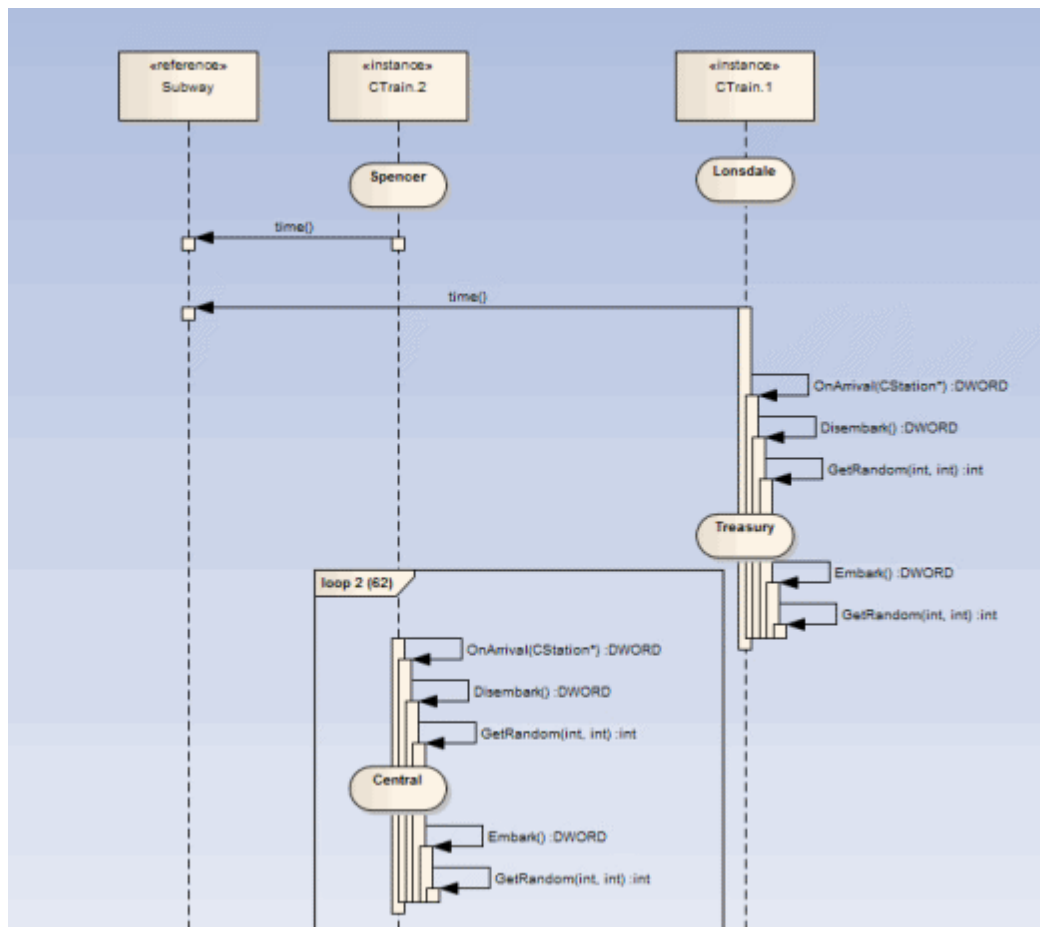

Action	Detail	See also
	<ul style="list-style-type: none"> <li>Click on the <b>Recorder Menu</b> icon (  ) in the Record &amp; Analyze window toolbar, and select the <b>Generate Sequence Diagram from Recording</b> option, or</li> <li>Right-click on the sequence and select the <b>Generate Diagram from Selected Sequence</b> context menu option</li> </ul>	
<b>Save a recorded sequence to an XML file</b>	Click on the sequence, click on the <b>Recorder Menu</b> icon (  ) in the Record & Analyze window toolbar, and select the <b>Save Sequence History to File</b> option.	
<b>Access an existing sequence XML file</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Recorder Menu</b> icon (  ) in the Record &amp; Analyze window toolbar, and select the <b>Load Sequence History from File</b> option, or</li> <li>Right-click on a blank area of the screen and click on the <b>Load Sequence From File</b> context menu option</li> </ul> <p>The Windows Open dialog displays, from which you select the file to open.</p>	<a href="#">Recorder Toolbar</a> <sup>[2544]</sup>

### 16.2.6 Reporting State Transitions

This section describes how you can generate Sequence diagrams that show transitions in state as a program executes.

#### Use to

- Generate Sequence diagrams that report user-defined transitions in state as a program executes (as shown in the example generated diagram below)

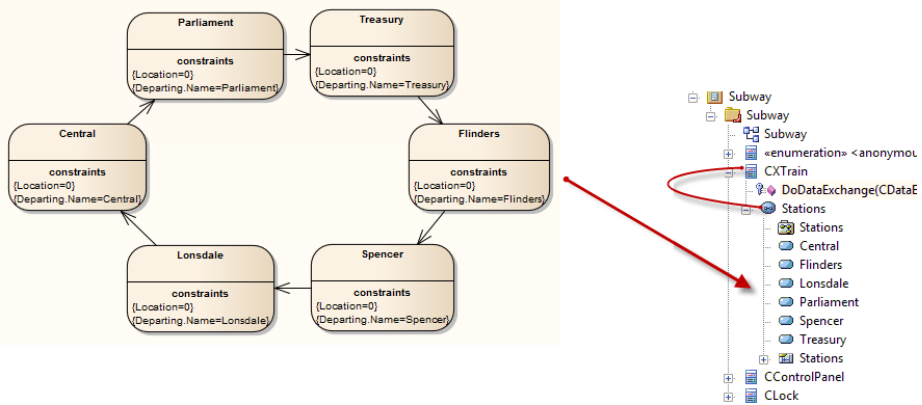

Topic	Link
Create a State Machine under the Class to be reported.	<a href="#">Reporting a State Machine</a> <sup>[2551]</sup>
Set the constraints against each State to define the change in state to be reported.	<a href="#">Recording and Mapping State Changes</a> <sup>[2553]</sup>

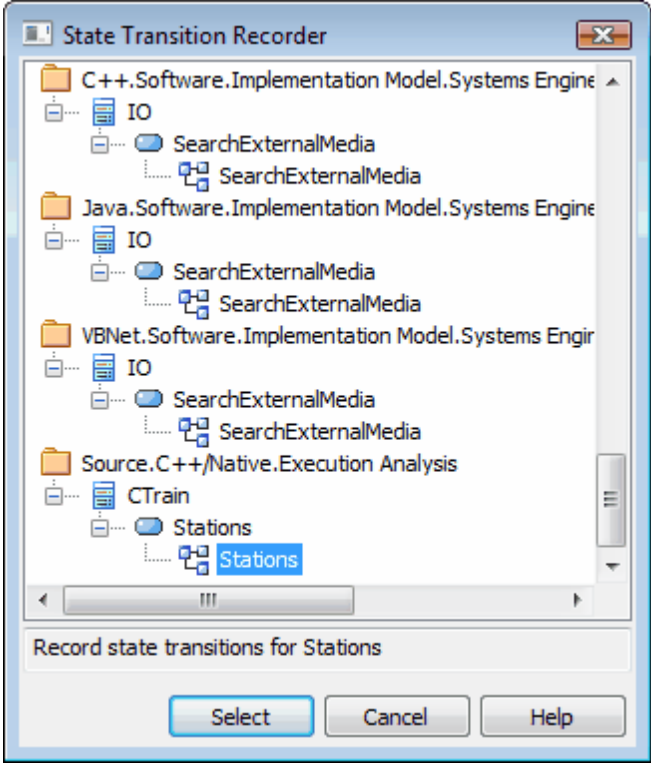

### 16.2.6.1 Reporting a State Machine

A State Machine can be used to illustrate how States change during the execution of an application, explicitly describing the transitions from State to State. You can show these State transitions on the Sequence diagrams you generate in Execution Analysis.

Topic	Detail	See also
<b>Process</b>	<p>Firstly you create a State Machine to model all the valid system states, as a child of the appropriate Class element, and on the State Machine you create the State elements that correspond to any states to be captured for your Class.</p> <p>You then set constraints in the States to record and map the State changes.</p> <p>When you record code execution for the Class, you set an option in the Record dialog and browse for the State Machine using the State Transition dialog.</p> <p>The State Transition dialog presents a list of State Machines for the entire model, in</p>	<a href="#">State Machines</a> <sup>[1203]</sup> <a href="#">Recording and Mapping State Changes</a> <sup>[2553]</sup> <a href="#">Start</a>

Topic	Detail	See also
	<p>which you locate and select the appropriate diagram (see the Example below).</p> <p>When you generate the Sequence diagram, it depicts not only the sequence but changes in State at the various points in the sequence; each Class instance participating in the detection process is displayed with its own lifeline.</p>	<p><a href="#">Recording</a> 2547</p> <p><a href="#">Reporting State Transitions</a> 2550</p>
<p><b>Example</b></p>	<p>The State Machine below, called <i>Stations</i>, shows the different States within the Melbourne Underground Loop subway system.</p> <p>A train traveling on the subway network can be stopped at any of the stations represented on the State Machine.</p> <p>The <i>Stations</i> State Machine is a child of the <i>CTrain</i> Class.</p>  <p>When you browse for the diagram in the State Transition Recorder dialog, the hierarchy shows only the root package, parent Class and child Sub Machine and diagram; no other model components are listed.</p>	

Topic	Detail	See also
		

16.2.6.2 Recording and Mapping State Changes

This topic discusses how to set constraints against each State in the State Machine under a Class, to define the change in state to be recorded.

Topics

Topic	Detail	See also									
Example	<p>The State Properties dialog shown below is for the State called <i>Parliament</i>; the Constraints tab is open to show how the State is linked to the Class <i>CXTrain</i>.</p> <p>A State can be defined by a single constraint or by many; in the example below the State <i>Parliament</i> has two constraints:</p> <div data-bbox="469 1700 1232 1870"><p>Defined Constraints   <span>New Save Delete</span></p><table><thead><tr><th>Constraint</th><th>Type</th><th>Status</th></tr></thead><tbody><tr><td>Location=0</td><td>Invariant</td><td>Approved</td></tr><tr><td>Departing.Name=Parliament</td><td>Invariant</td><td>Approved</td></tr></tbody></table></div> <p>The values of constraints can only be compared for <i>elemental</i>, <i>enum</i> and <i>string</i> types</p> <p>The <i>CXTrain</i> Class has a member called <i>Location</i> of type <i>int</i>, and a</p>	Constraint	Type	Status	Location=0	Invariant	Approved	Departing.Name=Parliament	Invariant	Approved	<p><a href="#">Reporting a State Machine</a></p>
Constraint	Type	Status									
Location=0	Invariant	Approved									
Departing.Name=Parliament	Invariant	Approved									

Topic	Detail	See also
	<p>member called <i>Departing.Name</i> of type <i>CString</i>; what this constraint means is that this State is evaluated to <b>true</b> when:</p> <ul style="list-style-type: none"> <li>• an instance of the <i>CXTrain</i> Class exists and</li> <li>• its member variable <i>Location</i> has the value <b>0</b> and</li> <li>• the member variable <i>Departing.Name</i> has the value <b>Parliament</b></li> </ul>	
<b>Operators in Constraints</b>	<p>There are two types of operators you can use on constraints to define a State:</p> <ul style="list-style-type: none"> <li>• Logical operators AND and OR can be used to combine constraints</li> <li>• Equivalence operators {= and !=} can be used to define the conditions of a constraint</li> </ul> <p>All the constraints for a State are subject to an AND operation unless otherwise specified; you can use the OR operation on them instead, so you could rewrite the constraints in the above example as:</p> <p style="padding-left: 40px;">Locat i on=0 OR</p> <p style="padding-left: 40px;">Locat i on=1 AND</p> <p style="padding-left: 40px;">Depart i ng. Name! =Cent r al</p> <p>Below are some examples of using the equivalence operators:</p> <p style="padding-left: 40px;">Depart i ng. Name! =Cent r al AND</p> <p style="padding-left: 40px;">Locat i on! =1</p>	

**Notes**

- Quotes around strings are optional; the comparison for strings is always case-sensitive in determining the truth of a constraint

## 16.3 Profiling

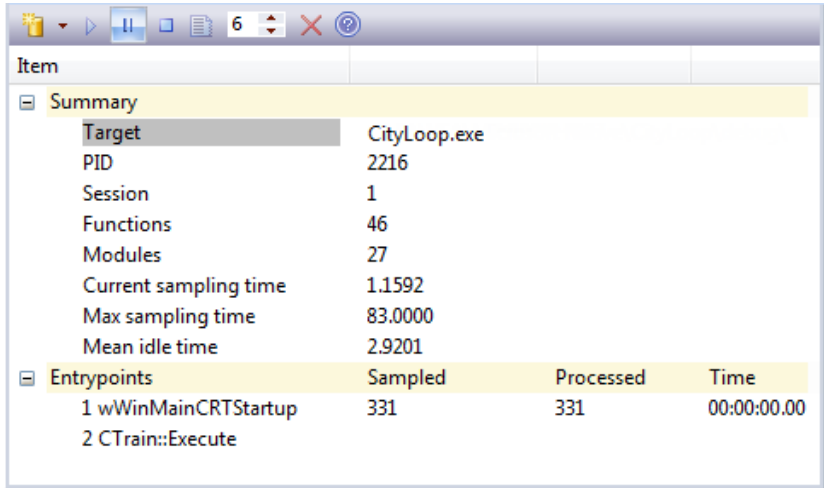

During the development of applications, you would commonly want to investigate which parts of code are taking the longest to execute. You can perform such an investigation by running the Profiler on an executing application to quickly generate a report on the most frequently called functions in the running application, tasks in the application that are taking more time than expected and which functions are taking the most time in the application.

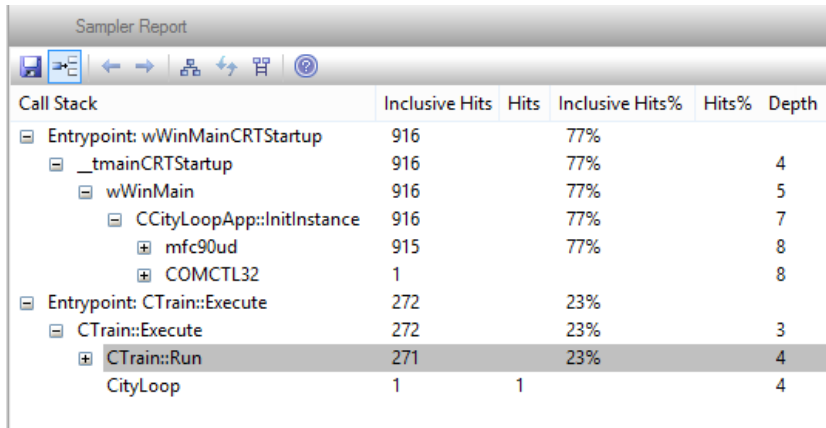

In Profiling the behavior of an application that is configured to be debugged in the Execution Analyzer, you can monitor calls in the application. Profiles can be recorded by executing an existing Analysis script that typically defines the application to build, test and debug, and any sequence recording options, or attaching to a running process. The second option is useful if the application being analyzed spawns from a call from another application (such as Winword.exe), Is running as a Service, or Is best monitored at a known point of processing (such as after a user interaction).

The Profiler reports can be stored as external binary or .xml files, which you can re-load at a later time, or internal documents attached to Artifact elements or Team Review posts, to distribute to team members.

**Access** [Analyzer | Profiler](#)

### The Profiling Process

Feature	Detail	See also
<b>Preparation</b>	The Profiler supports analysis of applications built on C, C++, Visual Basic, Microsoft .NET and Java platforms, each of which has certain pre-requisites.	<a href="#">System Requirements</a> [2556]
<b>Operation</b>	<p>When the Profiler is launched during the execution of a script, it creates a Profiler process that collects samples at regular intervals from the stacks of each thread in the target application process.</p> <p>The Profiler window displays the status details of the Profiler process as it executes. You have a number of toolbar options for starting the Profiler process, modifying its action, and pausing or stopping the process.</p>  <p>The screenshot shows the Profiler window with a toolbar at the top containing icons for file operations, execution control, and help. The main area is divided into two sections: 'Summary' and 'Entrypoints'. The 'Summary' section lists various metrics for the target application 'CityLoop.exe', including PID (2216), Session (1), Functions (46), Modules (27), Current sampling time (1.1592), Max sampling time (83.0000), and Mean idle time (2.9201). The 'Entrypoints' section is a table showing sampled and processed counts for specific functions, with '1 wWinMainCRTStartup' and '2 CTrain::Execute' listed.</p>	<a href="#">Profiler Operation</a> [2557]  <a href="#">Getting Started</a> [2558]

Feature	Detail	See also
Output	<p>The Profiler generates a report in the Call Stack, which shows how the application functions are called in relation to the application; for example, how one function might be taking most of the overall time recorded, and how that is caused by some of the sub-functions that it calls.</p> 	<a href="#">Generate, Save and Load Profile Reports</a> <sup>[2560]</sup>

### Notes

- The Profiler, or sampler, is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- The Profiler can also be used under WINE (Linux and Mac) to debug standard Windows applications deployed in a WINE environment

### Learning Center topics

- [Alt+F1 | Enterprise Architect | Execution Analysis | Profiling Native Code | Introducing the Profiler](#)

## 16.3.1 System Requirements

Using the Profiler, you can analyze applications built for the following platforms:

- Microsoft™ Native (C++, C, Visual basic)
- Microsoft .NET (supporting a mix of managed and unmanaged code)
- Java

### Microsoft Native applications

For C, C++ or Visual Basic applications, the Profiler requires that the applications are compiled with the Microsoft™ Native compiler and, for each application or module to be analyzed, a PDB file is available. The Profiler can sample both debug and release configurations of an application, provided that the PDB file for each executable exists and is up to date.

### Microsoft .NET applications

For Microsoft .NET applications, the Profiler requires that the appropriate Microsoft .NET framework is installed and, for each application or module to be analyzed, a PDB file is available.

### Java

For Java, the Profiler requires that the appropriate JDK from Oracle is installed. If you have configured an analyzer script for debugging, you can select the **Run** button. Alternatively, you can attach the Profiler to a running virtual machine; in this case, the Profiler requires that the JVM be hosting the Enterprise Architect profiling agent. For example:

```
java.exe -cp "%classpath%" -agent path: "C:\Program Files (x86)\Sparx Systems\EA\vea\x86\ssamplerlib32" myapp
```

or

```
java.exe -cp "%classpath%" -agent path: "C:\Program Files (x86)\Sparx Systems\EA\vea\x64\ssamplerlib64" myapp
```

(Refer to the JDK documentation for details of the -agent path VM startup option.)

## 16.3.2 Profiler Operation

Whenever you launch the Profiler or attach it to a running application, a Profiler process is started. The Profiler operates by taking samples from the target process at intervals of up to 250 milliseconds. At these intervals the Profiler interrupts the process and collects stack information for all threads running at that time; this information is sent back to Enterprise Architect where it is collected, sorted and stored.

**Access** **Analyzer | Profiler**

Actions

Action	Detail	See also
<b>Start a Profiler Process</b>	Click on the <b>Run Profiler</b> button on the Profiler window toolbar.	
<b>End a Profiler Process</b>	<p>The sampler process exits if:</p> <ul style="list-style-type: none"> <li>You click on the <b>Stop</b> button</li> <li>The target application terminates, or</li> <li>You close the current model</li> </ul> <p>If you stop the Profiler and the process is still running, you can quickly attach to it again.</p>	
<b>Pause and resume a session</b>	<p>You can pause and resume profile sample collection at any time during a session.</p> <p>When sampling is turned on or resumed, the Profiler process becomes active and samples are collected from the target; resuming sampling collects <b>completely new</b> samples.</p> <p>The Profiler process idles if sampling is turned off or paused during a session. The <b>Report</b> and <b>Discard Data</b> buttons then become enabled.</p>	<a href="#">Getting Started</a>  <sup>2558</sup>
<b>Generate report</b>	<p>Click on the <b>Report</b> button to display the Profiler report.</p> <p>Having reviewed this report, you can also generate from it a report on the execution of an individual function.</p>	<a href="#">Generate, Save and Load Profile Reports</a>  <sup>2560</sup> <a href="#">Function Line Reports</a>  <sup>2564</sup>
<b>Clear results</b>	You can clear any sample data collected for the target application and begin again - click on the <b>Discard Data</b> button to discard the samples currently collected in the Profiler window.	

**16.3.3 Getting Started**

When you run a Profiling session, almost every option you might need is available from the Profiler window toolbar. You can, for example, initiate the profiling session, attach to an already-running process, pause and resume profiling, stop the session, generate and view the Profile report or load a previously-generated report. You can also set Profiler options to modify the operation of the Profiler.

Access   **Analyzer | Profiler**

Toolbar Options

## 16.3.4 Generate, Save and Load Profile Reports

When you profile the execution of your MS Native Windows application, the Profiler generates a report in the Call Stack that shows how functions are called in relation to the profiled application; for example, how one function might be taking most of the overall time recorded, and what contributions are made by the subfunctions that function calls. You have a number of options for reviewing and sharing the resulting report. You might:

- View the report immediately, in detailed or summary form
- File the report in binary or xmi format
- Reload the report at a later time
- Refine the information displayed in the report
- Distribute the report as a Team Review resource
- Attach the report as a document to an Artifact element

**Access** [Analyzer | Profiler \(execute\): View Report](#)

### Learning Center topics

- [Alt+F1 | Enterprise Architect | Execution Analysis | Profiling Native Code | Introducing the Profiler | Set Capture Options](#)

### 16.3.6 Start & Stop the Profiler

For most debugging operations it is necessary to have first configured an Execution Analyzer Script that typically defines the application to build, test and debug, and any sequence recording options. It is possible to use the Profiler without doing any of this by using the **Attach to Process** option in the drop-down option list.

If the application to profile is the one defined in the current Package, use the **Run Profiler** button.

-  - (When an application is configured for the Package) create the Profiler process, which launches the configured application
-  - Stop the Profiler process

### 16.3.7 Function Line Reports

After you have run the Profiler on an executing application and generated a Sampler report, you can further analyze the activity of a specific **function** listed in the Sampler report by generating a **function line report** from that report item. A function line report shows the number of times each **line** of the function was executed. You produce one function line report at a time, on any method in the Sampler report that has a valid source file. The line report is particularly useful for functions that perform **loops** containing **conditional branching**; the coverage can provide a picture of the most frequently and least frequently executed portions of code within a single method.

The line report you generate is saved when you save the Sampler report. The **body** of the function is also saved with the line report to preserve the function state at that time.

**Platforms supported**    Java, Microsoft .NET and Microsoft native code

#### Create a Line Report

In the Sampler report, right-click on the name of the function to analyze, and select the **Create Line report for function** menu option.

Once the Profiler binds the method, the line report is opened on the Sampler Report window. The report shows the body of the function, including line numbers and text. As each line is executed a hit value will accumulate against that line. A timer will update the report approximately once every second.

Call Tree Report   Summary Report   ConsoleApplication::CQuickSort::Quicksort		
Module: ConsoleApplication Function: CQuickSort::Quicksort Date: 20/09/2013 2:53:21 PM Author: smeagher Iterations: 28679		
LineNo	Hits	Code
21	28645	{
22	28644	if (r <= l)
23	14460	return;
24	14184	int i = l-1, j = r, p = l-1, q = r;
25		for (,;)
26		{
27	439580	while (a[++i] < a[r]) ;
28	14185	while (a[--j] > a[r])
29		if (j == i)
30		break;
31		if (i >= j)
32	14185	break;
33		
34		Exchange(a, i, j);
35		if ( a[i] == a[r])
36		Exchange(a, ++p, i);
37		
38		if ( a[j] == a[r])
39		Exchange(a, j, --q);
40		
41		}
42	14185	Exchange(a, i, r);
43	14185	j = i-1; i = i+1;
44	14185	for (int k = l; k < p; k++, j--)

### End Line Report Capture

Once enough information is captured, or the function has ended, click on the Profiler toolbar **Stop** button to stop recording the capture.

### Save Reports

Use the **Save** button on the Call Stack toolbar to save the Sampler report and any function line reports to a file.

### Delete Line Reports

Closing the line report tab will close that report but the report data will only be deleted when the report is saved.

[Learn more](#)

- [Generate, Save and Load Profile Reports](#) 

### 16.3.8 *Save Report in Team Review*

You can save any current report as a resource for a Category, Topic or Document in the Team Review. The report can then be shared and reviewed at any time as it is saved with the model. This helps you to:

- Preserve a profiler report to compare against future runs
- Allow other people to investigate the profile

## 16.4.2 Create & Delete Workbench Instances

This topic explains how to create and delete a workbench instance for any Class in your model, for which a script has been built and executed.

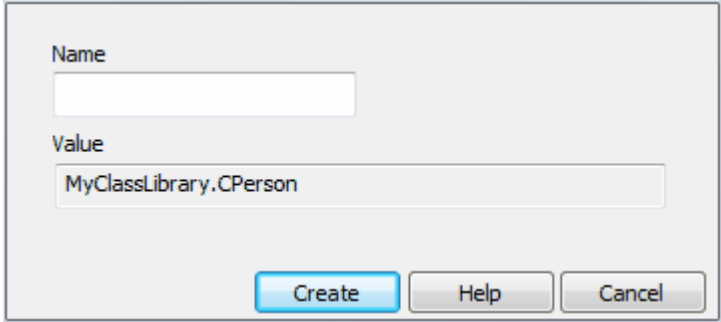

The Workbench supports the following workbench platforms:

- Microsoft .NET (version 2.0 or later) excluding native C++, C and VB
- Java (JDK 1.4 or later)

The Execution Analysis script for the package must have a debugger configured.

## 16.5 Unit Testing

Enterprise Architect supports integration with unit testing tools in order to make it easier to develop good quality software.

In sequence:

- You download and install the NUnit and JUnit applications (JUnit - <http://www.junit.org/> NUnit - <http://www.nunit.org/index.php?p=home>) - Enterprise Architect does not include these applications in the installer
- Enterprise Architect helps you to create test Class stubs with the **JUnit** and **NUnit** transformations
- You define your test code within the Class stubs
- You set up and run a **test script** against any package
- All test results are automatically recorded inside Enterprise Architect

## 16.6 Testpoint Management

Testpoints define constraints that are applied to Classes and Operations, ensuring that a system is behaving as expected during runtime. Testpoints are evaluated during a debugging session and the result of each evaluation is recorded as either a Pass or Fail. Test results can be viewed from the Testpoints Window in real-time as the program is executed. After a test run has completed, the recorded results can be saved for later reference.

Tests	Id	Constraints	Status	Evals	Passes	Fails	Parent Collections:

**16.6.1.2 Constraint Composition**

A Constraint is typically composed using local and member variables in expressions, separated by operators to define one or more specific criteria that must be met. A constraint must evaluate as **true** to be considered as **Passed**. If a constraint evaluates as **false**, it is considered as **Failed**.

Any variables referenced within the constraint must be in scope at the position where the Testpoint or Breakpoint is evaluated.

**General/Arithmetic Operators**

Operator	Description	Example
+	Add	$a + b > 0$
-	Subtract	$a - b > 0$
/	Divide	$a / b == 2$
*	Multiply	$a * b == c$
%	Modulus	$a \% 2 == 1$
( )	Parentheses - Used to define <i>precedence</i> in complex expressions.	$((a / b) * c) \leq 100$
[ ]	Square Brackets - Used for accessing Arrays.	<code>Names[0].Surname == "Smith"</code>
.	Dot operator - Used to access member variables of a class.	<code>Station.Name == "Flinders"</code>
->	Alternative notation for the Dot operator.	<code>Station-&gt;Name == "Flinders"</code>

**Comparison Operators**

Operator	Description	Example
=	Equal To	$a = b$
==	Equal To	$a == b$
!=	Not Equal To	$a != b$
<>	Not Equal To	$a <> b$
>	Greater Than	$a > b$

Operator	Description	Example
<code>&gt;=</code>	Greater Than or Equal To	<code>a &gt;= b</code>
<code>&lt;</code>	Less Than	<code>a &lt; b</code>
<code>&lt;=</code>	Less Than or Equal To	<code>a &lt;= b</code>

### Logical Operators

Operator	Description	Example
<b>AND</b>	Logical AND	<code>(a &gt;= 1) AND (a &lt;= 10)</code>
<b>OR</b>	Logical OR	<code>(a == 1) OR (b == 1)</code>

### Bitwise Operators

Operator	Description	Example
<b>&amp;</b>	Bitwise AND	<code>(1 &amp; 1) = 1</code> <code>(1 &amp; 0) = 0</code>
<b> </b>	Bitwise OR	<code>(1   1) = 1</code> <code>(1   0) = 1</code>
<b>^</b>	Bitwise XOR (exclusive OR)	<code>(1 ^ 1) = 0</code> <code>(1 ^ 0) = 1</code>

### Additional Examples

Example	Description
<code>(( m_nValue &amp; 0xFFFF0000) == 0)</code>	Use a Bitwise AND operator (&) with a hexadecimal value as the right operand to test that no bits are set in high order bytes of the

Example	Description
	variable.
(( m_nValue & 0x0000FFFF) == 0)	Use a Bitwise AND operator (&) with a hexadecimal value as the right operand to test that no bits are set in low order bytes of the variable.
m_value[0][1] = 2	Accessing a multi-dimensional array
a AND (b OR c)	Combining AND and OR operators, using parentheses to ensure precedence. In this example, variable 'a' must be true, and either 'b' or 'c' must be true.

## 16.6.2 Testpoint Editor

The Testpoint Editor is used to compose constraints for Classes and Operations. The types of constraints permitted are dependent on the selected object. For Classes, the type will always be **Invariant**. For operations, the type can be either **Pre-Condition**, **Post-Condition** or **Line-Condition**.

**Invariants** are evaluated by the Analyzer when any method called on an object of the selected Class type completes. **Pre-conditions** are evaluated at the beginning of each call to the specified operation. **Post-conditions** are evaluated upon completion of each call to the specified operation. **Line-conditions** are evaluated each time the specified line of code is executed.

**Access** [Analyzer](#) | [Testpoint Manager](#): Double-click on a Class or Operation in the Testpoints window

#### Constraint Group fields

Field	Usage	See also
<b>Type</b>	The type of constraint for the selected Class or Operation:	

Field	Usage	See also
	<ul style="list-style-type: none"> <li>• <b>Invariant</b> - Evaluated after any method called on the specified Class has completed</li> <li>• <b>Pre-Condition</b> - Evaluated at the beginning of each call to a specific Operation</li> <li>• <b>Post-Condition</b> - Evaluated after completion of each call to a specific Operation</li> <li>• <b>Line-Condition</b> - Evaluated upon execution of a specific line of code within an Operation</li> </ul>	
<b>Offset</b>	<p>Line number within the specified operation upon which to evaluate the constraint. Only applicable for <b>Line-Condition</b> constraint types.</p> <p>An offset value is automatically set if the Testpoint was created using the Code Editor Context Menu.</p>	<a href="#">Code Editor Context Menu</a> <sup>[2152]</sup>
<b>Condition</b>	The constraint to be evaluated when this Testpoint is triggered. A status of pass or fail will be recorded depending upon whether this constraint condition evaluates as true or false.	<a href="#">Constraint Composition</a> <sup>[2581]</sup>
<b>Action on Fail</b>	<p>Click on the drop-down arrow and select from the three options:</p> <ul style="list-style-type: none"> <li>• <b>Continue</b> - ignore failure of this constraint and continue execution</li> <li>• <b>Break execution</b> - halt execution and display the Stack trace</li> <li>• <b>Disable on fail</b> - do not execute the constraint again after failing once</li> </ul>	
<b>Evaluate When</b>	(Optional) An additional constraint which must be met before the main Testpoint Condition is evaluated, providing greater control over test coverage.	<a href="#">Constraint Composition</a> <sup>[2581]</sup>

#### Trace Group fields

Field	Usage	See also
<b>Level</b>	<p>Specifies when the trace statement (if defined) will be output. Available options are:</p> <ul style="list-style-type: none"> <li>• <b>Fail Only</b> - Output trace statement only when this Testpoint condition fails</li> <li>• <b>Always</b> - Output trace statement every time this Testpoint is evaluated</li> </ul>	
<b>Statement</b>	<p>(Optional) A message to be output when this Testpoint is evaluated.</p> <p>Variables currently in scope can be included in a trace statement output by prefixing the variable name with a <b>\$</b> token for string variables, or a <b>@</b> token</p>	<a href="#">Specifying a Trace Statement</a> <sup>[2228]</sup>

Field	Usage	See also
	<p>for primitive types such as int or long.</p> <p>Output from a Trace Statement may either be directed to the Testpoints tab of the <b>Output Window</b>, or to an external file, as configured by the <b>Analyzer Script</b> for the parent package.</p>

### 16.6.3 Combine Testpoints

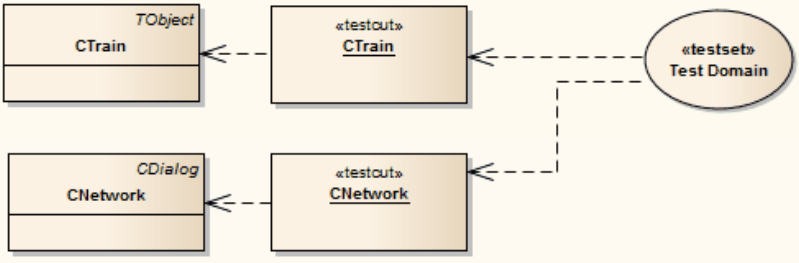

Testpoints are applied to a Class. Where functionality requires tests across multiple Classes, you can group the tests together to allow a single test run across the group of Classes.

You group the tests on a Test Domain diagram, either:

- Manually using the Test Domain Toolbox pages and Project Browser, or
- Automatically from the results of using the debugger and Record & Analyze window

#### Topics

Topic	Detail	See also
<b>Create Test Domain diagram manually</b>	<p>Create a new Test Domain diagram under the required package, and drag a Test Cut element from the Test Domain Toolbox page onto the diagram; give the element an appropriate name, such as the name of the Class it acts on.</p> <p>Drag the Class containing the tests from the Project Browser onto the diagram, and select the 'paste as simple link' option on the Paste Element dialog; create a Dependency connector between the Test Cut element and the Class.</p> <p>(When you select the Test Cut element on the diagram when the Testpoints window is open, the operations of the Class are listed in the window, each followed by a checkbox; you then select the checkbox against each Class operation to include in the Test Cut).</p> <p>Drag and connect further Test Cut and Class element pairs on the diagram as appropriate.</p> <p>Drag a Test Set element from the Toolbox onto the diagram, and create a</p>	<p><a href="#">Test Domain Toolbox</a><sup>[819]</sup></p> <p><a href="#">Test Cut</a><sup>[2588]</sup></p> <p><a href="#">Test Set</a><sup>[2588]</sup></p>

### 16.6.3.1 Test Cut

#### Description

A Test Cut element is a stereotyped Object element, used internal to Enterprise Architect for defining test sets using the Testpoint code testing facilities.

A task, such as 'Print', might involve operations on different Classes. In order to create a 'Print' test, you would want to include only the 'Print' operations of these Classes and exclude any other operations.

A Test Cut enables you to capture only the operations that represent the behavior (in this case, 'Print') defined for a single Class. You might then place the Test Cut from each of several Classes into a single task as a Test Set.

When you drag a Test Cut element onto a Test Domain diagram, you create a Dependency relationship with the required Class element. As a result, when you select the *Test Cut* element on the Testpoints Window, the operations of the *Class* are listed in the window, each with a checkbox. You then select the checkbox against each Class operation to include in the Test Cut.

### 16.6.3.2 Test Set

#### Description

A *Test Set* element is a stereotyped Use Case element used to aggregate one or more groups of methods (Test Cuts), which perhaps span multiple Classes, into a single task. Test Sets can also be aggregated into Test Suites.

You link the Test Cut elements to the Test Set using Dependency connectors.

## 16.7 Object Run State Diagrams

The run-time of an object instance can be defined using the local variables window of the Enterprise Architect debugger. During a debug session variables can be dragged from this window on to an Object diagram. The run-time of the element will then be composed using the attributes of the variable. Dragging members of the same variable will create an association. Using this method the complex run-of an element time can be composed quite quickly.

Requires that an [Analyzer Script](#)<sup>[2175]</sup> has been configured for debugging.

**Part**

---

## 17 Testing

It is important in any project to perform quality control of both the process and the output of the project; Enterprise Architect provides several facilities for testing and validating your model structure and content, including:

- **Model Validation Checks** - check UML elements, diagrams or packages against known UML rules (identified in configuring validation) and constraints defined within the model, using the Object Constraint Language (OCL)
- **Testing** - create and manage test scripts for model elements, covering unit, integration, scenario, system and acceptance tests
- **Testpoint Management** - pass or fail application tasks, viewing test results in real time as the program executes and results are saved
- Integration with the **unit testing** tools **JUnit** and **NUnit**

## 17.1 Model Validation

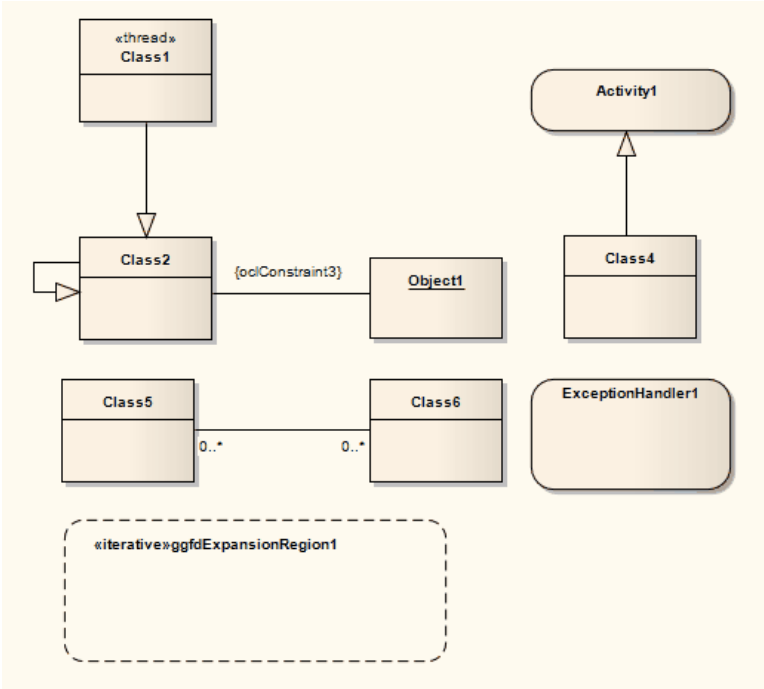

You use Model Validation to check UML models against known **UML rules** (which you identify when **configuring validation**) as well as any constraints defined within the model using the Object Constraint Language (OCL). You can run Model Validation against a single UML element, a diagram or an entire Package.

You can add to the system-provided validation rules by using an Add-In or an MDG Technology that contain their own rules.

**Access** **Project | Model Validation | Validate Selected (Ctrl+Alt+V)**

### Validation Concepts

Concept	Detail	See also
<b>Validating Objects</b>	Validating a UML: <ul style="list-style-type: none"> <li>• <b>Element</b> validates the element and its children, its features (attributes and operations) and its relationships (connectors)</li> <li>• <b>Diagram</b> validates the diagram itself (for correctness) as well as any elements and connectors within the diagram</li> <li>• <b>Package</b> validates the Package and all sub-Packages, elements, connectors and diagrams within it</li> </ul>	
<b>Example - Model Violation</b>	The following UML diagram contains several basic violations of the UML rules:	

Concept	Detail	See also
	 <p>If you run Model Validation on this diagram, the following violations are identified in the System Output window:</p> <ul style="list-style-type: none"> <li>• A UML ExpansionRegion (<i>ExpansionRegion1</i>) is missing its child input ExpansionNode</li> <li>• An invalid self-generalization exists on <i>Class2</i> (UML elements cannot be self-generalized)</li> <li>• An OCL violation exists for the anonymous Association (between <i>Class2</i> and <i>Object1</i>)</li> <li>• A UML ExceptionHandler (<i>ExceptionHandler1</i>) is missing its child input ObjectNode</li> </ul>

### 17.1.2 Run Validation

After you have configured the validation you want to perform and set the validation rules to be applied, you can execute the validation on objects you have selected from either the Project Browser or a diagram. If you do not want to continue a validation you have started, you can cancel it.

**Access**    **select object | Project | Model Validation | Validate Selected**

#### Validation

While the validation executes it displays a progress window. When validation is complete, the results are displayed in the System Output window. You can highlight and select on a diagram the element that an error message refers to, by double-clicking on the error line in the System Output window.

#### Cancel Validation

At any time during a validation, either:

- Click on the **Cancel Validation** button on the validation progress window, or
- Select the **Project | Model Validation | Cancel Validation** menu option

#### Notes

- If the System Output window does not automatically display, select the **View | System Output** menu option

#### Learn more

- [The System Output Window](#)<sup>[169]</sup>
- [Rules Reference](#)<sup>[2597]</sup>

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Testing | Model Validation | How to Run**

### 17.1.3 Rules Reference

Model Validation works by applying a set of validation rules to the selected object. These rules are arranged in groups.

#### Rule Groups

Group	Description	See also
<b>Well-Formedness</b>	<p>The validator applies these rules to check whether or not an element, relationship, feature or diagram is well-formed; for example, whether the object is a valid UML item or whether a diagram contains valid elements within it.</p> <p>As explained in <i>Error Message Format</i>, below, these rules generate messages with the codes:</p> <ul style="list-style-type: none"> <li>• MVR01.... (<b>Element: Well Formedness</b> checkbox selected)</li> <li>• MVR05.... (<b>Relationship: Well Formedness</b> checkbox selected)</li> <li>• MVR08.... (<b>Feature: Well Formedness</b> checkbox selected)</li> <li>• MVR0B.... (<b>Diagram: Well Formedness</b> checkbox selected)</li> </ul>	<a href="#">Well-Formedness</a> <sup>[2599]</sup>
<b>Element Composition</b>	<p>The validator applies these rules to check whether or not a UML element contains valid children, whether it contains the right number of valid children, and whether or not the element is missing any required children.</p> <p>These rules generate messages with the code:</p> <ul style="list-style-type: none"> <li>• MVR02.... (<b>Element: Composition</b> checkbox selected)</li> </ul>	<a href="#">Element: Composition</a> <sup>[2600]</sup>
<b>Property Validity</b>	<p>The validator applies these rules to check whether or not the element, relationship or feature has the correct UML properties defined, and whether the properties contain incorrect or conflicting values.</p> <p>These rules generate messages with the codes:</p>	<a href="#">Property Validity</a> <sup>[2600]</sup>

Group	Description	See also
	<ul style="list-style-type: none"> <li>MVR03.... (<b>Element: Property Validity</b> checkbox selected)</li> <li>MVR06.... (<b>Relationship: Property Validity</b> checkbox selected)</li> <li>MVR09.... (<b>Feature: Property Validity</b> checkbox selected)</li> </ul>	
<b>Custom Properties</b>	<p>The validator applies these rules to check an element, relationship or feature against any defined constraints in OCL.</p> <p>These rules generate messages with the codes:</p> <ul style="list-style-type: none"> <li>MVR04.... (<b>Element: OCL Conformance</b> checkbox selected)</li> <li>MVR07.... (<b>Relationship: OCL Conformance</b> checkbox selected)</li> <li>MVR0A.... (<b>Feature: OCL Conformance</b> checkbox selected)</li> </ul>	<a href="#">OCL Conformance</a> 

### Error Message Format

When you perform a validation, any violations of the rules are listed on the System Output window. Each violation has a violation ID of the format:

*MVRxxnnnn*

- MVR* stands for Model Validation Rule
- xx* is a hexadecimal number corresponding to the position of the validation rule in the Model Validation Configuration dialog, thus indicating which rule is applied and violated
- nnnn* is the number of the violation message

For example:

- Messages with the ID *MVR01nnnn* indicate that the **Element: Well-Formedness** checkbox is selected and a violation of that rule has been detected
- Messages with the ID *MVR0Annnn* indicate that the **Feature: OCL Conformance** checkbox (10th in order on the dialog, or *Ath* in hexadecimal) is selected and a violation of that rule has been detected

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Testing | Model Validation | Viewing Results**

### 17.1.3.1 Well-Formedness

**Well-formedness** rules are applied to check whether or not an element, relationship, feature or diagram is **well-formed**. For example, whether the target item is a valid UML item, or whether a diagram contains valid elements within it.

#### Reported violations

Violation ID	Description	Error
<b>MVR01000</b> <b>1</b>	«Element» is not a valid UML Element	The element is not a recognized UML 2.4.1 element.
<b>MVR05000</b> <b>1</b>	«Relationship» is not a valid UML Relationship	The relationship is not a recognized UML 2.4.1 relationship.
<b>MVR05000</b> <b>2</b>	«Relationship» is not legal for «Start Element» --> «End Element»	The relationship between the given start and end elements is not valid for those elements.
<b>MVR05000</b> <b>3</b>	«Parent Element»:isLeaf=true and cannot be generalized by «Child Element»	The Generalization relationship cannot exist between parent and child elements because the parent element is defined as a leaf element.
<b>MVR05000</b> <b>4</b>	«Child Element»:isRoot=true and cannot generalize «Parent Element»	The Generalization relationship cannot exist between parent and child elements because the child element is defined as a root element.
<b>MVR05000</b> <b>5</b>	«Element» cannot generalize self	The element cannot be self-generalized.
<b>MVR0B00</b> <b>01</b>	Statechart violation: «extended information»	The State diagram contains a UML violation; «extended information» provides more details on the specific violation.
<b>MVR0C00</b> <b>01</b>	Sequence Violation: «extended information»	The Sequence diagram contains a violation, «extended information» provides more details about the specific violation.  (This rule validates operations being called by Messages - as selected from the drop down combo box of the Messages Properties dialog - and will report a violation if the operation does not belong to the Lifeline.)
<b>MVR7F000</b> <b>1</b>	«Requirement» Not realized	A Requirement element must be at the target end of a Realization, Association (including Aggregation and Composition) or Generalization connector.

Violation ID	Description	Error

- [Association](#) <sup>[1393]</sup>
- [Realization](#) <sup>[1440]</sup>

### 17.1.3.2 Element Composition

**Element Composition** rules are applied to check whether or not a UML **element** contains valid children, whether it contains the right number of valid children, and whether or not the element is missing any required children.

#### Reported violations

Error ID	Description	Information
<b>MVR0200 01</b>	«Element» is missing required child element «Child Element»	The element is missing a child element of type <b>Child Element</b> .
<b>MVR0200 02</b>	Invalid UML Package child	The element cannot be a direct child of the Package and must be a child of another element (for example, Ports must be children of other elements, and not direct UML Package members).
<b>MVR0200 03</b>	Invalid child «Child Element name» («Child Element Type»)	The child element is invalid on the tested parent element.

#### Learn more

- [Rules Reference](#) <sup>[2597]</sup>

### 17.1.3.3 Property Validity

**Property Validity** rules are applied to check whether or not an element, relationship or feature has the correct UML **properties** defined for it and whether they contain incorrect or conflicting values.

#### Reported violations

Error ID	Description	Information
<b>MVR03000 1</b>	«Element»:«Property» property is undefined	The element property contains no value.

Error ID	Description	Information
<b>MVR03000 2</b>	«Element»:«Property» property has invalid value: "«Value»"	The element property contains an invalid value.
<b>MVR03000 3</b>	«Element»:isLeaf=true and cannot be abstract	The element's <i>isLeaf</i> and <i>isAbstract</i> properties are both set to <b>true</b> , which is invalid.
<b>MVR06000 1</b>	«Relationship»:«Property» property is undefined	The relationship property contains no value.
<b>MVR06000 2</b>	«Relationship»:«Property» property has invalid value: "«Value»"	The relationship property contains an invalid value.
<b>MVR09000 1</b>	Attribute/AssociationEnd mismatch, «Attribute»: «Mismatch description», ...	The given attribute has an <i>associationEnd</i> of the same name but they differ in the listed details.

### 17.1.3.4 OCL Conformance

**OCL Conformance** rules are applied to validate an element, relationship or attribute against any defined constraints in the **Object Constraint Language** (OCL). OCL is used to describe expressions on UML models, and to express constraints free of side-effects. You can add OCL constraints to any element, relationship or attribute in Enterprise Architect.

#### Reported violations

Error ID	Description	Information
<b>MVR040001</b>	OCL violation: «violated OCL»	The <b>element</b> violates the specified OCL constraint.
<b>MVR070001</b>	OCL violation: «violated OCL»	The <b>relationship</b> violates the specified OCL constraint.
<b>MVR0A0001</b>	OCL violation: «violated OCL»	The <b>attribute</b> violates the specified OCL constraint .

### Define OCL Constraints

You can add an OCL constraint to a model object by setting **OCL** as the Constraint type in the object Properties dialog.

For	Detail	See also
<b>An Element</b>	<p>Select <b>Element   Properties &gt; Constraints</b>; in the <b>Type</b> field click on the drop-down arrow and select <b>OCL</b>.</p> <p>To perform an OCL <b>Validation</b>:</p> <ol style="list-style-type: none"> <li>1. Select <b>Project   Model Validation   Configure</b> and select the <b>Element: (OCL) Conformance</b> checkbox</li> <li>2. Click on the element and select <b>Project   Model Validation   Validate Selected</b></li> </ol> <p>Any OCL violations are recorded in the Model Validation tab of the System Output window.</p>	<a href="#">Model Validation Configuration</a> <sup>[2596]</sup> <a href="#">Model Validation</a> <sup>[2594]</sup>
<b>A Relationship</b>	<p>On a diagram, right-click on the connector and select the <b>&lt;type&gt; Properties</b> context menu option; select the Constraints page, and in the <b>Type</b> field click on the drop-down arrow and select <b>OCL</b>.</p> <p>To perform an OCL <b>Validation</b>:</p> <ol style="list-style-type: none"> <li>1. Select <b>Project   Model Validation   Configure</b> and select the <b>Relationship: (OCL) Conformance</b> checkbox</li> <li>2. Click on the connector and select <b>Project   Model Validation   Validate Selected</b></li> </ol> <p>Any OCL violations are recorded in the Model Validation tab of the System Output window.</p>	
<b>An Attribute</b>	<p>Select <b>Element   Attributes &gt; Constraints</b>; in the <b>Type</b> field click on the drop-down arrow and select <b>OCL</b>.</p> <p>To perform an OCL <b>Validation</b>:</p> <ol style="list-style-type: none"> <li>1. Select <b>Project   Model Validation   Configure</b> and select the <b>Feature: (OCL) Conformance</b> checkbox</li> <li>2. Click on the element and select <b>Project   Model Validation   Validate Selected</b></li> </ol> <p>Any OCL violations are recorded in the Model Validation tab of the System Output window.</p>	

### Notes

- To have a valid OCL constraint, the syntax must be correctly formed; if the expression is not correct, a message displays stating that the OCL constraint is not valid

### Learn more

## 17.2 Testing

Enterprise Architect is not only a UML Modeling environment, it is also a complete **Test Management environment**. Using Enterprise Architect you can create and manage **test scripts** for model elements, covering unit, integration, scenario, system and acceptance tests; these can include **test cases** generated from **xUnit testing** and **Testpoint Management**.

You can also **import** tests from other elements, **generate** them from scenarios, and generate **test documentation** and reports; you can indicate the presence of tests on an element by displaying test information on the element in a diagram.

It is simple to attach even complex tests to any model element. Keeping the model elements and the testing documentation in one integrated model significantly improves the communication between the test-team and the software developers and architects.

The system's detailed **search facilities** make it easy to find failing test cases, test cases not run and test cases that have been passed; using the testing and search capabilities, it is easy to navigate through the model and quickly locate problem spots, design flaws and other critical issues.

### Test Tasks

Tasks	Detail	See also
<b>Create Tests</b>	<p>You create tests in the <b>Testing Workspace</b>, and using the <b>Test Details</b> dialog.</p> <p>Typically, you create:</p> <ul style="list-style-type: none"> <li>• <b>Unit tests</b> for things that are being built, such as Classes and components</li> <li>• <b>Integration tests</b> to test how components work together</li> <li>• <b>System tests</b> to ensure the system meets business requirements</li> <li>• <b>Acceptance tests</b> to test user satisfaction, and</li> <li>• <b>Scenario tests</b> to test the end-to-end suitability and functionality of the application</li> </ul> <p>These test categories are otherwise referred to as test <b>Classes</b>; the type of Class is internally identified by the <i>C/ass</i> attribute, which has a value from <b>1</b> to <b>5</b> corresponding to the test types in the order listed above.</p>	<p><a href="#">Working on Test Records</a> <sup>[2605]</sup></p> <p><a href="#">Create Test Records</a> <sup>[2607]</sup></p> <p><a href="#">Test Class</a> <sup>[2908]</sup></p>
<b>Using Tests</b>	<p>Tasks that you might perform when working with tests include:</p> <ul style="list-style-type: none"> <li>• Import a scenario as a test</li> <li>• Move or copy tests between test types</li> <li>• Import a test from other elements</li> </ul>	<p><a href="#">Import a Scenario as a Test</a> <sup>[2611]</sup></p> <p><a href="#">Move or Copy Tests Between Test Types</a> <sup>[2610]</sup></p>

Tasks	Detail	See also
	<ul style="list-style-type: none"> <li>• Import a responsibility or constraint as a test</li> <li>• Create a maintenance item from a test</li> <li>• Generate a Test Details report</li> <li>• Show test script compartments</li> <li>• Create test documentation</li> </ul>	<a href="#">Import a Test from Other Elements</a> <sup>[2613]</sup> <a href="#">The Element Browser</a> <sup>[989]</sup> <a href="#">Import a Responsibility or Constraint as a Test</a> <sup>[2614]</sup> <a href="#">Create a Maintenance Item from a Test</a> <sup>[2615]</sup> <a href="#">Generate Test Details Report</a> <sup>[2736]</sup> <a href="#">Show Test Script Compartments</a> <sup>[2616]</sup> <a href="#">Create Test Documentation</a> <sup>[2617]</sup>

### Notes

- Most of the tasks identified above relate to a tests for a single element
- You can make a set of tests available to a number of elements by performing the above tasks on a **Test Case** element and then associating that Test Case with each of the other elements; the Test Case element also helps to make tests more visible in diagrams, the Project Browser, windows and searches

### Learn more

## 17.2.1 Working On Test Records

Creating and working on element Test records is quick and convenient, using the **Testing window** or **Workspace**. If the Testing window is open, when you select an element in a **diagram** or in the **Project Browser**, the tests for that element are immediately listed in the window ready for modification or addition. The window provides several facilities for creating and managing the test records.

Access    **Element | Testing**    (Alt+3)

### Facilities

Facility	Detail	See also
<b>Window Formats</b>	<p>The Testing window has two formats - <b>Item</b> mode and <b>List</b> mode.</p> <ul style="list-style-type: none"> <li>• <b>Item</b> mode provides a list on the left hand side from which you select a test record, the details of which then display in the fields in the rest of the window; you can edit these fields directly</li> <li>• <b>List</b> mode consists of a list of test records with summary data distributed across the columns; you cannot directly edit these fields</li> </ul> <p>To toggle between the modes, click on the  (<b>Show/Hide Properties</b>) button in the window toolbar.</p>	
<b>Adding New Items</b>	<p>To add new items, click on the <b>New</b> icon in the window toolbar. In:</p> <ul style="list-style-type: none"> <li>• Item mode, this clears the fields for new data</li> <li>• List mode, this displays the Test Details dialog, which you complete in the same way as the Testing window in Item mode</li> </ul>	<a href="#">Create Test Records</a>  <sup>2607</sup>
<b>Applying Automatic Naming/Numbering</b>	<p>On the Testing window in Item mode, or on the Test details dialog, you can apply an automatic naming/numbering convention that you have previously defined, to each new test record. To do this, simply click on the <b>Auto</b> button next to the <b>Test</b> field.</p> <p>If you already have some text in the <b>Test</b> field, it is over-written by the auto-counter text.</p>	<a href="#">Set Auto Naming and Auto Counters</a>  <sup>904</sup>
<b>Test Types</b>	<p>The five types of test you can create records for are each managed on a separate tab of the window:</p> <ul style="list-style-type: none"> <li>• Unit tests - to test Classes, Components and other elements as programmers build them</li> <li>• Integration tests - to test how the constructed components work together</li> <li>• System tests - to test that the system performs the right business functions correctly</li> <li>• Acceptance tests - to test the system against user requirements</li> <li>• Scenario tests - to test the application with real-world situations and scenarios; an end-to-end test of all functions</li> </ul> <p>The Testing window opens at the Unit test tab by default.</p> <p>The fields you complete for each type of test are identical.</p> <p>An asterisk on a tab indicates that the tab contains saved information; if there is no information for a type of test, or the information has not yet been <b>saved</b>, its tab has no asterisk.</p> <p>You toggle the display for each tab between Item mode and List mode independently.</p>	

Facility	Detail	See also
<b>Element Browser</b>	<p>You can also use the Element Browser window to select and display specific items on the Testing window; click on the  icon in the Testing window toolbar to display the Element Browser, open the Testing folder and select the required test record.</p> <p>In the folder, the 'page' icon against each record contains a:</p> <ul style="list-style-type: none"> <li>• <b>U</b> for Unit Test items</li> <li>• <b>I</b> for Integration Test items</li> <li>• <b>Sy</b> for System test items</li> <li>• <b>A</b> for Acceptance Test items</li> <li>• <b>Sc</b> for Scenario Test items</li> </ul>	<a href="#">Element Browser</a> [989]

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records
- The Testing window can be docked to the application workspace
- Columns in the List mode can be reorganized, added, removed, grouped, filtered and sorted using the options provided in the **List Header** facilities

### Learn more

- [Permission List](#)<sup>[329]</sup>
- [List Header](#)<sup>[677]</sup>

## 17.2.2 Create Test Records

When you need to create or edit a test record on an element, for any of the five types of test, you can do so using either the Testing window in **Item** mode, or the Test Details dialog. The Test Details dialog displays when you select the **New** option or double-click on a test entry on the Testing window in **List** mode.

Whichever type of test you are recording, and whichever dialog you use, you complete the same fields.

**Access** **Select element | Element | Testing (Alt+3) > <test type tab> | Item mode: New toolbar icon** or **Select element | Element | Testing (Alt+3) > <test type tab> > List mode (:Show/Hide Properties if necessary): New toolbar icon**

### Create a test record

Field/Button	Action	See also
<b>Test</b>	Type the name of the test. This can be any alphanumeric text string you want to use.	
<b>Auto</b>	As an alternative to typing in the name, click on this button to insert predefined auto-counter text.  If you already have some text in the <b>Test</b> field, it is over-written by the auto-counter text.	<a href="#">Set Auto Naming and Auto Counters</a> 
<b>Status</b>	Click on the drop-down arrow and select the value indicating the current status of the test ( <b>Not Run, Pass, Fail, Deferred</b> and <b>Canceled</b> ).	
<b>Type</b>	Click on the drop-down arrow and select the value indicating the type of test ( <b>Load, Regression</b> or <b>Standard</b> ).	
<b>Run By</b>	Click on the drop-down arrow and select the name of the person who ran the test.	
<b>Checked By</b>	Click on the drop-down arrow and select the name of the person who checked the test run.	
<b>Last Run Date</b>	Click on the drop-down arrow and select the date on which the test was last run.	
<b>Description</b>	Type a description of the test; you can format the text using the Notes toolbar at the top of the field.  This text is also reflected in the Notes window, but cannot be edited there.	<a href="#">Notes Toolbar</a> 
<b>Input</b>	Type in the input data provided to the test; you can format the text using the Notes toolbar at the top of the field.  This text is also reflected in the Notes window, but cannot be edited there.	
<b>Acceptance Criteria</b>	Type the acceptance or test success conditions; you can format the text using the Notes toolbar at the top of the field.  This text is also reflected in the Notes window, but cannot be edited there.	
<b>Results</b>	Type the results of the last test; you can format the text using the Notes toolbar at the top of the field.	

Field/Button	Action	See also
	This text is also reflected in the Notes window, but cannot be edited there.	
<b>Previous</b>	(Test Details dialog) If earlier test records exist, click on this button to reset the fields to the values of the previous test record.	
<b>Next</b>	(Test Details dialog) If you are looking at an earlier test record, click on this button to reset the fields to the values of the next most recent test record.	
<b>New</b>	(Test Details dialog) Click on this button to clear the fields so that you can enter the information for a new test record.	
<b>OK</b>	(Test Details dialog) Click on this button to <b>save</b> the new or changed data <b>and close</b> the dialog.	
<b>Close</b>	(Test Details dialog) Click on this button to <b>close</b> the dialog <b>without</b> saving the new or changed data.	
<b>Apply</b>	(Test Details dialog) Click on this button to <b>save</b> the new or changed data without <b>closing the dialog</b> .	

### Notes

- On the Test Details dialog, you can add multiple test cases in one batch using the **New** and **Apply** buttons
- On the Test Details dialog, if you have several tests of one category (such as Unit or Integration), once you have saved a new test (click on the **Apply** button) or displayed an existing test, you can work backwards and forwards through any other existing tests of that category, by clicking on the **Previous** and **Next** buttons
- To display an existing item for editing, click on the item in the left-hand panel in Item mode, or double-click on the item in List mode to display the Test Details dialog
- To delete an item, right-click on it on the Testing window and click on the **Delete** icon in the window toolbar; in response to the confirmation prompt, click on the **Yes** button
- A further possibility for editing and deleting items is to right-click on items in the Element Browser and select menu options there; to access an item through the Element Browser, click on the  icon in the Testing window toolbar and click on the required item in the *Testing* folder in the Element Browser window
- To change the **element** for which to create or edit test items, click on the new element in the Project Browser
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

### 17.2.3 Move or Copy Tests Between Categories

After you define a test within one test category (Unit, Integration, System, Acceptance or Scenario), you might decide that the test either is better suited to another category, or forms a good template for tests in other categories. If so, you can either **move** or **copy** the test to the other categories.

**Access** **Select element | Element | Testing (Alt+3) > <test type tab> | right-click on test in list to move/copy** or  
**Select element | Element | Element Browser (Alt+9) > Testing folder | right-click on test to move/copy**

#### Move or copy a test

Step	Action	See also
1	Click on the appropriate option - <b>Move to</b> or <b>Copy to</b> . A list of test categories displays.	
2	Click on the test category to which to move or copy the test. A confirmatory prompt displays.	
3	Click on the <b>Yes</b> button to confirm the move or copy.	
4	Click on the target tab of the Testing window to ensure that the test has been added, and make any necessary changes.	<a href="#">Create Test Records</a> <sup>[2607]</sup>
5	If you are copying the test to more than one other category, repeat steps 1 to 4 for the next category to copy to.	

#### Notes

- If you move or copy a test into the **Scenario** category, some unassociated data could be lost

#### Learn more

- [Element Browser](#) <sup>[989]</sup>

#### Learning Center topics

## 17.2.4 Import Scenario as Test

If you are creating a test for a scenario from either a single element or many elements in a package, you do not have to manually re-type the scenario details into the test record in the Testing window. You can generate the test into the Scenario tab of one element from one or more scenarios in any element in the model.

Within the Scenario test record, the scenario description is copied to the Description tab. If a scenario contains a Structured Specification, its **Action** steps are also copied to the Description tab under the heading *Structured Specification*.

### Import a scenario from a single element

**Access** **Select target element | Element | Testing (Alt+3) > Scenario | right-click on tests | Import element scenario(s)** or  
**Select target element | Element | Element Browser (Alt+9) > Testing folder | right-click on tests | Import element scenario(s)**

Field/Button	Action	See also
<b>Select element</b>	If you are copying scenarios from a <b>different</b> element to the target element, click on the drop-down arrow and select the source element. The list identifies elements that have scenarios that can be imported.  Otherwise, leave this field blank.	
<b>Show related elements only</b>	Select this checkbox to restrict the list of selectable elements to those that are related to the target element.	
<b>Limit selection to these Object Types only</b>	If you want to restrict the list of selectable elements to only those of specific types, type in those element types in a comma-separated list.	
<b>Refresh</b>	Click on this button after changing any of the above field values, to refresh the list of available elements in the <b>Select element</b> field.	
<b>Select items to import</b>	Lists the scenarios defined in the source element. Select the scenario (s) to import.  If you do not use the <b>Select element</b> field, any scenarios listed are from the current element to which this test record belongs.  If you have selected a different element, the scenarios come from that element.	
<b>All</b>	Click on this button to select all scenarios listed in the <b>Select items to import</b> field.	
<b>None</b>	Click on this button to clear the selection of scenarios listed in the	

Field/Button	Action	See also
	<b>Select items to import</b> field.	
<b>Import</b>	Click on this button to import the selected scenario(s).	

#### Import scenarios from the elements in a package

Access **Select target element | Element | Testing (Alt+3) > Scenario > right-click on tests | Import Package Scenarios** or  
**Select target element | Element | Element Browser (Alt+9) > Testing folder > right-click on tests | Import Package Scenarios**

Field/Button	Action	See also
<b>Limit selection to these Object Types only</b>	If you want to restrict the selected elements to only those of specific types, type in those element types in a comma-separated list.  This version of the Import Scenario dialog lists all scenarios against all elements in the package; it does not enable you to select a specific element, but does enable you to filter the list of scenarios to those from specific types of element.	
<b>Refresh</b>	Click on this button after changing any of the above field values, to refresh the list of available elements in the <b>Select element</b> field.	
<b>Select Items to import</b>	Lists the scenarios defined in the selected elements in the package. Select the scenario(s) to import.	
<b>All</b>	Click on this button to select all scenarios listed in the <b>Select items to import</b> field.	
<b>None</b>	Click on this button to clear the selection of scenarios listed in the <b>Select items to import</b> field.	
<b>Import</b>	Click on this button to import the scenarios from each element as Scenario tests.	

#### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update

and delete test records

### 17.2.5 Import Test From Other Elements

If you have created useful tests in one element, you can import those tests into any other element through the Testing window and so avoid having to duplicate the test information manually. You open the Testing window for the empty, target element and then select the source element that contains the tests to import.

**Access** **Select target element | Element | Testing (Alt+3) | Import tests from other element** or **Select target element | Element | Element Browser (Alt+9) > Testing folder | right-click on tests | Import tests from other element**

#### Import a test

Field/Button	Action	See also
<b>Select element</b>	Click on the drop-down arrow and locate and select the source element.  This list identifies elements that have tests that can be imported.	
<b>Show related elements only</b>	Select this checkbox to restrict the list of selectable elements to those that are related to the target element.	
<b>Limit selection to these Object Types only</b>	If you want to restrict the list of selectable elements to only those of specific types, type in those element types in a comma-separated list.	
<b>Refresh</b>	Click on this button after changing any of the above field values, to refresh the list of available elements in the <b>Select element</b> field.	
<b>Select items to import</b>	Lists the tests defined in the source element. Select the test(s) to import.  If you have not used the <b>Select element</b> field, any tests listed are from the <b>current</b> element to which this test record belongs. There is no purpose in importing these.	
<b>All</b>	Click on this button to select all tests listed in the <b>Select items to import</b> field.	

Field/Button	Action	See also
<b>None</b>	Click on this button to clear the selection of tests listed in the <b>Select items to import</b> field.	
<b>Import</b>	Click on this button to import the selected test(s).	

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

## 17.2.6 Import Responsibility or Constraint as Test

If you are creating a test against a **responsibility** (internal requirement) or internal **constraint** of an element, you do not have to manually **re-type** the details into the test record in the Testing window. You can **generate** a testing record on the element from the responsibility or constraint.

The test record is generated into the test-type tab that you currently have open, and the responsibility or constraint description is copied to the Description tab for the test record.

**Access** [Select element](#) | [Element](#) | [Testing](#) (Alt+3) > <test type tab> | right-click on test list | [Import element constraint\(s\)](#) or [Select element](#) | [Element](#) | [Testing](#) (Alt+3) > <test type tab> | right-click on test list | [Import element requirement\(s\)](#) or [Select element](#) | [Element](#) | [Element Browser](#) (Alt+9) > [Testing folder](#) | right-click on test of required type | <option>

### Import a requirement or constraint as a test

Step	Action	See also
<b>1</b>	On the Import Constraint or Import Requirements dialog (the two dialogs are identical) review the list of internal requirements or constraints in the selected element.	
<b>2</b>	Click on one of the items to import as a test, or <b>(Ctrl)+click</b> on more than one to import several.  Click on the <b>OK</b> button.  Each item is added to the list of tests in the Testing window, on the selected <test-type> tab, as a standard, 'Not Run' test.	

Step	Action	See also
3	Edit the items to complete their definition as tests.	

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

### Learn more

- [Element Browser](#)

### Learning Center topics

- (Alt+F1) | **Enterprise Architect** | **Execution Analysis** | **Testing** | **Import from Responsibility**

## 17.2.7 Create Maintenance Item From Test

If an element fails a test, one likely consequence is that a Defect (Issue) item has to be raised in model maintenance to correct the problem. You can generate this Defect item directly from the test that failed.

**Access** **Select element | Element | Testing (Alt+3) > <test type tab> | right-click on test in list | Create a Maintenance Defect from this test** or  
**Select element | Element | Element Browser (Alt+9) > Testing folder | right-click on test | Create a Maintenance Defect from this test**

### Create a Maintenance item from a test

Step	Action	See also
1	The system immediately creates the Defect item and displays a confirmation message box.  Click on the <b>OK</b> button to clear the message.	
2	Open the Maintenance window ( <b>Element   Maintenance</b> ), which defaults to the Defects tab.  The tab shows a Defect item having the same name as the test. The <b>Description</b> , <b>Input</b> , <b>Acceptance Criteria</b> and <b>Results</b> texts from the test are all displayed in the defect Description tab under separate headings.	

Step	Action	See also
3	Complete the Defect item as necessary - you might provide values for the <b>Reported By</b> , <b>Status</b> and <b>Priority</b> fields.	<a href="#">Create Maintenance Items</a>  <small>2625</small>

#### Notes

- You can create Maintenance Defect items from several Test items at once; press and hold **(Shift)** as you select the Test items, and then right-click and proceed as above - **each** selected Test item then generates a Defect item

#### Learning Center topics

- (Alt+F1) | Enterprise Architect | Testing | Testing | Create Maintenance Items**

### 17.2.8 Show Test Script Compartments

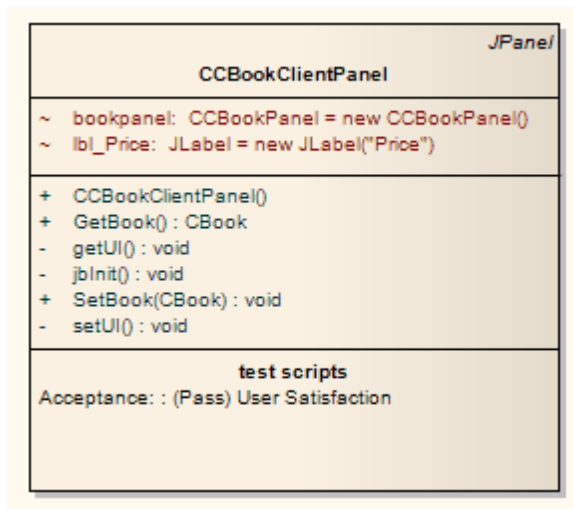

When you have created a Test record, it is useful to make the test **visible** on its parent **element**. You can do this by displaying the test within a Test Script **compartment** on the element as it **displays** in a diagram. Any element that is capable of displaying a compartment, and that has a test assigned to it, can show test scripts in a diagram.

#### Show the Test Scripts on an element in a diagram

Step	Action	See also
1	Open a diagram containing the element with the attached test items.	
2	Double-click on the diagram background to display the Diagram Properties dialog.  Click on the Elements tab.	
3	In the Show Compartments panel, select the <b>Testing</b> checkbox.	
4	Click on the <b>OK</b> button to save the setting.  Each test now appears as an item in the test scripts compartment of the diagram element.	

#### Example

#### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Testing | Testing | Show on Diagrams**

### 17.2.9 Test Documentation

After you have recorded a number of test scripts and results against elements in the model, you can output the information as a **report** in Rich Text Format, using the Generate Test Documentation dialog. You can configure which tests to **include or exclude** in the report, whether to include **child packages**, and the file location to which to generate the report.

Access    **Project Browser | right-click on package | Documentation | Testing Report**    or  
**Project | Documentation | Testing Report**

## 18 Maintenance

In the course of your team's work on a model changes and issues can arise at a number of levels, for problems that apply system-wide through areas of the model and down to within a specific element. A change, very broadly, defines an addition or alteration to a requirement, whilst an issue identifies either a failure to meet a requirement, or a risk in meeting the requirement.

There are two mechanisms that can be used to identify a change or issue, and the work required to resolve it:

- Change and Issue (or Defect) **elements** - structured comments that identify a problem at system-level, although they can also be attached to a specific element from which a problem arises; both types of element can be linked to one or more other elements that have to be reviewed, with relationships such as Association, Dependency and Realize, and for complex problems can also form hierarchies or groups
- Maintenance items - properties raised against a specific element, and recorded for that element in the Maintenance window; these provide a distinction between Defects (a failure to meet a requirement) and Issues (a risk factor that might affect satisfying the requirement) and also include Tasks, which record **work items** associated with the element

Maintenance items are very specific, but if an item begins to have a wider impact on other elements or the system in general, you can translate that item into a Change, Issue, or any other type of element that best identifies the problem and its solution

*Maintenance items* are defects, changes, issues and tasks that apply at the **model element level**. They are properties of individual model elements that can be used to record and capture problems, changes, issues and tasks as they arise, and document the solution and associated details.

### Maintenance Tasks

Task Area	Detail	See also
<b>Maintenance Items - Element-level</b>	<p>You create maintenance items in the <b>Maintenance window</b>, and using the <b>Item Details</b> dialog. Typically you create:</p> <ul style="list-style-type: none"> <li>• A <b>defect</b> to record a failure to meet a requirement for the current model element</li> <li>• A <b>change</b> to record a change in requirement for the current model element</li> <li>• An <b>issue</b> to record a risk factor that might affect the project being recorded for the current model element</li> <li>• A <b>task</b> to record work in progress and work outstanding for the current model element</li> </ul>	<a href="#">Working on Maintenance Items</a> <small>[2623]</small> <a href="#">Create Maintenance Items</a> <small>[2625]</small>
<b>Creating and Editing Maintenance</b>	<p>Tasks that you might perform when working with maintenance items include:</p> <ul style="list-style-type: none"> <li>• Moving or copying maintenance items between</li> </ul>	<a href="#">Move or Copy Maintenance Items</a> <small>[2628]</small>

## 18.1 Introduction to Maintenance

### Introduction to Maintenance

Topic	Detail	See also
<b>Maintenance Items</b>	<p><i>Maintenance</i> items are defects, changes, issues and tasks. They all apply to individual model elements and can be used to record and capture problems, changes, issues and tasks as they arise, and document the solution and associated details. They are defined as follows:</p> <ul style="list-style-type: none"> <li>• A <b>defect</b> can be considered as a failure to meet a requirement for the current model element</li> <li>• A <b>change</b> can be considered as a change in requirement for the current model element</li> <li>• An <b>issue</b> records a risk factor that might affect the project being recorded for the current model element</li> <li>• A <b>task</b> is a means of recording work in progress and work outstanding for the current model element</li> </ul> <p>Note that each of these maintenance items applies at the <b>model element level</b>. For changes, defects and issues that apply to the <b>whole system</b>, see the <i>Changes and Defects</i> topic; for tasks that apply to the whole system, see the <i>Project Tasks</i> topic.</p>	<p><a href="#">Changes and Issues</a> <sup>[2631]</sup></p> <p><a href="#">Project Tasks</a> <sup>[526]</sup></p>
<b>Creating and Editing Maintenance Items</b>	<p>The following topics explain how to create and edit Maintenance items:</p> <ul style="list-style-type: none"> <li>• <i>Working on Maintenance Items</i> - describes the Maintenance window</li> <li>• <i>Create Maintenance Items</i> - describes how to complete the Maintenance window tabs for the various maintenance items</li> <li>• <i>Move or Copy Maintenance Items</i> - describes how to move items between maintenance categories or generate items from an item in a different category</li> <li>• <i>Create Elements From Maintenance Items</i> - describes how to generate elements from maintenance items</li> <li>• <i>Show Maintenance Items in Diagram</i> - describes how to display maintenance items in elements on diagrams</li> <li>• <i>Insert Maintenance Feature</i> - describes how to add a maintenance item directly to an element via in-place editing</li> </ul>	<p><a href="#">Working on Maintenance Items</a> <sup>[2623]</sup></p> <p><a href="#">Create Maintenance Items</a> <sup>[2625]</sup></p> <p><a href="#">Move or Copy Maintenance Items</a> <sup>[2628]</sup></p> <p><a href="#">Create Elements From Maintenance Items</a> <sup>[2629]</sup></p> <p><a href="#">Show Maintenance Items in Diagram</a> <sup>[2630]</sup></p> <p><a href="#">Insert Maintenance Feature</a> <sup>[1042]</sup></p>

Learning Center topics

- (Alt+F1) | **Enterprise Architect | Maintenance**

## 18.2 Working on Maintenance Items

Creating, viewing and modifying the Maintenance items - changes, issues, defects and tasks - associated with a particular model element is quick and convenient, using the **Maintenance window** or **Workspace**. If the Maintenance window is open, when you select an element in a **diagram** or in the **Project Browser**, the Maintenance Items for that element are immediately listed in the window ready for modification or addition. The window provides several facilities for creating and managing the Maintenance items.

You can include the maintenance items in the document and web reports generated on your model. The Document Setup dialog has checkboxes to show or hide element maintenance items.

**Access**    **Element | Maintenance**    (Alt+4)

### Facilities

Facility	Detail	See also
<b>Window Formats</b>	<p>The Maintenance window has two formats - <b>Item</b> mode and <b>List</b> mode.</p> <ul style="list-style-type: none"> <li><b>Item</b> mode provides a list on the left hand side from which you select a maintenance item, the details of which then display in the fields in the rest of the window; you can edit these fields directly</li> <li><b>List</b> mode consists of a list of maintenance items with summary data distributed across the columns; you cannot directly edit these fields</li> </ul> <p>To toggle between the modes, click on the  (<b>Show/Hide Properties</b>) button in the window toolbar.</p> <p>When you first open the window, in either mode, the oldest maintenance item of the type is shown at the top of the list and, in Item mode, in the data fields.</p>	
<b>Adding New Items</b>	<p>To add new items, click on the <b>New</b> icon in the window toolbar. In:</p> <ul style="list-style-type: none"> <li>Item mode, this clears the fields for new data</li> <li>List mode, this displays the &lt;item type&gt; details for &lt;element type&gt; &lt;element name&gt; dialog, which you complete in the same way as the Maintenance window in Item mode</li> </ul> <p>The fields you complete for each <b>type</b> of maintenance item are almost identical.</p>	<a href="#">Create Maintenance Items</a> <sup>[2625]</sup>
<b>Applying Automatic Naming/ Numbering</b>	<p>On the Maintenance window in Item mode, or on the item details dialog, you can apply an automatic naming/numbering convention that you have previously defined, to each new item record. To do this, simply click on the <b>Auto</b> button next to the <b>Name</b> field.</p> <p>If you already have some text in the <b>Name</b> field, it is over-written by the auto-counter text.</p>	<a href="#">Set Auto Naming and Auto Counters</a> <sup>[904]</sup>

Facility	Detail	See also
<b>Maintenance Item Types</b>	<p>The four types of Maintenance Item you can create records for are each managed on a separate tab of the window:</p> <ul style="list-style-type: none"> <li>• <b>Defects</b> - each recording a failure to meet a requirement for the current model element</li> <li>• <b>Changes</b> - each recording a change in requirement for the current model element</li> <li>• <b>Issues</b> - each recording a risk factor that might affect the project, associated with the current model element</li> <li>• <b>Tasks</b> - each recording work in progress and work outstanding for the current model element</li> </ul> <p>The Maintenance window opens at the Defects tab by default.</p> <p>An asterisk on a tab indicates that the tab contains saved information; if there is no information for a type of item, or the information has not yet been <b>saved</b>, its tab has no asterisk.</p> <p>You toggle the display for each tab between Item mode and List mode independently.</p>	
<b>Element Browser</b>	<p>You can also use the Element Browser window to select and display specific items on the Maintenance window; click on the  icon in the Maintenance window toolbar to display the Element Browser, open the <i>Maintenance</i> folder and select the required item.</p> <p>In the folder, the 'page' icon against each item contains a:</p> <ul style="list-style-type: none"> <li>• <b>C</b> for Change items</li> <li>• <b>D</b> for Defect items</li> <li>• <b>T</b> for Task items, or</li> <li>• <b>I</b> for Issue items</li> </ul>	<a href="#">Element Browser</a> <sup>[989]</sup>

**Notes**

- Columns in the item list can be reorganized, added, removed, grouped, filtered and sorted using the options provided in the **List Header** facilities

**Learn more**

- [List Header](#)<sup>[677]</sup>

## 18.3 Create Maintenance Items

When you need to create or edit a maintenance record on an element on a diagram or in the Project Browser, for any of the four types of item, you can do so using either the Maintenance window in **Item** mode, or the <item type> Details for <element type> <element name> dialog. The Item Details dialog displays when you select the **New** option or double-click on an entry on the Maintenance window in **List** mode.

Whichever type of item you are recording, and whichever dialog you use, you complete effectively the same fields.

**Access** **Select element | Element | Maintenance (Alt+4) > <item type tab> > Item mode: New toolbar icon** or  
**Select element | Element | Maintenance (Alt+4) > <item type tab> > List mode (:Show/Hide Properties if necessary): New toolbar icon**

### Create maintenance items

Field/Button	Usage	See also
<b>Name</b>	Type the name or a short description of the defect, change, task or defect.	
<b>Auto</b>	As an alternative to typing in the name, click on this button to insert predefined auto-counter text.  If you already have some text in the <b>Name</b> field, it is over-written by the auto-counter text.	<a href="#">Set Auto Naming and Auto Counters</a> [904]
<b>Reported by Requested Raised by</b>	Click on the drop-down arrow and select the user name of the person who initiated the maintenance item.	
<b>Date</b>	Defaults to today's date as the date on which the maintenance item was raised; if necessary, change this by clicking on the drop-down arrow and selecting a different date.	
<b>Status</b>	Click on the drop-down arrow and select the appropriate status of the maintenance item, such as <b>New</b> or <b>Complete</b> .	
<b>Resolved by Implemented by Completed by</b>	Click on the drop-down arrow and select the user name of the person who completed and closed the maintenance item.	
<b>Date Resolved Date Date Completed</b>	Defaults to today's date as the date on which the maintenance item was completed; click on the checkbox to select today's date or, if necessary, change the field by clicking on the drop-down arrow and selecting a different date.	

Field/Button	Usage	See also
<b>Priority</b>	Click on the drop-down arrow and select the priority for completing the maintenance item.	
<b>Version</b>	Type the version number associated with this defect, change, issue or task.	
<b>Description</b>	Type a longer description of the maintenance item; you can format the text using the Notes toolbar at the top of the field.  This text is also reflected in the Notes window, but cannot be edited there.	<a href="#">Notes Toolbar</a> 
<b>History</b>	Enter any notes or references to previous occurrences of this maintenance item; you can format the text using the Notes toolbar at the top of the field.  This text is also reflected in the Notes window, but cannot be edited there.	
<b>New</b>	Click on this button to clear the fields ready to create a new maintenance item.	
<b>OK</b>	Click on this button to save the record data and close the dialog.	
<b>Close</b>	Click on this button to close the dialog without saving the record.	
<b>Apply</b>	Click on this button to save the record without clearing the data fields or closing the dialog.	

### Notes

- To edit an item, right-click on it on the Maintenance window and select the **Modify Selected** option; the Item Details dialog displays with the values for the selected item in the fields, and you can change those values
- To delete an item, right-click on it on the Maintenance window and click on the **Delete** icon in the window toolbar; in response to the confirmation prompt, click on the **Yes** button
- A further possibility for editing and deleting items is to right-click on items in the Element Browser and select menu options there; to access an item through the Element Browser, click on the  icon in the Maintenance window toolbar and click on the required item in the *Maintenance* folder in the Element Browser window
- To change the **element** for which to create or edit maintenance items, click on the new element in the Project Browser

## 18.4 Move or Copy Maintenance Items

After you define a maintenance item of one type (Defect, Change, Issue or Task), you might decide that the item either is better suited to another type or forms a good template for items of other types. If so, you can either **move** or **copy** the item to the other types.

**Access** **Select element | Element | Maintenance (Alt+4) > <item type tab> | right-click on item in list to move/copy** or  
**Select element | Element | Element Browser (Alt+9) > Maintenance folder | right-click on item to move/copy**

### Move or copy a maintenance item

Step	Action	See also
1	Click on the appropriate option - <b>Move to</b> or <b>Copy to</b> . A list of maintenance item types displays.	
2	Click on the item type to which to move or copy the item. A confirmatory prompt displays.	
3	Click on the <b>Yes</b> button to confirm the move or copy.	
4	Click on the target tab of the Maintenance window to ensure that the item has been added, and make any necessary changes.	<a href="#">Create Maintenance Items</a> 
5	If you are copying the item to more than one other item type, repeat steps 1 to 4 for the next item type to copy to.	

### Learn more

- [Working on Maintenance Items](#) 

## 18.5 Create Elements From Maintenance Item

A maintenance item identifies a defect, change, issue or task concerning an element. The maintenance item could **itself** be represented by an **element** if it has wider implications for the project or identifies - for example - an actor, activity or action that requires further definition.

You can create one or more elements from any maintenance item, using the Maintenance window. The new element is connected to the maintenance item's **parent element** by a Dependency connector. The item itself remains unchanged as a characteristic of its parent element.

**Access** **Element | Maintenance (Alt+4) | <Item Type tab> | right-click item in list | Create as New Element**

### Create an element from a maintenance item

Step	Action	See also
1	<p>On the New Element dialog, complete the fields (follow the link on the right).</p> <p>In the <b>Type</b> field, you select the <b>required element</b> type; you might create:</p> <ul style="list-style-type: none"><li>• An Issue element for a Defect or Issue maintenance item</li><li>• A Change element for a Change item, or</li><li>• An Action for a Task item</li></ul> <p>You can, however, create a wide range of <b>other</b> element types should any of these be more appropriate.</p> <p>When you click on the <b>Create</b> button, the new element is added to the Project Browser. You can drag and drop it onto a diagram from there.</p>	<a href="#">Add Elements Directly To a Package</a> <sup>[903]</sup>

### Learn more

- [Working on Maintenance Items](#)<sup>[2623]</sup>

### Learning Center topics

- (Alt+F1) | **Enterprise Architect | Maintenance | Element from Item**

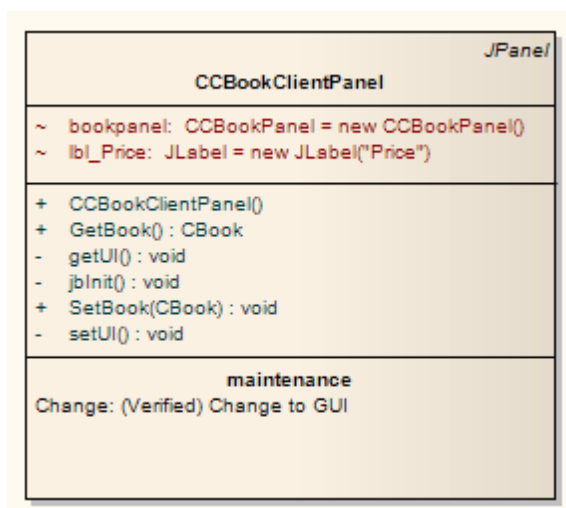

## 18.6 Show Maintenance Items in Diagram

When you have created a maintenance item, it is useful to make the record **visible** on its parent element. You can do this by displaying the record within a maintenance **compartment** on the **element** as it displays in a diagram. Any element that is capable of displaying a compartment, and that has maintenance items assigned to it, can show the items in a diagram.

### Show maintenance items in a diagram

Step	Action	See also
1	Open a diagram containing the element with the attached maintenance items.	
2	Double-click on the diagram background to display the Diagram Properties dialog. Click on the Elements tab.	
3	In the Show Compartments panel, select the <b>Maintenance</b> checkbox.	
4	Click on the <b>OK</b> button to save the setting.  Each maintenance item now appears in the maintenance compartment of the diagram element.	

### Maintenance Compartment - Example

### Learn more

- [Working on Maintenance Items](#) <sup>2623</sup>

## 18.7 Changes and Issues

If your work in managing a project identifies issues, defects or required changes in the **model** rather than internal to a single element, you can represent these using Change or Issue (Defect) elements as structured comments with which you can track and manage the problems.

- A **Change** element corresponds to a **change in requirements** for the current system
- An **Issue** element corresponds to a **failure to match** the requirements for the current system

You can also define any specific work to be done in researching or resolving the problem using **Task** elements, and assign **resources** to these or directly to the Change or Issue elements internally, in Resource Allocation, or externally as Actors.

The use of maintenance **elements** provides a broad scope for managing changes and issues, providing the facility to fully define the issue and its resolution with linked documents, both internal and external Notes, and composite structure diagrams including Interaction and Activity diagrams.

You can create Change and Issue elements in various UML diagrams (especially **Maintenance diagrams**) and connect them using Realization, Dependency, Aggregation and other relationships to show what model elements each issue affects and how each is resolved. Within the element Properties dialog for Changes and Issues you can identify the issue as the element name and record relevant management details, such as owner and dates.

A useful tool in managing issues and changes is the Relationship Matrix, in which you might - for example - link staff (Actors) through Realization connectors to Issues. Each highlighted square in the Matrix indicates the responsibility of a staff member to work on or correct a named Issue

- [Issues \(Defects\)](#) <sup>[2631]</sup>
- [Task](#) <sup>[2010]</sup>
- [Maintenance Diagram](#) <sup>[2634]</sup>
- [Relationship Matrix](#) <sup>[727]</sup>
- [Resource Allocation](#) <sup>[512]</sup>

### 18.7.1 Issues (Defects)

In your modeling issues concerning, or defects in, the development of the system or model might arise; more formally, you encounter a failure to meet defined requirements for the current system. You can represent this failure using an **Issue (or Defect)** element, which is a structured comment containing information about the issue and the measures taken to manage it. The element is rendered as shown.

You can link Issues to model elements that are responsible for the defect, using *Realize* connectors. You can also create a hierarchy of related Issues using *Aggregation* connectors. Each Issue element has a status band at the left end, which is color coded to visually represent the value of the **Status** field in the element properties. The element has an identifying **I** in the top right corner, which you can hide if you prefer not to show it.

You can create Issue elements on most types of diagram, although the Maintenance diagram is specifically designed for displaying and managing them. You can also create your own issue-management diagram as a Custom diagram. You can add the Issue (and other) elements to the diagram from the Diagram Toolbox, or directly to a package in the Project Browser.

#### Add an Issue to the model using the Toolbox

Step	Action	See also
1	Open the Maintenance or Custom (or other) diagram to depict the problem.	
2	From the Custom pages or Common page of the Diagram Toolbox, drag the <b>Issue</b> icon onto the diagram.	<a href="#">Custom Toolbox</a> <sup>[813]</sup> <a href="#">Common Page</a> <sup>[800]</sup>
3	If the Properties dialog does not automatically display, double-click on the element. Record the name and details of the Issue, in the Properties dialog.	<a href="#">Properties Dialog</a> <sup>[956]</sup> <a href="#">Create Maintenance Items</a> <sup>[2625]</sup>

#### Add an Issue to the model using the New Element dialog

Step	Action	See also
1	Identify the package in which to record the Issue, in the Project Browser.  Right-click on this package and select the <b>Insert   New Element</b> context menu option.	
2	Complete the fields on the New Element dialog - in the <b>Type</b> field, click on the drop-down arrow and select <b>Issue</b> .	<a href="#">Add Elements Directly To Packages</a> <sup>[903]</sup>
3	When you have created the element, double-click on it. Record the name and details of the Issue, in the Properties dialog.	<a href="#">Properties Dialog</a> <sup>[956]</sup> <a href="#">Create Maintenance Items</a> <sup>[2625]</sup>

#### Notes

- To toggle display of the letter I in the top right corner of the element, select or deselect the **Show**

**stereotype icon for requirements** checkbox on the Options dialog, Objects page

## 18.7.2 Changes

In your modeling it might become necessary to change an aspect of the system or model; more formally, you need to request and manage a change in the defined requirements for the current system. You can represent this change request using a **Change** element, which is a structured comment containing information about the change and the measures taken to manage it. The element is rendered as shown.

You can link Changes to model elements that are impacted by the change, using *Realize* connectors. You can also create a hierarchy of related Changes using *Aggregation* connectors. Each Change element has a status band at the left end, which is color coded to visually represent the value of the **Status** field in the element properties. The element has an identifying **C** in the top right corner, which you can hide if you prefer not to show it.

You can create Change elements on most types of diagram, although the Maintenance diagram is specifically designed for displaying and managing them. You can also create your own change-management diagram as a Custom diagram. You can add the Change (and other) elements to the diagram from the Diagram Toolbox, or directly to a package in the Project Browser.

#### Add a Change to the model using the Toolbox

Step	Action	See also
1	Open the Maintenance or Custom (or other) diagram to depict the problem.	
2	From the Custom pages or Common page of the Diagram Toolbox, drag the <b>Change</b> icon onto the diagram.	<a href="#">Custom Toolbox</a> <sup>[813]</sup> <a href="#">Common Page</a> <sup>[800]</sup>
3	If the Properties dialog does not automatically display, double-click on the element. Record the name and details of the Change, in the Properties dialog.	<a href="#">Properties Dialog</a> <sup>[956]</sup> <a href="#">Create Maintenance Items</a> <sup>[2625]</sup>

**Add a Change to the model using the New Element dialog**

Step	Action	See also
1	Identify the package in which to record the change, in the Project Browser.  Right-click on this package and select the <b>Insert   New Element</b> context menu option.	
2	Complete the fields on the New Element dialog - in the <b>Type</b> field, click on the drop-down arrow and select <b>Change</b> .	<a href="#">Add Elements Directly To Packages</a> <sup>[903]</sup>
3	When you have created the element, double-click on it. Record the name and details of the Change, in the Properties dialog.	<a href="#">Properties Dialog</a> <sup>[956]</sup>  <a href="#">Create Maintenance Items</a> <sup>[2625]</sup>

**Notes**

- To toggle display of the letter **C** in the top right corner of the element, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page

**18.7.3 Maintenance Diagram**

A Maintenance diagram is a type of Custom diagram, an extension to the UML model. It is a change management tool, used to record:

- Requests for change to the model structure or project process, as **Change** elements
- Issues that impact the development and progress of the project, as **Issue** elements, and
- Groups of tests that can be applied to many elements rather than specific elements, as **Test Cases**

Each Change, Issue or Test Case element can link to other model elements in the project, to illustrate how they contribute to or are impacted by the item, and how they must be modified, removed, applied or extended to provide a solution. This includes identifying areas of work, represented by Task elements, to which resources can be allocated as either external (Actor) elements or internal properties (resource allocation).

**Example Diagram** [Example Maintenance Diagram](#) <sup>[2635]</sup>

## Tools

Select Maintenance diagram elements and connectors from the Maintenance pages of the Toolbox. For further information on a type of element or connector, click on the corresponding icon.

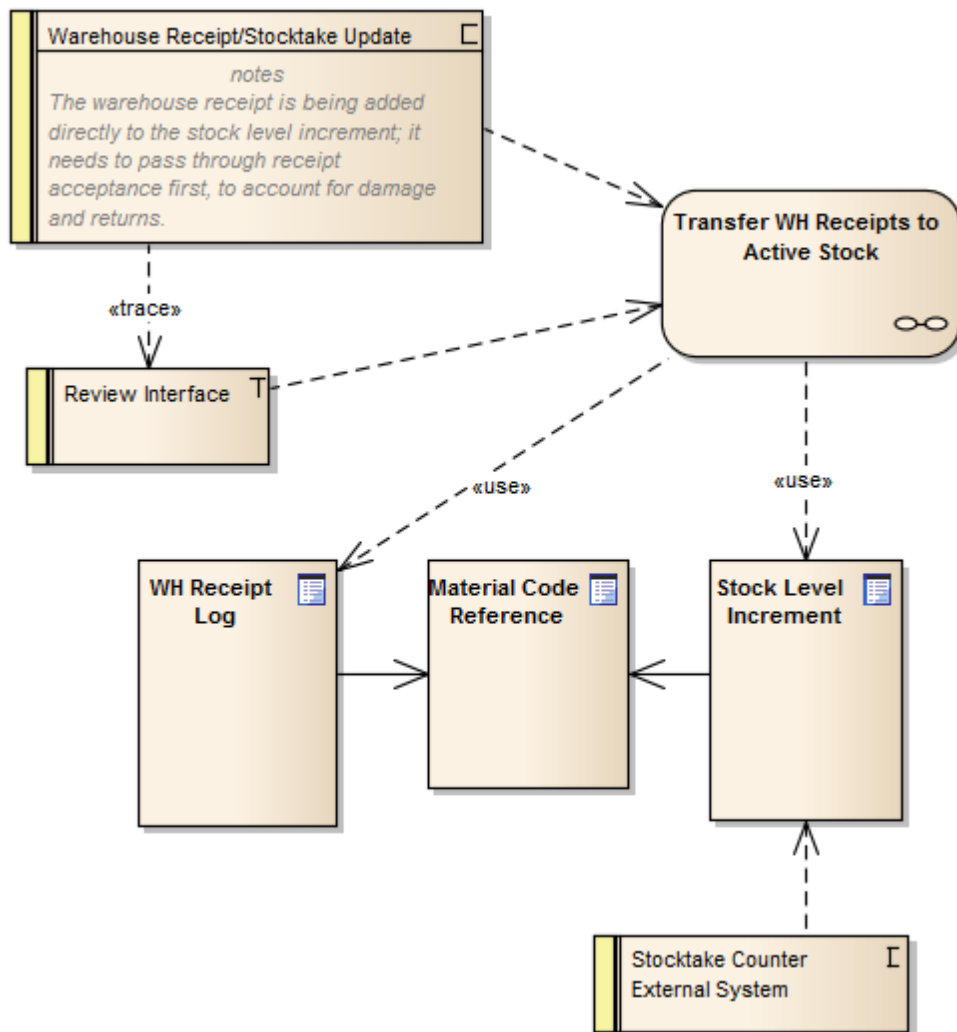

Maintenance Diagram Elements	Maintenance Diagram Connectors
 Package	 Aggregate

### 18.7.3.1 Example Maintenance Diagram

Very simply, this example diagram depicts a request for a change (C) to a process represented by an Activity element (Transfer WH Receipts to Active Stock). The change currently involves the Task (T) of reviewing the interface between two recording systems, one of which could be affected by an Issue (I) concerning an external stocktaking system.

## 19 Reporting

As you develop your models in Enterprise Architect, you will want to report on, review and disseminate information on a number of aspects of the model through both online and printed documentation. Enterprise Architect provides a powerful mechanism for generating high quality, customized documentation directly from the model, in document format or web page format.

### Report Generation Facilities

Facility	Detail	See also
<b>Specifying Content</b>	<p>There are many ways to specify the model content being documented; you can:</p> <ul style="list-style-type: none"> <li>Document a Package and/or its child Packages by manually highlighting the Package and selecting a documentation control</li> <li>Specify embedded Packages for <b>exclusion</b> if child Packages are recursively documented</li> <li>Generate your documentation using a range of <b>system-provided templates</b> that support many different aspects of your model, or develop your own, <b>customized templates</b> to meet your specific requirements</li> <li>Use system-provided or user-customized Stylesheets, Tables of Contents and Cover Pages to further tailor individual reports or sets of reports, independent of the template used</li> <li>Link a Package to a document template to simplify generating consistent types of documentation (for example, Use Case reports) using the <b>Resource Documents</b> feature</li> <li>Select, group and order packages in a different organization from the Project Browser by creating <b>'Virtual' Documents</b>, either linked through a master document with headers, footers and contents list, or as separate individual documents</li> </ul>	<p><a href="#">Generate Documents</a> <small>[2642]</small></p> <p><a href="#">Exclude Package From Report</a> <small>[2761]</small></p> <p><a href="#">Document Templates</a> <small>[2681]</small></p> <p><a href="#">Generate Documentation</a> <small>[2644]</small></p> <p><a href="#">Save As Document</a> <small>[2728]</small></p> <p><a href="#">Virtual Documents</a> <small>[2669]</small></p>
<b>Document Reports</b>	<p>You can generate Document reports in a number of document formats, which you can tailor using templates and Stylesheets to alter the content and appearance of the generated output.</p> <p>Enterprise Architect has a fully-featured document generator that features:</p> <ul style="list-style-type: none"> <li>Powerful WYSIWYG template editor support</li> <li>An easy-to-use document generator</li> </ul>	<p><a href="#">Document Reports</a> <small>[2640]</small></p> <p><a href="#">Generate Documents</a> <small>[2642]</small></p> <p><a href="#">Design Custom Document Templates</a> <small>[2684]</small></p>

Facility	Detail	See also
	<ul style="list-style-type: none"> <li>An embedded viewer that enables you to view documents generated within the system</li> </ul> <p>Using Virtual Documents, you can draw out information on structurally separate model elements in a set of individual reports, or in a combined report under a <b>master document</b> with common headers, footers and styles.</p>	<a href="#">Virtual Documents</a>  <sup>[2669]</sup>
<b>System Reports</b>	You can also generate a number of system-provided reports on different aspects of your model, such as the elements in a package in Implementation relationships or in Dependency relationships.	<a href="#">System Documents</a>  <sup>[2736]</sup>
<b>Web Documentation</b>	<p>It is possible to provide automated web-based publishing of your Enterprise Architect models, making it simple to explore large models efficiently on-line.</p> <p>You can export an entire model or a single branch of the model to Web pages, and also create web style templates to customize the web page output.</p>	<a href="#">Web Reports</a>  <sup>[2744]</sup>
<b>Charts</b>	You can capture statistical information on a range of element properties across the model, and display this information on a diagram in one of several formats, such as a pie chart, bar chart or 3-D column chart. You can also print and distribute the charts you have created, using the standard Diagrams Only Report facility.	<a href="#">Charts</a>  <sup>[2762]</sup> <a href="#">Diagrams Only Report</a>  <sup>[2741]</sup>

## 19.1 Document Reports

If you want to produce immediate, screen-viewable or printable reports on the contents of your model, you can generate documents in a number of formats, on selected Packages or elements. You have the options of:

- Generating one of a set of system-provided reports on specific aspects of your model
- Generating a report from a system-provided template, with control of the report output through Stylesheets, add-in cover pages and tables of contents, filters and a wide range of dialog options
- Creating your own templates, Stylesheets and add-in pages from which to generate reports, applying an even greater degree of control over the contents and format of the output

The document formats are common to many word processors, so you can also work on the reports in other word-processing tools to, for example, integrate the report into a larger, externally-created document.

### Documentation Solutions

Feature	Detail	See also
<b>Document Generation</b>	<p>The Document Generator features:</p> <ul style="list-style-type: none"> <li>• A powerful WYSIWYG Document editor that you can use to: <ul style="list-style-type: none"> <li>• Import and export document templates using XML</li> <li>• Customize copies of the basic, system-provided templates</li> <li>• Create entirely new templates of your own design</li> <li>• Test templates as you design them, by generating ad-hoc reports within the designer</li> <li>• Create and customize independent Stylesheets, Tables of Contents and Cover Sheets to apply to any of your reports</li> </ul> </li> <li>• A documentation generator that: <ul style="list-style-type: none"> <li>• Provides a wide range of simple options for filtering and modifying the report output</li> <li>• Generates detailed and comprehensive documents based on the templates</li> <li>• Has an embedded viewer for reading the generated documents directly within Enterprise Architect</li> </ul> </li> </ul> <p>A tutorial on using the Document Generator and creating document reports is available on the Sparx Systems website.</p>	<p><a href="#">Design Custom Document Templates</a>  <sup>2684</sup></p> <p><a href="#">Document Templates</a>  <sup>2681</sup></p> <p><a href="#">Generate Documents</a>  <sup>2642</sup></p> <p><a href="http://www.sparxsystems.com/resources/whitepapers/">http://www.sparxsystems.com/resources/whitepapers/</a></p>
<b>Virtual Documents</b>	<p>If you want to create very focussed and specific documents, with a greater complexity and presenting different views of your model data, you can do so using <b>virtual documents</b>. For these, you set up a Master Document (package) element and/or Model Document elements, and link packages or model searches (for elements) into the document in whatever order or combination is</p>	<p><a href="#">Virtual Documents</a>  <sup>2669</sup></p>

Feature	Detail	See also
	<p>most appropriate to your requirements.</p> <p>You can select packages from different areas of the model, arrange them in any order, and edit or delete the packages; the virtual document automatically incorporates the changes each time you generate it.</p>	
<b>Word Master Documents</b>	<p>As an alternative to virtual documents, you can link a number of document reports into a single Word <b>master document</b>. This is quite possible with the current report generator but is of greater use with the original, Legacy RTF Report Generator.</p> <p>Typically you create a Word master document, then in Enterprise Architect generate some reports that you link back into sub-sections of the master document and refresh as required during project development. In this way the project document becomes an easily-managed and feature-rich work product.</p> <p>You can also populate a Word document from specific sections of reports, based on <b>bookmarks</b> - for example, a Word document might have a section for a small part of your component model; using bookmarks you can generate a full component model, and then link into just one section of the report.</p> <p>This way you can maintain a complex Word document from parts of Enterprise Architect reports; the Document Generator performs one pass for one template, but using a Word master document and Enterprise Architect bookmarks you can incorporate material from several documents with different formats based on different templates.</p> <p>By adding tables of contents, figure tables, sections, and headers and footers, you can manage a complex document with relative ease; simply update the Enterprise Architect reports then refresh the links in MS Word.</p>	<p><a href="#">Using MS Word</a>  <sup>2729</sup></p> <p><a href="#">Document Bookmarks</a>  <sup>2730</sup></p>

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Documents** permission to generate document reports
- You can have several reports open at the same time, as separate **tabs** in the central view area of the Enterprise Architect work area; you can also close the reports individually or all together, leaving views of other types (such as diagrams or code editors) still open

## 19.1.1 Generate Document Reports

When you want to generate a document report on part of your model, you have a number of options for selecting the **object** to document, and for defining how your document is to be generated.

A document report describes an **element** or, more usually, a **Package** in the model; therefore, your first step is to select the Package or element to generate the document for, from the:

- Project Browser
- Diagram
- Package Browser
- Specification Manager
- Diagram List or
- Model Search

For a Package, you can also define how any **diagrams** in the Package are to be set out in the document; you do this in the **Diagram Properties dialog** for each diagram. When you have prepared and selected your Package, you open the Generate Documentation dialog and configure the parameters for generating the document.

A tutorial for quickly creating a basic document from the Example model is provided in the second of these two tables. Repeat the tutorial with different selections in the drop-down fields, to see what the system can generate for you automatically.

**Access**    **Project Browser package:** ( F8 ) or  
**Diagram element:** ( F8 )

### Generating reports

Option	Detail	See also
<b>Alternative ways to open the Generate Documentation dialog</b>	<p>Use one of the following methods:</p> <ul style="list-style-type: none"> <li>• Click on a Package, then select the <b>Project   Documentation   Generate Documentation (RTF/PDF)</b> menu option</li> <li>• Right-click on the Package and select the <b>Documentation   Rich Text Format (RTF) Report</b> context menu option</li> <li>• In a diagram, click on a specific element and select the <b>Element   Advanced   Rich Text Format (RTF) Report</b> menu option</li> <li>• In the Specification Manager, click on the Reporting icon drop-down arrow and select the <b>Generate Documentation (RTF/PDF)</b> menu option</li> <li>• In the Diagram List, Package Browser or Model Search, select one or more items, right-click and, from the context menu, select either the <b>Documentation   RTF report for</b></li> </ul>	<a href="#">Generate Documentation</a> <small>2644</small>

Option	Detail	See also
	<b>each selected Item</b> option or the <b>Documentation   RTF report on selected Items</b>	
<b>Generate report on elements from Package Browser or Model Search</b>	<p>When you select to create a report from the Diagram List, Package Browser or Model Search tools, you can generate an element-level report rather than a Package-level report, and you have additional flexibility in selecting:</p> <ul style="list-style-type: none"> <li>• The type of element to report on</li> <li>• The specific elements to report on, together or separately, whether in the same Package or not</li> </ul> <p>For example, you might want to find all elements with test cases, with the intention of reporting on some or possibly all such elements; with the Diagram List or Package Browser, you would identify these elements yourself within the list of all elements in a selected diagram or package, but with the Model Search you can automatically pick out the elements across a section of the model or across the whole model, as required.</p> <p>The search filtering could be for specific test cases; however, the results are by element so if there are test cases outside the range in any element that has a filtered test, these elements are listed as well.</p> <p>Having generated the list of elements, you can select individual elements, blocks of elements, or all elements from it and then use the context menu to generate one report on all of the selected elements, or a separate report on each element.</p>	<a href="#">Diagram List</a> <sup>[684]</sup> <a href="#">Package Browser</a> <sup>[673]</sup> <a href="#">Model Search</a> <sup>[700]</sup>

#### Generate and view an example report immediately

Step	Action	See also
1	Open the <i>EAExample</i> project.	
2	In the Project Browser, expand the <i>Testing</i> View and right-click on the <b>Testing</b> Package.	
3	Select the <b>Documentation   Rich Text Format (RTF) Report</b> context menu option. The Generate Documentation dialog displays.	
4	In the <b>Output to file</b> field, click on the ( ... ) button and browse for a convenient file location in which to hold the generated report.	
5	In the <b>Template</b> field, click on the drop-down arrow and select <b>Basic Report</b> .	

6	In the <b>Table of Contents</b> field, click on the drop-down arrow and select <b>TOC (portrait)</b> .	
7	In the <b>Stylesheet</b> field, click on the drop-down arrow and select <b>Styles - Print Medium</b> .	
8	In the <b>Cover Page</b> field, click on the drop-down arrow and select <b>Cover Page (portrait)</b> .	
9	In the <b>Output Format</b> field, click on the drop-down arrow and select <b>Portable Document Format (PDF)</b> .	
10	Click on the <b>Generate</b> button.	
11	When the report has been generated, click on the <b>View</b> button and examine the report.	

#### Notes

- Reports can be configured to include all Packages within a parent Package, or just the top level

### **19.1.1.1 Generate Documentation**

It is possible to specify a wide range of parameters to control how your document report is generated and output. You can specify, for example, where the document file is written to, what format it is generated in, and what elements are included in the document. You set these options on the Generate Documentation dialog, on which the options are provided on a number of tabs.

The first, and default, tab is the Generate tab, on which you define how and where the document is generated. After you have set options on any or all of the other tabs, you return to the Generate tab and click on the **Generate** button to produce your document.

**Access** **Project Browser package: ( F8 ) > Generate** or  
**Diagram element ( F8 ) > Generate**

#### Set Report Generation Options

Option	Action	See also
<b>Model Document</b>  <b>Root Element</b> <b>Root Package</b>	<p>Check the name of the element selected from the Project Browser, diagram, Diagram List, Specification Manager or Model Search.</p> <p>If this is the specially-created Model Document element for a virtual document, the field is <b>Model Document</b>.</p> <p>Otherwise, this field identifies the selected element of the hierarchy to be reported on; that is, the <b>Root Element</b> or <b>Root Package</b>.</p>	<a href="#">Virtual Document</a>  <sup>[2669]</sup>

### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | Rich Text Reports | Generate an RTF Report**

#### **19.1.1.1.1 Selecting a Template**

You use **report templates** to generate reports on your model that present specific information in a particular format, and to help you generate those reports repeatedly and consistently. You can select from a range of **system templates** on the Document Generator, to immediately generate reports from your model, or you can select **custom templates** designed by your project team members specifically for the purposes of your project.

A template principally defines the **type of content** of the report, so that if you generate a report, say, on a Package you will extract and present information on a specific set of structures such as:

- the elements and their features and connectors, or
- the elements at the top of the Package hierarchy, or
- all elements in the Package, or
- all elements in the diagrams whether they are in that Package or from other Packages

A template also presents the report information in a specific **format and style**, initially based on a set of **standard** styles. Your report designers can **redefine** the styles in a custom **template** to whatever extent they need, but it is better to select the alternative styles from a **Stylesheet** so that **you** can choose to apply that set of styles to a report or not, independent of which template you are using, as you need.

The initial range of system templates and Stylesheets give you a great deal of flexibility in quickly and easily determining the content and presentation of the reports you want to generate, and you can further increase this flexibility with additional templates and Stylesheets developed in-house, customized to the requirements of your organization.

### Learn more

- [Custom Document Templates](#) <sup>[2681]</sup>
- [Selecting a Stylesheet](#) <sup>[2653]</sup>

#### **19.1.1.1.1.1 System Document Templates**

When you **generate reports** on your model, you select one of the report **templates** to extract information on specific key aspects of your model. There are several **system templates** available to use, either to generate a report straight away or to copy and customize to suit your own requirements. Each of the system templates supports a specific aspect of modeling or model management.

You usually generate reports on **Packages** selected from the Project Browser; these can be used to produce great hierarchical reports on parts of your model, or the whole model if you wish. There are also system templates for reporting the **diagrams** in a Package, and you can use the system templates to report on **elements** returned in search results - such reports are non-hierarchical, as they extract specific information from different areas of the model.

**Access** **Tools | Document Template Designer** (for review/copying)  
**Project Browser Object: ( F8 ) > General** (to select to generate a report)

#### Available Predefined Templates

- Basic Report
- Basic + Audit Report
- Data Model Specification
- Diagram Report
- Effort, Metrics & Risk Report
- Interaction Messages Report
- Maintenance Report
- Model Document - Master Template
- Project Glossary
- Project Issues
- Project Resources Report
- Software Requirement Specification
- Software Requirements Specification (Relationships)
- Task Allocation
- Test Specification
- Use Case Scenarios Specification
- Use Case Specification

#### Basic Template Variations

Template	Description	See also
<b>Basic</b>	The most generalized template, which includes all of the commonly used Sections and fields. It is more appropriate in its use of field names to UML Classes.  This template provides table formatting for most of the <b>Elements</b> sub-groups, such as Scenarios, Constraints, Attributes and Operations.	<a href="#">Setting Sections for Reporting</a> <sup>[2688]</sup>
<b>Basic + Audit</b>	A variation of the Basic template that incorporates information from the latest Audit runs.	<a href="#">Auditing</a> <sup>[446]</sup>
<b>Data Model Specification</b>	Used for reporting on Physical database models of any of the three types - UML DDL, Information Engineering and IDEF1X.	<a href="#">Physical Data Model</a> <sup>[2335]</sup>

Template	Description	See also
	With data modeling, a Class represents a table and its Attributes represent table fields. In the Data Model template, the section and field names are selected to represent the Tables, Columns (fields) and specific Column attributes.	
<b>Interaction Messages Report</b>	Used for generating documentation on Sequence diagrams and other Interaction diagrams. It represents connectors specifically as Messages, as well as listing the message sequence details (which are not included in the Basic template).	<a href="#">Sequence Diagram</a>  <sup>1249</sup>
<b>Diagram Report</b>	Extracts information on the diagrams for a package. It is primarily used for outputting diagram graphics and titles.  A common use of this template is where diagrams linked into an external Word master document (where virtual documents are not being used) are to be refreshed. Using the bookmarks generated with the documents, you can refresh the master document diagrams.	<a href="#">Diagrams</a>  <sup>778</sup>  <a href="#">Document Bookmarks</a>  <sup>2730</sup>

#### Sub-Element Details

Template	Description	See also
<b>Maintenance Report</b>	Extracts the <i>Element   Change</i> , <i>Element   Defect</i> and <i>Element   Issue</i> details for all elements in a selected package. This is the information defined on the Maintenance window.	<a href="#">Working on Maintenance Items</a>  <sup>2623</sup>
<b>Test Specification</b>	Extracts the <i>Element   Test</i> details for all elements in a selected package, as defined on the Testing window, and the test data generated by xUnit testing and Testpoint code testing.	<a href="#">Working on Test Records</a>  <sup>2602</sup> <a href="#">Record Test Results</a>  <sup>2575</sup> <a href="#">The Testpoints Window</a>  <sup>2578</sup>
<b>Effort, Metrics and Risk Report</b>	Extracts the efforts, metrics and risks associated with the elements in a selected package. It is useful in getting details for analyzing the time/costing on projects.  This reflects the information defined on the Project Management window.	<a href="#">Use Case Estimation</a>  <sup>584</sup> <a href="#">Project Estimation Using Use Case Metrics</a> <a href="#">The Project Management Window</a>  <sup>510</sup>
<b>Task Allocation</b>	Reports the assignment of tasks to people (Authors and Resources).	<a href="#">Resource Allocation</a>  <sup>512</sup>

Template	Description	See also
	The template extracts the details defined in the Resource Allocation tab of the Project Management window, and any Gantt chart assignment of resources to a package or elements. It principally reports the <i>Element / Resource</i> section.	

### Project Specific

Template	Description	See also
<b>Project Glossary</b>	Extracts the Glossary terms and their types, defined in the Project Glossary.  This is commonly used in Virtual documents for appending the Glossary to a larger document.	<a href="#">Project Glossary</a> <sup>[533]</sup> <a href="#">Virtual Documents</a> <sup>[2665]</sup>
<b>Project Issues</b>	Extracts information on the set of issues that are logged globally in the repository.  To report on the <b>non-global</b> , element-specific issues, see the <i>Element / Issue</i> section in the Basic template.	<a href="#">Project Issues</a> <sup>[528]</sup>

### Virtual Document

Template	Description	See also
<b>Model Document Master</b>	Model Document templates are used when creating 'virtual documents'. The Master template provides the common features for a series of documents generated from other templates.  Virtual documents do not have to have a Master Document – a single model document template can provide the basis for a generated document. This allows Package details (such as <i>Package / Package Element / Tagged Value</i> ) to be defined in Model Documents; these sections are not available in Master Documents.	<a href="#">Create Master Document</a> <sup>[2672]</sup> <a href="#">Create Model Document</a> <sup>[2673]</sup>
<b>Model Document Basic</b>		
<b>Model Document Data Model</b>	If you do use a Master template, set any Table of Contents you require in the first <b>Model Document</b> template, to ensure that a Header text is available to create a TOC. A Master document often does not have Header text and hence a TOC cannot be created.	

### Use Case/Requirements

Template	Description	See also
<b>Software Requirements Specification</b>	<p>Extracts information on external requirement elements associated with other elements (often Use Cases). The specific report section <i>Element   External Requirements</i> is selected in the template.</p> <p>To extract information on each element's <b>internal</b> requirements (responsibilities), you would select the <i>Element   Requirements</i> section, as in the Basic template.</p>	<a href="#">Requirements</a>  <a href="#">Dependency Report</a>  <a href="#">Implementation Report</a>  <a href="#">Internal Requirements</a> 
<b>Use Case Specification</b>	Extracts basic element description information on the Use Cases in a selected package. This excludes scenario details and child structures (to filter out the information on any Sequence diagrams set as child diagrams of the Use Case elements).	<a href="#">Use Case</a> 
<b>Use Case Scenarios Specification</b>	<p>Extracts information on the Use Cases in a selected package, <b>including</b> the details of any scenarios. This template also excludes child structures.</p> <p>If you want to include sub-element Use Cases, select the <i>Element   Child Elements</i> section.</p>	<a href="#">Scenarios</a> 

### Notes

- The facility to use the *Diagram | Element* section to report elements contained in a diagram but **defined in another Package**, is inactive in system templates

- [Design Custom Document Templates](#) 

#### 19.1.1.1.2 Selecting a Table of Contents

A very useful feature of any documentation is the inclusion of a **Table of Contents**. This can, however, be quite demanding to create, especially when you have to set up a Table of Contents for individual documents. Even setting up Contents Lists within templates can still be very time consuming, when you have a number of templates to maintain. It is far quicker and easier to apply a specific **Table of Contents template** to your document reports independent of which report you are generating and which content template you are basing the report on.

Enterprise Architect provides two **TOC** templates - one for landscape documents and one for portrait documents - that have the appropriate styles, formatting and numbering system already defined. You can access these templates through the **Table of Contents** field on the General tab of the Generate Documentation dialog.

Your report developers can copy the two system-provided templates as the bases for **custom** Tables of Contents, tailored to the requirements of your organization. These customized templates are also directly available to you through the drop-down list for the **Table of Contents** field.

### Notes

- If you have a Table of Contents defined in any of your custom report templates, and you want to use it, just set the **Table of Contents** field on the General tab to **<none>**

### Learn more

- [Generate Documentation](#) <sup>[2644]</sup>
- [Custom Document Templates](#) <sup>[2681]</sup>
- [Notes on Creating Tables of Contents](#) <sup>[2706]</sup>

#### 19.1.1.1.3 Selecting a Stylesheet

Using **Stylesheets** is an effective method of applying consistent format and appearance standards to categories of documentation, independent of the templates or other methods of defining document **content** you use. Stylesheets increase the flexibility of your documentation generation, in that you can:

- Provide a suite of documents generated from different templates with the same style standards, using one Stylesheet, **and**
- Deliver the same document content in different styles for different customer audiences by applying different Stylesheets to documents generated from one template

Enterprise Architect provides six **standard** Stylesheets - three for printed documentation and three for online documentation. Your report designers can copy these as the bases for **custom** Stylesheets, reflecting the corporate standards of your organization. Each custom Stylesheet can define a totally different page layout and document styles to other Stylesheets and to the Normal.rtf Styleheet. You can access both system and custom Stylesheets from the **Stylesheet** drop-down list on the General tab of the Generate Documentation dialog.

### Style Hierarchy

Stylesheets are the top level of a hierarchy of styles across the system.

- Initially, all documents and templates, whether for linked documents or report documents, reflect the global styles defined in the **Normal.rtf** file; you can edit this file to provide new global styles for all documents and templates created **after** the update
- In a specific document or template, you can edit the styles for that document or for all documents generated from that template; these edited styles override those of the same name in the Normal.rtf file, but any styles that have **not** been changed still reflect the definitions in the Normal.rtf file
- You can use a Stylesheet to apply a set of style definitions to a generated document, independent of the template you use; these styles override any styles of the same name defined in the document templates and/or the Normal.rtf file

### Notes

- If you have custom templates that contain all the style definitions you need, or if you want to just use the Normal.rtf styles, you can continue to apply those simply by setting the **Stylesheet** field on the General tab to **<none>**

### Learn more

- [Generate Documentation](#)  <sup>[2644]</sup>
- [Custom Template Design Options](#)  <sup>[2704]</sup>
- [Notes on Creating Stylesheets](#)  <sup>[2705]</sup>

#### 19.1.1.1.4 Selecting a Cover Page

A **cover page** defines the text, styles, graphics and layout of the front page of a document. Enterprise Architect provides two **standard** cover pages, one for portrait documents and one for landscape documents, which you can apply to your document reports independent of the report template and Stylesheet you are using. Your report designers can copy these standard cover pages as the bases for **custom** cover pages that reflect your corporate styles, logos and document naming conventions.

The cover page templates can contain fields that automatically extract and display data such as:

- The report type
- The Package or element being reported on
- The version of the report
- The status of the report
- The date on which the report was generated
- The name of the person who generated the report
- The location of the report file
- Any logos or graphics to be displayed on the front page

In using a cover page, you do not need to spend time defining the inclusion and display of the report title and provenance - it is already prepared for you. You can access the cover page templates from the **Cover Page** drop-down list on the Generate tab of the Generate Documentation dialog.

#### Notes

- If you have custom report templates that already contain the cover page definitions you want, you can still apply them by just setting the **Cover Page** field on the Generate tab to **<none>**

#### Learn more

- [Design Custom Document Templates](#)  <sup>[2684]</sup>
- [Notes on Creating Cover Pages](#)  <sup>[2707]</sup>

#### 19.1.1.2 Document Options

When defining the contents of your document, you can set a wide range of options for selecting the reported items by type and property, and you can organize the information within each type in order of position in the Project Browser or by created or modified date. These **Document** options are provided in two different ways:

- As the Options tab on the Generate Documentation dialog, to be set for a **specific instance** of a report; the options are **reset** when you exit the dialog or select a different template
- As panels on the Document Options dialog, to be configured in a template as the **default settings** to be applied to **every** report generated using that template; these settings can be overridden by the 'specific instance' settings on the Generate Documentation dialog

The listed options are the same for both dialogs, except that the **Document Options** dialog:

- Includes the Exclude Filters, Element Filters and Other Filters tabs from the Generate Documentation dialog
- Includes the Custom Query tab (for Template Fragments)
- Does not provide these options (as found on the Options tab of the Generate Documentation dialog):
  - The **Switch generator** button
  - The **Disable large OLE file support** option
  - The **Insert page breaks when generating a Master Document** option

**Access** **Project Browser package:** ( F8 ) > Options, or

**Tools | Document Template Designer:** <template> > Content | File | Document Options

### Options

Field	Action	See also
<b>Packages by</b>	Click on the drop down arrow in the first field and select to organize Packages in the generated documentation by <b>Name</b> , <b>Tree Order</b> , <b>Modified Date</b> or <b>Created Date</b> .  Click on the drop down arrow in the second field and select to list the Packages in either <b>Ascending</b> or <b>Descending</b> order.	
<b>Elements by</b>	Click on the drop down arrow in the first field and select to organize elements in the generated documentation by <b>Name</b> , <b>Tree Order</b> , <b>Modified Date</b> or <b>Created Date</b> .  Click on the drop down arrow in the second field and select to list the elements in either <b>Ascending</b> or <b>Descending</b> order.	
<b>Diagrams by</b>	Click on the drop down arrow in the first field and select to organize diagrams in the generated documentation by <b>Name</b> , <b>Tree Order</b> , <b>Modified Date</b> or <b>Created Date</b> .  Click on the drop down arrow in the second field and select to list the diagrams in either <b>Ascending</b> or <b>Descending</b> order.	
<b>Hide 'note-less' elements</b>	Select this checkbox to exclude all elements without notes from the documentation.	
<b>Skip root package</b>	Select this checkbox to exclude the parent Package from the documentation and include only the child Packages.	
<b>No bookmarks</b>	Select this checkbox to prevent document bookmarks from being inserted into the generated document.	

Field	Action	See also
<b>Hide &lt;Anonymous&gt; elements</b>	Select this checkbox to hide anonymous elements in the documentation.	
<b>Use style defined in template for notes</b>	Select this checkbox to override the character formatting specified in your <b>Notes</b> fields with the formatting set for the field in the template.	
<b>Disable large OLE file support</b>	Select this checkbox to disable support for large Object Linking and Embedding (OLE) files.	
<b>Insert page breaks when generating a Master Document</b>	Select this checkbox to insert a page break after each Model Document in a Master Document.	<a href="#">Virtual Documents</a> <small>[2669]</small>
<b>Include child elements even if the parent element is filtered out</b>	Select this checkbox to document all child elements that are not otherwise filtered out by the restrictions, even if the parent elements are filtered out.	
<b>Hide 'note-less' connectors</b>	Select this checkbox to exclude all connectors without notes from the documentation.	
<b>Diagram Format</b>	Click on the drop-down arrow and select the diagram format for the images included within the documentation; either <b>Metafile</b> or <b>Bitmap</b> .	
<b>Adjust Heading Levels</b>	<p>Click on the drop-down arrow and select the lowest heading level that can be generated for nested sub-packages in the document</p> <p>The Document Generator reproduces heading levels down to the value you set; for example, if you have four nested levels of sub-packages and you set this field to:</p> <ul style="list-style-type: none"> <li>• <b>Heading 2</b>, all sub-packages in the report are documented under level 2 headings</li> <li>• <b>Heading 4</b>, the first level of subpackages are documented under level 2 headings, the next level under level 3 headings, and the remainder all under level 4 headings</li> <li>• <b>Heading 6</b>, the first level of subpackages are documented under level 2 headings, the next level under level 3 headings, the next under level 4 headings, and the next under level 5 headings; if you added further levels of sub-package they would all be documented under level 6 headings</li> </ul> <p>The field defaults to <b>Heading 9</b> to accommodate the maximum number of levels of nested subpackages.</p>

- **Alt+F1 | Enterprise Architect | Reporting | RTF Templates | Filter Elements**
- **Alt+F1 | Enterprise Architect | Reporting | RTF Templates | Filter Connectors**

#### **19.1.1.2.1 Exclude Package Query and Script**

On the Document Options dialog (Template Editor) or Options tab (Report Generator) you can enter a **custom SQL Query** or select a **custom Script** to tailor the report in a specific way. One possibility is to **exclude** the selected **Package** or a child Package from the reporting filter conditions. You can base your Query or script on the examples provided here.

The two parameters you use in excluding a Package are:

- **#PACKAGEID#** - the **Package\_ID** of the current record in **t\_package** being processed on the exclusion condition
- **#OBJECTID#** - the **Object\_ID** of the current Package element record in **t\_object** being processed on the exclusion condition

#### Custom SQL Query

To exclude the Package from the filter conditions using a **Custom SQL Query**, you can create the Query based on the **t\_package** columns. For example:

```
SELECT Package_ID AS ExcludePackage FROM t_package WHERE Package_ID =
#PACKAGEID# and Name = 'Test'
```

Alternatively, you can create the Query based on the package object columns in the **t\_object** table:

```
SELECT t_package.Package_ID AS ExcludePackage FROM t_package, t_object
WHERE
t_package.Package_ID = #PACKAGEID#
AND
```

```
t_object.Object_ID =#OBJECTID#

AND

t_object.Stereotype = ' NoDoc'
```

### Custom Script

If you have selected the **Custom Script** option and want to exclude the Package from the filter conditions, you can create a script and enter a call to it, such as:

```
ExcludePackage( #PACKAGEID#)
```

This is a sample of the **XML returned** by the script:

```
<?xml version="1.0"?>
  <EADATA version="1.0" exporter="Enterprise Architect">
    <Dataset_0>
      <Data>
        <Row>
          <ExcludePackage>
            89
          </ExcludePackage>
        </Row>
      </Data>
    </Dataset_0>
  </EADATA>
```

This is an example of **JScript** for excluding the Package:

```
!INC Local Scripts.EAConstants-JScript
/*
 * Script Name: RTF Exclude Packages Script Sample
 */

function ExcludePackage(packagelD)
{
  var xml DOM = new ActiveXObject( "MSXML2.DOMDocument.4.0" );
  xml DOM.validateOnParse = false;
  xml DOM.async = false;

  var node = xml DOM.createProcessingInstruction( "xml", "version='1.0'
encoding='ISO-8859-1'" );
  xml DOM.appendChild( node );

  var xml Root = xml DOM.createElement( "EADATA" );
  xml DOM.appendChild( xml Root );

  var xml DataSet = xml DOM.createElement( "Dataset_0" );
  xml Root.appendChild( xml DataSet );

  var xml Data = xml DOM.createElement( "Data" );
  xml DataSet.appendChild( xml Data );

  var xml Row = xml DOM.createElement( "Row" );
  xml Data.appendChild( xml Row );
```

```

var package as EA.Package;
package = Repository.GetPackageById( packageId )

if ( package.StereotypeEx == "NoDoc" )
{
    var xmlName = xmlDOM.createElement( "ExcludePackage" );

    xmlName.text = "" + package.PackageId;
    xmlRow.appendChild( xmlName );
}

return xmlDOM.xml;
};

```

**19.1.1.3 Exclude Filters**

As you specify the output of your report, you might want to **exclude** objects of a specific **type**. You can do this using the **Exclude Filters** tab, through which you can select to exclude from your report one or more:

- Types of **element**
- Types of **connector**, and/or
- Types of **diagram**

You can select the objects in one of two ways:

- Click on the **All** button underneath the appropriate panel, to **exclude** every type of element, connector or diagram, and then click on the individual types that you **DO** want to include in the report, or
- Click on the **None** button underneath the appropriate panel to clear all selections (which includes the objects of every type in the report) and then click on each type of object that you do **NOT** want to show in the report

Notes

- If you want to specifically include or exclude elements on the basis of their specific **properties** or **features**, rather than their type, use the Element Filters and Other Filters tabs

Learn more

- [Generate Documentation](#) 
- [Element Filters](#) 
- [Other Filters](#) 

**19.1.1.4 Element Filters**

As you specify the output of your report, you might want to include only elements that have specific properties, rather than every element encountered. Using the Element Filters tab, you can define which element properties to report on, and which fields and field values. You can also delete the element filters if you no longer want to apply them.

The Element Filters tab is provided in two different ways, as a tab of:

- The Generate Documentation dialog, to set filters for a **specific instance** of a report; the filters are **reset** when you exit the dialog or select a different template
- The Document Options dialog, to set filters in a template as the **default settings** to be applied to **every** report generated using that template; these settings can be overridden by the 'specific instance' settings on the Generate Documentation dialog

The options and behavior are the same for both dialogs, except that the **Document Options** dialog provides a facility for importing a previously-defined set of Model Search filters from within your model or from an external file (created by exporting a Model Search from another model).

The facilities are also provided through the Element Filters page of the Properties dialog for a Standard Chart element. This page most closely resembles the tab of the Document Options dialog in the Document Template editor.

**Access** **Project Browser package: ( F8 ) > Element Filters, or**  
**Tools | Document Template Designer: <template> > Content | File | Document Options >**  
**Element Filters**

#### Review Element Filters

Column/Button	Action	See also
<b>Search In</b>	Shows the type and name of each element property field to search on. Select the checkbox against a property field to include it in the current search.	
<b>Condition</b>	Displays the condition of the search parameter. The possible values are <b>Contains</b> , <b>Equal To</b> , <b>Not Equals</b> and <b>One Of</b> .	
<b>Look For</b>	Displays the search term to perform the conditional search on. This value is specific to the selected field; for example, the value could be a date for <i>DateCreated</i> or a text or numerical value for other fields. The search term can contain multiple values, separated by commas.	
<b>Required</b>	Indicates that the search results must include elements with the search term in that field; these checkboxes are set on the <b>Add Filters dialog</b> . When no <b>Required</b> checkboxes are selected, the fields listed as filters have an OR relationship; that is, if the search term is found in any <b>one</b> of those fields, then the element is displayed. Any field having the <b>Required</b> checkbox ticked overrides fields where the <b>Required</b> checkbox is not ticked.	
<b>Element Features</b>	Specify whether element features are optional or required; these	

Column/Button	Action	See also
<b>- Optional</b> <b>- Required</b>	<p>appear as a new branch underneath the root element term in the <b>Search In</b> column.</p> <p>If you scroll down the <b>Search In</b> column, you might see sub-branches such as <i>Attribute</i>, <i>Change</i> and <i>Custom Property</i>; these are the element features. You can add these features using the Add Filters dialog.</p> <p><b>Select the:</b></p> <ul style="list-style-type: none"> <li><b>Optional</b> radio button to generate a list of elements that have <b>one</b> of the element features (<b>Element Type = Object</b>), or <b>one</b> of the feature filters (<b>Attribute Name = Att1</b>); for example, if your search is:   <b>Element Name = Class11, Attribute Name = m_Att1 or Scope = Public</b>   the search results list all the elements that have the name of <b>Class11</b> <i>and</i> all the elements that have an <b>Attribute Name</b> of <b>m_Att1</b> <i>or</i> a <b>Scope</b> of <b>Public</b>.</li> <li><b>Required</b> radio button to generate a list of elements that must have the element features; for example, if your search is:   <b>Element Name = Class, Attribute Name = m_Att1 or Scope = Public</b>   you would get elements that must have the name of <b>Class</b> <i>AND</i> have an Attribute with a name of <b>m_att1</b> <i>OR</i> a <b>Scope</b> of <b>Public</b>.</li> </ul>	<a href="#">Add Filters</a> 
<b>Import Search</b>	<p>Click on this button and select to import the filters defined within a search, from either:</p> <ul style="list-style-type: none"> <li>An external XML file exported from another project, located on a Browser dialog, or</li> <li>A list of the standard and custom Model Searches within your installation of Enterprise Architect</li> </ul>	
<b>Add Filter</b>	Click on this button to display the Add Filters dialog, to add a new set of parameters to filter the search on.	
<b>Edit Filter</b>	Click on this button to display the Edit Filters dialog, to change the search parameters.	
<b>Remove Filter</b>	Click on this button to immediately remove the selected filter from the search.	

#### Notes

- Check that the values you provide for the **Look for** fields are exactly what is contained in the element

data fields to be searched; for example, the Test Classes Unit, Integration, System, Acceptance and Scenario are represented by attribute values **1 - 5**, not by their respective tab names

#### 19.1.1.6 Project Constants

As you develop your report, you can incorporate flags that represent project-wide terms and values. The flags - or **Project Constants** - are replaced with the actual text during document compilation. Using this facility, you can use a particular text string or number extensively throughout your project documentation, whilst maintaining the value in a single location. You define Project Constants on the Generate Documentation dialog; they are then available to be inserted into **all** custom document report templates in the text, section headers, end-notes, page headers or page footers, using the Document Template Designer context menu.

**Access** **Project Browser package: ( F8 ) > Project Constants or Diagram element ( F8 ) > Project Constants**

#### Manage Project Constants

Field/ Button	Action	See also
<b>Add</b>	Click on this button to add a new Project Constant to the list.	

Field/ Button	Action	See also
	A prompt displays for the name and value; type these in and click on the <b>OK</b> button.	
<b>Delete</b>	Click on this button to remove the selected Project Constant from the list. A prompt displays to confirm the deletion; click on the <b>OK</b> button to complete the task..	
<b>Import</b>	Click on this button to import a set of fields from an external XML file. A browser displays to select the source file and location.	
<b>Export</b>	Click on this button to export all fields to an external XML file. A browser displays to specify the target file and location.	

#### Learn more

- [Styles, Special Text & Table of Contents](#) 

### 19.1.1.7 Word Substitution

In generating document reports, you will call in many English technical terms that are used across the system, in particular field names. It is possible to replace these field names in your generated documents with other terms that might be more meaningful to the readers, such as a translation of each term into your own language.

**Access** **Project Browser package: ( F8 ) > Word Substitution or  
Diagram element ( F8 ) > Word Substitution**

#### Add a translation for a term

Step	Action	See also
<b>1</b>	Double-click on the term in the <b>English</b> column; the <b>Enter Value</b> field displays.	
<b>2</b>	Type the substitute text in the <b>Enter Value</b> field, and click on the <b>OK</b> button. The text displays in the <b>Substitute</b> column, against the English term. This substitute will display in your generated reports in place of the English term.	

#### Note

- To put the word substitutions into effect in a generated report, select the **Language Substitution**

checkbox on the Generate tab

### 19.1.1.8 Language Substitution

If you want to generate and export document reports from Enterprise Architect in languages or dialects other than US English, you can customize the codepage, default language ID and character set that the system uses when generating the documentation. This makes it much easier to generate documentation appropriate to your country or location.

**Access** **Project Browser | Click on Package: F8 > Codepage or**  
**Diagram element: F8 > Codepage**

#### Set Reporting Language

Field/Button	Action	See also
<b>Language</b>	Click on the drop-down arrow and select the language code appropriate to the language you want to generate reports in.	
<b>Codepage</b>	Click on the drop-down arrow and select the codepage appropriate to the language you want to generate reports in.	
<b>Charset</b>	Click on the drop-down arrow and select the character set appropriate to the language you want to generate reports in.	
<b>English Tag</b>	Lists the default US English language code tags within Enterprise Architect.	
<b>Substitute Tag</b>	<p>(For advanced use only.) If you want to apply a different language code tag in place of a US English tag, double-click on the item line. A prompt displays for the substitute tag code; type in the code and click on the <b>OK</b> button.</p> <p>To clear a substitute tag, double-click on the item and delete the code value.</p> <p>When you generate your document reports, the substitute tags are used in the output.</p>	

#### Notes

- If you want to generate reports in a language that requires Unicode support, please note that Enterprise Architect **.EAP** files default to using **JET 3.5** as the database engine, which does not support Unicode character sets (see the *Getting Started > Basics* topic) ; to provide Unicode support in your project, either upsize to a **DBMS repository** or set **JET 4.0** as the database engine, and download a copy of the **Jet 4.0 EABase** model from the Sparx Systems website and do an **EAP to EAP transfer** of your model into the Jet 4.0 file
- The codes that you select remain set for all reports you generate, until such time as you specifically change them again

- You can transport these language tag definitions between models, using the **Export Reference Data** and **Import Reference Data** options

### 19.1.1.9 Diagram Options

When generating reports on a Package that includes diagrams, you can set options in each diagram's Properties dialog to define whether that diagram is to be included in the report and, if so, how it is to be represented.

**Access** **Diagram background context menu | Properties > Diagram**

#### Document Options

Option	Action	See also
<b>Exclude Image from RTF Documents</b>	Select this checkbox to exclude the image of the this diagram from any document reports.	
<b>Document Each Contained Element in RTF</b>	<p>Select this checkbox to include, in the report, details of any elements that belong in other (external) Packages but that form part of this diagram within the Package being reported on; the report includes external elements in each diagram on which you have selected the checkbox.</p> <p>On the Generate Documentation dialog, the <b>Include all Diagram Elements in Report</b> checkbox defaults to selected to include external elements for <i>every</i> diagram covered by the report; therefore, to include external elements only for <b>specific</b> diagrams, <b>deselect</b> that checkbox.</p> <p>In either case, you must enable the <i>Package.Diagram.Element</i> and <i>Package.Element</i> sections in your (customized) document generation templates in order to include this external element information in the report.</p>	<p><a href="#">Generate Documentation</a> <sup>[2644]</sup></p> <p><a href="#">Report Elements From External Packages</a> <sup>[2695]</sup></p>
<b>Divide Diagram Into Multiple Pages</b>	<p>If the diagram is large, select this checkbox to divide the diagram into separate pages in the document report.</p> <p>This option is only effective when the <b>Scaled Printing option</b> on the Print Advanced dialog is set to <b>None</b>.</p>	<a href="#">Scaled Printing Option</a> <sup>[871]</sup>
<b>Rotate Images</b>	Select this checkbox to rotate each diagram image by 90 degrees in	

Option	Action	See also
	the document report; this is only valid for <b>bitmap</b> (.bmp) images.	

#### Learn more

- [Configure Diagram Display](#)<sup>[825]</sup>

### 19.1.1.10 Resource Documents

When you set the parameters on the Generate Documentation dialog to define an output document as you need it, you might want to re-use that configuration to obtain a consistent view of changes to your model over time. You can capture the configuration as a **Resource Document**, which saves the:

- Package name
- Output file destination
- Template
- Output format
- Options page settings
- Exclude Filters
- Element Filters and
- Other Filters

The document is saved into the *Document Generation > Defined Documents* folder of the Resources window. Saving your often-used report configurations as Resource Documents can simplify future document generation, both in producing specific documents and in batch-generating all documents or a selection of documents.

**Access** **Project Browser package:** F8 > **Generate:** Resource Document **or**  
**Diagram element:** F8 > **Generate:** Resource Document

**Project | Resources (Alt+6) | Document Generation | Defined Documents**

#### Manage Resource Documents

Task	Action	See also
<b>Create a Resource Document</b>	On the Generate Documentation dialog, click on the <b>Resource Document</b> button and, in the <b>Enter Value</b> field, type a name for the document.  Click on the <b>OK</b> button. The document is added to the Resources window for easy future access.	
<b>Open, Generate or Delete Documents</b>	In the Resources window, expand the <i>Defined Documents</i> folder and right-click on the required <b>document</b> .  Select the required context menu option: <ul style="list-style-type: none"> <li>• <b>Open Document</b> - Open the corresponding .document file, as specified by the document template <b>Filename</b> property</li> </ul>	

Task	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Generate Document</b> - Open the Generate Documentation dialog, loaded with the specified template</li> <li>• <b>Auto Generate Document</b> - Generate documentation, with the document located at the path specified by the template's <b>Filename</b> property</li> <li>• <b>Delete Document</b> - Remove the specified document</li> </ul>	
<b>Batch-generate a number of documents</b>	<p>Right-click on the <i>Defined Documents</i> <b>folder</b> name and select the <b>Generate Documents</b> context menu option; the Batch Document Generation dialog displays.</p> <p>The dialog lists all resource documents in the <i>Defined Documents</i> folder, defaulted to selected; deselect the checkbox against each document that you do not want to generate (or click on the <b>Deselect All</b> button to clear all selections, then select those you require).</p> <p>Click on the <b>OK</b> button to generate each of the remaining reports into their respective target file locations.</p> <p>Alternatively, to automatically generate every document in the <i>Defined Documents</i> folder, without displaying the Batch Document Generation dialog, click on the <b>Generate All Documents</b> context menu option.</p>

### 19.1.2 Virtual Documents

Both standard and custom report templates generate documents that present information reflecting the organization of the Project Browser. You can also generate document and web reports independent of that organization, grouping and ordering individual Packages and elements according to whatever criteria you want to apply. For this purpose, you use **virtual documents**.

You can create separate virtual documents describing, say, the Requirements, Use Cases or Design elements of a project, based on individual **Model Document** elements. Alternatively, you can make these separate sections of one report, retaining their own different formats but with common headers and footers, organized under a **Master Document** Package element. Any Table of Contents, Stylesheet and/or Cover Page you select would be applied to the combined document and could apply your corporate standards across all the Model Document sections. You can create as many virtual documents as you want, for as many combinations of information as you need.

#### Elements, Templates and Content Definitions

Construct	Detail	See also
<b>Document Elements</b>	<p>Master Document and Model Document elements are available from the Documentation page of the Diagram Toolbox; on the Toolbox, select <b>More tools   Documentation</b>.</p>  <p>When you drag the Master Document and Model Document elements onto a diagram, the following symbols display, respectively:</p>  <p>The Documentation Toolbox page also provides the <b>Document Artifact</b> element, into which you can generate a virtual document or through which you can add a linked document to an element.</p>	<p><a href="#">Diagram Toolbox</a> <sup>[792]</sup></p> <p><a href="#">Create Model Document</a> <sup>[2673]</sup></p> <p><a href="#">Create Master Document</a> <sup>[2672]</sup></p> <p><a href="#">Document Artifact</a> <sup>[1373]</sup></p> <p><a href="#">Generate Report to an Artifact Element</a> <sup>[2680]</sup></p>
<b>Templates</b>	<p>For each <b>Model Document</b> element, you can create a custom template; for example, a specifically-designed Requirements template for a Requirements document, or a Use Case template for a section on Use Cases.</p> <p>For web reports, you identify the template on the Publish as HTML dialog; for document reports, you specify the template name as the value of the <b>RTFTemplate Tagged Value</b>.</p> <p>The Master Document element has its own <b>RTFTemplate</b> Tagged Value, which defines the headers, footers and any other common content; you can import your <b>corporate standards template</b> and insert its name in the Tagged Value.</p> <p>The template in the Master Document overrides the templates in the Model Documents; for example, header and footer definitions in the Master Document template override any header and footer definitions in the Model Document templates. In this way, you can apply consistent and continuous styles and page numbering throughout the report generated through the Master Document.</p> <p>If you want the Model Documents to have their own styles, applied through their own <b>RTFTemplate</b> Tagged Values, either leave the Master Document <b>RTFTemplate</b> Tagged Value blank (for completely separate overall styles) or remove the definition of specific styles from</p>	<p><a href="#">Design Custom Document Templates</a> <sup>[2684]</sup></p> <p><a href="#">Import Template</a> <sup>[2707]</sup></p>

Construct	Detail	See also
	the Master Document template.	
<b>Content</b>	<p>The content of the report is defined as either:</p> <ul style="list-style-type: none"> <li>A list of Packages (defined as attributes) dragged onto the element in whatever order or combination is most appropriate to your requirements; you can easily <b>add</b> or <b>delete</b> Packages as necessary</li> <li>or</li> <li>(Not for web reports) a standard search (identified by Tagged Values) created within the Model Search facility - when you generate the document, this search captures the required data throughout the model and populates the document; note that diagram searches are not supported</li> </ul> <p>You can control the sequence in which information is presented in the document by, for example, changing the sequence of Packages in the Model Document or the sequence of Model Documents in the Master Document.</p>	<p><a href="#">Add Packages to Model Document</a><sup>[2675]</sup></p> <p><a href="#">Delete Package in Model Document</a><sup>[2676]</sup></p> <p><a href="#">Create and Modify Searches</a><sup>[709]</sup></p> <p><a href="#">Document Order</a><sup>[2677]</sup></p>

### Notes

- In a Model Document for a document report, you should not define both a list of Packages and a search; if both are present, when you generate the document it is created from the Package list only
- You cannot use **Bookmarking** in Master Document elements, which effectively replace Bookmarking in Word

Bookmarking requires each bookmark to be unique; when you generate a report with a standard template (including in a single Model Document element), each bookmark is unique and there is a 1:1 association between the Elements-details being generated and the elements in the repository

As Master Documents are intended to contain multiple sub-documents, the association ceases to be 1:1; there is no simple method that enables the generated data to be uniquely identified directly in association with the original element

### 19.1.2.1 Create Master Document

If you want to create a series of **documents** - or **sections** of a document - that are individually tailored but are generated and organized as a single unit, you can design each document in its own **Model Document** element but organize these elements under a **Master Document**. This is a Package element with a child Common diagram to which you add the Model Document elements. You can then generate a document with a corporate template for the common contents and the headers and footers, and each section having its own appearance defined by a template appropriate to the section content. When you add Model Document elements to a Master Document, the Master Document element resembles the following:

The Master Document element and child diagram are listed in the Project Browser as shown:

#### Create a Master Document

Step	Action	See also
1	Open or create a diagram in which to create the Master Document. The diagram can be of any type, although <b>Documentation</b> automatically provides the correct Toolbox page.	<a href="#">Add New Diagrams</a> <sup>[822]</sup>
2	If the Toolbox Documentation page is not already shown, select <b>More tools   Documentation</b> .	<a href="#">Diagram Toolbox</a> <sup>[792]</sup> <a href="#">Virtual Documents</a> <sup>[2669]</sup>
3	Drag the <i>Master Document</i> icon onto the diagram. The system prompts you for the name of the Master Document element.	
4	Type the element name and click on the <b>OK</b> button. The system creates the Master Document element and a child Custom diagram of	

Step	Action	See also
	the same name.	
5	<p>If creating a Master Document for an HTML report, go to step 7.</p> <p>Otherwise, open the Tagged Values window (<b>View   Tagged Values</b>) and click on the Master Document element.</p> <p>The <b>RTFTemplate</b> Tagged Value displays in the window; this Tagged Value is filled with the valid template names.</p>	<a href="#">Tagged Values</a> <sup>[1134]</sup>
6	<p>The <b>RTFTemplate</b> Tagged Value defaults to <i>(model document: master template)</i>.</p> <p>If you want to use a customized master template that you have imported, click on the drop down arrow at the right of the field and click on that template in the list.</p>	<a href="#">Import a Document Template</a> <sup>[2707]</sup>
7	<p>Return to the Project Browser and open the Master Document child diagram. At this point, to provide the content for the generated document, you either:</p> <ul style="list-style-type: none"> <li>• Create the Model Document elements in the child diagram, or</li> <li>• Drag existing Model Document elements from the Project Browser into the child diagram</li> </ul>	<a href="#">Create Model Document</a> <sup>[2673]</sup>
8	Having set up the Master Document, and created or added and set up its Model Documents as required, you can generate the document report on the Master Document; this pulls in the contents of the Model Documents.	<a href="#">Generate the Document</a> <sup>[2679]</sup>

#### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | Virtual Documents | Create a Master Document**

#### **19.1.2.2 Create Model Document**

If you want to create a single document that captures specific details from specific areas of your model, you can define that document using a **Model Document** element. You can also create a number of individual documents and combine them as sections of a larger document, defining the larger document in a **Master Document** element. You can create as many Model Document elements as are necessary to provide the independent documents or the sections of the document you require.

#### Prerequisites

Before you create a Model Document element, you might have to:

- Create the appropriate document or web page template to define the structure and appearance of the document
- For a document, determine whether to provide the content of the document using selected Packages or a Model Search and - if necessary - create the Model Search to use

**Create a Model Document element**

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>Open the child Custom diagram of the Master Document element you have created or</li> <li>If you are creating separate Model Documents, create a new Documentation diagram (<b>Extended   Documentation</b> in the New Diagram dialog)</li> </ul> <p>The new diagram can live anywhere in the model hierarchy, outside the Packages you are adding to the document; you could create a diagram called Documentation within a specific Documentation Package, and use this to hold the independent Model Document elements for your virtual documents.</p> <p>You can also create Model Documents on any other convenient type of diagram, changing the Toolbox page to Documentation (step 2).</p>	<a href="#">Create Master Document</a> <sup>[2672]</sup> <a href="#">Add New Diagrams</a> <sup>[822]</sup>
2	<p>From the Documentation page of the Toolbox (<b>More tools   Documentation</b>) drag the <b>Model Document</b> icon onto the diagram to create a new Model Document element.</p> <p>Give the element an appropriate name; for example, if the documentation is relevant to the shopping cart requirements of a model, you could call it <i>ShoppingCartReqDocumentation</i>.</p> <p>Click on the <b>OK</b> button.</p>	
3	<p>If you are creating a Model Document element for a web report, go now to the <i>Add Packages to Model Document</i> topic.</p> <p>Otherwise, open the Tagged Values window (<b>View   Tagged Values</b>) and click on the Model Document element.</p> <p>The <b>RTTemplate</b>, <b>SearchName</b> and <b>SearchValue</b> Tagged Values display in the window.</p>	<a href="#">Add Packages to Model Document</a> <sup>[2675]</sup>
4	<p>Click on the drop-down arrow to the right of the <b>RTTemplate</b> field, and click on the template to use for this Model Document.</p>	
5	<p>If you are creating a list of Packages for the Model Document, go now to the <i>Add Packages to Model Document</i> topic.</p> <p>Otherwise, click on the drop-down arrow to the right of the <b>SearchName</b> field, and click on the model search type to populate this Model Document.</p> <p>In a Model Document for a document report, do not define both a list of Packages <b>and</b> a search; if both are present, when you generate the document it is created from the Package list only.</p>	<a href="#">Add Packages to Model Document</a> <sup>[2675]</sup>
6	<p>If necessary for your Model Search, type a search term in the <b>SearchValue</b> field.</p>	

Step	Action	See also
7	<p>Create further Model Document elements as required.</p> <p>Your Model Document element appears in the Project Browser with a Class icon, as shown below:</p>  <p>When you have created all the required Model Document elements, go to the <i>Document Order</i> topic.</p>	<a href="#">Document Order</a> <small>2677</small>

### Notes

- Diagram Searches are not supported
- Custom SQL searches are supported if they are returning elements; the SQL must include *ea\_guid* AS *CLASSGUID* (case sensitive) and the *object type*

#### 19.1.2.3 Add Packages to Model Document

After you create a Model Document element, one of the two options available to you is to identify the Packages to document in the reports generated from the element. You can add as many Packages as you need, from anywhere in the model.

#### Add Packages to Model Document element

Step	Action	See also
1	Open the Documentation diagram, and locate a Package in the Project Browser to add to the documentation; for example, a Resources Package in a Dynamic view.	
2	Drag and drop the Package from the Project Browser onto the Model Document	

Step	Action	See also
	<p>element, as shown below:</p> 	
3	<p>Adding the Package creates an attribute with the same name as the Package; the attribute can be seen in the Model Document element in the <i>Attributes</i> compartment:</p>  <p>Repeat step 2 for each of the Packages you want to include in the document.</p>	
4	<p>You could now generate your report as a document or as a web page, but you might prefer to first review how your Package list impacts the order in which information is presented in the report.</p> <p>You can change the sequence of Packages, or delete any Packages that are no longer required.</p>	<p><a href="#">Generate the Document</a> <sup>[2679]</sup></p> <p><a href="#">Master Documents and Model Documents</a> <sup>[2759]</sup></p> <p><a href="#">Document Order</a> <sup>[2677]</sup></p> <p><a href="#">Delete Package in Model Document</a> <sup>[2676]</sup></p>

#### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | Virtual Documents | Reorder Packages**
- **Alt+F1 | Enterprise Architect | Reporting | Virtual Documents | Remove a Package**

#### **19.1.2.4 Delete Package in Model Document**

In your use of Model Document elements to generate documents on specific Packages, you might determine that a Package you have identified to be documented is no longer necessary. You can omit the Package from your documentation by deleting the corresponding attribute from the Model Document element.

### Delete Package from Model Document element

Step	Action	See also
1	In the Project Browser, expand the Model Document element to list the Package attributes.	
2	Right-click on the attribute for the Package to omit, and select the <b>Delete Attribute</b> context menu option.	

### Alternatively

Step	Action	See also
1	In either the Project Browser or the diagram, right-click on the Model Document element and select the <b>Attributes</b> context menu option. The Attributes dialog displays.	
2	On the <b>Attributes</b> list, click on the attribute for the Package to omit.	
3	Click on the <b>Delete</b> button to remove the attribute from the document element.	

### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | Virtual Documents | Remove a Package**

### **19.1.2.5 Document Order**

The order in which information is compiled into a virtual document depends on:

- The sequence of Model Document elements in a Master Document element
- Whether you define a Model Search in a Model Document element (not for web reports)
- Whether you define a Package list in a Model Document element, and how you order that list

You can review and, if necessary, amend the order in which information is to be compiled, before you generate the document or web page.

### Document Sequences

Aspect	Detail	See also
<b>Model Document Sequence</b>	<p>When you generate a document from a Master Document element, the sequence in which the sections are created is determined by the order in which the child Model Document elements are listed <b>in the Project Browser</b>.</p> <p>You can create elements anywhere in a diagram, therefore for sequencing information the document generator refers to the Project Browser.</p> <p>If necessary, change the sequence using the green <b>Move Element Up</b> and <b>Move Element Down</b> arrows in the Project Browser toolbar to move a Model Document element up or down within the Package.</p>	<p><a href="#">The Project Browser</a><sup>[646]</sup></p> <p><a href="#">Project Browser Toolbar</a><sup>[649]</sup></p>
<b>Model Search</b>	<p>A Model Search operates on the database, and accesses records in the order <b>in which they are stored</b>; this order depends on many factors, and can change with database maintenance.</p> <p>Therefore, the sequence of information provided by the search is unpredictable.</p>	
<b>Package Order</b>	<p>When you create a Package list in a Model Document element, the sequence of information is determined by the order in which the <b>Package attributes are listed within the element</b>.</p> <p>You can change the sequence using the Attributes dialog and, if you prefer a Package to be in a different section of the document, you can move the attribute from one Model Document element to another.</p>	

### Change sequence of Packages in a Model Document element

Step	Action	See also
1	<p>In the Project Browser or diagram, right-click on the Model Document element and select the <b>Attributes</b> context menu option.</p> <p>The Attributes dialog displays.</p>	
2	<p>On the Attributes list, click on attribute to move and click on the <b>Up</b> or <b>Down</b> (arrow) buttons to change the order in which the corresponding Packages are included in the documentation.</p>	
3	<p>Click on the <b>Close</b> button.</p>	

### Move a Package attribute from one Model Document to another

Step	Action	See also
1	In the Project Browser, expand both Model Document elements so that they list their Package attributes.	
2	Click-and-hold on the attribute to move, and drag it onto the name of the target Model Document element.	
3	Release the mouse button.  The attribute is removed from the source element and added to the top of the list of attributes in the target element.	
4	If necessary, move the attribute down the attribute list, as described in the <i>Change sequence of Packages in a Model Document element</i> section, above.

- [Generate Report to an Artifact Element](#)<sup>[2680]</sup>

#### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | Virtual Documents | Generate RTF**

### 19.1.2.7 Generate Report to an Artifact Element

When working with virtual documents, it is also possible to directly generate a report as a **linked document** associated with a **Document Artifact** element. Because the generated report is stored directly in the model, rather than in the current user's file system, it is much easier to share the report in a team-based modeling environment. The linked document also eliminates the separation of the modeled system and the generated document output, keeping everything integrated and readily accessible.

To generate a report to an Document Artifact's linked document, you start with either:

- A **Master Document** element with Model Document elements, or
- An **independent Model Document** element

These elements will contain templates, the Master Document will contain defined Model Documents and the Model Documents will identify Packages or Model Searches. At this point you can quickly and easily create a Document Artifact element on which to generate the report.

#### Create a Document Artifact element

Step	Action	See also
1	On the Documentation diagram, click on the Master Document element or the independent Model Document element.	
2	Drag and release the Quick Linker arrow to the right of the Master or Model Document element, and select the <b>Common   Document</b> menu option to create a connector and	<a href="#">Create New Elements</a> <sup>[897]</sup>

Step	Action	See also
	<p>the Artifact element.</p> <p>Optionally, you can name the element as well.</p>	

#### Generate a report to a Document Artifact element

Step	Action	See also
1	<p>Double-click on the Document Artifact.</p> <p>The Generate Documentation dialog displays.</p>	
2	<p>The text field values are automatically set.</p> <p>Select any checkboxes required (such as <b>View Document on Completion</b>), and click on the <b>Generate</b> button.</p>	<a href="#">Generate Documentation</a>  [2644]
3	<p>When the report generation is complete, the report displays as a linked document of the Document Artifact element (if not, click on the <b>View</b> button on the Generate Documentation dialog).</p>	<a href="#">Linked Documents</a>  [1044]

#### Note

- If you have a Master Document with Model Document elements, you can easily create a Document Artifact to test one of the Model Documents individually; in this case, you need to remove the Document Artifact before creating a report from the Master Document, otherwise the Artifact becomes part of the report instead of being a vehicle for the report

#### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | Virtual Documents | Generate Report to an Artifact Element**

### 19.1.3 Custom Document Templates

You use **report templates** to generate reports on your model that present specific information in a particular format, and to generate those reports repeatedly and consistently. You can select from a range of **system templates** on the Document Generator, to immediately generate reports from your model.

A template consists of:

- 'Sections' that identify the model components to report on
- Fields that identify the type of information to extract on each component
- Styles and formatting instructions that define the layout of the report
- Template Fragments containing smaller sub-templates

The system provides more specialized document templates for separate Cover Pages, Stylesheets and Tables of Contents.

You can also design your own **custom templates**, which provide the additional advantages of being able to generate reports tailored to your own organization, and to update certain aspects of the report without having to re-define every other specification. The report generator helps you **manage** these custom templates; that is:

- Review the custom templates available to you for generating reports
- Create additional custom templates
- Edit custom templates
- Import templates that were saved to XML files, and
- Delete any custom templates that are no longer required

**Access** **Project Browser package context menu | Documentation | Generate Documentation (F8) > Templates**

#### Manage your Custom Templates

Field/Button	Description	See also
<b>User Templates</b>	<p>Lists the <b>custom</b> Templates, Fragments, Stylesheets, Cover Pages and Tables of Contents currently available to you for generating reports through the Generate tab.</p> <p>Your custom templates can be grouped within these standard folders (by Template Type), or in another folder that you have created to hold specific templates - see below.</p>	<a href="#">Generate Documentation</a> 
<b>New</b>	<p>To create a new custom template, click on this button. The New Document Template dialog displays.</p> <p>In the <b>New template</b> field, type the template name.</p> <p>In the <b>Template Type</b> field, click on the drop-down arrow and select the type of template to create.</p> <p>In the <b>Copy Template</b> field, click on the drop down arrow and select either:</p> <ul style="list-style-type: none"> <li>• <b>None</b>, to create an empty template to develop from scratch, or</li> <li>• The name of an existing system, Technology or custom template to act as a base; this list is filtered to show templates of the type you specified in the <b>Template Type</b> field</li> </ul> <p>In the <b>Template Group</b> field either:</p> <ul style="list-style-type: none"> <li>• Select an existing group or</li> <li>• Enter the name for a new template group, or</li> <li>• Leave this field blank, to place the template in the appropriate standard type group</li> </ul>	

Field/Button	Description	See also
	<p>The <b>Template Group</b> determines the organization of document templates in the Resources window. You cannot create a template of a specific type and assign it to the standard group of a different type. For example, you cannot specify a Fragment and select to create it in the <i>Cover Page</i> folder. It either goes to a <b>user-created</b> group that <b>you select</b> or is automatically redirected to the <i>Fragment</i> folder.</p> <p>Click on the <b>OK</b> button; the template opens in the Document Template Designer.</p>	<a href="#">Design Custom Document Templates</a>  <sup>2684</sup>
<b>Edit</b>	<p>To make changes to an existing template, click on the template name and then click on this button.</p> <p>The template opens in the Document Template Designer.</p>	<a href="#">Design Custom Document Templates</a>  <sup>2684</sup>
<b>Import From Reference File</b>	<p>To import custom templates that were previously saved to <b>batch XML</b> files (that is, through the <b>Export Reference Data</b> option), click on this button. The Import Reference Data dialog displays.</p> <p>Click on the <b>Select File</b> button and browse for and select the required source XML file.</p> <p>In the Select Datasets to Import panel, click on the required datasets:</p> <ul style="list-style-type: none"> <li>• RTF Document Templates</li> <li>• Templates - RTF Style Detail</li> <li>• Templates - RTF Tag &amp; Language Options</li> </ul> <p>Click on the <b>Import</b> button to import the templates. The names of the imported templates are added to the list on the Templates tab.</p> <p>If the template you want to import is a single, external file (not in a <b>batch file</b>) you can instead <b>open</b> a template and use a different option to import the file into that template.</p>	<a href="#">Export Reference Data</a>  <sup>376</sup> <a href="#">Import Reference Data</a>  <sup>380</sup>  <a href="#">Import a Document Template</a>  <sup>2707</sup>
<b>Delete</b>	<p>To delete a custom template, click on the template name and click on the <b>Delete</b> button.</p> <p>A prompt displays to confirm the deletion.</p> <p>You can select multiple custom templates for deletion; press <b>Ctrl</b> or <b>Shift</b> as you click on each template name.</p>	

### Notes

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is switched on, you need **Configure Resources** access permission to create document templates

- Whatever template you initially select on the Template tab or New Document Template dialog, of whichever template type and/or group, you can easily switch to a different template and template type within the Document Template Editor whenever you need to

### 19.1.3.1 Design Custom Document Templates

If you want to record and document details of your model, you can do so using a range of document reports, each generated using a document **template**. To meet your specific requirements, it is possible to **customize** the reports by developing **your own** templates; during this process you also have the option of generating **test reports** to review the output from your design as you develop it. The custom templates you can develop include full-document templates and independent Stylesheets, Cover Pages and Tables of Contents.

You **create** and **edit** report templates using the **Document Template Designer** to define:

- The model components to report on
- The information to extract on each component and
- The styles and layout of the report

It is possible to create a template from scratch or by copying and editing either another custom template or a system template. If you want to review the system templates you can list and display them using the Document Template Designer, and establish what templates already exist to either extract the information you require, or act as a starting point for your own design.

#### Access   **Tools | Document Template Designer**

Also, through the Generate Documentation dialog or the *Document Generation* folders in the project Resources window

#### The Document Template Designer

The Document Template Designer consists of:

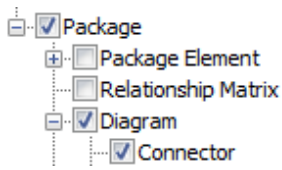

- A Toolbar, through which you create or select a template to work on, save your work, and generate and view the test reports
- A Sections panel, on which you select the components of the model to report on
- A Content panel, in which you develop the content and layout of the report, using an extensive range of context menu options

Toolbar Options

Icon	Action	See also
	Creates a new template. A prompt displays for you to enter the name of the new template and, optionally, the name of an existing template to use as a base.	<a href="#">Custom Document Templates</a> <small>[2682]</small>
	Saves changes to the current template.	
	Saves the current template as a new template. A prompt displays for the new template name.	
	Displays a range of document options that you can set to apply to all reports generated using the template. These options filter and organize the information presented in the report.	<a href="#">Document Options</a> <small>[2654]</small>
	Opens the Resources window and/or folder containing the currently-displayed document template, and highlights the template name.	<a href="#">Resources</a> <small>[1173]</small>
	Toggles the Document Generator view between showing the Sections hierarchy panel and hiding it.	<a href="#">Setting Sections for Reporting</a> <small>[2688]</small>
	Displays the Template Group name in which to locate or save the template; defaults to <b>Model Templates</b> .  Click on the drop-down arrow and select the appropriate Template Group name to search in. This filters the options in the next field to templates within that group only. For example, Cover Pages, or 'DavidG Reports'.	
	Displays a list of the templates in the Template Group you specified in the previous field. To view or edit an existing template, click on the drop-down arrow and select the template name.  <ul style="list-style-type: none"> <li>The system templates are protected; when you select one all editing options are grayed out</li> <li>Custom templates are available to edit</li> </ul>	<a href="#">Custom Document Templates</a> <small>[2682]</small>
	Displays the path and name of the file into which to generate the test report from the template.	

Icon	Action	See also
	If no file path is shown, you can either type one in or use the browser button (below).	
	Displays the browser dialog, in which you can locate and select the file to hold the generated test report.	
	Generates and displays the test report based on the template.  To generate a test report, you need to specify a target file (above) and select a Package, diagram or element in the Project Browser to run the report on. You could develop a special test Package for this purpose.	
	Displays the report held in the file specified in the file path field.  You can return to a generated report many times whilst you review the effects of different sections of the template you are editing.	

### The Sections and Content Panels

Facility	Description	See also
<b>Sections Panel</b>	Consists of a hierarchy of model components and their properties, each with a checkbox. To include information on a type of component in the report, you select the checkbox against it.  As you select checkboxes, corresponding pairs of open/close markers display in the Content panel; for example:	<a href="#">Setting Sections for Reporting</a> <sup>[2688]</sup>
	<div> <div> <b>Sections panel</b>  </div> <div> <b>Content Panel</b> <pre>package &gt; diagram &gt; connector &gt; &lt; connector &lt; diagram &lt; package</pre> </div> </div>	
<b>Content Panel</b>	The editing area, in which you develop the structure and content of the template.  As you add section markers to the template (as above), various pointer texts display between them such as:  <code>element&gt;</code>	<a href="#">Add Section Content</a> <sup>[2702]</sup>

Facility	Description	See also
	<p>[right-click-to-insert-Element-field(s)]  <b>&lt;element</b></p> <p>You replace this text with a range of fields that extract information from your model to display in the report.</p> <p>You can also add your own text.</p>	
<b>Content Panel Context Menu</b>	<p>Lists a wide range of options to:</p> <ul style="list-style-type: none"> <li>• Apply styles and formatting to the template</li> <li>• Insert objects such as tables, images and an internal contents list, and</li> <li>• Save, import and export the template file</li> </ul>	<a href="#">Custom Template Design Options</a> <sup>[2704]</sup>
<b>Content Panel Toolbars</b>	<p>Two text editing toolbars (based on the standard Windows toolbars) that you can use in conjunction with the context menu options.</p> <p>The lower toolbar provides an additional facility, for toggling the format of <b>sequenced</b> lists in the document. This is the drop-down arrow to the left of the bullet-list icon; it provides options for switching the list format of:</p> <ul style="list-style-type: none"> <li>• Single-level lists, with the sequence represented by arabic or roman numerals or upper case or lower case letters, and</li> <li>• Multiple-level lists, with the sequencing represented by arabic or roman numerals or symbols (whichever bullet symbol you are using)</li> </ul>	<a href="#">Format Paragraphs</a> <sup>[1064]</sup>

### Notes

- A standard file of global document styles, called Normal.rtf, is **automatically** applied to all new templates you create from scratch; it is possible to edit Normal.rtf to tailor the styles to your requirements, and to override these styles within the template
- You can also create special customized Tables of Contents and Cover Pages to be used optionally on any document report in place of any Cover Pages or Tables of Contents built into the report templates, and Stylesheets that can be chosen to override the Normal.rtf styles or any edited styles in a report template
- You can transport templates between models, using the **Export Reference Data** and **Import Reference Data** options

### 19.1.3.2 Setting Sections for Reporting

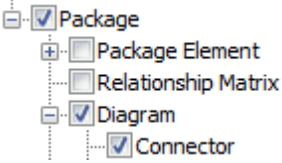

As part of designing or editing a template for generating a document report, you define the content to deliver in your report, specifically:

- Which **model features** to report on (such as elements, attributes, linked documents and Tagged Values), using the Sections panel of the Document Template Designer
- What **information** to provide on the instances of each feature (such as the name, type, phase, priority or author), using the Content panel of the Document Template Designer

The information you define here determines the structure of the report, what sections it contains and the order of those sections.

**Access**    **Tools | Document Template Designer > Sections**  
**Tools | Document Template Designer > Content**

#### Select model components to be documented in the report

Step	Action	See also
1	<p>Expand the some or all of the hierarchy in the Sections panel.</p> 	
2	<p>Select the checkbox next to the feature name; the feature name is then displayed as a pair of section tags in the Content panel of the Document Template Designer.</p> <p><b>element &gt;</b> <b>&lt; element</b></p> <p>For features in the lower levels of the hierarchy, selecting a child feature automatically selects the parent level(s) and adds the parent tags to the Contents panel.</p>	
3	<p>If you want to change the sequence of sections, click on the appropriate feature name in the Sections hierarchy and click on  or  to move the feature name up or down.</p>	

Step	Action	See also
	The position of the feature name within the Sections hierarchy determines the position of the section documenting that feature in the Content panel, and hence in the report. You can change the sequence either before or after you have selected the checkboxes, it makes no difference.	
4	For each selected feature, click between the section tags in the Contents panel and add text, or right-click and select the <b>Insert Fields</b> context menu option to add fields.	<a href="#">Add Section Content</a> <sup>[2702]</sup>

### Notes

- More specific guidance is provided for selecting the following features:
  - Child objects
  - Embedded elements
  - Profiled Relationship Matrices
  - Constraints and Scenarios
  - Linked Documents and Document Artifact contents
  - Elements held in external packages
  - Tagged Values
  - Sections formatted as tables
  - Using the Custom section for Custom Query Fragments

### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | RTF Templates | Add a Section**

### 19.1.3.2.1 Child Objects

An object in your model can have subordinate objects: for example, elements have child diagrams and other elements; packages contain other packages, elements and diagrams; and diagrams contain elements and connectors. When you set up your document report template to report on these subordinate objects, you can:

- Generate just the information you specify in selected fields, such as the object name only; for example, details of elements could be extracted in a number of places - Package elements, Embedded elements, source and target elements on connectors, child elements - and you might not require full details in all sections in your report, so you would just set a field for the element name in some of the sections

Alternatively

- Generate the same type of information as is provided for the parent-level objects of that type, by not defining any content (text or fields) between the section tags; for example, you could generate recursive documentation of child packages, getting the same level of detail as for the parent package

**Access** [Tools | Document Template Designer > Sections](#)  
[Tools | Documentation | Document Template Designer > Content](#)

#### Examples of reporting on child objects

Example	Detail	See also
<b>Specific object details</b>	<p>This template has valid content (text and the <b>Element.Name</b> field) between the <i>child element</i> tags. Therefore, in the generated report, the child element section will show only the element name and none of the detail shown for the parent element.</p> <pre> element&gt;{   {Element.Name}   Type: → {Element.Type} -- {Element.BaseClasses}   Status: → {Element.Status} .. Version {Element.Version} .. Phase {Element.Phase}   Package: → {Element.ParentPackage} ... Keywords: {Element.Tag}   Detail: → Created on {Element.DateCreatedShort}   {Element.Notes}   child element&gt;     → Child: {Element.Name}   &lt;child element &lt;/element </pre>	
<b>Default to parent-level detail</b>	<p>This template has no valid content between the <i>child element</i> tags. Therefore, in the generated report the child element section will default to the detail shown for the parent element.</p>	

Example	Detail	See also												
	<pre>element"&gt;{    {Element.Name}    Type: → → {Element.Type}..{Element.BaseClasses}   Status: → → {Element.Status}..Version: {Element.Version}..Phase: {Element.Phase}   Package: → → {Element.ParentPackage}..Keywords: {Element.Tag}   Detail: → → Created on: {Element.DateCreatedShort}    {Element.Notes}    child*element"&gt;   &lt;child*element   &lt;element</pre>													
Default parent detail for child objects	<table><tr><th>Child Object (Checkboxes)</th><th>Section Content Applied</th></tr><tr><td>Package &gt; Child Package</td><td>Package</td></tr><tr><td>Package &gt; Element &gt; Child Element</td><td>Package &gt; Element</td></tr><tr><td>Package &gt; Element &gt; Diagram</td><td>Package &gt; Diagram</td></tr><tr><td>Package &gt; Diagram &gt; Element</td><td>Package &gt; Element</td></tr><tr><td>Package &gt; Diagram &gt; Connector</td><td>Package &gt; Element &gt; Connec</td></tr></table>	Child Object (Checkboxes)	Section Content Applied	Package > Child Package	Package	Package > Element > Child Element	Package > Element	Package > Element > Diagram	Package > Diagram	Package > Diagram > Element	Package > Element	Package > Diagram > Connector	Package > Element > Connec	
Child Object (Checkboxes)	Section Content Applied													
Package > Child Package	Package													
Package > Element > Child Element	Package > Element													
Package > Element > Diagram	Package > Diagram													
Package > Diagram > Element	Package > Element													
Package > Diagram > Connector	Package > Element > Connec													

### Notes

- In principle, it is better to leave Child sections blank to replicate their parent sections

Child sections do not contain the same sub-section detail as their parents; **Element::Child Element** does not contain sub-sections such as Scenario or Attribute, so where Child Element sections are populated, these sub-sections are not rendered

An exception to this is cases where sub-sections are not required, but different formatting of the section fields is preferred

### Learn more

- [Setting Sections for Reporting](#)<sup>[2688]</sup>
- [Add Section Content](#)<sup>[2702]</sup>

#### 19.1.3.2.2 Report on Embedded Elements

As part of your model, you might have created embedded (structural) elements on an element, such as:

- ActivityParameter
- RequiredInterface
- ActionPin
- Port
- EntryPoint
- ExpansionNode
- ObjectNode

- ProvidedInterface
- ExitPoint
- Part

When you design a document report template, you can add a section to specifically identify and report on these embedded elements.

**Access** [Tools | Document Template Designer > Sections](#)

#### Add section to report on embedded elements on an element

Action	Detail	See also
<b>Add section</b>	<p>Select the <b>Package &gt; Element &gt; Embedded Elements</b> checkbox. The embedded elements section markers are added to the template:</p> <pre>embedded elements &gt; &lt;embedded elements</pre> <p>When the report is generated from the template, any embedded elements are listed with their parent element.</p>	

#### Notes

- The Embedded Elements section does not contain the same sub-sections as the parent Element section, such as Scenario or Attribute; if you do not define fields in the Embedded Elements section, it defaults to displaying the same detail as is in the Element section, whereas if you do add fields, only those field values are shown

#### Learn more

- [Setting Sections for Reporting](#) <sup>[2688]</sup>
- [Child Objects](#) <sup>[2690]</sup>
- [Add Section Content](#) <sup>[2702]</sup>
- [Manage Structural Elements](#) <sup>[935]</sup>

#### **19.1.3.2.3 Reporting Profiled Relationship Matrices**

When you are using the Relationship Matrix, you search on combinations of source and target packages, element types, connector type and connector direction. You can save your frequently-used combinations as profiles, and you can include the results of using these profiles in your document report by setting up a section in the report template.

You do not directly specify a matrix profile; the Document Generator returns the Relationship Matrix for all profiles that include the documented package as the source **or** target package.

**Access** [Tools | Document Template Designer > Sections](#)

**Add section to report on Relationship Matrix contents**

Action	Detail	See also
<b>Add section</b>	<p>Select the <b>Package &gt; Relationship Matrix</b> checkbox; the relationship matrix section markers are added to the template.</p> <p>Right-clicking between the markers and add the Image field to return the relationship matrix in the report.</p> <pre>relationship matrix &gt; {Matrix.Image} &lt; relationship matrix</pre> <p>You can also insert a number of fields to identify specific aspects of the profile, such as relationship name, direction, type, target element and element type, and source element and element type.</p>	<a href="#">Add Section Content</a> <sup>[2702]</sup>

**Notes**

- You can view a list of the Relationship Matrix profiles in your project in the Resources window, in the *Matrix Profiles* folder

**Learn more**

- [Relationship Matrix](#)<sup>[727]</sup>
- [Matrix Profiles](#)<sup>[735]</sup>
- [Resources](#)<sup>[1173]</sup>

**19.1.3.2.4 Report on Constraints and Scenarios**

In the Document Template Designer, you can create sections to include information from your model on:

- Constraints* on Package Elements, Elements, Connectors and Attributes, and
- Scenarios* for Package Elements and Elements

You can set additional options in the Constraints and Scenarios sections to define what **types** of constraint or scenario are included in your reports.

**Access**   **Tools | Document Template Designer > Sections**

**Set sections to extract Constraint and Scenario details**

Object	Detail	See also
<b>Constraints</b>	<p>In the Sections panel, you can choose any or all of the following constraint option checkboxes:</p> <ul style="list-style-type: none"> <li><b>Constraint-Pre</b> - to include all constraints of the type 'pre-condition' in</li> </ul>	<a href="#">Constraints</a> <sup>[963]</sup>

Object	Detail	See also
	<p>this section of the report</p> <ul style="list-style-type: none"> <li>• <b>Constraint-Post</b> - to include all constraints of the type 'post-condition' in this section of the report</li> <li>• <b>Constraint</b> - to include all constraints that have not been generated in the Pre-Constraint and Post-Constraint sections of the report</li> </ul> <p>Set any fields you need, between the section markers.</p>	<p><a href="#">Add Section Content</a><sup>[2702]</sup></p>
<b>Scenarios</b>	<p>In the Sections panel, you can choose any or all of the following scenario option checkboxes:</p> <ul style="list-style-type: none"> <li>• <b>Element &gt; Scenario</b> - to include all scenarios in this section of the report; if any of the following sections are also selected, the report includes all scenarios that are not exception paths</li> <li>• <b>Element &gt; Scenario &gt; Exception</b> - to include all exceptions for each scenario</li> <li>• <b>Element &gt; Scenario &gt; Structured Scenarios</b> - to include all scenario steps in the scenario sections of the report</li> <li>• <b>Element &gt; Scenario &gt; Structured Scenarios &gt; Exception</b> - to include the steps for each exception path in the scenario sections of the report</li> </ul> <p>Set any fields you need, between the section markers.</p>	<p><a href="#">Scenarios</a><sup>[965]</sup></p> <p><a href="#">Add Section Content</a><sup>[2702]</sup></p>

#### Learn more

- [Setting Sections for Reporting](#)<sup>[2688]</sup>

#### 19.1.3.2.5 Reporting Linked Documents

If you have large quantities of information to provide on an element or package, you can attach it as a formatted document either as the content of a Document Artifact element associated with your subject element, or by attaching the document file directly to the element (depending on the edition of Enterprise Architect you are using). In either case, you can include the linked document contents **in your document report** by selecting one or more of the **Linked Document** checkboxes in the report template definition.

**Access**   **Tools | Document Template Designer > Sections**

#### Add sections to report on Linked Documents

Action	Detail	See also
<b>Add sections</b>	<p>Select the checkboxes for the levels of Linked Document you want to include in the report:</p> <ul style="list-style-type: none"> <li>• <b>Package &gt; Package Element &gt; Linked Document</b></li> </ul>	<p><a href="#">Linked Documents</a><sup>[1044]</sup></p> <p><a href="#">Creating Document Artifacts</a><sup>[1046]</sup></p>

Action	Detail	See also
	<ul style="list-style-type: none"> <li>Package &gt; Package Element &gt; External Requirements &gt; Linked Document</li> <li>Package &gt; Element &gt; Linked Document or</li> <li>Package &gt; Element &gt; External Requirements &gt; Linked Document</li> </ul> <p>The linked document is rendered into the document report at:</p> <pre>linked document &gt; &lt;linked document</pre>	

### Notes

- In some system templates that you might copy, the **Linked Document** checkbox is only available as a child of the **External Requirements** checkbox
- You do not need to add any fields between the linked document section markers

### Learn more

- [Setting Sections for Reporting](#) 

### Learning Center topics

- Alt+F1 | Enterprise Architect | Reporting | RTF Templates | Include Linked Documents**

#### 19.1.3.2.6 Report Elements From External Packages

Elements can be re-used in different diagrams across a model, which can often mean that a diagram contains 'external' elements from packages **other than** the diagram's parent package. Using the Document Template Designer, you can create **custom** templates to generate reports showing all elements used in a package with 'internal' and 'external' elements grouped separately, or only the elements actually held within a package. You can also select options to expose the external elements from all diagrams in a package, or only from selected diagrams in the package.

The separation of 'external' and 'internal' elements avoids duplication of information and identifies the elements that impact the package but are not part of the package structure. Normally, you would report the same level of detail for each internal and external element, but you can also define a smaller group of details for the external elements, including the name of the parent package.

**Access**   **Tools | Document Template Designer > Sections**

**Add sections to include elements in diagrams**

Step	Action	See also
1	<p>In the Sections panel on the left-hand side of the editor window, select the <b>Package &gt; Element</b> checkbox.</p> <p>Selecting the checkbox adds the following set of sections to the Content panel of the template:</p> <pre>package &gt; [right-click-to-insert-Package-field(s)] element &gt; [right-click-to-insert-Element-field(s)] &lt; element &lt; package</pre>	<a href="#">Setting Sections for Reporting</a> <sup>[2688]</sup>
2	<p>Delete the two [right-click-to...] texts and after the:</p> <ul style="list-style-type: none"> <li><code>package &gt;</code> section marker, type <b>Package Name:</b> then right-click and select the <b>Insert Field   Name</b> option</li> <li><code>element &gt;</code> section marker, type <b>Element Name:</b> then right-click and select the <b>Insert Field   Name</b> option</li> </ul> <p>The template now resembles the following illustration:</p> <pre>package &gt; Package Name: {Pkg.Name} element &gt; Element Name: {Element.Name} &lt; element &lt; package</pre>	<a href="#">Add Section Content</a> <sup>[2702]</sup>
3	<p>In the Sections panel, select the <b>Package &gt; Diagram &gt; Element</b> checkbox.</p> <p>Selecting the checkbox extends the set of sections in the Content panel of the template:</p> <pre>package &gt; Package Name: {Pkg.Name} element &gt; Element Name: {Element.Name} &lt; element diagram &gt; [right-click-to-insert-Diagram-field(s)] element &gt; [right-click-to-insert-Element-field(s)] &lt; element &lt; diagram &lt; package</pre>	
4	<p>Delete the two [right-click-to...] texts and after the:</p> <ul style="list-style-type: none"> <li><code>diagram &gt;</code> section marker type <b>Diagram:</b> then right-click and select the</li> </ul>	

Step	Action	See also
	<p><b>Insert Field   Name</b> option</p> <p>Delete the space between the <b>element &gt;</b> section markers. The template now resembles the following illustration:</p> <pre> package &gt; Package Name: {Pkg.Name} element &gt; Element Name: {Element.Name} &lt; element diagram &gt; Diagram: {Diagram.Name} element &gt; &lt; element &lt; diagram &lt; package </pre> <p>Because the <b>Diagram &gt; Element</b> section does not contain any fields, the type of content of this section in the generated report is determined by the <b>Package &gt; Element</b> section.</p>	

### Specify diagrams & generate report

Step	Action	See also
1	<p>Select the appropriate option:</p> <ul style="list-style-type: none"> <li>In the Diagram Properties dialog for <b>selected</b> diagrams, the <b>Document each contained element in RTF</b> checkbox, to identify <b>all</b> the elements in those diagrams in your report, or</li> <li>On the Generate RTF Documentation dialog, the <b>Include all diagram elements in report</b> checkbox to include <b>all</b> elements in <b>each and every</b> diagram covered by the report</li> </ul>	<a href="#">Diagram Options</a> <sup>[2667]</sup> <a href="#">Generate Documentation</a> <sup>[2644]</sup>
2	<p>In the Project Browser, select the package to report on, and execute the report through either:</p> <ul style="list-style-type: none"> <li>The Document Template Designer, or</li> <li>The Generate Documentation Dialog</li> </ul>	<a href="#">Design Custom Document Templates</a> <sup>[2684]</sup> <a href="#">Generate Documentation</a> <sup>[2644]</sup>
3	The generated report for this example resembles the following output:	

Step	Action	See also
	<p> <a href="#">Package Name: BlockFrame</a>  <a href="#">Element Name: Activity1</a>  <a href="#">Element Name: ActivityInitial</a>  <a href="#">Element Name: Block1</a>  <a href="#">Element Name: Block2</a>  <a href="#">Element Name: Block3</a>  <a href="#">Element Name: Block4</a>  <a href="#">Element Name: Block8</a>  <a href="#">Element Name: ExceptionHandler1</a>  <a href="#">Diagram: BlockFrame</a>  <a href="#">Element Name: Class-who</a>  <a href="#">Element Name: Class2</a>  <a href="#">Element Name: Class3</a> </p> <p>The report shows that the <i>BlockFrame</i> package contains 8 elements, but has links to three elements from other packages because those three elements have been used in the <i>BlockFrame</i> diagram.</p>	

### Notes

- The illustrations in this description show the very simplest set-up, to achieve the result of identifying external elements in a report; you can, if you wish, populate the report with other sections and fields, leaving the **Diagram > Element** section empty to duplicate the structure of the **Package > Element** section
- If you do add fields to the **Diagram > Element** section, the section will have its **own** structure and format and can provide different element details; for example, selecting the **Insert Field | Name (Full)** menu option adds the `{Element.FullName}` field, which identifies each external element's parent package
- If you insert the **Package > Diagram > Element** section but *not* the **Package > Element** section, the subsequent report will show just the elements used in each diagram, without distinguishing between external and internal elements
- If you insert the **Package > Element** section but not the **Package > Diagram > Element** section, the subsequent report will show just the elements held in the package

### Learning Center topics

- [Alt+F1 | Enterprise Architect | Reporting | RTF Templates | Reporting Elements from External Packages](#)

#### 19.1.3.2.7 Report on Tagged Values

Tagged Values are used extensively across the objects of your model, including:

- Package Elements
- Elements
- Connectors and their Source and Target elements
- Attributes
- Operations (Methods) and

- External Requirements

When designing a template to report on these objects, you can include information on their Tagged Values either:

- As a group, using the Tagged Value subsection to identify all Tagged Values used in the object, or
- Individually, using the **valueOf()** field to extract a specific value of a specific tag

Access   **Tools | Document Template Designer > Sections**

#### Extract information on Tagged Values

Action	Detail	See also
<b>Insert a Tagged Value section</b>	<p>The Tagged Value section reports all Tagged Values for the object.</p> <p>In the Sections panel, select the checkbox for each object to report on, and for the Tagged Value subsection for that object. For example:</p> <ul style="list-style-type: none"> <li>• <b>Package &gt; Package Element &gt; Tagged Value</b></li> <li>• <b>Package &gt; Connector &gt; Source &gt; Tagged Value</b></li> <li>• <b>Package &gt; Element &gt; External Requirements &gt; Tagged Value</b>, or</li> <li>• <b>Package &gt; Element &gt; Method &gt; Tagged Value</b></li> </ul> <p>The Tagged Value section markers display in the Contents panel.</p> <p><b>tagged value &gt;</b>  <b>[right-click-to-insert-Tagged-Value-field(s)]</b>  <b>&lt; tagged value</b></p> <p>Delete the <i>[right-click-to-...]</i> text, right-click in the space and select the <b>Insert Fields</b> option to add Tagged Value <b>Name</b>, <b>Notes</b> and/or <b>Value</b> fields.</p>	<p><a href="#">Setting Sections for Reporting</a> <sup>[2688]</sup></p> <p><a href="#">Add Section Content</a> <sup>[2702]</sup></p>
<b>Insert a valueOf() field</b>	<p>For any object having a Tagged Value, you can add a <b>valueOf()</b> field to your report template to extract the value of a specific tag. This should be one of the tags normally associated with the object, such as <i>ConnectorAltName</i> for a connector.</p> <p>Obtain the name of the tag before starting this procedure.</p> <p>To insert the field, right-click between the section tags for the <b>object</b> and select the <b>Insert Field   valueOf</b> option.</p> <p>The Document Template Designer prompts you to type in the name of the tag from which to extract the value. Type the name and click on the <b>OK</b> button. The Document Template Designer adds the field at the cursor position, in the format:</p> <p style="text-align: center;">{Objecttype.valueOf(tagname)}</p>	<p><a href="#">Add Section Content</a> <sup>[2702]</sup></p>

Action	Detail	See also
	<p>For example:</p> <pre>{Connector.valueOf(ConnectorAltName)}</pre> <p>The <b>valueOf</b> field extracts just the <b>value of the tag</b>, so for clarity you could type some lead-in text or the meaning of the tag, immediately preceding the value field. For example:</p> <p><b>Alternative Name:</b> {Connector.valueOf(ConnectorAltName)}</p>	

#### 19.1.3.2.8 Create Sections as Tables

In a **document report template**, you can render a model section as a table, defined with any number of columns but with only *two* rows:

- The first row is used to describe the **headings** of the columns, which you define and format yourself
- The second row defines the output, which you specify by right-clicking in each cell and selecting the output type from the **field list**; the output is then generated iteratively for every occurrence of the section in question

For example, you might set up the **Model > Glossary >** section as a section table, using the table definition:

model >		
<b>Model Glossary</b>		
glossary >		
<b>Term</b>	<b>Type</b>	<b>Meaning</b>
{ModelGlossary.Term}	{ModelGlossary.Type}	{ModelGlossary.Meaning}
< glossary		
< model		

This table definition renders the document output:

<b>Model Glossary</b>		
<b>Term</b>	<b>Type</b>	<b>Meaning</b>
Accounting Periods	Business	A defined period of time whereby performance reports may be extracted. (normally 4 week periods)
Association	Technical	A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.

**Access** Select **Table** from the menu bar at the top of the Document Editor window, or right-click and select the **Table** option within either:

- The Content panel of the Document Template Designer or
- The text area of the document

### Create and format a table

To	Action	See also
<b>Insert a table in the document</b>	<p>Position the cursor on the point in the text to create the table, and select the <b>Table   Insert Table</b> menu option.</p> <p>The New Table Parameters dialog displays, in which you specify the number of table rows and columns. For a model section table in a report template you can accept the default values of two rows and three columns. Click on the <b>OK</b> button.</p> <p>Your table might be invisible; if so, select the <b>Table   Show Gridlines</b> menu option to reveal the table and cell borders in dotted lines. These lines are for guidance in creating the document, and do not display on the printed document. You can add printable borders if you wish, using other context menu options.</p> <p>The editor initially creates a table with cells of equal width across the page; you can change the cell width by dragging the cell borders using the mouse, or using other context menu options.</p>	<a href="#">Create Tables</a> 
<b>Add a header row</b>	<p>Select the top row of the table, and then select the <b>Table   Header Row</b> menu option. Apply any heading text, settings and formatting to the highlighted row.</p> <p>In the document or compiled report, the heading row is repeated at the top of the columns each time the table flows on to a new page. In a report, if the heading row is populated with the values from field names, the heading rows on subsequent pages reflect the values from that first row.</p> <p>This option operates on the single row at the top of the table, and not on multiple rows.</p>	
<b>Populate data row with fields</b>	<p>Right-click on the table cell and select the <b>Insert Field   &lt;field name&gt;</b> option to add one or more fields to the cell.</p> <p>When the report is generated, the field values are extracted and displayed in the table for each instance of the object, such as an element or attribute.</p>	

### Notes

- In a document report template, if you type a carriage return between the end of the table and the section terminator, the table you generate has a line space between the rows; for example:

```

package*>@
?
@
element*>@
*      ElementName*      Author*
*      {ElementName}*      {ElementAuthor}*
@
<~element@
<~package@

```

← Carriage Return

This generates the table:

	Element Name	Author
	Choose Recipient	John Redfern

Line Space

	Manage Contacts	Walter Frederick
--	-----------------	------------------

To avoid this, remove any carriage return between the end of the table and the section terminator, as follows:

```

package*>@
?
@
element*>@
*      ElementName*      Author*
*      {ElementName}*      {ElementAuthor}*
<~element@
<~package@

```

← No Carriage Return

This generates a table with no space between the rows:

	Element Name	Author
	Choose Recipient	John Redfern
	Manage Contacts	Walter Frederick

#### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | RTF Templates | Add a Table** (to a report)

#### 19.1.3.2.9 Add Section Content

In the Document Template Designer, as you select the check boxes in the Sections panel to report on the different objects and features of the model, pairs of highlighted tags are added to the Contents panel. Many of these pairs of tags have a short instruction between them, as indicated below:

```

sectionname >
[right-click-to-insert-<objectname>-fields]
< sectionname

```

Where the text message is shown, you can delete it and use the space between the tags to provide the **content** of the report, by:

- Typing or pasting boiler-plate text that you want to include in your reports, and
- Inserting fields that extract the values of specific characteristics and properties of the object

**Access** [Tools | Document Template Designer > Content](#)

#### Add information content to template

Action	Detail	See also
<b>Add text</b>	<p>Click in the space between the tags (or anywhere else in the template) and type or paste <b>Ctrl+V</b> the text you want to display in the report.</p> <p>Highlight and right-click on text to format it, using the Document Editor commands.</p>	<a href="#">Custom Template Design Options</a>  2704
<b>Insert fields</b>	<p>Right-click in the area between the opening and closing tags, and select the <b>Insert Field</b> context menu option; this displays a context-sensitive list of fields to add to this section of the template.</p> <p>Click on the name of the field you want to add. The Document Template Editor displays the field tag in the text space. For example:</p> <pre>{Element.ParentPackage}</pre> <p>When you generate a report from the template, the report generator replaces the field name with the actual value. You might need to type lead-in text and add spaces to support the field value, or use the fields in a table with row and column headings.</p> <p>You can insert as many fields as you want from the list; you usually apply each field once, as the report generator applies the template instructions to each instance of the object.</p>	<a href="#">Create Tables</a>  1075

#### Notes

- As the **model** and **linked document** tags do not require fields, you cannot display the editor context menu between these tags
- The **child element**, **embedded element** and **child package** tags represent sections that, **can** have defined fields, but these fields prevent the sections from replicating the structure of their parent **element** and **package** sections; as it is preferable to use the parent structures, these tags do not **prompt** you to add fields with the *[right-click-to-insert-<objectname>-fields]* message, although the message is still applicable
- If you select a field with short date format (such as *Pkg.DateCreatedShort*, *Diagram.DateModifiedShort* or *Element.DateCreatedShort*) the format is actually drawn from the MS Windows settings

To use a different short date format, click on the **Start** icon on the Windows desktop and select the **Control Panel | Regional and Language Options | Customize** option

### 19.1.3.3 Custom Template Design Options

The Document Template Designer, through the common document Editor, provides a wide range of options for defining the format and styles of the document reports generated from your custom templates. You access the Document Editor options through a context menu and, for some of the functions, through the toolbars at the top of the Content panel.

**Access**   **Tools | Document Template Designer: <template>**

When you have opened the template in the Designer, you display the context menu by right-clicking in the **Content** panel.

#### Option Descriptions

The menu option descriptions are grouped according to the actions you are performing.

Actions	Link
<b>Creating and importing templates</b>	<a href="#">File Control</a> 
<b>Configuring the editor page display and formatting tools shown</b>	<a href="#">Editor Tool Display Options</a> 
<b>Incorporating stylesheets, special texts and Tables of Contents</b> <b>Managing the base styles in the Normal.rtf style template file</b>	<a href="#">Styles, Special Texts &amp; Table of Contents</a>  <a href="#">The Normal.rtf Style Template</a>

Protecting document and template text from accidental change	<a href="#">Protect Document Contents</a> <sup>[1093]</sup>
Printer setup and printing documents	<a href="#">Print Report Documents</a> <sup>[1094]</sup>

### Notes

- Throughout your template editing:
  - To undo one or more immediately previous edits, press **Ctrl+Z**, or select the **Edit | Undo** menu option; you can still undo a change even after you have saved the change
  - To redo one or more immediately previous undone edits, press **Ctrl+Y**, or select the **Edit | Redo** menu option

#### 19.1.3.4 Notes on Creating Stylesheets

**Stylesheets** define a range of formatting parameters that control the appearance and layout of a document report. You create them to provide an alternative set of styles to the Normal.rtf file and to any special styles redefined within a document report template. A user can **choose** to apply a Stylesheet to **any** kind of document report they are generating, in which case the styles in the Stylesheet override the styles with matching names in the template or Normal.rtf. You can, therefore, create a Stylesheet that:

- Redefines and overrides certain styles
- Does not include other named styles, so use of those styles defaults to the template or Normal.rtf file definition, and
- Provides additional styles that can be applied by editing the generated report

Each custom Stylesheet can define a totally different page layout and document styles to other Stylesheets and to the Normal.rtf Stylesheet.

The simplest way to create a new Stylesheet is to copy one of the system-provided files (for print output or for

online output) or another custom Stylesheet, and edit the style definitions in the copy. However, you can create a Stylesheet from scratch if you wish; this would be initially derived from the Normal.rtf file.

**Access** **Project | Resources > Document Generation > User Templates | right-click on Style Sheets | Create Document Template**  
**Project | Resources > Document Generation > System Templates > Style Sheets | right-click on <stylesheet name> | Copy Document Template**  
**Tools | Document Template Designer | **

You can also create Stylesheets within the Templates tab of the Generate Documentation dialog

In each of these cases, you create the new Stylesheet file through the New Document Template dialog, and edit the styles in the Document Template Designer using the Styles, Special Text and Table of Contents facilities.

#### Learn more

- [Styles, Special Text & Table of Contents](#)<sup>[1054]</sup>

### 19.1.3.5 Notes on Creating Tables of Contents

A **Table of Contents** template defines the style, levels and numbering formats of a document report Table of Contents that a user can **choose** to apply to **any** kind of document report they are generating, in which case the Table of Contents template overrides any Table of Contents styles defined in the template or Normal.rtf file.

The simplest way to create a new Table of Contents is to copy one of the system-provided files (for portrait output or for landscape output) or another custom Tables of Contents, and edit the style definitions in the copy. However, you can create a Table of Contents from scratch if you wish; this would be initially derived from the Normal.rtf file.

**Access** **Project | Resources > Document Generation > User Templates | right-click on Table of Contents | Create Document Template**  
**Project | Resources > Document Generation > System Templates > Table of Contents | right-click on <table of contents name> | Copy Document Template**  
**Tools | Document Template Designer | **

You can also create Table of Contents within the Templates tab of the Generate Documentation dialog

In each of these cases, you create the new Table of Contents template file through the New Document Template dialog, and edit the styles in the Document Template Designer using the Styles, Special Text and Table of Contents facilities.

#### Learn more

### 19.1.3.6 Notes on Creating Cover Pages

A **Cover Page** template defines the style, fields and format of a document report front cover that a user can **choose** to apply to **any** kind of document report they are generating, in which case the Cover Page styles override any styles of the same name defined in the report template or Normal.rtf file.

The simplest way to create a new Cover Page is to copy one of the system-provided files (for portrait output or for landscape output) or another custom Cover Page Contents, and edit the style definitions in the copy. However, you can create a Cover Page from scratch if you wish; this would be initially derived from the Normal.rtf file.

**Access** **Project | Resources > Document Generation > User Templates | right-click on Cover Pages | Create Document Template**  
**Project | Resources > Document Generation > System Templates > Cover Pages | right-click on <cover page name> | Copy Document Template**  
**Tools | Document Template Designer | **

You can also create a Cover Page within the Templates tab of the Generate Documentation dialog

In each of these cases, you create the new Cover Page template file through the New Document Template dialog, and edit the styles in the Document Template Designer using the Styles, Special Text and Table of Contents facilities.

#### Learn more

- [Selecting a Cover Page](#) <sup>[2654]</sup>
- [Custom Document Templates](#) <sup>[2681]</sup> (New Document Template dialog)

### 19.1.3.7 Import a Document Template

Many organizations have established corporate formats and templates, or might design templates outside Enterprise Architect. If you want to use such 'external' templates from your business to apply formats and standards to your document reports, you can import them into your document template library.

**Access** **File | Import**

#### Import a template from an external directory

Step	Action	See also
1	Save the external template as a document.	

Step	Action	See also
2	In Enterprise Architect, create a new blank template; name the template but do not specify an existing template to copy from.	<a href="#">Custom Document Templates</a>  <sup>[2682]</sup>
3	When the template is listed on the Templates tab of the Generate Documentation dialog, click on the name and click on the <b>Edit</b> button.  The Document Template Designer displays.	<a href="#">Design Custom Document Templates</a>  <sup>[2684]</sup>
4	Right-click in the Content panel and select the <b>File   Import</b> context menu option.  The File Open dialog displays.	
5	Locate your template file, and click on the <b>Open</b> button.  The Open dialog closes, returning you to the Document Template Designer; this now contains your imported template.	
6	Right-click and select the <b>File   Save</b> menu option.  If necessary, make any changes to the template and select <b>File   Save</b> again before selecting <b>File   Close</b> to exit the dialog.	<a href="#">Custom Template Design Options</a>  <sup>[2704]</sup>

### Notes

- Standard graphical images (such as a logo in the header, main text or footer) are imported; however, any **meta-file** graphics are not imported
- You can select the new template to use in generating a document report, either on the Generate Documentation dialog or in a Master Document or Model Document element

### Learn more

## 19.1.3.8 Template Fragments

Within a document template it is possible to include one or more sub-templates, or **Template Fragments**. Using Template Fragments, you can include in your document reports information from **SQL Queries** and **Model Scripts**, as well as Project Browser data, providing a greater level of customization of the document output. You can also reuse the same Template Fragment in several different templates, so you can develop a library of common Template Fragments that can be used to build larger, more complex document reports.

A Template Fragment is created through the same process as a normal, full-document template. Each Template Fragment can have its own Document Options, such as the filtering and sorting applied.

You can also use, copy and edit a number of system-provided Template Fragments, which you can access from the *Document Generation > System Templates > Fragments* folder in the Resources window.

### Template Fragments - Process Overview

Step	Action	See also
1	Create the Template Fragments to be included in your template.	<a href="#">Creating a Template Fragment</a> 
2	Create a normal, full-document template that is to include your Template Fragments.	<a href="#">Design Custom Document Templates</a> 
3	Within this full-document template add references to your Template Fragments in the appropriate locations.	<a href="#">Adding Fragments to a Template</a> 

### Notes

- You cannot generate documentation directly from a Fragment; to use a Fragment it must be included in a template

### Learn more

- [Generate Documents](#) 
- [Document Templates](#) 
- [Resources](#) 
- [Enhanced Reporting Webinar](#) (Online Resource; speakers/headphones required, allow approx. 20 minutes for viewing)

### Learning Center topics

- Alt+F1 | Enterprise Architect | Reporting | RTF Template Fragments | Overview**

#### 19.1.3.8.1 Creating a Template Fragment

A Template Fragment can return data from either an SQL Query, Model Scripts or Project Browser data. The process of defining the content of a Template Fragment depends on which of these types of data you want your Template Fragment to return, although in all cases the process is very similar to creating a normal document template.

**Access** **Project Browser package context menu | Documentation | Rich Text Format (RTF) Report (F8) > Templates**

### Create a new Template Fragment

Step	Action	See also
1	Click on the <b>New</b> button. The New Document Template dialog displays.	<a href="#">Document Templates</a>  <sup>[2681]</sup>
2	In the <b>New Template</b> field, type the name for the Template Fragment.	
3	In the <b>Copy Template</b> field, click on the drop down arrow and select either: <ul style="list-style-type: none"> <li>• <b>None</b>, to create an empty Template Fragment to develop from scratch, or</li> <li>• The name of an existing Template Fragment to act as a base</li> </ul>	
4	In the <b>Template Group</b> field either: <ul style="list-style-type: none"> <li>• Click on the drop-down arrow and select an existing group from the list, or</li> <li>• Type a name to generate a new template group, or</li> <li>• Leave this field blank, to <b>not</b> place the Template Fragment in a group</li> </ul> <p>The Template Group determines the location of the Template Fragment in the Resources window.</p>	<a href="#">Resources</a>  <sup>[1173]</sup>
5	Select the <b>Mark Template as Fragment</b> checkbox.	
6	Click on the <b>OK</b> button. The Document Template Designer displays in the Diagram View.	<a href="#">Design Custom Document Templates</a>  <sup>[2684]</sup>
7	Define the contents of your Template Fragment; the actual steps you follow depend on the data type you want the Template Fragment to return: <ul style="list-style-type: none"> <li>• Normal Document Template model data - the Template Fragment operates in the same way as a normal template</li> <li>• Custom SQL - returns data from a custom SQL query</li> <li>• Custom Scripts - returns data from a Model Script</li> </ul>	<a href="#">Design Custom Document Templates</a>  <sup>[2684]</sup> <a href="#">Custom SQL Fragments</a>  <sup>[2712]</sup> <a href="#">Custom Script Fragments</a>  <sup>[2714]</sup>
8	Once you have created the Template Fragment, you incorporate it into a normal template (or into an existing Template Fragment, if you wish).	<a href="#">Adding Fragments to a Document Template</a>  <sup>[2718]</sup>

#### Notes

- As with normal document templates, Template Fragments can also be created and opened via the **Resources window**
- Template Fragments in the Resources window are held in a *Fragments* folder in each of the

*Document Generation > System Templates* and *Document Generation > User Templates* folders, and are indicated by a red **T** symbol

- If you have an existing template that you want to use as a Template Fragment, open the template in the document editor and select the **Template Fragment** checkbox in the Document Options dialog
- If you embed a Template Fragment within another Fragment, report generation from the parent template will be slower

#### Learn more

#### **19.1.3.8.1.1 Custom Query Fragments**

You can create Template Fragments to return data from SQL Queries, or from Model Scripts. The first step in defining such Fragments is to use the **Custom Query** settings to enter either your SQL Search or a starting point for your Model Script.

**Access** **Tools | Document Template Designer: <template> > Content | File | Document Options > Custom Query**

#### Custom Query Options

Option	Action	See also
<b>Custom SQL</b>	Click on this radio button to enter an SQL Query.  You can then add fields within the <i>Custom</i> section of your Template Fragment, to refer to the data returned by the SQL Query.	<a href="#">Custom SQL Fragments</a> <sup>[2712]</sup>
<b>Custom Script</b>	Click on this radio button to display a field in which you specify a Model Script; click on the drop-down arrow and select the name of the Script that will be used by your Template Fragment.  You can then add fields within the <i>Custom</i> section of your Template	<a href="#">Custom Script Fragments</a> <sup>[2714]</sup>

Option	Action	See also
	Fragment that refer to the data returned by the Script.	

### Notes

- Custom Queries and the *Custom* template section can only be used in Template Fragments; they cannot be used in normal, full-document templates
- Custom Queries can reference the ID of the element or Package currently being processed by the document template, using the **#OBJECTID#** or **#PACKAGEID#** macros
- **#Branch#** gets the IDs of the child Packages of the current Package being processed, working recursively down to the lowest level of sub-Package; this is only valid when processing a Package - elements return a **0** value
- **#UserName#** gets the name of the user logged into version control
- **#Author#** takes the user name from the **Author** field in the General page of the Options dialog, so the defined search can be performed on objects created by that user (this value can be manually re-set in the Options dialog)
- **#Package#** gets the **package\_ID** of the currently-selected Package

  - **Create a SQL based Fragment 1**
  - **Create a SQL based Fragment 2**
  - **Create a Script Fragment 1**
  - **Create a Script Fragment 2**

You can create a Template Fragment to return data from an SQL Query. You do this by defining an SQL Query in the Document Options of the Template Fragment, then adding fields within the *Custom* section of your Template Fragment that refer to the columns returned by the SQL Query.

### Create an SQL Query Fragment

Step	Action	See also
1	Open or create a Template Fragment in the Document Template Editor.	<a href="#">Document Templates</a>  <sup>2687</sup> <a href="#">Creating a Template Fragment</a>  <sup>2709</sup>

Step	Action	See also
2	In the Document Template Editor, right-click on the Template background and select <b>File   Document Options</b> . The Document Options dialog displays.	
3	Select the Custom Query tab.	
4	In the <b>Template Fragment type</b> panel, select the <b>Custom SQL</b> radio button.	
5	In the main text field on the tab, type the SQL Query that is to be run on your model. This Query must return one or more columns; for example:  <pre>SELECT DocName AS TemplateName, Author AS TemplateLocation FROM t_document WHERE DocType = 'SSDOCSTYLE' and (IsActive = 1)</pre> <p>The SQL Query can also reference the ID of the Element or Package currently being processed by the document template, using the #OBJECTID# or #PACKAGEID# macros; for example:</p> <pre>SELECT Count ( Object_Type) AS CountOfActors FROM t_object WHERE Object_Type = "Actor" and Package_ID = #PACKAGEID#</pre>	
6	Click on the <b>OK</b> button to close the Document Options dialog.	
7	In the Document Template Editor, in the Sections panel, select the <b>Custom</b> checkbox to generate the <i>Custom</i> section.	<a href="#">Setting Sections for Reporting</a> <sup>[2688]</sup>
8	Within the <i>Custom</i> section, right-click and select the <b>Insert Custom Field</b> context menu option. A prompt displays for the name of the field to create.	
9	In response to the prompt, type the name of the column that is being returned by your Query; for example, <b>CountOfActors</b> . Click on the <b>OK</b> button.	
10	Repeat steps 8 and 9 for each column that you want to include in your report. Add any other formatting and content you need, to the Template Fragment.	
11	Save the Template Fragment, and add it to a normal document template.	<a href="#">Adding</a>

Step	Action	See also
		<a href="#">Fragments to a Document Template</a> <sup>[2718]</sup>

### Notes

- An Element Filter will not apply to the *Custom* section in a Template Fragment
- You can test your SQL Query using the SQL Editor in the Model Search window

### Learn more

- [Template Fragments](#)<sup>[2708]</sup>
- [Custom Query Fragments](#)<sup>[2711]</sup>
- [Create Search Definitions](#)<sup>[711]</sup>

### Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | RTF Template Fragments |**
  - **Create a SQL based Fragment 1**
  - **Create a SQL based Fragment 2**

You can create a Template Fragment to return data from a Model Script. You do this by creating a Script that returns an XML string in a specific format. You add a reference to this Script in the Template Fragment Document Options, then add fields within the *Custom* section of your Template Fragment that refer to the data returned by the Script.

### Creating a Script Fragment

Step	Action	See also
1	Using the Scripting window, create a Model Script that returns a string in XML format.  Examples are available of: <ul style="list-style-type: none"> <li>• A Script that returns data in the appropriate XML format</li> <li>• The XML format that the Script must return so that it can be used by a Template Fragment</li> </ul>	<a href="#">Scripting</a> <sup>[2791]</sup> <a href="#">Example Template Fragment Script</a> <sup>[2718]</sup> <a href="#">Example Output of a Template Fragment Script</a> <sup>[2711]</sup>
2	Open or create a Template Fragment in the Document Template Editor. Right click on the Template background and select <b>File   Document Options</b> . The Document Options dialog displays.	<a href="#">Document Templates</a> <sup>[2681]</sup> <a href="#">Creating a Template Fragment</a> <sup>[2709]</sup>

Step	Action	See also
3	<p>Select the Custom Query tab and, in the Template Fragment type panel, select the <b>Custom Script</b> option.</p> <p>A blank field displays to the right of the options.</p>	
4	Click on the drop-down arrow and select your Script from the list.	
5	<p>In the main text field on the tab, type the entry point of your Script that returns the XML data.</p> <p>For example, if you were using the example script mentioned in step 1, then the entry point would be:</p> <pre>MyRtfData( #OBJECTID# );</pre> <p>To convey <b>Package</b> information, you can replace #OBJECTID# with #PACKAGEID#.</p>	
6	Click on the <b>OK</b> button to close the Document Options dialog.	
7	In the Document Template Editor, in the Sections panel, select the <b>Custom</b> checkbox to generate the <i>Custom</i> section.	<a href="#">Setting Sections for Reporting</a> <sup>[2688]</sup>
8	<p>Within the <i>Custom</i> section, right-click and select the <b>Insert Custom Field</b> context menu option.</p> <p>A prompt displays for the name of the field to create.</p>	
9	<p>In response to the prompt, type the name of the data field that is being returned by your script.</p> <p>Referring to the example from step 1, you would add <b>DateGen</b>.</p> <p>Click on the <b>OK</b> button.</p>	
10	<p>Repeat steps 8 and 9 for each data field that you want to include in your report.</p> <p>Add any other formatting and content you need, to the Template Fragment.</p>	
11	Save the Template Fragment, and add it to a normal Document Template.	<a href="#">Adding Fragments to a Document Template</a> <sup>[2718]</sup>

**Notes**

- Scripts have a limit of 60 seconds per call before control is returned to the Document Generator

Learning Center topics

- **Alt+F1 | Enterprise Architect | Reporting | RTF Template Fragments |**
  - **Create a Script Fragment 1**
  - **Create a Script Fragment 2**

The following JavaScript returns a row of data in XML format. This XML data can be returned in a document report using a **Custom Script** Template Fragment.

This script will also display the XML data in the System Output window, so you can easily check the output without running a document report.

```
! I N C Local Scripts.EAConstants-JScript

/*
 * Script Name: Document Properties
 * Author: Tom O'Reilly
 * Purpose: To display the properties of a document
 * Date: 02/02/2013
 */

function MyRtfData(objectID)
{
    var i;
    var xml DOM = new ActiveXObject( "MSXML2.DOMDocument.4.0" );
    xml DOM.validateOnParse = false;
    xml DOM.async = false;

    var node = xml DOM.createProcessingInstruction("xml", "version='1.0'
encoding='ISO-8859-1'");
    xml DOM.appendChild(node);

    var xml Root = xml DOM.createElement( "EADATA" );
    xml DOM.appendChild(xml Root);

    var xml DataSet = xml DOM.createElement( "Dataset_0" );
    xml Root.appendChild(xml DataSet);

    var xml Data = xml DOM.createElement( "Data" );
    xml DataSet.appendChild(xml Data);

    var xml Row = xml DOM.createElement( "Row" );
    xml Data.appendChild(xml Row);

    var xml Name = xml DOM.createElement( "DateGen" );
    var today = new Date();
    var dd = today.getDate();
    var mm = today.getMonth()+1; //January is 0!

    var yyyy = today.getFullYear();
    if(dd<10){dd='0'+dd} if(mm<10){mm='0'+mm} today = mm+'/' +dd+'/' +yyyy;

    xml Name.text = today;
    xml Row.appendChild(xml Name);
}
```

```

var xml Name = xml DOM.createElement( "TimeGen" );
var currentTime = new Date();
var hours = currentTime.getHours();
var minutes = currentTime.getMinutes();
if ( minutes < 10 )
{
    minutes = "0" + minutes;
}
xml Name.text = hours + ":" + minutes + " ";
xml Row.appendChild( xml Name );

var xml Name = xml DOM.createElement( "Author" );
xml Name.text = Session.UserName;
xml Row.appendChild( xml Name );

var xml Name = xml DOM.createElement( "EA_REPOS" );
xml Name.text = Repository.ConnectionString;
xml Row.appendChild( xml Name );

return xml DOM.xml;
};

Session.Output( MyRtfData(439) );

```

### Learn more

- [Scripting](#)<sup>[2791]</sup>
- [Template Fragments](#)<sup>[2708]</sup>
- [Creating a Template Fragment](#)<sup>[2709]</sup>
- [Custom Script Fragments](#)<sup>[2714]</sup>
- [The System Output Window](#)<sup>[169]</sup>

You can create a Template Fragment to return data from a Model Script into a document report. The Script must return one or more rows of data in the following XML format:

```

<EADATA>
  <Dataset_0>
    <Data>
      <Row>
        <DateGen>09/01/2013</DateGen>
        <TimeGen>9:31</TimeGen>
        <Author>John</Author>
        <EA_REPOS>C:\Users\John\Documents\Sample Model.eap</EA_REPOS>
      </Row>
    </Data>
  </Dataset_0>
</EADATA>

```

Each of these data fields in the XML (such as **DateGen**, **TimeGen**) refers to fields that can be included in the *Custom* section of a Template Fragment.

### Notes

- If the text is a formatted Note, add `formatted="1"` to the field row; for example: `<Author formatted="1"><i>John</i></Author>`

- [Custom Script Fragments](#)  <sup>[2714]</sup>

#### 19.1.3.8.2 Adding Fragments to a Document Template

A **Template Fragment** is a template that can be used as a smaller sub-section of a normal document template. You do not generate a report from a Template Fragment on its own; instead you use a normal template that includes **references** to one or more Template Fragments.

Fragments can be called into any of the following sections in the template:

- Package
- Element
- Attribute
- Method

When generating a document report, as the report generator processes each section in the template, if it encounters a reference to a Template Fragment it will process that Fragment, inserting its output in the appropriate location of the generated report.

**Access** [Project Browser package context menu | Documentation | Rich Text Format \(RTF\) Report \(F8\) > Templates](#)

#### Incorporating Template Fragments into a Document Template

Step	Action	See also
1	Create the Template Fragment(s) to be included in your document template, or identify system Template Fragments to use.	<a href="#">Creating a Template Fragment</a>  <sup>[2709]</sup>
2	Create a new document template, or open an existing template in the document editor.	<a href="#">Document Templates</a>  <sup>[2681]</sup>
3	In the Sections panel, select the checkbox against each section that will refer to the Template Fragment(s).	<a href="#">Setting Sections for Reporting</a>  <sup>[2688]</sup>
4	In the Content panel, at the appropriate point within one of these sections, right-click and select the <b>Insert Template</b> context menu option.  The Select Template dialog displays.	
5	Click on the drop-down arrow and select the Template Fragment to insert.	
6	Click on the <b>OK</b> button.	

Step	Action	See also
	The tag <b>{Template - &lt;template name&gt;}</b> is inserted at the current cursor position.	
<b>7</b>	Repeat steps 4 to 6 for each Fragment you want to insert into the document template.  Complete any other work you need to do on the template, then save it and use it to run reports.	

### Editing or Switching Template Fragments

**Access** Right-click on the red **Template** tag > <required option>

Option	Action	See also
<b>View / Edit Fragment</b>	Opens the selected Template Fragment in another instance of the Document Template editor.  If you have selected a System Fragment, you can view the Fragment but not edit it. If you have selected a Model (user-created) Fragment, you can edit the Fragment.	<a href="#">Design Custom Document Templates</a> <sup>[2684]</sup>
<b>Override Fragment</b>	(Option available for a selected System Fragment)  Opens another instance of the Document Template Editor, where the System Fragment is duplicated as a Model (user created) Fragment with the same name. You can edit this Fragment and save it, and the original template will apply that new Model fragment instead.	
<b>Switch Fragment</b>	Displays the <b>Select Template</b> dialog; click on the drop-down arrow and select a different Template Fragment.	

### Notes

- You can also add a Template Fragment to a document template by locating the Fragment in the *Document Generation* folder in the **Resources window** and dragging the Fragment into the Document Editor; Template Fragments are held in the *Fragments* folders within the *System Templates* and *User Templates* folders
- It is possible to embed a Template Fragment within another Fragment; however, this will slow down report generation

  - **Add Script Fragment to Template**

**19.1.4 The Legacy RTF Report Generator**

Creating a Rich Text Format (RTF) document is a simple and flexible process. An RTF document is based on a Package or an element in your project (more usually a Package). To produce a document, you select the Package or element to report on in the Project Browser, Package Browser, Diagram List or Model Search, then press **F8** to display the Generate Documentation dialog. On the Options tab, click on the **Switch Generator** button to access the legacy Rich Text Format Report dialog.

The Rich Text Format Report dialog enables you to set the exact contents and look and feel of your report. You enter the file name of the report, a heading, additional notes, template name (for saving the set-up) and other options. You can also select the style of the report; either plain or formal.

Optionally, you can set up a filter, the details to include, element types to exclude, whether to process child packages, whether to show diagrams and the diagram format.

You can switch back to the Generate Documentation dialog by clicking on the **Switch RTF Generator** button.

Notes

- The Legacy Generator is available if you have RTF templates created in releases of Enterprise Architect prior to 4.1, and you prefer to generate RTF reports using the original generator; however, as you can generate reports from these templates using the post-Enterprise Architect 4.1 RTF Generator, the Legacy Generator and instructions for its use are no longer updated
- Reports produced using the Legacy RTF Generator do reflect the Notes formatting feature in any text associated with elements
- The Rich Text Format Report dialog panels are individually described in the subsequent topics of this section (listed below); the dialog has a lot of options - you can use them selectively to produce output at the level of detail suited to your project

Learn more

- [Document a Single Element](#)<sup>[2721]</sup>
- [Set the Main RTF Properties](#)<sup>[2721]</sup>
- [Apply a Filter](#)<sup>[2722]</sup>
- [Exclude Elements](#)<sup>[2722]</sup>
- [RTF Diagram Format](#)<sup>[2723]</sup>
- [Model Include](#)<sup>[2723]</sup>
- [RTF Report Options](#)<sup>[2723]</sup>
- [RTF Report Selections](#)<sup>[2724]</sup>
- [Generate the Report](#)<sup>[2726]</sup>
- [Diagrams Only Report](#)<sup>[2741]</sup>
- [Report Templates](#)<sup>[2726]</sup>
- [Include or Exclude a Package from Report](#)<sup>[2761]</sup>
- [Save as Document](#)<sup>[2728]</sup>

- [Notes Toolbar](#)<sup>[1143]</sup>

#### 19.1.4.1 Document a Single Element

RTF documentation can also be generated for a single element.

**Access** Click on **element** | **Element** | **Advanced** | **Rich Text Format (RTF) Report**

Click on the Options tab and the **Switch Generator** button to display the Rich Text Format Report dialog.

#### Learn more

- [Generate Documentation](#)<sup>[2644]</sup>
- [The Legacy RTF Report Generator](#)<sup>[2720]</sup>

#### 19.1.4.2 Set the Main RTF Properties

The main section of the Rich Text Format Report dialog enables you to set the output location and appearance of the final RTF document.

#### Set Output Location and Appearance

Step	Action	See also
1	Open the Rich Text Format Report dialog.	<a href="#">The Legacy RTF Report Generator</a> <sup>[2720]</sup>
2	Supply an <b>Output Filename</b> to save the report into; always include the extension . RTF as part of the filename.	
3	In the <b>Template Name</b> field, provide the name of the template to generate the report from.	
4	Select a report <b>Style</b> : Formal or Basic.	
5	Type a <b>Heading</b> for your report; this appears as the first heading item in your output.	
6	Select your required <b>Heading Style</b> and <b>Initial Heading Level Indent</b> from the drop-down lists.	

#### Notes

- It is recommended that you enter a full path name for your report; the images in your report are saved externally in an images directory, and supplying the full directory path avoids confusion over the location of these images

- If you move your report you must also move the images directory

### 19.1.4.3 Apply a Filter

You can apply a filter on the Rich Text Format Report dialog to include or exclude elements by date modified, phase or status. This helps to track changes and break a document into multiple delivery phases.

#### Apply Filter

Topic	Detail	See also
<b>Usage</b>	<p>Open the Rich Text Format Report dialog.</p> <ul style="list-style-type: none"> <li>• To enable the date filter, select the checkbox in the <b>Date</b> field</li> <li>• In the first two <b>Only include objects</b> fields, click on the drop-down arrows and select the appropriate criteria (<b>Modified/Created, Before/After</b>)</li> <li>• The package phase filter applies at the package level (not the element level) and ignores the phase of the root package that you are documenting; to enable the phase filter, in the <b>Where Package Phase</b> field click on the drop-down arrow and select an operator</li> </ul> <p>Enterprise Architect filters out all packages that do not meet the selection criteria; All elements in the package are ignored, regardless of their individual phase</p> <ul style="list-style-type: none"> <li>• The element status filter enables you to limit the output by element status; unlike the package phase filter, this filter applies to every element</li> </ul> <p>You can filter against a status of like or <i>unlike</i> a criterion, for example, <i>like proposed</i>, or against the <i>in</i> and <i>not in</i> operators, such as <i>in approved</i>, <i>not in validated</i>; when using the <i>in</i> and <i>not in</i> operators, enter a comma-separated list of status types as your criteria expression</p>	<a href="#">The Legacy RTF Report Generator</a> <small>[2720]</small>

### 19.1.4.4 Exclude Elements

Using the Rich Text Format Report dialog, you can exclude elements of any type from your final output; this is useful when you want to highlight particular items and not clutter up a report with too much detail.

#### Exclude Elements

Topic	Detail	See also
<b>Usage</b>	<p>Open the Rich Text Format Report dialog.</p> <p>Click on each element to exclude, or click on the <b>All</b> button to exclude all elements.</p> <p>Click on the <b>None</b> button to clear your selections.</p>	<a href="#">The Legacy RTF Report Generator</a> <small>[2720]</small>

#### 19.1.4.5 RTF Diagram Format

It is possible to output diagrams to Bitmap files, GIF files or Windows Metafiles.

##### Set Format

Topic	Detail	See also
<b>Usage</b>	<p>Open the Rich Text Format Report dialog.</p> <p>In the Diagram format panel (bottom center of the dialog) select the required format for the report.</p> <p>Generally the two metafile options (EMF and WMF) are recommended; however, there are times that the others might be suitable.</p>	<a href="#">The Legacy RTF Report Generator</a> <sup>[2720]</sup>

#### 19.1.4.6 Model Include

##### Include model items in report

Topic	Detail	See also
<b>Usage</b>	<p>The Model Include panel of the Rich Text Format Report dialog has the following options:</p> <ul style="list-style-type: none"> <li>• <b>Glossary</b> to include the project glossary</li> <li>• <b>Tasks</b> to include project tasks</li> <li>• <b>Issues</b> to include project issues</li> </ul> <p>Select the appropriate checkbox to include the items in the generated RTF documentation.</p>	<a href="#">Project Glossary</a> <sup>[533]</sup> <a href="#">Project Tasks</a> <sup>[526]</sup> <a href="#">Project Issues</a> <sup>[528]</sup>

#### 19.1.4.7 RTF Report Options

Additional RTF report options you can select from the Options panel on the Rich Text Format Report dialog are shown below.

##### Options

Topic	Detail	See also
<b>Checkboxes</b>	<p>You can select whether or not to recursively document packages, show diagrams or add a page break before each new package. Select the:</p> <ul style="list-style-type: none"> <li>• <b>Process all Children</b> checkbox to recursively process all child packages within the main package</li> <li>• <b>Show Diagrams</b> checkbox to include diagrams in your document; clear this item for no diagrams</li> <li>• <b>New page per package</b> checkbox to force a page break on each new package (excepting empty packages)</li> </ul>	<a href="#">Setting the Main RTF Properties</a> <sup>[2721]</sup>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <b>Document all elements</b> checkbox to include all elements included in the project</li> <li>• <b>Document Packages</b> checkbox to document the package as an element in addition to the documentation that would normally be produced for package documentation</li> <li>• <b>Hide 'note-less' elements</b> checkbox to exclude all elements without notes from the documentation</li> <li>• <b>Embed Diagrams in Document</b> checkbox to ensure that the diagram images are contained within the RTF document rather than stored in a linked external file</li> <li>• <b>Skip root package</b> checkbox to exclude the parent package from the documentation and include only the child packages</li> <li>• <b>Document Linked Elements</b> checkbox to include the object details for linked elements that do not originate from the selected package</li> <li>• <b>Use Heading styles for Details</b> checkbox to ensure that the details are formatted as heading styles rather than formatted text; this option is only available when the <b>Heading Style</b> field in the Main section of the Rich Text Format Report dialog is set to <b>Max 9 levels</b> - elements are package + 1.</li> </ul>	

#### 19.1.4.8 RTF Report Selections

Using the **For each Object Include** section of the Rich Text Format Report dialog you can select the documentation sections to include in your report.

##### Select Document Sections

Topic	Detail	See also
<b>Usage</b>	<p>What you include or exclude governs how simple or detailed your report is. You can create multiple reports at different levels of detail for different audiences. Experiment with these options to see what effect inclusion or exclusion has. Most items are self-explanatory.</p> <p>Selecting the checkbox against a category item in the list selects all of the options that are contained in the category. To expand a category, click on the + symbol next to the category name. To exercise greater control over a category of options expand the top level item and then select the required individual items from the list.</p> <p>Sometimes an item applies only to a certain type of element; for example, <i>Attributes</i> only applies to Class elements and a few other element types. The <i>Child Diagrams</i> option shows or hides any diagrams that are attached under a model element; for example, a Use Case might have a Scenario diagram attached.</p>	

##### Notes

- Use this feature to produce the right level of detail for your audience; technical readers might want to see everything, whilst management might require only the general outline

### 19.1.4.9 Custom Language Settings

If you export RTF-format documents from Enterprise Architect in languages other than English, you can customize the codepage, default language ID and character set that Enterprise Architect uses when generating RTF. This makes it much easier to generate documentation appropriate to your country or locale.

You can also set up a list of word substitutions. For instance, where Enterprise Architect would include the word *Figure*, you can specify another word to replace it that is either in your language or more meaningful to your readers.

#### Set up Substitutions

Step	Action	See also
1	Open the <b>Rich Text Format Report</b> dialog.	<a href="#">The Legacy RTF Report Generator</a> [2720]
2	In the Language panel (bottom left of dialog) click on the <b>Adjust</b> button. The <b>Customize RTF Language</b> dialog displays.	
3	Double-click on an item to set or clear its <b>Substitute</b> word.	
4	When you have finished, click on the <b>OK</b> button.	

#### Set Up Codepage and Character Set

Step	Action	See also
1	From the drop-down lists in the <b>Language</b> , <b>Codepage</b> and <b>Charset</b> fields, select the language, codepage and character set that most closely match your location.	
2	If required, modify the <b>Substitute Tags</b> by double-clicking on each and manually setting the value (for advanced use only).	
3	To clear the substitution list, double-click on each item in turn and delete the substitute value.	
4	When you have completed the settings, click on the <b>OK</b> button to save them. Now when you generate RTF documents, the substitute tags are used in the output.	

**Notes**

- If you want to generate reports in a language that requires Unicode support, please note that Enterprise Architect .EAP files default to using **JET 3.5** as the database engine, which does not support Unicode character sets (see the *Getting Started > Basics* topic) ; to provide Unicode support in your project, either upsize to a **DBMS repository** or set **JET 4.0** as the database engine, and download a copy of the **Jet 4.0 EABase** model from the Sparx Systems website and do an **EAP to EAP transfer** of your model into the Jet 4.0 file
- You can transport these language and tag definitions between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu

**Learn more**

- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>

**19.1.4.10 Generate the Report****Generate**

Topic	Detail	See also
<b>Usage</b>	<p>Once you have set up the document properties as required, click on the <b>Generate</b> button to generate the report.</p> <p>When you have generated the document, click on the <b>View</b> button to open the report in MS Word.</p>	

**19.1.4.11 Legacy Report Style Templates**

Using the **Legacy RTF Style Editor** you can edit the RTF associated with various sections of the RTF Report facility in Enterprise Architect. You would typically use this functionality to customize a report's look and feel for your company or client.

If you have previously defined and saved a template, click on the **Load** button on the Rich Text Format Report dialog to open the list of defined templates. Select one in order to load it as the current template; all the features saved become the current features. This enables you to define a set of standard report types that streamline document production.

**Access**   **Project | Resources | Document Generation | Legacy Templates**

**Create or Edit RTF Style Templates**

Step	Action	See also
<b>1</b>	Expand the <i>Legacy Templates</i> folder.	

Step	Action	See also
2	To edit an <b>existing</b> Legacy template, expand the <i>Legacy Templates</i> tree and double-click on the template name, or right-click and select the <b>Modify Document Template</b> context menu option. The RTF Style Editor displays.	
3	Alternatively, to create a <b>new</b> Legacy template, right-click on <i>Legacy Templates</i> and select the <b>Create RTF Style Template (Legacy)</b> context menu option.  A prompt displays for the new template name.	
4	Type the name of the new template and click on the <b>OK</b> button.  The RTF Style Editor displays.	

### RTF Fragments

Topic	Detail	See also
<b>RTF Style Editor</b>	<p>The RTF Style Editor contains a list of all available RTF fragments for modification and customization.</p> <p>Each fragment typically contains RTF plus one or more special tag names that Enterprise Architect replaces with information during generation. Currently you cannot alter the content within the tag names, but you can omit a complete tag by removing it, or alter its basic display properties in the surrounding RTF.</p> <p>Special tag names are delimited by # characters; for example, <b>#NOTES#</b></p> <p>Click on the:</p> <ul style="list-style-type: none"> <li>• <b>Get Default</b> button to retrieve the default Enterprise Architect template for the currently-selected template item in the left hand list</li> <li>• <b>Save</b> button to save the version of the template for this style only</li> <li>• <b>Delete</b> button to remove your modified version of the template, which causes Enterprise Architect to use the default template during report generation</li> </ul> <p>To select a template during report generation, click on the <b>Style</b> drop-down arrow on the Rich Text Format Report dialog. Once a style is selected, Enterprise Architect applies that to the current report. Select &lt;Basic&gt; for the inbuilt style.</p>	<a href="#">The Legacy RTF Report Generator</a>  <sup>2720</sup>

### Notes

- The RTF Style Editor discussed here automatically displays when you modify or create a Legacy RTF template. If you select a template created in the more recent Document Template Editor, that editor opens automatically instead
- You can transport these RTF templates between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu
- To delete a template, right-click on it and select the **Delete Document Template** context menu option
- You can also alter the custom language settings

#### Learn more

- [Design Custom Document Templates](#) <sup>[2684]</sup>
- [Export Reference Data](#) <sup>[376]</sup>
- [Import Reference Data](#) <sup>[380]</sup>
- [Custom Language Settings](#) <sup>[2725]</sup>

### 19.1.4.12 Save as Document

The *Document* feature enables a particular documentation configuration to be 'remembered', linking the loaded template within the Report dialog to the current highlighted package. If a particular template is always used with a specific package, and multiple cases of documentation exist to be propagated, saving these as Documents can ease document generation later.

#### Create and use Documents

Step	Action	See also
1	Open the Rich Text Format Report dialog.	<a href="#">The Legacy Report Generator</a> <sup>[2720]</sup>
2	Click on the <b>Save as Document</b> button. The Save current as document definition dialog displays:	
3	In the <b>Enter Value</b> field, type a name for the document and click on the <b>OK</b> button. The document is added to the Resources window for easy future access.	
4	To generate documentation from the Resources window, right-click on the required document. The context menu displays.	
5	Select the required context menu option. <ul style="list-style-type: none"> <li>• <b>Open Document</b> - Opens the corresponding document file, as specified by the template Filename property</li> <li>• <b>Generate Document</b> - Opens the Report dialog, loaded with the specified template</li> <li>• <b>Auto Generate Document</b> - Generates documentation, with the document located at the path specified by the template's Filename property</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Delete Document</b> - Removes the specified document</li> </ul>	

#### 19.1.4.13 Use Microsoft Word

When generating reports with the 'legacy' Report Generator, you can use Microsoft Word™ to easily incorporate additional features in the reports. You can:

- Create a custom master document combining separate reports, to add a common table of contents, table of figures, headers and footers
- Create documents with sustainable links to generated 'pieces' of Enterprise Architect output, pre-divided using bookmarks, and updated automatically when the document is opened
- Open a report in Word
- Change linked images to embedded images

#### Notes

- With the more recent, 'enhanced' Document Report Generator, many of the facilities provided by Word have been incorporated into the Generator or otherwise rendered unnecessary; it is therefore likely that you would have no need to use Word in generating your reports - you can use Virtual Documents, for example, instead of Word master documents and Bookmarks
- These topics on the use of Word are therefore included only to support users who are still working with the 'Legacy' Report Generator, or who are using Word for personal preference
- When you develop a report using Word with Enterprise Architect, leave definition of the section styles in the Editor to the final stages just prior to report generation; Word truncates the section bookmarks, as it uses a smaller field length for sections
- In Word, you can review and edit reports generated by Enterprise Architect, but you cannot import them back into Enterprise Architect without damaging the section style definition

#### Learn more

- [The Legacy Report Generator](#)<sup>[2720]</sup>
- [Bookmarks](#)<sup>[2730]</sup>
- [Virtual Documents](#)<sup>[2669]</sup>
- [Open a Report in Microsoft Word](#)<sup>[2729]</sup>
- [Change Linked Images to Embedded](#)<sup>[2730]</sup>
- [Features of Word](#)<sup>[2732]</sup>

##### 19.1.4.13.1 Open a Report in Microsoft Word

If you want to use Microsoft Word™ to open a document file generated in Enterprise Architect, simply load Word and open the file as a normal document. Word converts the file for display.

If Word is your default handler of document files, you can also load up and view the report by either:

- Double-clicking on the output file, or
- Clicking on the **View** button on the Generate Documentation dialog

### 19.1.4.13.2 Change Linked Images to Embedded

One of the options available when generating document reports is to embed images in the document, instead of incorporating links to the image files. You would embed images if you want the document to be portable (separated from the directory containing the image files), but use links to the image files if you want to update the images without regenerating the document. You would be more likely to link to image files when developing the model and documentation, and more likely to embed images when the document was ready for review or use.

If you have generated the document report with linked images and imported the document into Word™, and you want to distribute that document, you can convert the file links to embedded images without having to go back to Enterprise Architect to regenerate the document with embedded images.

#### Break image links in Word

Step	Action	See also
1	Open the required document in Word.	
2	Select the <b>Edit   Links</b> menu option.	
3	Highlight all links in the <b>Links</b> list.	
4	Select the <b>Save Picture in Document</b> checkbox.	
5	Click on the <b>Break Link</b> button.	
6	When prompted, click on the <b>Yes</b> button to break the links. Word breaks the links and saves copies of the images inside the document.	

### 19.1.4.13.3 Document Bookmarks

If you want to create a complex document that consists of **sections** of one or more document reports, rather than one **complete** report, you can create a master document in Microsoft Word™ and within it create links to the report sections using their **bookmarks**. Bookmarks are GUID-based numbers that are automatically created for packages, diagrams and elements, and placed in a document when it is generated. Every object is bookmarked in the document according to the following rules:

- All alphabetic and numeric characters remain the same
- All other characters (including spaces) are converted to underscores

For example *UC01: Use Case Model* becomes *UC01\_\_Use\_Case\_Model*. A Package bookmark applies from the beginning of a Package to the end, and includes all child Packages and elements underneath. You can also manually assign bookmarks if you want to have references to additional subdivisions of a model or document. If you change your model and regenerate your document report, you can simply refresh the links in the master document in Word to automatically update the Word document.

When you use bookmarks to add sections of a generated report to a Word master document, you work with Word and the Enterprise Architect Project Browser open at the same time.

#### Add a Bookmarked Section of an RTF Document to a Word Document

Step	Action	See also
1	Within the Word file, position the cursor at the point at which to insert the section of the document.	
2	Select the Word <b>Insert   File</b> menu option. The Insert File dialog displays.	
3	Browse for and select the document file to insert, then click on the <b>Range</b> button.	
4	In the Enterprise Architect Project Browser, right-click on the Package, diagram or element to include in the documentation. The context menu displays.	
5	To paste the object's bookmark into the clipboard, select the appropriate menu option: <ul style="list-style-type: none"> <li>• <b>Documentation   Copy Documentation Bookmark</b> (Package)</li> <li>• <b>Copy/Paste   Copy Documentation Bookmark</b> (element)</li> <li>• <b>Copy Documentation Bookmark</b> (diagram)</li> </ul>	
6	In Word, in the <b>Range</b> cell of the Insert File dialog, press <b>Ctrl+V</b> to paste the information from the clipboard.	
7	Click on the <b>OK</b> button.	
8	Click on the drop-down arrow next to the <b>Insert</b> button. A short menu displays containing two options: <ul style="list-style-type: none"> <li>• <b>Insert</b> embeds a permanent copy of the text</li> <li>• <b>Insert as Link</b> creates a link that can be updated if you alter the source document</li> </ul> Select the <b>Insert as Link</b> option.	
9	Repeat steps 1 to 8 for each section of each document you want to include in the Word document.	
10	Select the Word <b>Tools   Options</b> menu option and, on the Options dialog, select the General tab and select the <b>Update automatic links at Open</b> checkbox.	

Step	Action	See also
	Whenever the Word document is opened, the links to the document sections will be automatically updated with any changes made to the generated documents.	

### Notes

- You cannot use Bookmarking in **Master Document** elements, which effectively replace Bookmarking in Word

Bookmarking requires each bookmark to be unique; when you generate a report with a standard template (including in a single Model Document element), each bookmark is unique and there is a 1:1 association between the element details being generated and the elements in the repository

As Master Documents are intended to contain multiple sub-documents, the association ceases to be 1:1; there is no simple method that enables the generated data to be uniquely identified directly in association with the original element

### Learn more

- [Insert Reference Links](#)<sup>[1083]</sup> (manually insert bookmarks)
- [Create Master Document](#)<sup>[2672]</sup>

#### 19.1.4.13.4 Features of Word

When you have generated reports in the Enterprise Architect **'legacy'** report generator, you can open them in Microsoft Word™ to enhance the output of your project documentation. Some of the things you might do include:

- Add a table of contents
- Add a table of figures
- Add headers and footers
- Manipulate the report tables
- Set an option to refresh linked files automatically

### Learn more

- [Add Table of Contents](#)<sup>[2733]</sup>
- [Add Table of Figures](#)<sup>[2733]</sup>
- [Add Headers and Footers](#)<sup>[2734]</sup>
- [Manipulate Tables](#)<sup>[2734]</sup>
- [Refresh Links](#)<sup>[2735]</sup>

### Learning Center topics

- Alt+F1 | **Enterprise Architect | Reporting | Rich Text Reports | Report Baseline Difference**

#### 19.1.4.13.4.1 Add Table of Contents

Among the features of Microsoft Word™ that can be incorporated into generated Enterprise Architect document reports is a Table of Contents, which can be used to aid navigation of the documentation and enhance readability. The Table of Contents provides hyperlinks to the diagrams in the electronic version of the documentation, and page numbers in both the printed and electronic versions of the documentation.

##### Include Table of Contents in document

Step	Action	See also
1	In Word, open the report to which to add a Table of Contents.	
2	Select the <b>Insert   Reference   Index and Tables</b> menu option.	
3	Click on the Table of Contents tab to set the options that are available for setting up the Table of Contents.	

##### Notes

- The format of the Table of Contents is dependant on the heading levels created when the document is generated; to set the heading styles in the document, see the *RTF Report Options* topic

##### Learn more

- [RTF Report Options](#)  2723

#### 19.1.4.13.4.2 Add Table of Figures

Among the features of Microsoft Word™ that can be incorporated into generated Enterprise Architect reports is a Table of Figures, which can be used to aid navigation of the documentation and enhance readability. The Table of Figures provides hyperlinks to the diagrams in the electronic version of the documentation, and page numbers in both the printed and electronic versions of the documentation.

##### Include Table of Figures in document

Step	Action	See also
1	In Word, open the report to which to add a table of figures.	
2	Select the <b>Insert   Reference   Index and Tables</b> menu option.	
3	Click on the Table of Figures tab to set the options that are available for setting up the table of figures.	

#### 19.1.4.13.4.3 Add Headers and Footers

Among the features of Microsoft Word™ that can be incorporated into generated Enterprise Architect document reports are headers and footers.

##### Include headers and footers in the document report

Step	Action	See also
1	In Word, open the report to which to add headers and footers.	
2	Select the <b>View   Header and Footer</b> menu option, and enter the appropriate information into the header section and the footer section of the document.	

#### 19.1.4.13.4.4 Manipulate Tables in Word

In the document reports generated from the **Legacy** report generator in Enterprise Architect, tables are included when items such as attributes and methods are selected in the **For each Object** section of the Rich Text Format Report dialog. Microsoft Word™ offers several levels of customization for tables and can be used to enhance formatting the tables in situations where the margins of the table exceed the dimensions of the page size selected for printing in Word.

##### Manually resize the table

When the amount of detail for a documented item, such as an attribute or operation, exceeds the margins of the page in Word, you can manually resize the table in order to view all of the details.

Step	Action	See also												
1	Select the table that exceeds the margin size.													
2	<p>Mouse over the border of the table until the mouse pointer changes into the 'drag' icon, as shown below.</p> <div><p><i>Message Attributes</i></p><table><tr><th>Attribute</th><th>Type</th><th>Notes</th></tr><tr><td><u>sentTime</u></td><td>protected : <i>Date</i></td><td></td></tr><tr><td><u>receivedTime</u></td><td>protected : <i>Date</i></td><td></td></tr><tr><td>body</td><td>protected : <i>String</i></td><td></td></tr></table></div>	Attribute	Type	Notes	<u>sentTime</u>	protected : <i>Date</i>		<u>receivedTime</u>	protected : <i>Date</i>		body	protected : <i>String</i>		
Attribute	Type	Notes												
<u>sentTime</u>	protected : <i>Date</i>													
<u>receivedTime</u>	protected : <i>Date</i>													
body	protected : <i>String</i>													
3	Drag the cursor to the left to reduce the width of the table, and then select the <b>File   Print Preview</b> menu option to confirm that the table borders are within the page margins.													

Step	Action	See also
4	Resize all of the tables that overhang the margins of the page, using steps 1 to 3.	

### **Apply styles to tables**

One of the customizable properties of Word when working with tables is the ability to apply a style to a table, so that you can rapidly change the appearance of the table.

Step	Action	See also
1	In Word, open the report in which to change the table styles.	
2	Locate and select the table for which to adjust the appearance.	
3	<p>Select the <b>Table   Table Auto Format</b> menu option.</p> <p>The Table Autoformat dialog displays.</p> <p>From here you can specify a predefined table style from the <b>Table styles</b> list, or create a new style by clicking on the <b>New</b> button. The table styles defined in the Table Autoformat dialog only apply to one table at a time so you must apply the style to each table individually.</p>	

#### **19.1.4.13.4.5 Refresh Links**

If you link into reports generated in Enterprise Architect, you can set an option in the Microsoft™ Word master document so that each time the document is opened, the links are refreshed and - if the reports have changed - the linked text is automatically updated.

**Access** **In Word, Tools | Options > General**

### **Refresh linked report text**

Step	Action	See also
1	Select the <b>Update automatic links at Open</b> checkbox.	
2	Click on the <b>OK</b> button.	

### 19.1.5 System Documents

As well as tailoring the output generated from standard or custom report templates, you can generate a number of **pre-set reports** that are each provided to meet a specific modeling requirement.

#### Pre-set Reports

Report	See also
<b>Testing Details Report</b> - extracts the test details for all elements in the selected Package hierarchy that have test items lodged against them.	<a href="#">Testing Details Report</a> <sup>[2736]</sup>
<b>Implementation Details Report</b> - lists, for a specified Package, the elements that require implementation, together with any source elements in Realize (Implements) relationships with those elements.	<a href="#">Implementation Details Report</a> <sup>[2737]</sup>
<b>Dependency Details Report</b> - shows a list of any elements that are dependent on (having a Dependency connector to) another element for their specification.	<a href="#">Dependency Details Report</a> <sup>[2738]</sup>
<b>Maintenance Report</b> - extracts the maintenance details for all elements in the selected Package hierarchy that have maintenance items lodged against them.	<a href="#">Maintenance Report</a> <sup>[2740]</sup>
<b>Diagrams Only Report</b> - lists only the diagrams from the target Package.	<a href="#">Diagrams Only Report</a> <sup>[2741]</sup>
<b>Resource Report</b> - shows how your resources are deployed in your project, displaying a list of all elements that have resources allocated to them.	<a href="#">Resource Report</a> <sup>[546]</sup>
<b>Testing Report</b> - outputs the test scripts and results you have entered against elements in the model.	<a href="#">Testing Report</a> <sup>[2742]</sup>

#### 19.1.5.1 Testing Details Report

As you manage the test program for your model, you can monitor the status of tests run on the elements within a Package hierarchy by generating a Testing Details report on the Package. You can filter the report to show tests of a certain type, having a specific status, run by a specific person and/or checked by a specific person.

Access **Project | QA Reports & Metrics > Testing Details**

#### Generate a Testing Details report

Field/Button	Action	See also
<b>Root Package</b>	Displays the name of the Package selected from the Project Browser. All elements and Packages under this package are included in the report.	

Field/Button	Action	See also
	If you want to change the Package, click on the new Package in the Project Browser and then click on the  icon at the end of the field. The replacement Package name displays in the field.	
<b>Run By</b>	Click on the drop-down arrow and select a name to filter for tests run by that person. Click on the <b>x</b> button to clear the field.	
<b>Checked By</b>	Click on the drop-down arrow and select a name to filter for tests checked by that person. Click on the <b>x</b> button to clear the field.	
<b>Test Type</b>	Select the radio button for the required test type - <b>Unit, Integration, System, Scenario, Acceptance</b> , or <b>All</b> types.	
<b>Status</b>	Select the radio button for the required test status - <b>Passed, Failed, Not Run</b> , or <b>All</b> statuses.	
<b>Refresh</b>	Click on this button to re-run the report query on the Package currently selected in the <b>Root Package</b> field.	
<b>Print</b>	Click on this button to print a summary of the test results.	

### Notes

- The **Testing Details** report provides a **summary** of the test status and who ran and checked the test; the **Testing** report is an alternative option, providing a **detailed** description of how each test executed, what the input and acceptance criteria were, and what the results were
- You can restructure the output of the report using the List Header facilities for reported information

### Learn more

- [Customizing the Search View](#)<sup>[709]</sup>
- [Working on Test Records](#)<sup>[2605]</sup>
- [Testing Report](#)<sup>[2742]</sup>
- [List Header](#)<sup>[677]</sup>

### 19.1.5.2 Implementation Details Report

Using the **Implementation report**, you can list all elements in a package (selected from the Project Browser) that **require implementors**, together with any source elements that are in **Realization** (or **Implements**) relationships with those elements.

**Access** [Project | QA Reports & Metrics > Implementation Details](#)

**Generate Implementation report**

Field/Button	Action	See also
<b>Root Package</b>	Displays the name of the root Package; all elements and packages under this Package are included in the report.  If you want to change the Package, click on the replacement in the Project Browser and click on the <b>Refresh List</b> button.	
<b>Set Target Types</b>	By default the Implementation report includes only a limited number of element types, such as Use Cases and Requirements.  If you want to include other element types, click on this button and select the additional types on the Implementation Targets dialog.	<a href="#">Implementation Targets Dialog</a>  <sup>[2739]</sup>
<b>Refresh List</b>	Click on this button to run the report and display the results in the Details panel.	
<b>Locate Object</b>	Click on this button to locate the selected <b>implemented</b> (or <b>realized</b> ) element in the Project Browser.	
<b>Show Unimplemented</b>	Select this checkbox to list all elements in the Package that can be implemented but currently don't have any other element to realize them (for example, a Use Case that has no Component or Class to implement the Use Case behavior).	
<b>Show Implemented</b>	Select this checkbox to list all elements in the Package that <b>are</b> implemented; that is, they have another element associated with them in a Realize relationship (for example, a Use Case that is implemented by a Component).	<a href="#">Realize</a>  <sup>[1440]</sup>
<b>Details</b>	Lists the implementation details, consisting of: <ul style="list-style-type: none"> <li>• The names of the elements in the current Package that can be implemented</li> <li>• The type of the elements that can be implemented</li> <li>• The type of the relationship on the elements (Realization)</li> <li>• The name of any element that the element is implemented by</li> <li>• The type of the implementor element</li> </ul>	
<b>Print</b>	Click on this button to print the Implementation report.	
<b>Save Report</b>	Click on this button to specify the file location into which to save the Implementation report. A prompt displays for the file path and name.	

### 19.1.5.2.1 Implementation Targets Dialog

When you generate an Implementation report, by default it includes only certain element types, such as Use Cases and Requirements. If you want to include other element types, you can add them to the report parameters using the Implementation Targets dialog.

**Access** [Project | Documentation | Implementation Details: Set Target Types](#)

#### Include other element types in report

Field/Button	Action	See also
<b>Targets - Active</b>	Lists the types of element that the Implementation report includes.  If you do not want to include a type of element in your report, double-click on it to remove it from the list. The element type is then displayed in the <b>Targets - Available</b> list.	
<b>Targets - Available</b>	Lists the types of element that <b>could</b> be included in the report but are currently not.  If you want to include any of these types of element in your report, double-click on each one to transfer it to the <b>Targets - Active</b> list.	
<b>Close</b>	Click on this button to close the Implementation Targets dialog and immediately refresh the Implementation report with details on the additional element types.	

### 19.1.5.3 Dependency Details Report

Using the **Dependency report**, you can list all elements in a Package (selected from the Project Browser) that are **dependent on another element** for their specification. For example, a Use Case derives its specification from the Requirement that it realizes. On the report, each of the elements in the first column is the source or dependent in a Dependency relationship with the corresponding target element in the **Dependent on** column.

**Access** [Project | QA Reports & Metrics > Dependency Details](#)

#### Run the Dependency report

Field	Action	See also
<b>Root Package</b>	Displays the name of the root Package; all elements and Packages under this Package are included in the report.  If you want to change the Package, click on the replacement Package in the Project Browser and click on the <b>Refresh</b> button.	
<b>Refresh</b>	Click on this button to run the report.	

Field	Action	See also
<b>Locate Object</b>	Click on an element name in the report and click on this button to locate the element in the Project Browser.	
<b>Print</b>	Click on this button to print the dependency details.	
<b>Save Report</b>	Click on this button to save the report as a file. A small dialog displays in which you specify the file location to save the report to.	
<b>Details</b>	<p>Lists the dependency details, consisting of:</p> <ul style="list-style-type: none"> <li>• The names of the elements in the current Package that have a dependency</li> <li>• The type of the elements that have a dependency</li> <li>• The relationship type</li> <li>• The names of the elements that they are dependent on</li> <li>• The type of the elements that they are dependent on</li> </ul>	<a href="#">Dependency</a> <small>1404</small>

#### 19.1.5.4 Maintenance Report

As you manage the maintenance items against elements in your model, you can monitor the status of reported defects, changes, issues and tasks by generating a Maintenance report on the Package. You can filter the report to show maintenance items of a certain type, having a specific status, reported by a specific person and/or resolved by a specific person.

**Access** [Project | QA Reports & Metrics > Maintenance Details](#)

##### Generate a Maintenance report

Field/Button	Action	See also
<b>Root Package</b>	<p>Displays the name of the Package selected from the Project Browser. All elements and packages under this Package are included in the report.</p> <p>If you want to change the Package, click on the new package in the Project Browser and then click on the  icon at the end of the field. The replacement Package name displays in the field.</p>	
<b>Reported By</b>	Click on the drop-down arrow and select a name to filter for maintenance items reported by that person. Click on the <b>x</b> button to clear the field.	
<b>Resolved By</b>	Click on the drop-down arrow and select a name to filter for maintenance items resolved by that person. Click on the <b>x</b> button to clear the field.	

Field/Button	Action	See also
<b>Maintenance Type</b>	Select the radio button for the required item type - <b>Defects, Issues, Changes, Tasks</b> or <b>All</b> types.	
<b>Status</b>	Select the radio button for the required item status - <b>New, Verified, Complete</b> or <b>All</b> statuses.	
<b>Locate Object</b>	(After clicking on an item in the Item Details list.) Click on this button to highlight the element containing the maintenance item, in the Project Browser.	
<b>Refresh</b>	Click on this button to re-run the report query on the Package currently selected in the <b>Root Package</b> field.	
<b>Print</b>	Click on this button to print a summary of the item maintenance list.	

#### Notes

- If you want to edit an item from the report, double-click on the item line; the Maintenance window displays, on which you can update the details
- You can re-organize the display of the listed items using the List Header facilities for reported information

#### Learn more

- [Create Maintenance Items](#)<sup>[2625]</sup>
- [List Header](#)<sup>[677]</sup>

### 19.1.5.5 Diagrams Only Report

If you want to report on the diagrams in a Package, and **only** the diagrams, you can generate a **Diagrams Only report**. This is convenient for printing or handling a lot of diagrams in batch, rather than exporting or printing each diagram at a time.

**Access** **Project Browser package context menu | Documentation | Diagrams Only Report**

#### Produce a Diagrams Only report

Field/Button	Action	See also
<b>Output Path</b>	Type in or browse for the output location to create the report in.	

Field/Button	Action	See also
<b>Embed Diagrams in Document</b>	<p>Leave the checkbox selected to create the diagrams within the document file.</p> <p>Deselect the checkbox to represent the diagrams with linked image files.</p>	
<b>Include all child packages</b>	<p>Leave the checkbox selected to include the diagrams in any child Package under the selected Package.</p> <p>Deselect the checkbox to report on the diagrams in the selected Package only.</p>	
<b>Include Diagram Name</b>	<p>Leave the checkbox selected to include the diagram names in the generated documentation.</p> <p>Deselect the checkbox to omit the diagram names.</p>	
<b>Order Diagrams Alphabetically</b>	<p>Leave the checkbox selected to present the diagrams in alphabetical order.</p> <p>Deselect the checkbox to present the diagrams in the order in which they are listed in the Project Browser.</p>	
<b>Diagram Format</b>	<p>Click on the appropriate radio button for the graphics format in which to capture the diagrams.</p> <p>The <b>GIF</b> radio button defaults to selected.</p>	
<b>Page Setup</b>	Click on this button to define the page dimensions and layout for the report.	<a href="#">Set Up Diagram Page</a> <small>870</small>
<b>Generate</b>	Click on this button to run the report.	
<b>View</b>	When the report is generated, click on this button to display the output document.	

#### 19.1.5.6 Testing Report

As you develop the testing environment for your model, you create and execute test scripts for the elements in the model. To help you track the status and results of running the scripts, you can generate a **Testing report** on a Package selected from the Project Browser. This report can cover just the selected Package, or the complete hierarchy of the Package. You can also report on scripts for specific types of test, or for all types of test.

**Access** [Project | Documentation | Testing Report, or Project Browser package context menu | Documentation | Testing Report](#)

**Generate a Testing Report**

Field/Button	Action	See also
<b>Root Package</b>	Displays the selected Package name.  If you want to run the report on a different Package, close the Generate Test Documentation dialog, select the replacement Package in the Project Browser, and open the dialog again.	
<b>Report on</b>	<b>Deselect</b> the check box against each type of test to <b>omit</b> from the report. All checkboxes default to selected.	
<b>Include Child Packages</b>	Leave the checkbox selected to report on tests on elements in the subordinate Packages.  Deselect the checkbox to report just on the root Package.	
<b>Output file</b>	Type in or browse for the file name and path into which to generate the Testing report.	
<b>Generate</b>	Click on this button to generate the report.  A message displays when the report has been generated. You can then open the file in your preferred file viewer.	

**Notes**

- In your file viewer settings, set the page layout to Landscape to display the columns of the report clearly
- The **Testing** report provides a **detailed** description of how each test executed, what the input and acceptance criteria were, and what the results were; the **Testing Details** report is an alternative option, showing a **summary** of the test status and who ran and checked the test

## 19.2 Web Reports

As you develop your model you can publish it on the web, where the outline structure closely mirrors the model hierarchy and makes it very simple to explore models on-line. With a great look and the ability to explore very large models efficiently on-line, the web-publishing capability is a significant enhancement. You can export either an entire model or a single branch of the model to the web pages. The report provides an easy to use, highly detailed, Javascript-based model tree. In addition, hyperlinked elements make it very simple to browse to related information.

### Notes

- The HTML output is compatible with any standard web server, on either Unix or Windows platforms - simply bundle up the entire output directory and place it within the context of your web server; all path names should be relative and case sensitive
- You can create **Web Style Templates** to customize your web output
- You can use Master Documents and Model Documents to select specific areas of your model for reporting
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Documents** permission to generate HTML documents

### 19.2.1 Create a Web Page Report

If you want to create a report on a Package to display as a **web page**, you can select the Package in the Project Browser and perform a simple procedure using the Publish as HTML dialog. All child Packages of the selected Package are automatically included in the report.

**Access** **Project Browser package context menu | Documentation | HTML Report (Shift+F8)**

#### Create a Web Page report

Field/Button	Action	See also
<b>Package</b>	<p>Confirm the name of the selected package, for which you are creating the web documentation.</p> <p>If you want to change the Package, close the dialog, select the new Package and select the <b>HTML Report</b> option again.</p>	

Field/Button	Action	See also
<b>Title</b>	Defaults to the Package name. If you want the report to have a different title, overtype the field contents with your preferred text.	
<b>Output to</b>	Type in or browse for the directory path your report is to be saved to.	
<b>Style</b>	<p>(Optional.) Click on the drop-down arrow and select a custom web style template to apply to your documentation, in place of the default template.</p> <p>Use the <b>&lt;default&gt;</b> value for the standard, system-provided template.</p>	<a href="#">Create Web Style Templates</a> <sup>[2747]</sup>
<b>File</b>	Type the file extension for your web documentation files; the default is <b>.htm</b> .	
<b>Header Image</b>	<p>If you want the report to have an identifying image at the top, type in or browse for the image file directory path and filename.</p> <p>If you do not specify a path, the image defaults to the Enterprise Architect logo.</p>	
<b>Preserve White space in Notes</b>	Select the checkbox to reproduce the spacing of any element notes. Deselect the checkbox to remove white space.	
<b>No Page for Note and Text Items</b>	Select the text box to <b>exclude</b> Note elements and Text elements from the report.	
<b>Default Diagram</b>	<p>Select the appropriate radio button to begin the web report with:</p> <ul style="list-style-type: none"> <li>• The default Model Diagram</li> <li>• The currently-selected diagram</li> <li>• Another diagram, for which you can browse by clicking on the  button</li> <li>• No diagrams (the <b>None</b> radio button defaults to selected)</li> </ul>	
<b>Image Format</b>	Select the appropriate radio button for the file format in which to store images - PNG or GIF.	
<b>Include</b>	<p>Select the appropriate checkboxes to include, in your web document:</p> <ul style="list-style-type: none"> <li>• Test Case elements</li> <li>• Maintenance Items</li> <li>• Resource allocations</li> </ul>	

Field/Button	Action	See also
	<ul style="list-style-type: none"> <li>Hyperlinked files</li> </ul>	
<b>System</b>	Select the appropriate checkboxes to include, in your web document, the System components: <ul style="list-style-type: none"> <li>Glossary</li> <li>Model Tasks</li> <li>Model Issues</li> </ul>	
<b>Generate</b>	Click on this button to generate the report.	
<b>Progress</b>	Shows the accumulating percentage completion of the report generation process.	
<b>View</b>	Once the report is complete, click on this button to launch your default web browser and view the web pages.	

#### View page for specific diagram or element

When you **view** the web report in your web browser, you can switch directly to a page for a specific diagram or element by specifying the appropriate GUID after the report web address. That is:

```
ht t p : / / pat h / pat h / pat h / I ndex . ht m ? gui d = x x x x x x x x x x x
```

Type the word *guid* in lower case, and do not include braces { } in the value; for example:

```
ht t p : / / . . . / pat h / I ndex . ht m ? gui d = DC62B0DA- 0D60- 4447- 85E6- B9BBAE7FC90F
```

To obtain the GUID, right-click on the Package or element in the Project Browser and select the **Copy/Paste** menu option, or click on the diagram and select the **Copy Reference** context menu option.

#### Browser behaviour

The display of your web report can be affected by the browser that you use. Specifically:

- Firefox** automatically converts the diagram or element page locator path (above) to a **file:///C:/path** protocol and actions it
- Opera** automatically adds **file://localhost/** to the start of the page locator path, in the same way as Firefox adds the **file:///C:/path** protocol
- Opera** by default disables **XMLHttpRequest** when loading a file, and the web report detects this and prompts the user to change settings; there are no problems when the page is hosted on a web server
- Microsoft Internet Explorer** does not operate on the page locator path directly, but the protocol in Firefox also works in Internet Explorer; therefore, to use the absolute references without a web server, you must access the path using the **file:///** protocol
- If you are using **Internet Explorer 7.0** or later, and you do not have it open, its security profile might block the report display; click on the explanation banner at the top of the screen and select the **Allow**

**Blocked Content** context menu option

- **Chrome** completely disables **XMLHttpRequest** when loading a file, so will not display web reports directly from the file system; there are no problems when the page is hosted on a webserver

### Notes

- To generate a demonstration web report right now, open the *EAExample* project, select the *System Model* package and follow the steps above
- You can also select Packages in your model to exclude them (and their subordinate Packages) from the web reports you generate

## 19.2.2 Create Web Style Templates

If you want to customize the look and feel of a web report for your company or client, you can use the **HTML and CSS Style Editor** to change the HTML associated with the various sections of the report. This editor is derived from, and provides the facilities of, the common Code Editor. The HTML and CSS Style Editor contains a set of HTML **fragments** for modification and customization, listed in the left hand Templates panel of the dialog.

Each fragment typically contains HTML plus one or more special tag names that are replaced with information during generation. The special tag names are delimited by two # characters; for example, **#NOTES#**, as you can see if you click on a template fragment name to display its contents in the right hand Current Modified Template panel. The HTML report generator produces output based on the fragments, either in their default state or as you have customized them. Currently you cannot alter the content within the tag names, but you can omit a complete tag by removing it, or alter its basic display properties in the surrounding HTML.

**Access** **Project | Resources | Document Generation | Web Style Templates**

### Create or edit web style templates

Task	Action	See also
<b>Create a new template</b>	<p>Right-click on the <i>Web Style Templates</i> folder and select the <b>Create HTML Template</b> context menu option.</p> <p>Type the name of the new template when prompted to do so. The HTML and CSS Style Editor displays.</p>	

Task	Action	See also
<b>Edit an existing template</b>	<p>Expand the <i>Web Style Templates</i> folder and either:</p> <ul style="list-style-type: none"> <li>• Double-click on the template name or</li> <li>• Right-click on the template name and select the <b>Modify HTML Style Template</b> context menu option</li> </ul> <p>The HTML and CSS Style Editor displays.</p>	
<b>Delete a customized template</b>	<p>Expand the <i>Web Style Templates</i> folder, right-click on the template name and select the <b>Delete HTML Template</b> context menu option.</p>	

#### Within the HTML and CSS Style Editor

Task	Action	See also
<b>Edit a template fragment</b>	<p>Click on the required fragment in the <b>Templates</b> list; the fields in that fragment display in the Current Modified Template panel.</p> <p>Change the field values, or delete fields, as you wish.</p>	<a href="#">HTML Template Fragments</a> <small>[2749]</small>
<b>Save your style changes</b>	<p>Click on the <b>Save</b> button to save your version of this template fragment only.</p> <p>Save each fragment before you move on to another fragment.</p>	
<b>Delete a modified template fragment</b>	<p>Click on the template fragment in the left-hand list and click on the <b>Delete</b> button. This removes the modified version of the fragment, which causes the report generator to use the default (system-provided) fragment during report generation.</p>	
<b>Retrieve the original, default template fragment</b>	<p>Click on the template fragment in the left hand list and click on the <b>Get Default</b> button.</p>	

#### Notes

- Each time you generate the web report it overwrites the templated files, so you must back up your modified versions and copy them back in after every update

#### 19.2.2.1 HTML Template Fragments

When you create a **web report template** in the **HTML and CSS Style Editor**, it automatically contains a wide range of system-provided **HTML Template fragments**. You can edit the fields of each separate fragment, or use the unchanged default.

**Access** [Project | Resources | Document Generation | Web Style Templates | right-click | Create HTML Template](#), or  
[Project | Resources | Document Generation | Web Style Templates | <template name> | right-click | Modify HTML Style Template](#)

### Fragment Fields

Fragment	Fields
<b>Body - Diagram</b>	<ul style="list-style-type: none"> <li>• #AUTHOR# - Diagram author</li> <li>• #CREATEDATE# - Diagram created date</li> <li>• #CSS# - Style Sheet to use</li> <li>• #GUID# - Diagram GUID</li> <li>• #IMAGE# - Image of the diagram</li> <li>• #IMAGES# - Image path</li> <li>• #LOCKED# - Is the diagram locked (<b>true</b> or <b>false</b>)</li> <li>• #MODDATE# - Diagram modified date</li> <li>• #NAME# - Diagram name</li> <li>• #NOTE# - Diagram notes</li> <li>• #STEREOTYPE# - Diagram stereotype</li> <li>• #TITLE# - Diagram title</li> <li>• #TYPE# - Diagram type</li> <li>• #VERSION# - Diagram version</li> </ul>
<b>Body – Object</b>	<ul style="list-style-type: none"> <li>• #ABSTRACT# - Element abstract (if true, = <b>abstract</b>)</li> <li>• #ACTIVE# - Element isActive (<b>true</b> or <b>false</b>)</li> <li>• #ALIAS# - Element alias ("<b>#ALIAS#</b>")</li> <li>• #AUTHOR# - Element author</li> <li>• #BEHAVIOR# - Returns the object behavior.</li> <li>• #CLASSIFIER# - Element classifier</li> <li>• #CLASSIFIERREF# - Returns the HREF of the classifier</li> <li>• #COMPLEXITY# - Element complexity</li> <li>• #CREATEDATE# - Element created date</li> <li>• #CSS# - Style Sheet to use</li> <li>• #DIAGRAMS# - List of diagrams the element is on</li> </ul>

Fragment	Fields
	<ul style="list-style-type: none"> <li>• #DIFF# - Element difficulty</li> <li>• #GUID# - Element GUID</li> <li>• #IMAGES# - Image path</li> <li>• #KEYWORDS# - Element keywords</li> <li>• #LANGUAGE# - Element language</li> <li>• #LEAF# - Element isLeaf (<b>true</b> or <b>false</b>)</li> <li>• #LEVELNUMBER# - Element level number</li> <li>• #MODDATE# - Element modified date</li> <li>• #MULTIPLICITY# - Element multiplicity ("<b>Multiplicity:</b> <b>#MULTIPLICITY#</b>")</li> <li>• #NAME# - Element name</li> <li>• #NOTE# - Element notes</li> <li>• #PHASE# - Element phase</li> <li>• #PRIORITY# - Element priority</li> <li>• #ROOT# - Element isRoot (<b>true</b> or <b>false</b>)</li> <li>• #SCOPE# - Element scope</li> <li>• #STATUS# - Element status</li> <li>• #STEREOTYPE# - Element stereotype(s)</li> <li>• #TYPE# - Element type; for example, Class, Object</li> <li>• #VERSION# - Element version</li> </ul>
<b>Body – Project Glossary</b>	<ul style="list-style-type: none"> <li>• #CONTENT# - Loops <b>Body – Project Glossary Item</b> for each Project Glossary item</li> </ul>

### 19.2.3 Master Documents and Model Documents

You can develop virtual documentation for output in both printable document and web page formats, using Master Document and Model Document elements. The process for generating web virtual documentation differs from that for printable documentation in two ways:

- You use a standard or customized HTML template, which you select in the **Style** field on the Publish as HTML dialog; you do **not** specify or use any templates defined in the element **RTFTemplate** Tagged Value
- You create a **Package list** to select the elements for the report, and not a Model Search (which is defined in the **SearchName** and **SearchValue** Tagged Values in the Model Document elements)

**Access** Click **Document element**, then **Project | Documentation | Publish as HTML** (Shift+F8) or **Project Browser Document element context menu | Documentation | HTML Report**

#### Generate web documentation from a Master Document and/or Model Documents

Step	Action	See also
1	<p>On the Publish as HTML dialog, set the options for your web document as you wish.</p> <p>Select your preferred template - such as a customized Master Document</p>	<a href="#">Create a Web Page Report</a> <sup>[2748]</sup>

Step	Action	See also
	template - in the <b>Style</b> field.	
2	Click on the <b>Generate</b> button to generate the documentation.  The HTML Report Generator works through the defined content of the Master Document element and/or the Model Document elements, and pulls in the information from the listed Packages, formatted according to the template identified in the <b>Style</b> field.	
3	Click on the <b>View</b> button to view the documentation.

## 19.3 Exclude Package from Report

When you generate a document or web report on a Package, all child Packages of that Package are, by default, included in the report. If you do not want to include a particular Package in any reports, you can mark it for exclusion. All of the excluded Package's child Packages are also excluded from the reports.

**Access**   **Project Browser Package context menu | Documentation | Generated Report Options**

### Mark a Package to be excluded from reporting

Step	Action	See also
1	On the Generated Report Options dialog, select the <b>Exclude Package from Generated Reports</b> radio button.  (Select the <b>Include Package in Generated Reports</b> radio button to add the Packages to the reports again.)	
2	Click on the <b>OK</b> button.	

## 19.4 Charts

Enterprise Architect can provide you with a **wealth of data** that is crucial to business planning, organizational strategy, decision making and Project Management. One way of **summarizing** this data in a format suitable for swift and easy appraisal is to present it in the form of **charts and graphs**, which are ideal for including in reports and distributing via the internet. Within Enterprise Architect you can create **Chart** elements that define the type, source, content and appearance of a chart, either on their own **Dashboard** diagram (one of the **Extended** diagram types) or on other types of diagram as best suits your requirements. This provides a simple and fast mechanism for collating and presenting a lot of information automatically, such as summaries of Requirement Status or Test Case Status values across the current project.

### Types of Chart Available

Using Enterprise Architect, you can create a number of different charts including:

- Pie - 2-dimensional and 3-dimensional
- Doughnut - 2D and 3D
- Torus
- Line Graph (Time Series)
- Table (Model Views)
- Horizontal bar - 2D and 3D
- Vertical column - 2D and 3D

You can also generate some of these charts filtered according to **another** data quantity, presenting this as table columns, segments of a bar or separate bars in a cluster.

### Creating a Chart

You create a Chart element by dragging a Chart icon onto a diagram from the **Dashboard** pages of the Diagram Toolbox onto a diagram (standard Chart icons are also available on the common **Artifacts** page of the Toolbox). You then define the type of Chart, the data it presents, the source of that data and the appearance of the Chart, within the **element Properties**.

Depending on the type of Chart you are creating, the data can be sourced from across the **whole model**, from **specific Packages** within the model, or from a custom **SQL Query** that extracts the information from the model. You can also paste the data from an **external CSV file** into the element, to be presented as a Chart.

Each Chart is **dynamic**, and is automatically updated whenever you edit it or open its parent diagram. You can also manually refresh it using an option on the element context menu. Time Series Charts can also be automatically updated by the Cloud Server according to a schedule that you define in the element Properties.

### Key Features

A major benefit of generating a Chart as and from a model element is that many of the facilities for working with elements - and the Packages and diagrams that contain them - are available on the Chart, such as:

- Including charts and graphs in **document reports**
- Hosting Charts on a **website** to facilitate communication
- **Automatically updating** and processing the element content (and hence refreshing the Chart)
- Performing **XMI imports and exports** on Chart Packages
- Saving a Chart as a diagram **image**

- Setting the Chart diagram as the **model** or **user default diagram**
- Defining a Chart as a **model Pattern**
- Changing the element properties and getting an **immediate change** to the content and/or appearance of the Chart; useful in, for example, testing a search and visualizing the results

- [Chart Appearance](#) <sup>[2774]</sup>
- [Including Charts in Reports](#) <sup>[2788]</sup>

### 19.4.1 Chart Elements

The starting point for defining your own data charts is to drag one of the **Chart** element icons from the Diagram Toolbox onto your diagram. The Chart icons are divided into two groups:

- **Patterned** Pie Charts, Bar Charts, Series Charts and Model Views, which create Charts ready-defined for specific purposes and just require small adjustments to tailor them for your project data
- **Basic templates** for Standard Charts (Pie and Bar Charts), Time Series graphs and Model View tables, which create Charts that you develop to meet your own requirements

Both groups of icons are available from the **Dashboard** pages of the Diagram Toolbox. Basic template icons are also available from the common **Artifacts** page of the Diagram Toolbox.

Additionally, you can obtain a selection of sample Charts (reporting on Issues and Defects) together on a diagram by selecting the **Dashboard: Issues and Defects** checkbox in the Model Wizard. This Pattern is in the **Core Extensions Technology** group, and provides:

- Two Model View Charts
- A Pie Chart
- A 2D Bar Chart and
- A Time Series Chart

#### Initial Appearance

The Chart element initially displays as a 'normal' element, as shown:

However, depending on which type of Chart icon you select, the element either immediately transforms to the Chart and its Properties dialog automatically displays, or you select to display the Properties dialog and, once you identify the Chart type and contents, the element becomes the Chart you have defined; for example:

This Chart image is dynamically generated - it shows the selected properties of the model elements at the moment:

- The definition is saved, or
- The element's parent diagram is opened, or
- You right-click on the element in the open diagram and select the **Refresh Chart** or **Refresh List** menu option, or
- For TimeSeries Charts, either when the Cloud server is triggered by the update timetable you have defined in the Chart properties, or when you click on the **Manual Record** button in the Properties dialog

You can add a Chart element to any existing diagram, and any number of these elements to one diagram. To make the Charts clear, easy to locate and simple to report on, you might store your Charts:

- On dedicated Dashboard diagrams, the diagram having the same name as a Chart it contains
- Where Charts are not related or for comparison, with just one Chart element per diagram (the Chart depictions are, however, very clear within quite small Chart elements)
- Within a child Package of the Packages that they report on

### Define Chart

You define the Chart represented by an element using the element's Properties dialog. On the General page of the dialog, notice that the element has a stereotype: *Chart*, *TimeSeriesChart* or *ModelView*.

You define a Time Series Chart and a Model View Chart each in a specific way. You define a Standard (Pie or Bar) Chart in three stages:

1. Double-click on the element to open the Properties dialog, and (if the Chart does not already have a specific name) on the **General** page type in the function of the Chart as its name; for example, **Element Status Chart**.
2. Select the **Chart Details | Source** page and define the type of Chart, the type of data you want the Chart to show, and the source of that data.

3. Select the **Chart Details | Appearance** page and define exactly how you want the Chart to display on the screen and in reports.

### 19.4.2 Define a Model View Chart

Your model contains a great deal of information on both project design and project management, and a major benefit of the Chart feature is providing the facility to capture, summarize and present that information in the form of a Model View table that you can operate on both as a single element and as a list of selectable items. On one diagram you can put a number of Model View elements reporting on different aspects of the model, to create a tailored automatic status review of your project.

For a Model View Chart, the type is defined in the template and the content is defined in the SQL Query that you create as the data source. After you generate the Chart, you can perform a number of operations on the data it displays.

**Access**    **Double-click on Chart element (opens directly to Chart Details | Source > Custom SQL)**  
**Right-click on Chart element | Edit List View**

#### Specify Content

Field/ Button	Action	See also
data panel	Type in the SQL Query to define what type of data to extract from the model, and what structures in the model to extract it from.  For example: <code>SELECT t_object.Name, t_object.Status, t_object.Author FROM t_object WHERE t_object.Object_Type = 'Change'</code>  This Query returns a list of Change elements, showing the element name, status and author.	<a href="#">Create Search Definitions</a> <sup>[711]</sup>
<b>OK</b>	Click on this button to close the dialog and generate the Chart.	
<b>Cancel</b>	Click on this button to abort the changes and close the dialog.	

#### Edit Chart Entries

Having created the Model View Chart, you can drag the borders of the element to a suitable display size, manipulate the display as for other Search views, and work on individual entries through the context menu.

Context Menu Option	Action	See also
<b>Exit Edit Mode</b>	Close the Chart as a list of accessible entries and revert to the Chart as a single element.	
<b>Properties</b>	Open the Properties dialog for the selected item in the Model View.	
<b>Copy Selected to Clipboard</b>	Copy the selected item to the clipboard.	
<b>Documentation</b>	<p>Display options to generate a report on the selected item or items, either as:</p> <ul style="list-style-type: none"> <li>• One report on all selected items, or</li> <li>• A separate report for each of the selected items</li> </ul> <p>In either case, the Generate Documentation dialog displays. If you have selected to generate separate reports, the Generate Documentation dialog displays separately for each report in turn.</p>	<a href="#">Generate Documentation</a> 
<b>Create (Edit/Delete) Linked Document</b>	<p>Open the Linked Document Editor to create (or edit) a linked document on the selected item.</p> <p>OR</p> <p>Delete the existing linked document on the item.</p>	
<b>Find in Diagrams</b>	<p>Locate the selected item in any diagrams in which it is used.</p> <p>If the item is only used in one diagram, the display switches to that diagram with the item highlighted on that diagram.</p> <p>If the item is not used in any other diagram, or is used in more than one diagram, the Element Usage dialog displays.</p>	<a href="#">Show Element Use</a> 
<b>Find in Project Browser</b>	Locate and highlight the selected item in the Project Browser.	

#### Notes

- Provided that the SQL Query contains the parameter *ea\_guid AS CLASSGUID*, you can also drag items out of the list and drop them onto the diagram containing the Chart element, in the same way as you would from the Project Browser

**19.4.3 Define a Time Series Chart**

Your model contains a great deal of information on both project design and project management, and a major benefit of the Chart feature is providing the facility to capture, summarize and present that information. Using the **Time Series** Chart you can record changes in **multiple series** of data over time. Each series corresponds to an SQL Query that you can either run **manually** or update **automatically** on a schedule run by the Cloud service. The value of each series is plotted on the line graph on the day or at the time it was collected.

As an example, you might generate the Chart manually on different days, running two Queries showing Issues created and Issues resolved, for comparison. The Chart might resemble this:

After defining the **content** of the Time Series Chart, you can modify its **appearance** on the Appearance page of the element's Properties dialog.

**Access**    **Double-click on Chart element | Chart Details | Source**

Define Content

Field/Button	Action	See also
<b>Package</b>	To generate the Chart on the entire project, leave this field blank or click on the ( ... ) <b>Browse</b> button and select the <b>&lt;none&gt;</b> entry.  Otherwise, click on the <b>Browse</b> button and select the specific Package to generate the Chart on.	<a href="#">Select &lt;item&gt; dialog</a> <sup>[994]</sup>
<b>Include Child Packages</b>	If you have specified a Package, select this checkbox to extract information from the child Packages of that Package.  Clear the checkbox to ignore any child Packages when extracting information from the parent Package.	
<b>Data Point Interval</b>	Click on the down-arrow and select either:	

Field/Button	Action	See also
	<ul style="list-style-type: none"> <li>• <b>Manual</b>, to generate the Chart manually at any time or date you need; the <b>Manual Record</b> button is enabled</li> <li>• A time interval at which the Cloud Server will automatically regenerate the Chart</li> </ul>	
<b>Exclude Weekends</b>	<p>Enabled when the <b>Data Point Interval</b> field is set to <b>Daily</b>.</p> <ul style="list-style-type: none"> <li>• Select the checkbox to refresh the Chart on each week day except for Saturday and Sunday</li> <li>• Clear the checkbox to refresh the Chart on each week day including Saturday and Sunday</li> </ul>	
<b>Run On</b>	<p>Enabled when the <b>Data Point Interval</b> field is set to <b>Weekly</b> or <b>Monthly</b>. If that field is set to:</p> <ul style="list-style-type: none"> <li>• <b>Weekly</b> - click on the down arrow and select the day of the week on which to refresh the Chart</li> <li>• <b>Monthly</b> - click on the down arrow and select the date in the month on which to refresh the Chart</li> </ul>	
<b>Series</b>	Lists the SQL Queries that will be run whenever the Chart is regenerated. This panel also shows the date on which the Query was last executed, and the number of records displayed as a result.	
<b>Edit</b>	<p>Click on an SQL Query name in the Series list and click on this button to edit the Query.</p> <p>The Edit Series dialog displays; see the <i>Edit Series Dialog</i> table below.</p>	
<b>Add</b>	<p>Click on this button to add a new SQL Query to the Series list, to be executed when the Chart is regenerated.</p> <p>The Edit Series dialog displays; see the <i>Edit Series Dialog</i> table below.</p>	
<b>Remove</b>	<p>Click on a SQL Query in the Series list and click on this button to delete the Query as a source of information for the Chart.</p> <p>A confirmation prompt displays. Click on the <b>Yes</b> button to delete the Query.</p>	
<b>Manual Record</b>	<p>If you have set the <b>Data Point Interval</b> field to manual, click on this button to regenerate the Chart.</p> <p>The <b>Results</b> column in the Series list updates (if changes have occurred); the Chart itself does not change until you click on the <b>OK</b> button to close the dialog.</p>	
<b>OK</b>	Click on this button to scan the specified Packages, close the dialog and	

Field/Button	Action	See also
	generate the Chart.	
<b>Cancel</b>	Click on this button to abort the changes and close the dialog.  The aborted changes include updates to the <b>Results</b> column if you have clicked on the <b>Manual Record</b> button.	

### Edit Series Dialog

Field/Button	Action	See also
<b>Examples</b>	(Optional) Click on the drop-down arrow and select an example SQL Query to use intact or to edit to suit your requirements.	
<b>Series Name</b>	Type a name for the SQL Query, to use as a reference to the Query in the <b>Series</b> list on the Source page.	
<b>Query</b>	Type the text of the SQL Query.	<a href="#">Create Search Definitions</a> 
<b>Test Query</b>	(Optional) Click on this button to test the Query you have written or updated.  A message displays to confirm that the Query was successful or to identify that problems exist.	
<b>OK</b>	Click on this button to save the Query, close the dialog and add or update the Query in the <b>Series</b> list on the Source page.	
<b>Cancel</b>	Click on this button to abort the changes, close the dialog and return to the Source page.

### 19.4.4 Standard Chart Data

When you have created a Standard Chart element (for a Pie Chart or Bar Chart), the next step is to define:

- What type of Chart to create
- What data the Chart will collate and present
- What the source of the data is

You define these aspects on the Chart element's Properties dialog.

**Access**    **Double-click on Chart element | Chart Details | Source**

#### Define Chart Data

Task	Action	See also
<b>Define Chart Type</b>	<p>In the <b>Type</b> field, click on the drop-down arrow and click on the basic type of Chart to create (<b>Pie</b>, <b>2D Bar</b> or <b>3D Bar</b>).</p> <p>After you have specified the data type and source (below), you can further refine the Chart type using the Appearance page of the dialog.</p>	<a href="#">Chart Appearance</a> <small>[2774]</small>
<b>Define Data Type</b>	<p>In the <b>Series</b> field, click on the <b>Browse</b> icon ( ... ) and select the primary object type and property to show in the Chart, from the menu and sub-menus. For example:</p> <p><b>Element</b> and <b>Status</b></p> <p>For a <b>Bar Chart</b>, whether <b>2D</b> or <b>3D</b>, you can optionally select a secondary object and property by which to impose a grouping of the data on the Chart. In the <b>Group By</b> field, click on the <b>Browse</b> icon ( ... ) and select the secondary object type and property by which to group the data. For example:</p> <p><b>Element</b> and <b>ObjectType</b></p> <p>This combination produces a Chart that shows the numbers of elements having each status, grouped by element type.</p> <p><u>Notes</u></p> <ul style="list-style-type: none"> <li>• You cannot apply grouping to a Pie Chart, so if you select <b>Pie</b> in the <b>Type</b> field, the <b>Group By</b> field is disabled</li> <li>• SQL Searches and CSV strings define the data selection, so if you select either of these as the data source, the <b>Series Data</b> and <b>Group By</b> fields are disabled</li> </ul>	
<b>Define Data Source</b>	<p>The data you present in your Chart is likely to come from within your model, although you can also copy a simple <b>Comma Separated Value (CSV) spreadsheet</b> from an external file into the dialog, for display.</p> <p>You have several options for locating the data within your model. You can search:</p>	<a href="#">External Data</a> <small>[2773]</small>  <a href="#">Source</a>

Task	Action	See also
	<ul style="list-style-type: none"> <li>• Within one or more specific Packages</li> <li>• Across the whole model</li> <li>• As defined by a tailored SQL Query</li> </ul> <p>You can also filter the data you are collecting, to highlight specific features of the model. Again, as the CSV and SQL definitions specify the data characteristics themselves, the filtering option is not enabled for them.</p> <p>An advantage of defining the search or CSV table within the element is that the search or data is available with the Chart element where all users can access it, rather than being restricted to the workstation of the person who created the data Chart.</p> <p>Fully specifying and committing one type of data source will clear the definition of any previously-used data source.</p>	<a href="#">Package</a> <sup>[2771]</sup>  <a href="#">Custom Query</a> <sup>[2773]</sup>  <a href="#">Element Filters in Charts</a> <sup>[2772]</sup>

#### 19.4.4.1 Source Package

Your model contains a great deal of information on both project design and project management, and a major benefit of the Chart feature is providing the facility to capture, summarize and present that information from:

- A specific Package in the model
- A number of specific Packages in the Model, or
- Across the whole model

You can also select to include information from just a Package itself, or from the Package and all its child Packages.

If you want to further refine the data to omit certain quantities or highlight others, you can apply element filters to the data from the selected Packages.

**Access**    **Double-click on Chart element | Chart Details | Source > Package**

#### Specify Source Packages

Field/Button	Action	See also
<b>Add</b>	<p>Click on this button and select either:</p> <ul style="list-style-type: none"> <li>• <b>Add Package</b> to identify a specific Package from which to extract the information - the Select a Toolbox Profile Package dialog displays, from which you select the Package; or</li> <li>• <b>Search Model</b> to extract the information from the whole model; the text</li> </ul>	<a href="#">Select &lt;item&gt; dialog</a> <sup>[994]</sup>

Field/Button	Action	See also
	<p><i>Model</i> in the <b>Source</b> list confirms your selection</p> <p>You can click on the <b>Add</b> button a number of times, to add several specific Packages.</p>	
<b>Remove</b>	Click on a Package name in the Source list and click on this button to remove the Package as a source of data for the Chart.	
<b>Include Child Packages</b>	<p>Select this checkbox against a Package to extract information from its child Packages.</p> <p>Clear the checkbox to ignore any child Packages when extracting information from the parent Package.</p>	
<b>OK</b>	Click on this button to scan the specified Packages, close the dialog and generate the Chart.	
<b>Cancel</b>	Click on this button to abort the changes and close the dialog.

- [Element Filters](#) <sup>[2772]</sup>

#### **19.4.4.1.1 Element Filters in Standard Charts**

If you are creating a Pie or Bar Chart of object properties from the **Packages** within your model, you can refine the data that is presented in the Chart to include only elements that have specific properties rather than every element encountered, using **element filters**.

Whilst you apply the element filters using a special page of the Chart element Properties dialog, this page is identical in use to the Element Filters tab in the Document Template Designer.

**Access**    **Double-click on Chart Object element | Chart Details | Element Filters**

#### Notes

- Element filters are not available for Charts constructed using an SQL Query or CSV file contents

#### Learn more

- [Element Filters](#) <sup>[2660]</sup>

### 19.4.4.2 Custom Query

Your model contains a great deal of information on both project design and project management, and a major benefit of the Chart feature is providing the facility to search through your model and extract specific aspects of that information using your own SQL Query, within the Chart element.

**Access** Double-click on Chart element | Chart Details | Source > Custom SQL

#### Extract Information Using SQL Query

Field/Button	Action	See also
panel	<p>Type in your SQL Query.</p> <p>The <b>Select</b> statement must include the alias <b>Series</b>. For Bar Charts you can also group the results using the alias <b>GroupName</b>. For example:</p> <pre>Select t_object.Status AS Series, t_object.Author AS Groupname from t_object</pre> <p>The field provides the facilities of the Common Code Editor, such as intellisense.</p>	<a href="#">Code Editor Functions</a> <sup>[2157]</sup>
OK	Click on this button to execute the query, close the dialog and generate the Chart.	
Cancel	Click on this button to abort the changes and close the dialog.

### 19.4.4.3 External Data

Although your model contains a great deal of information on both project design and project management, you might want to check or present the status of some external spreadsheet data for comparison or for review before importing it into your model. A major benefit of the Chart feature is providing the facility to quickly paste in and display, in the appropriate Chart format, the contents of an external CSV file.

Before you start, copy the content of the CSV file to the clipboard.

**Access** Double-click on Chart element | Chart Details | Source > CSV

#### Review External CSV Data

Field/Button	Action	See also
panel	Right click on the panel and select the <b>Paste</b> option to paste the contents of the CSV file.  If necessary, edit the data so that the first column represents the series object (the objects listed along the X axis of the Chart). You need perform only very basic editing on the text.	
<b>OK</b>	Click on this button to process the data, close the dialog and generate the Chart.	
<b>Cancel</b>	Click on this button to abort the changes and close the dialog.

### 19.4.5 Chart Appearance

Each of the Chart formats provided on the system - Model View, Time Series, 2D Bar Chart, 3D Bar-Chart and Pie Chart - has a default appearance, but you can modify this appearance to better suit the information you are presenting. You can, for example, change the:

- Configuration
- Direction of shading
- Orientation
- Use of a legend or key
- Color intensity and/or
- Position of labels, if you choose to display them

The options vary between the Chart types, and are described separately.

**Access**    **Double-click on Chart Object element | Chart Details | Appearance**

### 19.4.5.3 Pie Chart

A **Pie Chart** can have this appearance:

Element Status By Type

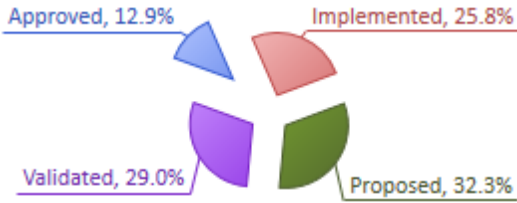

You define this appearance - or its alternatives - on the Appearance page of the element Properties dialog, after having set the **Type** field on the Source page to **Pie**. Each change in setting is immediately illustrated by an example Chart on the Appearance page.

**Access** Double-click on Chart element | Chart Details | Appearance

#### Define Pie Chart Appearance

Field	Action	See also
<b>Category</b>	Click on the drop down arrow and select the Pie Chart category:	

Field	Action	See also
	<ul style="list-style-type: none"> <li>• <b>3D Chart</b> - the Chart displays as a 3-D disc tilted away from you</li> <li>• <b>Doughnut</b> - the Chart displays as a 2-D ring</li> <li>• <b>Doughnut 3D</b> - the Chart displays as a 3-D ring with a rectangular profile</li> <li>• <b>Torus 3D</b> - the Chart displays as a 3-D ring with an elliptical profile</li> <li>• <b>Pie</b> - the Chart displays as a 2-D disc (the default, as illustrated above)</li> </ul>	
<b>Label Position</b>	<p>You can show the meaning and value of each segment of the Chart as a label (see <b>Show Data Labels</b> below); if you want to do this, you can specify where on the Chart the label will display.</p> <p>Click on the drop down arrow and select the position in which to display the labels relative to the segments:</p> <ul style="list-style-type: none"> <li>• <b>Center</b> - the label is shown in the middle of the segment</li> <li>• <b>Inside End</b> - the label is shown inside the rim of the segment,</li> <li>• <b>Inside Base</b> - the label is shown closer to the point of the segment</li> <li>• <b>Outside End</b> - the label is shown outside the rim of the segment and linked to it by a line (the default, as shown for the <b>Exploded</b> field)</li> </ul>	
<b>Show Data Labels</b>	<p>Select the checkbox to display a label against each segment of the Pie Chart.</p> <ul style="list-style-type: none"> <li>• If the <b>Show Index in Labels</b> checkbox <b>is</b> selected, only the index numbers ( <b>1, 2, 3...</b>) display in the labels, keyed to the legend (see <b>Display Legend</b>, below)</li> <li>• If the <b>Show Index in Labels</b> checkbox is <b>not</b> selected, the property name and percentage (such as <i>Approved, 12.9%</i>) display in the labels</li> </ul>	
<b>Gradient</b>	<p>Click on the drop down arrow and select the direction of the color gradient across the Chart:</p> <ul style="list-style-type: none"> <li>• <b>Solid Color</b> (no color gradient)</li> <li>• <b>Diagonal Left</b> (the default, as shown above; color fades from right to left)</li> <li>• <b>Diagonal Right</b> (color fades from left to right)</li> <li>• <b>Radial</b> (color fades from edges to center)</li> <li>• <b>Bevel</b> (dark rim and color fading from the bottom to the top)</li> </ul> <p>The <b>Torus 3D</b> category of Chart relies on a specific color gradient to create the effect of the Torus, therefore changes in the <b>Gradient</b> settings have no effect on Charts of this type.</p>	
<b>Hole Size</b>	<p>This field is available for the <b>Doughnut</b> and <b>Doughnut 3D</b> categories of the Pie Chart.</p> <p>Click on the slider and drag it to expand or contract the size of the hole in the middle of the Chart. The default (and the fixed size of the <b>Torus 3D</b> category) is <b>50%</b></p> <p>If you drag the hole size to <b>0%</b>, the Chart is effectively a <b>Pie Chart</b> or <b>3D Chart</b>.</p>	

Field	Action	See also
<b>Show Index in Labels</b>	<p>If you are displaying the meaning and value of each segment, you can display a legend providing this information (see <b>Display Legend</b>, below) and have a simple index to the legend as a label against each segment.</p> <p>Select the checkbox to display the index (<b>1, 2, 3...</b>) as the label text</p> <p>Clear the checkbox to display more complete information in the label.</p>	
<b>Exploded</b>	<p>Select the checkbox to pull each segment of the Chart out away from the other segments, with the 'first' segment separated out even further.</p> 	
<b>Fit Diagram Area</b>	<p>As you re-size your Chart element, the Chart width and height normally change with the element but stay in proportion.</p> <p>Leave this checkbox unselected to maintain this behavior.</p> <p>Select this checkbox to expand the Chart to fit the element space, even if the Chart has to elongate disproportionately up and down or sideways.</p>	
<b>Display Legend</b>	<p>You can select to show the meaning and value of the Chart segments on the Chart itself, as labels, or you can display some or all of this information as a legend to the right of the diagram.</p> <p>Select this checkbox to display a legend for the Chart.</p> <p>Deselect the checkbox to hide the legend.</p>	
	<p>For the <b>3D Chart</b> and <b>Doughnut 3D</b> categories:</p> <ul style="list-style-type: none"> <li>The small <b>top</b> (up) arrow swings the Chart toward horizontal, so you are increasing the side view; the extreme is to show the front edge of the Chart</li> <li>The small <b>bottom</b> (down) arrow swings the Chart towards vertical, so you are increasing the top view; the extreme is to show a <b>Pie Chart</b> or <b>Doughnut Chart</b></li> </ul> <p>For all categories of Pie Chart:</p> <ul style="list-style-type: none"> <li>The rotating arrow at the <b>center</b> returns the Chart to its default perspective</li> <li>The <b>left</b>-pointing arrow rotates the Chart by 24-degree increments anti-clockwise</li> <li>The <b>right</b>-pointing arrow rotates the Chart in 24-degree increments clockwise</li> </ul>	

Field	Action	See also
<b>OK</b>	Click on this button to apply the changes and close the dialog.	
<b>Cancel</b>	Click on this button to abort the changes and close the dialog.

**19.4.6 Including Charts in Reports**

If you want to distribute your Charts in the form of a printed or printable report, you can do so in two ways:

- **Print the diagram** containing the Chart (for small and/or informal distributions of a Chart or group of Charts)
- Generate a **Diagrams-Only report** to show all Charts in the selected Package, without any other model or element details

If you want to show the Chart **definitions** and other properties of each Chart element, you can generate other types of document report on the Packages containing the diagrams and elements.

It is also possible to include the Charts (in the form of a normal diagram) as a feature of any web documentation that you might generate on the model or Packages.

## 20 Automation and Scripting

In Enterprise Architect you can extend and automate the facilities and functionality through the use of Scripts, the Enterprise Architect Object Model and the Enterprise Architect Add-in Model:

Topic	Link
Scripts	<a href="#">Scripts</a> <sup>[2791]</sup>
The Enterprise Architect Object Model	<a href="#">The Enterprise Architect Object Model</a> <sup>[2804]</sup>
The Enterprise Architect Add-In Model	<a href="#">The Enterprise Architect Add-In Model</a> <sup>[3010]</sup>

- **Alt+F1 | Enterprise Architect | Automation | Scripting**

## 20.1 Scripting

Enterprise Architect implements a flexible and easy to use scripting capability based on both industry standard Javascript and Microsoft JScript and VBScript. Using a built in '**Repository**' object, you can programmatically inspect and/or modify elements within your currently open model. There are built in tools to edit, run, debug and manage your scripts.

Scripts can be used for a wide range of purposes, including:

- Inspecting and reporting on model and element composition
- Modifying and updating element properties
- Running queries to obtain extended model information
- Modifying diagram layouts
- Being called from report document templates to populate reports
- Creating and implementing process workflows
- Being included in MDG Technologies to augment domain specific languages

Scripting can help you get the custom information you need from your model, verify the structure of your model and help you automate time consuming manual tasks.

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Scripts executed in Enterprise Architect have access to the currently open model and are a powerful tool for querying and updating the model in situations that would otherwise require you to perform time consuming and repetitive GUI tasks.</p> <p>Enterprise Architect supports management of scripts using the following script engines:</p> <ul style="list-style-type: none"> <li>• JavaScript</li> <li>• Microsoft JScript</li> <li>• Microsoft VBScript</li> </ul> <p>The management interface for Scripting is the Scripting window, which contains the:</p> <ul style="list-style-type: none"> <li>• Script Tree View (Scripts tab), which you use to review, create and edit scripts</li> <li>• Script Console (Console tab), which you use to operate on an executing script</li> </ul> <p>Scripts are managed in groups: the first group in the list is always Local</p>	<p><a href="#">Scripts Tab</a> <sup>[2792]</sup></p> <p><a href="#">Console Tab</a> <sup>[2793]</sup></p> <p><a href="#">Script Group Properties</a> <sup>[2794]</sup></p>

Topic	Detail	See also
	<p>Scripts, which are files in the Scripts subdirectory of the Enterprise Architect installation - any instance of Enterprise Architect that has a currently open model can see these scripts; you cannot create, edit, drag-and-drop or delete Local scripts.</p> <p>All other groups are User Scripts, which you create yourself; a user group can be <b>one of several types</b>, each of which applies a template and certain conditions to the scripts you create within that group.</p> <p>User scripts are only visible inside the model in which they were created; the contents of the scripts are stored with the model, although they can be saved to the file system easily using the Script Editor.</p> <p>During the development of a script, you can debug it as you test it and analyse the execution; for example, by recording a Sequence diagram of the script execution, and halting execution to view local variables.</p>	<p><a href="#">Script Editor</a>  <sup>[2798]</sup></p> <p><a href="#">Script Debugging</a>  <sup>[2801]</sup></p>

### Notes

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- If you intend to use the Scripting facility under Crossover/WINE, you must also install Internet Explorer version 6.0 or above

## 20.1.1 Scripts Tab

**Access**   **Tools | Scripting > Scripts**

### Topics

Topic	Detail	See also
<b>Usage</b>	<p>The Scripts tab is composed of a toolbar and a view of all scripts according to group.</p> <p>To execute a script, press ( <b>Ctrl</b> ) while you double-click on the script name.</p> <p>To write or edit a user script, <b>double-click on the script name</b> to display the Script Editor; this usually displays a script template, determined by the user group type as assigned on creation or on the Script Group Properties dialog.</p> <p>You can move or copy a script from one user scripts folder to another; to:</p> <ul style="list-style-type: none"> <li>• Move a script, highlight it in the Scripts tab and drag it into the user scripts folder it now belongs to</li> </ul>	<p><a href="#">Script Group Properties</a>  <sup>[2794]</sup></p> <p><a href="#">Script Editor</a>  <sup>[2798]</sup></p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>Copy a script, highlight it in the Scripts tab and press ( <b>Ctrl</b> ) while you drag it into the user scripts folder in which to duplicate it</li> </ul>	
<b>Context Menus</b>	<p>The script groups and their scripts also have context menus that provide some or all of the following options:</p> <ul style="list-style-type: none"> <li><b>Group Properties</b> - to display or edit script group properties in the Script Group Properties dialog</li> <li><b>Run Script</b> - to execute the selected script</li> <li><b>Edit Script</b> - to update the selected script</li> <li><b>Rename Script</b> - to change the name of the selected group or script</li> <li><b>New VBScript/JScript/JavaScript</b> - add a new script to the selected user group</li> <li><b>Import Workflow Script</b> - to display the Browser dialog through which you locate and select a workflow script source (.vbs) file to import into the Workflow script folder</li> <li><b>Delete Group/Script</b> - to delete the selected user group or script</li> </ul>	<a href="#">Script Group Properties</a> <small>[2794]</small>

The Scripts tab toolbar provides the following options:

### Script Toolbar

Icon	Action	See also
	<p>Create a new script group; this option displays a short menu of the types of script group you can create, namely:</p> <ul style="list-style-type: none"> <li>Normal Group ()</li> <li>Project Browser Group ()</li> <li>Diagram Group ()</li> <li>Workflow Group ()</li> <li>Search Group ()</li> <li>Model Search Group</li> </ul> <p>The new group is added to the end of the list in the Scripting window, with the ' <i>New group</i> ' text highlighted so that you can type in the group name.</p>	
	<p>Create a new script file in the selected script group; displays a short menu of the types of script you can create, namely:</p> <ul style="list-style-type: none"> <li>VBScript ()</li> </ul>	

Icon	Action	See also
	<ul style="list-style-type: none"> <li>JScript (  )</li> <li>JavaScript (  )</li> </ul> <p>The new script is added to the end of the list in the selected group, with the 'New script' text highlighted so that you can type in the script name.</p>	
	Refresh the script tree in the Scripting window; this icon also reloads any changes made to a workflow script.	
	<p>Compile and execute the selected script.</p> <p>The output from the script is written to the Script tab of the Output window, which you display using the <b>View Script Output</b> button (below).</p>	
	Stop an executing script; the icon is disabled if no script is executing.	
	<p>Delete a <i>script</i> from the model; you cannot use this icon to delete a script <i>group</i> (see the <i>Context Menu</i> item above), scripts in the Local Scripts group, or a script that is executing.</p> <p>The system prompts you to confirm the deletion only if the <b>Confirm Deletes</b> checkbox is selected in the Project Browser panel of the General page of the Options dialog; if this option is not selected, no prompt is displayed.</p> <p>Script deletion is permanent - scripts cannot be recovered.</p>	<a href="#">General Options</a> 
	Display the Output window with the results of the most recently executed script displayed in the Script tab.	

### Notes

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- If you add, delete or change a script, you might have to reload the model in order for the changes to take effect
- If you select to delete a script group that contains scripts, the system always prompts you to confirm the action regardless of any system settings for delete operations; be certain that you intend to delete the group and its scripts before confirming the deletion - deletion of script groups and scripts is permanent

#### 20.1.1.1 Script Group Properties

When you create a script you develop it within a script group, the properties of which determine how that script is to be made available to the user - through the Project Browser context menu to operate on objects of a specific type, or through a diagram context menu. You create a Script Group using the first icon on the Scripts tab toolbar.

**Access**   **Tools | Scripting > Scripts | Script Group name | Group Properties**

### Define the Script Group Properties

Field/Button	Action	See also
<b>Name</b>	Type in the name of the script group.	
<b>Group UID</b>	(Read only) The automatically assigned GUID for the group.	
<b>Source</b>	(Read only) The location of the template used to create the script.	
<b>Group Type</b>	<p>Click on the drop-down arrow and select the type of script contained in the group; this can be one of:</p> <ul style="list-style-type: none"> <li>• <b>Normal</b> - (📄) General model scripts</li> <li>• <b>Project Browser</b> - (📁) Scripts that are listed in and can be executed from the Project Browser <b>Scripts</b> context menu option</li> <li>• <b>Workflow</b> - (🔄) Scripts executed by Enterprise Architect's workflow engine; you can create only VB scripts of this type</li> <li>• <b>Search</b> - (🔍) Scripts that can be executed as <b>model searches</b>; these scripts are listed in the <b>Search</b> field of the Model Search window, in the last category in the list</li> <li>• <b>Diagram</b> - (📐) Scripts that can be executed from the <b>Scripts</b> submenu of the diagram context menu</li> <li>• <b>Find in Project</b> - (🔍) Scripts that can be executed from the <b>Scripts</b> submenu of a context menu within the Model Search view, on the results of a successfully-executed SQL search that includes CLASSGUID and CLASSTYPE, or a Query-built search</li> <li>• <b>Element</b> - Scripts that can be executed from the <b>Scripts</b> submenu of element context menus; accessible from the Project Browser, Diagram, Model Search, Element List, Package Browser and Gantt views</li> <li>• <b>Package</b> - Scripts that can be executed from the <b>Scripts</b> submenu of package context menus; accessible from the Project Browser</li> <li>• <b>Diagram</b> - Scripts that can be executed from the <b>Scripts</b> context menu option for diagrams; accessible from the Project Browser and diagrams</li> <li>• <b>Link</b> - Scripts that can be executed from the <b>Scripts</b> context menu option for connectors; accessible from diagrams</li> </ul>	<p><a href="#">Package Context Menu</a><sup>65↑</sup></p> <p><a href="#">Workflow Scripts</a><sup>36↑</sup></p> <p><a href="#">Model Search</a><sup>70↑</sup></p> <p><a href="#">Diagram Context Menu</a><sup>78↑</sup></p>
<b>Notes</b>	Type in any comments you need regarding this script group.

## 20.1.2 Console Tab

**Access** **Tools | Scripting > Console**

#### Topics

Topic	Detail	See also
<b>Abstract</b>	<p>The script console is a tab of the Scripting window; it is a command line interpreter through which you can quickly enable a script engine and enter commands to act on the script.</p> <p>You type the commands in the field at the bottom of the tab; when you press the ( <b>Enter</b> ) key, the script console executes the commands and displays any output immediately</p> <p>You can input two types of command:</p> <ul style="list-style-type: none"> <li>• Console commands</li> <li>• Script commands</li> </ul>	
<b>Console Commands</b>	<p>Console commands are preceded by the ! character and instruct the console to perform an action.</p> <p>The available console commands are listed below; to list these commands on the <b>Console</b> tab itself, type ? in the console field (without the preceding ! character) and press the ( <b>Enter</b> ) key.</p> <ul style="list-style-type: none"> <li>• <b>c(lear)</b> - clears the console display</li> <li>• <b>sa(ve)</b> - saves the console display to a file</li> <li>• <b>h(elp)</b> - prints a list of commands, as for ?</li> <li>• <b>VB</b> - opens a VBScript console</li> <li>• <b>JA</b> - opens a JavaScript console</li> <li>• <b>JS</b> - opens a JScript console</li> <li>• <b>st(op)</b> - closes any script running console</li> <li>• <b>i(nclude)</b> name - executes the named script item; name is of the format <i>GroupName.ScriptName</i> (spaces are allowed in names)</li> <li>• <b>?</b> - (without the !) lists commands</li> <li>• <b>?name</b> - Outputs the value of a variable name (only if a script console is opened).</li> </ul>	

Topic	Detail	See also
<b>Script Commands</b>	<p>A script command is script code that depends on the script engine.</p> <p>Script commands can be executed only once a script console has been created.</p> <p><i>Examples:</i></p> <p>The following lines, entered into the console, create a <i>VBScript</i> console and then execute the script <i>MyScript</i> in the user group <i>MyGroup</i>:</p> <pre>&gt;! VB &gt;! i MyGr oup. MyScr i pt</pre> <p>The following lines, entered into the console, create a <i>JScript</i> console and then create a variable called <i>x</i> with the value <b>1</b>:</p> <pre>&gt;! JS &gt;var x = 1</pre> <p>The following image shows the result of entering the above <i>JScript</i> example; remember that you can use <b>?&lt;variable name&gt;</b> to get the current value of any item you have created during the console session.</p> 	
<b>Console Tab Toolbar</b>	<p>The <b>Console</b> tab has two operations available through the toolbar:</p> <ul style="list-style-type: none"> <li>• <b>Open Console</b> (  ) - click on the down-arrow and select to open a VBScript console, JScript console or JavaScript console</li> <li>• <b>Stop Script</b> (  ) - click to stop an executing script and close the current console</li> </ul>	

### Notes

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- You can save the output of the console to an external .txt file; right-click on the console window, select the **Save As** context menu option, browse for an appropriate file location and specify the file name

### 20.1.3 Script Editor

Using the **Script Editor** you can perform a number of operations on an open script file, such as:

- Save changes to the current script
- Save the current script under a different name
- Run the script
- Debug the script
- Stop the executing script
- View the script output in the Scripts tab of the System Output window

The editor is based on, and provides the facilities of, the common Code Editor in the application work area.

**Access** **Tools | Scripting > Scripts: double-click on script name**

#### Facilities

Facility	Detail	See also
<b>Scripting Objects</b>	<p>Enterprise Architect adds to the available functionality and features of the editor script language by providing inbuilt objects; these are either <i>Type Libraries</i>, providing Intelli-sense for editing purposes, or <i>Runtime objects</i>, providing access to objects of the types described in the Type Libraries.</p> <p>The available Intelli-sense scripting objects are:</p> <ul style="list-style-type: none"> <li>• EA</li> <li>• MathLib</li> <li>• System</li> </ul> <p>The runtime scripting objects are:</p> <ul style="list-style-type: none"> <li>• Repository ( Type: IDualRepository, an instance of EA. Repository, the Enterprise Architect <b>Automation Interface</b> )</li> <li>• Maths ( Type: IMath, an instance of MathLib; this exposes functions from the Cephes mathematical library for use in scripts - see below )</li> <li>• Session ( Type: ISession, an instance of System )</li> </ul>	<p><a href="#">Automation Interface</a> [2804]</p> <p><a href="#">Session Object</a> [2806]</p>
<b>Script Editing Intelli-sense (Required Syntax)</b>	<p>Intelli-sense is available not only in the Script Editor, but also in the Script Console; Intelli-sense at its most basic is presented for the inbuilt functionality of the script engine.</p> <p>For Intelli-sense on the additional Enterprise Architect scripting objects listed above, you must declare variables according to syntax that specifies a type; it is not necessary to use this syntax to execute a script properly, it is only present so that the correct Intelli-sense can be displayed for an item.</p> <p>The syntax can be seen in, for example:</p> <pre>Dim e as EA.Element</pre>	

Facility	Detail	See also
	<p>Then when you type, in this case, <b>e.</b>, the editor displays a list of member functions and properties of <b>e</b>'s type.</p> <p>You select one of these to complete the line of script; you might, therefore, type:</p> <pre>VBTrace( e.</pre> <p>As you type the period, the editor presents the appropriate list and you might double-click on, for example, <b>Abstract</b>; this is inserted in the line, and you continue to type or select the rest of the statement, in this case adding the end space and parenthesis:</p> <pre>VBTrace( e. Abstract )</pre>	
<b>Keystrokes</b>	<p>In the Script Editor or Console, Intelli-sense is presented on the following keystrokes.</p> <ul style="list-style-type: none"> <li>• Press ( <b>.</b> ) (period) after an item to list any members for that item's type</li> <li>• Press ( <b>Ctrl</b> ) + ( <b>Spacebar</b> ) on a word to list any Intelli-sense items with a name starting with the string at the point the keys were pressed</li> <li>• Press ( <b>Ctrl</b> ) + ( <b>Spacebar</b> ) when not on a word to display any available top level Intelli-sense items - these are the Intelli-sense objects described above plus any built-in methods and properties of the current scripting language.</li> </ul>	
<b>Include script libraries</b>	<p>An <b>Include statement</b> ( <b>!INC</b> ) allows a script to reference constants, functions and variables defined by another script accessible within the Scripting Window. Include statements are typically used at the beginning of a script.</p> <p>To include a script library, use the following syntax:</p> <pre>!INC [ Script Group Name] . [ Script Name]</pre> <p>For example:</p> <pre>!INC Local Scripts.EAConstants-VBScript</pre>	
<b>Using Inbuilt Math Functions</b>	<p>Various mathematical functions are available within the Script Editor, through the use of the inbuilt <b>Maths</b> object.</p> <p>You can access the Maths object within the Script Editor by typing <b>Maths</b> followed by a period. The Intelli-sense feature displays a list of the available mathematical functions provided by the Cephes Mathematical Library. For example:</p> <pre>Session.Output "The square root of 9 is " &amp; Maths.sqrt(9)</pre> <pre>Session.Output "2^10 = " &amp; Maths.pow(2, 10)</pre>	

Facility	Detail	See also
<b>System Script Library</b>	<p>When Enterprise Architect is installed on your system, it includes a default script library that provides a number of helpful scripting functions, varying from simple string functions to functions for defining your own CSV or XML import and export.</p> <p>To use the script library you must enable it in the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p> <p>Scroll through the list of technologies, and select the <b>Enabled</b> checkbox against <b>EAScriptLib</b>.</p>	

### Notes

- The Script Editor is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- Enterprise Architect scripting supports declaring variables to match the Enterprise Architect types; this enables the editor to present **Intelli-sense**, but is not necessary for executing the script

### Learn more

## 20.1.4 Session Object

The **Session** runtime object provides a common input/feedback mechanism across all script languages, giving access to objects of the types described in the **System Type** library. It is available through both the Scripts tab and the script console to any script run within Enterprise Architect.

### Properties

Properties	Detail	See also
<b>Attributes</b>	<ul style="list-style-type: none"> <li>• <b>UserName</b> - Returns the current windows username (read only)</li> <li>• <b>Version</b> - Returns the version of this object (read only)</li> </ul>	
<b>Methods</b>	<ul style="list-style-type: none"> <li>• <b>Input(string Prompt)</b> - displays a dialog box prompting the user to input a value; returns the string value that was entered by the user</li> <li>• <b>Output(string Output)</b> - writes text to the current default output location; during: <ul style="list-style-type: none"> <li>• Normal script execution, output is written to the Script tab of the Output window</li> </ul> </li> </ul>	

Properties	Detail	See also
	<ul style="list-style-type: none"> <li>Script Debugging, output is written to the Debug window</li> <li>Use of the Script Console, output is written to the Console</li> <li><b>Prompt(string Prompt, long PromptType)</b> - displays a modal dialog to the user containing the specified prompt text and button types; returns the <i>PromptResult</i> value corresponding to the button that the user clicked</li> </ul>	
<b>PromptType values</b>	<ul style="list-style-type: none"> <li>promptOK = 1</li> <li>promptYESNO = 2</li> <li>promptYESNOCANCEL = 3</li> <li>promptOKCANCEL = 4</li> </ul>	
<b>PromptResult values</b>	<ul style="list-style-type: none"> <li>resultOK = 1</li> <li>resultCancel = 2</li> <li>resultYes = 3</li> <li>resultNo = 4</li> </ul>

### 20.1.5 Script Debugging

Script debugging aids in the development and maintenance of model scripts, and monitoring their activity at the time of execution. While debugging a script, you can:

- Control execution flow using the **Debug**, **Step Over**, **Step Into**, **Step Out** and **Stop Script** buttons on the Script Editor toolbar
- Set Breakpoints, Recording Markers and Tracepoint Markers
- Use the Debug window to view output generated by the script
- Use the Locals window to inspect values of variables, including objects from the Automation Interface
- Use the Record & Analyze window to record a Sequence diagram of the script execution

**Access**    **Script Editor Toolbar: Debug button**

**Begin debugging a model script**

Step	Action	See Also
1	Open a model script in the Script Editor.	<a href="#">Scripts Tab</a> <sup>[2792]</sup> <a href="#">Script Editor</a> <sup>[2798]</sup>
2	Set any Breakpoints on the appropriate line(s) of code.	<a href="#">Setting Code Breakpoints</a> <sup>[2226]</sup> <a href="#">Marker Types</a> <sup>[2538]</sup>
3	Click on the  toolbar icon ( <b>Debug</b> ).	

**Notes**

- Script debugging is supported for VBScript, JScript and Javascript
- VBScript and JScript require the Microsoft Process Debug Manager to be installed on the local machine; this is available through various Microsoft products including the free 'Microsoft Script Debugger'
- Breakpoints are not saved for scripts and will not persist when the script is next opened
- While debugging, script output is redirected to the Debug window

**20.1.6 Simulation Scripts**

You can perform **dynamic simulation** of your models using **scripts** written in **JavaScript**. All simulation objects and variables are created in the Java run time environment.

The current simulation objects have a root element **sim** and the object or Class type **SimObject**. The **sim** element is the root of the tree structure of generated simulation objects and their properties shown in the Locals window, although - unlike user interfaces or Java variables - **sim** itself as the root is not shown. Each **SimObject** has properties, some of which are themselves **SimObjects**. For example: **sim.a.b** can be a simulation object, having a single value - an integer or a string.

Java variables created by Java data types, such as **var**, **Object** and **Array** are not shown in the Locals window, though they exist in the Java runtime environment. You can check for them using code; for example:

```
var a = 5; sim.a = a;
```

In this way, `sim.a` will be shown in the Locals window.

You can also create an Array or an Object using this code:

```
sim.a = new Array();  
sim.a = [ 1000, 1100, 1200, 1300];  
sim.simArray = nativeArray; //nativeArray is a Java Array  
sim.o = new Object();  
sim.o = { property1: 5, property2: "myString" };
```

The resulting objects are **simulation** objects but not **Java** objects; that is, this is a **transformation** process, creating Java objects and transforming them into simulation objects.

## 20.2 Enterprise Architect Object Model

### Topics

Topic	Detail	See also
<b>Introduction</b>	<p>Automation provides a way for other applications to access the information in an Enterprise Architect model using Windows OLE Automation (ActiveX). Typically this involves scripting clients such as MS Word or Visual Basic, or using scripts created within Enterprise Architect using the Scripting window.</p> <p>The Automation Interface provides a way of accessing the internals of Enterprise Architect models. Examples of things you can do using the Automation Interface include:</p> <ul style="list-style-type: none"> <li>• Perform repetitive tasks, such as update the version number for all elements in a model</li> <li>• Generate code from a State Machine diagram</li> <li>• Produce custom reports</li> <li>• Perform ad hoc queries</li> </ul>	<a href="#">Scripting</a> <sup>[2791]</sup>
<b>Connecting to the Automation Interface</b>	All development environments capable of generating <i>ActiveX</i> Com clients should be able to connect to the Enterprise Architect Automation Interface. This guide provides detailed instructions on connecting to the interface using Microsoft Visual Basic 6.0, Borland Delphi 7.0, Microsoft C# and Java. There are also more detailed steps on how to set-up Visual Basic; the principles are applicable to other languages.	<a href="#">Connecting to the Interface</a> <sup>[2805]</sup> <a href="#">Set References in Visual Basic</a> <sup>[2808]</sup>
<b>Examples and Tips</b>	Instruction on how to use the Automation Interface is provided by means of sample code. See pointers to the samples and other available resources. Also, consult the extensive Reference Section.	<a href="#">Pointers to the Samples</a> <sup>[2809]</sup> <a href="#">Available Resources</a> <sup>[2811]</sup> <a href="#">Reference</a> <sup>[2812]</sup>
<b>Calling Executables from Enterprise Architect</b>	Enterprise Architect can be set up to call an external application. You can pass parameters on the current position selected in the Project Browser to the application being called. For instructions, go to the Call from Enterprise Architect topic. A more sophisticated method is to create Add-Ins, which are discussed in a separate topic.	<a href="#">Call from Enterprise Architect</a> <sup>[2810]</sup> <a href="#">Add-Ins</a> <sup>[3010]</sup>

## 20.2.1 Using the Automation Interface

This section provides instructions on how to connect to and use the Automation Interface, including:

Topic	See also
Connecting to the Interface	<a href="#">Connecting to the Interface</a> 
Setting References In Visual Basic	<a href="#">Setting References In Visual Basic</a> 
Examples and Tips	<a href="#">Examples and Tips</a> 

### 20.2.1.1 Connect to the Interface

All development environments capable of generating ActiveX Com clients can connect to the Enterprise Architect Automation Interface.

By way of example, the following sections describe how to connect using several such tools. The procedure might vary slightly with different versions of these products.

#### Microsoft Visual Basic 6.0

Step	Action	See also
1	Create a new project.	
2	Select the <b>Project   References</b> menu option.	
3	Select <i>Enterprise Architect Object Model 2.0</i> from the list. If this does not appear, go to the command line and re-register Enterprise Architect using:  <i>EA.exe /unregister</i>  then  <i>EA.exe /register</i>	
4	See the general library documentation on the use of Classes. The following example creates and opens a repository object:  <pre>Public Sub ShowRepository()     Dim MyRep As New EA.Repository     MyRep.OpenFile "c:\eat est.eap" End Sub</pre>	

**Borland Delphi 7.0**

Step	Action	See also
1	Create a new project.	
2	Select the <b>Project   Import Type Library</b> menu option.	
3	<p>Select <b>Enterprise Architect Object Model 2.0</b> from the list.</p> <p>If this does not appear, go to the command line and re-register Enterprise Architect using:</p> <pre>EA.exe /unregister</pre> <p>then</p> <pre>EA.exe /register</pre>	
4	Click on the <b>Create Unit</b> button.	
5	Include <i>EA_TLB</i> in Project1's <i>Uses</i> clause.	
6	<p>See the general library documentation on the use of Classes. The following example creates and opens a repository object:</p> <pre> procedure TForm1.Button1Click(Sender: TObject); var   r: TRepository;   b: boolean; begin   r := TRepository.Create(nil);   b := r.OpenFile('c:\eat\eat.eap'); end; </pre>	

**Microsoft C#**

Step	Action	See also
1	Select the Visual Studio <b>Project   Add Reference</b> menu option.	
2	Click on the Browse tab.	
3	<p>Navigate to the folder in which you installed Enterprise Architect; usually:</p> <pre>Program Files\ Sparx Systems\ EA</pre>	

Step	Action	See also
	<p>Select</p> <p><code>Interop.EA.dll</code></p>	
4	<p>See the general library documentation on the use of Classes. The following example creates and opens a repository object:</p> <pre>private void button1_Click(object sender, System. EventArgs e) {     EA.Repository r = new EA.Repository();     r.OpenFile("c:\\eatest.eap"); }</pre>	

### Java

Step	Action	See also
1	<p>Copy the file:</p> <p><code>SSJavaCOM.dll</code></p> <p>from the Java API subdirectory of your installed directory, usually:</p> <p><code>Program Files/Sparx Systems/EA</code></p> <p>into any location within the Windows PATH</p> <p><code>windows\system32\directory.</code></p>	
2	<p>Copy the file</p> <p><code>eaapi.jar</code></p> <p>from the Java API subdirectory of your installed directory, usually:</p> <p><code>Program Files/Sparx Systems/EA</code></p> <p>to a location in the Java CLASSPATH or where the Java class loader can find it at run time.</p>	
3	<p>All of the Classes described in the documentation are in the package <i>org.sparx</i>. See the <b>general library documentation</b> for their use. The following example creates and opens a repository object:</p> <pre>public void OpenRepository() {     org.sparx.Repository r = new org.sparx.Repository();     r.OpenFile("c:\\eatest.eap"); }</pre>	<a href="#">Reference</a> <sup>[2812]</sup>

Step	Action	See also

### 20.2.1.1.1 Set References In Visual Basic

This topic describes how to use the Enterprise Architect ActiveX interface with Visual Basic (VB). Use is ensured for Visual Basic version 6, but might vary slightly with versions other than version 6.

It is assumed that you have accessed VB through a Microsoft Application such as VB 6.0, MS Word or MS Access. If the code is not called from within Word, the *Word VB* reference must also be set.

#### How to

On creating a new VB project, to set a reference to an Enterprise Architect Type Library and a Word Type Library follow the steps below:

Step	Action	See also
1	Select the <b>Tools   References</b> menu option.	
2	Select the <b>Enterprise Architect Object Model 2.10</b> checkbox from the list.	
3	Do the same for VB or VB Word: select the checkbox for the <b>Microsoft Word 10.0 Object Library</b> .	
4	Click on the <b>OK</b> button.	

#### Notes

- If Enterprise Architect Object Model 2.10 does not appear in the list, go to the command line and manually re-enter Enterprise Architect using the following:
  - To unregister Enterprise Architect: `ea.exe /unregister`
  - To register Enterprise Architect: `ea.exe /register`
- **Visual Basic 5/6** users should also note that the version number of the Enterprise Architect interface is stored in the VBP project file in a form similar to the following:

```
Reference=* \ G{ 64FB2BF4- 9EFA- 11D2- 8307- C45586000000} #2. 2#0#. . \ . . \ . .
\ Program Files\ Sparx Systems\ EA\ EA. TLB#Enterprise Architect Object
Model 2. 02
```

If you experience problems moving from one version of Enterprise Architect to another, open the VBP file in a text editor and remove this line, then open the project in Visual Basic and use Project-References to create a new reference to the Enterprise Architect Object model

Reference to objects in Enterprise Architect and Word should now be available in the **Object Browser**,

which can be accessed from the main menu by selecting **View | Object Browser**, or by pressing ( **F2** )

The drop-down list on the top-left of the window should now include Enterprise Architect and Word; if MS-Project is installed, also set this up

### 20.2.1.2 Examples and Tips

#### Topics

Topic	Detail	See also
<b>Usage</b>	<p>Instructions for using the interface are provided through sample code. There are several sets of examples:</p> <ul style="list-style-type: none"> <li>• VB 6 and C# examples are available in the Code Samples folder under your Enterprise Architect installation (default: C:\Program Files\Sparx Systems\EA\Code Samples)</li> <li>• Enterprise Architect can be set up to <b>call an external application</b></li> <li>• Several VB.NET code snippets are provided in the <b>reference section</b></li> <li>• A comprehensive example of using Visual Basic to create MS Word documentation is available from the internet at <a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a></li> <li>• Additional samples are available from the Sparx Systems website; see the <i>Available Resources</i> topic</li> </ul>	<p><a href="#">Call an External Application</a> <sup>[2810]</sup></p> <p><a href="#">Code Samples</a> <sup>[2994]</sup></p> <p><a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a></p> <p><a href="#">Available Resources</a> <sup>[2811]</sup></p>
<b>Tips and Tricks</b>	<p>Additionally, you should note the following tips and tricks:</p> <ul style="list-style-type: none"> <li>• An instance of the Enterprise Architect (<i>EA.exe</i>) process is executed when you initialize a new repository object - this process must remain running in order to perform automation tasks; if the main window is visible, you can safely minimize it, but it must remain running</li> <li>• The Enterprise Architect ActiveX Interface is a functional interface rather than a data interface; when you load data through the interface there is a noticeable delay as Enterprise Architect user interface elements (such as Windows and menus) are loaded and the specified database connection is established</li> <li>• Collections use a zero-based index; for example, <code>Repository.Models(0)</code> represents the first model in the repository</li> <li>• During the development of your client software your program might terminate unexpectedly and leave <i>EA.exe</i> running in such a state that it is unable to support further interface calls; if your program terminates abnormally, ensure that Enterprise Architect is not left running in the background (see</li> </ul>	<p><a href="#">Repository Class</a> <sup>[2850]</sup></p> <p><a href="#">App Class</a> <sup>[2814]</sup></p>

Topic	Detail	See also
	<p>the Windows Task Manager / Process tab)</p> <ul style="list-style-type: none"> <li>A handle to a currently running instance of Enterprise Architect can be obtained through the use of a <i>GetObject()</i> call (see the reference page for the <i>App</i> object); accessing your Enterprise Architect model via the <i>App</i> object enables querying the current User Interface status, such as using <i>GetCurrentItem()</i> on the <b>Repository</b> object to detect the current selection by the user, allowing for rapid prototyping and testing</li> </ul>	
<b>Enterprise Architect Not Closing</b>	<p>If your automation controller was written using the .NET framework, Enterprise Architect does not close even after you release all your references to it.</p> <p>To force the release of the COM pointers, call the memory management functions as shown below:</p> <pre>GC. Collect ( ) ; GC. Wait For PendingFinalizers ( ) ;</pre> <p>There are additional concerns when controlling a running instance of Enterprise Architect that loads Add-Ins - see the <i>Tricks and Traps</i> topic for details.</p>	<a href="#">Tricks and Traps</a> 

#### 20.2.1.2.1 Call from Enterprise Architect

Enterprise Architect can be set up to call an external application. You can pass parameters on the current position selected in the Project Browser to the application being called.

**Access**   **Tools | Customize > Tools**

#### Topics

Topic	Detail	See also
<b>Uses</b>	<p>With this you can:</p> <ul style="list-style-type: none"> <li>Add a command line for an application</li> <li>Define parameters to pass to this application</li> </ul> <p>The parameters required for running the AutInt executable are:</p> <ul style="list-style-type: none"> <li>The Enterprise Architect file parameter \$f and</li> <li>The current PackageID \$p</li> </ul> <p>Hence the arguments should simply contain: \$f , \$p</p>	

The available parameters for passing information to external applications are:

Parameter	Description	Notes
\$d	Diagram ID	ID for accessing associated diagram.
\$D	Diagram GUID	GUID for accessing the associated diagram.
\$e	Comma separated list of element IDs	All elements selected in the current diagram.
\$E	Comma separated list of element GUIDs	All elements selected in the current diagram.
\$f	Project Name	For example: C: \ p r o j e c t s \ EAexamp l e . eap .
\$F	Calling Application (Enterprise Architect)	'Enterprise Architect'.
\$p	Current Package ID	For example: 144.
\$P	Package GUID	GUID for accessing this package.

Once this has been set up, the application can be called from the main menu in Enterprise Architect using the **Extensions | <YourApplication>** menu option.

#### 20.2.1.2.2 Available Resources

Other available resources include:

Resource	Download Link
VB 6 Add-In for generating MS Word documentation.	<a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a>
VB 6 Add-In to display a custom ActiveX graph control within the Enterprise Architect window as a new view.	<a href="http://www.sparxsystems.com/resources/developers/autint_vb_custom_view.html">www.sparxsystems.com/resources/developers/autint_vb_custom_view.html</a>
A basic Add-In framework written in C#. Useful as a starting point for authoring your own custom Enterprise Architect Add-In.	<a href="http://www.sparxsystems.com/bin/CS_AddinFramework.zip">www.sparxsystems.com/bin/CS_AddinFramework.zip</a>
An extension on the <i>CS_AddinFramework</i> example showing how to export Tagged	<a href="http://www.sparxsystems.com/bin/CS_AddinTaggedCSV.zip">www.sparxsystems.com/bin/CS_AddinTaggedCSV.zip</a>

## 20.2.2 Reference

This section provides detailed information on all the objects available in the object model provided by the Automation Interface, covering:

Topic	Link
Interface Overview Package	<a href="#">Interface Overview Package</a> <sup>[2813]</sup>
App Object	<a href="#">App Object</a> <sup>[2814]</sup>
Enumerations	<a href="#">Enumerations</a> <sup>[2815]</sup>
Repository Package	<a href="#">Repository Package</a> <sup>[2826]</sup>
Element Package	<a href="#">Element Package</a> <sup>[2877]</sup>
Element Features Package	<a href="#">Element Features Package</a> <sup>[2910]</sup>
Connector Package	<a href="#">Connector Package</a> <sup>[2933]</sup>
Diagram Package	<a href="#">Diagram Package</a> <sup>[2948]</sup>
Project Interface Package	<a href="#">Project Interface Package</a> <sup>[2962]</sup>
Document Generator Interface Package	<a href="#">Document Generator Interface Package</a> <sup>[2985]</sup>

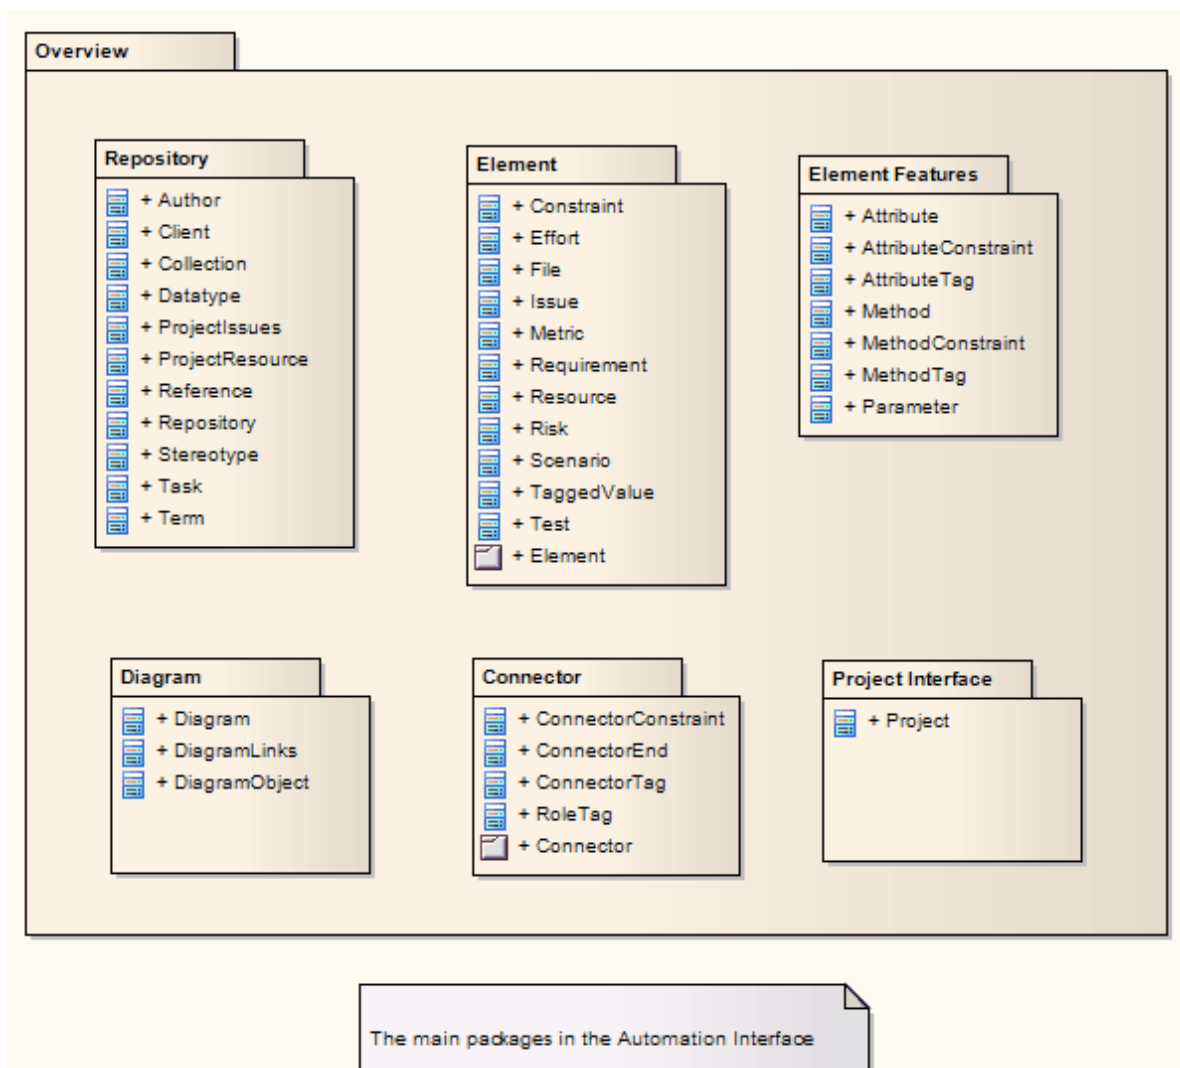

Topic	Link
Mail Interface Package	<a href="#">Mail Interface Package</a> 
Code Samples	<a href="#">Code Samples</a> 

### 20.2.2.1 Interface Overview Package

The Interface Overview Package provides an overview of the main components of the Automation Interface. These include the:

Topic	Detail	Link
<b>Repository Package</b>	Represents the model as a whole and provides entry to model packages and collections.	<a href="#">Repository Package</a> 
<b>Element Package</b>	Identifies the basic structural units (such as Class, Use Case and Object).	<a href="#">Element Package</a> 
<b>Element Features Package</b>	Identifies the attributes and operations defined on an element.	<a href="#">Element Features Package</a> 
<b>Diagram Package</b>	Describes the visible drawings contained in the model.	<a href="#">Diagram Package</a> 
<b>Connector Package</b>	Defines the relationships between elements.	<a href="#">Connector Package</a> 

The following diagram illustrates the main interface packages and their associated contents. Each element in this document is creatable by Automation and can be accessed through the various collections that exist or, in some cases, directly.

The *Repository* Class is the starting point for all use of the automation interface. It contains the high level system objects and entry point into the model itself using the *Models* collection and the other system level collections.

### 20.2.2.2 App Object

The *App* object represents a running instance of Enterprise Architect. Its object provides access to the Automation Interface.

Attribute	Type	Notes
Project	Project	Read only Provides a handle to the Project Interface.
Repository	Repository	Read only Provides a handle to the Repository object.
Visible	Boolean	Read/Write

Attribute	Type	Notes
		Whether or not the application is visible.

Topic	Detail	See also
<b>GetObject() Support</b>	<p>The <i>App</i> object is creatable and a handle can be obtained by creating one. In addition, clients can use the equivalent of Visual Basic's <i>GetObject()</i> to obtain a reference to a currently running instance of Enterprise Architect.</p> <p>Use this method to more quickly test changes to Add-Ins and external clients, as the Enterprise Architect application and data files do not have to be constantly re-loaded.</p> <p>For example:</p> <pre>Dim App as EA.App Set App = GetObject(, "EA.App") MsgBox App.Repository.Models.Count</pre> <p>Another example, which uses the App object without saving it to a variable:</p> <pre>Dim Rep as EA.Repository Set Rep = GetObject(, "EA.App").Repository MsgBox Rep.ConnectionString</pre>	

### 20.2.2.3 Enumerations

The following enumerations are defined by the Automation Interface:

Enumeration	Link
Constant Layout Styles	<a href="#">ConstLayoutStyles</a>  <sup>[2816]</sup>
Create Baseline Flag	<a href="#">CreateBaselineFlag</a>  <sup>[2817]</sup>
Create Model Type	<a href="#">CreateModelType</a>  <sup>[2818]</sup>
Document Break	<a href="#">DocumentBreak</a>  <sup>[2818]</sup>
Document Page Orientation	<a href="#">DocumentPageOrientation</a>  <sup>[2818]</sup>
Document Type	<a href="#">DocumentType</a>  <sup>[2819]</sup>
EA Edition Types	<a href="#">EAEditionTypes</a>  <sup>[2819]</sup>

Enumeration	Link
Enumeration Relation Set Type	<a href="#">EnumRelationSetType</a>  [2820]
Export Package XML Flag	<a href="#">ExportPackageXMLFlag</a>  [2820]
Mail Interface Message Flag	<a href="#">MessageFlag</a>  [2821]
MDG Menus	<a href="#">MDGMenus</a>  [2821]
Object Type	<a href="#">ObjectType</a>  [2822]
PropType	<a href="#">PropType</a>  [2823]
Reload Type	<a href="#">ReloadType</a>  [2823]
Scenario Diagram Type	<a href="#">ScenarioDiagramType</a>  [2824]
Scenario Step Type	<a href="#">ScenarioStepType</a>  [2825]
Scenario Test Type	<a href="#">ScenarioTestType</a>  [2825]
XML Type	<a href="#">XMLType</a>  [2825]

#### 20.2.2.3.1 ConstLayoutStyles

The *enum* values defined here are used exclusively for the *Lay Out a Diagram* method. They enable you to define the layout options as depicted in the **Diagram | Layout Diagram** menu option.

Value	Meaning
<i>IsCrossReduceAggressive</i>	Perform aggressive Cross-reduction in the layout process (time consuming).
<i>IsCycleRemoveDFS</i>	Use the <i>Depth First Cycle Removal</i> algorithm.
<i>IsCycleRemoveGreedy</i>	Use the <i>Greedy Cycle Removal</i> algorithm.

Value	Meaning
<i>IsDiagramDefault</i>	Use existing layout options specified for this diagram.
<i>IsInitializeDFSIn</i>	Initialize the layout using the <i>Depth First Search Inward</i> algorithm.
<i>IsInitializeNaive</i>	Initialize the layout using the <i>Naïve Initialize Indices</i> algorithm.
<i>IsInitializeDFSOut</i>	Initialize the layout using the <i>Depth First Search Outward</i> algorithm.
<i>IsLayeringLongestPathSink</i>	Layer the diagram using the <i>Longest Path Sink</i> algorithm.
<i>IsLayeringLongestPathSource</i>	Layer the diagram using the <i>Longest Path Source</i> algorithm.
<i>IsLayeringOptimalLinkLength</i>	Layer the diagram using the <i>Optimal Link Length</i> algorithm.
<i>IsLayoutDirectionDown</i>	Direct connectors to point down.
<i>IsLayoutDirectionLeft</i>	Direct connectors to point left.
<i>IsLayoutDirectionRight</i>	Direct connectors to point right.
<i>IsLayoutDirectionUp</i>	Direct connectors to point up.
<i>IsProgramDefault</i>	Use factory default layout options as specified by Enterprise Architect.

#### Learn more

- [Lay Out a Diagram](#)<sup>[89]</sup>

#### 20.2.2.3.2 CreateBaselineFlag

The *CreateBaselineFlag* enumeration is used in Baseline Management, when creating a Baseline.

Value	Meaning
<i>cbSaveToStub</i>	Baseline this package with only immediate children (child packages are included as stubs only).

### 20.2.2.3.3 CreateModelType

The *CreateModelType* enumeration is used in the **CreateModel** method on the Repository Class.

Value	Meaning
<i>cmEAPFromBase</i>	Create a copy of the EABase model file to the specified file path.
<i>cmEAPFromSQLRepository</i>	Create a .eap file shortcut to an SQL-based repository; requires user interaction to provide sql connection details.

#### Learn more

- [CreateModel Method](#) 

### 20.2.2.3.4 DocumentBreak

The *DocumentBreak* enumeration is used in the **InsertBreak** method on the *DocumentGenerator* Class.

Value	Meaning
<i>breakPage</i>	Insert a page break in the document.
<i>breakSection</i>	Insert a section break in the document.

#### Learn more

- [InsertBreak Method](#) 

### 20.2.2.3.5 DocumentPageOrientation

The *DocumentPageOrientation* enumeration is used in the **SetPageOrientation** method on the *DocumentGenerator* Class.

Value	Meaning
<i>pagePortrait</i>	Sets the current page orientation to <b>Portrait</b> .
<i>pageLandscape</i>	Sets the current page orientation to <b>Landscape</b> .

#### Learn more

- [SetPageOrientation Method](#) 

### 20.2.2.3.6 DocumentType

The *DocumentType* enumeration is used in the **SaveDocument** method on the *DocumentGenerator* Class.

Value	Meaning
<i>dtRTF</i>	Save the document file to disk as an RTF document.
<i>dtHTML</i>	Save the document file to disk as a HTML document.
<i>dtPDF</i>	Save the document file to disk as a PDF document.
<i>dtDOCX</i>	Save the document file to disk as a DOCX document.

#### Learn more

- [SaveDocument Method](#) 

### 20.2.2.3.7 EAEditionTypes

#### Topics

Topic	Detail	See also
<b>General Usage</b>	<p>The <i>EAEditionTypes</i> enumeration identifies the current level of licensed functionality available</p> <pre> EAEditionTypes theEdition = theRepository. GetEAEdition(); if ( theEdition == EAEditionTypes.piDesktop )     ... else if ( theEdition == EAEditionTypes. piProfessional )     ... </pre> <p>The enumeration defines the following formal values:</p> <ul style="list-style-type: none"> <li>• <i>piLite</i></li> <li>• <i>piDesktop</i></li> <li>• <i>piProfessional</i></li> <li>• <i>piCorporate</i></li> <li>• <i>piBusiness</i></li> <li>• <i>piSystemEng</i></li> <li>• <i>piUltimate</i></li> </ul> <p>There is no separate value for the trial edition; the <i>Repository.GetEAEdition()</i> function returns the appropriate <b>EAEditionTypes</b> value for whichever edition the user has selected to trial.</p>	

Topic	Detail	See also

#### 20.2.2.3.8 *EnumRelationSetType*

This enumeration represents values returned from the *GetRelationSet* method of the **Element** object.

Value	Meaning
<i>rsDependEnd</i>	List of elements that depend on the current element.
<i>rsDependStart</i>	List of elements that the current element depends on.
<i>rsGeneralizeEnd</i>	List of elements that are generalized by the current element.
<i>rsGeneralizeStart</i>	List of elements that the current element generalizes.
<i>rsParents</i>	List of all parent elements of the current element.
<i>rsRealizeEnd</i>	List of elements that are realized by the current element.
<i>rsRealizeStart</i>	List of elements that the current element realizes.

#### Learn more

- [Element Class](#) 

#### 20.2.2.3.9 *ExportPackageXMIFlag*

The *ExportPackageXMIFlag* enumeration is used in package control, when exporting to XML.

Value	Meaning
<i>epSaveToStub</i>	Export this package with only immediate children (child packages are included as stubs only).

#### 20.2.2.3.10 MDGMenus

Use this enumeration when providing the *HiddenMenus* property to *MDG\_GetProperty*.

These options are exclusive of one another and can be read or added to hide more than one menu.

Value	Meaning
<i>mgBuildProject</i>	Hide <b>Build Project</b> menu option.
<i>mgMerge</i>	Hide <b>Merge</b> menu option.
<i>mgRun</i>	Hide <b>Run</b> menu option.

#### Learn more

- [MDG\\_GetProperty](#)<sup>[3102]</sup>

#### 20.2.2.3.11 MessageFlag

The *MessageFlag* enumeration is used in both the **SendMailMessage** and **ComposeMailMessage** methods of the MailInterface, to specify a flag to attach to the message.

Value	Meaning
<b>mfNone</b>	Do not flag the message.
<b>mfComplete</b>	Flag the message as 'Complete'.
<b>mfPurple</b>	Flag the message with a 'Purple' flag.
<b>mfOrange</b>	Flag the message with a 'Orange' flag.
<b>mfGreen</b>	Flag the message with a 'Green' flag.
<b>mfYellow</b>	Flag the message with a 'Yellow' flag.
<b>mfBlue</b>	Flag the message with a 'Blue' flag.
<b>mfRed</b>	Flag the message with a 'Red' flag.

### 20.2.2.3.12 *ObjectType*

The **ObjectType** enumeration identifies Enterprise Architect object types even when referenced through a Dispatch interface. For example:

```

var treeSelectedType = Repository.GetTreeSelectedItemType();

switch ( treeSelectedType )
{
    case otElement :
    {
        // Code for when an element is selected
        var theElement as EA.Element;
        theElement = Repository.GetTreeSelectedObject();

        break;
    }
    case otPackage :
    {
        // Code for when a package is selected
        var thePackage as EA.Package;
        thePackage = Repository.GetTreeSelectedObject();

        break;
    }
}

```

#### Valid Enumeration Values

```

otAttribute
otAttributeConstraint
otAttributeTag
otAuthor
otClient
otCollection
otConnector
otConnectorConstraint
otConnectorEnd
otConnectorTag
otConstraint
otCustomProperty
otDatatype
otDiagram
otDiagramLink
otDiagramObject
otEffort
otElement
otEventProperties
otEventProperty
otFile
otIssue
otMailInterface
otMethod
otMethodConstraint
otMethodTag
otMetric
otModel
otNone
otPackage
otParameter
otParamTag
otPartition
otProject
otProjectIssues
otProjectResource
otProperties
otProperty

```

```

ot PropertyType
ot Reference
ot Repository
ot Requirement
ot Resource
ot Risk
ot RoleTag
ot Scenario
ot ScenarioExtension
ot ScenarioStep
ot Stereotype
ot Swimlane
ot SwimlaneDef
ot Swimlanes
ot TaggedValue
ot Task
ot Term
ot Test
ot Transition

```

### 20.2.2.3.13 PropType

The *PropType* enumeration gives the automation programmer an indication of what sort of data is going to be stored by this property.

Value	Meaning
<i>ptArray</i>	An array containing values of any type.
<i>ptBoolean</i>	<b>True</b> or <b>False</b> .
<i>ptEnum</i>	A string being an entry in the semi-colon separated list specified in the validation field of the Property.
<i>ptFloatingPoint</i>	4 or 8 byte floating point value.
<i>ptInteger</i>	16-bit or 32-bit signed integer.
<i>ptString</i>	Unicode string.

### 20.2.2.3.14 ReloadType

This enumeration represents values returned from the *GetReloadItem* and *PeekReloadItem* methods of the *ModelWatcher* Class. It has four possible values, which define the type of change that was made to a model.

Value	Meaning
<i>rtElement</i>	The <i>Item</i> parameter represents a particular element that must be reloaded.
<i>rtEntireModel</i>	Entire model must be reloaded to ensure that all changes are reloaded.

Value	Meaning
<i>rtNone</i>	No change in the model.
<i>rtPackage</i>	The <i>Item</i> parameter represents a particular package that must be reloaded.

#### 20.2.2.3.15 ScenarioDiagramType

The *ScenarioDiagramType* enumeration provides the following enumeration values to the **Project.GenerateDiagramFromScenario()** method. They specify the type of diagram to generate.

Value	Meaning	See also
<i>sdActivity</i>	Generate an Activity diagram.	<a href="#">Generated Activity diagram</a> <sup>[978]</sup>
<i>sdActivityWithAction</i>	Generate an Activity diagram with an Action.	<a href="#">Generated Activity diagram</a> <sup>[978]</sup>
<i>sdActivityWithActionPin</i>	Generate an Activity diagram with an ActionPin.	<a href="#">Generated Activity diagram</a> <sup>[978]</sup>
<i>sdActivityWithActivityParameter</i>	Generate an Activity diagram with an ActivityParameter.	<a href="#">Generated Activity diagram</a> <sup>[978]</sup>
<i>sdRobustness</i>	Generate a Robustness diagram.	<a href="#">Generated Robustness diagram</a> <sup>[984]</sup>
<i>sdRuleFlow</i>	Generate a RuleFlow diagram	<a href="#">Generated RuleFlow diagram</a> <sup>[980]</sup>
<i>sdSequence</i>	Generate a Sequence diagram.	<a href="#">Generated Sequence diagram</a> <sup>[982]</sup>
<i>sdState</i>	Generate a State Machine diagram.	<a href="#">Generated State Machine diagram</a> <sup>[980]</sup>

#### Learn more

- [Project.GenerateDiagramFromScenario\(\) Method](#) <sup>[2968]</sup>

### 20.2.2.3.16 ScenarioStepType

The *ScenarioStepType* enumeration is used to identify the steps of a scenario, and the entity performing the step.

Value	Meaning	See also
<i>stActor</i>	Identify that the step is an action performed by an actor.	
<i>stSystem</i>	Identify that the step is an action performed by the system.	

#### Learn more

- [Scenario Step Class](#) <sup>[2905]</sup>

### 20.2.2.3.17 ScenarioTestType

The *ScenarioTestType* enumeration provides the following enumeration values to the **Project.GenerateTestFromScenario()** method. They specify the type of test to generate.

Value	Meaning	See also
<i>stExternal</i>	Generate an external Test Case element.	
<i>stInternal</i>	Generate an internal test.	

#### Learn more

- [Project.GenerateTestFromScenario\(\) Method](#) <sup>[2971]</sup>
- [Generate Test Classes](#) <sup>[986]</sup>

### 20.2.2.3.18 XMIType

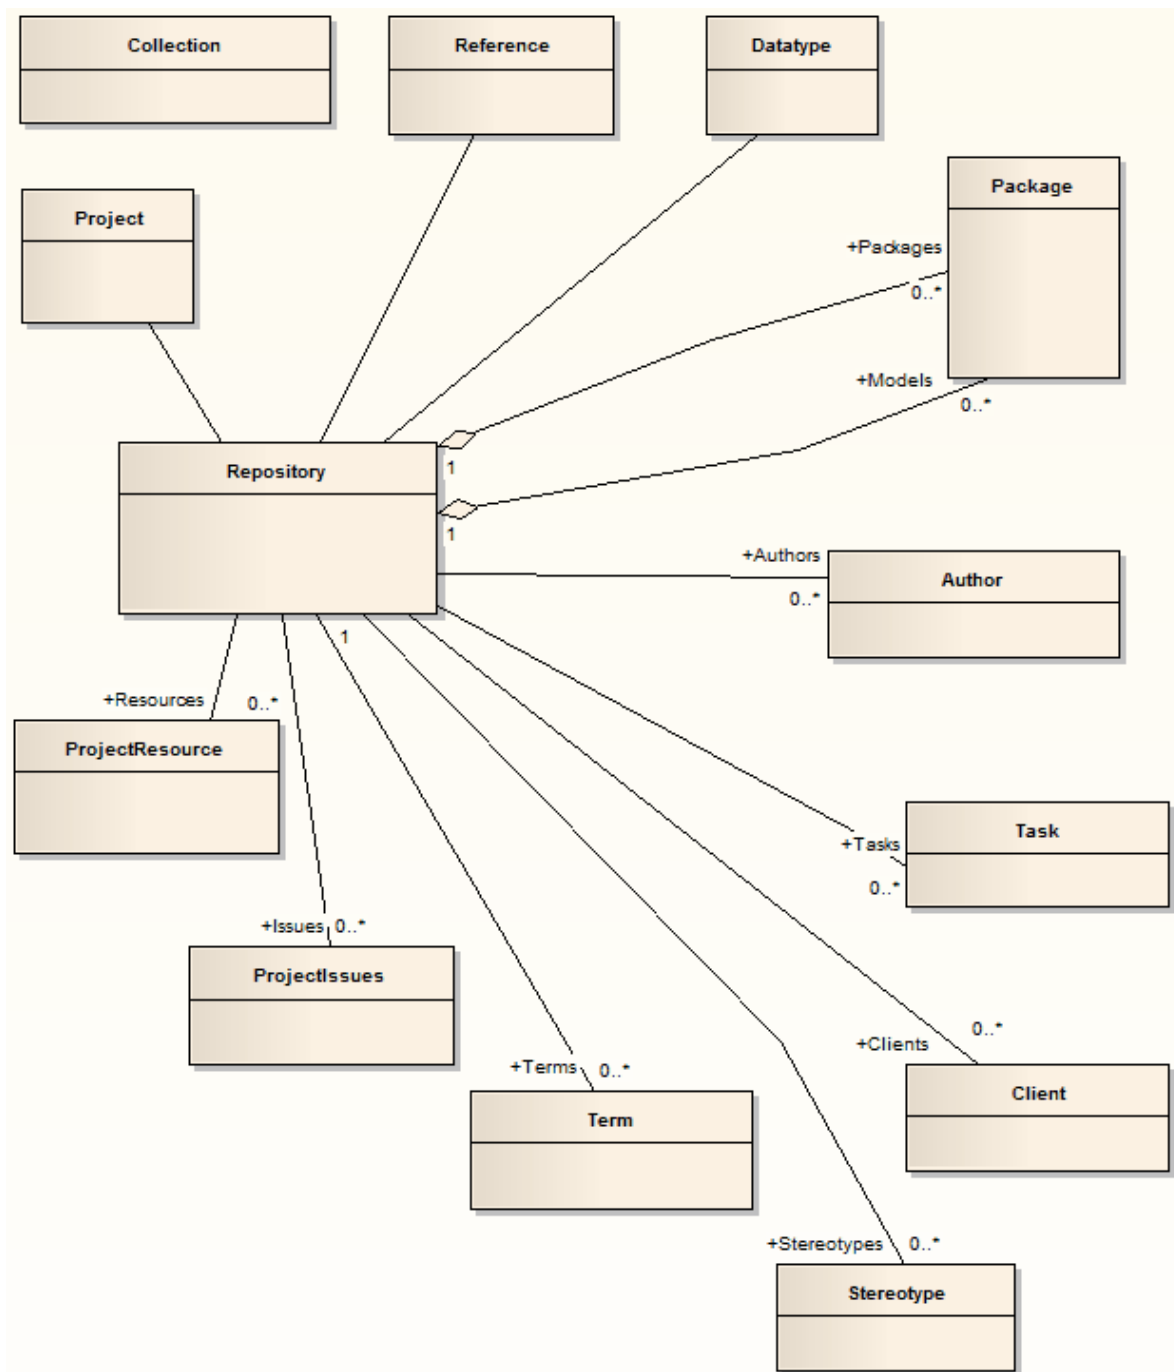

The following enumeration values are used in the *Project.ExportPackageXML()* method. They enable specification of the XML export type.

*xmiEADefault*  
*xmiRoseDefault*  
*xmiEA10*  
*xmiEA11*  
*xmiEA12*  
*xmiEA20*  
*xmiEA21*  
*xmiMOF13*  
*xmiMOF14*  
*xmiRose10*  
*xmiRose11*  
*xmiRose12*

### 20.2.2.4 Repository Package

The *Repository* package contains the high level system objects and entry point into the model itself using the *Models* collection and the other system level collections.

This diagram illustrates the **Repository** and its first level functions and collections.

**20.2.2.4.1 Author Class**

An **Author** object represents a named model author. Authors can be accessed using the Repository **Authors** collection.

Associated table in .EAP file    *t\_authors*

Author Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write The Author name.
<b>Notes</b>	<i>String</i>	Read/Write Notes about the author.
<b>ObjectType</b>	<a href="#">ObjectTy</a> <a href="#">pe</a> <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Roles</b>	<i>String</i>	Read/Write Roles the author might play in this project.

Author Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Author object after modification or appending a new item. If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.2 Client Class

A **Client** represents one or more people or organizations related to the project. Clients can be accessed using the Repository *Clients* collection.

**Associated table in .EAP file** *t\_clients*

##### Client Attributes

Attribute	Type	Notes
<b>Email</b>	<i>String</i>	Read/Write The client's email address.
<b>Fax</b>	<i>String</i>	Read/Write The client's fax number.
<b>Mobile</b>	<i>String</i>	Read/Write The client's mobile phone number, if available.
<b>Name</b>	<i>String</i>	Read/Write The client's name.
<b>Notes</b>	<i>String</i>	Read/Write Notes about the client.
<b>ObjectType</b>	<a href="#">Object Type</a> e[2822]	Read only Distinguishes objects referenced through the <i>Dispatch</i> interface.
<b>Organization</b>	<i>String</i>	Read/Write The client's associated organization.
<b>Phone1</b>	<i>String</i>	Read/Write The client's main phone number.
<b>Phone2</b>	<i>String</i>	Read/Write The client's second phone number.
<b>Roles</b>	<i>String</i>	Read/Write Roles this client might play in the project.

Attribute	Type	Notes

#### Client Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Client object after modification or appending a new item. If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.3 Collection Class

**Collection** is the main collection Class used by all elements within the Automation Interface. It contains methods to iterate through the collection, refresh the collection and delete an item from the collection.

It is important to realize that when **AddNew** is called, the item is not automatically added to the current collection. The typical steps are:

- Call **AddNew** to add a new item
- Modify the item as required
- Call **Update** on the item to save it to the database
- Call **Refresh** on the collection to include it in the current set

**Delete** is the same; until **Refresh** is called, the collection still contains a reference to the deleted item, which should not be called.

Each method can be used to iterate through the collection for languages that support this type of construct.

#### Collection Attributes

Attribute	Type	Notes	
<b>Count</b>	<i>Short</i>	Read only The number of objects referenced by this list.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> <sup>[2822]</sup>

#### Collection Methods

Method	Type	Notes	See also
<b>AddNew (string Name, string Type)</b>	<i>Object</i>	<p>Adds a new item to the current collection.</p> <p>Note that the interface is the same for all collections; you must provide a <i>Name</i> and <i>Type</i> argument. What these arguments are used for depends on the actual collection being accessed. For example, when adding a new element to the Elements collection, the Type string can be either a basic UML element type or a fully qualified element type (stereotype) defined by a profile, such as SysML::Requirement, differentiating it from a standard requirement.</p> <p>Also note that you must call <b>Update()</b> on the returned object to complete the <b>AddNew</b>. If <b>Update()</b> is not called the object is left in an indeterminate state.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Name: String</li> <li>• Type: String (up to 30 characters long)</li> </ul>	
<b>Delete (short index)</b>	<i>Void</i>	<p>Deletes the item at the selected reference.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• index: Short</li> </ul>	
<b>DeleteAt (short index, boolean Refresh)</b>	<i>Void</i>	<p>Deletes the item at the selected index. The second parameter is currently unused.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• index: Short</li> <li>• Refresh: Boolean</li> </ul>	
<b>GetAt (short index)</b>	<i>Object</i>	<p>Retrieves the array object using a numerical index. If the index is out of bounds, an error occurs.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• index: Short</li> </ul>	
<b>GetByName (string Name)</b>	<i>Object</i>	<p>Gets an item in the current collection by name.</p> <p>If the collection does not contain any items, the method returns a null value. If the collection contains items, but it was unable to find an object with the specified name, the method raises an exception.</p> <p>Only supported for the following collections: <i>Model</i>, <i>Package</i>, <i>Element</i>, <i>Diagram</i> and element <i>TaggedValue</i>.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Name: String</li> </ul>	<a href="#">Package Class</a> <a href="#">Element Class</a> <a href="#">Diagram Class</a> <a href="#">TaggedValue Class</a>
<b>GetLastError ()</b>	<i>String</i>	<p>Returns a string value describing the most recent error that occurred in relation to this object.</p>	

Method	Type	Notes	See also
<b>Refresh ()</b>	<i>Void</i>	Refreshes the collection by re-querying the model and reloading the collection. Should be called after adding a new item or after deleting an item.	
<b>Update ()</b>	<i>Boolean</i>	Updates the current Collection object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError ()</b> function for more information.	

#### 20.2.2.4.4 Datatype Class

A **Datatype** is a named type that can be associated with attribute or method types. It typically is related to either code engineering or database modeling. Datatypes also indicate which language or database system they relate to. Datatypes can be accessed using the Repository **Datatypes** collection.

Associated table in .EAP file    *t\_datatypes*

#### Datatype Attributes

Attribute	Type	Notes
<b>DatatypeID</b>	<i>Long</i>	Read/Write  The instance ID for this datatype within the current model; this is system maintained.
<b>DefaultLen</b>	<i>Long</i>	Read/Write  The default length (DDL only).
<b>DefaultPrec</b>	<i>Long</i>	Read/Write  The default precision (DDL only).
<b>DefaultScale</b>	<i>Long</i>	Read/Write  The default scale (DDL only).
<b>GenericType</b>	<i>String</i>	Read/Write  The associated generic type for this data type.
<b>HasLength</b>	<i>String</i>	Read/Write  Indicates whether the datatype has a length component.

Attribute	Type	Notes
<b>MaxLen</b>	<i>Long</i>	Read/Write The maximum length (DDL only).
<b>MaxPrec</b>	<i>Long</i>	Read/Write The maximum precision (DDL only).
<b>MaxScale</b>	<i>Long</i>	Read/Write The maximum scale (DDL only).
<b>Name</b>	<i>String</i>	Read/Write The datatype name (such as <i>integer</i> ). This appears in the related drop-down datatype lists where appropriate.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>e[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Product</b>	<i>String</i>	Read/Write The datatype product, such as Java, C++ or Oracle.
<b>Size</b>	<i>Long</i>	Read/Write The datatype size.
<b>Type</b>	<i>String</i>	Read/Write The type can be <i>DDL</i> for database datatypes or <i>Code</i> for language datatypes.
<b>UserDefined</b>	<i>Long</i>	Read/Write Indicates if the datatype is a user defined type or system generated. Datatypes distributed with Enterprise Architect are all system generated. Datatypes created in the Datatype dialog are marked <b>1 (true)</b> .

#### Datatype Methods

Method	Type	Notes
<b>GetLastError() ( )</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.

Method	Type	Notes
<b>Update ()</b>	<i>Boolean</i>	Updates the current Datatype object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.5 EventProperties Class

An **EventProperties** object is passed to *BroadcastFunctions* to facilitate parameter passing.

##### EventProperties Attributes

Attribute	Type	Notes
<b>Count</b>	<i>Long</i>	Read only  The number of parameters being passed to this broadcast event.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only  Distinguishes objects referenced through a Dispatch interface.

##### EventProperties Methods

Method	Type	Notes
<b>Get (object Index)</b>	<a href="#">EventProperty</a> [2833]	Read only  Returns an <i>EventProperty</i> in the list, raising an error if <i>Index</i> is out of range.  Parameters: <ul style="list-style-type: none"><li>Index: Variant - can either be a number representing a zero-based index into the array, or a string representing the name of the <i>EventProperty</i>: for example, <i>Props.Get(3)</i> or <i>Props.Get("ObjectID")</i></li></ul>

#### 20.2.2.4.6 EventProperty Class

**EventProperty** objects are always part of an **EventProperties** collection, and are passed to Add-In methods responding to broadcast events.

##### EventProperty Attributes

Attribute	Type	Notes
<b>Description</b>	<i>String</i>	An explanation of what this property represents.
<b>Name</b>	<i>String</i>	A string distinguishing this property from others in the list.

Attribute	Type	Notes
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <a href="#">e</a> <sup>[2822]</sup>	Distinguishes objects referenced through a Dispatch interface.
<b>Value</b>	<i>Variant</i>	A string, number or object reference representing the property value.

#### Learn more

- [EventProperties Class](#)<sup>[2833]</sup>
- [Broadcast Events](#)<sup>[3029]</sup>

#### 20.2.2.4.7 *ModelWatcher Class*

The **ModelWatcher** object enables an automation client to track changes in a particular model.

#### ModelWatcher Attributes

Attribute	Type	Notes
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <a href="#">e</a> <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.

#### ModelWatcher Methods

Methods	Type	Notes
<b>GetReloadItem</b> ( <b>object Item</b> )	<a href="#">ReloadTyp</a> <a href="#">e</a> <sup>[2823]</sup>	The object that must be reloaded in order to see all changes is returned through the <i>Item</i> parameter. If there are no changes or the entire model must be reloaded, this value is returned as <b>null</b> (C#) or <b>Nothing</b> (VB).  Calling this method clears the records so that the next time it is called the return values refer only to new changes.  Returns a value from the <b>ReloadType</b> enumeration that specifies which type of change, if any, has occurred.  Parameters: <ul style="list-style-type: none"> <li>Item: Object</li> </ul>
<b>PeekReloadItem</b>	<a href="#">ReloadTyp</a> <a href="#">e</a> <sup>[2823]</sup>	This method behaves identically to <b>GetReloadItem()</b> but does not clear the change record.

#### Notes

- After your model has been loaded, you only create the ModelWatcher once; if you **reload** the model, or load another model, the created ModelWatcher is still valid

#### 20.2.2.4.8 Package Class

A **Package** object corresponds to a Package element in the Enterprise Architect Project Browser. Packages can be accessed either through the **Repository Models** collection (a Model is a special form of Package) or through the Package **Packages** collection.

Note that a Package has an Element object as an attribute; this corresponds to an Enterprise Architect Package element in the *t\_object* table and is used to associate additional information (such as scenarios and constraints) with the logical package.

To set additional information for a package, reference the Element object directly. Also note that if you add a Package to a diagram, you should add an instance of the element (not the Package itself) to the **DiagramObject** Class for a diagram.

**Associated table in .EAP file**    *t\_package*

#### Package Attributes

Attribute	Type	Notes
<b>Alias</b>	<i>String</i>	Read only Alias
<b>BatchLoad</b>	<i>Long</i>	Read/Write Flag to indicate that the package is batch loaded during batch import from controlled packages. <b>Not currently used.</b>
<b>BatchSave</b>	<i>Long</i>	Read/Write Boolean value to indicate whether the package is included in the batch XML export list or not.
<b>CodePath</b>	<i>String</i>	Read/Write The path where associated source code is found. <b>Not currently used.</b>
<b>Connectors</b>	<a href="#">Collection</a> <sup>[2829]</sup>	Read only The collection of connectors.

Attribute	Type	Notes
<b>Created</b>	<i>Date</i>	Read/Write Date the package was created.
<b>Diagrams</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only A collection of diagrams contained in this package.
<b>Element</b>	<a href="#">Element</a> <small>[2881]</small>	Read only The associated element object; use to get/set common information such as Stereotype, Complexity, Alias, Author, Constraints, Tagged Values and Scenarios.
<b>Elements</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only A collection of elements that belong to this package.
<b>Flags</b>	<i>String</i>	Read/Write Extended information about the package.
<b>IsControlled</b>	<i>Boolean</i>	Read/Write Indicates if the package has been marked as <i>Controlled</i> .
<b>IsModel</b>	<i>Boolean</i>	Read only Indicates if the package is a model or a package.
<b>IsNamespace</b>	<i>Boolean</i>	Read/Write <b>True</b> indicates that 'package is a Namespace root'. Use <b>0</b> and <b>1</b> to set <b>False</b> and <b>True</b> .
<b>IsProtected</b>	<i>Boolean</i>	Read/Write Indicates if the package has been marked as <i>Protected</i> .
<b>IsVersionControlled</b>	<i>Boolean</i>	Read only Indicates whether or not this package is under version control.
<b>LastLoadDate</b>	<i>Date</i>	Read/Write The date XML was last loaded for the package.

Attribute	Type	Notes
<b>LastSaveDate</b>	<i>Date</i>	Read/Write The date XML was last saved from the package.
<b>LogXML</b>	<i>Boolean</i>	Read/Write Indicates if XML export information is to be logged.
<b>Modified</b>	<i>Date</i>	Read/Write Date the package was last modified.
<b>Name</b>	<i>String</i>	Read/Write The name of the package.
<b>Notes</b>	<i>String</i>	Read/Write Notes about this package.
<b>ObjectType</b>	<a href="#">Object Type</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Owner</b>	<i>String</i>	Read/Write. The package owner when using controlled packages.
<b>PackageGUID</b>	<i>Variant</i>	Read only The global Package ID; valid across models.
<b>PackageID</b>	<i>Long</i>	Read only The local Package ID number. Valid only in this model file.
<b>Packages</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only A collection of contained packages that can be walked through.
<b>ParentID</b>	<i>Long</i>	Read/Write The ID of the package that is the parent of this one. <b>0</b> indicates this package is a <i>model</i> (that is, it has no parent).
<b>TreePos</b>	<i>Long</i>	Read/Write

Attribute	Type	Notes
		The relative position in the tree compared to other packages (use to sort packages).
<b>UMLVersion</b>	<i>String</i>	Read/Write The UML version for XML export purposes.
<b>UseDTD</b>	<i>Boolean</i>	Read/Write Indicates if a DTD is to be used when exporting XML.
<b>Version</b>	<i>String</i>	Read/Write The version of the package.
<b>XMLPath</b>	<i>String</i>	Read/Write The path to which the XML is saved when using controlled packages.

#### Package Methods

Method	Type	Notes
<b>ApplyGroupLock (string aGroupName)</b>	<i>Boolean</i>	Applies a group lock to the package object, for the specified group, on behalf of the current user.  Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError ()</b> to retrieve error information.  Parameters: <ul style="list-style-type: none"> <li>aGroupName: String - The name of the security group for which to apply the lock</li> </ul>
<b>ApplyGroupLockRecursive (string aGroupName)</b>	<i>Boolean</i>	Applies a group lock to the package object, object, and all of the package, diagrams and elements contained within that package, for the specified group, on behalf of the current user.  Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError ()</b> to retrieve error information.  Parameters: <ul style="list-style-type: none"> <li>aGroupName: String - The name of the security group for which to apply the lock</li> </ul>
<b>ApplyUserLock ()</b>	<i>Boolean</i>	Applies a user lock to the package object for the current user.

Method	Type	Notes
		Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError ()</b> to retrieve error information.
<b>ApplyUserLockRecursive ()</b>	<i>Boolean</i>	Applies user locks to the package object, and all of the packages, diagrams and elements contained within that package.  Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError ()</b> to retrieve error information.
<b>Clone</b>	<i>LDISPAT CH</i>	Inserts a copy of the package into the same parent as the original package.  Returns the newly-created package.
<b>FindObject (string DottedID)</b>	<i>LPDISPAT CH</i>	Returns a package, element, attribute or operation matching the parameter <i>DottedID</i> .  If the <i>DottedID</i> is not found, an error is returned: <i>Can't find matching object</i> .  Parameters: <ul style="list-style-type: none"> <li>DottedID: String - Is in the form <i>object.object.object</i> where <i>object</i> is replaced by the name of a package, element attribute or operation; examples include <i>MyNamespace.Class1</i>, <i>CStudent.m_Name</i>, <i>MathClass.DoubleIt(int)</i></li> </ul>
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>ReleaseUserLock ()</b>	<i>Boolean</i>	Removes an existing User or Group lock from the package object.  Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError ()</b> to retrieve error information.
<b>ReleaseUserLockRecursive ()</b>	<i>Boolean</i>	Releases user locks and group locks from the package object, and all of the packages, diagrams and elements contained within that package.  Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError ()</b> to retrieve error information
<b>SetReadOnly (boolean ReadOnly,</b>	<i>Void</i>	Sets a Package Flag to mark a package as <b>ReadOnly=1</b> .  If Project Security is enabled, the user must have <b>Configure</b>

Method	Type	Notes
<b>boolean IncludeSubPkgs)</b>		<p><b>Packages</b> permission to use this method.</p> <p>Throws an exception if the operation fails due to the user not having <b>Configure Packages</b> permission; use <b>GetLastError ()</b> to retrieve error information.</p> <p>Parameters;</p> <ul style="list-style-type: none"> <li>ReadOnly: Boolean - Sets or clears the <i>Read Only</i> flag on the package(s); if: <ul style="list-style-type: none"> <li><b>False</b>, any <i>Read Only</i> flag is removed from the package</li> <li><b>True</b>, a <i>Read Only</i> flag is applied to the package</li> </ul> </li> <li>IncludeSubPkgs: Boolean - Indicates whether to set/reset the <i>Read Only</i> flag on just the object package, or on the object package and all of the nested sub-packages that it contains; if: <ul style="list-style-type: none"> <li><b>False</b>, only the flag on the object package is set or cleared</li> <li><b>True</b>, flags are set (or cleared, according to the <i>ReadOnly</i> parameter) for the object package plus all of the nested sub-packages that it contains</li> </ul> </li> </ul> <p>When working with version controlled packages, the <i>Read Only</i> flag can be applied to packages whether they are checked-in or checked-out.</p> <p>User Security applies to setting this flag - if you are prevented from editing the package, you are also prevented from setting the flag.</p>
<b>Update ()</b>	<i>Boolean</i>	<p>Updates the current package object after modification or appending a new item.</p> <p>If <b>false</b> is returned, check the <b>GetLastError ()</b> function for more information.</p> <p>Note that a package object also has an <i>element</i> component that must be taken into account; the package object contains information about the package attributes such as hierarchy or contents.</p> <p>The element attribute contains information about, for example, Stereotypes, Constraints or Files - all the attributes of a typical element.</p>
<b>VersionControlAdd (string ConfigGuid, string XMLFile, string Comment, boolean KeepCheckedOut)</b>	<i>Void</i>	<p>Places the package under version control, using the specified Version Control Configuration and the specified XML filename.</p> <p>Throws an exception if the operation fails; use <b>GetLastError ()</b> to retrieve error information.</p> <p>It is recommended that the package be saved using <i>Update()</i> before calling <b>VersionControlAdd ()</b>, so that any outstanding changes are not lost.</p>

Method	Type	Notes
		<p>Parameters:</p> <ul style="list-style-type: none"> <li>• ConfigGuid: String - Name corresponding to the Unique ID of the version control configuration to use</li> <li>• XMLFile: String - Name of the XML file to use for this package; this filename is relative to the Working Copy folder specified for the Config</li> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> <li>• KeepCheckedOut: Boolean - Specify <b>True</b> to add to version control and keep package checked-out</li> </ul>
<b>VersionControlCheckin (string Comment)</b>	<i>Void</i>	<p>Perform checkin of the version controlled package (also see <b>VersionControlCheckinEx</b>, below).</p> <p>Throws an exception if the operation fails; use <b>GetLastError ( )</b> to retrieve error information.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> </ul>
<b>VersionControlCheckinEx (string Comment, boolean PreserveCrossPkgRefs)</b>	<i>Void</i>	<p>Perform checkin of the version controlled package.</p> <p>Throws an exception if the operation fails; use <b>GetLastError ( )</b> to retrieve error information.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> <li>• PreserveCrossPkgRefs: Boolean - Flag to indicate whether to preserve or discard pre-existing Cross Package References when checking-in; this parameter overrides the setting in the Options dialog, XML Specifications page</li> </ul> <p>Unsatisfied cross package references are preserved or discarded according to this setting, without prompting the user; see <i>Learn more</i> below</p>
<b>VersionControlCheckout (string Comment)</b>	<i>Void</i>	<p>Perform checkout of the version controlled package.</p> <p>Throws an exception if the operation fails; use <b>GetLastError ( )</b> to retrieve error information.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> </ul> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-package references, it is recommended that you invoke</p>

Method	Type	Notes
		the <b>Repository.ScanXMIAndReconcile ( )</b> method from time to time, following the re-importation of controlled packages - for example, after using <b>Package.VersionControlGetLatest ( )</b> to update a number of packages, or after performing a number of package check-outs.
<b>VersionControlGetLatest ( boolean ForceImport )</b>	<i>Void</i>	<p>Updates the local working copy of the package file associated with the object package, before re-importing the package data from the package file.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ForceImport: Boolean - Used if the package data in the model is found to be up-to-date with respect to the version controlled package file; if: <ul style="list-style-type: none"> <li><b>False</b>, the package data that exists in the model is accepted as being up-to-date and no attempt is made to re-import data from the package file</li> <li><b>True</b>, Enterprise Architect re-imports the package from the package file regardless</li> </ul> </li> </ul> <p>See also the version control menu option <b>Get Latest</b>.</p> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-package references, it is recommended that you invoke the <b>Repository.ScanXMIAndReconcile ( )</b> method from time to time, following the re-importation of controlled packages - for example, after using <b>Package.VersionControlGetLatest ( )</b> to update a number of packages, or after performing a number of package check-outs.</p>
<b>VersionControlGetStatus ( )</b>	<i>Long</i>	<p>Returns the version control status of the package, as recorded in the current Enterprise Architect project database.</p> <p>Throws an exception if the operation fails; use <b>GetLastError ( )</b> to retrieve error information.</p> <p>Return value maps to the following enumerated type:</p> <pre>enum EnumCheckOut Status {     csUncontrolled = 0,     csCheckedIn,     csCheckedOut ToThisUser,     csReadOnlyVersion,     csCheckedOut ToAnotherUser,     csOfflineCheckedIn,     csCheckedOut OfflineByUser,     csCheckedOut OfflineByOther,     csDeleted, };</pre> <p><i>csUncontrolled</i> - Either unable to communicate with the version control provider associated with the package or the package file</p>

Method	Type	Notes
		<p>is unknown to the provider.</p> <p><i>csCheckedIn</i> - The package is not checked-out to anybody in the current project database.</p> <p><i>csCheckedOutToThisUser</i> - The package is marked as checked-out to the current user, in the current project database.</p> <p><i>csReadOnlyVersion</i> - Package is marked as read-only; an earlier revision of the package has been retrieved from version control.</p> <p><i>csCheckedOutToAnotherUser</i> - The package is marked as checked-out in the current project database, by a user other than the current user.</p> <p><i>csOfflineCheckedIn</i> - The package is not checked-out to anybody in the current project database; however, the version control configuration associated with the package was unable to connect to the VC server.</p> <p><i>csCheckedOutOfflineByUser</i> - Indicates that the package was 'checked out' in this database, by this user, whilst disconnected from version control.</p> <p><i>csCheckedOutOfflineByOther</i> - Indicates that the package was checked out in this project database, by another user, whilst disconnected from version control.</p> <p><i>csDeleted</i> - The package file has been deleted from version control.</p>
<b>VersionControlPutLatest (string CheckInComment)</b>	<i>Void</i>	<p>Perform a checkin of the version controlled package, whilst keeping the package checked-out.</p> <p>Throws an exception if the operation fails; use <b>GetLastError ( )</b> to retrieve error information.</p> <p>When a package that was previously marked as <i>Checked Out Offline</i>, is successfully 'Put' (checkedin) to version control, that package's flags are updated to clear the <i>Checked Out Offline</i> indicator.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Comment: String - Log message added to the version controlled file's history (where applicable)</li> </ul>
<b>VersionControlRemove ( )</b>	<i>Void</i>	<p>Removes version control from the package.</p> <p>Throws an exception if the operation fails; use <b>GetLastError ( )</b> to retrieve error information.</p>
<b>VersionControlResynchPkg Status (boolean ClearSettings)</b>		<p>Synchronizes the version control status of the single object package recorded in your current model with the package status reported by your version control provider.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ClearSettings: Boolean - used if the package file associated with the specified package is reported by the</li> </ul>

Method	Type	Notes
		<p>version control provider as uncontrolled; if ClearSettings is:</p> <ul style="list-style-type: none"> <li>• <b>True</b>, the version control settings are cleared from the package</li> <li>• <b>False</b>, the version control settings remain unchanged</li> </ul>

#### 20.2.2.4.9 *ProjectIssues Class*

A **ProjectIssue** is a system-level Issue that indicates a problem or risk associated with the system as a whole. ProjectIssues can be accessed using the Repository **Issues** collection.

Associated table in .EAP file *t\_issues*

#### ProjectIssues Attributes

Attribute	Type	Notes
<b>Category</b>	<i>String</i>	Read/Write The category this issue belongs to.
<b>Date</b>	<i>Date</i>	Read/Write The date the issue item was created.
<b>DateResolved</b>	<i>Date</i>	Read/Write The date the issue was resolved.
<b>Name</b>	<i>String</i>	Read/Write The issue name (that is, the issue itself).
<b>IssueID</b>	<i>Long</i>	Read only The ID of this issue.

Attribute	Type	Notes
<b>Notes</b>	<i>String</i>	Read/Write The associated description of the issue.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e<sub>[2822]</sub></small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Owner</b>	<i>String</i>	Read/Write The owner of the issue.
<b>Priority</b>	<i>String</i>	Read/Write The issue priority - <b>Low</b> , <b>Medium</b> or <b>High</b> .
<b>Resolution</b>	<i>String</i>	Read/Write A description of the resolution.
<b>Resolver</b>	<i>String</i>	Read/Write The name of the person resolving the issue.
<b>Severity</b>	<i>String</i>	Read/Write The issue severity - <b>Low</b> , <b>Medium</b> or <b>High</b> .
<b>Status</b>	<i>String</i>	Read/Write The current status of the issue.

**ProjectIssues Methods**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Issue object after modification or appending a new item. If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.10 ProjectResource Class

A **Project Resource** is a named person who is available to work on the current project in any capacity. ProjectResources can be accessed using the Repository **Resources** collection.

Associated table in .EAP file    *t\_resources*

##### ProjectResource Attributes

Attribute	Type	Notes
<b>Email</b>	<i>String</i>	The resource's email address.
<b>Fax</b>	<i>String</i>	The resource's fax number.
<b>Mobile</b>	<i>Variant</i>	The resource's mobile number, if available.
<b>Name</b>	<i>String</i>	The name of the resource.
<b>Notes</b>	<i>String</i>	A description of the resource, if appropriate.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Organization</b>	<a href="#">Package</a> <small>[2835]</small> : <i>String</i>	The organization the resource is associated with.
<b>Phone1</b>	<i>Variant</i>	The resource's main telephone number.
<b>Phone2</b>	<i>Variant</i>	The resource's alternative telephone number.
<b>Roles</b>	<i>String</i>	The roles this resource can play in the current project.

##### ProjectResource Methods

Method	Type	Notes
<b>GetLastError() ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.

Method	Type	Notes
<b>Update ()</b>	<i>Boolean</i>	Updates the current Resource object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.11 ProjectRole Class

A **ProjectRole** object represents a named project role. ProjectRoles can be accessed using the Repository **ProjectRole** collection.

Associated table in .EAP file    *t\_projectroles*

##### ProjectRole Attributes

Attribute	Type	Notes
<b>Description</b>	<i>String</i>	Read/Write The project role item description.
<b>Notes</b>	<i>String</i>	Read/Write Notes about the project role item.
<b>ObjectType</b>	<a href="#">ObjectTy pe</a> <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Role</b>	<i>String</i>	Read/Write The project role item name.

##### ProjectRole Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current ProjectRole object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.12 PropertyType Class

A **PropertyType** object represents a defined property that can be applied to UML elements as a Tagged Value. PropertyTypes can be accessed using the Repository **PropertyTypes** collection.

Each PropertyType corresponds to one of the predefined Tagged Values for the model.

**Associated table in .EAP file** `t_propertytypes`

##### PropertyType Attributes

Attribute	Type	Notes
<b>Description</b>	<i>String</i>	Read/Write A short description of the property.
<b>Detail</b>	<i>String</i>	Read/Write Configuration information for the property.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Tag</b>	<i>String</i>	Read/Write The name of the property (Tag Name).

##### PropertyType Methods:

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current <b>PropertyType</b> object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

#### 20.2.2.4.13 Reference Class

This **Interface** provides access to the various lookup tables within Enterprise Architect. Use the Repository **GetReferenceList()** method to get a handle to a list.

Valid lists are:

- Diagram

- Element
- Constraint
- Requirement
- Connector
- Status
- Cardinality
- Effort
- Metric
- Scenario
- Status
- Test

#### Reference Attributes

Attribute	Type	Notes
<b>Count</b>	<i>Short</i>	A count of items in the list.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <a href="#">e<sub>[2822]</sub></a>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	The list type (for example, <i>Diagram Types</i> ).

#### Reference Methods

Method	Type	Notes
<b>GetAt (short Index)</b>	<i>String</i>	Get the item at the specified index. Parameters: <ul style="list-style-type: none"><li>• Index: Short - The index of the item to retrieve from the list</li></ul>
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Refresh ()</b>	<i>Short</i>	Refresh the current list and return the count of items.

#### 20.2.2.4.14 Repository Class

The **Repository** is the main container of all structures such as models, packages and elements. You can iteratively begin accessing the model using the **Models** collection. It also has some convenient methods to directly access the structures without having to locate them in the hierarchy first.

**Associated table in .EAP file** <none>

#### Repository Attributes

Attribute	Type	Notes	See also
<b>Authors</b>	<a href="#">Collection</a> [2829]	Read only  This is the system <b>Authors</b> collection. This contains <b>0</b> or more <b>Author objects</b> , each of which can be associated with, for example, elements or diagrams as the item author or owner.  Use <b>AddNew ()</b> , <b>Delete ()</b> and <b>GetAt ()</b> to manage Authors.	
<b>BatchAppend</b>	<i>Boolean</i>	Read/Write  Set this property to <b>true</b> when your automation client has to rapidly insert many elements, operations, attributes and/or operation parameters.  Set to <b>false</b> when work is complete.  This can result in 10- to 20-fold improvement in adding new elements in bulk.	
<b>Clients</b>	<a href="#">Collection</a> [2829]	Read only  A list of <b>Clients</b> associated with the project. You can modify, delete and add new <b>Client objects</b> using this collection.	
<b>ConnectionString</b>	<i>String</i>	Read only  The filename/connection string of the current Repository.  For a connection string, the DBMS repository type is identified by "DBType=n;" where n is a number corresponding to the DBMS type, as follows:  <b>0</b> - MYSQL <b>1</b> - SQLSVR <b>2</b> - ADOJET <b>3</b> - ORACLE <b>4</b> - POSTGRES	

		<b>5</b> - ASA <b>7</b> - OPENEDGE <b>8</b> - ACCESS2007	
<b>Datatypes</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only  The <b>Datatypes</b> collection. This contains a list of <b>Datatype objects</b> , each representing a data type definition for either data modeling or code generation purposes.	
<b>EAEdition</b>	<a href="#">EAEdition Types</a> <small>[2819]</small>	Read only  Returns the current level of core licensed functionality available.  This property returns <b>Corporate</b> when the edition is <i>Business and Software Engineering</i> , <i>Systems Engineering</i> or <i>Ultimate</i> .  Use <b>EAEditionEx</b> to identify which of these extended editions is available.	
<b>EAEditionEx</b>	<a href="#">EAEdition Types</a> <small>[2819]</small>	Read only  Returns the current level of extended licensed functionality available.	
<b>EnableCache</b>	<i>Boolean</i>	Read/Write  An optimization for pre-loading package objects when dealing with large sets of automation objects.	
<b>EnableUIUpdates</b>	<i>Boolean</i>	Read/Write  Set this property to <b>false</b> to improve the performance of changes to the model; for example, bulk addition of elements to a package. To reveal changes to the user, call <b>Repository.RefreshModelView ()</b> .	
<b>FlagUpdate</b>	<i>Boolean</i>	Read/Write  Instructs Enterprise Architect to update the Repository with the <b>LastUpdate</b> value.	
<b>InstanceGUID</b>	<i>String</i>	Read only  The identifier string identifying the Enterprise Architect runtime session.	

<b>IsSecurityEnabled</b>	<i>Boolean</i>	Read only  Checks whether User Security is enabled for the current repository.	
<b>Issues</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only  The <b>System Issues</b> list. Contains <b>ProjectIssues objects</b> , each detailing a particular issue as it relates to the project as a whole.	
<b>LastUpdate</b>	<i>String</i>	Read only  The identifier string identifying the Enterprise Architect runtime session and the timestamp for when it was set.	
<b>LibraryVersion</b>	<i>Long</i>	Read only  The build number of the Enterprise Architect runtime.	
<b>Models</b>	<a href="#">Collection</a> <small>[2829]</small> of type <a href="#">Package</a> <small>[2835]</small>	Read only  <b>Models</b> are of type <b>package</b> and belong to a collection of packages. This is the top level entry point to an Enterprise Architect project file. Each model is a <b>root node</b> in the Project Browser and can contain items such as Views and packages.  A model is a special form of a package; it has a <i>ParentID</i> of <b>0</b> . By iterating through all models, you can access all the elements within the project hierarchy.  You can also use the <b>AddNew ()</b> function to create a new model. A model can be deleted, but remember that everything contained in the model is deleted as well.	
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only  Distinguishes objects referenced through the Dispatch interface.	
<b>ProjectGUID</b>	<i>String</i>	Read only  Returns a unique ID for the project.	
<b>ProjectRoles</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only  The system Roles collection. Contains <b>0</b> or more Role objects, each of which can be	

		<p>associated with, for example, elements or diagrams as the item author or owner.</p> <p>Use <b>AddNew ()</b>, <b>Delete ()</b> and <b>GetAt ()</b> to manage Roles.</p>	
<b>PropertyTypes</b>	<a href="#">Collection</a> [2829]	<p>Read only</p> <p>Collection of <b>Property Types</b> available to the Repository.</p>	<a href="#">Property Type Class</a> [2848]
<b>Resources</b>	<a href="#">Collection</a> [2829]	<p>Read only</p> <p>Contains available <i>ProjectResource</i> objects to assign to work items within the project.</p> <p>Use the <b>add new</b>, <b>modify</b> and <b>delete</b> functions to manage resources.</p>	
<b>Stereotypes</b>	<a href="#">Collection</a> [2829]	<p>Read only</p> <p>The <b>Stereotype</b> collection. A list of <i>Stereotype objects</i> that contain information on a stereotype and which elements it can be applied to.</p>	<a href="#">Stereotype Class</a> [2873]
<b>SuppressEADialogs</b>	<i>Boolean</i>	<p>Read/Write</p> <p>Set this property in the <b>EA_OnPostNewElement</b> broadcast event to control whether Enterprise Architect should suppress showing the default Properties dialog to the user when an element is created.</p>	<a href="#">EA_OnPostNewElement</a> [3061] <a href="#">EA_OnPostNewConnector</a> [3062]
<b>SuppressSecurityDialog</b>	<i>Boolean</i>	<p>Read/Write</p> <p>Suppress the login prompt dialog that appears by default when username and password parameters passed to <i>OpenFile2</i> are invalid. For use by external automation clients only.</p>	
<b>Tasks</b>	<a href="#">Collection</a> [2829]	<p>Read only</p> <p>A list of system tasks (to do list). Each entry is a <b>Task</b> item; you can modify, delete and add new tasks.</p>	<a href="#">Task Class</a> [2874]
<b>Terms</b>	<a href="#">Collection</a> [2829]	<p>Read only</p> <p>The project <i>Glossary</i>. Each <b>Term</b> object is an entry in the Glossary. Add, modify and delete Terms to maintain the Glossary.</p>	<a href="#">Term Class</a> [2876]

--	--	--	--

### Repository Methods

Method	Type	Notes	See also
<b>ActivateDiagram (long DiagramID)</b>		Activates an already open diagram (that is, makes it the active tab) in the main Enterprise Architect user interface.  Parameters: <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to make active</li> </ul>	
<b>ActivatePerspective (string long)</b>	<i>Boolean</i>	<b>Deprecated</b> - no longer in use.	
<b>ActivateTab (string Name)</b>		Activates an open Enterprise Architect tabbed view.  Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the view to activate</li> </ul>	
<b>ActivateTechnology (string TechnologyID)</b>		Activates an enabled MDG Technology.  Parameters: <ul style="list-style-type: none"> <li>TechnologyID: String - the ID of the Technology to activate, as assigned in the MDG Technology Wizard</li> </ul>	<a href="#">Create MDG Technology File</a> <sup>[1545]</sup>
<b>ActivateToolbox (string Toolbox, long Options)</b>	<i>Boolean</i>	Activates a Toolbox page in the GUI.  The returned value is reserved for future use.  Parameters: <ul style="list-style-type: none"> <li>Toolbox: String - the name of the Toolbox page to activate</li> <li>Options: Long - reserved for future use</li> </ul>	
<b>AddDefinedSearches (string sXML)</b>		Enables you to enter a set of defined searches that last in Enterprise Architect for the life of the application; when Enterprise Architect loads again they must be inserted again by your Add-In.  Parameters: <ul style="list-style-type: none"> <li>sXML: String - the XML of the defined searches; you can get this XML by performing an <i>export</i> of the searches from the Manage Searches dialog in Enterprise Architect</li> </ul>	<a href="#">Create and Manage Searches</a> <sup>[709]</sup>

<b>AddDocumentationPath</b> ( string Name, string Path, long Type)		<p>Provides an Add-In with the ability to insert a book path into the Enterprise Architect installation directory, to display Learning Center pages on user-authored subjects (such as use of the Add-In).</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String - the top-level (root) name for the Learning Center documentation hierarchy for the Add-In (for example, Enterprise Architect)</li> <li>Path: String - the directory path to the folder to contain the Learning Center documentation structure (for example, C:\Program Files (86)\Sparx Systems\EA\Books</li> <li>Type: Long - reserved for future use; set to 0</li> </ul>	<a href="#">Learning Center</a> <sup>[74]</sup>  <a href="#">Create Learning Center Pages</a> <sup>[74]</sup>
<b>AddPerspective</b> ( string Perspective, long Options)	<i>Boolean</i>	<b>Deprecated</b> - no longer in use.	
<b>AddTab</b> ( string TabName, string ControlID)	<i>activeX custom control</i>	<p>Adds an ActiveX custom control as a tabbed window. Enterprise Architect creates a control and, if successful, returns its Unknown pointer, which can be used by the caller to manipulate the control.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>TabName: String - used as the tab caption</li> <li>ControlID: String - the ProgID of the control; for example, "CS_AddinFramework.UserControl1"</li> </ul>	<a href="#">Create a Custom View</a> <sup>[3095]</sup>
<b>AddWindow</b> ( string WindowName, string ControlID)	<i>activeX custom control</i>	<p>Adds an ActiveX custom control as a window to the Add-Ins docked window. Enterprise Architect creates a control and, if successful, returns its Unknown pointer, which can be used by the caller to manipulate the control.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>WindowName: String - used as the window title</li> <li>ControlID: String - the ProgID of the control; for example, "CS_AddinFramework.UserControl1"</li> </ul>	<a href="#">Custom Docked Window</a> <sup>[3096]</sup>  <a href="#">RemoveWindow</a> <sup>[2869]</sup>
<b>AdviseConnectorChange</b> ( 		Provides an Add-In or automation client with the ability to advise the Enterprise Architect	

<b>long ConnectorID)</b>		<p>user interface that a particular connector has changed and, if it is visible in any open diagram, to reload and refresh that connector for the user.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ConnectorID: Long - the ID of the connector</li> </ul>	
<b>AdviseElementChange (long ObjectID)</b>		<p>Provides an Add-In or automation client with the ability to advise the Enterprise Architect user interface that a particular element has changed and, if it is visible in any open diagram, to reload and refresh that element for the user.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ObjectID: Long - the ID of the element</li> </ul>	
<b>ChangeLoginUser (string Name, string Password)</b>	<i>Boolean</i>	<p>Sets the currently logged on user to be that specified by a name and password; this logs the user into the repository when security is enabled.</p> <p>If security is not enabled an exception (<i>Security not enabled</i>) is thrown.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String - the name of the user</li> <li>Password: String - the password of the user</li> </ul>	
<b>ClearAuditLogs (Object StartDateTime, Object EndDateTime)</b>	<i>Boolean</i>	<p>Clears all Audit Logs from the model.</p> <p>If <i>StartDateTime</i> and <i>EndDateTime</i> are not null then only log items that fall into this period are cleared.</p> <p>Returns <b>true</b> for success, <b>false</b> for failure.</p> <ul style="list-style-type: none"> <li>This method cannot be undone. It is strongly advised that you call <b>SaveAuditLogs</b> first to backup the logs</li> <li>This method might fail if the user logged into the model does not have the correct access permission</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>StartDateTime: Variant ( DateTime ) - the earliest date and time of log entries to clear</li> <li>EndDateTime; Variant ( DateTime ) - the latest date and time of log entries to clear</li> </ul>	

<b>ClearOutput (string Name)</b>		Removes all the text from a tab in the Output window.  Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the tab to remove text from</li> </ul>	<a href="#">CreateOutputTab</a> <sup>[2857]</sup> <a href="#">EnsureOutput Visible</a> <sup>[2858]</sup> <a href="#">WriteOutput</a> <sup>[2872]</sup>
<b>CloseAddins ()</b>		Called by automation controllers to ensure that Add-Ins created in .NET do not linger after all controller references to Enterprise Architect have been cleared.	
<b>CloseDiagram (long DiagramID)</b>		Closes a diagram in the current list of diagrams that Enterprise Architect has open.  Parameters: <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to close</li> </ul>	
<b>CloseFile ()</b>		Closes any open file.	
<b>CreateDocumentGenerator()</b>	<a href="#">DocumentGenerator</a> <sup>[2965]</sup>	Returns a pointer to the <b>EA.DocumentGenerator</b> interface.	
<b>CreateModel (CreateModelType CreateType, string FilePath, long ParentWnd)</b>	<i>Boolean</i>	Creates a new .eap model file based on the standard Enterprise Architect Base model, or a shortcut .eap based on a provided SQL connection.  Returns <b>true</b> when the new file is created, otherwise returns <b>false</b> .  Parameters: <ul style="list-style-type: none"> <li>CreateType: CreateModelType - Specify whether to make a new copy of the EABase.eap model, or create a .eap file shortcut to a DBMS repository; the latter option requires a dialog to be opened for the user to provide SQL connection details</li> <li>FilePath: String - Destination for new .eap file</li> <li>ParentWnd: Long - Window handle to act as the parent for the SQL connection dialog; only required when using <i>cmEAPFromSQLRepository</i></li> </ul>	<a href="#">CreateModelType</a> <sup>[2818]</sup>
<b>CreateOutputTab (string Name)</b>		Creates a tab in the Output window.  Parameters:	<a href="#">CreateOutputTab</a> <sup>[2857]</sup> <a href="#">EnsureOutput Visible</a> <sup>[2858]</sup>

		<ul style="list-style-type: none"> <li>Name: String - the name of the tab to create</li> </ul>	<a href="#">WriteOutput</a> <sup>[2872]</sup>
<b>DeletePerspective (string Perspective, long Options)</b>	<i>Boolean</i>	<b>Deprecated</b> - no longer in use.	
<b>DeleteTechnology (string ID)</b>	<i>Boolean</i>	<p>Removes a specified MDG Technology resource from the repository.</p> <p>Returns <b>true</b>, if the technology is successfully removed from the model. Returns <b>false</b> otherwise.</p> <ul style="list-style-type: none"> <li>This applies to technologies imported into pre-7.0 versions of Enterprise Architect (imported technologies), not to technologies referenced in version 7.0 and later (referenced technologies)</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ID: String - the ID of the technology</li> </ul>	<a href="#">Deploy an MDG Technology</a> <sup>[1581]</sup>
<b>EnsureOutputVisible (string Name)</b>		<p>Ensures that a specified tab in the Output window is visible to the user. The Output window is made visible if it is hidden.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String - the name of the tab to make visible</li> </ul>	<a href="#">CreateOutputTab</a> <sup>[2857]</sup> <a href="#">EnsureOutput Visible</a> <sup>[2858]</sup> <a href="#">WriteOutput</a> <sup>[2872]</sup>
<b>ExecutePackageBuildScript (long ScriptOptions, string PackageGuid)</b>		<p>Enables you to run the active package build script based on your current selection in the Project Browser. You can also run a script by passing in the package GUID.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ScriptOptions: Long - the script type; can be any one of these numerical values: <ul style="list-style-type: none"> <li>1 = Build</li> <li>2 = Test</li> <li>3 = Run</li> <li>4 = Create Workbench Instance</li> <li>5 = Debug</li> </ul> </li> <li>PackageGuid: String - the ID of the package for which to run the script</li> </ul>	
<b>Exit</b>		Shuts down Enterprise Architect immediately. Used by .NET programmers where the	

		garbage collector does not immediately release all referenced COM objects.	
<b>GetActivePerspective ()</b>	<i>String</i>	<b>Deprecated</b> - no longer in use.	
<b>GetAttributeByGuid (string Guid)</b>	<a href="#">Attribute</a> [2911]	Returns a pointer to an attribute in the repository, located by its GUID. This is usually found using the <i>AttributeGUID</i> property of an attribute.  Parameters: <ul style="list-style-type: none"><li>Guid: String - the GUID of the attribute to locate</li></ul>	
<b>GetAttributeByID (string Id)</b>	<a href="#">Attribute</a> [2911]	Returns a pointer to an attribute in the repository, located by its ID. This is usually found using the <i>AttributeID</i> property of an attribute.  Parameters: <ul style="list-style-type: none"><li>Id: String - the ID of the attribute to locate</li></ul>	
<b>GetConnectorByGuid (string Guid)</b>	<a href="#">Connector</a> [2933]	Returns a pointer to a connector in the repository, located by its GUID. This is usually found using the <i>ConnectorGUID</i> property of a connector.  Parameters: <ul style="list-style-type: none"><li>Guid: String - the GUID of the connector to locate</li></ul>	
<b>GetConnectorByID (long ConnectorID)</b>	<a href="#">Connector</a> [2933]	Searches the repository for a connector with a specific ID.  Parameters: <ul style="list-style-type: none"><li>ConnectorID: Long - the ID of the connector to locate</li></ul>	
<b>GetContextItem (object Item)</b>	<a href="#">ObjectType</a> [2822]	Sets a pointer to an item in context within Enterprise Architect.  Also returns the corresponding <i>ObjectType</i> .  For additional information about <i>ContextItems</i> and the supported <i>ObjectTypes</i> see the <b>GetContextItemType</b> method (below).  Parameters: <ul style="list-style-type: none"><li>Item: Object - the item to point to</li></ul>	
<b>GetContextItemType ()</b>	<a href="#">ObjectType</a>	Returns the <i>ObjectType</i> of an item in context	

	<a href="#">ype</a> <sup>[2822]</sup>	<p>within Enterprise Architect. A <i>ContextItem</i> is defined as an item selected anywhere within the Enterprise Architect GUI including:</p> <ul style="list-style-type: none"> <li>• An item selected in the Project Browser</li> <li>• An item selected in an open diagram</li> <li>• An item selected in certain dialogs, such as the attribute Properties dialog</li> </ul> <p>The supported <i>ObjectTypes</i> can be any one of the following values:</p> <ul style="list-style-type: none"> <li>• <i>otElement</i></li> <li>• <i>otPackage</i></li> <li>• <i>otDiagram</i></li> <li>• <i>otAttribute</i></li> <li>• <i>otMethod</i></li> <li>• <i>otConnector</i></li> </ul>	
<b>GetCurrentContextObject ()</b>	<i>Object</i>	Returns the current context Object.	
<b>GetCounts ()</b>	<i>String</i>	Returns a set of counts from a number of tables within the base Enterprise Architect repository. These can be used to determine whether records have been added or deleted from the tables for which information is retrieved.	
<b>GetCurrentDiagram ()</b>	<a href="#">Diagram</a> <sup>[2948]</sup>	Returns a selected diagram.	
<b>GetCurrentLoginUser (boolean GetGuid)</b>	<i>String</i>	<p>If security is not enabled in the repository, an error is generated.</p> <p>If <i>GetGuid</i> is <b>True</b>, a GUID generated by Enterprise Architect representing the user is returned; otherwise the text as entered in <i>System Users/User Details/Login</i> is returned.</p>	
<b>GetDiagramByGuid (string Guid)</b>	<a href="#">Diagram</a> <sup>[2948]</sup>	<p>Returns a pointer to a diagram using the global reference ID (global ID). This is usually found using the diagram <i>GUID</i> property of an element, and stored for later use to open an diagram without using the collection <i>GetAt()</i> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Guid: String - the GUID of the diagram to locate</li> </ul>	

<b>GetDiagramByID (long DiagramID)</b>	<a href="#">Diagram</a> [2948]	<p>Gets a pointer to a diagram using an absolute reference number (local ID). This is usually found using the <b>DiagramID</b> property of an element, and stored for later use to open a diagram without using the collection <b>GetAt()</b> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to locate</li> </ul>	
<b>GetElementByGuid (string Guid)</b>	<a href="#">Element</a> [2887]	<p>Returns a pointer to an element in the repository, using the element's GUID reference number (global ID). This is usually found using the <b>ElementGUID</b> property of an element, and stored for later use to open an element without using the collection <b>GetAt ()</b> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Guid: String - the GUID of the element to locate</li> </ul>	
<b>GetElementByID (long ElementID)</b>	<a href="#">Element</a> [2887]	<p>Gets a pointer to an element using an absolute reference number (local ID). This is usually found using the <b>ElementID</b> property of an element, and stored for later use to open an element without using the collection <b>GetAt ()</b> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementID: Long - the ID of the element to locate</li> </ul>	
<b>GetElementsByQuery (string QueryName, string SearchTerm)</b>	<a href="#">Collection</a> [2829] (of type <i>Element</i> )	<p>Enables the user to run a search in Enterprise Architect, returning the result as a collection.</p> <p>For example <i>GetElementsByQuery ('Simple','Class1')</i>, where results contain elements with <i>Class1</i> in the <b>Name</b> and <b>Notes</b> fields.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>QueryName: String - the name of the search to run, for example 'Simple'</li> <li>SearchTerm: String - the term to search for</li> </ul>	
<b>GetElementSet (string IDList, long Options)</b>	<a href="#">Collection</a> [2829] (of type <i>Element</i> )	<p>Returns a set of elements as a collection based on a comma-separated list of <b>ElementID</b> values. By default, if no values are provided in the IDList parameter, all objects for the entire project are returned.</p> <p>Parameters</p>	

		<ul style="list-style-type: none"> <li>• IDList: String - a comma-separated list of <i>ElementID</i> values</li> <li>• Options: Long - modifies default behaviour of this method <ul style="list-style-type: none"> <li>• 1 - Returns empty collection when empty IDList parameter is given</li> <li>• 2 - Use IDList string as an SQL query to populate this collection</li> </ul> </li> </ul>	
<b>GetFieldFromFormat (string Format, string Text)</b>	<i>String</i>	<p>Converts a field from your preferred format to Enterprise Architect's internal format; returns the field in that format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Format: String - The format to convert the field from; valid formats are: <ul style="list-style-type: none"> <li>• HTML - Full HTML</li> <li>• RTF - Rich Text Format</li> <li>• TXT - Plain text</li> </ul> </li> <li>• Text: String - The field to be converted</li> </ul>	
<b>GetFormatFromField (string Format, string Text)</b>	<i>String</i>	<p>After accessing a field that contains formatting, use this method to convert it to your preferred format; returns the field in the format specified.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Format: String - The format to convert the field to; valid formats are: <ul style="list-style-type: none"> <li>• HTML - Full HTML</li> <li>• RTF - Rich Text Format</li> <li>• TXT - Plain text</li> </ul> </li> <li>• Text: String - The field to be converted</li> </ul>	
<b>GetGapAnalysisMatrix ()</b>	<i>String</i>	<p>Read Only.</p> <p>Returns all Gap Analyses as an XML document.</p>	<a href="#">Gap Analysis Matrix</a> [745]
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.	
<b>GetMailInterface()</b>	<i>MailInterface</i>	Returns an instance of the <b>EA.MailInterface</b> ; use this interface to automate the process of creating and sending model mail messages.	<a href="#">MailInterface Package</a> [2990]

<b>GetMethodByGuid (string Guid)</b>	<a href="#">Method</a> [2919]	<p>Returns a pointer to a method in the repository; this is usually found using the <i>MethodGUID</i> property of a method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Guid: String - the GUID of the method to look for</li> </ul>	
<b>GetMethodById (string Id)</b>	<a href="#">Method</a> [2919]	<p>Returns a pointer to a method in the repository; this is usually found using the <i>MethodID</i> property of a method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Id: String - the ID of the method to look for</li> </ul>	
<b>GetPackageByGuid (string Guid)</b>	<a href="#">Package</a> [2835]	<p>Returns a pointer to a package in the repository using the package's GUID reference number (global ID). This is usually found using the <i>PackageGUID</i> property of the package.</p> <p>Each package in the model also has an associated element with the same GUID, so if you have an element with <i>Type="Package"</i> then you can load the package by calling:</p> <p style="text-align: center;"><i>GetPackageByGuid(ElementGUID)</i></p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Guid: String - the GUID of the package to look for</li> </ul>	
<b>GetPackageById (long PackageID)</b>	<a href="#">Package</a> [2835]	<p>Get a pointer to a package using an absolute reference number (local ID). This is usually found using the <i>PackageID</i> property of an package, and stored for later use to open a package without using the collection <b>GetAt ()</b> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageID: Long - the ID of the package to locate</li> </ul>	
<b>GetProjectInterface ()</b>	<a href="#">Project</a> [2962]	<p>Return a pointer to the <b>EA.Project</b> interface (the XML-based automation server for Enterprise Architect). Use this interface to work with Enterprise Architect using XML, and also to access utility functions for loading diagrams, running reports and so on.</p>	<a href="#">EA Project interface</a> [2962]
<b>GetReferenceList (string Type)</b>	<a href="#">Reference</a> [2848]	<p>Uses the list type to get a pointer to a <b>Reference List</b> object.</p> <p>Parameters:</p>	

		<ul style="list-style-type: none"> <li>Type: String - specifies the list type to get; valid list types are:   <i>Diagram</i>  <i>Element</i>  <i>Constraint</i>  <i>Requirement</i>  <i>Connector</i>  <i>Status</i>  <i>Cardinality</i>  <i>Effort</i>  <i>Metric</i>  <i>Scenario</i>  <i>Status and</i>  <i>Test</i> </li> </ul>	
<b>GetRelationshipMatrix()</b>	<i>String</i>	Returns all Relationship Matrices as an XML document.	<a href="#">Relationship Matrix</a> [727]
<b>GetTechnologyVersion (string ID)</b>	<i>String</i>	Returns the version of a specified MDG Technology resource.  Parameters: <ul style="list-style-type: none"> <li>ID: String - the specified technology ID</li> </ul>	
<b>GetTreeSelectedElements()</b>	<a href="#">Collection</a> [2825]	Returns the set of elements currently selected in the Project Browser as a collection.	
<b>GetTreeSelectedItem (object SelectedItem)</b>	<a href="#">Object</a> <a href="#">Type</a> [2822]	Gets an object variable and type corresponding to the currently selected item in the tree view.  To use this function, create a generic object variable and pass this as the parameter. Depending on the return type, cast it to a more specific type.  The object passed back through the parameter can be a package, element, diagram, attribute or operation object.  Parameters: <ul style="list-style-type: none"> <li>SelectedItem: Object - the object to get the variable and type for</li> </ul>	
<b>GetTreeSelectedItemType ()</b>	<a href="#">Object</a> <a href="#">Type</a> [2822]	Returns the type of the object currently selected in the tree. One of: <ul style="list-style-type: none"> <li><i>otDiagram</i></li> <li><i>otElement</i></li> <li><i>otPackage</i></li> <li><i>otAttribute</i></li> </ul>	

		<ul style="list-style-type: none"> <li><i>otMethod</i></li> </ul>	
<b>GetTreeSelectedObject ()</b>	<i>Object</i>	The related method <b>GetTreeSelectedItem ()</b> has an output parameter that is inaccessible by some scripting languages. As an alternative, this method provides the selected item through the return value.	<a href="#">GetTreeSelectedItem</a> <sup>[2864]</sup>
<b>GetTreeSelectedPackage ()</b>	<a href="#">Package</a> <sup>[2835]</sup>	Returns the package in which the currently selected tree view object is contained.	
<b>HasPerspective (string Perspective)</b>	<i>String</i>	<b>Deprecated</b> - no longer in use.	
<b>HideAddinWindow ()</b>		Hides the docked Add-In window.	<a href="#">AddWindow</a> <sup>[2855]</sup> <a href="#">Custom Docked Window</a> <sup>[3096]</sup> <a href="#">RemoveWindow</a> <sup>[2869]</sup>
<b>ImportPackageBuildScripts (string PackageGuid, string BuildScriptXML)</b>		Imports build scripts into a package in Enterprise Architect.  Parameters: <ul style="list-style-type: none"> <li>PackageGuid: String - the GUID of the package into which to import the build scripts</li> <li>BuildScriptXML: String - the build script XML data, which you can export from within Enterprise Architect</li> </ul>	
<b>ImportTechnology (string Technology)</b>	<i>Boolean</i>	Installs a given MDG Technology resource into the repository.  Returns <b>True</b> , if the technology is successfully loaded into the model. Otherwise returns <b>False</b> .  This applies to technologies imported into pre-7.0 versions of Enterprise Architect (imported technologies), not to technologies referenced in version 7.0 and later (referenced technologies).  Parameters: <ul style="list-style-type: none"> <li>Technology: String - the contents of the technology resource file</li> </ul>	<a href="#">Deploy an MDG Technology</a> <sup>[1581]</sup>
<b>InvokeConstructPicker (string ElementFilter)</b>	<i>String</i>	Invokes the Select <Item> dialog with filters on the object type and, optionally, stereotype. Returns the <i>ElementID</i> of the selected object, or <b>0</b> if no object was selected when the	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[994]</sup>

		<p>dialog was closed.</p> <p>For example:</p> <pre>elementid=Repository. InvokeConstructPicker ("IncludedTypes=Class,Component; StereoType=foo,bar")</pre> <p>In this example, the Select &lt;item&gt; dialog will allow the user to select any Class or Component element in the model that has a stereotype of <i>foo</i> or <i>bar</i>.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• ElementFilter: String - specifies which elements or packages are to be made available for selection, based on element types and stereotypes identified by the <b>IncludedTypes</b> and <b>StereoType</b> filters <ul style="list-style-type: none"> <li>• IncludedTypes - (mandatory) comma separated list of element types that can be selected in this dialog; example: Package, Class, Component</li> <li>• StereoType - (optional) comma separated list of stereotypes that can be selected in this dialog</li> </ul> </li> <li>• The IncludedTypes and StereoType filters are separated by a semi-colon</li> <li>• Do not use leading or trailing spaces between element type or stereotype values</li> <li>• StereoType and IncludedTypes must be written with the correct case; element type names are also case sensitive</li> </ul>	
<b>InvokeFileDialog (</b> <b>string FilterString,</b> <b>long Filterindex,</b> <b>long Flags)</b>	String	<p>Opens a standard Open File Dialog and returns a string containing the full path to the selected file on success. Returns an empty string if the dialog was canceled.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• FilterString: String - list of file type filters.</li> <li>• Filterindex: Long - One-based index of the filter to be used by default</li> <li>• Flags: Long - additional bit flags used to initialize the file dialog. See OPENFILENAME structure in MSDN documentation for accepted values.</li> </ul>	<a href="#">Project.</a> <a href="#">GetFileNameDialog()</a> <small>[2974]</small>

<b>IsTabOpen (string TabName)</b>	<i>String</i>	<p>Checks whether a named Enterprise Architect tabbed view is open and active. This includes open diagram windows or custom controls added using <b>Repository.AddTab ()</b>.</p> <p>Returns:</p> <ul style="list-style-type: none"> <li>• <b>2</b> to indicate that a tab is open and active (top-most)</li> <li>• <b>1</b> to indicate that it is open but not top-most, or</li> <li>• <b>0</b> to indicate that it is not visible at all</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• TabName: String - the name of the tab to check for; TabName is case sensitive</li> </ul>	<a href="#">Repository.AddTab()</a> <sup>[2855]</sup>
<b>IsTechnologyEnabled (string ID)</b>	<i>Boolean</i>	<p>Checks whether a specified technology is enabled in Enterprise Architect.</p> <p>Returns <b>True</b> if the MDG Technology resource is enabled. Otherwise returns <b>False</b>.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• ID: String - the technology ID to check for</li> </ul>	
<b>IsTechnologyLoaded (string ID)</b>	<i>Boolean</i>	<p>Checks whether a specified technology is loaded into the repository.</p> <p>Returns <b>True</b> if the MDG Technology resource is loaded into the repository. Otherwise returns <b>False</b>.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• ID: String - the technology ID to check for</li> </ul>	
<b>LoadAddins ()</b>		Loads all Add-Ins from a repository.	
<b>OpenDiagram (long DiagramID)</b>		<p>Provides a method for an automation client or Add-In to open a diagram. The diagram is added to the tabbed list of open diagrams in the main Enterprise Architect view.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• DiagramID: Long - the ID of the diagram to open</li> </ul>	
<b>OpenFile (string Filename)</b>	<i>Boolean</i>	This is the main point for opening an Enterprise Architect project file from an automation client, and working with the contained objects.	<a href="#">Open a Project</a> <sup>[202]</sup>

		<p>If the required project is a DBMS repository, and you have created a shortcut .EAP file containing the database connection string, you can call this shortcut file to access the DBMS repository.</p> <p>You can also connect to a SQL database by passing in the connection string itself instead of a filename. A valid connection string can be obtained from the <b>Open Project</b> dialog by selecting a recently opened SQL repository.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Filename: String - the filename of the Enterprise Architect project to open</li> </ul>	
<b>OpenFile2 (string FilePath, string Username, string Password)</b>	<i>Boolean</i>	<p>As for <b>OpenFile ()</b> except this enables the specification of a password.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Filepath: String - the file path of the Enterprise Architect project to open</li> <li>Username: String - the user login ID</li> <li>Password: String - the user password</li> </ul>	
<b>RefreshModelView (long PackageID)</b>		<p>Reloads a package or the entire model, updating the user interface.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageID: Long - the ID of the package to reload: if <b>0</b>, the entire model is reloaded; if a valid package ID, only that package is reloaded</li> </ul>	
<b>RefreshOpenDiagrams (boolean FullReload)</b>		<p>Reloads the diagram contents for all open diagrams from the repository.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>FullReload: Boolean - if <b>false</b> only the contents of element compartments are reloaded; if <b>true</b> the full content of each diagram is reloaded</li> </ul>	
<b>ReloadDiagram (long DiagramID)</b>		<p>Reloads a specified diagram. This would commonly be used to refresh a visible diagram after code import/export or other batch process where the diagram requires complete refreshing.</p> <ul style="list-style-type: none"> <li>Calling this method within a call to <b>EA_OnNotifyContextItemModified</b> is not supported</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the</li> </ul>	<a href="#">EA_OnNotifyContextItemModified</a> <small>[3039]</small>

		diagram to be reloaded	
<b>RemoveOutputTab (string Name)</b>		Removes a specified tab from the Output window.  Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the tab to be removed</li> </ul>	
<b>RemoveWindow (string WindowName)</b>	<i>Boolean</i>	Removes an Add-In window that matches the specified WindowName.  Parameters: <ul style="list-style-type: none"> <li>WindowName: String - the name of the window to remove</li> </ul>	<a href="#">AddWindow</a> 
<b>RepositoryType ()</b>	<i>String</i>	Returns the currently open database/repository type.  May return one of the following values: <ul style="list-style-type: none"> <li>JET ( .EAP file, MS Access 97 to 2003 format )</li> <li>ACCESS2007 ( .accdb file, MS Access 2007+ format )</li> <li>ASA ( Sybase SQL Anywhere )</li> <li>SQLSVR ( Microsoft SQL Server )</li> <li>MYSQL ( MySQL )</li> <li>ORACLE ( Oracle )</li> <li>POSTGRES ( PostgreSQL )</li> </ul>	
<b>RunModelSearch (string sQueryName, string sSearchTerm, string sSearchOptions, string sSearchData)</b>		Runs a search, displaying the results in Enterprise Architect's Model Search window.  Parameters: <ul style="list-style-type: none"> <li>sQueryName: String - the name of the search to run, for example <i>Simple</i></li> <li>sSearchTerm: String - the term to search for</li> <li>sSearchOptions: String - currently not being used</li> <li>sSearchData: String - enables you to supply a list of results in the form of XML, which is appended onto the result list in Enterprise Architect - see <b>XML Format</b>; this parameter is not mandatory so pass in an empty string to run the search as per normal</li> </ul>	<a href="#">XML Format</a>  <a href="#">Project Class</a>  (a different call to Run Model Search)
<b>SaveAllDiagrams ()</b>		Saves all open diagrams.	

<b>SaveAuditLogs (</b> <b>string FilePath,</b> <b>object StartDateTime,</b> <b>object EndDateTime)</b>	<i>Boolean</i>	<p>Saves the Audit Logs contained within a model to a specified file.</p> <p>If <i>StartDateTime</i> and <i>EndDateTime</i> are not null then only log items that fall into this period are saved.</p> <p>Returns <b>true</b> for success, <b>false</b> for failure.</p> <ul style="list-style-type: none"> <li>This might fail if the user logged into the model does not have the correct access permission</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>FilePath: String - the file to save the Audit Logs to</li> <li>StartDateTime: Variant ( DateTime ) - the earliest date and time of log entries to save</li> <li>EndDateTime; Variant ( DateTime ) - the latest date and time of log entries to save</li> </ul>	
<b>SaveDiagram (</b> <b>long DiagramID)</b>		<p>Saves an open diagram; assumes the diagram is open in the main user interface Tab list.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to save</li> </ul>	
<b>ScanXMIAndReconcile</b> <b>()</b>		<p>Scans the package XMI files associated with each of the project's controlled packages and restores any diagram objects or cross-references that are detected as missing from the project.</p> <p>This function is useful in team environments where each user maintains their own private copy of the model database (i.e. multiple private EAP files) and model updates are propagated through the use of controlled packages; it provides no benefit when the model is hosted in a single shared database that is accessed by all team members.</p> <p>Each controlled package is compared with its associated XMI file and, if the cross-reference information in the model does not match the XMI, Enterprise Architect updates the model with the information from the XMI and records the update in the Output window.</p> <p>You can roll back such updates by right-clicking on the entry in the Output window and selecting the context menu option <b>Rollback Update</b> (or <b>Rollback Selected Updates</b> if multiple entries are selected).</p>	

		<p>Closing the model clears the entries in the Output window; an entry in the Output window is also cleared as and when you roll-back the update for it.</p> <p>This functionality is invoked automatically as part of the <b>Get All Latest</b> operation.</p> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-package references, it is recommended that you invoke this function from time to time, following the re-importation of controlled packages - for example, after using <b>Get Latest</b> to update a number of packages, or after performing a number of package check-outs.</p> <ul style="list-style-type: none"> <li>As a general rule, avoid running this function while you have uncommitted changes in your model</li> <li>Generally, you should: <ul style="list-style-type: none"> <li>Check-out a number of packages</li> <li>Invoke <b>ScanXMIAndReconcile</b></li> <li>Make your modifications</li> <li>Commit any outstanding changes before you check-out more packages and run <b>ScanXMIAndReconcile</b> again</li> </ul> </li> </ul>	
<b>ShowAddinWindow (string TabName)</b>	<i>Boolean</i>	<p>Shows the docked Add-In window on the specified page. Returns <b>true</b> if a tab of the specified name is now displayed.</p> <p>Parameters</p> <ul style="list-style-type: none"> <li>TabName: String - specifies the tab page</li> </ul>	<a href="#">AddWindow</a>  <sup>[2855]</sup> <a href="#">Custom Docked Window</a>  <sup>[3098]</sup> <a href="#">RemoveWindow</a>  <sup>[2869]</sup>
<b>ShowDynamicHelp (string Topic)</b>		<p>Shows a help topic as a view.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Topic: String - specifies the help topic</li> </ul>	
<b>ShowInProjectView (object Item)</b>		<p>Selects a specified object in the Project Browser.</p> <p>Accepted object types are <i>Package</i>, <i>Element</i>, <i>Diagram</i>, <i>Attribute</i>, and <i>Method</i>; an exception is thrown if the object is of an invalid type.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Item: Object - the object to highlight</li> </ul>	
<b>ShowWindow (long Show)</b>		Shows or hides Enterprise Architect.	

		Parameters: <ul style="list-style-type: none"> <li>Show: Long</li> </ul>	
<b>SQLQuery (string SQL)</b>	<i>String</i>	Enables execution of a SQL <i>select</i> statement against the current repository.  Returns an XML formatted string value of the resulting recordset.  Parameters: <ul style="list-style-type: none"> <li>SQL: String - contains the SQL Select statement</li> </ul>	
<b>SynchProfile (string Profile, string Stereotype)</b>	<i>Boolean</i>	Synchronizes Tagged Values and constraints of a UML Profile item using the Synch Profile Elements dialog.  Parameters: <ul style="list-style-type: none"> <li>Profile: String - the name of the profile that contains the stereotype</li> <li>Stereotype: String - the name of the profile stereotype for which the default tags and constraints are to be synchronized</li> </ul>	<a href="#">Synchronize Tagged Values and Constraints</a> <sup>[1473]</sup>
<b>VersionControlResynch PkgStatuses (boolean ClearSettings)</b>		Synchronizes the version control status of each version controlled package within the current model with the status reported by your version control provider.  Parameters: <ul style="list-style-type: none"> <li>ClearSettings: Boolean <ul style="list-style-type: none"> <li>- if <b>true</b>, clear the version control settings from packages that are reported by the version control provider as <i>uncontrolled</i></li> <li>- if <b>false</b>, leave the version control settings unchanged for packages reported as <i>uncontrolled</i></li> </ul> </li> </ul>	<a href="#">Resynchronize the Status of Version Controlled Packages</a> <sup>[444]</sup>
<b>WriteOutput (string Name, string Output, long ID)</b>		Writes text to a specified tab in the Output window, and associates the text with an ID.  Parameters: <ul style="list-style-type: none"> <li>Name: String - specifies the tab on which to display the text</li> <li>Output: String - specifies the text to display</li> <li>ID: Long - specifies a numeric ID value to associate with this output item for further handling by Add-Ins; can be set to <b>0</b> if no handling is required</li> </ul>	<a href="#">ClearOutput</a> <sup>[2857]</sup> <a href="#">CreateOutputTab</a> <sup>[2857]</sup> <a href="#">EnsureOutput Visible</a> <sup>[2858]</sup> <a href="#">EA_OnOutputItemClicked</a> <sup>[3027]</sup> <a href="#">EA_OnOutputItemDoubleClicked</a> <sup>[3028]</sup>

--	--	--	--

#### 20.2.2.4.15 Stereotype Class

The **Stereotype** element corresponds to a UML stereotype, which is an extension mechanism for varying the behavior and type of a model element. Use the Repository **Stereotypes** collection to add new elements and delete existing ones.

**Associated table in .EAP file** *t\_stereotypes*

#### Stereotype Attributes

Attribute	Type	Notes
<b>AppliesTo</b>	<i>String</i>	Read/Write A reference to the stereotype <i>Base Class</i> , that is, which element it applies to.
<b>MetafileLoadPath</b>	<i>String</i>	Read/Write The path to an associated metafile. The automation interface does not yet support loading metafiles. To do this you must use the Stereotype tab of the UML Types dialog in Enterprise Architect.
<b>Notes</b>	<i>String</i>	Read/Write. Notes about the stereotype.
<b>Name</b>	<i>String</i>	Read/Write The stereotype name, which appears in the <b>Stereotype</b> drop list for elements that match the <b>AppliesTo</b> attribute.
<b>ObjectType</b>	<a href="#">Object Type</a> 	Read only Distinguishes objects referenced through a Dispatch interface.
<b>StereotypeGUID</b>	<i>String</i>	Read/Write A unique identifier for stereotype, generally set and maintained by Enterprise Architect.
<b>Style</b>	<i>String</i>	Read/Write An additional style specifier for the stereotype.
<b>VisualType</b>	<i>String</i>	Read/Write Indicates an inbuilt visual style associated with a stereotype.  <b>Not currently implemented.</b>

Attribute	Type	Notes

#### Stereotype Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current stereotype object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError ()</b> function for more information.

#### 20.2.2.4.16 Task Class

A **Task** is an entry in the System ToDo list. Tasks can be accessed using the Repository **Tasks** collection.

Associated table in .EAP file    *t\_tasks*

#### Task Attributes

Attribute	Type	Notes
<b>ActualTime</b>	<i>Long</i>	Read/Write The time already expended on the task, in hours, days or other units.
<b>AssignedTo</b>	<i>String</i>	Read/Write The person this task is assigned to; that is, the responsible resource.
<b>EndDate</b>	<i>Date</i>	Read/Write The date the task is scheduled to finish.
<b>History</b>	<i>String</i>	Read/Write A memo field to hold, for example, task history or notes.
<b>Name</b>	<i>Variant</i>	Read/Write The task name.
<b>Notes</b>	<i>Variant</i>	Read/Write

Attribute	Type	Notes
		A description of the task.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Owner</b>	<i>String</i>	Read/Write The task owner.
<b>Percent</b>	<i>Long</i>	Read/Write The percentage completion of the task.
<b>Phase</b>	<i>String</i>	Read/Write The phase of the project the task relates to.
<b>Priority</b>	<i>String</i>	Read/Write The priority of this task.
<b>StartDate</b>	<i>Date</i>	Read/Write The date the task is to start.
<b>Status</b>	<i>Variant</i>	Read/Write The current status of the task.
<b>TaskID</b>	<i>Long</i>	Read only The local ID of the task.
<b>TotalTime</b>	<i>Long</i>	Read/Write The total expected time the task might run, in hours, days or some other unit.
<b>Type</b>	<i>String</i>	Read/Write Sets or returns a string representing the type.

#### Task Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Task object after modification or appending a new item. If <b>false</b> is returned, check the <b>GetLastError ()</b> function for more information.

#### 20.2.2.4.17 Term Class

A **Term object** represents one entry in the system glossary. Terms can be accessed using the Repository *Terms* collection.

Associated table in .EAP file    *t\_glossary*

##### Term Attributes

Attribute	Type	Notes
<b>Meaning</b>	<i>String</i>	Read/Write The description of the term; its meaning.
<b>ObjectType</b>	<a href="#">ObjectType</a> 	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Term</b>	<i>String</i>	Read/Write The glossary item name.
<b>TermID</b>	<i>Long</i>	Read only A local ID number to identify the term in the model.
<b>Type</b>	<i>String</i>	Read/Write The type this term applies to (for example, business or technical).

##### Term Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.

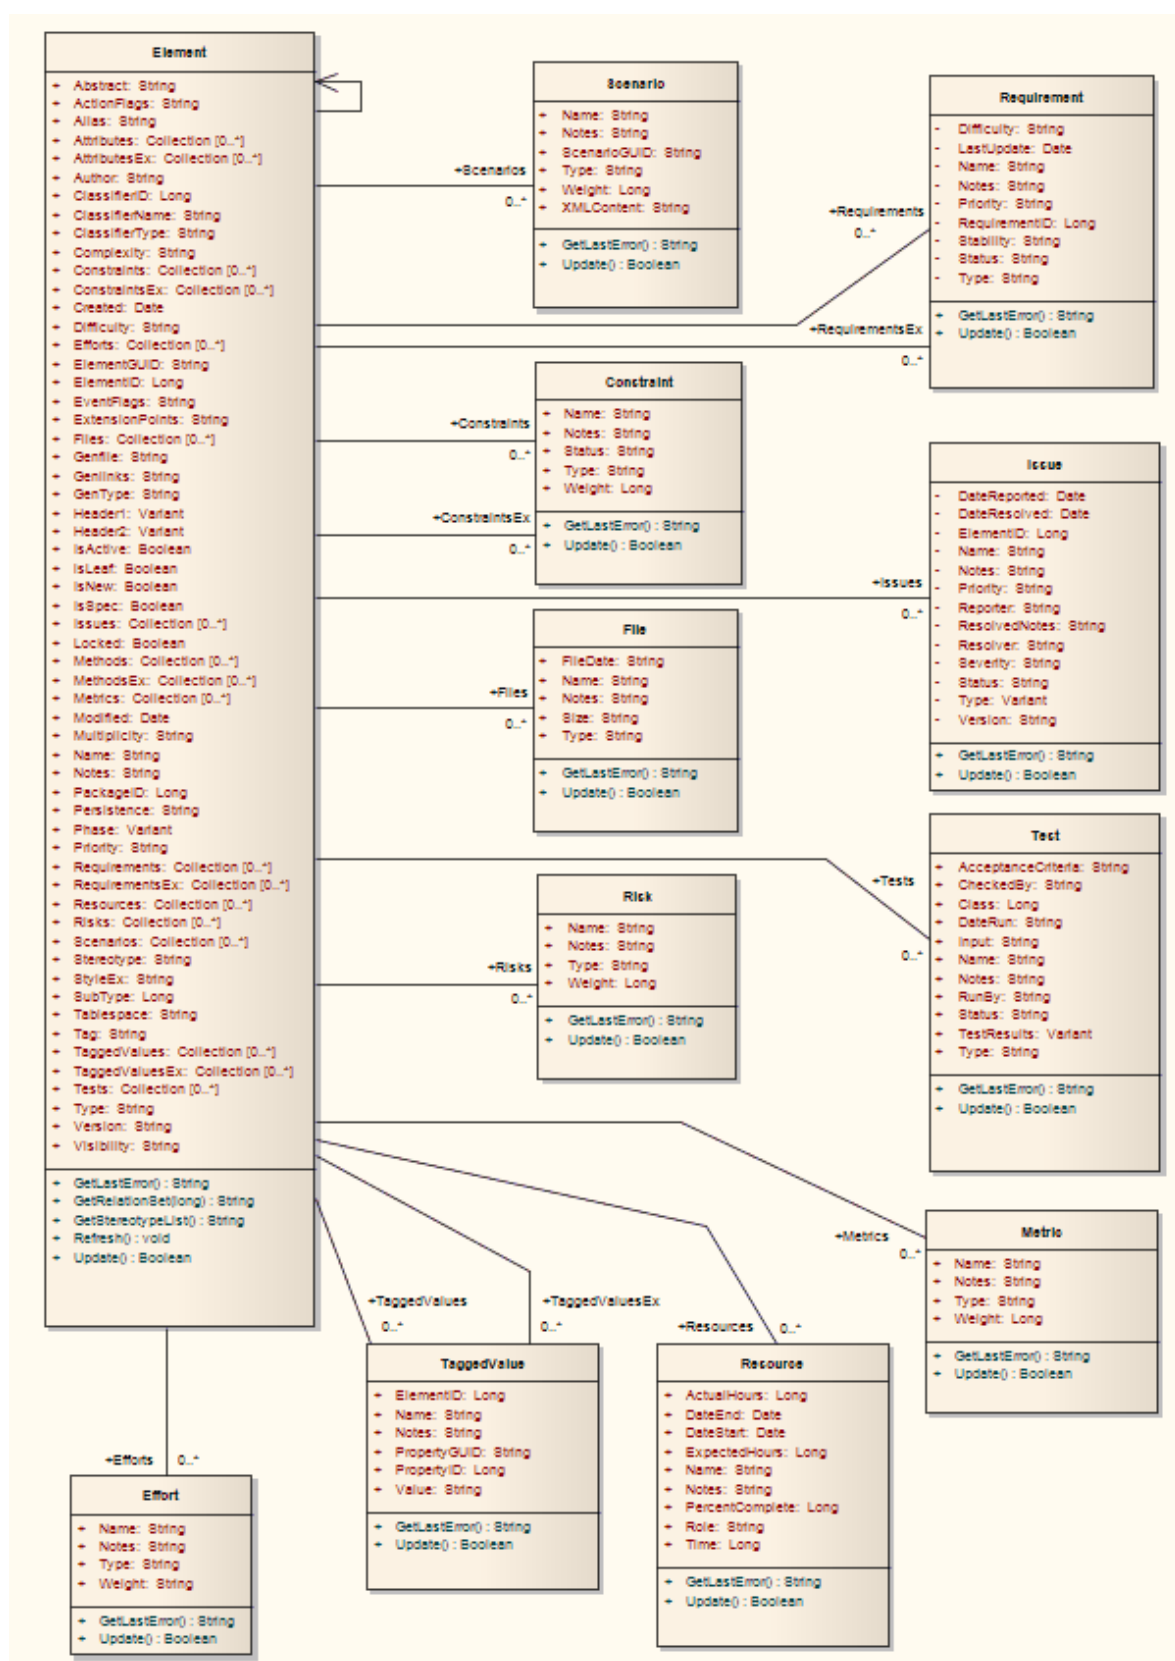

Method	Type	Notes
<b>Update ()</b>	<i>Boolean</i>	Updates the current Term object after modification or appending a new item. If <b>false</b> is returned, check the <b>GetLastError ()</b> function for more information.

#### 20.2.2.5 Element Package

The **Element Package** contains information about an element and its associated extended properties such as testing and project management information. An element is the basic item in an Enterprise Architect model. Classes, Use Cases and Components are all different types of UML element.

The diagram below illustrates the relationships between an *element* and its associated extended information. The related information is accessed through the collections owned by the element (for example, Scenarios and Tests). It also includes a full description of the element object (the basic model structural unit).

#### Example

### 20.2.2.5.1 Constraint Class

A **Constraint** is a condition imposed on an element. Constraints are accessed through the Element **Constraints** collection.

**Associated table in .EAP file** *t\_objectconstraints*

#### Constraint Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write The name of the constraint (that is, the constraint).
<b>Notes</b>	<i>String</i>	Read/Write Notes about the constraint.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> e <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>ParentID</b>	<i>Long</i>	Read only The <b>ElementID</b> of the element to which this constraint applies.
<b>Status</b>	<i>String</i>	Read/Write The current status of the constraint.
<b>Type</b>	<i>String</i>	Read/Write The constraint type.
<b>Weight</b>	<i>Long</i>	Read/Write A weighting factor.

#### Constraint Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>Constraint</i> object after modification or appending a new

Method	Type	Notes
		<p>item.</p> <p>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.</p>

#### 20.2.2.5.2 Effort Class

An **Effort** is a named item with a weighting that can be associated with an element for purposes of building metrics about the model. Efforts are accessed through the Element **Efforts** collection.

Associated table in .EAP file    *t\_objecteffort*

##### Effort Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	<p>Read/Write</p> <p>The name of the effort.</p>
<b>Notes</b>	<i>String</i>	<p>Read/Write</p> <p>Notes about the effort.</p>
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e<sub>2822</sub></small>	<p>Read only</p> <p>Distinguishes objects referenced through a Dispatch interface.</p>
<b>Type</b>	<i>String</i>	<p>Read/Write</p> <p>The effort type.</p>
<b>Weight</b>	<i>Long</i>	<p>Read/Write</p> <p>A weighting factor.</p>
<b>Weight2</b>	<i>Float</i>	<p>Read/Write</p> <p>A weighting factor.</p>

##### Effort Methods

Method	Type	Notes
<b>GetLastError() ( )</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.

Method	Type	Notes
<b>Update ()</b>	<i>Boolean</i>	Update the current <b>Effort</b> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 20.2.2.5.3 Element Class

An **Element** is the main modeling unit, corresponding to (for example) a Class, Use Case, Node or Component. You create new elements by adding to the Package *Elements* collection. Once you have created an element, you can add it to the *DiagramObjectClass* of a diagram to include it in the diagram.

Elements also have a collection of connectors. Each entry in this collection indicates a relationship to another element.

There are also some extended collections for managing additional information about the element, including properties such as Tagged Values, Issues, Constraints and Requirements.

**Associated table in .EAP file** *t\_object*

### Element Attributes

Attribute	Type	Notes	See also
<b>Abstract</b>	<i>String</i>	Read/Write Indicates if the element is <b>Abstract (1)</b> or <b>Concrete (0)</b> .	
<b>ActionFlags</b>	<i>String</i>	Read/Write A structure to hold flags concerned with Action semantics.	
<b>Alias</b>	<i>String</i>	Read/Write An optional alias for this element.	
<b>AssociationClassConnectorID</b>	<i>Long</i>	Read only If the element is an <i>AssociationClass</i> , <i>AssociationClassConnectorID</i> contains the Connector ID of the respective Association connector.	<a href="#">CreateAssociationClass()</a> <sup>[2892]</sup> (Information on creating <i>AssociationClasses</i> from elements)
<b>Attributes</b>	<i>Collection</i>	Read only A collection of <b>Attribute</b> objects for the current	<a href="#">Attribute Class</a> <sup>[2911]</sup> <a href="#">Collection Class</a>

Attribute	Type	Notes	See also
		element; use the <b>AddNew</b> and <b>Delete</b> functions to manage attributes.	<a href="#">[2829]</a>
<b>AttributesEx</b>	<i>Collection</i>	Read only A collection of <b>Attribute</b> objects belonging to the current element and its parent elements.	<a href="#">Attribute Class</a> <a href="#">[2911]</a> <a href="#">Collection Class</a> <a href="#">[2829]</a>
<b>Author</b>	<i>String</i>	Read/Write The element author.	<a href="#">Repository: Authors</a> <a href="#">[2850]</a>
<b>BaseClasses</b>	<i>Collection</i>	Read only A list of Base Classes for this element, presented as a collection for convenience.	<a href="#">Collection Class</a> <a href="#">[2829]</a>
<b>ClassifierID</b>	<i>Long</i>	<b>Deprecated</b> See <i>ClassifierID</i> .	
<b>ClassifierID</b>	<i>Long</i>	Read/Write The <b>ElementID</b> of a Classifier associated with this element; that is, the base type. Only valid for instance type elements (such as Object or Sequence).	
<b>ClassifierName</b>	<i>String</i>	Read/Write Name of associated Classifier (if any).	
<b>ClassifierType</b>	<i>String</i>	Read only Type of associated Classifier.	
<b>Complexity</b>	<i>String</i>	Read/Write A complexity value indicating how complex the element is; used for metric reporting and estimation. Valid values are: <b>1</b> for Easy, <b>2</b> for Medium, <b>3</b> for Difficult.	
<b>CompositeDiagram</b>	<i>Diagram</i>	Read only If the element is Composite, returns its associated diagram; otherwise returns null.	<a href="#">Diagram Class</a> <a href="#">[2948]</a>

Attribute	Type	Notes	See also
<b>Connectors</b>	<i>Collection</i>	Read only Returns a collection containing the connectors to other elements.	<a href="#">Connector Class</a> <sup>[2933]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Constraints</b>	<i>Collection</i>	Read only A collection of Constraint objects.	<a href="#">Constraint Class</a> <sup>[2879]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>ConstraintsEx</b>	<i>Collection</i>	Read only Collection of Constraint objects belonging to the current element and its parent elements.	<a href="#">Constraint Class</a> <sup>[2879]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Created</b>	<i>Date</i>	Read/Write The date the element was created.	
<b>CustomProperties</b>	<i>Collection</i>	Read only List of advanced properties for an element. The collection of advanced properties differs depending on element type; for example, an Action and an Activity have different advanced properties. Currently only editable from the user interface.	<a href="#">Custom Properties Collection</a> <sup>[2918]</sup>
<b>Diagrams</b>	<i>Collection</i>	Read only Returns a collection of sub-diagrams (child diagrams) attached to this element as seen in the tree view.	<a href="#">Diagram Class</a> <sup>[2948]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Difficulty</b>	<i>String</i>	Read/Write A difficulty level associated with this element for estimation/metrics; only useable for Requirement, Change and Issue element types, otherwise ignored. Valid values are: <b>Low</b> , <b>Medium</b> , <b>High</b> .	
<b>Efforts</b>	<i>Collection</i>	Read only A collection of Effort objects.	<a href="#">Effort Class</a> <sup>[2880]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>ElementGUID</b>	<i>String</i>	Read only A globally unique ID for this element; that is, unique across all model files.	

Attribute	Type	Notes	See also
<b>ElementID</b>	<i>Long</i>	Read only The local ID of the Element; valid for this file only.	
<b>Elements</b>	<i>Collection</i>	Read only Returns a collection of child elements (sub-elements) attached to this element as seen in the tree view.	<a href="#">Collection Class</a> 
<b>EmbeddedElements</b>	<i>Collection</i>	Read only A list of elements that are embedded into this element, such as Ports, Parts, Pins and Parameter Sets.	<a href="#">EmbeddedElements Collection</a> 
<b>EventFlags</b>	<i>String</i>	Read/Write A structure to hold a variety of flags to do with signals or events.	
<b>ExtensionPoints</b>	<i>String</i>	Read/Write Optional extension points for a Use Case as a comma-separated list.	
<b>Files</b>	<i>Collection</i>	Read only A collection of <b>File</b> objects.	<a href="#">File Class</a>  <a href="#">Collection Class</a> 
<b>GenFile</b>	<i>String</i>	Read/Write The file associated with this element for code generation and synchronization purposes; can include macro expansion tags for local conversion to full path.	
<b>Genlinks</b>	<i>String</i>	Read/Write Links to other Classes discovered at code reversing time; Parents and Implements connectors only.	
<b>GenType</b>	<i>String</i>	Read/Write The code generation type; for example, Java, C++, C#, VBNNet, Visual Basic, Delphi.	
<b>Header1</b>	<i>Variant</i>	Read/Write	

Attribute	Type	Notes	See also
		A user defined string for inclusion as header in the source files generated.	
<b>Header2</b>	<i>Variant</i>	Read/Write  Same as for <b>Header1</b> , but used in the CPP source file.	
<b>IsActive</b>	<i>Boolean</i>	Read/Write  Boolean value indicating whether the element is active or not.  <b>1</b> = True, <b>0</b> = False.	
<b>IsComposite</b>	<i>Boolean</i>	Read/Write  Indicates whether the element is composite or not.  <b>1</b> = True, <b>0</b> = False.	
<b>IsLeaf</b>	<i>Boolean</i>	Read/Write  Boolean value indicating whether the element is in leaf node or not.  <b>1</b> = True, <b>0</b> = False.	
<b>IsNew</b>	<i>Boolean</i>	Read/Write  Boolean value indicating whether the element is new or not.  <b>1</b> = True, <b>0</b> = False.	
<b>IsSpec</b>	<i>Boolean</i>	Read/Write  Boolean value indicating whether the element is a specification or not.  <b>1</b> = True, <b>0</b> = False.	
<b>Issues</b>	<i>Collection</i>	Read only  Collection of Issue objects.	<a href="#">Issue (Maintenance) Class</a> <sup>[2896]</sup>  <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Locked</b>	<i>Boolean</i>	Read/Write  Indicates if the element has been locked against further change.	

Attribute	Type	Notes	See also
<b>MetaType</b>	<i>String</i>	Read only  The element's domain-specific meta type, as defined by an applied stereotype from an MDG Technology.	
<b>Methods</b>	<i>Collection</i>	Read only  Collection of Method objects for current element.	<a href="#">Method Class</a> <sup>[2919]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>MethodsEx</b>	<i>Collection</i>	Read only  Collection of Method objects belonging to the current element and its parent elements.	<a href="#">Method Class</a> <sup>[2919]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Metrics</b>	<i>Collection</i>	Read only  Collection of Metric elements for current element.	<a href="#">Metric Class</a> <sup>[2898]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>MiscData</b>	<i>String</i>	Read only  This low-level property provides information about the contents of the <b>PData<sub>x</sub></b> fields.  These database fields are not documented, and developers must gain understanding of these fields through their own endeavors to use this property.  <b>MiscData</b> is zero based, therefore: <ul style="list-style-type: none"> <li>• <b>MiscData(0)</b> corresponds to <b>PData1</b></li> <li>• <b>MiscData(1)</b> to <b>PData2</b></li> </ul> and so on.	
<b>Modified</b>	<i>Date</i>	Read/Write  The date the element was last modified.	
<b>Multiplicity</b>	<i>String</i>	Read/Write  Multiplicity value for this element.	
<b>Name</b>	<i>String</i>	Read/Write  The element name; should be unique within the current package.	
<b>Notes</b>	<i>String</i>	Read/Write	

Attribute	Type	Notes	See also
		Further descriptive text about the element.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> <sup>[2822]</sup>
<b>PackageID</b>	<i>Long</i>	Read/Write A local ID for the Package containing this element.	
<b>ParentID</b>	<i>Long</i>	Read/Write If this element is a child of another, used to set or retrieve the <i>ElementID</i> of the other element; if not, returns <b>0</b> .	
<b>Partitions</b>	<i>Collection</i>	Read only List of logical partitions into which an element can be divided.  Only valid for elements that support partitions, such as Activities and States.	<a href="#">Partitions Collection</a> <sup>[2928]</sup>
<b>Persistence</b>	<i>String</i>	Read/Write The persistence associated with this element; can be <b>Persistent</b> or <b>Transient</b> .	
<b>Phase</b>	<i>String</i>	Read/Write The phase this element is scheduled to be constructed in; any string value.	
<b>Priority</b>	<i>String</i>	Read/Write The priority of this element as compared to other project elements; only applies to Requirement, Change and Issue types, otherwise ignored.  Valid values are: <b>Low</b> , <b>Medium</b> and <b>High</b> .	
<b>Properties</b>	<i>Properties</i>	Returns a list of specialized properties that apply to the element that might not be available using the automation model.  The properties are purposely undocumented because of their obscure nature and because they are subject to change as progressive enhancements are made to them.	<a href="#">Properties</a> <sup>[2929]</sup>

Attribute	Type	Notes	See also
<b>PropertyType</b>	<i>Long</i>	Read/Write The ElementID of a Type associated with this element; only valid for Port and Part elements.	
<b>PropertyTypeName</b>	<i>String</i>	Read The name of a Type associated with this element; only valid for <b>Port</b> and <b>Part</b> elements.	
<b>Realizes</b>	<i>Collection</i>	Read only List of Interfaces realized by this element for convenience.	<a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Requirements</b>	<i>Collection</i>	Read only Collection of <b>Requirement</b> objects.	<a href="#">Requirement Class</a> <sup>[2899]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>RequirementsEx</b>	<i>Collection</i>	Read only Collection of <b>Requirement</b> objects belonging to the current element and its parent elements.	<a href="#">Requirement Class</a> <sup>[2899]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Resources</b>	<i>Collection</i>	Read only Collection of <b>Resource</b> objects for current element.	<a href="#">Resource Class</a> <sup>[2900]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>Risks</b>	<i>Collection</i>	Read only Collection of <b>Risk</b> objects.	<a href="#">Risk Class</a> <sup>[2902]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>RunState</b>	<i>String</i>	Read/Write The object's runstate list as a string.	
<b>Scenarios</b>	<i>Collection</i>	Read only Collection of <b>Scenario</b> objects for current element.	<a href="#">Scenario Class</a> <sup>[2903]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>StateTransitions</b>	<i>Collection</i>	Read only List of State Transitions that an element can support; applies in particular to Timing elements.	<a href="#">Collection Class</a> <sup>[2829]</sup> <a href="#">Transitions Collection</a> <sup>[2932]</sup>
<b>Status</b>	<i>String</i>	Read/Write	

Attribute	Type	Notes	See also
		Sets or gets the status, such as <b>Proposed</b> or <b>Approved</b> .	
<b>Stereotype</b>	<i>String</i>	Read/Write  The primary element stereotype; the first of the list of stereotypes you can access using the <i>StereotypeEx</i> attribute.	
<b>StereotypeEx</b>	<i>String</i>	Read/Write  All the applied stereotypes of the element in a comma-separated list.	
<b>StyleEx</b>	<i>String</i>	Read/Write  Advanced style settings; reserved for the use of Sparx Systems.	
<b>Subtype</b>	<i>Long</i>	Read/Write  A numeric subtype that qualifies the <b>Type</b> of the main element <ul style="list-style-type: none"> <li>For Event: <b>0</b> = Receiver, <b>1</b> = Sender</li> <li>For Class: <b>1</b> = Parameterised, <b>2</b> = Instantiated, <b>3</b> = Both, <b>0</b> = Neither, <b>17</b> = Association Class</li> </ul> If <b>17</b> , because an Association Class has been created through the user interface, <b>MiscData(3)</b> contains the ID of the related Association; as MiscData is read-only, you cannot create an Association Class through the Automation Interface: <ul style="list-style-type: none"> <li>For Note: <b>1</b> = Note linked to connector, <b>2</b> = Constraint linked to connector</li> <li>For StateNode: <b>100</b> = ActivityInitial, <b>101</b> = ActivityFinal</li> <li>For Activity: <b>0</b> = Activity, <b>8</b> = composite Activity (also set to <b>8</b> for other composite elements such as Use Cases)</li> <li>For Synchronization: <b>0</b> = Horizontal, <b>1</b> = Vertical</li> </ul> Note that there are many more Types than indicated in the above examples.	<a href="#">Type</a> 
<b>Tablespace</b>	<i>String</i>	Read/Write	

Attribute	Type	Notes		See also
		Associated tablespace for a Table element.		
<b>Tag</b>	<i>String</i>	Read/Write Corresponds to the <b>Keywords</b> field in the Enterprise Architect user interface.		<a href="#">General Settings</a> [958]
<b>TaggedValues</b>	<i>Collection</i>	Read only Returns a collection of <b>TaggedValue</b> objects.		<a href="#">TaggedValue Class</a> [2907] <a href="#">Collection Class</a> [2829]
<b>TaggedValuesEx</b>	<i>Collection</i>	Read only Returns a collection of <b>TaggedValue</b> objects belonging to the current element and the elements specialized or realized by the current element.		<a href="#">TaggedValue Class</a> [2907] <a href="#">Collection Class</a> [2829]
<b>TemplateParameters</b>	<i>Collection</i>	Read Only A collection of <b>TemplateParameter</b> objects.		<a href="#">Parameterized Classes (Templates)</a> [1365] <a href="#">TemplateParameter Class</a> [2931] <a href="#">Collection Class</a> [2829]
<b>Tests</b>	<i>Collection</i>	Read only A collection of Test objects for the current element.		<a href="#">Test Class</a> [2908] <a href="#">Collection Class</a> [2829]
<b>TreePos</b>	<i>Long</i>	Read/Write Sets or gets the tree position.		
<b>Type</b>	<i>String</i>	Read/Write The element type (such as Class, Component). Note that <b>Type</b> is case sensitive inside Enterprise Architect and should be provided with an initial capital (proper case); valid types are:		
		<b>Action</b> <b>Activity</b> <b>ActivityPartition</b> <b>ActivityRegion</b> <b>Actor</b> <b>Artifact</b> <b>Association</b> <b>Boundary</b>	<b>InteractionFragment</b> <b>InteractionOccurrence</b> <b>InteractionState</b> <b>Interface</b> <b>InterruptibleActivityRegion</b> <b>Issue</b> <b>Node</b>

		<b>Change</b> <b>Class</b> <b>Collaboration</b> <b>Component</b> <b>Constraint</b> <b>Decision</b> <b>DeploymentSpecification</b> <b>DiagramFrame</b> <b>EmbeddedElement</b> <b>Entity</b> <b>EntryPoint</b> <b>Event</b> <b>ExceptionHandler</b> <b>ExitPoint</b> <b>ExpansionNode</b> <b>ExpansionRegion</b> <b>Feature</b> <b>GUIElement</b>	<b>Note</b> <b>Object</b> <b>Package</b> <b>Parameter</b> <b>Part</b> <b>Port</b> <b>ProvidedInterface</b> <b>Report</b> <b>RequiredInterface</b> <b>Requirement</b> <b>Screen</b> <b>Sequence</b> <b>State</b> <b>StateNode</b> <b>Synchronization</b> <b>Text</b> <b>TimeLine</b> <b>UMLDiagram</b> <b>UseCase</b>	
<b>Version</b>	<i>String</i>	Read/Write  The version of the element.		
<b>Visibility</b>	<i>String</i>	Read/Write  The Scope of this element within the current package.  Valid values are: <b>Public</b> , <b>Private</b> , <b>Protected</b> or <b>Package</b> .		

### Element Methods

Method	Type	Notes	See also
<b>ApplyGroupLock (string aGroupName)</b>	<i>Boolean</i>	Applies a group lock to the element object, for the specified group, on behalf of the current user. Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <i>GetLastError()</i> to retrieve error information. Parameters: <ul style="list-style-type: none"> <li>aGroupName: String - the name of the user group for which to set the group lock</li> </ul>	
<b>ApplyUserLock ()</b>	<i>Boolean</i>	Applies a user lock to the element object for the current user. Returns <b>true</b> if the operation is successful; returns	

Method	Type	Notes	See also
		<b>false</b> if the operation is unsuccessful. Use <i>GetLastError()</i> to retrieve error information.	
<b>CreateAssociationClass (long ConnectorID)</b>	<i>Boolean</i>	<p>Makes this element an AssociationClass of the Association with the provided <b>Connector ID</b>; the return value indicates whether the function succeeded in converting the element to an AssociationClass.</p> <p>AssociationClasses are created only where:</p> <ul style="list-style-type: none"> <li>• The current element is valid</li> <li>• The current element is a Class</li> <li>• The current element is not already an AssociationClass</li> <li>• The specified connector exists</li> <li>• The specified connector is an Association</li> <li>• The specified connector is not already in an AssociationClass pair</li> <li>• The current element is not at either end of the specified connector</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• ConnectorID: Long - the Connector ID of an Association connector</li> </ul>	<a href="#">UnlinkFromAssociation</a> <sup>[2895]</sup>
<b>DeleteLinkedDocument()</b>	<i>Boolean</i>	<p>Removes the Linked Document for the element. This method does not display a confirmatory prompt.</p> <p>Returns <b>true</b> if a document was deleted.</p>	
<b>GetBusinessRules()</b>	<i>String</i>	<p>Read Only.</p> <p>Returns all the Business Rules for the element.</p>	<a href="#">Model Business Rules</a> <sup>[1821]</sup>
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.	
<b>GetLinkedDocument ()</b>	<i>String</i>	<p>Returns a string value containing the element's linked document contents, in RTF format.</p> <p>If the element contains no linked document, an empty string is returned.</p>	
<b>GetRelationSet (EnumRelationSetType Type)</b>	<i>String</i>	Returns a string containing a comma-separated list of ElementIDs of directly- and indirectly-related elements based on the given type.	<a href="#">EnumRelationSetType</a> <sup>[2820]</sup> <a href="#">Connector</a> <sup>[2933]</sup>

Method	Type	Notes	See also
		<p>Recurses using the same relation type on all elements it finds, retrieving all dependencies and sub-dependencies of the current element; for example, <i>Object1</i> depends on <i>Object2</i>, which depends on <i>Object3</i>, therefore this method returns <i>Object2</i> and <i>Object3</i>.</p> <p>To obtain only the direct relationships of the element, use the <i>Connector</i> collection instead.</p>	
<b>GetStereotypeList ()</b>	<i>String</i>	Returns a comma-separated list of stereotypes allied to this element.	
<b>IsAssociationClass</b>	<i>Boolean</i>	Returns whether or not the current element is an AssociationClass.	
<b>LoadLinkedDocument (string Filename)</b>	<i>Boolean</i>	<p>Loads the RTF document from the specified file into the element's linked document.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <b>FileName:</b> String - the name of the file from which to load the RTF document</li> </ul>	
<b>Refresh ()</b>	<i>Void</i>	<p>Refreshes the element features in the Project Browser.</p> <p>Usually called after adding or deleting attributes or methods, when the user interface is required to be updated as well.</p>	
<b>ReleaseUserLock ()</b>	<i>Boolean</i>	<p>Releases a user lock or group lock on the element object.</p> <p>Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <i>GetLastError()</i> to retrieve error information.</p>	
<b>SaveLinkedDocument (string Filename)</b>	<i>Boolean</i>	<p>Saves the linked document for this element to the specified RTF file.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <b>FileName:</b> String - the name of the RTF file to which to save the linked document</li> </ul>	
<b>SetAppearance (long Scope, long Item, long Value)</b>	<i>Void</i>	<p>Sets the visual appearance of the element.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <b>Scope:</b> Long - Scope of appearance set to modify 1 – Base (Default appearance across entire</li> </ul>	<a href="#">DiagramObject Class</a> <sup>[2958]</sup>

Method	Type	Notes	See also
		<p>model)</p> <p>To set appearance for the element (diagram object) in a selected diagram only, see <i>Setting The Style</i> in the <i>Diagram Object Class</i> topic</p> <ul style="list-style-type: none"> <li>Item: Long - Appearance feature to modify <ul style="list-style-type: none"> <li>0 – Background color</li> <li>1 – Font Color</li> <li>2 – Border Color</li> <li>3 – Border Width</li> </ul> </li> <li>Value: Long - Value to set appearance to</li> </ul>	
<b>SetCompositeDiagram ()</b>	<i>Boolean</i>	<p>Sets the composite diagram of the element.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>GUID: String - the GUID of the composite diagram. A blank GUID will remove the link to the composite diagram</li> </ul>	<a href="#">Composite Elements</a> <sup>[936]</sup>
<b>SetCreated (Date NewVal)</b>	<i>Void</i>	<p><b>Deprecated</b></p> <p>This method is no longer supported.</p>	
<b>SetModified (Date NewVal)</b>	<i>Void</i>	<p><b>Deprecated</b></p> <p>This method is no longer supported.</p>	
<b>SynchConstraints (string Profile, string Stereotype)</b>	<i>Boolean</i>	<p>Synchronizes the constraints of a UML Profile item for this element, only if the specified stereotype has been applied.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Profile: String - Name of the profile that contains the stereotype</li> <li>Stereotype: String - Name of the profile <i>stereotype</i> for which the default constraints are to be synchronized</li> </ul>	
<b>SynchTaggedValues (string Profile, string Stereotype)</b>	<i>Boolean</i>	<p>Synchronizes the Tagged Values of a UML Profile item for this element, only if the specified stereotype has been applied.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Profile: String - Name of the profile that contains the stereotype</li> <li>Stereotype: String - Name of the profile <i>stereotype</i> for which the default tags are to</li> </ul>	

Method	Type	Notes	See also
		be synchronized	
<b>UnlinkFromAssociation</b>	<i>Boolean</i>	Performs the opposite of <b>CreateAssociationClass()</b> .	<a href="#">CreateAssociationClass()</a> <sup>[2892]</sup>
<b>Update ()</b>	<i>Boolean</i>	Updates the current element object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.	

#### 20.2.2.5.4 File Class

A **File** represents an associated file for an element. Files are accessed through the Element **Files** collection.

Associated table in .EAP file *t\_objectfiles*

##### File Attributes

Attribute	Type	Notes
<b>FileDate</b>	<i>String</i>	Read/Write The file date when the entry was created.
<b>Name</b>	<i>String</i>	Read/Write The file name can be a logical file or a reference to a web address (using <i>http://</i> ).
<b>Notes</b>	<i>String</i>	Read/Write Notes about the file.
<b>ObjectType</b>	<a href="#">Object Type</a> <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Size</b>	<i>String</i>	Read/Write The file size.
<b>Type</b>	<i>String</i>	Read/Write The file type.

**File Methods:**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current File object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**20.2.2.5.5 Issue (Maintenance) Class**

An **Issue** is either a **Change** or a **Defect**, is associated with the containing element, and is accessed through the **Issues** collection of an element.

**Associated table in .EAP file** *t\_objectproblems*

**Issue Attributes**

Attribute	Type	Notes
<b>DateReported</b>	<i>Date</i>	Read/Write The date the issue was reported.
<b>DateResolved</b>	<i>Date</i>	Read/Write The date the issue was resolved.
<b>ElementID</b>	<i>Long</i>	Read/Write The ID of the element associated with this issue.
<b>Name</b>	<i>String</i>	Read/Write The Issue name; that is, the Issue itself.
<b>Notes</b>	<i>String</i>	Read/Write The Issue description.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <a href="#">e</a> <sub>[2822]</sub>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Priority</b>	<i>String</i>	Read/Write

Attribute	Type	Notes
		The priority of the Issue - <b>Low</b> , <b>Medium</b> or <b>High</b> .
<b>Reporter</b>	<i>String</i>	Read/Write The user ID of the person reporting the issue.
<b>Resolver</b>	<i>String</i>	Read/Write The user ID of the person resolving the issue.
<b>ResolverNotes</b>	<i>String</i>	Read/Write Notes entered by the resolver about resolution of the Issue.
<b>Severity</b>	<i>String</i>	Read/Write The Issue severity - <b>Low</b> , <b>Medium</b> or <b>High</b> .
<b>Status</b>	<i>String</i>	Read/Write The current status of the issue.
<b>Type</b>	<i>Variant</i>	Read/Write The Issue type - <b>Defect</b> , <b>Change</b> , <b>Issue</b> or <b>ToDo</b> .
<b>Version</b>	<i>String</i>	Read/Write The version associated with the issue. Note that this method is only available through a Dispatch interface.  Object ob = Issue; Print ob.Version;

**Issue Methods**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Issue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.5.6 Metric Class

A **Metric** is a named item with a weighting that can be associated with an element for purposes of building metrics about the model. Metrics are accessed through the Element **Metrics** collection.

Associated table in .EAP file    *t\_objectmetrics*

##### Metric Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write The name of the metric.
<b>Notes</b>	<i>String</i>	Read/Write Notes about this metric.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <a href="#">e</a> <sub>[2822]</sub>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write The metric type.
<b>Weight</b>	<i>Long</i>	Read/Write A user-defined weighting for estimation or metric purposes.

##### Metric Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Metric object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 20.2.2.5.7 Requirement Class

An **Element Requirement** object holds information about the responsibilities of an element in the context of the model. Requirements can be accessed using the Element **Requirements** collection.

Associated table in .EAP file *t\_objectrequires*

#### Requirement Attributes

Attribute	Type	Notes
<b>Difficulty</b>	<i>String</i>	Read/Write The estimated difficulty of implementing the requirement.
<b>LastUpdate</b>	<i>Date</i>	Read/Write The date the requirement was last updated.
<b>Name</b>	<i>String</i>	Read/Write The requirement itself.
<b>Notes</b>	<i>String</i>	Read/Write Further notes on the requirement.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e<sub>2822</sub></small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>ParentID</b>	<i>Long</i>	Read only The <b>ElementID</b> of the element to which this requirement applies.
<b>Priority</b>	<i>String</i>	Read/Write The assigned priority of the requirement.
<b>RequirementID</b>	<i>Long</i>	Read only A local ID for this requirement.
<b>Stability</b>	<i>String</i>	Read/Write The estimated stability of the requirement.  This is an indication of the probability of the requirement - or understanding of the requirement - changing. High stability indicates a low probability of the requirement changing.

Attribute	Type	Notes
<b>Status</b>	<i>String</i>	Read/Write The current status of the requirement.
<b>Type</b>	<i>String</i>	Read/Write The requirement type.

#### Requirement Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current Requirement object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.5.8 Resource Class

An Element **Resource** is a named person/task pair with timing constraints and percent complete indicators. Use this to manage the work associated with delivering an Element.

Associated table in .EAP file *t\_objectresources*

#### Resource Attributes

Attribute	Type	Notes
<b>ActualHours</b>	<i>Long</i>	Read/Write The time already expended on the task, in hours, days or other units.
<b>DateEnd</b>	<i>Date</i>	Read/Write The expected end date.
<b>DateStart</b>	<i>Date</i>	Read/Write The date to start work.

Attribute	Type	Notes
<b>ExpectedHours</b>	<i>Long</i>	Read/Write The total expected time the task might run, in hours, days or other units.
<b>History</b>	<i>String</i>	Read/Write Gets or sets history text.
<b>Name</b>	<i>String</i>	Read/Write The name of the resource (for example, a person's name).
<b>Notes</b>	<i>String</i>	Read/Write Descriptive notes.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>PercentComplete</b>	<i>Long</i>	Read/Write The current percent complete figure.
<b>Role</b>	<i>String</i>	Read/Write The role the resource plays in implementing the element.
<b>Time</b>	<i>Long</i>	Read/Write The time expected to complete the task; a numeric indicating the number of days.

#### Resource Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Resource object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

Method	Type	Notes

#### 20.2.2.5.9 Risk Class

A **Risk** object represents a named risk associated with an element, it is used for project management purposes. Risks can be accessed through the Element **Risks** collection.

Associated table in .EAP file    *t\_objectrisks*

##### Risk Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write The name of the risk.
<b>Notes</b>	<i>String</i>	Read/Write Further notes describing the risk.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write The risk type associated with this element.
<b>Weight</b>	<i>Long</i>	Read/Write A weighting for estimation or metric purposes.

##### Risk Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current Risk object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 20.2.2.5.10 Scenario Class

A **Scenario** corresponds to a Collaboration or Use Case instance. Each Scenario is a path of execution through the logic of a Use Case. Scenarios can be added to using the Element *Scenarios* collection.

**Associated table in .EAP file** `t_objectscenarios`

#### Scenario Attributes

Attribute	Type	Notes	See also
<b>Name</b>	<i>String</i>	Read/Write The Scenario name.	
<b>Notes</b>	<i>String</i>	Read/Write A description of the Scenario, usually containing the steps to execute the scenario.	
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.	
<b>ScenarioGUID</b>	<i>String</i>	Read/Write A unique ID for the Scenario, used to identify the Scenario unambiguously within a model.	
<b>Steps</b>	<a href="#">Collection of ScenarioStep</a> [2905]	Read only A collection of step objects for this Scenario.  Use the <i>AddNew</i> and <i>Delete</i> functions to manage steps. <i>AddNew</i> passes the step name and "1" as the type for an actor step.	<a href="#">Collection Class</a> [2823]
<b>Type</b>	<i>String</i>	Read/Write The scenario type (for example, <i>Basic Path</i> ).	
<b>Weight</b>	<i>Long</i>	Read/Write Currently used to position scenarios in the scenario list (that is, <i>List Position</i> ).	
<b>XMLContent</b>	<i>String</i>	Read/Write A structured field that can contain scenario details in XML format. It is recommended that you use the <i>Steps</i> collection to read or modify this field.	

Attribute	Type	Notes	See also

### Scenario Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current Scenario object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.5.11 ScenarioExtension Class

### ScenarioExtension Attributes

Attribute	Type	Notes
<b>ExtensionGUID</b>	<i>String</i>	Read/Write A unique GUID for this Extension.
<b>Join</b>	<i>String</i>	Read/Write The GUID of the step where this Extension rejoins the Scenario.
<b>JoiningStep</b>	<a href="#">ScenarioStep</a> [2905]	Read only The actual step where this Extension rejoins the Scenario, if any.
<b>Level</b>	<i>String</i>	Read only The number of this Extension as shown in the scenario editor. This is derived from the value of <i>Pos</i> for this object and the owning step.
<b>Name</b>	<i>String</i>	Read/Write The Extension name. This should match the name of the linked scenario.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Pos</b>	<i>Long</i>	Read/Write

Attribute	Type	Notes
		The position of the Extension in the Extensions list.
<b>Scenario</b>	<a href="#">Scenario</a> <sup>[2903]</sup>	Read only The scenario that is executed as an alternative path for this Extension.

#### ScenarioExtension Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current <b>ScenarioExtension</b> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.5.12 ScenarioStep Class

##### ScenarioStep Attributes

Attribute	Type	Notes	See also
<b>Extensions</b>	<i>Collection of ScenarioExtension</i>	Read only A collection of <b>ScenarioExtension</b> objects that specify how the scenario is extended from this step. The arguments to <b>AddNew</b> should match the name and GUID of the alternative scenario being linked to.	<a href="#">Collection</a> <sup>[2829]</sup> <a href="#">ScenarioExtension</a> <sup>[2904]</sup>
<b>Level</b>	<i>String</i>	Read only The number of this Step as shown in the scenario editor. This is derived from the value of <b>Pos</b> .	
<b>Link</b>	<i>String</i>	Read/Write The GUID of a Use Case that is relevant to this step.	
<b>LinkedElement</b>	<i>Element</i>	Read only The actual element specified by Link, if any.	<a href="#">Element</a> <sup>[2881]</sup>
<b>Name</b>	<i>String</i>	Read/Write	

Attribute	Type	Notes	See also
		The Step name.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> <sup>[2822]</sup>
<b>Pos</b>	<i>Long</i>	Read/Write The position of the Step in the Scenario Step list.	
<b>Results</b>	<i>String</i>	Read/Write Any results that are given from this step.	
<b>State</b>	<i>String</i>	Read/Write A description of the state the system enters when this Step is executed.	
<b>StepGUID</b>	<i>String</i>	Read/Write A unique GUID for this Step.	
<b>StepType</b>	<i>ScenarioStepType</i>	Read/Write Identifies whether this step is being performed by a user or the system.	<a href="#">ScenarioStepType</a> <sup>[2825]</sup>
<b>Uses</b>	<i>String</i>	Read/Write The input and requirements that are relevant to this step.	
<b>UsesElement List</b>	<i>Collection of Element</i>	Read only Indicates that the Structured Specification tab <b>Uses</b> field is a linked element list.	<a href="#">Collection</a> <sup>[2829]</sup> <a href="#">Element</a> <sup>[2881]</sup> <a href="#">Set Up Scenario Specification</a> <sup>[968]</sup>

**ScenarioStep Methods:**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.

Method	Type	Notes
<b>Update ()</b>	<i>Boolean</i>	Updates the current <b>ScenarioStep</b> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.5.13 TaggedValue Class

A **TaggedValue** is a named property and value associated with an element. Tagged Values can be accessed through the **TaggedValues** collection.

Associated table in .EAP file    *t\_objectproperties*

#### TaggedValue Attributes

Attribute	Type	Notes
<b>ElementID</b>	<i>Long</i>	Read/Write The local ID of the associated element.
<b>FQName</b>	<i>String</i>	Read only The fully-qualified name of the tag.
<b>Name</b>	<i>String</i>	Read/Write The name of the tag.
<b>Notes</b>	<i>String</i>	Read/Write Further descriptive notes about this tag.  If <b>Value</b> (below) is set to "<memo>", then <b>Notes</b> should contain the actual Tagged Value content.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e<sup>[2822]</sup></small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>PropertyGUID</b>	<i>String</i>	Read/Write The global ID of the tag.
<b>PropertyID</b>	<i>Long</i>	Read only The local ID of the tag.

Attribute	Type	Notes
<b>Value</b>	<i>String</i>	<p>Read/Write</p> <p>The value assigned to this tag.</p> <p>This field has a 255 character limit. If the value is greater than 255 characters long, set the value to "&lt;memo&gt;" and insert the body of text in the <b>Notes</b> attribute (above).</p> <p>When reading existing Tagged Values, if <b>Value</b> = "&lt;memo&gt;" then the developer should read the actual body of text from the <b>Notes</b> attribute.</p>

#### TaggedValue Methods

Method	Type	Notes
<b>GetAttribute(string propName)</b>	<i>String</i>	<p>Returns the text of a single named property within a structured Tagged Value.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>propName: String - the name of the property for which the text is being returned</li> </ul>
<b>GetLastError()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>HasAttributes()</b>	<i>Boolean</i>	Returns true if the Tagged Value is a structured Tagged Value with one or more properties.
<b>SetAttribute(string propName, string propValue)</b>	<i>Boolean</i>	<p>Sets the text of a single named property within a structured Tagged Value.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>propName: String - the name of the property for which the text is being set</li> <li>propValue: the value of the property</li> </ul>
<b>Update()</b>	<i>Boolean</i>	<p>Updates the current TaggedValue object after modification or appending a new item.</p> <p>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.</p>

#### 20.2.2.5.14 Test Class

A **Test** is a single Test Case applied to an element. Tests are added and accessed through the Element **Tests** collection.

Associated table in .EAP file    *t\_objecttests*

**Test Attributes**

Attribute	Type	Notes
<b>AcceptanceCriteria</b>	<i>String</i>	Read/Write The acceptance criteria for successful execution.
<b>CheckedBy</b>	<i>String</i>	Read/Write User ID of the person confirming the results.
<b>Class</b>	<i>Long</i>	Read/Write The test Class: 1 = Unit Test 2 = Integration Test 3 = System Test 4 = Acceptance Test 5 = Scenario Test
<b>DateRun</b>	<i>Date</i>	Read/Write The date the test was last run.
<b>Input</b>	<i>String</i>	Read/Write Input data for the test.
<b>Name</b>	<i>String</i>	Read/Write The test name.
<b>Notes</b>	<i>String</i>	Read/Write Detailed notes about test to be carried out.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>RunBy</b>	<i>String</i>	Read/Write The user ID of the person conducting the test.
<b>Status</b>	<i>String</i>	Read/Write Current status of test.

Attribute	Type	Notes
<b>TestResults</b>	<i>Variant</i>	Read/Write Results of test.
<b>Type</b>	<i>String</i>	Read/Write The test type, such as Load or Regression.

#### Test Methods

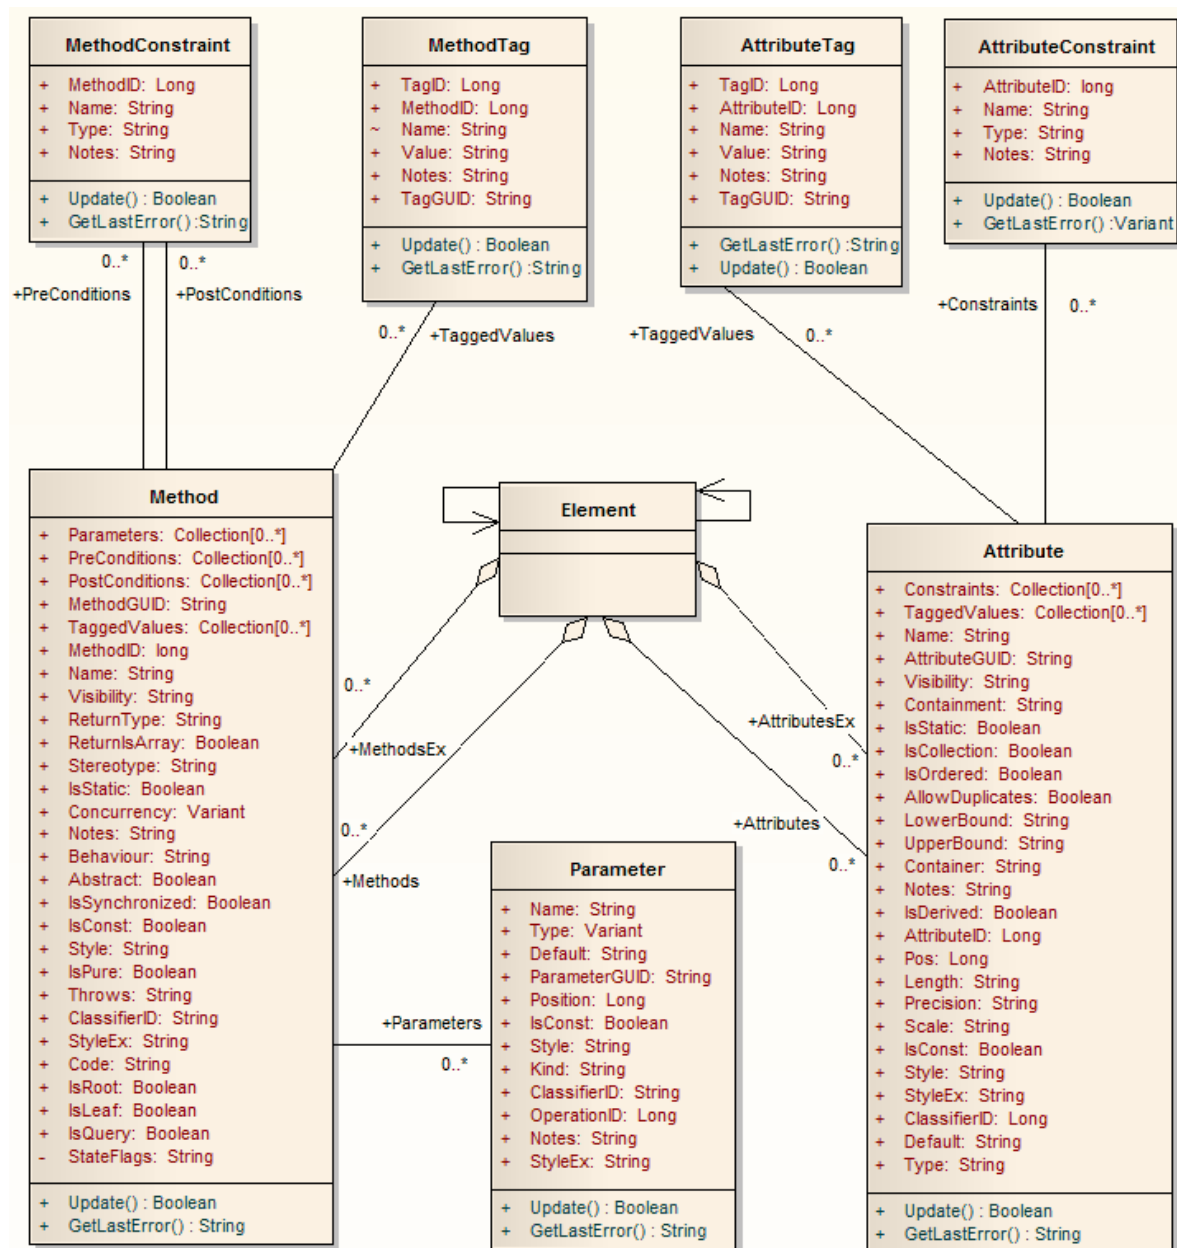

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current Test object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 20.2.2.6 Element Features Package

The *ElementFeatures* package contains descriptions of the model interfaces that enable access to operations and attributes, and their associated Tagged Values and constraints.

This diagram illustrates the components associated with element features. These include *Attributes* and *Methods*, and the associated constraints and Tagged Values related to them. It also includes the *Parameter* object that defines the arguments associated with an operation (method).

#### Example

#### 20.2.2.6.1 Attribute Class

An **attribute** corresponds to a UML Attribute. It contains further collections for constraints and Tagged Values. Attributes are accessed from the element **Attributes** collection.

Associated table in .EAP file *t\_attribute*

#### Attribute Attributes

Attribute	Type	Notes
<b>Alias</b>	<i>String</i>	Read/Write Contains the (optional) <b>Alias</b> property for this attribute. This can be used

Attribute	Type	Notes
		interchangeably with the <b>Style</b> attribute, below.
<b>AllowDuplicates</b>	<i>Boolean</i>	Read/Write Indicates if duplicates are allowed in the collection. If the attribute represents a database column this, when set, represents the <b>Not Null</b> option.
<b>AttributeGUID</b>	<i>String</i>	Read only A globally unique ID for the current attribute. This attribute is system generated.
<b>AttributeID</b>	<i>Long</i>	Read only The local ID number of the attribute.
<b>ClassifierID</b>	<i>Long</i>	Read/Write The classifier ID, if appropriate, indicating the base type associated with the attribute, if not a primitive type.
<b>Container</b>	<i>String</i>	Read/Write The container type.
<b>Containment</b>	<i>String</i>	Read/Write The type of containment - <b>Not Specified</b> , <b>By Reference</b> or <b>By Value</b> .
<b>Constraints</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only A collection of <i>AttributeConstraint</i> objects, used to access and manage constraints associated with this attribute.
<b>Default</b>	<i>String</i>	Read/Write The initial value assigned to this attribute.
<b>IsCollection</b>	<i>Boolean</i>	Read/Write Indicates if the current feature is a collection or not. If the attribute represents a database column this, when set, represents a Foreign Key.
<b>IsConst</b>	<i>Boolean</i>	Read/Write A flag indicating if the attribute is <b>Const</b> or not.

Attribute	Type	Notes
<b>IsDerived</b>	<i>Boolean</i>	Read/Write Indicates if the attribute is derived (that is, a calculated value).
<b>IsID</b>	<i>Boolean</i>	Read/Write Indicates if the attribute uniquely identifies an instance of the containing Class, or not.
<b>IsOrdered</b>	<i>Boolean</i>	Read/Write Indicates if a collection is ordered or not. If the attribute represents a database column this, when set, represents a Primary Key.
<b>IsStatic</b>	<i>Boolean</i>	Read/Write Indicates if the current attribute is a static feature or not. If the attribute represents a database column this, when set, represents the <b>Unique</b> option.
<b>Length</b>	<i>String</i>	Read/Write The attribute length, where applicable.
<b>LowerBound</b>	<i>String</i>	Read/Write A value for the collection lower boundary.
<b>Name</b>	<i>String</i>	Read/Write The attribute name.
<b>Notes</b>	<i>String</i>	Read/Write Further notes on this attribute.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>ParentID</b>	<i>Long</i>	Read only Returns the <i>ElementID</i> of the element that this attribute is a part of.
<b>Pos</b>	<i>Long</i>	Read/Write The position of the attribute in the Class attribute list.

Attribute	Type	Notes
<b>Precision</b>	<i>String</i>	Read/Write The precision value.
<b>RedefinedProperty</b>	<i>String</i>	Read/Write Corresponds to the <b>Redefined Property</b> field on the Detail page of the attribute Properties dialog, or the UML <i>redefinedProperty</i> attribute. Contains a comma separated list of GUIDs.
<b>Scale</b>	<i>String</i>	Read/Write The scale value.
<b>Stereotype</b>	<i>String</i>	Read/Write Sets or gets the stereotype for this attribute.
<b>StereotypeEx</b>	<i>String</i>	Read/Write Provides all the applied stereotypes of the attribute, in a comma-separated list.
<b>Style</b>	<i>String</i>	Read/Write Contains the (optional) <b>Alias</b> property for this attribute. This can be used interchangeably with the <b>Alias</b> attribute, above.
<b>SubsettedProperty</b>	<i>String</i>	Read/Write Corresponds to the <b>Subsetted Property</b> field on the Detail page of the attribute Properties dialog, or the UML <i>subsettedProperty</i> attribute. Contains a comma separated list of GUIDs.
<b>StyleEx</b>	<i>String</i>	Read/Write Advanced style settings, reserved for the use of Sparx Systems.
<b>TaggedValues</b>	<a href="#">Collection</a> [2829] of type <a href="#">AttributeTag</a> [2916]	Read only A collection of <i>AttributeTag</i> objects, used to access and manage Tagged Values associated with this attribute.
<b>TaggedValuesEx</b>	<a href="#">Collection</a> [2829] of type <a href="#">TaggedValue</a> [2907]	Read only A collection of <i>TaggedValue</i> objects belonging to the current attribute and the <i>TaggedValuesEx</i> property of its classifier.

Attribute	Type	Notes
<b>Type</b>	<i>String</i>	Read/Write The attribute type (by name; also see <i>ClassifierID</i> ).
<b>UpperBound</b>	<i>String</i>	Read/Write A value for the collection upper boundary.
<b>Visibility</b>	<i>String</i>	Read/Write Identifies the scope of the attribute - <b>Private</b> , <b>Protected</b> , <b>Public</b> or <b>Package</b> .

#### Attribute Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current attribute object after modifying or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### **20.2.2.6.2 AttributeConstraint Class**

An **AttributeConstraint** is a constraint associated with the current Attribute.

Associated table in .EAP file    *t\_attributeconstraints*

#### AttributeConstraint Attributes

Attribute	Type	Notes
<b>AttributeID</b>	<i>Long</i>	Read/Write The ID of the attribute this constraint applies to.
<b>Name</b>	<i>String</i>	Read/Write The name of the constraint.
<b>Notes</b>	<i>String</i>	Read/Write

Attribute	Type	Notes
		Descriptive notes about the constraint.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write The type of constraint.

#### AttributeConstraint Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current <b>AttributeConstraint</b> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.6.3 *AttributeTag Class*

An *AttributeTag* represents a Tagged Value associated with an attribute.

**Associated table in .EAP file:** *t\_attributetag*

#### AttributeTag Attributes:

Attribute	Type	Notes
<b>AttributeID</b>	<i>Long</i>	Read/Write The local ID of the attribute associated with this Tagged Value.
<b>FQName</b>	<i>String</i>	Read only The fully-qualified name of the tag.
<b>Name</b>	<i>String</i>	Read/Write The name of the tag.

Attribute	Type	Notes
<b>Notes</b>	<i>String</i>	Read/Write Further descriptive notes about this tag. If <b>Value</b> (below) is set to "<memo>", then <b>Notes</b> should contain the actual Tagged Value content.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>TagGUID</b>	<i>String</i>	Read/Write A globally unique ID for this Tagged Value.
<b>TagID</b>	<i>Long</i>	Read only The local ID to identify the Tagged Value.
<b>Value</b>	<i>String</i>	Read/Write The value assigned to this tag. This field has a 255 character limit. If the value is greater than 255 characters long, set the value to "<memo>" and insert the body of text in the <b>Notes</b> attribute (above). When reading existing Tagged Values, if <b>Value</b> = "<memo>" then the developer should read the actual body of text from the <b>Notes</b> attribute.

**AttributeTag Methods:**

Method	Type	Notes
<b>GetAttribute</b> (string propName)	<i>String</i>	Returns the text of a single named property within a structured tagged value.
<b>GetLastError()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object. This function is rarely used as an exception is thrown when an error occurs.
<b>HasAttributes()</b>	<i>Boolean</i>	Returns true if the tagged values is a structured tagged value with one or more properties.
<b>SetAttribute</b> (string propName, string propValue)	<i>Boolean</i>	Sets the text of a single named property within a structured tagged value.

Method	Type	Notes
<b>Update ()</b>	<i>Boolean</i>	<p>Updates the current <i>AttributeTag</i> object after modification or appending a new item.</p> <p>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.</p>

#### 20.2.2.6.4 CustomProperties Collection

The *CustomProperties* collection contains 0 or more *Cust Properties* associated with the current element. These properties provide advanced UML configuration options, and must not be added to or deleted. The value of each property can be set.

##### CustomProperty:

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	<p>Read only</p> <p>The CustomProperty name.</p>
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	<p>Read only</p> <p>Distinguishes objects referenced through a Dispatch interface.</p>
<b>Value</b>	<i>String</i>	<p>Read/Write</p> <p>The value associated with this custom property. This can be:</p> <ul style="list-style-type: none"> <li>• A string</li> <li>• The boolean values <b>true</b> or <b>false</b>, or</li> <li>• An enumeration value from a defined list</li> </ul> <p>The UML 2.4.1 specification in general provides information on the kinds of enumeration relevant here.</p>

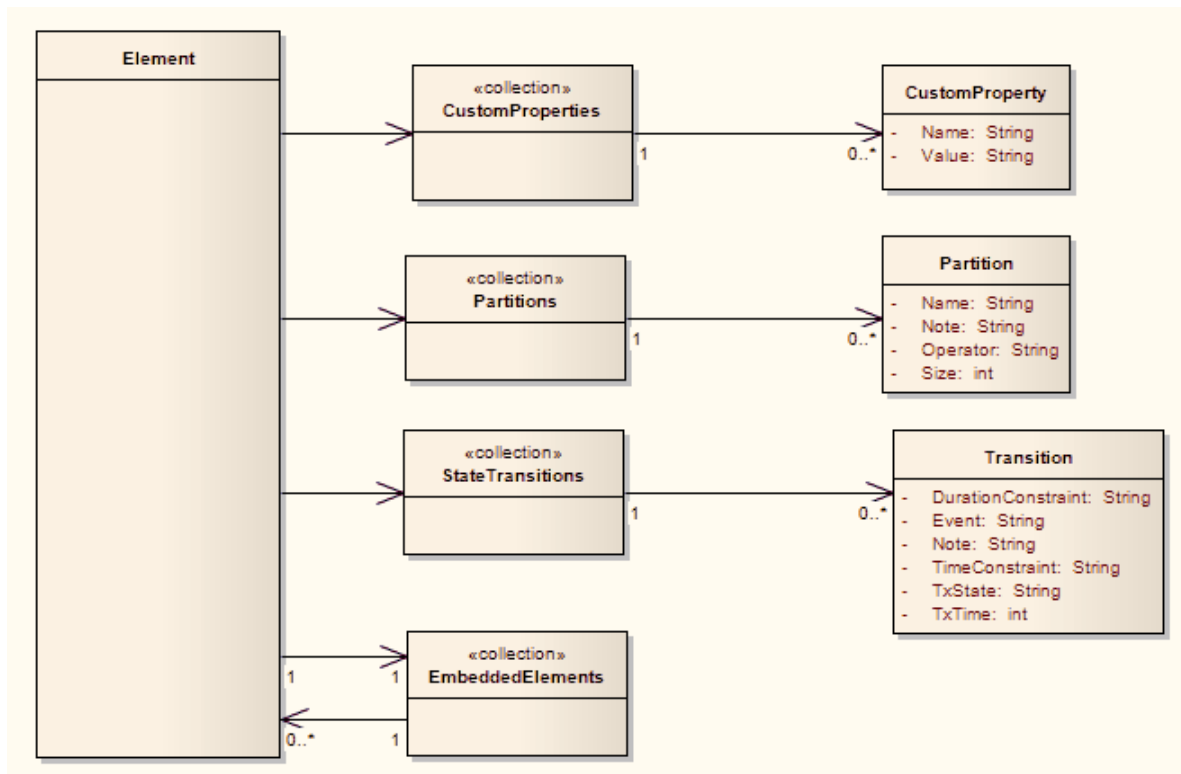

##### Notes

- The number and type of properties vary depending on the actual element

#### 20.2.2.6.5 EmbeddedElements Collection

In UML 2.4.1 an element can have one or more embedded elements such as Ports, Pins, Parameters or ObjectNodes. These are attached to the boundary of the host element and cannot be moved off the element. They are owned by their host element. This collection gives easy access to the set of elements embedded on the surface of an element. Note that some embedded elements can have their own embedded element collection (for example, Ports can have Interfaces embedded on them).

The *EmbeddedElements* collection contains Element objects.

Example**20.2.2.6.6 Method Class**

A *method* represents a UML *operation*. It is accessed from the *Element Methods* collection and includes collections for parameters, constraints and Tagged Values.

Associated table in .EAP file: *t\_operation*

Method Attributes:

Attribute	Type	Notes
<b>Abstract</b>	<i>Boolean</i>	Read/Write A flag indicating if the method is abstract (1) or not (0).
<b>Behavior</b>	<i>String</i>	Read/Write Some further explanatory behavior notes (for example, pseudocode). In earlier releases of Enterprise Architect this attribute had the UK/ Australian spelling 'Behaviour'; this is still present for backwards compatibility, but please now use the 'Behavior' attribute for consistency.
<b>ClassifierID</b>	<i>String</i>	Read/Write

Attribute	Type	Notes
		The Classifier ID that applies to the <i>ReturnType</i> .
<b>Code</b>	<i>String</i>	Read/Write An optional field to hold the method code (used for the <b>Initial Code</b> field).
<b>Concurrency</b>	<i>Variant</i>	Read/Write Indicates the concurrency type of the method.
<b>IsConst</b>	<i>Boolean</i>	Read/Write A flag indicating that the method is <b>Const</b> .
<b>IsLeaf</b>	<i>Boolean</i>	Read/Write A flag to indicate if the method is <i>Leaf</i> (cannot be overridden).
<b>IsPure</b>	<i>Boolean</i>	Read/Write A flag indicating that the method is defined as <b>Pure</b> in C++.
<b>IsQuery</b>	<i>Boolean</i>	Read/Write A flag to indicate if the method is a query (that is, does not alter Class variables).
<b>IsRoot</b>	<i>Boolean</i>	Read/Write A flag to indicate if the method is <i>Root</i> .
<b>IsStatic</b>	<i>Boolean</i>	Read/Write A flag to indicate a static method.
<b>IsSynchronized</b>	<i>Boolean</i>	Read/Write A flag indicating a Synchronized method call.
<b>MethodGUID</b>	<i>String</i>	Read/Write A globally unique ID for the current method. This is system generated.
<b>MethodID</b>	<i>Long</i>	Read only A local ID for the current method, only valid within this .EAP file.

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write The method name.
<b>Notes</b>	<i>String</i>	Read/Write Descriptive notes on the method.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Parameters</b>	<a href="#">Collection</a> [2829]	Read only The <i>Parameters</i> collection for the current method, used to add and access parameter objects for the current method.
<b>ParentID</b>	<i>Long</i>	Read only Returns the <i>ElementID</i> of the element that this method belongs to.
<b>Pos</b>	<i>Long</i>	Read/Write Specifies the position of the method within the set of operations defined for a Class.
<b>PostConditions</b>	<a href="#">Collection</a> [2829]	Read only The PostConditions (constraints) as they apply to this method. This returns a <i>MethodConstraint</i> object of type <b>post</b> .
<b>PreConditions</b>	<a href="#">Collection</a> [2829]	Read only The PreConditions (constraints) as they apply to this method. This returns a <i>MethodConstraint</i> object of type <b>pre</b> .
<b>ReturnsArray</b>	<i>Boolean</i>	Read/Write A flag to indicate that the return value is an array.
<b>ReturnType</b>	<i>String</i>	Read/Write The return type for the method; this can be a primitive data type or a Class or Interface type.
<b>StateFlags</b>	<i>String</i>	Read/Write Some flags as applied to methods in State elements.

Attribute	Type	Notes
<b>Stereotype</b>	<i>String</i>	Read/Write The method stereotype (optional).
<b>StereotypeEx</b>	<i>String</i>	Read/Write All the applied stereotypes of the method in a comma-separated list.
<b>Style</b>	<i>String</i>	Read/Write Contains the <b>Alias</b> property for this method.
<b>StyleEx</b>	<i>String</i>	Read/Write Advanced style settings, reserved for the use of Sparx Systems.
<b>TaggedValues</b>	<a href="#">Collection</a> <sup>[2829]</sup> of type <a href="#">MethodTag</a> <sup>[2924]</sup>	Read only The <i>TaggedValues</i> collection for the current method. This accesses a list of <i>MethodTag</i> objects.
<b>Throws</b>	<i>String</i>	Read/Write Exception information.
<b>Visibility</b>	<i>String</i>	Read/Write The method scope - <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> .

**Method Methods:**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current method object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 20.2.2.6.7 MethodConstraint Class

A *MethodConstraint* is a condition imposed on a method. It is accessed through either the Method *PreConditions* or Method *PostConditions* collection.

**Associated table in .EAP file:** *t\_operationpres* and *t\_operationposts*

#### **MethodConstraint Attributes:**

Attribute	Type	Notes
<b>MethodID</b>	<i>Long</i>	Read/Write The local ID of the associated method.
<b>Name</b>	<i>String</i>	Read/Write The name of the constraint.
<b>Notes</b>	<i>String</i>	Read/Write Descriptive notes about this constraint.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write The constraint type.

#### **MethodConstraint Methods:**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>MethodConstraint</i> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 20.2.2.6.8 MethodTag Class

A *MethodTag* is a Tagged Value associated with a method.

**Associated table in .EAP file:** *t\_operationtag*

#### MethodTag Attributes:

Attribute	Type	Notes
<b>FQName</b>	<i>String</i>	Read only The fully-qualified name of the tag.
<b>MethodID</b>	<i>Long</i>	Read/Write The ID of the associated method.
<b>Name</b>	<i>String</i>	Read/Write The tag or name of the property.
<b>Notes</b>	<i>String</i>	Read/Write Further descriptive notes about this tag. If <b>Value</b> (below) is set to "<memo>", then <b>Notes</b> should contain the actual Tagged Value content.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>TagGUID</b>	<i>String</i>	Read/Write A unique GUID for this Tagged Value.
<b>TagID</b>	<i>Long</i>	Read only A unique ID for this Tagged Value.
<b>Value</b>	<i>String</i>	Read/Write The value assigned to this tag. This field has a 255 character limit. If the value is greater than 255 characters long, set the value to "<memo>" and insert the body of text in the <b>Notes</b> attribute (above). When reading existing Tagged Values, if <b>Value</b> = "<memo>" then the developer should read the actual body of text from the <b>Notes</b> attribute.

**MethodTag Methods:**

Method	Type	Notes
<b>GetAttribute</b> (string propName)	<i>String</i>	Returns the text of a single named property within a structured tagged value.
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>HasAttributes()</b>	<i>Boolean</i>	Returns true if the tagged values is a structured tagged value with one or more properties.
<b>SetAttribute</b> (string propName, string propValue)	<i>Boolean</i>	Sets the text of a single named property within a structured tagged value.
<b>Update ()</b>	<i>Boolean</i>	Updates the current <i>MethodTag</i> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**20.2.2.6.9 Parameter Class**

A **Parameter** object represents a method argument and is accessed through the **Method Parameters** collection.

**Associated table in .EAP file** *t\_operationparams*

**Parameter Attributes**

Attribute	Type	Notes
<b>Alias</b>	<i>String</i>	Read/Write An optional alias for this parameter.
<b>ClassifierID</b>	<i>String</i>	Read/Write A ClassifierID for the parameter, if known.
<b>Default</b>	<i>String</i>	Read/Write A default value for this parameter.

Attribute	Type	Notes
<b>IsConst</b>	<i>Boolean</i>	Read/Write A flag indicating that the parameter is <i>Const</i> (cannot be altered).
<b>Kind</b>	<i>String</i>	Read/Write The parameter kind - <b>in</b> , <b>inout</b> , <b>out</b> , or <b>return</b> .
<b>Name</b>	<i>String</i>	Read/Write The parameter name; this must be unique for a single method.
<b>Notes</b>	<i>String</i>	Read/Write Descriptive notes.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>28221</small>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>OperationID</b>	<i>Long</i>	Read only The ID of the method associated with this parameter.
<b>ParameterGUID</b>	<i>String</i>	Read/Write A system generated, globally unique ID for the current Parameter.
<b>Position</b>	<i>Long</i>	Read/Write The position of the parameter in the argument list.
<b>Stereotype</b>	<i>String</i>	Read/Write The first stereotype of the parameter.
<b>StereotypeEx</b>	<i>String</i>	Read/Write All the applied stereotypes of the parameter in a comma-separated list.
<b>Style</b>	<i>String</i>	Read/Write Some style information.
<b>StyleEx</b>	<i>String</i>	Read/Write

Attribute	Type	Notes
		Advanced style settings, reserved for the use of Sparx Systems.
<b>TaggedValues</b>	<a href="#">Collection</a> of type <a href="#">ParamTag</a>	Read/Write The GUID of the parameter with which this <i>ParamTag</i> is associated.
<b>Type</b>	<i>Variant</i>	Read/Write The parameter type; can be a primitive type or a defined classifier.

#### Parameter Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current Parameter object after modifying or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.6.10 ParamTag Class

A **ParamTag** is a Tagged Value associated with a method parameter.

Associated table in .EAP file    *t\_taggedvalue*

#### ParamTag Attributes

Attribute	Type	Notes
<b>ElementGUID</b>	<i>String</i>	Read/Write The GUID of the parameter with which this <i>ParamTag</i> is associated.
<b>FQName</b>	<i>String</i>	Read only The fully qualified name of the tag.
<b>ObjectType</b>	<a href="#">Object Type</a>	Read only Distinguishes objects referenced through a Dispatch interface.

Attribute	Type	Notes
<b>PropertyGUID</b>	<i>String</i>	Read/Write A system generated GUID to identify the Tagged Value.
<b>Tag</b>	<i>String</i>	Read/Write The actual tag name.
<b>Value</b>	<i>String</i>	Read/Write The value associated with this tag.

#### ParamTag Methods

Method	Type	Notes
<b>GetAttribute( string propName)</b>	<i>String</i>	Returns the text of a single named property within a structured tagged value.
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>HasAttributes()</b>	<i>Boolean</i>	Returns true if the tagged values is a structured tagged value with one or more properties.
<b>SetAttribute( string propName, string propValue)</b>	<i>Boolean</i>	Sets the text of a single named property within a structured tagged value.
<b>Update ()</b>	<i>Boolean</i>	Updates the current ParamTag object after modifying or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.6.11 Partitions Collection

A collection of internal element partitions (regions). This is commonly seen in Activity, State, Boundary, Diagram Frame and similar elements. Not all elements support partitions.

This collection contains a set of *Partition* elements. The set is read/write: information is not saved until the host element is saved, so ensure that you call the *Element.Save* method after making changes to a Partition.

**Partition Attributes**

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write The partition name; this can represent a condition or constraint in some cases.
<b>Note</b>	<i>String</i>	Read/Write A free text note associated with this partition.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Operator</b>	<i>String</i>	Read/Write An optional operator value that specifies the partition type.
<b>Size</b>	<i>String</i>	Read/Write The vertical or horizontal width of the partition in pixels.

**Learn more**

- [Activity](#) [1279]
- [State](#) [1329]
- [Boundary](#) [1997]
- [Diagram Frame](#) [1296]

**20.2.2.6.12 Properties Class****Properties****Properties Attributes**

Attribute	Type	Notes
<b>Count</b>	<i>Long</i>	The number of properties that are available for this object.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.

**Properties Methods**

Method	Type	Notes
<b>Item (object Index)</b>	<i>Property</i>	<p>Returns a property either by name or by a zero-based integer offset into the list of properties.</p> <p>Parameter:</p> <ul style="list-style-type: none"> <li>Index: Variant - either a string representing the property name or an integer representing the zero-based offset into the property list</li> </ul>

**Property****Property Attributes**

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	<p>Read only</p> <p>The name of the property.</p> <p>The object to which the properties list applies can have an automation property with the same name, in which case the data accessed through <b>Value</b> is identical to that obtained through the automation property.</p>
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	<p>Read only</p> <p>Distinguishes objects referenced through a Dispatch interface.</p>
<b>Type</b>	<a href="#">PropType</a> [2823]	<p>Read only</p> <p>Provides an indication of what sort of data is going to be stored by this property. This restriction can be further defined by the <i>Validation</i> attribute.</p>
<b>Validation</b>	<i>String</i>	<p>Read only</p> <p>An optional string that is used to validate any data that is passed to the <i>Value</i> attribute. This string is used by the programmer at run time to provide an indication of what is expected, and by Enterprise Architect to ensure that the submitted data is appropriate.</p>
<b>Value</b>	<i>Variant</i>	<p>Read/write</p> <p>The value of the property as defined in the other fields.</p>

### 20.2.2.6.13 TemplateParameter Class

A **TemplateParameter** for a template signature specifies a formal parameter that will be substituted by an actual parameter (or the default) in a TemplateBinding relationship on a Class element.

**Associated table in .EAP file** *t\_xref*

#### TemplateParameter Attributes

Attribute	Type	Notes
<b>Constraint</b>	<i>String</i>	Read/Write The name of the Classifier that acts as the constraint value.
<b>Default</b>	<i>String</i>	Read/Write The name of the Classifier that acts as the default value.
<b>Name</b>	<i>String</i>	Read/Write The name of the Template Parameter.
<b>ObjectType</b>	<a href="#">Object Type</a> 	Read Only Distinguishes objects referenced through a Dispatch interface.
<b>TemplateParameterID</b>	<i>String</i>	Read Only The Enterprise Architect Globally Unique ID (GUID) of the current Template Parameter, in the <b>XrefID</b> column of <i>t_xref</i> .
<b>Type</b>	<i>String</i>	Read/Write The Template Parameter type.

#### TemplateParameter Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Updates the current TemplateParameter object after modifying or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**20.2.2.6.14 Transitions Collection**

The Transitions collection applies only to *Timeline elements*.

A Timeline element displays **0** or more state transitions at set times on its extent. This collection enables you to access the transition set. You can also access additional information by referring to the connectors associated with the Timeline, and by referencing messages passed between timelines. Note that any changes made to elements in this collection are only saved when the main element is saved.

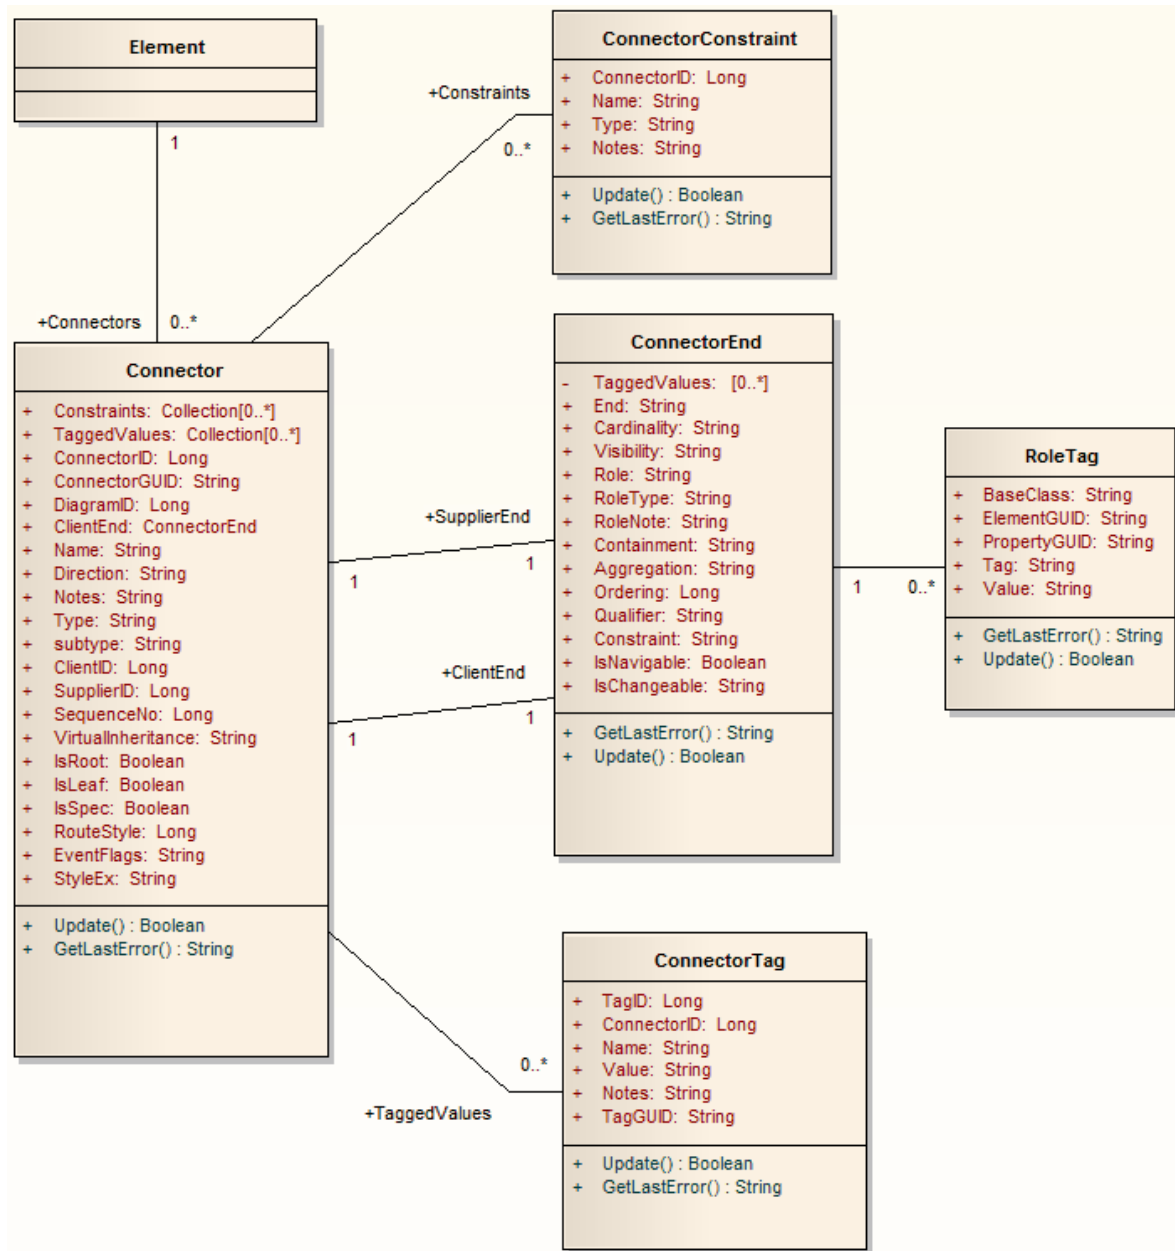

Transition Attributes

Attribute	Type	Notes
<b>DurationConstraint</b>	<i>String</i>	Read/Write A constraint on the time duration of the transition.
<b>Event</b>	<i>String</i>	Read/Write The event (optional) that initiated the transition.
<b>Note</b>	<i>String</i>	Read/Write A free text note.
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.
<b>TimeConstraint</b>	<i>String</i>	Read/Write A constraint on when the transition has to be completed.
<b>TxState</b>	<i>String</i>	Read/Writ The state to transition to, as defined in the Timeline Properties dialog.
<b>TxTime</b>	<i>String</i>	Read/Write. The time that the transition occurs. The value depends on a range set in the diagram.

### 20.2.2.7 Connector Package

The **Connector** Package details how connectors between elements are accessed and managed.

#### Example

#### 20.2.2.7.1 Connector Class

To represent the various kinds of connectors between UML elements, you use a **Connector** object. You can access this from either the **Client** or **Supplier** element, using the **Connectors** collection of that element. When creating a new connector you assign to it a valid type from the following list:

- Aggregation
- Assembly
- Association

- Collaboration
- CommunicationPath
- Connector
- ControlFlow
- Delegate
- Dependency
- Deployment
- ERLink
- Generalization
- InformationFlow
- Instantiation
- InterruptFlow
- Manifest
- Nesting
- NoteLink
- ObjectFlow
- Package
- Realization
- Sequence
- StateFlow
- TemplateBinding
- UseCase

**Associated table in .EAP file** *t\_connector*

#### **Connector Attributes**

Attribute	Type	Notes	See also
<b>Alias</b>	<i>String</i>	Read/Write An optional alias for this connector.	
<b>ClientEnd</b>	<i>ConnectorEnd</i>	Read only A pointer to the <i>ConnectorEnd</i> object representing the source end of the relationship.	<a href="#">ConnectorEnd Class</a> <sup>[2946]</sup>
<b>ClientID</b>	<i>Long</i>	Read/Write The <i>ElementID</i> of the element at the source end of this connector.	
<b>Color</b>	<i>Long</i>	Read/Write	

Attribute	Type	Notes	See also
		Sets the color of the connector.	
<b>ConnectorGUID</b>	<i>Variant</i>	Read only A system generated, globally unique ID for the current connector.	
<b>ConnectorID</b>	<i>Long</i>	Read only A system generated local identifier for the current connector.	
<b>Constraints</b>	<i>Collection</i>	Read only A collection of <b>constraint</b> objects.	<a href="#">Constraint Class</a> <sup>[2879]</sup> <a href="#">Collection Class</a> <sup>[2829]</sup>
<b>ConveyedItems</b>	<i>Collection</i>	Read only Returns a collection of elements that have been conveyed.  To add another element to the conveyed Collection, use <i>AddNew (ElementGUID,NULL)</i> ; where <i>ElementGUID</i> is the GUID of the element to be added.	<a href="#">Collection Class</a> <sup>[2829]</sup>
<b>CustomProperties</b>	<i>Collection</i>	Read only Returns a collection of advanced properties associated with an element in the form of <b>CustomProperty</b> objects.	<a href="#">Collection Class</a> <sup>[2829]</sup> <a href="#">CustomProperties Collection</a> <sup>[2918]</sup>
<b>DiagramID</b>	<i>Long</i>	Read/Write The <i>DiagramID</i> of the connector.	
<b>Direction</b>	<i>String</i>	Read/Write  The connector direction, which can be set to one of the following: <ul style="list-style-type: none"> <li>• <b>Unspecified</b></li> <li>• <b>Bi-Directional</b></li> <li>• <b>Source -&gt; Destination</b></li> <li>• <b>Destination -&gt; Source</b></li> </ul> If the connector is non-navigable, set the <b>sourceNavigability</b> and/or <b>targetNavigability</b> attributes.	<a href="#">Special Attributes</a> <sup>[1503]</sup>
<b>EndPointX</b>	<i>Long</i>	Read/Write	

Attribute	Type	Notes	See also
		The x-coordinate of the connector's end point. Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen.	
<b>EndPointY</b>	<i>Long</i>	Read/Write The y-coordinate of the connector's end point. Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen.	
<b>EventFlags</b>	<i>String</i>	Read/Write A structure to hold a variety of flags concerned with event signaling on messages.	
<b>IsLeaf</b>	<i>Boolean</i>	Read/Write A flag indicating that the connector is a <i>leaf</i> .	
<b>IsRoot</b>	<i>Boolean</i>	Read/Write A flag indicating that the connector is a <i>root</i> .	
<b>IsSpec</b>	<i>Boolean</i>	Read/Write. A flag indicating that the connector is a specification.	
<b>MetaType</b>	<i>String</i>	Read only The connector's domain-specific meta type, as defined by an applied stereotype from an MDG Technology	
<b>MiscData</b>	<i>String</i>	Read only This low-level property returns an array providing information about the contents of the <b>PData</b> x fields; these database fields are not documented and developers must gain understanding of these fields through their own endeavors to use this property. <b>MiscData</b> is zero based, therefore: <ul style="list-style-type: none"> <li>• <b>MiscData(0)</b> corresponds to <b>PData1</b></li> <li>• <b>MiscData(1)</b> corresponds to <b>PData2</b>, and so on</li> </ul>	
<b>Name</b>	<i>String</i>	Read/Write The connector name.	

Attribute	Type	Notes	See also
<b>Notes</b>	<i>String</i>	Read/Write Descriptive notes about the connector.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> <sup>[2822]</sup>
<b>Properties</b>	<i>Properties</i>	Returns a list of specialized properties applicable to the connector that might not be available using the automation model.  The properties are purposely undocumented because of their obscure nature and because they are subject to change as progressive enhancements are made to them.	<a href="#">Properties Class</a> <sup>[2925]</sup>
<b>RouteStyle</b>	<i>Long</i>	Read/Write The route style.	
<b>SequenceNo</b>	<i>Long</i>	Read/Write The <i>SequenceNo</i> of the connector.	
<b>StartPointX</b>	<i>Long</i>	Read/Write The x-coordinate of the connector's start point. Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen.	
<b>StartPointY</b>	<i>Long</i>	Read/Write The y-coordinate of the connector's start point. Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen.	
<b>StateFlags</b>	<i>String</i>	Read/Write A structure to hold a variety of flags concerned with State signaling on messages; the list is delimited by semi-colons.	
<b>Stereotype</b>	<i>String</i>	Read/Write Sets or gets the stereotype for this connector end.	

Attribute	Type	Notes	See also
<b>StereotypeEx</b>	<i>String</i>	Read/Write All the applied stereotypes of the connector in a comma-separated list.	
<b>StyleEx</b>	<i>String</i>	Read/Write Advanced style settings; reserved for the use of Sparx Systems.	
<b>Subtype</b>	<i>String</i>	Read/Write A possible subtype to refine the meaning of the connector.	
<b>SupplierEnd</b>	<i>ConnectorEnd</i>	Read only A pointer to the <i>ConnectorEnd</i> object representing the target end of the relationship.	<a href="#">ConnectorEnd Class</a> <small>[2940]</small>
<b>SupplierID</b>	<i>Long</i>	Read/Write The <i>ElementID</i> of the element at the target end of this connector.	
<b>TaggedValues</b>	<i>Collection of type ConnectorTag</i>	Read only The collection of <i>ConnectorTag</i> objects.	<a href="#">Collection Class</a> <small>[2829]</small> <a href="#">ConnectorTag Class</a> <small>[2943]</small>
<b>TemplateBindings</b>	<i>Collection of type TemplateBinding</i>	Read only A collection of <i>TemplateBinding</i> objects.	<a href="#">Collection Class</a> <small>[2829]</small> <a href="#">TemplateBinding Class</a> <small>[2946]</small>
<b>TransitionAction</b>	<i>String</i>	Read/Write See the <i>Transition</i> topic for appropriate values.	<a href="#">Transition</a> <small>[1446]</small>
<b>TransitionEvent</b>	<i>String</i>	Read/Write See the <i>Transition</i> topic for appropriate values.	
<b>TransitionGuard</b>	<i>String</i>	Read/Write See the <i>Transition</i> topic for appropriate values.	

Attribute	Type	Notes	See also
<b>Type</b>	<i>String</i>	Read/Write The connector type; valid types are held in the <i>t_connectortypes</i> table in the .EAP file.	
<b>VirtualInheritance</b>	<i>String</i>	Read/Write For <i>Generalization</i> , indicates if the inheritance is virtual.	
<b>Width</b>	<i>Long</i>	Read/Write Specifies the width of the connector.	

#### Connector Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ConnectorObject</i> after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### **20.2.2.7.2 ConnectorConstraint Class**

A **ConnectorConstraint** holds information about special conditions that apply to a connector. It is accessed through the Connector **Constraints** collection.

Associated table in .EAP file *t\_connectorconstraints*

#### ConnectorConstraint Attributes

Attribute	Type	Notes	See also
<b>ConnectorID</b>	<i>Long</i>	Read/Write A local ID value (long) - system generated.	
<b>Name</b>	<i>String</i>	Read/Write The constraint name.	

Attribute	Type	Notes	See also
<b>Notes</b>	<i>String</i>	Read/Write Notes about this constraint.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> [2822]
<b>Type</b>	<i>String</i>	Read/Write The constraint type.	

#### ConnectorConstraint Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ConnectorConstraint</i> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.7.3 *ConnectorEnd Class*

A **ConnectorEnd** contains information about a single end of a connector. A **ConnectorEnd** is accessed from the connector as either the **ClientEnd** or **SupplierEnd**.

Associated table in .EAP file    *derived from t\_connector*

#### ConnectorEnd Attributes

Attribute	Type	Notes	See also
<b>Aggregation</b>	<i>Long</i>	Read/Write The type of Aggregation as it applies to this end; valid values are:  <b>0</b> = None <b>1</b> = Shared <b>2</b> = Composite	
<b>Alias</b>	<i>String</i>	Read/Write An optional alias for this connector end.	

Attribute	Type	Notes	See also
<b>AllowDuplicates</b>	<i>Boolean</i>	Read/Write For multiplicities greater than <b>1</b> , indicates that duplicate entries are possible.	
<b>Cardinality</b>	<i>String</i>	Read/Write The cardinality associated with this end.	
<b>Constraint</b>	<i>String</i>	Read/Write A constraint that can be applied to this connector end.	
<b>Containment</b>	<i>String</i>	Read/Write The containment type applied to this connector end.	
<b>Derived</b>	<i>Boolean</i>	Read/Write Indicates that the value of this end is derived.	
<b>DerivedUnion</b>	<i>Boolean</i>	Read/Write Indicates the value of this role derived from the union of all roles that subset this.	
<b>End</b>	<i>String</i>	Read only The end this <i>ConnectorEnd</i> object applies to - <b>Client</b> or <b>Supplier</b> .	
<b>IsChangeable</b>	<i>String</i>	Read/Write Flag indicating whether this end is changeable or not - <b>frozen</b> , <b>addOnly</b> or <b>none</b> .	
<b>IsNavigable</b>	<i>Boolean</i>	Read/Write A flag indicating this end is navigable from the other end.	
<b>Navigable</b>	<i>String</i>	Read/Write Indicates whether this role of an association is navigable from the opposite classifier - <b>Navigable</b> , <b>Non-Navigable</b> or <b>Unspecified</b> .	
<b>ObjectType</b>	<i>ObjectTy</i>	Read only	<a href="#">ObjectType</a>

Attribute	Type	Notes	See also
	<i>pe</i>	Distinguishes objects referenced through a Dispatch interface.	<a href="#">[2822]</a>
<b>Ordering</b>	<i>Long</i>	Read/Write Ordering for this connector end.	
<b>OwnedByClassifier</b>	<i>Boolean</i>	Read/Write Indicates that this Association end corresponds to an attribute on the opposite end of the Association.	
<b>Qualifier</b>	<i>String</i>	Read/Write A qualifier that can apply to the connector end.	
<b>Role</b>	<i>String</i>	Read/Write The connector end role.	
<b>RoleNote</b>	<i>String</i>	Read/Write Notes associated with the role of this connector end.	
<b>RoleType</b>	<i>String</i>	Read/Write The role type applied to this end of the connector.	
<b>Stereotype</b>	<i>String</i>	Read/Write Sets or gets the stereotype for this connector end.	
<b>StereotypeEx</b>	<i>String</i>	Read/Write All the applied stereotypes of the connector end in a comma-separated list.	
<b>TaggedValues</b>	<i>Private</i>	Read only A collection of <i>RoleTag</i> objects.	<a href="#">RoleTag Class</a> <a href="#">[2944]</a>
<b>Visibility</b>	<i>String</i>	Read/Write The Scope associated with this connector end - <b>Public</b> , <b>Private</b> , <b>Protected</b> or <b>Package</b> .	

#### ConnectorEnd Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ConnectorEnd</i> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.7.4 ConnectorTag Class

A **ConnectorTag** is a Tagged Value for a connector and is accessed through the Connector **TaggedValues** collection.

Associated table in .EAP file *t\_connectortag*

#### ConnectorTag Attributes

Attribute	Type	Notes	See also
<b>ConnectorID</b>	<i>Long</i>	Read/Write The local ID of the associated connector.	
<b>FQName</b>	<i>String</i>	Read only The fully qualified name of the tag.	
<b>Name</b>	<i>String</i>	Read/Write The tag or name.	
<b>Notes</b>	<i>String</i>	Read/Write Further descriptive notes on this tag.  If <b>Value</b> (below) is set to "<memo>", then <b>Notes</b> should contain the actual Tagged Value content.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> e <sub>[2822]</sub>
<b>TagGUID</b>	<i>String</i>	Read/Write A globally unique ID for this Tagged Value.	
<b>TagID</b>	<i>Long</i>	Read only	

Attribute	Type	Notes	See also
		A local ID to identify the Tagged Value.	
<b>Value</b>	<i>String</i>	<p>Read/Write</p> <p>The value assigned to this tag.</p> <p>This field has a 255 character limit. If the value is greater than 255 characters long, set the value to "&lt;memo&gt;" and insert the body of text in the <b>Notes</b> attribute (above).</p> <p>When reading existing Tagged Values, if <b>Value</b> = "&lt;memo&gt;" then the developer should read the actual body of text from the <b>Notes</b> attribute.</p>	

#### ConnectorTag Methods

Method	Type	Notes
<b>GetAttribute ( string propName)</b>	<i>String</i>	Returns the text of a single named property within a Structured Tagged Value.
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>HasAttributes ()</b>	<i>Boolean</i>	Returns true if the Tagged Value is a Structured Tagged Value with one or more properties.
<b>SetAttribute ( string propName, string propValue)</b>	<i>Boolean</i>	Sets the text of a single named property within a Structured Tagged Value.
<b>Update ()</b>	<i>Boolean</i>	<p>Update the current <i>ConnectorTag</i> object after modification or appending a new item.</p> <p>If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.</p>

#### 20.2.2.7.5 RoleTag Class

The **RoleTag** interface provides access to an Association's Role Tagged Values. Each connector end has a RoleTag collection that can be accessed to add, delete and access the RoleTags.

You might use this in creating code that resembles this fragment for accessing a RoleTag in VB.NET (where *con* is a Connector Object):

```
client = con.ClientEnd
```

```

client.Role = "m_client"
client.Update()
tag = client.TaggedValues.AddNew("tag", "value")
tag.Update()
tag = client.TaggedValues.AddNew("tag2", "value2")
tag.Update()
client.TaggedValues.Refresh()
For idx = 0 To client.TaggedValues.Count - 1
    tag = client.TaggedValues.GetAt(idx)
    Console.WriteLine(tag.Tag)
    client.TaggedValues.DeleteAt(idx, False)
Next
tag = Nothing

```

Associated table in .EAP file    *t\_taggedvalue*

### RoleTag Attributes

Attribute	Type	Notes	See also
<b>BaseClass</b>	<i>String</i>	Read/Write Indicates the role end; set to <b>ASSOCIATION_SOURCE</b> or <b>ASSOCIATION_TARGET</b> .	
<b>ElementGUID</b>	<i>String</i>	Read/Write The GUID of the connector with which this role tag is associated.	
<b>FQName</b>	<i>String</i>	Read only The fully qualified name of the tag.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> e <sub>2822</sub>
<b>PropertyGUID</b>	<i>String</i>	Read/Write A system generated GUID to identify the Tagged Value.	
<b>Tag</b>	<i>String</i>	Read/Write The actual tag name.	
<b>Value</b>	<i>String</i>	Read/Write The value associated with this tag.	

### RoleTag Methods

Method	Type	Notes
<b>GetAttribute (string propName)</b>	<i>String</i>	Returns the text of a single named property within a Structured Tagged Value.
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>HasAttributes ()</b>	<i>Boolean</i>	Returns true if the Tagged Value is a Structured Tagged Value with one or more properties.
<b>SetAttribute (string propName, string propValue)</b>	<i>Boolean</i>	Sets the text of a single named property within a Structured Tagged Value.
<b>Update ()</b>	<i>Boolean</i>	Update the RoleTag after changes or on initial creation.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 20.2.2.7.6 TemplateBinding Class

A **TemplateBinding** defines the connector between a binding Class and a parameterized Class, and the binding expression on that connector.

##### TemplateBinding Attributes

Attribute	Type	Notes	See also
<b>ActualGUID</b>	<i>String</i>	Read/Write  The GUID of the element classifier set as the <i>Actual</i> Template Binding parameter.  If the <i>Actual</i> Template Binding parameter is set as a string expression only, this will be an empty string.  Assigning a GUID value will automatically change the <b>ActualName</b> attribute after <b>Update()</b> has been called.	
<b>ActualName</b>	<i>String</i>	Read/Write  The name of the <i>Actual</i> Template Binding parameter.  Assigning a new value will clear any current <b>ActualGUID</b> value.	
<b>BindingExpression</b>	<i>String</i>	Read only  The Binding Expression as shown in Enterprise Architect.	

Attribute	Type	Notes	See also
<b>ConnectorGUID</b>	<i>String</i>	Read only The Globally Unique ID of the associated connector.	
<b>ConnectorType</b>	<i>String</i>	Read only The type of the associated connector.	
<b>FormalName</b>	<i>String</i>	Read/Write The name of the <i>Formal</i> Template Binding parameter.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch Interface.	<a href="#">ObjectType</a> [2822]
<b>Pos</b>	<i>String</i>	Read only The position of the Template Binding in the list (as on the Bindings page of the connector Properties dialog).	
<b>TemplateBindingID</b>	<i>String</i>	Read only The Globally Unique ID of the current Template Binding.	

#### TemplateBinding Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>Update ()</b>	<i>Boolean</i>	Update the current <b>TemplateBinding</b> object after modification or appending a new item.  If <b>false</b> is returned, check the <b>GetLastError</b> function for more information.

### 20.2.2.8 Diagram Package

The *Diagram* package has information on a diagram and on *DiagramObject* and *DiagramLink*, which are the instances of elements within a diagram.

#### Example

#### 20.2.2.8.1 Diagram Class

A **Diagram** corresponds to a single UML diagram. It is accessed through the **Package Diagrams** collection and in turn contains a collection of diagram objects and diagram connectors. Adding to the *DiagramObject* Class adds an existing element to the diagram. When adding a new diagram, you must set the diagram type to one of the valid types:

- Activity
- Analysis
- Component
- Custom
- Deployment
- Logical
- Sequence
- Statechart
- Use Case

For a Collaboration (Communication) diagram, use the Analysis type.

**Associated table in .EAP file** `t_diagram`

#### Diagram Attributes

Attribute	Type	Notes	See also
<b>Author</b>	<i>String</i>	Read/Write The name of the author.	
<b>CreatedDate</b>	<i>Date</i>	Read/Write The date the diagram was created.	
<b>cx</b>	<i>Long</i>	Read/Write The X dimension of the diagram (the default is <b>800</b> ).	
<b>cy</b>	<i>Long</i>	Read/Write The Y dimension of the diagram (the default is <b>1100</b> ).	
<b>DiagramGUID</b>	<i>Variant</i>	Read/Write A globally unique ID for this diagram.	
<b>DiagramID</b>	<i>Long</i>	Read only A local ID for the diagram.	
<b>DiagramLinks</b>	<a href="#">Collection</a> <small>[2829]</small>	Read only A list of <b>DiagramLink</b> objects, each containing information about the display characteristics of a connector in a diagram.	<a href="#">DiagramLink Class</a> <small>[2955]</small>

Attribute	Type	Notes	See also
<b>DiagramObjects</b>	<a href="#">Collection</a> <small>[2828]</small>	Read only  A collection of references to <b>DiagramObjects</b> . A <i>DiagramObject</i> is an instance of an element in a diagram, and includes size and display characteristics.	<a href="#">DiagramObject Class</a> <small>[2956]</small>
<b>ExtendedStyle</b>	<i>String</i>	Read/Write  An extended style attribute.	
<b>HighlightImports</b>	<i>Boolean</i>	Read/Write  A flag to indicate that elements from other packages should be highlighted. Corresponds with the 'Show Namespace' option in the diagram properties dialog.	<a href="#">Configure Diagram Display</a> <small>[825]</small>
<b>IsLocked</b>	<i>Boolean</i>	Read/Write  A flag indicating whether this diagram is locked or not.	
<b>MetaType</b>	<i>String</i>	Read only  The diagram's domain-specific meta type, as defined by an MDG Technology.	
<b>ModifiedDate</b>	<i>Variant</i>	Read/Write  The date the diagram was last modified.	
<b>Name</b>	<i>String</i>	Read/Write  The diagram name.	
<b>Notes</b>	<i>String</i>	Read/Write  Set or retrieve notes for this diagram.	
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only  Distinguishes objects referenced through a Dispatch interface.	
<b>Orientation</b>	<i>String</i>	Read/Write  The page orientation: <b>P</b> for Portrait or <b>L</b> for Landscape.	
<b>PackageID</b>	<i>Long</i>	Read/Write	

Attribute	Type	Notes	See also
		The ID of the Package that this diagram belongs to.	
<b>PageHeight</b>	<i>Long</i>	Read The number of pages high the diagram is.	
<b>PageWidth</b>	<i>Long</i>	Read The number of pages wide the diagram is.	
<b>ParentID</b>	<i>Long</i>	Read/Write The optional ID of an element that 'owns' this diagram; for example, a Sequence diagram owned by a Use Case.	
<b>Scale</b>	<i>Long</i>	Read/Write The zoom scale (the default is <b>100</b> ).	
<b>SelectedConnector</b>	<a href="#">Connector</a> [2933]	Read/Write The currently selected connector on this diagram. Null if there is no currently selected diagram.	
<b>SelectedObjects</b>	<a href="#">Collection</a> [2829]	Read only Gets a collection representing the currently selected elements on the diagram.  You can remove objects from this collection to deselect them, and add elements to the collection by passing the Object ID as a name to select them.	
<b>ShowDetails</b>	<i>Long</i>	Read/Write A flag to indicate that the Diagram Details text should be shown: <b>1</b> = Show, <b>0</b> = Hide.	
<b>ShowPackageContents</b>	<i>Boolean</i>	Read/Write A flag to indicate that the package contents should be shown in the current diagram.	
<b>ShowPrivate</b>	<i>Boolean</i>	Read/Write A flag to show or hide Private features.	
<b>ShowProtected</b>	<i>Boolean</i>	Read/Write	

Attribute	Type	Notes	See also
		A flag to show or hide Protected features.	
<b>ShowPublic</b>	<i>Boolean</i>	Read/Write A flag to show or hide Public features.	
<b>Stereotype</b>	<i>String</i>	Read/Write Sets or gets the stereotype for this diagram.	
<b>StyleEx</b>	<i>String</i>	Read/Write Advanced style settings, reserved for the use of Sparx Systems.	
<b>Swimlanes</b>	<i>String</i>	Read/Write Information on swimlanes contained in the diagram. Please note that this property is superseded by <b>SwimlaneDef</b> .	<a href="#">SwimlaneDef Class</a> <small>[2958]</small>
<b>SwimlaneDef</b>	<a href="#">SwimlaneDef</a> <small>[2958]</small>	Read/Write Information on swimlanes contained in the diagram.	
<b>Type</b>	<i>String</i>	Read only The diagram type; see the <i>t_diagramtypes</i> table in the .EAP file for more information.	
<b>Version</b>	<i>String</i>	Read/Write The version of the diagram.	

#### Diagram Methods

Method	Type	Notes	See also
<b>ApplyGroupLock (string aGroupName)</b>	<i>Boolean</i>	Applies a group lock to this diagram object, for the specified group, on behalf of the current user.  Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError()</b> to retrieve error information.  Parameter:	

Method	Type	Notes	See also
		<ul style="list-style-type: none"> <li>aGroupName: String - the name of the user group for which to set the group lock</li> </ul>	
<b>ApplyUserLock ()</b>	<i>Boolean</i>	<p>Applies a user lock to this diagram object, for the current user.</p> <p>Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError()</b> to retrieve error information.</p>	
<b>GetDiagramObject ByID ( long ID, string DUID)</b>	<i>DiagramObject</i>	<p>Returns the DiagramObject object, if it exists on the diagram.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ID: Long - the ElementID of the diagram object</li> <li>DUID: String - the optional Diagram Unique ID of the diagram object.</li> </ul>	<a href="#">DiagramObject Class</a> [2956]
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.	
<b>ReadStyle ( string StyleName)</b>	<i>String</i>	<p>Returns the current value of the named diagram style.</p> <p>Use <b>GetLastError()</b> to retrieve error information.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>StyleName: String - the name of the diagram style whose value is to be retrieved; valid StyleNames are: <ul style="list-style-type: none"> <li>Show Element Property String</li> <li>Show Connector Property String</li> <li>Show Feature Property String</li> </ul> </li> </ul>	
<b>ReleaseUserLock ()</b>	<i>Boolean</i>	<p>Releases a group lock or user lock on this diagram object.</p> <p>Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful. Use <b>GetLastError()</b> to retrieve error information.</p>	
<b>ReorderMessages ()</b>	<i>Void</i>	<p>Resets the display order of Sequence and Collaboration messages.</p> <p>This is typically used after inserting or deleting messages in the diagram.</p>	
<b>SaveAsPDF ( string FileName)</b>	<i>Boolean</i>	<p>Export the diagram to a PDF document. Returns <b>true</b> on success.</p> <p>Parameters:</p>	

Method	Type	Notes	See also
		<ul style="list-style-type: none"> <li>FileName: String - full path to file location</li> </ul>	
<b>SaveImagePage (longx, longy, longSizeX, long sizeY, string filename, long flags)</b>	<i>Boolean</i>	<p>Saves a page of the diagram to disk.</p> <p>Returns <b>true</b> if the operation is successful; returns <b>false</b> if the operation is unsuccessful.</p> <p>Use <b>GetLastError()</b> to retrieve error information.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>x: Long - the horizontal page</li> <li>y: Long - the vertical page</li> <li>sizeX: Long - the page width to use</li> <li>sizeY: Long - the page height to use</li> <li>filename: String - the filename to save the image to.</li> <li>flags: Long - options</li> </ul> <p>The image type is determined by the extension of the filename. Currently only .EMF, .BMP and .PNG formats are supported.</p>	
<b>ShowAsElementList (bool ShowAsList, bool Persist)</b>	<i>Boolean</i>	<p>Toggles the diagram display between diagram format and Diagram List depending on the value of <i>ShowAsList</i>.</p> <p>If <i>Persist</i> is set, the display format is written to the database so the diagram always opens in that format (diagram or list). Otherwise, the display format falls back to the default (diagram) once the display is closed.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ShowAsList: Boolean - indicates diagram or Diagram List</li> <li>Persist: Boolean - indicates set (maintain <i>ShowAsList</i> value) or not (revert to default)</li> </ul>	<a href="#">Diagram List</a> <sup>[684]</sup>
<b>Update ()</b>	<i>Boolean</i>	<p>Updates this diagram object after modification or appending a new item.</p> <p>If <b>false</b> is returned, use <b>GetLastError()</b> to retrieve error information.</p>	
<b>WriteStyle (string StyleName, string StyleValue)</b>	<i>Void</i>	<p>Sets the value of the named diagram style.</p> <p>Use <b>GetLastError()</b> to retrieve error information.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>StyleName: String - the name of the diagram style whose value is to be retrieved; valid StyleNames are:</li> </ul>	

Method	Type	Notes	See also
		<ul style="list-style-type: none"> <li>• Show Element Property String</li> <li>• Show Connector Property String</li> <li>• Show Feature Property String</li> <li>• StyleValue: String - the value to be set in the named diagram style; valid values for the StyleNames listed above are <b>0</b> and <b>1</b>.</li> </ul>	

#### 20.2.2.8.2 DiagramLinks Class

A *DiagramLink* is an object that holds display information about a connector between two elements in a specific diagram. It includes, for example, the custom points and display appearance. It can be accessed from the Diagram **DiagramLinks** collection.

**Associated table in .EAP file:** *t\_diagramlinks*

#### DiagramLinks Attributes:

Attribute	Type	Notes
<b>ConnectorID</b>	<i>Long</i>	Read/Write The ID of the associated connector.
<b>DiagramID</b>	<i>Long</i>	Read/Write The local ID for the associated diagram.
<b>Geometry</b>	<i>String</i>	Read/Write The geometry associated with the current connector in this diagram.
<b>InstanceID</b>	<i>Long</i>	Read only The connector identifier for the current model.
<b>IsHidden</b>	<i>Boolean</i>	Read/Write A flag to indicate if this item is hidden or not.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Path</b>	<i>String</i>	Read/Write

Attribute	Type	Notes
		The path of the connector in this diagram.
<b>Style</b>	<i>String</i>	Read/Write Additional style information; for example, color or thickness.

**DiagramLinks Methods:**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>DiagramLink</i> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**Learn more**

- [DiagramLinks](#)  <sup>2949</sup>

**20.2.2.8.3 DiagramObject Class**

The *DiagramObject* Class stores presentation information that indicates what is displayed in a diagram and how it is shown.

**Associated table in .EAP file:** *t\_diagramobjects*

**DiagramObject Attributes:**

Attribute	Type	Notes	See also
<b>Bottom</b>	<i>Long</i>	Read/Write The bottom edge position of the element.	
<b>DiagramID</b>	<i>Long</i>	Read/Write The ID of the associated diagram.	
<b>ElementID</b>	<i>Long</i>	Read/Write	

Attribute	Type	Notes	See also
		The <i>ElementID</i> of the object instance in this diagram.	
<b>InstanceID</b>	<i>Long</i>	Read The attribute that holds the connector identifier for the current model.	
<b>Left</b>	<i>Long</i>	Read/Write The left edge position of the element.	
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <a href="#">e</a> <sup>[2822]</sup>	Read only Distinguishes objects referenced through a Dispatch interface.	
<b>Right</b>	<i>Long</i>	Read/Write The right edge position of the element.	
<b>Sequence</b>	<i>Long</i>	Read/Write The sequence position when loading the object into the diagram (this affects its Z order). The Z-order is one-based and the lowest value is in the foreground.	
<b>Style</b>	<i>Variant</i>	Write only (reading this value gives undefined results) The style information for this object.	<a href="#">Setting the Style</a> <sup>[2958]</sup>
<b>Top</b>	<i>Long</i>	Read/Write The top edge position of the element.	

**DiagramObject Methods**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>Diagram Object</i> after modification or appending a new item

Method	Type	Notes
		If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### Topics

Topic	Detail	See also
<b>Setting The Style</b>	<p>The <i>Style</i> attribute is used for setting the appearance of a DiagramObject; it is set with a string value in the format:</p> <p><code>BCol =n; BFol =n; LCol =n; LWth =n;</code></p> <p>where:</p> <ul style="list-style-type: none"> <li>• <i>BCol</i> = Background Color</li> <li>• <i>BFol</i> = Font Color</li> <li>• <i>LCol</i> = Line Color</li> <li>• <i>LWth</i> = Line Width</li> </ul> <p>The color value is a decimal representation of the hex RGB value, where Red=FF, Green=FF00 and Blue=FF0000</p> <p><code>DiagramObj . #### 20.2.2.8.4 SwimlaneDef Class

A **SwimlaneDef** object makes available attributes relating to a single row or column in a list of swimlanes.

Attribute	Type	Notes
<b>Bold</b>	<i>Boolean</i>	Read/Write Show the title text in bold.

Attribute	Type	Notes
<b>FontColor</b>	<i>Long</i>	Read/Write The RGB color used to draw the titles.
<b>HideClassifier</b>	<i>Boolean</i>	Read/Write Removes any classifier from the title display.
<b>HideNames</b>	<i>Boolean</i>	Read/Write Set to <b>true</b> to hide the swimlane titles.
<b>LineColor</b>	<i>Long</i>	Read/Write The RGB color used to draw swimlane borders.
<b>LineWidth</b>	<i>Long</i>	Read/Write The width, in pixels, of the line used to draw swimlanes. Valid values are <b>1</b> , <b>2</b> or <b>3</b> .
<b>Locked</b>	<i>Boolean</i>	Read/Write If set to <b>true</b> , disables user modification of the swimlanes via the diagram.
<b>ObjectType</b>	<a href="#">ObjectType</a> [2822]	Read only Distinguishes objects referenced through a Dispatch interface.
<b>Orientation</b>	<i>String</i>	Read/Write Indicates whether the swimlanes are vertical or horizontal.
<b>ShowInTitleBar</b>	<i>Boolean</i>	Read/Write Enables vertical swimlane titles to be shown in the title bar.
<b>Swimlanes</b>	<a href="#">Swimlanes</a> [2960]	Read/Write A list of individual swimlanes.

### 20.2.2.8.5 Swimlanes Class

A *Swimlanes* object is attached to a diagram's *SwimlaneDef* object and provides a mechanism to access individual swimlanes.

#### Swimlanes Attributes

Attribute	Type	Notes
<b>Count</b>	<i>Long</i>	Read/Write Gives the number of swimlanes.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[2822]</small>	Read only Distinguishes objects referenced through a Dispatch interface.

#### Swimlanes Methods

Method	Type	Notes
<b>Add (string Title, long Width)</b>	<a href="#">Swimlane</a> <small>[2961]</small>	Adds a new swimlane to the end of the list, and returns a swimlane object representing the newly added entry.  Parameters: <ul style="list-style-type: none"> <li>Title: String - The title text that appears at the top of the swimlane; this can be the same as an existing swimlane title</li> <li>Width: Long - The width of the swimlane in pixels</li> </ul>
<b>Delete (object Index)</b>	<i>Void</i>	Deletes a selected swimlane.  If the string matches more than one entry, only the first entry is deleted.  Parameter: <ul style="list-style-type: none"> <li>Index: Object - Either a string representing the title text or an integer representing the zero-based index of the swimlane to delete</li> </ul>
<b>DeleteAll ()</b>	<i>Void</i>	Removes all swimlanes.
<b>Insert (long Index, string Title, long Width)</b>	<a href="#">Swimlane</a> <small>[2961]</small>	Inserts a swimlane at a specific position, and returns a swimlane object representing the newly added entry.  Parameters: <ul style="list-style-type: none"> <li>Index: Long - The zero-based index of the existing Swimlane before which this new entry is inserted</li> <li>Title: String - The title text which appears at the top of the swimlane; this can be the same as an existing swimlane title</li> <li>Width: Long - The width of the swimlane in pixels</li> </ul>

Method	Type	Notes
<b>Items (object Index)</b>	<a href="#">Swimlane</a> collection	<p>Accesses an individual swimlane.</p> <p>If the string matches more than one swimlane title, the first matching swimlane is returned.</p> <p>Parameter:</p> <ul style="list-style-type: none"> <li>Index: Object - Either a string representing the title text or an integer representing the zero-based index of the swimlane to get</li> </ul>

### 20.2.2.9 Project Interface Package

The *Enterprise Architect.Project* interface. This is the interface to Enterprise Architect elements; it also includes some utility functions. You can get a pointer to this interface using the *Repository*. *GetProjectInterface* method.

#### Example

#### 20.2.2.9.1 Project Class

The Project interface can be accessed from the Repository using *GetProjectInterface()*. The returned interface provides access to the XML-based Enterprise Architect Automation Interface. Use this interface to get XML for the various internal elements and to run some utility functions to perform tasks such as load diagrams or run reports.

#### Project Attributes

Attribute	Type	Notes
<b>ObjectType</b>	<a href="#">Object Type</a> <sup>2822</sup>	Read only Distinguishes objects referenced through a Dispatch interface.

#### Project Methods

Method	Type	Notes	See also
<b>CancelValidation ()</b>	<i>Void</i>	Cancels a validation process.	<a href="#">Model Validation</a> <sup>2594</sup>
<b>CanValidate ()</b>	<i>Boolean</i>	Returns a value to indicate that the Model Validation component is loaded.	

Method	Type	Notes	See also
<b>CreateBaseline (string PackageGUID, string Version, string Notes)</b>	<i>Boolean</i>	Creates a Baseline of a specified package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to Baseline</li> <li>Version: String - the version of the Baseline</li> <li>Notes: String - any notes concerning the Baseline</li> </ul>	
<b>CreateBaselineEx (string PackageGUID, string Version, string Notes, EA.CreateBaselineFlag Flags)</b>	<i>Boolean</i>	Creates a Baseline of a specified package, with a flag to <b>exclude package contents</b> below the first level. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to be Baselined</li> <li>Version: String - the version of the Baseline</li> <li>Notes: String - any notes concerning the Baseline</li> <li>Flags: <i>EA.CreateBaselineFlag</i> - whether or not to exclude the package contents below the first level</li> </ul>	<a href="#">Create Baselines</a> <sup>[462]</sup> <a href="#">EA.CreateBaselineFlag</a> <sup>[2817]</sup>
<b>DefineRule (string CategoryId, EA.EnumMVErrorType ErrorType, string ErrorMessage)</b>	<i>String</i>	Defines the individual rules that can be performed during model validation. It must be called once for each rule from the <i>EA_OnInitializeUserRules</i> broadcast handler. The return value is a <i>RuleId</i> , which can be used for reference purposes when an individual rule is executed by Enterprise Architect during model validation. See the <i>Model Validation Example</i> for a detailed example of the use of this method. Parameters: <ul style="list-style-type: none"> <li>CategoryId: String - should be passed the return value from the <i>DefineRuleCategory</i> method</li> <li>ErrorType: <i>EA.EnumMVErrorType</i> - depending on the severity of the error being validated, can be: <ul style="list-style-type: none"> <li><b>mvErrorCritical</b></li> <li><b>mvError</b></li> <li><b>mvWarning</b>, or</li> </ul> </li> </ul>	<a href="#">EA_OnInitializeUserRules</a> <sup>[3048]</sup> <a href="#">Model Validation Example</a> <sup>[3056]</sup> <a href="#">DefineRuleCategory</a> <sup>[2964]</sup> <a href="#">PublishResult</a> <sup>[2979]</sup>

Method	Type	Notes	See also
		<ul style="list-style-type: none"> <li>• <b>mvlInformation</b></li> <li>• ErrorMessage: String - can contain a default error string, although this is probably overridden by the <i>PublishResult</i> call</li> </ul>	
<b>DefineRuleCategory (string CategoryName)</b>	<i>String</i>	<p>Defines a category of rules that can be performed during model validation (there is typically one category per Add-In). It must be called once from the <i>EA_OnInitializeUserRules</i> broadcast handler.</p> <p>The return value is a CategoryId that must to be passed to the <i>DefineRule</i> method.</p> <p>See the <i>Model Validation Example</i> for a detailed example of the use of this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• CategoryName: String - a text string that is visible in the Model Validation Configuration dialog</li> </ul>	<a href="#">EA_OnInitializeUserRules</a> <sup>[3048]</sup> <a href="#">DefineRule</a> <sup>[2963]</sup> <a href="#">Model Validation Example</a> <sup>[3056]</sup>
<b>DeleteBaseline (string BaselineGUID)</b>	<i>Boolean</i>	<p>Deletes a Baseline, identified by the BaselineGUID, from the repository.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• BaselineGUID: String - the GUID (in XML format) of the Baseline to delete</li> </ul>	
<b>DoBaselineCompare (string PackageGUID, string Baseline, string ConnectString)</b>	<i>String</i>	<p>Performs a Baseline comparison using the supplied package GUID and Baseline GUID (obtained in the result list from <i>GetBaselines</i>).</p> <p>Optionally you can include the connection string required to find the Baseline if it exists in a different model file.</p> <p>This method returns a log file of the status of all elements found and compared in the difference procedure. You can use this log information as input to <i>DoBaselineMerge</i> - automatically merging information from the Baseline.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String - the GUID (in XML format) of the package to run the comparison on</li> <li>• Baseline: String - the GUID (in XML format) of the Baseline to run the comparison on</li> <li>• ConnectString: String - the location of the external .EAP file or DBMS to extract</li> </ul>	<a href="#">GetBaselines</a> <sup>[2972]</sup> <a href="#">DoBaselineMerge</a> <sup>[2965]</sup>

Method	Type	Notes	See also
		the Baseline from	
<b>DoBaselineMerge (</b> <b>string PackageGUID,</b> <b>string Baseline,</b> <b>string</b> <b>MergeInstructions,</b> <b>string ConnectString)</b>	<i>String</i>	<p>Performs a batch merge based on instructions contained in an XML file (<i>MergeInstructions</i>). You can supply an optional connection string if the Baseline is located in another model.</p> <p>In the <i>MergeInstructions</i> file, each <i>MergeItem</i> node supplies the GUID of a differenced item from the XML difference log. As the merge is uni-directional and actioned in only one possible way, no additional arguments are required. Enterprise Architect chooses the correct procedure based on the Difference results.</p> <pre>&lt;Merge&gt;   &lt;MergeItem guid="{XXXXXX}" /&gt;   &lt;MergeItem guid="{XXXXXX}" /&gt; &lt;/Merge&gt;</pre> <p>Alternatively, you can supply a single <i>MergeItem</i> with a GUID of <i>RestoreAll</i>. In this case, Enterprise Architect batch-processes ALL differences.</p> <pre>&lt;Merge&gt;   &lt;MergeItem     guid="RestoreAll"     changed="true"     baselineOnly="true"     modelOnly="true"     moved="true"     fullRestore="false" /&gt; &lt;/Merge&gt;</pre> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to merge the Baseline into</li> <li>Baseline: String - the GUID of the Baseline (in XML format) to merge into the package</li> <li>MergeInstructions: String - the file containing the GUID of each differenced item from the XML difference log returned by <i>DoBaselineCompare()</i></li> <li>ConnectString: String - the location of the EAP file or DBMS to get the Baseline from, if not in the same</li> </ul>	<a href="#">DoBaselineCompare()</a> <sup>[2964]</sup>

		model as the package	
<b>EnumDiagramElements (string DiagramGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of all elements in a diagram. Parameters: <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to get elements for</li> </ul>	
<b>EnumDiagrams (string PackageGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of all diagrams in a specified package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to list diagrams for</li> </ul>	
<b>EnumElements (string PackageGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of elements in a specified package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to get a list of elements for</li> </ul>	
<b>EnumLinks (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of connectors for a specified element. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element to get all associated connectors for</li> </ul>	
<b>EnumPackages (string PackageGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of child packages inside a parent package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the parent package</li> </ul>	
<b>EnumProjects ()</b>	protected abstract: <i>String</i>	Gets a list of projects in the current file; corresponds to <i>Models</i> in <i>Repository</i> .	<a href="#">Models</a> 
<b>EnumViews ()</b>	protected abstract: <i>String</i>	Enumerates the Views for a project. Returned as an XML document.	
<b>EnumViewEx (string ProjectGUID)</b>	protected abstract	Gets a list of Views in the current project. Parameters:	

Method	Type	Notes	See also
	t: <i>String</i>	<ul style="list-style-type: none"> <li>ProjectGUID: String - the GUID (in XML format) of the project to get views for</li> </ul>	
<b>Exit ()</b>	protected abstract t: <i>String</i>	<p>Exits the current instance of Enterprise Architect; this function is maintained for backward compatibility and should never be called.</p> <p>Enterprise Architect automatically exits when you are no longer using any of the provided objects.</p>	
<b>ExportPackageXML (</b> string PackageGUID, enumXMIMType XMIMType, long DiagramXML, long DiagramImage, long FormatXML, long UseDTD, string FileName)	protected abstract t: <i>String</i>	<p>Exports XMI for a specified package.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to be exported</li> <li>XMIMType: EnumXMIMType - specifies the XMI type and version information; see <i>XMIMType Enum</i> for accepted values</li> <li>DiagramXML: Long - <b>true</b> if XML for diagrams is required; accepted values: <ul style="list-style-type: none"> <li><b>0</b> = Do not export diagrams</li> <li><b>1</b> = Export diagrams</li> <li><b>2</b> = Export diagrams along with alternate images</li> </ul> </li> <li>DiagramImage: Long - the format for diagram images to be created at the same time; accepted values: <ul style="list-style-type: none"> <li><b>-1</b>=NONE</li> <li><b>0</b>=EMF</li> <li><b>1</b>=BMP</li> <li><b>2</b>=GIF</li> <li><b>3</b>=PNG</li> <li><b>4</b>=JPG</li> </ul> </li> <li>FormatXML: Long - <b>true</b> if XML output should be formatted prior to saving</li> <li>UseDTD: Long - <b>true</b> if a DTD should be used</li> <li>FileName: String - the filename to output to</li> </ul>	<a href="#">XMIMType Enum</a> <sup>[2825]</sup>
<b>ExportPackageXMIMEx (</b> string PackageGUID, enumXMIMType XMIMType, long DiagramXML,	protected abstract t: <i>String</i>	<p>Exports XMI for a specified package, with a flag to determine whether the export <b>includes package content</b> below the first level.</p> <p>Parameters:</p>	<a href="#">Package Content</a> <sup>[488]</sup> <a href="#">XMIMType Enum</a> <sup>[2825]</sup> <a href="#">ExportPackageXMIMFI</a>

		<p>3 - All</p> <ul style="list-style-type: none"> <li>Generate in SingleFile (<i>singlefile</i>)</li> </ul>	
<b>GenerateTestFromScenario</b> ( string ElementGUID, EnumScenarioTestType TestType)	Boolean	<p>Generates either an <b>Internal test</b> or an <b>External test</b> from the Structured Specification of an element.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element containing the Structured Specification</li> <li>TestType: EnumScenarioTestType - the type of test to generate; see <i>ScenarioTestType Enum</i> for accepted values</li> </ul>	<a href="#">Generate Test Cases</a> <sup>[986]</sup> <a href="#">ScenarioTestType Enum</a> <sup>[2825]</sup>
<b>GenerateWSDL</b> ( string WSDLComponentGUID, string Filename, string Encoding, string ExtraOptions)	Boolean	<p>Generates WSDL for the specified WSDL stereotyped Component.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>WSDLComponentGUID: String - the GUID (in XML format) of the WSDL stereotyped Component</li> <li>Filename: String - the target file path</li> <li>Encoding: String - the XML encoding for the code page instruction</li> <li>ExtraOptions: String - enables extra options to be given to the command; currently unused</li> </ul>	<a href="#">Web Services - WSDL</a> <sup>[2423]</sup>
<b>GenerateXSD</b> ( string PackageGUID, string FileName, string Encoding, string Options)	Boolean	<p>Creates an XML schema for a package, specified by its GUID. Returns <b>true</b> on success.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package</li> <li>FileName: String - the target filepath</li> <li>Encoding: String - the XML encoding for the code page instruction</li> <li>Options: String - enables extra options to be given to the command; currently enables: <ul style="list-style-type: none"> <li><i>GenGlobalElement</i> - turn the generation of global elements for all global <i>ComplexTypes</i> <b>On</b> or <b>Off</b>; for example: - GenGlobalElement = 1</li> </ul> </li> </ul>	

Method	Type	Notes	See also
<b>GetBaselines (string PackageGUID, string ConnectString)</b>	<i>String</i>	<p>Returns a list (in XML format) of Baselines associated with the supplied package GUID. Optionally, you can provide a connection string to get Baselines from the same package, but located in a different model file (or DBMS).</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to get Baselines for</li> <li>ConnectString: String - the location of the EAP file or DBMS to get the Baselines from, if not in the same model as the package</li> </ul>	
<b>GetDiagram (string DiagramGUID)</b>	protected abstract: <i>String</i>	<p>Gets the diagram details, in XML format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to get details for</li> </ul>	
<b>GetElement (string ElementGUID)</b>	protected abstract: <i>String</i>	<p>Gets XML for the specified element.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element to retrieve XML for</li> </ul>	
<b>GetElementConstraints (string ElementGUID)</b>	protected abstract: <i>String</i>	<p>Gets constraints for an element, in XML format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementEffort (string ElementGUID)</b>	protected abstract: <i>String</i>	<p>Gets efforts for an element, in XML format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementFiles (string ElementGUID)</b>	protected abstract: <i>String</i>	<p>Gets metrics for an element, in XML format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementMetrics (string ElementGUID)</b>	protected	Gets files for an element, in XML format.	

Method	Type	Notes	See also
	abstract: <i>String</i>	Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementProblems (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of issues (problems) associated with an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementProperties (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets Tagged values for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementRequirements (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of requirements for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementResources (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of resources for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementRisks (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of risks associated with an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementScenarios (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of scenarios for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	
<b>GetElementTests (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of tests for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element</li> </ul>	

Method	Type	Notes	See also
		XML format) of the element	
<b>GetFileNameDialog (</b> <b>string Filename,</b> <b>string FilterString,</b> <b>long FilterIndex,</b> <b>long Flags,</b> <b>string InitialDirectory,</b> <b>long OpenOrSave)</b>	<i>String</i>	<p>Opens a standard File Open or Save As dialog and returns a string containing the full path to the selected file on success. Returns an empty string if the dialog was canceled.</p> <p>For example:</p> <pre> Filename = " " FilterString = " CSV Files (*.csv) *.csv All Files (*.*) *.*  " FilterIndex = 1 Flags = &amp;H2 ' OFN_OVERWRITEPROMPT InitialDirectory = " " OpenOrSave = 1 filepath = Project. GetFileNameDialog (Filename, FilterString, FilterIndex, Flags, InitialDirectory, OpenOrSave) </pre> <p>In this example, the Save As dialog will prompt for a CSV file.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Filename: String - default filename specified in the dialog</li> <li>• FilterString: String - delimited list of available file type filters</li> <li>• FilterIndex: Long - One-based index of the filter to be used by default</li> <li>• Flags: Long - additional bit flags used to initialize the file dialog. See OPENFILENAME structure in MSDN documentation for accepted values.</li> <li>• InitialDirectory: String - directory path to open this dialog</li> <li>• OpenOrSave: Long - Show dialog as an "Open" or "Save As" style dialog. Accepted values: 0 = Open, 1 = Save As</li> </ul>	
<b>GetLastError ()</b>	protected abstract: <i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.	
<b>GetLink (</b> <b>string LinkGUID)</b>	protected abstract: <i>String</i>	<p>Gets connector details, in XML format.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• LinkGUID: String - the GUID (in XML format) of the connector to get details</li> </ul>	

Method	Type	Notes	See also
		of	
<b>GUIDtoXML (string GUID)</b>	<i>String</i>	<p>Changes an internal GUID to the form used in XML.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>GUID: String - the Enterprise Architect style GUID to convert to XML format</li> </ul>	
<b>ImportDirectory (string PackageGUID, string Language, string DirectoryPath, string ExtraOptions)</b>	<i>Boolean</i>	<p>Imports a source code directory into the model.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to reverse engineer code into</li> <li>Language: String - specifies the language of the code to be imported</li> <li>DirectoryPath: String - specifies the path where the code is found on the computer</li> <li>ExtraOptions: String - enables extra options to be given to the command; currently enables import of source from all child directories (<i>recurse</i>) - for example: <i>recurse=1</i></li> </ul>	
<b>ImportFile (string PackageGUID, string Language, string FileName, string ExtraOptions)</b>	<i>Boolean</i>	<p>Imports an individual file or binary module into the model, in a package per namespace style import.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to reverse engineer code into; this is expected to be a namespace root package.</li> <li>Language: String - specifies the language of the code to be imported</li> </ul> <p>Use the value <b>"DNPE"</b> to import a binary module; this imports a .Net assembly or Java .class file, but <b>not</b> a .jar file.</p> <ul style="list-style-type: none"> <li>Filename: String - specifies the path where the code or module is found on the computer</li> <li>ExtraOptions: String - enables extra options to be given to the command; currently unused</li> </ul>	

Method	Type	Notes	See also
<b>ImportPackageXML</b> ( string PackageGUID, string Filename, long ImportDiagrams, long StripGUID)	<i>String</i>	<p>Imports an XML file at a point in the tree.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the target package to import the XML file into (or overwrite with the XML file)</li> <li>Filename or XMLText: String - the name of the XML file</li> </ul> <p>If the String is of type <i>filename</i> it is interpreted as a source file, otherwise the String is imported as XML text.</p> <ul style="list-style-type: none"> <li>ImportDiagrams: Long</li> <li>StripGUID: Long - boolean value to indicate whether to replace the element UniqueIDs on import; if stripped, then a package could be imported twice into Enterprise Architect, as two different versions</li> </ul> <p>Returns an empty string if successful, or returns an error message on failure.</p>	
<b>LayoutDiagram</b> ( string DiagramGUID, long LayoutStyle)	<i>Boolean</i>	<p><b>Deprecated.</b> it is recommended that <i>LayoutDiagramEx</i> is used instead.</p> <p>Calls the function to automatically layout a diagram in hierarchical fashion. It is only recommended for Class and Object diagrams.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to lay out</li> <li>LayoutStyle: Long - always ignored</li> </ul>	
<b>LayoutDiagramEx</b> ( string DiagramGUID, long LayoutStyle, long Iterations, long LayerSpacing, long ColumnSpacing, boolean SaveToDiagram )	<i>Boolean</i>	<p>Calls the function to automatically layout a diagram in hierarchical fashion. It is only recommended for Class and Object diagrams.</p> <p><i>LayoutStyle</i> accepts the following options</p> <ul style="list-style-type: none"> <li>Default Options: <ul style="list-style-type: none"> <li>IsDiagramDefault</li> <li>IsProgramDefault</li> </ul> </li> <li>Cycle Removal Options: <ul style="list-style-type: none"> <li>IsCycleRemoveGreedy</li> </ul> </li> </ul>	<a href="#">ConstLayoutStyles Enum</a> <sup>[2816]</sup>

Method	Type	Notes	See also
		<p>IsCycleRemoveDFS</p> <ul style="list-style-type: none"> <li>Layering Options: <ul style="list-style-type: none"> <li>IsLayeringLongestPathSink</li> <li>IsLayeringLongestPathSource</li> <li>IsLayeringOptimalLinkLength</li> </ul> </li> <li>Initialize Options: <ul style="list-style-type: none"> <li>IsInitializeNaive</li> <li>IsInitializeDFSOut</li> <li>IsInitializeDFSIn</li> </ul> </li> <li>Crossing Reduction Option: <ul style="list-style-type: none"> <li>IsCrossReduceAggressive</li> </ul> </li> <li>Layout Options - Direction <ul style="list-style-type: none"> <li>IsLayoutDirectionUp</li> <li>IsLayoutDirectionDown</li> <li>IsLayoutDirectionLeft</li> <li>IsLayoutDirectionRight</li> </ul> </li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to lay out</li> <li>LayoutStyle: Long - the layout style</li> <li>Iterations: Long - the number of layout iterations the Layout process should take to perform cross reduction (Default value = <b>4</b>)</li> <li>LayerSpacing: Long - the per-element layer spacing the Layout process shall use (Default value = <b>20</b>)</li> <li>ColumnSpacing: Long - the per-element column spacing the Layout process shall use (Default value = <b>20</b>)</li> <li>SaveToDiagram: Boolean - specifies whether or not Enterprise Architect should save the supplied layout options as default to the diagram in question</li> </ul>	
<b>LoadControlledPackage</b> ( <b>string PackageGUID</b> )	<i>String</i>	<p>Loads a package that has been marked and configured as controlled. The filename details are stored in the package control data.</p> <p>Parameters:</p>

### 20.2.2.10 Document Generator Interface Package

The *DocumentGenerator* Class provides an interface to the document and web reporting facilities, which you can use to generate reports on specific packages, diagrams and elements in your model.

**Access** You can create a pointer to this interface using the *Repository.CreateDocumentGenerator* method

#### Example

This diagram illustrates how you might use the Document Generator interface in generating a report through the Automation Interface.

#### Learn more

**DocumentGenerator Methods**

Method	Type	Notes	See Also
<b>DocumentDiagram (</b> <b>long diagramID,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a diagram.  Parameters: <ul style="list-style-type: none"> <li>• diagramId: Long - the ID of the diagram</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - the name of a template to use when documenting diagrams; this can be blank</li> </ul>	
<b>DocumentElement (</b> <b>long elementID,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents an element.  Parameters: <ul style="list-style-type: none"> <li>• elementId: Long - the ID of the element</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - the name of a template to use when documenting elements; this can be blank</li> </ul>	
<b>DocumentModelAuthor (</b> <b>string name,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a model author.  Parameters: <ul style="list-style-type: none"> <li>• name: String - the name of the author</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model authors; this can be blank</li> </ul>	
<b>DocumentModelClient (</b> <b>string name,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a single model client.  Parameters: <ul style="list-style-type: none"> <li>• name: String - the name of the client</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model clients; this can be blank</li> </ul>	
<b>DocumentModelGlossary (</b> <b>long id,</b>	<i>Boolean</i>	Documents a single model glossary term.  Parameters:	

<b>long nDepth, string templateName)</b>		<ul style="list-style-type: none"> <li>• id: Long - the ID of the term</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model glossary terms; this can be blank</li> </ul>	
<b>DocumentModelIssue (</b> <b>long id,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a single model issue. Parameters: <ul style="list-style-type: none"> <li>• id: Long - the ID of the issue</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model issues; this can be blank</li> </ul>	
<b>DocumentModelResource (</b> <b>string name,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a single model resource. Parameters: <ul style="list-style-type: none"> <li>• name: String - the name of the resource</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model resources; this can be blank</li> </ul>	
<b>DocumentModelRole (</b> <b>string name,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a single model role. Parameters: <ul style="list-style-type: none"> <li>• name: String - the name of the role</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model roles; this can be blank</li> </ul>	
<b>DocumentModelTask (</b> <b>long id,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a single model task. Parameters: <ul style="list-style-type: none"> <li>• id: Long - the ID of the the task</li> <li>• nDepth: Long - the depth by which to adjust the heading level</li> <li>• templateName: String - a template to use when documenting model tasks; this can be blank</li> </ul>	
<b>DocumentPackage (</b> <b>long packageID,</b> <b>long nDepth,</b> <b>string templateName)</b>	<i>Boolean</i>	Documents a package. Parameters: <ul style="list-style-type: none"> <li>• packageID: Long - the ID of the package</li> </ul>	

		<ul style="list-style-type: none"> <li>nDepth: Long - the depth by which to adjust the heading level</li> <li>templateName: String - a template to use when documenting packages; this can be blank</li> </ul>	
<b>GetLastError()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.	
<b>InsertBreak (long breakType)</b>	<i>Boolean</i>	<p>Inserts a break into the report at the current location.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>breakType: Long - <b>0</b> = page break, <b>1</b> = section break</li> </ul>	<a href="#">DocumentBreak</a> <small>[2818]</small>
<b>InsertCoverPageDocument (string name)</b>	<i>Boolean</i>	<p>Inserts the Coverpage into the document at the current location.</p> <p>Note: The style sheet is applied to the document before it is insert into the generated document.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>name: String - the name of the Cover page document found in the Resource tree</li> </ul>	
<b>InsertLinkedDocument (string guid)</b>	<i>Boolean</i>	<p>Inserts a linked document into the report at the current location.</p> <p>A linked document can used to set the header and footer of the report. These are taken from the first linked document added to the report.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>guid: String - the GUID of the element that has a linked document</li> </ul>	
<b>InsertTableOfContents</b>	<i>Boolean</i>	Inserts a Table of Contents at the current position.	
<b>InsertTeamReviewPost (string path)</b>	<i>Boolean</i>	<p>Inserts a Team Review posting into the report at the current location.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>path: String - the path of the Team Review post</li> </ul>	
<b>InsertText (string text,</b>	<i>Boolean</i>	Inserts static text into the report at the current location.	

<b>string style)</b>		<p>A carriage return is not included; if you need to use one, you can add it manually.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• text: String - the static text to be inserted</li> <li>• style: String - the name of the style in the template; defaults to <i>Normal</i> style</li> </ul>	
<b>InsertTOCDocument (string name)</b>	<i>Boolean</i>	<p>Inserts the Table of Contents into the document at the current location.</p> <p>Note: The stylesheet is applied to the document before it is insert into the generated document.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• name: String - the name of the Table of Contents document found in the Resource tree</li> </ul>	
<b>NewDocument (string templateName)</b>	<i>Boolean</i>	<p>Starts a new document; you call this before attempting to document anything else.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• templateName: String - the name of a template to use when documenting elements; this can be blank</li> </ul>	
<b>ReplaceField (string fieldname, string fieldvalue)</b>	<i>Boolean</i>	<p>Replaces the <b>Section</b> field identified by the <i>fieldname</i> parameter with the value provided in <i>fieldvalue</i>. For example:</p> <pre>ReplaceField ( " Element . Alias " , " MyAl i as " )</pre> <p>If you call this function more than once with the same <i>fieldname</i>, the field only has the most recent value set.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• fieldname: String - the field name to find (this does not include the {} braces)</li> <li>• fieldvalue: String - the value to insert into the field; this can be a constant or a derived value</li> </ul>	
<b>SaveDocument (string filename, long nDocType)</b>	<i>Boolean</i>	<p>Saves the document to disk.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• filename: String - the filename to save the file to</li> <li>• nDocType: Long - <b>0</b> = RTF, <b>1</b> = HTML, <b>2</b> = PDF, <b>3</b> = DOCX</li> </ul>	<a href="#">DocumentType</a>  2819

<b>SetPageOrientation (long pageOrientation)</b>	<i>Boolean</i>	Sets the current page orientation.  Parameters: <ul style="list-style-type: none"> <li>pageOrientation: Long - <b>0</b> = Portrait, <b>1</b> = Landscape</li> </ul>	<a href="#">DocumentPageOrientation</a> <sup>[2816]</sup>
<b>SetStyleSheetDocument (string name)</b>	<i>Boolean</i>	Sets the Stylesheet to be used for TOC, Coverpage and templates used. This can be called before <b>NewDocument</b> (above).  Parameters: <ul style="list-style-type: none"> <li>name: String - the name of the stylesheet found in the Resource tree</li> </ul>

**20.2.2.11.1 MailInterface Class**

The **MailInterface** interface can be accessed from the Repository using *GetMailInterface()*. The returned interface provides access to the Enterprise Architect Model Mail Interface. Use this interface to automate the process of creating and sending messages using Enterprise Architect's Model Mail system.

MailInterface Attributes

Attribute	Type	Notes	See also
<b>MessagingEnabled</b>	<i>Boolean</i>	Read Only  Advises whether messaging is enabled on the current model.	
<b>ObjectType</b>	<i>ObjectTy</i>	Read Only	<a href="#">ObjectType</a> <sup>[2822]</sup>

Attribute	Type	Notes	See also
	<i>pe</i>	Distinguishes objects referenced through a dispatch interface.	

**MailInterface Methods**

Method	Type	Notes
<b>ComposeMailMessage</b> ( string InitialRecipientGUID, string InitialSubject, messageflag InitialFlag, string InitialMessageText)	<i>Boolean</i>	Creates a new mail message using the values specified in the input parameters; the message is displayed in the composition window, ready for sending.  This method does NOT send the message.  Parameters: <ul style="list-style-type: none"> <li>InitialRecipientGUID: String - Initial value for the GUID of the addressee user (an Enterprise Architect user defined in the current model)</li> <li>InitialSubject: String - Initial value for the Subject text to display for this message</li> <li>InitialFlag: MessageFlag - Initial value for the flag type/color to attach to this message</li> <li>InitialMessageText: String - Initial value for the text that is the body of the message</li> </ul>
<b>GetAttributeHyperlink</b> ( string AttributeGUID, string LinkText)	<i>String</i>	Returns a string containing a hyperlink to the attribute specified by the input parameter AttributeGUID.  Parameters: <ul style="list-style-type: none"> <li>AttributeGUID: String - The GUID of the attribute for which a hyperlink is required</li> <li>LinkText: String - The text to display for the hyperlink (e.g. the attribute name)</li> </ul>
<b>GetDiagramHyperlink</b> ( string DiagramGUID, string LinkText)	<i>String</i>	Returns a string containing a hyperlink to the diagram specified by the input parameter DiagramGUID.  Parameters: <ul style="list-style-type: none"> <li>DiagramGUID: String - The GUID of the diagram for which a hyperlink is required</li> <li>LinkText: String - The text to display for the hyperlink (e.g. the diagram name)</li> </ul>
<b>GetElementHyperlink</b> ( string ElementGUID, string LinkText)	<i>String</i>	Returns a string containing a hyperlink to the element specified by the input parameter ElementGUID.  Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - The GUID of the element for which a hyperlink is required</li> <li>LinkText: String - The text to display for the hyperlink (e.g. the</li> </ul>

Method	Type	Notes
		element name)
<b>GetFileHyperlink( string FilePath, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the file specified by the input parameter FilePath.  Parameters: <ul style="list-style-type: none"> <li>• FilePath: String - The path name of the file for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the file name)</li> </ul>
<b>GetLastError( )</b>	<i>String</i>	Returns the last error message set for the MailInterface.
<b>GetMethodHyperlink( string MethodGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the method specified by the input parameter MethodGUID.  Parameters: <ul style="list-style-type: none"> <li>• MethodGUID: String - The GUID of the method for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the method name)</li> </ul>
<b>GetPackageHyperlink( string PackageGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the package specified by the input parameter PackageGUID.  Parameters: <ul style="list-style-type: none"> <li>• PackageGUID: String - The GUID of the package for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the package name)</li> </ul>
<b>GetRecipientGUID( string UserName)</b>	<i>String</i>	Returns the GUID of the specified Enterprise Architect user.  Parameters: <ul style="list-style-type: none"> <li>• UserName: String - The name of a user defined in the current model</li> </ul>
<b>GetWebHyperlink( string URL, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the URL specified by the input parameter URL.  Parameters: <ul style="list-style-type: none"> <li>• URL: String - The URL of the item for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink</li> </ul>
<b>SendMailMessage( string RecipientGUID, string Subject,</b>	<i>Boolean</i>	Creates and sends a new mail message using the values specified in the input parameters.  Parameters:

Method	Type	Notes
<b>messageflag Flag, string MessageText)</b>		<ul style="list-style-type: none"> <li>RecipientGUID: String - The GUID of the addressee user (an Enterprise Architect user defined in the current model)</li> <li>Subject: String - The Subject text to display for this message</li> <li>Flag: MessageFlag - The flag type/color to attach to this message</li> <li>MessageText: String - The text that is the body of the message</li> </ul>

### 20.2.2.12 Simulation Package

The **Simulation** Package contains:

- An attribute to set, increase and decrease the speed of the simulation
- A function to check if a simulation is currently running
- Functions to Start, Stop, Step Into, Step Out of and Step Over and Pause a simulation
- A function to send a broadcast signal to the simulation that is currently running

#### 20.2.2.12.1 Simulation Class

The **Simulation** Class provides an interface to the Enterprise Architect Model Simulation facilities.

#### Simulation Attributes

Attribute	Type	Notes	See Also
<b>ObjectType</b>	<i>ObjectType</i>	Read only Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> <sup>[2822]</sup>
<b>Speed</b>	<i>Long</i>	Read/Write Retrieve or set the current simulation running speed.	<a href="#">Run Model Simulation</a> <sup>[2475]</sup>

#### Simulation Methods

Method	Type	Notes	See Also
<b>BroadcastSignal ( string sSignalName,</b>	<i>Boolean</i>	Send a signal into the running simulation. If the simulation is stopped, do nothing.	<a href="#">Dynamic Simulation with Javascript</a> <sup>[2486]</sup>

<b>string sParameters)</b>		Parameters: <ul style="list-style-type: none"> <li>sSignalName: String - the name of the signal OR the GUID of the Signal element</li> <li>sParameters: String - a string of one or more signal parameters, in the following format  <pre>{parameter1 : 5, parameter2 : "test", parameter3 : 3.2}</pre> </li> </ul>	
<b>IsSimulatorRunning ()</b>	<i>Boolean</i>	Check the state of the simulation.  Returns <b>true</b> if the simulation is running; returns <b>false</b> if the simulation is stopped.	
<b>Pause ()</b>	<i>Boolean</i>	Pause the simulation if it is running.	<a href="#">Run Model Simulation</a>  <sup>[2475]</sup>
<b>Start ()</b>	<i>Boolean</i>	Start the simulation based on the current selection. If the current simulation is in a paused state, then the simulation is resumed.	
<b>StepIn ()</b>	<i>Boolean</i>	Step In to the routine in the current simulation.	
<b>StepOut ()</b>	<i>Boolean</i>	Step Out of the routine in the current simulation.	
<b>StepOver ()</b>	<i>Boolean</i>	Step Over the routine in the current simulation.	
<b>Stop ()</b>	<i>Boolean</i>	Stop the simulation.

### 20.2.2.13.1 Open the Repository

An example of the VB.Net code to open an Enterprise Architect repository.

```
Public Class AutomationExample
    'class level variable for Repository
    Public m_Repository As Object

    Public Sub Run()
        try
            'create the repository object
            m_Repository = CreateObject("EA.Repository")

            'open an EAP file
            m_Repository.OpenFile("F:\Test\EAAuto.EAP")
            'use the Repository in any way required
            DumpModel

            'close the repository and tidy up
            m_Repository.Exit()
            m_Repository = Nothing

            ....catch e as exception
        end try
    end Sub
end Class
```

```

        Console.WriteLine(e)
    End try
End Sub
end Class

```

### 20.2.2.13.2 Iterate Through a .EAP File

An example of the VB.Net code to iterate through a .EAP file starting at the Model level, after the repository has been opened.

```

Sub DumpModel()
    Dim idx as Integer
    For idx=0 to m_Repository.Models.Count-1
        DumpPackage("", m_Repository.Models.GetAt(idx))
    Next
End Sub

' output package name, then element contents, then process child packages
Sub DumpPackage(Indent as String, Package as Object)
    Dim idx as Integer
    Console.WriteLine(Indent + Package.Name)
    DumpElements(Indent + "    ", Package)

    For idx = 0 to Package.Packages.Count-1
        DumpPackage(Indent + "    ", Package.Packages.GetAt(idx))
    Next
End Sub

'' dump element name
Sub DumpElements(Indent as String, Package as Object)
    Dim idx as Integer
    For idx = 0 to Package.Elements.Count-1
        Console.WriteLine(Indent + "::" + Package.Elements.GetAt(idx).
Name)
    Next
End Sub

```

### 20.2.2.13.3 Add and Manage Packages

#### Topics

## 20.3 Enterprise Architect Add-In Model

### Topics

Topic	Detail	See also
<b>Introduction</b>	<p>Add-Ins enable you to add functionality to Enterprise Architect. The Enterprise Architect Add-In model builds on the features provided by the <b>Automation Interface</b> to enable you to extend the Enterprise Architect user interface.</p> <p>Add-Ins are ActiveX COM objects that expose public Dispatch methods. They have several advantages over stand-alone automation clients:</p> <ul style="list-style-type: none"> <li>• Add-Ins can define Enterprise Architect menus and sub-menus</li> <li>• Add-Ins receive notifications about various Enterprise Architect user-interface events including menu clicks and file changes</li> <li>• Add-Ins can (and should) be written as in-process (DLL) components. This provides lower call overhead and better integration into the Enterprise Architect environment</li> <li>• Because a current version of Enterprise Architect is already running there is no requirement to start a second copy of Enterprise Architect via the automation interface</li> <li>• Because the Add-In receives object handles associated with the currently running copy of Enterprise Architect, more information is available about the current user's activity; for example, which diagram objects are selected</li> <li>• You are not required to do anything other than to install the Add-In to make it usable; that is, you do not have to configure Add-Ins to run on your systems</li> <li>• Because Enterprise Architect is constantly evolving in response to customer requests, the Add-In interface is flexible</li> <li>• The Add-In interface does not have its own version, rather it is identified by the version of Enterprise Architect it first appeared in; for example, the current version of the Enterprise Architect Add-In interface is version 2.1</li> <li>• When creating your Add-In, you do not have to subscribe to a type-library</li> </ul> <p>From Enterprise Architect release 7.0, Add-Ins created before 2004 are no longer supported. If an Add-In subscribes to the Addn_Tmpl.tlb interface (2003 style), it fails on load. In this event, contact the vendor or author of the Add-In and request an upgrade.</p> <ul style="list-style-type: none"> <li>• Add-Ins do not have to implement methods that they never use</li> <li>• Add-Ins prompt users via context menus in the tree view and the</li> </ul>	<p><a href="#">Automation Interface</a> <sup>[2804]</sup></p> <p><a href="#">Scripts</a> <sup>[2791]</sup></p> <p><a href="#">UML Profiles</a> <sup>[1485]</sup></p> <p><a href="#">Register Add-in</a> <sup>[3171]</sup></p> <p><a href="#">Add-In Manager</a> <sup>[3018]</sup></p>

### 20.3.1.1 Create Add-Ins

Before you start you must have an application development tool that is capable of creating ActiveX COM objects supporting the IDispatch interface, such as:

- Borland Delphi
- Microsoft Visual Basic
- Microsoft Visual Studio .Net

You should consider how to **define menu items**. To help with this, you could review some **examples of Automation Interfaces** - examples of code used to create Add-Ins for Enterprise Architect - on the Sparx Systems web page.

#### How to

An Enterprise Architect Add-In can be created in four steps:

Step	Action	See also
1	Use a development tool to create an ActiveX COM DLL project. Visual Basic users, for example, choose <i>File&gt;Create New Project-ActiveX DLL</i> .	
2	Connect to the interface using the syntax appropriate to the language.	<a href="#">Connect to the Interface</a> 
3	Create a COM Class and implement each of the <b>general Add-In Events</b> applicable to your Add-In. You only have to define methods for events to respond to.	<a href="#">Add-In Events</a> 
4	Add a registry key that identifies your Add-In to Enterprise Architect, as described in the <i>Deploy Add-Ins</i> topic.	<a href="#">Deploy Add-Ins</a>

### 20.3.1.1.1 Define Menu Items

#### Topics

Topic	Detail
<b>Defining Menu Items</b>	<p>Menu items are defined by responding to the <i>GetMenuItems</i> event.</p> <p>The first time this event is called, <i>MenuName</i> is an empty string, representing the top-level menu. For a simple Add-In with just a single menu option you can return a string</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     EA_GetMenuItems = "&amp;Joe's Add-In" End Function</pre>
<b>Defining Sub-Menus</b>	<p>To define sub-menus, prefix a parent menu with a dash. Parent and sub-items are defined as follows:</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     Select Case MenuName         Case ""             ' Parent Menu Item             EA_GetMenuItems = "- &amp;Joe's Add-In"         Case "- &amp;Joe's Add-In"             ' Define Sub-Menu Items using the Array notation.             ' In this example, "Diagram" and "Treeview"             compose the "Joe's Add-In" sub-menu.             EA_GetMenuItems = Array("&amp;Diagram", "&amp;Treeview")         Case Else             MsgBox "Invalid Menu", vbCritical         End Select     End Function</pre>
<b>Defining Further Sub-Menus</b>	<p>Similarly, you can define further sub-items:</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     Select Case MenuName         Case ""             EA_GetMenuItems = "- Joe's Add-In"         Case "- Joe's Add-In"             EA_GetMenuItems = Array("- &amp;Diagram", "&amp;TreeView")         Case "- &amp;Diagram"             EA_GetMenuItems = "&amp;Properties"         Case Else             MsgBox "Invalid Menu", vbCritical         End Select     End Function</pre>
<b>Enabling/Disabling menu options</b>	<p>To enable or disable menu options by default, you can use this method to show particular items to the user:</p> <pre>Sub EA_GetMenuState(Repository As EA.Repository, Location As String, MenuName As String, ItemName As String, IsEnabled As Boolean, IsChecked As Boolean)     Select Case Location</pre>

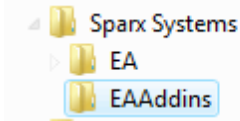

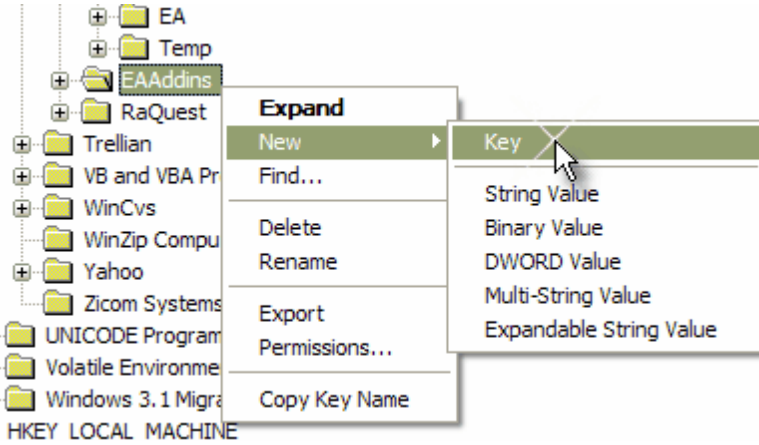

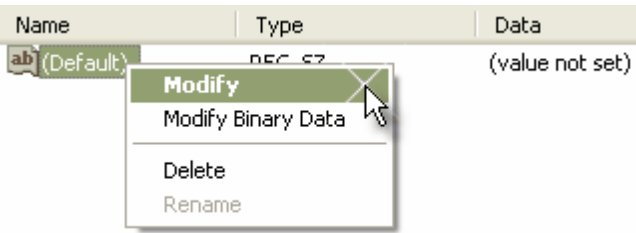

Topic	Detail
	<pre> Case "TreeVie w" ' Al ways enable Case "Di agram" ' Al ways enable Case "Mai nMenu" Select Case ItemName Case "&amp;Tran slate", " Save &amp;Pr oject " If GetIsPr oject Sel ect ed() Then IsEnabled = Fal se End If End Select End Select IsChecked = GetIsCur rent Sel ect ion() End Sub </pre>

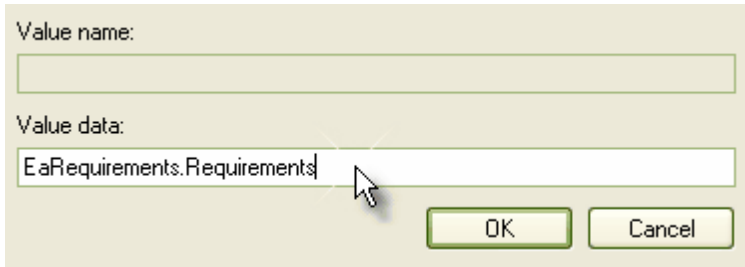

### 20.3.1.1.2 Deploy Add-Ins

#### How to

To deploy Add-Ins to users' sites

Step	Action	See also
1	Add the Add-In DLL file to an appropriate directory on the user's computer; that is: C:\Program Files\ ( new dir )	
2	<p>Register the DLL as appropriate to your platform:</p> <ul style="list-style-type: none"> <li>If compiled as a native Win32 DDL, such as VB6 or C++, register the DDL using the <b>regsvr32</b> command from the command prompt   <pre>regsvr32 "C:\Program Files\MyCompany\EAAddin\EAAddin.dll"</pre> </li> <li>If compiled as a .NET DLL, such as C# or VB.NET, register the DLL using the <b>RegAsm</b> command from the command prompt   <pre>C:\WINDOWS\Microsoft.NET\Framework\v2.0.50727 \RegAsm.exe "C:\Program Files\MyCompany\EAAddin\EAAddin.dll" /codebase</pre> </li> </ul>	
3	Place a new entry into the registry using the registry editor (run <b>regedit</b> ) so that Enterprise Architect recognizes the presence of your Add-In.	
4	<p>Add a new key value <b>EAAddIns</b> under the location:</p> <ul style="list-style-type: none"> <li><i>HKEY_CURRENT_USER\Software\Sparx Systems</i> for single users</li> <li><i>HKEY_LOCAL_MACHINE\Software\Sparx Systems</i> for multiple users on a machine</li> </ul>	

Step	Action	See also
		
5	<p>Add a new key under this key with the project name.</p>  <p>( ProjectName ) is not necessarily the name of your DLL, but the name of the Project; in Visual Basic, this is the value for the property <b>Name</b> corresponding to the project file.</p>	
6	<p>Specify the default value by modifying the default value of the key.</p> 	
7	<p>Enter the value of the key by typing in the ( project name ) . ( class name )</p> <p>EaRequirements. Requirements</p> <p>where <i>EaRequirements</i> is the project name, as shown in the example below:</p>	

Step	Action	See also
		

### 20.3.1.1.3 Tricks and Traps

#### Topics

Topic	Detail	See also
<b>Visual Basic 5/6 Users Note</b>	<p>Visual Basic 5/6 users should note that the version number of the Enterprise Architect interface is stored in the VBP project file in a form similar to the following:</p> <pre>Reference=*\G{64FB2BF4-9EFA-11D2-8307-C45586000000}#2.2#0#... \Program Files\Sparx Systems\EA\EA.TLB#Enterprise Architect Object Model 2.02</pre> <p>If you experience problems moving from one version of Enterprise Architect to another, open the VBP file in a text editor and remove this line. Then open the project in Visual Basic and use <i>Project-References</i> to create a new reference to the Enterprise Architect Object model.</p>	
<b>Add-In Fails to Load</b>	<p>From Enterprise Architect release 7.0, Add-Ins created before 2004 are no longer supported. If an Add-In subscribes to the <code>Addn_Tmpl.tlb</code> interface (2003 style), it fails on load. In this event, contact the vendor or author of the Add-In and request an upgrade.</p>	
<b>Holding State Information</b>	<p>It is possible for an Add-In to hold state information, meaning that data can be stored in member variables in response to one event and retrieved in another. There are some dangers in doing this:</p> <ul style="list-style-type: none"> <li>Enterprise Architect Automation Objects do not update themselves in response to user activity, to activity on other workstations, or even to the actions of other objects in the same automation client; retaining handles to such objects between calls can result in the second event querying objects that have no relationship with the current state of Enterprise Architect</li> <li>When you close Enterprise Architect, all Add-Ins are</li> </ul>	

Topic	Detail	See also
	<p>asked to shut down; if there are any external automation clients Enterprise Architect must stay active, in which case all the Add-Ins are reloaded, losing all the data</p> <ul style="list-style-type: none"> <li>Enterprise Architect acting as an automation client does not close if an Add-In still holds a reference to it (releasing all references in the <code>Disconnect()</code> event avoids this problem)</li> </ul> <p>It is recommended that unless there is a specific reason for doing so, the Add-In should use the repository parameter and its method and properties to provide the necessary data.</p>	
<b>Enterprise Architect Not Closing</b>	<p><b>.NET Specific Issues</b></p> <p>Automation checks the use of objects and won't enable any of them to be destroyed until they are no longer being used.</p> <p>As noted in the <i>Automation Interface</i> topic, if your automation controller was written using the .NET framework, Enterprise Architect does not close even after you release all your references to it. To force the release of the COM pointers, call the memory management functions as shown below:</p> <pre>GC. Collect(); GC. WaitForPendingFinalizers();</pre> <p>Additionally, because automation clients hook into Enterprise Architect, which creates Add-Ins which in turn hook back into Enterprise Architect, it is possible to get into a deadlock situation where Enterprise Architect and the Add-Ins won't let go of one another and keep each other active. An Add-In might retain hooks into Enterprise Architect because:</p> <ul style="list-style-type: none"> <li>It keeps a private reference to an Enterprise Architect object (see <b>Holding State Information</b> above), or</li> <li>It has been created by .NET and the GC mechanism hasn't got around to releasing it</li> </ul> <p>There are two actions required to avoid deadlock situations:</p> <ul style="list-style-type: none"> <li>Automation controllers must call <code>Repository.CloseAddIns()</code> at some point (presumably at the end of processing)</li> <li>Add-Ins must release all references to Enterprise Architect in the <code>Disconnect()</code> event; see the <i>Add-In Events</i> topic for details</li> </ul> <p>It is possible that your Automation client controls a running instance of Enterprise Architect where the Add-Ins have not complied with the rule above. In this case you could call <code>Repository.Exit()</code> to terminate Enterprise Architect.</p> <p><b>Miscellaneous</b></p>	<p><a href="#">Automation Interface</a> <sup>[2809]</sup></p> <p><a href="#">Holding State Information</a> <sup>[3018]</sup></p> <p><a href="#">Add-In Events</a> <sup>[3021]</sup></p>

Topic	Detail	See also
	<p>In developing Add-Ins using the .Net framework you must select COM Interoperability in the project's properties in order for it to be recognized as an Add-In.</p> <p>Some development environments do not automatically register COM DLLs on creation. You might have to do that manually before Enterprise Architect recognizes the Add-In.</p> <p>You can use your private Add-In key (as required for Add-In deployment) to store configuration information pertinent to your Add-In.</p>	
<b>Concurrent Calls</b>	<p>In Enterprise Architect releases up to release 7.0, there is a possibility that Enterprise Architect could call two Add-In methods concurrently if the Add-In calls:</p> <ul style="list-style-type: none"> <li>• A message box</li> <li>• A modal dialog</li> <li>• VB DoEvents, .NET Application DoEvents or the equivalent in other languages</li> </ul> <p>In such cases, Enterprise Architect could initiate a second Add-In method before the first returns (re-entrancy). In release 7.0. and subsequent releases, Enterprise Architect cannot make such concurrent calls.</p> <p>If developing Add-Ins, ensure that the Add-In users are running Enterprise Architect release 7.0 or a later release to avoid any risk of concurrent method calls.</p>	

### 20.3.2 The Add-In Manager

If you want to check what Add-Ins are available on your system, and enable or disable them for use, you can review the Add-In Manager dialog. This dialog lists the Add-Ins that have been registered on your system, and their current status (**Enabled** or **Disabled**).

Access **Extensions | Manage Add-Ins**

#### Enable/disable Add-Ins

Action	Detail
<b>Enable an Add-In</b>	<p>To enable an Add-In so that it is available for use, select the <b>Load on Startup</b> check box to the left of the name.</p> <p>Click on the <b>OK</b> button.</p> <ul style="list-style-type: none"> <li>• Any Add-In specific features, facilities and Help are made available through the <b>Extensions   &lt;add-in name&gt;</b> menu option</li> <li>• Any defined Add-In windows are populated with information; select <b>Extensions   Add-In Windows</b></li> </ul>

Action	Detail
<b>Disable an Add-In</b>	<p>To disable an Add-In so that it is not available for use, clear the <b>Load on Startup</b> check box against the name.</p> <p>Click on the <b>OK</b> button.</p> <p>All menu options, features and facilities specific to the Add-In are hidden and made inactive.</p>

**Notes**

- When you enable or disable an Add-In, you must re-start Enterprise Architect to action the change

**20.3.3 Add-In Search****Topics**

Topic	Detail	See also								
<b>General Usage</b>	Enterprise Architect enables Extensions to integrate with the Model Search. Searches can be defined that execute a method within your Add-In and display your results in an integrated way.  The method that runs the search must be structured in the following way:  <pre>variant &lt;method name&gt; (Rep as Repository, SearchText as String, XMLResults as String)</pre>	<a href="#">Model Search</a> <sup>[700]</sup>  <a href="#">Search Data Format</a> <sup>[3020]</sup>								
	<table><tr><th>Parameter</th><th>Description</th></tr><tr><td><b>Rep</b></td><td>The currently open repository.</td></tr><tr><td><b>SearchText</b></td><td>An optional field that you can fill in through the M</td></tr><tr><td><b>XMLResults</b></td><td>At completion of the method, this should contain the search. The results should be an XML string the <b>Search Data Format</b>.</td></tr></table>	Parameter	Description	<b>Rep</b>	The currently open repository.	<b>SearchText</b>	An optional field that you can fill in through the M	<b>XMLResults</b>	At completion of the method, this should contain the search. The results should be an XML string the <b>Search Data Format</b> .	
Parameter	Description									
<b>Rep</b>	The currently open repository.									
<b>SearchText</b>	An optional field that you can fill in through the M									
<b>XMLResults</b>	At completion of the method, this should contain the search. The results should be an XML string the <b>Search Data Format</b> .									

Topic	Detail	See also
<b>Return</b>	The method must return a value for the results to be displayed.	
<b>Advanced Usage</b>	<p>In addition to the displayed results, two additional hidden fields can be passed into the XML that provide special functionality.</p> <p><b>CLASSTYPE</b></p> <p>Returning a field of CLASSTYPE, containing the <i>Object_Type</i> value from the <i>t_object</i> table, displays the appropriate icon in the column you place the field.</p> <p><b>CLASSGUID</b></p> <p>Returning a field of CLASSGUID, containing an <i>ea_guid</i> value, enables the Model Search to track the object in the Project Browser and open the Properties window for the element by double-clicking in the Model Search.</p>	

### 20.3.3.1 XML Format (Search Data)

#### Topics

Topic	Detail	See also
<b>General Usage</b>	The XML below provides the format for the <i>sSearchData</i> parameter of the <i>RunModelSearch</i> method.	<a href="#">Repository</a> [2869]
<b>Example Code</b>	<pre> &lt;Report ViewData UID=\ " My SearchID\ " &gt;   &lt;!--     // The UID attribute enables XML type     searches to persist column information. That     is, if you run the search, group by column or     adjust column widths, then close the window     and run the search again, the format/     organization changes are retained. To avoid     persisting column arrangements, leave the     attribute value blank or remove it altogether.     // Use this section to declare all possible     fields - columns that appear in Enterprise     Architect's search window - that are used     below in &lt;Rows/&gt;.     // The order of the columns of information     to be appended here must match the order that     the search run in Enterprise Architect would     normally display.     // Furthermore, if you append results onto     a custom SQL Search, then the order used in     your Custom SQL must match the order used     below.     --&gt;      &lt;Fields&gt;       &lt;Field name="" /&gt;       &lt;Field name="" /&gt;       &lt;Field name="" /&gt; </pre>	

Topic	Detail	See also
	<pre>         &lt;Field name="" /&gt;       &lt;/Fields&gt;        &lt;Rows&gt;         &lt;Row&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;         &lt;/Row&gt;         &lt;Row&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;         &lt;/Row&gt;         &lt;Row&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;           &lt;Field name="" value="" /&gt;         &lt;/Row&gt;       &lt;/Rows&gt;     &lt;/ReportViewData&gt; </pre>	

### 20.3.4 Add-In Events

All Enterprise Architect Add-Ins can choose to respond to the following general Add-In events:

Topic	Link
<i>EA_Connect</i> - enables Add-Ins to identify their type and to respond to Enterprise Architect start up.	<a href="#">EA_Connect</a> <sup>[3022]</sup>
<i>EA_Disconnect</i> - enables the Add-In to respond to user requests to disconnect the model branch from an external project.	<a href="#">EA_Disconnect</a> <sup>[3023]</sup>
<i>EA_GetMenuItems</i> - enables the Add-In to provide the Enterprise Architect user interface with additional Add-In menu options in various context and main menus.	<a href="#">EA_GetMenuItems</a> <sup>[3023]</sup>
<i>EA_MenuClick</i> - received by an Add-In in response to user selection of a menu option.	<a href="#">EA_MenuClick</a> <sup>[3025]</sup>
<i>EA_GetMenuState</i> - enables the Add-In to set a particular menu option to either enabled or disabled.	<a href="#">EA_GetMenuState</a> <sup>[3024]</sup>
<i>EA_ShowHelp</i> - enables the Add-In to show a help topic for a particular menu option.	<a href="#">EA_ShowHelp</a> <sup>[3029]</sup>

Topic	Link
<i>EA_OnOutputItemClicked</i> - informs Add-Ins that the user has clicked on a list entry in the system tab or one of the user defined output tabs.	<a href="#">EA_OnOutputItemClicked</a> 
<i>EA_OnOutputItemDoubleClicked</i> - informs Add-Ins that the user has used the mouse to double-click on a list entry in one of the user-defined output tabs.	<a href="#">EA_OnOutputItemDoubleClicked</a> 

### 20.3.4.1 EA\_Connect

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_Connect</i> events enable Add-Ins to identify their type and to respond to Enterprise Architect start up.</p> <p>This event occurs when Enterprise Architect first loads your Add-In. Enterprise Architect itself is loading at this time so that while a Repository object is supplied, there is limited information that you can extract from it.</p> <p>The chief uses for <i>EA_Connect</i> are in initializing global Add-In data and for identifying the Add-In as an MDG Add-In.</p>	<a href="#">MDG Add-In</a>  <a href="#">EA_Disconnect</a> 

#### Syntax:

**Function** *EA\_Connect*(*Repository As EA.Repository*) *As String*

The *EA\_Connect* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

A string identifying a specialized type of Add-In:

Type	Details
"MDG"	MDG Add-Ins receive <a href="#">MDG Events</a>  and extra menu options.

Type	Details
""	A non-specialized Add-In.

### 20.3.4.2 EA\_Disconnect

#### Topics

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_Disconnect</i> event enables the Add-In to respond to user requests to disconnect the model branch from an external project.</p> <p>This function is called when the Enterprise Architect closes. If you have stored references to Enterprise Architect objects (not particularly recommended anyway), you must release them here.</p> <p>In addition, .NET users must call memory management functions as shown below:</p> <pre>GC. Collect ( ) ; GC. Wait For PendingFinalizers ( ) ;</pre>	<a href="#">EA_Connect</a> <sup>[3022]</sup>

#### Syntax:

*Sub* EA\_Disconnect()

#### Return Value:

None.

### 20.3.4.3 EA\_GetMenuItems

#### Topics

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_GetMenuItems</i> event enables the Add-In to provide the Enterprise Architect user interface with additional Add-In menu options in various context and main menus. When a user selects an Add-In menu option, an event is raised and passed back to the Add-In that originally defined that menu option.</p> <p>This event is raised just before Enterprise Architect has to show particular menu options to the user, and its use is described in the <i>Define Menu Items</i> topic.</p>	<a href="#">Define Menu Items</a> <sup>[3013]</sup> <a href="#">EA_MenuClick</a> <sup>[3025]</sup> <a href="#">EA_GetMenuState</a> <sup>[3024]</sup>

Topic	Detail	See also

**Syntax:**

**Function** *EA\_GetMenuItems*(*Repository As EA.Repository, MenuLocation As String, MenuName As String*) *As Variant*

The *EA\_GetMenuItems* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>MenuLocation</b>	<i>String</i>		A string representing the part of the user interface that brought up the menu. This can be <i>TreeView</i> , <i>MainMenu</i> or <i>Diagram</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu this is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

One of the following types:

- A string indicating the label for a single menu option
- An array of strings indicating a multiple menu options
- Empty (Visual Basic/VB.NET) or null (C#) to indicate that no menu should be displayed

In the case of the top-level menu it should be a single string or an array containing only one item, or empty/null.

#### 20.3.4.4 *EA\_GetMenuState*

**Topics**

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_GetMenuState</i> event enables the Add-In to set a particular menu option to either enabled or disabled. This is useful when dealing with locked packages and other situations where it is convenient to show a menu option, but not enable it for use.</p> <p>This event is raised just before Enterprise Architect has to show particular menu options to the user. Its use is described in the <i>Define Menu Items</i> topic.</p>	<a href="#">Define Menu Items</a>  <a href="#">EA_GetMenuItems</a> 

Topic	Detail	See also

**Syntax:**

**Sub EA\_GetMenuState**(*Repository as EA.Repository, MenuLocation As String, MenuName as String, ItemName as String, IsEnabled as Boolean, IsChecked as Boolean*)

The *EA\_GetMenuState* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>IsChecked</b>	<i>Boolean</i>		Set to <b>True</b> to check this particular menu option.
<b>IsEnabled</b>	<i>Boolean</i>		Set to <b>False</b> to disable this particular menu option.
<b>ItemName</b>	<i>String</i>		The name of the option actually clicked; for example, <i>Create a New Invoice</i> .
<b>MenuLocation</b>	<i>String</i>		A string representing the part of the user interface that brought up the menu. This can be <i>TreeView</i> , <i>MainMenu</i> or <i>Diagram</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items must be defined.  In the case of the top-level menu it is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

**20.3.4.5 EA\_MenuClick****Topics**

Topic	Detail	See also
<b>Details</b>	<i>EA_MenuClick</i> events are received by an Add-In in response to user selection of a menu option.	<a href="#">Repository</a> <small>[2850]</small>  <a href="#">EA_GetMenuItems</a>

Topic	Detail	See also
	<p>The event is raised when the user clicks on a particular menu option. When a user clicks on one of your non-parent menu options, your Add-In receives a <i>MenuClick</i> event, defined as follows:</p> <pre>Sub EA_MenuClick( Repository As EA. Repository, ByVal MenuName As String, ByVal ItemName As String)</pre> <p>The code below illustrates an example of use:</p> <pre>    If MenuName = "- &amp;Diagram" And ItemName = "&amp;Properties" then         MsgBox Repository. Get Current Diagram Name, vbInformation     Else         MsgBox "Not Implemented", vbCritical     End If</pre> <p>Notice that your code can directly access Enterprise Architect data and UI elements using <b>Repository</b> methods.</p>	

**Syntax:**

***Sub EA\_MenuClick(Repository As EA.Repository, MenuLocation As String, MenuName As String, ItemName As String)***

The *EA\_GetMenuClick* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>ItemName</b>	<i>String</i>		The name of the option actually clicked, for example, <i>Create a New Invoice</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items are to be defined.  In the case of the top-level menu this is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

### 20.3.4.6 EA\_OnOutputItemClicked

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnOutputItemClicked</i> events inform Add-Ins that the user has clicked on a list entry in the system tab or one of the user defined output tabs.</p> <p>Usually an Add-In responds to this event in order to capture activity on an output tab they had previously created through a call to <i>Repository.AddTab()</i>.</p> <p>Note that every loaded Add-In receives this event for every click on an output tab in Enterprise Architect, irrespective of whether the Add-In created that tab. Add-Ins should therefore check the <i>TabName</i> parameter supplied by this event to ensure that they are not responding to other Add-Ins' events.</p>	<a href="#">EA_OnOutputItemDoubleClicked</a> <sup>[3028]</sup>

#### Syntax:

**EA\_OnOutputItemClicked**(*Repository As EA.Repository, TabName As String, LineText As String, ID As Long*)

The *EA\_OnOutputItemClicked* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>ID</b>	<i>Long</i>	IN	The ID value specified in the original call to <i>Repository.WriteOutput()</i> .
<b>LineText</b>	<i>String</i>	IN	The text that had been supplied as the String parameter in the original call to <i>Repository.WriteOutput()</i> .
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>TabName</b>	<i>String</i>	IN	The name of the tab that the click occurred in. Usually this would have been created through <i>Repository.AddTab()</i> .

#### Return Value:

None.

### 20.3.4.7 EA\_OnOutputItemDoubleClicked

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnOutputItemDoubleClicked</i> events informs Add-Ins that the user has used the mouse to double-click on a list entry in one of the user-defined output tabs.</p> <p>Usually an Add-In responds to this event in order to capture activity on an output tab they had previously created through a call to <i>Repository.AddTab()</i>.</p> <p>Note that every loaded Add-In receives this event for every double-click on an output tab in Enterprise Architect, irrespective of whether the Add-In created that tab; Add-Ins should therefore check the <i>TabName</i> parameter supplied by this event to ensure that they are not responding to other Add-Ins' events.</p>	<a href="#">EA_OnOutputItemClicked</a> [3027]

#### Syntax:

**EA\_OnOutputItemDoubleClicked**(*Repository As EA.Repository, TabName As String, LineText As String, ID As Long*)

The *EA\_OnOutputItemClicked* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>ID</b>	<i>Long</i>	IN	The ID value specified in the original call to <i>Repository.WriteOutput()</i> .
<b>LineText</b>	<i>String</i>	IN	The text that had been supplied as the String parameter in the original call to <i>Repository.WriteOutput()</i> .
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model; poll its members to retrieve model data and user interface status information.
<b>TabName</b>	<i>String</i>	IN	The name of the tab that the click occurred in; usually this would have been created through <i>Repository.AddTab()</i> .

#### Return Value:

None.

### 20.3.4.8 EA\_ShowHelp

#### Topics

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_ShowHelp</i> event enables the Add-In to show a help topic for a particular menu option. When the user has an Add-In menu option selected, pressing ( <b>F1</b> ) can be related to the required Help topic by the Add-In and a suitable help message shown.</p> <p>This event is raised when the user presses ( <b>F1</b> ) on a menu option that is not a parent menu.</p>	<a href="#">EA_GetMenuItems</a> 

#### Syntax:

**Sub** EA\_ShowHelp(*Repository* as EA.Repository, *MenuLocation* As String, *MenuName* as String, *ItemName* as String)

The *EA\_ShowHelp* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>ItemName</b>	<i>String</i>		The name of the option actually clicked, for example, <b>Create a New Invoice</b> .
<b>MenuLocation</b>	<i>String</i>		A string representing the part of the user interface that brought up the menu. This can be <i>Treeview</i> , <i>MainMenu</i> or <i>Diagram</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu this is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value:

None.

### 20.3.5 Broadcast Events

#### Overview

The following general Broadcast events are sent to all loaded Add-Ins. For an Add-In to receive the event, they must first implement the required automation event interface. If Enterprise Architect detects that the Add-

If it has the required interface, the event is dispatched to the Add-In.

**MDG Events** add quite a number of additional events, but the Add-In must first have registered as an MDG-style Add-In, rather than as a generic Add-In.

#### Learn more

- [MDG Events](#) 

### 20.3.5.1 Add-In License Management Events

Enterprise Architect Add-Ins can respond to the following events associated with Add-In License Management:

Event	Link
EA_AddinLicenseValidate	<a href="#">EA_AddinLicenseValidate</a> 
EA_AddinLicenseGetDescription	<a href="#">EA_AddinLicenseGetDescription</a> 
EA_GetSharedAddinName	<a href="#">EA_GetSharedAddinName</a> 

#### Learn more

- [Register Add-In](#) 

#### 20.3.5.1.1 EA\_AddinLicenseValidate

##### Description

When a user directly enters a license key that doesn't match a Sparx Systems key into the License Management dialog **EA\_AddinLicenseValidate** is broadcast to all Enterprise Architect Add-Ins, providing them with a chance to use the Add-In key to determine the level of functionality to provide. When a key is retrieved from the Sparx Systems Keystore only the target Add-In will be called with the key.

For the Add-In to validate itself against this key, the Add-In's **EA\_AddinLicenseValidate** handler should return **true** to confirm that the license has been validated. As the **EA\_AddinLicenseValidate** event is broadcast to all Add-Ins, one license can validate many Add-Ins.

If an Add-In elects to handle a license key by returning **true** to **EA\_AddinLicenseValidate**, it is called upon to provide a description of the license key through the **EA\_AddinLicenseGetDescription** event. If more than one Add-In elects to handle a license key, the first Add-In that returns **true** to **EA\_AddinLicenseValidate** is

queried for the license key description.

### Syntax

**Function** *EA\_AddInLicenseValidate (Repository As EA.Repository, AddinKey As String) As Boolean*

Parameter	Type	Direction	Description
<b>AddinKey</b>	<i>String</i>	IN	The Add-in license key that has been entered in the License Management dialog.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <b>EA.Repository</b> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

For the Add-in to validate against this key it should return **true** to indicate that the key is valid and has been handled.

- [EA\\_AddInLicenseGetDescription](#)  
[3032]
- [EA\\_GetSharedAddinName](#)  
[3033]

#### 20.3.5.1.2 EA\_AddInLicenseGetDescription

### Description

Before the Enterprise Architect License Management dialog is displayed, *EA\_AddInLicenseGetDescription* is sent once for each Add-In key to the first Add-In that elected to handle that key.

The value returned by *EA\_AddInLicenseGetDescription* is used as the key's plain text description.

### Syntax

**Function** *EA\_AddInLicenseGetDescription (Repository as EA.Repository, AddinKey as String) As String*

Parameter	Type	Direction	Description
<b>AddinKey</b>	<i>String</i>	IN	The Add-In license key that Enterprise Architect requires a description for.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An EA.Repository object representing the currently open model. Poll its members to retrieve model data and user interface status information.

Parameter	Type	Direction	Description

### Return Value

A String containing a plain text description of the provided AddinKey.

### Learn more

- [EA\\_AddinLicenseValidate](#)  <sup>[3031]</sup>
- [EA\\_GetSharedAddinName](#)  <sup>[3033]</sup>

#### 20.3.5.1.3 *EA\_GetSharedAddinName*

### Description

As an add-in writer you can distribute keys to your add-in via the Enterprise Architect Keystore providing your keys are generated using a prefix that allows Enterprise Architect to identify the add-in to which they belong. *EA\_GetSharedAddinName* is called by Enterprise Architect to determine what prefix an add-in is using. If a matching key is found in the keystore the License Management dialog will display the name returned by *EA\_AddinLicenseGetDescription* to your users. Finally, when the user selects a key, that key will be passed to your add-in to validate by calling *EA\_AddinLicenseValidate*.

### Syntax

**Function** *EA\_GetSharedAddinName (Repository as EA.Repository) As String*

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a>  <sup>[2850]</sup>	IN	An EA.Repository object representing the currently open model. Poll its members to retrieve model data and user interface status information.

### Return Value

A String containing a product name code for the provided Add-In. This will be shown in plain text at the start of any keys added to the keystore. We recommend contacting Sparx Systems directly with proposed values to ensure you don't clash with any other add-ins.

eg. The following keys would all be interpreted as belonging to an add-in returning "MYADDIN" from this function:

- MYADDIN-Test
- MYADDIN-{7AC4D426-9083-4fa2-93B7-25E2B7FB8DC5}
- MYADDIN-7AC4D426-9083-4fa2-93B7
- MYADDIN-25E2B7FB8DC5

**20.3.5.2 Compartment Events**

Enterprise Architect Add-Ins can respond to the following events associated with user-generated element compartments:

Topic	Link
EA_QueryAvailableCompartments	<a href="#">EA_QueryAvailableCompartments</a> <sup>[3034]</sup>
EA_GetCompartmentData	<a href="#">EA_GetCompartmentData</a> <sup>[3035]</sup>

**20.3.5.2.1 EA\_QueryAvailableCompartments**Topics

Topic	Detail	See also
<b>Details</b>	<p>This event occurs when Enterprise Architect's diagrams are refreshed. It is a request for the Add-In to provide a list of user-defined compartments.</p> <p>The <i>EA_GetCompartmentData</i> event then queries each object for the data to display in each user-defined compartment.</p>	<a href="#">EA_GetCompartmentData</a> <sup>[3035]</sup>

Syntax:

**Function** *EA\_QueryAvailableCompartments(Repository As EA.Repository) As Variant*

The *EA\_QueryAvailableCompartments* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

Return Value:

A *String* containing a comma-separated list of user-defined compartments.

**Example**

```

Function EA_QueryAvailableCompartments(Repository As EA.Repository) As Variant
    Dim sReturn As String
    sReturn = ""
    If m_FirstCompartmentVisible = True Then
        sReturn = sReturn + "first,"
    End If
    If m_SecondCompartmentVisible = True Then
        sReturn = sReturn + "second,"
    End If
    If m_ThirdCompartmentVisible = True Then
        sReturn = sReturn + "third,"
    End If

    If Len(sReturn) > 0 Then
        sReturn = Left(sReturn, Len(sReturn) - 1)
    End If

    EA_QueryAvailableCompartments = sReturn
End Function

```

**20.3.5.2.2 EA\_GetCompartmentData****Topics**

Topic	Detail	See also
<b>Details</b>	This event occurs when Enterprise Architect is instructed to redraw an element. It requests that the Add-In provide the data to populate the element's compartment.	

**Syntax:**

**Function** EA\_GetCompartmentData(*Repository As EA.Repository, sCompartment As String, sGUID As String, oType As EA.ObjectType*) **As Variant**

The *EA\_QueryAvailableCompartments* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>oType</b>	<i>ObjectType</i>	IN	The type of the element for which data is being requested.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>sCompartment</b>	<i>String</i>	IN	The name of the compartment for which data is being requested.
<b>sGUID</b>	<i>String</i>	IN	The GUID of the element for which data is being requested.

Parameter	Type	Direction	Description

**Return Value:**

A variant containing a formatted string. See the example below to view the format.

**Example**

```

Function EA_GetCompartmentData(Repository As EA.Repository, sCompartment
As String, sGUID As String, oType As EA.ObjectType) As Variant

### 20.3.5.3 Context Item Events

Enterprise Architect Add-Ins can respond to the following events associated with changing context:

Topic	Link
EA_OnContextItemChanged	<a href="#">EA_OnContextItemChanged</a> 
EA_OnContextItemDoubleClicked	<a href="#">EA_OnContextItemDoubleClicked</a> 
EA_OnNotifyContextItemModified	<a href="#">EA_OnNotifyContextItemModified</a> 

#### 20.3.5.3.1 EA\_OnContextItemChanged

##### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnContextItemChanged</i> notifies Add-Ins that a different item is now in context.</p> <p>This event occurs after a user has selected an item anywhere in the Enterprise Architect GUI. Add-Ins that require knowledge of the current item in context can subscribe to this broadcast function. If <b>ot = otRepository</b>, then this function behaves the same as <i>EA_FileOpen</i>.</p>	<p><a href="#">EA_FileOpen</a> </p> <p><a href="#">EA_OnContextItemDoubleClicked</a> </p> <p><a href="#">EA_OnNotifyContextItemModified</a> </p>

##### Syntax:

**Sub** EA\_OnContextItemChanged(*Repository As EA.Repository, GUID As String, ot as EA.ObjectType*)

The *EA\_OnContextItemChanged* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>GUID</b>	<i>String</i>	IN	<p>Contains the GUID of the new context item. This value corresponds to the following properties, depending on the value of the <b>ot</b> parameter:</p> <p><i>ot (ObjectType)</i> - GUID value</p> <p><i>otElement</i> - <i>Element.ElementGUID</i></p> <p><i>otPackage</i> - <i>Package.PackageGUID</i></p> <p><i>otDiagram</i> - <i>Diagram.DiagramGUID</i></p> <p><i>otAttribute</i> - <i>Attribute.AttributeGUID</i></p> <p><i>otMethod</i> - <i>Method.MethodGUID</i></p> <p><i>otConnector</i> - <i>Connector.ConnectorGUID</i></p> <p><i>otRepository</i> - NOT APPLICABLE, GUID is an empty string</p>
<b>ot</b>	<i>EA.ObjectType</i>	IN	Specifies the type of the new context item.
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

**20.3.5.3.2 EA\_OnContextItemDoubleClicked****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnContextItemDoubleClicked</i> notifies Add-Ins that the user has double-clicked the item currently in context.</p> <p>This event occurs when a user has double-clicked (or pressed ( <b>Enter</b> ) ) on the item in context, either in a diagram or in the Project Browser. Add-Ins to handle events can subscribe to this broadcast function.</p>	<p><a href="#">EA_OnContextItemChanged</a> [3037]</p> <p><a href="#">EA_OnNotifyContextItemModified</a> [3039]</p>

**Syntax:**

**Function** *EA\_OnContextItemDoubleClicked*(*Repository As EA.Repository, GUID As String, ot as EA.ObjectType*)

The *EA\_OnContextItemDoubleClicked* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>GUID</b>	<i>String</i>	IN	Contains the GUID of the new context item. This value corresponds to the following properties, depending on the value of the <b>ot</b> parameter:  <i>ot (ObjectType)</i> - <i>GUID value</i> <i>otElement</i> - <i>Element.ElementGUID</i> <i>otPackage</i> - <i>Package.PackageGUID</i> <i>otDiagram</i> - <i>Diagram.DiagramGUID</i> <i>otAttribute</i> - <i>Attribute.AttributeGUID</i> <i>otMethod</i> - <i>Method.MethodGUID</i> <i>otConnector</i> - <i>Connector.ConnectorGUID</i>
<b>ot</b>	<i>EA.ObjectType</i>	IN	Specifies the type of the new context item.
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** to notify Enterprise Architect that the double-click event has been handled by an Add-In.

Return **False** to enable Enterprise Architect to continue processing the event.

**20.3.5.3.3 EA\_OnNotifyContextItemModified****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnNotifyContextItemModified</i> notifies Add-Ins that the current context item has been modified.</p> <p>This event occurs when a user has modified the context item. Add-Ins that require knowledge of when an item has been modified can subscribe to this broadcast function.</p>	<p><a href="#">EA_OnContextItemChanged</a> [3037]</p> <p><a href="#">EA_OnContextItemDoubleClicked</a> [3038]</p>

**Syntax:**

**Sub EA\_OnNotifyContextItemModified(Repository As EA.Repository, GUID As String, ot as EA.ObjectType)**

The *EA\_OnNotifyContextItemModified* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>GUID</b>	<i>String</i>	IN	<p>Contains the GUID of the new context item. This value corresponds to the following properties, depending on the value of the <b>ot</b> parameter:</p> <ul style="list-style-type: none"> <li>• <i>ot(ObjectType)</i> - <i>GUID value</i></li> <li>• <i>otElement</i> - <i>Element.ElementGUID</i></li> <li>• <i>otPackage</i> - <i>Package.PackageGUID</i></li> <li>• <i>otDiagram</i> - <i>Diagram.DiagramGUID</i></li> <li>• <i>otAttribute</i> - <i>Attribute.AttributeGUID</i></li> <li>• <i>otMethod</i> - <i>Method.MethodGUID</i></li> <li>• <i>otConnector</i> - <i>Connector.ConnectorGUID</i></li> </ul>
<b>ot</b>	<i>EA.ObjectType</i>	IN	Specifies the type of the new context item.
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

**20.3.5.4 EA\_FileClose****Topics**

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_FileClose</i> event enables the Add-In to respond to a File Close event. When Enterprise Architect closes an opened Model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>This event occurs when the model currently opened within Enterprise Architect is about to be closed (when another model is about to be opened or when Enterprise Architect is about to shutdown)..</p>	<a href="#">EA_FileOpen</a> [3042] <a href="#">EA_FileNew</a> [3041]

**Syntax:*****Sub EA\_FileClose(Repository As EA.Repository)***The *EA\_FileClose* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the Enterprise Architect model about to be closed.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

### 20.3.5.5 *EA\_FileNew*

**Topics**

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_FileNew</i> event enables the Add-In to respond to a <i>File New</i> event. When Enterprise Architect creates a new model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>The event occurs when the model being viewed by the Enterprise Architect user changes, for whatever reason (through user interaction or Add-In activity).</p>	<a href="#">EA_FileClose</a> <small>[3040]</small> <a href="#">EA_FileOpen</a> <small>[3042]</small>

**Syntax:*****Sub EA\_FileNew (Repository As EA.Repository)***

The *EA\_FileNew* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

### 20.3.5.6 *EA\_FileOpen*

#### Topics

Topic	Detail	See also
<b>Details</b>	<p>The <i>EA_FileOpen</i> event enables the Add-In to respond to a <i>File Open</i> event. When Enterprise Architect opens a new model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>The event occurs when the model being viewed by the Enterprise Architect user changes, for whatever reason (through user interaction or Add-In activity).</p>	<a href="#">EA_FileClose</a> <sup>[3040]</sup> <a href="#">EA_FileNew</a> <sup>[3041]</sup>

#### Syntax:

**Sub** *EA\_FileOpen*(*Repository As EA.Repository*)

The *EA\_FileOpen* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

#### Return Value:

None.

### 20.3.5.7 *EA\_OnPostCloseDiagram*

#### Topics

Topic	Detail	See also
<b>Details</b>	<i>EA_OnPostCloseDiagram</i> notifies Add-Ins that a diagram has been closed.	<a href="#">EA_OnPostOpenDiagram</a> <sup>[3044]</sup>

#### Syntax:

**Function** *EA\_OnPostCloseDiagram*(*Repository As EA.Repository, DiagramID As Integer*)

The *EA\_OnPostCloseDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>DiagramID</b>	<i>Integer</i>	IN	Contains the Diagram ID of the diagram that was closed.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the Enterprise Architect model about to be closed.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

**20.3.5.8 EA\_OnPostInitialized****Topics**

Topic	Detail	See also
<b>Details</b>	<i>EA_OnPostInitialized</i> notifies Add-Ins that the Repository object has finished loading and any necessary initialization steps can now be performed on the object.  For example, the Add-In can create an Output tab using <i>Repository.CreateOutputTab</i> .	<a href="#">Repository.CreateOutputTab</a> <small>[2857]</small>

**Syntax:*****Sub EA\_OnPostInitialized(Repository As EA.Repository)***The *EA\_OnPostInitialized* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

### 20.3.5.9 EA\_OnPostOpenDiagram

#### Topics

Topic	Detail	See also
<b>Details</b>	<i>EA_OnPostOpenDiagram</i> notifies Add-Ins that a diagram has been opened.	<a href="#">EA_OnPostCloseDiagram</a> <small>[3042]</small>

#### Syntax:

**Function** *EA\_OnPostOpenDiagram*(*Repository As EA.Repository, DiagramID As Integer*)

The *EA\_OnPostOpenDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>DiagramID</b>	<i>Integer</i>	IN	Contains the Diagram ID of the diagram that was opened.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value:

None.

### 20.3.5.10 EA\_OnPostTransform

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostTransform</i> notifies Add-Ins that an MDG transformation has taken place with the output in the specified target package.</p> <p>This event occurs when a user runs an MDG transform on one or more target packages; the notification is provided for each transform/target package immediately after all transform processes have completed.</p>	

#### Syntax:

**Function** *EA\_OnPostTransform(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPostTransform* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[2833]</small>	IN	Contains the following <i>EventProperty Objects</i> for the transform performed: <ul style="list-style-type: none"> <li><i>Transform</i>: A string value corresponding to the name of the transform used</li> <li><i>PackageID</i>: A long value corresponding to <i>Package.PackageID</i> of the destination package</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

Reserved for future use.

### 20.3.5.11 *EA\_OnPreExitInstance*

**Details:**

*EA\_OnPreExitInstance* is not currently used.

**Syntax:**

**Sub** *EA\_OnPreExitInstance(Repository As EA.Repository)*

The *EA\_OnPreExitInstance* function syntax contains the following element:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

### 20.3.5.12 EA\_OnRetrieveModelTemplate

#### Description

**EA\_OnRetrieveModelTemplate** requests that an Add-In pass a model template to Enterprise Architect. This event occurs when a user executes the **Add a New Model Using Wizard** command to add a model that has been defined by an MDG Technology.

#### Syntax

**Function** EA\_OnRetrieveModelTemplate(*Repository As EA.Repository, sLocation As String*) *As String*

The **EA\_OnRetrieveModelTemplate** function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <b>EA.Repository</b> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.
<b>sLocation</b>	<i>String</i>	IN	The name of the template requested; this should match the <i>location</i> attribute in the <ModelTemplates> section of an MDG Technology File.

#### Return Value

Return a string containing the XML export of the model that is being used as a template. Return an empty string if access to the template is denied; the Add-In is to handle user notification of the error.

#### Example

```
Public Function EA_OnRetrieveModelTemplate(ByRef Rep As EA.Repository,
ByRef sLocation As String) As String
    Dim sTemplate As String
    Select Case sLocation
        Case "Templates\Template1.xml"
            sTemplate = My.Resources.Template1
        Case "Templates\Template2.xml"
            sTemplate = My.Resources.Template2
        Case "Templates\Template3.xml"
            sTemplate = My.Resources.Template3
        Case Else
            MsgBox("Path for " & sLocation & " not found")
            sTemplate = ""
    End Select
    EA_OnRetrieveModelTemplate = sTemplate
End Function
```

### 20.3.5.13 EA\_OnTabChanged

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnTabChanged</i> notifies Add-Ins that the currently open tab has changed.</p> <p>Diagrams do <b>not</b> generate the message when they are first opened - use the broadcast event <i>EA_OnPostOpenDiagram</i> for this purpose.</p>	<a href="#">EA_OnPostOpenDiagram</a> <sup>[8044]</sup>

#### Syntax

**Function** *EA\_OnTabChanged*(*Repository As EA.Repository, TabName As String, DiagramID As Integer*)

The *EA\_OnTabChanges* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>DiagramID</b>	<i>Long</i>	IN	The diagram ID, or <b>0</b> if switched to an Add-In tab.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	<p>An EA.Repository object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>
<b>TabName</b>	<i>String</i>	IN	The name of the tab to which focus has been switched.

#### Return Value

None

### 20.3.5.14 Model Validation Broadcasts

#### Perform Model Validation from an Add-In

Using Enterprise Architect broadcasts, it is possible to define a set of rules that are evaluated when the user instructs Enterprise Architect to perform model validation. An Add-In that performs model validation would involve the following broadcast events:

Topic	Detail	Link
<b>EA_OnInitializeUserRu</b>	<i>EA_OnInitializeUserRules</i> is intercepted in order to	<a href="#">EA_OnInitializeUserRule</a>

Topic	Detail	Link
<b>les</b>	define rule categories and rules.	<a href="#">s</a> <sup>[3048]</sup>
<b>EA_OnStartValidation</b>	<i>EA_OnStartValidation</i> can be intercepted to perform any required processing prior to validation.	<a href="#">EA_OnStartValidation</a> <sup>[3049]</sup>
<b>Validate Request</b>	The following functions intercept each request to validate an individual element, package, diagram, connector, attribute and method.	
	<i>EA_OnRunElementRule</i>	<a href="#">EA_OnRunElementRule</a> <sup>[3050]</sup>
	<i>EA_OnRunPackageRule</i>	<a href="#">EA_OnRunPackageRule</a> <sup>[3051]</sup>
	<i>EA_OnRunDiagramRule</i>	<a href="#">EA_OnRunDiagramRule</a> <sup>[3052]</sup>
	<i>EA_OnRunConnectorRule</i>	<a href="#">EA_OnRunConnectorRule</a> <sup>[3053]</sup>
	<i>EA_OnRunAttributeRule</i>	<a href="#">EA_OnRunAttributeRule</a> <sup>[3053]</sup>
	<i>EA_OnRunMethodRule</i>	<a href="#">EA_OnRunMethodRule</a> <sup>[3054]</sup>
<b>EA_OnEndValidation</b>	<i>EA_OnEndValidation</i> can be intercepted to perform any required clean-up after validation has completed.	<a href="#">EA_OnEndValidation</a> <sup>[3050]</sup>

**Syntax:**

**Sub EA\_OnRunMethodRule**(*Repository As EA.Repository, RuleID As String, MethodGUID As String, ObjectID As Long*)

The *EA\_OnRunMethodRule* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>MethodGUID</b>	<i>String</i>	IN	The GUID of the method to potentially perform validation on. Use the <i>Repository.GetMethodByGuid</i> method to retrieve the method object.
<b>ObjectID</b>	<i>Long</i>	IN	The ID of the object that owns the given method. Use the <i>Repository.GetElementByID</i> method to retrieve the object.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.
<b>RuleID</b>	<i>String</i>	IN	The ID that was passed into the <i>Project.DefineRule</i> command.

#### 20.3.5.14.10 EA\_OnRunParameterRule

**Topics**

Topic	Detail	See also
<b>Details</b>	<p>This event is triggered once for each rule defined in <i>EA_OnInitializeUserRules</i> to be performed on each parameter in the selection being validated.</p> <p>If you don't want to perform the rule defined by <b>RuleID</b> on the given parameter, then simply return without performing any action.</p> <p>On performing any validation, if a validation error is found, use the <i>Repository.ProjectInterface.PublishResult</i> method to notify Enterprise Architect.</p>	<a href="#">EA_OnInitializeUserRule</a> <small>[3048]</small>

**Syntax**

***Sub EA\_OnRunParameterRule(Repository As EA.Repository, RuleID As String, ParameterGUID As String, MethodGUID As String, ObjectID As Long)***

The *EA\_OnRunMethodRule* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>MethodGUID</b>	<i>String</i>	IN	The GUID of the method that owns the given parameter. Use the <i>Repository.GetMethodByGuid</i> method to retrieve the method object.
<b>ObjectID</b>	<i>Long</i>	IN	The ID of the object that owns the given parameter. Use the <i>Repository.GetElementByID</i> method to retrieve the object.
<b>ParameterGUID</b>	<i>String</i>	IN	The GUID of the parameter to potentially perform validation on. Use this to retrieve the parameter by iterating through the <i>Method.Parameters</i> collection.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>RuleID</b>	<i>String</i>	IN	The ID that was passed into the <i>Project.DefineRule</i> command.

#### 20.3.5.14.11 Model Validation Example

The following example code is written in C# and provides a skeleton model validation implementation that you might like to use as a starting point in writing your own model validation rules.

##### Main.cs

```
using System;

namespace myAddIn
{
    public class Main
    {
        public Rules theRules;

        public Main()
        {
            theRules = new Rules();
        }

        public string EA_Connect(EA.Repository Repository)
        {
            return "";
        }
    }
}
```

```

public void EA_Disconnect()
{
    GC.Collect();
    GC.WaitForPendingFinalizers();
}

private bool IsProjectOpen(EA.Repository Repository)
{
    try
    {
        EA.Collection c = Repository.Models;
        return true;
    }
    catch
    {
        return false;
    }
}

public object EA_GetMenuItems(EA.Repository Repository, string
MenuLocation, string MenuName)
{
    switch (MenuName)
    {

### 20.3.5.15.1 EA\_OnPostNewElement

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostNewElement</i> notifies Add-Ins that a new element has been created on a diagram. It enables Add-Ins to modify the element upon creation.</p> <p>This event occurs after a user has dragged a new element from the Toolbox or Resources window onto a diagram. The notification is provided immediately after the element is added to the model.</p> <p>Set <i>Repository.SuppressEADialogs</i> to <b>true</b> to suppress Enterprise Architect from showing its default properties dialog.</p>	<a href="#">EA_OnPreNewElement</a> 

#### Syntax:

**Function** *EA\_OnPostNewElement*(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPostNewElement* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> 	IN	Contains the following <i>EventProperty</i> objects for the new element: <ul style="list-style-type: none"> <li><i>ElementID</i>: A long value corresponding to <i>Element.ElementID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.

Parameter	Type	Direction	Description
			Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** if the element has been updated during this notification. Return **False** otherwise.

**20.3.5.15.2 EA\_OnPostNewConnector****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostNewConnector</i> notifies Add-Ins that a new connector has been created on a diagram. It enables Add-Ins to modify the connector upon creation.</p> <p>This event occurs after a user has dragged a new connector from the Toolbox or Resources window onto a diagram. The notification is provided immediately after the connector is added to the model.</p>	<a href="#">EA_OnPreNewConnector</a> [3077]

**Syntax:**

**Function** *EA\_OnPostNewConnector*(*Repository* As *EA.Repository*, *Info* As *EA.EventProperties*) As *Boolean*

The *EA\_OnPostNewConnector* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> [2833]	IN	<p>Contains the following <i>EventProperty</i> objects for the new connector:</p> <ul style="list-style-type: none"> <li><i>ConnectorID</i>: A long value corresponding to <i>Connector.ConnectorID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

**Return Value:**

Return **True** if the connector has been updated during this notification. Return **False** otherwise.

### 20.3.5.15.3 EA\_OnPostNewDiagram

#### Topics

Topic	Detail	See also
<b>Details</b>	<i>EA_OnPostNewDiagram</i> notifies Add-Ins that a new diagram has been created. It enables Add-Ins to modify the diagram upon creation.	<a href="#">EA_OnPreNewDiagram</a> [3078]

#### Syntax:

**Function** *EA\_OnPostNewDiagram*(*Repository* As *EA.Repository*, *Info* As *EA.EventProperties*) As *Boolean*

The *EA\_OnPostNewDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> [2833]	IN	Contains the following <i>EventProperty</i> objects for the new diagram: <ul style="list-style-type: none"> <li><i>DiagramID</i>: A long value corresponding to <i>Diagram</i>. <i>PackageID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value:

Return **True** if the diagram has been updated during this notification. Return **False** otherwise.

### 20.3.5.15.4 EA\_OnPostNewDiagramObject

**EA\_OnPostNewDiagramObject** notifies Add-Ins that a new object has been created on a diagram. It enables Add-Ins to modify the object upon creation.

This event occurs after a user has dragged a new object from the Project Browser or Resources window onto a diagram. The notification is provided immediately after the object is added to the diagram.

#### Syntax

**Function** *EA\_OnPostNewDiagramObject*(*Repository* As *EA.Repository*, *Info* As *EA.EventProperties*) As *Boolean*

The *EA\_OnPostNewDiagramObject* function syntax contains the following parameters:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <sup>[2833]</sup>	IN	Contains the following <i>EventProperty</i> objects for the new element: <ul style="list-style-type: none"> <li><i>ID</i>: A long value corresponding to the <i>ElementID</i> of the object that has been added to the diagram</li> <li><i>DiagramID</i>: A long value corresponding to the <i>DiagramID</i> of the diagram to which the object has been added</li> <li><i>DUID</i>: A string value for the DUID; can be used with <i>Diagram.GetDiagramObjectByID</i> to retrieve the new <i>DiagramObject</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value

Return **True** if the element has been updated during this notification. Return **False** otherwise.

### 20.3.5.15.5 EA\_OnPostNewAttribute

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostNewAttribute</i> notifies Add-Ins that a new attribute has been created on a diagram. It enables Add-Ins to modify the attribute upon creation.</p> <p>This event occurs when a user creates a new attribute on an element by either drag-dropping from the Project Browser, using the Attributes Properties dialog, or using the in-place editor on the diagram. The notification is provided immediately after the attribute is created.</p>	<a href="#">EA_OnPreNewAttribute</a> <sup>[3080]</sup>

#### Syntax:

**Function** *EA\_OnPostNewAttribute*(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPostNewAttribute* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> [2833]	IN	Contains the following <i>EventProperty</i> objects for the new attribute: <ul style="list-style-type: none"> <li><i>AttributeID</i>: A long value corresponding to <i>Attribute.AttributeID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** if the attribute has been updated during this notification. Return **False** otherwise.

**20.3.5.15.6 EA\_OnPostNewMethod****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostNewMethod</i> notifies Add-Ins that a new method has been created on a diagram. It enables Add-Ins to modify the method upon creation.</p> <p>This event occurs when a user creates a new method on an element by either drag-dropping from the Project Browser, using the method's Properties dialog, or using the in-place editor on the diagram. The notification is provided immediately after the method is created.</p>	<a href="#">EA_OnPreNewMethod</a> [3081]

**Syntax:**

**Function** *EA\_OnPostNewMethod(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPostNewMethod* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> [2833]	IN	Contains the following <i>EventProperty</i> objects for the new method: <ul style="list-style-type: none"> <li><i>MethodID</i>: A long value corresponding to <i>Method.MethodID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.

Parameter	Type	Direction	Description
			Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** if the method has been updated during this notification. Return **False** otherwise.

**20.3.5.15.7 EA\_OnPostNewPackage****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostNewPackage</i> notifies Add-Ins that a new package has been created on a diagram. It enables Add-Ins to modify the package upon creation.</p> <p>This event occurs when a user drags a new package from the Toolbox or Resources window onto a diagram, or by selecting the <b>New Package</b> icon from the Project Browser.</p>	<a href="#">EA_OnPreNewPackage</a> <small>3062</small>

**Syntax:**

**Function** *EA\_OnPostNewPackage*(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPostNewPackage* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>2833</small>	IN	<p>Contains the following <i>EventProperty</i> objects for the new package:</p> <ul style="list-style-type: none"> <li><i>PackageID</i>: A long value corresponding to <i>Package.PackageID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>2850</small>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

**Return Value:**

Return **True** if the package has been updated during this notification. Return **False** otherwise.

### 20.3.5.15.8 EA\_OnPostNewGlossaryTerm

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPostNewGlossaryTerm</i> notifies Add-Ins that a new glossary term has been created. It enables Add-Ins to modify the glossary term upon creation.</p> <p>The notification is provided immediately after the glossary term is added to the model.</p>	<a href="#">EA_OnPreNewGlossaryTerm</a> 

#### Syntax:

**Function** *EA\_OnPostNewGlossaryTerm*(*Repository* As *EA.Repository*, *Info* As *EA.EventProperties*) As *Boolean*

The *EA\_OnPostNewGlossaryTerm* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> 	IN	<p>Contains the following <i>EventProperty</i> objects for the new glossary term:</p> <ul style="list-style-type: none"> <li><i>ElementID</i>: A long value corresponding to <i>Element.ElementID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

#### Return Value:

Return **True** if the glossary term has been updated during this notification. Return **False** otherwise.

### 20.3.5.16 Pre-Deletion Events

Enterprise Architect Add-Ins can respond to requests to delete elements, attributes, methods, connectors, diagrams, packages and glossary terms using the following broadcast events:

Topic	Link

EA_OnPreDeleteTechnology (Deprecated)	<a href="#">EA_OnPreDeleteTechnology</a>  <sup>[3091]</sup>

#### 20.3.5.16.1 EA\_OnPreDeleteElement

##### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreDeleteElement</i> notifies Add-Ins that an element is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the element.</p> <p>This event occurs when a user deletes an element from the Project Browser or on a diagram. The notification is provided immediately before the element is deleted, so that the Add-In can disable deletion of the element.</p>	

##### Syntax:

**Function** *EA\_OnPreDeleteElement*(*Repository As EA.Repository, Info As EA.EventProperties*) *As Boolean*

The *EA\_OnPreDeleteElement* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a>  <sup>[2833]</sup>	IN	<p>Contains the following <i>EventProperty</i> objects for the element to be deleted:</p> <ul style="list-style-type: none"> <li><i>ElementID</i>: A long value corresponding to <i>Element</i>. <i>ElementID</i></li> </ul>

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An EA.Repository object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** to enable deletion of the element from the model. Return **False** to disable deletion of the element.

**20.3.5.16.2 EA\_OnPreDeleteAttribute****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreDeleteAttribute</i> notifies Add-Ins that an attribute is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the attribute.</p> <p>This event occurs when a user attempts to permanently delete an attribute from the Project Browser. The notification is provided immediately before the attribute is deleted, so that the Add-In can disable deletion of the attribute.</p>	

**Syntax:**

**Function** *EA\_OnPreDeleteAttribute*(*Repository As EA.Repository, Info As EA.EventProperties*) *As Boolean*

The *EA\_OnPreDeleteAttribute* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[2833]</small>	IN	Contains the following <i>EventProperty</i> objects for the attribute to be deleted: <ul style="list-style-type: none"> <li><i>AttributeID</i>: A long value corresponding to <i>Attribute.AttributeID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** to enable deletion of the attribute from the model. Return **False** to disable deletion of the attribute.

**20.3.5.16.3 EA\_OnPreDeleteMethod****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreDeleteMethod</i> notifies Add-Ins that a method (operation) is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the method.</p> <p>This event occurs when a user attempts to permanently delete a method from the Project Browser. The notification is provided immediately before the method is deleted, so that the Add-In can disable deletion of the method.</p>	

**Syntax:**

**Function** *EA\_OnPreDeleteMethod*(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPreDeleteMethod* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> [2833]	IN	<p>Contains the following <i>EventProperty</i> objects for the method to be deleted:</p> <ul style="list-style-type: none"> <li><i>MethodID</i>: A long value corresponding to <i>Method</i>. <i>MethodID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

**Return Value:**

Return **True** to enable deletion of the method from the model. Return **False** to disable deletion of the method.

#### 20.3.5.16.4 EA\_OnPreDeleteConnector

##### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreDeleteConnector</i> notifies Add-Ins that a connector is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the connector.</p> <p>This event occurs when a user attempts to permanently delete a connector on a diagram. The notification is provided immediately before the connector is deleted, so that the Add-In can disable deletion of the connector.</p>	

##### Syntax:

**Function** *EA\_OnPreDeleteConnector*(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPreDeleteConnector* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[2833]</small>	IN	<p>Contains the following <i>EventProperty</i> objects for the connector to be deleted:</p> <ul style="list-style-type: none"> <li><i>ConnectorID</i>: A long value corresponding to <i>Connector.ConnectorID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

##### Return Value:

Return **True** to enable deletion of the connector from the model. Return **False** to disable deletion of the connector.

<b>Details</b>	<p><i>EA_OnPreDeleteDiagram</i> notifies Add-Ins that a diagram is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the diagram.</p>	

Topic	Detail	See also
	This event occurs when a user attempts to permanently delete a diagram from the Project Browser. The notification is provided immediately before the diagram is deleted, so that the Add-In can disable deletion of the diagram.	

**Syntax:**

**Function** *EA\_OnPreDeleteDiagram(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreDeleteDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> 	IN	Contains the following <i>EventProperty</i> objects for the diagram to be deleted: <ul style="list-style-type: none"> <li><i>DiagramID</i>: A long value corresponding to <i>Diagram</i>. <i>DiagramID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	An <i>EA.Repository</i> object representing the currently-open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value:**

Return **True** to enable deletion of the diagram from the model. Return **False** to disable deletion of the diagram.

### 20.3.5.16.6 EA\_OnPreDeleteDiagramObject

**Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreDeleteDiagramObject</i> notifies Add-Ins that a diagram object is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the element.</p> <p>This event occurs when a user attempts to permanently delete an element from a diagram. The notification is provided immediately before the element is deleted, so that the Add-In can disable deletion of the element.</p>	

**Syntax:**

**Function** *EA\_OnPreDeleteDiagramObject*(*Repository As EA.Repository, Info As EA.EventProperties*) *As Boolean*

The *EA\_OnPreDeleteDiagramObject* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>2833</small>	IN	Contains the following <i>EventProperty</i> objects for the element to be deleted: <ul style="list-style-type: none"> <li>ID: A long value corresponding to <i>Diagram Object.ElementID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>2850</small>	IN	An <i>EA.Repository</i> object representing the currently-open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value:

Return **True** to enable deletion of the element from the model. Return **False** to disable deletion of the element.

### 20.3.5.16.7 *EA\_OnPreDeletePackage*

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreDeletePackage</i> notifies Add-Ins that a package is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the package.</p> <p>This event occurs when a user attempts to permanently delete a package from the Project Browser. The notification is provided immediately before the package is deleted, so that the Add-In can disable deletion of the package.</p>	

#### Syntax:

**Function** *EA\_OnPreDeletePackage*(*Repository As EA.Repository, Info As EA.EventProperties*) *As Boolean*

The *EA\_OnPreDeletePackage* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a>	IN	Contains the following <i>EventProperty</i> objects for the package to be deleted:

Parameter	Type	Direction	Description
			<ul style="list-style-type: none"> <li><i>PackageID</i>: A long value corresponding to <i>Package</i>. <i>PackageID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

**Return Value:**

Return **True** to enable deletion of the package from the model. Return **False** to disable deletion of the package.

	<p>diagram object is about to be dropped on a diagram. It enables Add-Ins to permit or deny creation of the new object.</p> <p>This event occurs when a user drags an object from the Enterprise Architect Project Browser or Resources window onto a diagram. The notification is provided immediately before the object is created, so that the Add-In can disable addition of the object.</p>	<a href="#">Object</a> <sup>[3063]</sup>

**Syntax:**

**Function** *EA\_OnPreNewDiagramObject(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreNewDiagramObject* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <sup>[2833]</sup>	IN	<p>Contains the following <i>EventProperty</i> objects for the object to be created:</p> <ul style="list-style-type: none"> <li><i>Type</i>: A string value corresponding to the <i>Type</i> of object being added to the diagram</li> <li><i>Stereotype</i>: A string value corresponding to the <i>Stereotype</i> of the object being added to the diagram</li> <li><i>ID</i>: A long value corresponding to the <i>ID</i> of the Element, Package or Diagram being added to the diagram</li> <li><i>DiagramID</i>: A long value corresponding to the ID of the diagram to which the object is being added</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

**Return Value:**

Return **True** to enable addition of the object to the model. Return **False** to disable addition of the object.

**20.3.5.17.5 EA\_OnPreDropFromTree**

When a user drags any kind of element from the Project Browser onto a diagram, **EA\_OnPreDropFromTree** notifies the Add-In that a new item is about to be dropped onto a diagram. The notification is provided immediately before the element is dropped, so that the Add-In can override the default action that would be taken for this drag.

**Syntax**

**Function** *EA\_OnPreDropFromTree(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The **EA\_OnPreDropFromTree** function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[2833]</small>	IN	Contains the following <b>EventProperty</b> objects for the element to be created: <ul style="list-style-type: none"> <li>• <b>ID</b>: A long value of the type being dropped</li> <li>• <b>Type</b>: A string value corresponding to type of element being dropped</li> <li>• <b>DiagramID</b>: A long value corresponding to the ID of the diagram to which the element is being added</li> <li>• <b>PositionX</b>: The X coordinate into which the element is being dropped</li> <li>• <b>PositionY</b>: The Y coordinate into which the element is being dropped</li> <li>• <b>DroppedID</b>: A long value corresponding to the ID of the element the item has been dropped onto</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <b>EA.Repository</b> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value

Returns **True** to allow the default behavior to be executed. Return **False** if you are overriding this behavior.

#### 20.3.5.17.6 *EA\_OnPreNewAttribute*

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnPreNewAttribute</i> notifies Add-Ins that a new attribute is about to be created on an element. It enables Add-Ins to permit or deny creation of the new attribute.</p> <p>This event occurs when a user creates a new attribute on an element by either drag-dropping from the Project Browser, using the Attributes Properties dialog, or using the in-place editor on the diagram. The notification is provided immediately before the attribute is created, so that the Add-In can disable addition of the attribute.</p>	<a href="#">EA_OnPostNewAttribute</a> <small>[3064]</small>

#### Syntax:

**Function** *EA\_OnPreNewAttribute(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreNewAttribute* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> [2833]	IN	Contains the following <i>EventProperty</i> objects for the attribute to be created: <ul style="list-style-type: none"> <li><i>Type</i>: A string value corresponding to <i>Attribute.Type</i></li> <li><i>Stereotype</i>: A string value corresponding to <i>Attribute.Stereotype</i></li> <li><i>ParentID</i>: A long value corresponding to <i>Attribute.ParentID</i></li> <li><i>ClassifierID</i>: A long value corresponding to <i>Attribute.ClassifierID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value:

Return **True** to enable addition of the new attribute to the model. Return **False** to disable addition of the new attribute.

### 20.3.5.19.1 EA\_OnInitializeTechnologies

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>EA_OnInitializeTechnologies</i> requests that an Add-In pass an MDG Technology to Enterprise Architect for loading.</p> <p>This event occurs on Enterprise Architect startup. Return your technology XML to this function and Enterprise Architect loads and enables it.</p>	

#### Syntax:

#### Function EA\_OnInitializeTechnologies(*Repository As EA.Repository*) As Object

The *EA\_OnInitializeTechnologies* function syntax contains the following element:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

#### Return Value:

Return the MDG Technology as a single XML string.

#### Example

```
Public Function EA_OnInitializeTechnologies(ByVal Repository As EA.
Repository) As Object
    EA_OnInitializeTechnologies = My.Resources.MyTechnology
End Function
```

### 20.3.5.19.2 EA\_OnPreActivateTechnology

#### Topics

	<p>Add-In that has taken ownership of an Enterprise Architect model branch on a particular workstation.</p> <p>One of the additional responsibilities of an MDG Add-In is to take ownership of a branch of an Enterprise Architect model, which is done through the <i>MDG_Connect</i> event.</p> <p>MDG Add-Ins identify themselves as such during <i>EA_Connect</i> by returning the string <b>MDG</b>.</p> <p>Unlike ordinary Add-Ins, responding to <i>MDG Add-In</i> events is not optional, and methods must be published for each of the <i>MDG Events</i>.</p> <p>Two examples of MDG Add-Ins are the commercially available MDG Link for Eclipse and MDG Link for Visual Studio, published by <i>Sparx Systems</i>.</p>	<a href="#">Sparx Systems</a> (Online Resource)

### 20.3.8.1 MDG Events

An MDG Add-In must respond to all MDG Events. These events usually identify processes such as Build, Run, Synchronize, PreMerge and PostMerge, amongst others.

An MDG Link Add-In is expected to implement some form of forward and reverse engineering capability within Enterprise Architect, and as such requires access to a specific set of events, all to do with generation, synchronization and general processes concerned with converting models to code and code to models.

#### 20.3.8.1.1 MDGBuild Project

##### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_BuildProject</i> enables the Add-In to handle file changes caused by generation. This function is called in response to a user selecting the <b>Extensions   Build Project</b> menu option.</p> <p>Respond to this event by compiling the project source files into a running application.</p>	<a href="#">MDG_RunExe</a> 

##### Syntax:

**Sub MDG\_BuildProject(Repository As EA.Repository, PackageGuid As String)**

The *MDG\_BuildProject* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

**Return Value:**

None.

**20.3.8.1.2 MDGConnect**

An Add-In uses **MDG\_Connect** to handle a user driven request to connect a model branch to an external application. The function is called when the user attempts to connect a particular Enterprise Architect Package to an as yet unspecified external project. The Add-In calls the event to interact with the user to specify such a project.

The Add-In is responsible for retaining the connection details, which should be stored on a per-user or per-workstation basis. That is, users who share a common Enterprise Architect model over a network should be able to connect and disconnect to external projects independently of one another.

The Add-In should therefore not store connection details in an Enterprise Architect repository. A suitable place to store such details would be:

```
SHGet Folder Path( . . CSI DL_APPDATA. . ) \ Addi nName
```

The *PackageGuid* parameter is the same identifier as is required for most events relating to the MDG Add-In. Therefore it is recommended that the connection details be indexed using the *PackageGuid* value.

The *PackageID* parameter is provided to aid fast retrieval of Package details from Enterprise Architect, should this be required.

**Syntax**

**Function MDG\_Connect(*Repository As EA.Repository, PackageID as Long, PackageGuid As String*) As Long**

The *MDG\_Connect* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>PackageGuid</b>	<i>String</i>	IN	The unique ID identifying the project provided by the Add-In when a connection to a project branch of an Enterprise Architect model was first established.
<b>PackageID</b>	<i>Long</i>	IN	The <i>PackageID</i> of the Enterprise Architect package the user has requested to have connected to an external project.
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

**Return Value**

Returns a non-zero to indicate that a connection has been made; a zero indicates that the user has not

nominated a project and connection should not proceed.

### 20.3.8.1.3 MDGDisconnect

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_Disconnect</i> enables the Add-In to respond to user requests to disconnect the model branch from an external project.</p> <p>This function is called when the user attempts to disconnect an associated external project. The Add-In is required to delete the details of the connection.</p>	<a href="#">MDG_Connect</a> <sup>[3100]</sup>

#### Syntax:

**Function** *MDG\_Disconnect*(*Repository As EA.Repository, PackageGuid As String*) *As Long*

The *MDG\_Disconnect* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[2850]</sup>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

#### Return Value:

Returns a non-zero to indicate that a disconnection has occurred enabling Enterprise Architect to update the user interface. A zero indicates that the user has not disconnected from an external project.

#### 20.3.8.1.4 MDGGetConnectedPackages

##### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_GetConnectedPackages</i> enables the Add-In to return a list of current connection between Enterprise Architect and an external application.</p> <p>This function is called when the Add-In is first loaded, and is expected to return a list of the available connections to external projects for this Add-In.</p>	<a href="#">MDG_Connect</a> 

##### Syntax:

**Function** *MDG\_GetConnectedPackages*(*Repository As EA.Repository*) *As Variant*

The *MDG\_GetConnectedPackages* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> 	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

##### Return Value:

Returns an array of GUID strings representing individual Enterprise Architect packages.

#### 20.3.8.1.5 MDGGetProperty

##### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_GetProperty</i> provides miscellaneous Add-In details to Enterprise Architect.</p> <p>This function is called by Enterprise Architect to poll the Add-In for information relating to the <i>PropertyName</i>. This event should occur in as short a duration as possible as Enterprise Architect does not cache the information provided by the function.</p> <p>Values corresponding to the following <i>PropertyNames</i> must be provided:</p> <ul style="list-style-type: none"> <li><b>IconID</b> - Return the name of a DLL and a resource identifier in the format <i>#ResID</i>, where the resource ID indicates an Icon</li> </ul>	

Topic	Detail	See also
	<p><i>c:\program files\myapp\myapp.dll#101</i></p> <ul style="list-style-type: none"> <li>• <b>Language</b> - Return the default language that Classes should be assigned when they are created in Enterprise Architect</li> <li>• <b>HiddenMenus</b> - Return one or more values from the <i>MDGMenus</i> enumeration to hide menus that do not apply to your Add-In.</li> </ul> <pre>if (PropertyName == "HiddenMenus")     return mgBuildProject + mgRun;</pre>	

### Syntax

**Function** *MDG\_GetProperty(Repository As EA.Repository, PackageGuid As String, PropertyName As String) As Variant*

The *MDG\_GetProperty* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>PropertyName</b>	<i>String</i>	IN	The name of the property that is used by Enterprise Architect. See <i>Details</i> for the possible values.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently-open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

### Return Value:

See *Details*, above.

## 20.3.8.1.6 MDGMerge

### Topics

Topic	Detail	See also
<b>Details</b>	<i>MDG_Merge</i> enables the Add-In to jointly handle changes to both the model branch and the code project that the model branch is	<a href="#">MDG_Connect</a> <small>[3100]</small>

Topic	Detail	See also
	<p>connected to.</p> <p>This event should be called whenever the user has asked to merge their model branch with its connected code project, or whenever the user has established a new connection to a code project.</p> <p>The purpose of this event is to enable the Add-In to interact with the user to perform a merge between the model branch and the connected project.</p>	<a href="#">MDG_PreMerge</a> <small>[3109]</small> <a href="#">MDG_PostMerge</a> <small>[3108]</small>

**Syntax:**

**Function** MDG\_Merge(*Repository As EA.Repository, PackageGuid As String, SynchObjects As Variant, SynchType As String, ExportObjects As Variant, ExportFiles As Variant, ImportFiles As Variant, IgnoreLocked As String, Language As String*) **As Long**

The *MDG\_Merge* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>ExportFiles</b>	<i>Variant</i>	OUT	<p>A string array containing the list of files for each model object chosen for export by the Add-In.</p> <p>Each entry in this array must have a corresponding entry in the <i>ExportObjects</i> parameter at the same array index, so <i>ExportFiles</i> (2) must contain the filename of the object by <i>ExportObjects</i>(2).</p>
<b>ExportObjects</b>	<i>Variant</i>	OUT	The string array containing the list of new model objects (in <i>Object ID</i> format) to be exported by Enterprise Architect to the code project.
<b>IgnoreLocked</b>	<i>String</i>	OUT	A value indicating whether to ignore any files locked by the code project (that is, "TRUE" or "FALSE").
<b>ImportFiles</b>	<i>Variant</i>	OUT	<p>A string array containing the list of code files made available to the code project to be newly imported to the model.</p> <p>Enterprise Architect imports each file listed in this array for import into the connected model branch.</p>
<b>Language</b>	<i>String</i>	OUT	The string value containing the name of the code language supported by the code project connected to the model branch.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.
<b>SynchObjects</b>	<i>Variant</i>	OUT	A string array containing a list of objects ( <i>Object ID</i> format) to be jointly synchronized between the model branch and the project.  See below for the format of the Object IDs.
<b>SynchType</b>	<i>String</i>	OUT	The value determining the user-selected type of synchronization to take place.  See below for a list of valid values.

**Return Value:**

Return a non-zero if the merge operation completed successfully and a zero value when the operation has been unsuccessful.

**Merge:**

A merge consists of three major operations:

- **Export:** Where newly created model objects are exported into code and made available to the code project
- **Import:** Where newly created code objects, Classes and such things are imported into the model
- **Synchronize:** Where objects available both to the model and in code are jointly updated to reflect changes made in either the model, code project or both

**Synchronize Type:**

The *Synchronize* operation can take place in one of four different ways. Each of these ways corresponds to a value returned by *SynchType*:

- None: (*SynchType* = 0) No synchronization is to be performed
- Forward: (*SynchType* = 1) Forward synchronization, between the model branch and the code project is to occur
- Reverse: (*SynchType* = 2) Reverse synchronization, between the code project and the model branch is to occur
- Both: (*SynchType* = 3) Reverse, then Forward synchronization's are to occur

**Object ID Format:**

Each of the Object IDs listed in the string arrays described above should be composed in the following format:

```
( @namespace ) * ( #class ) * ( $attribute | %operation | : property ) *
```

### 20.3.8.1.7 MDGNewClass

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_NewClass</i> enables the Add-In to alter details of a Class before it is created.</p> <p>This method is called when Enterprise Architect generates a new Class, and requires information relating to assigning the language and file path. The file path should be passed back as a return value and the language should be passed back via the language parameter.</p>	<a href="#">MDG_PreGenerate</a> <small>[3109]</small>

#### Syntax:

**Function** *MDG\_NewClass*(*Repository As EA.Repository, PackageGuid As String, CodeID As String, Language As String*) *As String*

The *MDG\_NewClass* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>CodeID</b>	<i>String</i>	IN	A string used to identify the code element before it is created. For more information, see <a href="#">MDG_View</a> <small>[3112]</small> .
<b>Language</b>	<i>String</i>	OUT	A string used to identify the programming language for the new Class. The language must be supported by Enterprise Architect.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.

#### Return Value:

Returns a string containing the file path that should be assigned to the Class.

### 20.3.8.1.8 MDGPostGenerate

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_PostGenerate</i> enables the Add-In to handle file changes caused by generation.</p> <p>This event is called after Enterprise Architect has prepared text to replace the existing contents of a file. Responding to this event enables the Add-In to write to the linked application's user interface rather than modify the file directly.</p> <p>When the contents of a file are changed, Enterprise Architect passes <i>FileContents</i> as a non-empty string. New files created as a result of code generation are also sent through this mechanism, enabling Add-Ins to add new files to the linked project's file list.</p> <p>When new files are created Enterprise Architect passes <i>FileContents</i> as an empty string. When a non-zero is returned by this function, the Add-In has successfully written the contents of the file. A zero value for the return indicates to Enterprise Architect that the file must be saved.</p>	<a href="#">MDG_PreGenerate</a> <small>[3109]</small>

#### Syntax:

**Function** *MDG\_PostGenerate*(*Repository As EA.Repository, PackageGuid As String, FilePath As String, FileContents As String*) *As Long*

The *MDG\_PostGenerate* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>FileContents</b>	<i>String</i>	IN	A string containing the proposed contents of the file.
<b>FilePath</b>	<i>String</i>	IN	The path of the file Enterprise Architect intends to overwrite.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>

#### Return Value:

The return value depends on the type of event that this function is responding to (see *Details*, above). This function is required to handle two separate and distinct cases.

### 20.3.8.1.9 MDGPostMerge

#### Topics

Topic	Detail	See also
<b>Details</b>	<p>MDG_PostMerge is called after a merge process has been completed.</p> <p>This function is called by Enterprise Architect after the merge process has been completed.</p> <p>File save checking should not be performed with this function, but should be handled by <i>MDG_PreGenerate</i>, <i>MDG_PostGenerate</i> and <i>MDG_PreReverse</i>.</p>	<a href="#">MDG_PreGenerate</a> [3109] <a href="#">MDG_PostGenerate</a> [3107] <a href="#">MDG_PreReverse</a> [3110] <a href="#">MDG_PreMerge</a> [3109] <a href="#">MDG_Merge</a> [3109]

#### Syntax:

**Function** MDG\_PostMerge(*Repository As EA.Repository, PackageGuid As String*) As Long

The *MDG\_PostMerge* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

#### Return Value:

Return a zero value if the post-merge process has failed, a non-zero return indicates that the post-merge has been successful. Enterprise Architect assumes a non-zero return if this method is not implemented

### 20.3.8.1.10 MDGPreGenerate

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_PreGenerate</i> enables the Add-In to deal with unsaved changes.</p> <p>This function is called immediately before Enterprise Architect attempts to generate files from the model. A possible use of this function would be to prompt the user to save unsaved source files.</p>	<a href="#">MDG_PostGenerate</a> <a href="#">e</a> <small>[3107]</small>

#### Syntax:

**Function** *MDG\_PreGenerate*(*Repository As EA.Repository, PackageGuid As String*) *As Long*

The *MDG\_PreGenerate* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[2850]</small>	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

#### Return Value:

Return a zero value to abort generation. Any other value enables the generation to continue.

### 20.3.8.1.11 MDGPreMerge

#### Topics

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_PreMerge</i> is called after a merge process has been initiated by the user and before Enterprise Architect performs the merge process.</p> <p>This event is called after a user has performed their interactions with the merge screen and has confirmed the merge with the <b>OK</b> button, but before Enterprise Architect performs the merge process using the data provided by the <i>MDG_Merge</i> call, before</p>	<a href="#">MDG_PreGenerate</a> <small>[3109]</small> <a href="#">MDG_PostGenerate</a> <a href="#">e</a> <small>[3107]</small> <a href="#">MDG_PreReverse</a> <small>[3110]</small> <a href="#">MDG_Merge</a> <small>[3103]</small>

Topic	Detail	See also
	<p>any changes have been made to the model or the connected project.</p> <p>This event is made available to provide the Add-In with the opportunity to generally set internal Add-In flags to augment the <i>MDG_PreGenerate</i>, <i>MDG_PostGenerate</i> and <i>MDG_PreReverse</i> events.</p> <p>File save checking should not be performed with this function, but should be handled by <i>MDG_PreGenerate</i>, <i>MDG_PostGenerate</i> and <i>MDG_PreReverse</i>.</p>	<a href="#">MDG_PostMerge</a> [3108]

**Syntax:**

**Function** *MDG\_PreMerge*(*Repository As EA.Repository, PackageGuid As String*) *As Long*

The *MDG\_PreMerge* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	<p>An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.</p> <p>Poll its members to retrieve model data and user interface status information.</p>
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

**Return Value:**

A return value of zero indicates that the merge process can not occur. If the value is not zero the merge process proceeds.

If this method is not implemented then it is assumed that a merge process is used.

**20.3.8.1.12 MDGPreReverse****Topics**

Topic	Detail	See also
<b>Details</b>	<p><i>MDG_PreReverse</i> enables the Add-In to save file changes before being imported into Enterprise Architect.</p> <p>This function operates on a list of files that are about to be reverse-engineered into Enterprise Architect. If the user is working on unsaved versions of these files in an editor, you could either prompt the user or save automatically.</p>	<a href="#">MDG_PostGenerate</a> [3107]  <a href="#">MDG_PreGenerate</a> [3109]

Topic	Detail	See also

**Syntax:**

**Sub MDG\_PreReverse(*Repository As EA.Repository, PackageGuid As String, FilePaths As Variant*)**

The *MDG\_PreReverse* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> [2850]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>FilePaths</b>	<i>String array</i>	IN	An array of filepaths pointed to the files that are to be reverse engineered.

**Return Value:**

None.

**20.3.8.1.13 MDGRunExe****Topics**

Topic	Detail	See also
<b>Details</b>	<i>MDG_RunExe</i> enables the Add-In to run the target application. This function is called when the user selects the <b>Extensions   Run Exe</b> menu option. Respond to this event by launching the compiled application.	<a href="#">MDG_BuildProject</a> [3099]

**Syntax:**

**Sub MDG\_RunExe(*Repository As EA.Repository, PackageGuid As String*)**

The *MDG\_RunExe* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<a href="#">EA.Repository</a> 2850	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

**Return Value:**

None.

**20.3.8.1.14 MDGView****Topics**

Topic	Detail	See also
<b>Details</b>	<i>MDG_View</i> enables the Add-In to display user specified code elements.  This function is called by Enterprise Architect when the user asks to view a particular code element. This enables the Add-In to present that element in its own way, usually in a code editor.	

**Syntax:*****Function MDG\_View(Repository As EA.Repository, PackageGuid As String, CodeID as String) As Long***The *MDG\_View* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<i>EA.Repository</i>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model.  Poll its members to retrieve model data and user interface status information.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>CodeID</b>	<i>String</i>	IN	Identifies the code element in the following format:  <type>ElementPart<type>ElementPart...

Parameter	Type	Direction	Description
			<p>where each element is proceeded with a token identifying its type:</p> <ul style="list-style-type: none"><li>@ -namespace</li><li># - Class</li><li>\$ - attribute</li><li>% - operation</li></ul> <p>For example if a user has selected the <i>m_Name</i> attribute of <i>Class1</i> located in <i>namespace Name1</i>, the <i>class ID</i> would be passed through in the following format:</p> <p>@Name1#Class1%m_Name</p>

**Return Value:**

Return a non-zero value to indicate that the Add-In has processed the request. Returning a zero value results in Enterprise Architect employing the standard viewing process which is to launch the associated source file.

**Part**

## 21.1 A

Name	Detail	See also
<b>Abstract Class</b>	A Class that cannot be directly instantiated.	Concrete Class
<b>Abstraction</b>	The essential characteristics of an entity that distinguish it from all other kinds of entities. An abstraction defines a boundary relative to the perspective of the viewer.	
<b>Action</b>	The specification of an executable statement that forms an abstraction of a computation procedure. An action typically results in a change in the state of the system, and can be realized by sending a message to an object or modifying a connector or a value of an attribute.	
<b>Action Sequence</b>	An expression that resolves to a sequence of actions.	
<b>Action State</b>	A state that represents the execution of an atomic action, typically the invocation of an operation.	
<b>Activation</b>	The execution of an action.	
<b>Active Class</b>	A Class whose instances are active objects. When instantiated, an active Class controls its execution. Rather than being invoked or activated by other objects, it can operate standalone, and define its own thread of behavior.	Active Object
<b>Active Object</b>	An object that owns a thread and can initiate control activity. An instance of active Class.	Active Class, Thread
<b>Activity</b>	Defines the bounds for the structural organization that contains a set of basic or fundamental behaviors. It can be used to model procedural type application development for system design through to modeling business processes in organizational structures and work flow.	
<b>Activity Diagram</b>	A diagram used to model procedural type application development for system design through to modeling business processes in organizational structures and work flow.	
<b>Activity Graph</b>	A special case of a State Machine that is used to model processes involving one or more classifiers.	State Chart Diagram

<b>Actor ( Class )</b>	A coherent set of roles that users of Use Cases play when interacting with these Use Cases. An Actor has one role for each Use Case with which it communicates.	
<b>Actual Parameter</b>	A binding for a parameter that resolves to a run-time instance.	Argument, (Formal) Parameter
<b>Aggregate ( Class )</b>	A Class that represents the 'whole' in an Aggregation (whole-part) relationship.	Aggregation
<b>Aggregation</b>	A special form of Association that specifies a whole-part relationship between the Aggregate (whole) and a component part.	Composition
<b>Analysis</b>	The part of the software development process whose primary purpose is to formulate a model of the problem domain. Analysis focuses on what to do, design focuses on how to do it.	Design
<b>Analysis Diagram</b>	A diagram used to capture high level business processes and early models of system behavior and elements. It is less formal than some other diagrams, but provides a good means of capturing the essential business characteristics and requirements.	
<b>Analysis Time</b>	Refers to something that occurs during an analysis phase of the software development process.	Modeling Time, Run Time, Compile Time, Design Time
<b>Architecture</b>	The organizational structure and associated behavior of a system. An architecture can be recursively decomposed into parts that interact through interfaces, relationships that connect parts, and constraints for assembling parts. Parts that interact through interfaces include Classes, Components and subsystems.	
<b>Argument</b>	A binding for a parameter that resolves to a run-time instance.	Actual Parameter (Formal) Parameter
<b>Artifact</b>	A physical piece of information that is used or produced by a business or development process. Examples of Artifacts include models, source files, scripts, and binary executable files. An Artifact can constitute the implementation of a deployable component.	Product, Component

<b>Assembly</b>	A connector that bridges the required interface of a component with the provided interface of a second component.	
<b>Association</b>	The semantic relationship between two or more classifiers that specifies connections among their instances.	Link
<b>Association Class</b>	A model element that has both Association and Class properties. An Association Class can be seen as an Association that also has Class properties, or as a Class that also has Association properties.	Class
<b>Association End</b>	The endpoint of an Association, which connects the Association to a classifier.	Classifier, Link End
<b>Attribute</b>	A feature within a classifier that describes a range of values that instances of the classifier can hold.	
<b>Auxiliary Class</b>	A stereotyped Class that supports another more central or fundamental Class, typically by implementing secondary logic or control flow. Auxiliary Classes are typically used together with focus Classes, and are particularly useful for specifying the secondary business logic or control flow of components during design.	Focus Class

## 21.2 B

Name	Detail	See also
<b>Behavior</b>	The observable effects of an operation or event, including its results.	
<b>Behavioral Diagram</b>	A diagram that depicts the behavioral features of a system or business process.  Behavioral diagrams include Activity diagrams, State Machine diagrams, Communication diagrams, Interaction Overview diagrams, Sequence diagrams, Timing diagrams and Use Case diagrams.	
<b>Behavioral Feature</b>	A dynamic feature of a model element, such as an operation or method.	
<b>Behavioral Model aspect</b>	A model aspect that emphasizes the behavior of the instances in a system, including their methods, collaborations, and state histories.	
<b>Binary Association</b>	An Association between two Classes; a special case of an N-ary Association.	N-ary Association
<b>Binding</b>	The creation of a model element from a template by supplying arguments for the parameters of the template.	
<b>Bookmark</b>	A marker in a Rich Text Format document that enables you to link inner sections of a document into a master document (using the Word 'Insert File' function).	
<b>Boolean</b>	An enumeration whose values are <b>true</b> and <b>false</b> .	
<b>Boolean Expression</b>	An expression that evaluates to a boolean value.	
<b>Boundary</b>	<ol style="list-style-type: none"> <li>1. A stereotyped Class that models some system boundary – typically a user interface screen; it is: <ul style="list-style-type: none"> <li>• Used in the conceptual phase to capture user interaction with the system at a screen level (or some other boundary interface type)</li> <li>• Often used in Sequence and Robustness (Analysis) diagrams</li> <li>• The View in the Model-View-Controller pattern</li> </ul> </li> <li>2. A System Boundary element used to delineate a particular</li> </ol>	

Name	Detail	See also
	part of the system.	

## 21.3 C

Name	Detail	See also
<b>C++</b>	An object-oriented programming language based on the earlier 'C' language.	
<b>Call</b>	An action state that invokes an operation on a classifier.	
<b>Cardinality</b>	The number of elements in a set.	Multiplicity
<b>CASE</b>	Computer Aided Software Engineering. A tool designed for the purpose of modeling and building software systems.	
<b>Child</b>	In a Generalization relationship, the specialization of another element, the parent.	Subclass Subtype Parent
<b>Choice</b>	A pseudo-state used to compose complex transitional paths, where the outgoing transition path is decided by dynamic, runtime conditions determined by the actions performed by the State Machine on the path leading to the choice.	
<b>Class</b>	A description of a set of objects that share the same attributes, operations, methods, relationships and semantics. A Class can use a set of interfaces to specify collections of operations it provides to its environment.	Interface Object
<b>Class Diagram</b>	A diagram that shows a collection of declarative (static) model elements, such as Classes, types, and their contents and relationships.	Object Diagram
<b>Classification</b>	The assignment of an object to a classifier.	Dynamic Classification Multiple Classification Static Classification
<b>Classifier</b>	A mechanism that describes behavioral and structural features. Classifiers include Interfaces, Classes, datatypes, and components.	
<b>Client</b>	A classifier that requests a service from another classifier.	Supplier

Name	Detail	See also
<b>Collaboration</b>	The specification of how an operation or classifier, such as a Use Case, is realized by a set of classifiers and Associations playing specific roles used in a specific way. The Collaboration defines an interaction.	Interaction
<b>Collaboration Diagram</b>	Used pre-UML 2.0. Now called a Communication diagram.	
<b>Collaboration Use</b>	Uses an occurrence to apply a pattern defined by a Collaboration to a specific situation.	
<b>Combined Fragment</b>	A combined fragment reflects a piece or pieces of interaction (called interaction operands) controlled by an interaction operator, whose corresponding boolean conditions are known as interaction constraints. It appears graphically as a transparent window, divided by horizontal dashed lines for each operand.	
<b>Comment</b>	An annotation attached to an element or a collection of elements. A comment, or note, has no semantics.	Constraint
<b>Communication Diagram</b>	A diagram that shows the interactions between elements at run-time in much the same manner as a Sequence diagram. However, Communication diagrams are used to visualize inter-object relationships, while Sequence diagrams are more effective at visualizing processing over time.	Collaboration Diagram, Object Diagram
<b>Compile Time</b>	Refers to something that occurs during the compilation of a software module.	Modeling Time, Run Time, Analysis Time, Design Time
<b>Component</b>	A modular, deployable, and replaceable part of a system that encapsulates implementation and exposes a set of interfaces. A Component is typically specified by one or more classifiers (such as implementation Classes) that reside on it, and can be implemented by one or more artifacts (such as binary, executable, or script files).	Module Artifact, Product
<b>Component Diagram</b>	A diagram that shows the organizations and dependencies among Components.	
<b>Composite ( Class )</b>	A Class that is related to one or more Classes by a Composition relationship.	Composition

Name	Detail	See also
<b>Composite State</b>	A State that consists of either concurrent (orthogonal) substates or sequential (disjoint) substates.	Substate, Concurrent Substate, Disjoint Substate
<b>Composite Structure Diagram</b>	A diagram that reflects the internal collaboration of Classes, Interfaces, or Components to describe a functionality. Composite Structure diagrams are similar to Class diagrams, except that they model a specific usage of the structure.	
<b>Composition</b>	A form of Aggregation that requires that a part instance be included in at most one Composite at a time, and that the Composite object is responsible for the creation and destruction of the parts. Composition can be recursive.	Composite Aggregation
<b>Concrete Class</b>	A Class that can be directly instantiated.	Abstract Class
<b>Concurrency</b>	The occurrence of two or more activities during the same time interval. Concurrency can be achieved by interleaving or simultaneously executing two or more threads.	Thread
<b>Concurrent Substate</b>	A substate that can be held simultaneously with other substates contained in the same composite State.	Composite State Disjoint Substate
<b>Connector</b>	A logical link between model elements. Can be structural, dynamic or possessive.	
<b>Constraint</b>	<ol style="list-style-type: none"> <li>1. A semantic condition or restriction. Certain constraints are predefined in the UML, others can be user defined. Constraints are one of three extensibility mechanisms in UML.</li> <li>2. A rule or condition that applies to some element. It is often modeled as a pre- or post- condition.</li> </ol>	Tagged Value, Stereotype Comment
<b>Container</b>	<ol style="list-style-type: none"> <li>1. An instance that exists to contain other instances, and that provides operations to access or iterate over its contents. (for example, arrays, lists, sets).</li> <li>2. A component that exists to contain other components.</li> </ol>	
<b>Containment Hierarchy</b>	A namespace hierarchy consisting of model elements, and the containment relationships that exist between them. A containment hierarchy forms a graph.	
<b>Context</b>	A view of a set of related modeling elements for a particular purpose, such as specifying an operation.	

Name	Detail	See also
<b>Continuation</b>	A Continuation is used in seq and alt combined fragments, to indicate the branches of continuation an operand follows.	
<b>Control</b>	A stereotyped Class that represents a controlling entity or manager. A Control organizes and schedules other activities and elements. It is the controller of the Model-View-Controller pattern.	
<b>Control Flow</b>	A connector linking two nodes in an activity diagram. Control Flow connectors start a node's activity when the preceding node's action is finished.	

## 21.4 D

Name	Detail	See also
<b>Database Schema</b>	The description of a database structure. It defines tables and fields and the relationship between them.	
<b>Datastore</b>	An element used to define permanently stored data. A token of data that is stored in the Datastore is stored permanently. A token of data that comes out of the Datastore is a copy of the original data. The tokens imported are kept for the life of the Activity in which it exists.	
<b>Datatype</b>	A descriptor of a set of values that lack identity and whose operations do not have side effects. Datatypes include primitive pre-defined types and user-definable types. Pre-defined types include numbers, string and time. User-definable types include enumerations.	
<b>Decision</b>	An element of an Activity diagram that indicates a point of conditional progression: if a condition is true, then processing continues one way, if not, then another.	
<b>Defining Model ( MOF )</b>	The model on which a repository is based. Any number of repositories can have the same defining model.	
<b>Delegate</b>	A connector that defines the internal assembly of a component's external ports and interfaces. Using a Delegate connector wires the internal workings of the system to the outside world, by a delegation of the external interfaces' connections.	
<b>Delegation</b>	The ability of an object to issue a message to another object in response to a message. Delegation can be used as an alternative to inheritance.  Contrast: inheritance	
<b>Dependency</b>	A relationship between two modeling elements, in which a change to one modeling element (the independent element) affects the other modeling element (the dependent element).	
<b>Deployment</b>	A type of Dependency relationship that indicates the deployment of an artifact onto a node or executable target.	
<b>Deployment Diagram</b>	A diagram that shows the configuration of run-time processing nodes and the components, processes, and objects that live	Component Diagrams

Name	Detail	See also
	on them. Components represent run-time manifestations of code units.	
<b>Deployment Specification</b>	Specifies parameters guiding deployment of an artifact, as is common with most hardware and software technologies.	
<b>Derived Element</b>	A model element that can be computed from another element, but that is shown for clarity or that is included for design purposes even though it adds no semantic information.	
<b>Design</b>	The part of the software development process whose primary purpose is to decide how the system is to be implemented. During design, strategic and tactical decisions are made to meet the required functional and quality requirements of a system.	Analysis
<b>Design Time</b>	Refers to something that occurs during a design phase of the software development process.	Modeling Time Run Time Compile Time Analysis Time
<b>Development Process</b>	A set of partially ordered steps performed for a given purpose during software development, such as constructing models or implementing models.	
<b>Diagram</b>	A graphical presentation of a collection of model elements, most often rendered as a connected graph of arcs (relationships) and vertices (other model elements). UML supports 14 diagram types, and Enterprise Architect extends these with seven more. Add-Ins, technologies and profiles can provide further diagram types.	
<b>Diagram Gate</b>	A simple graphical way to indicate the point at which messages can be transmitted into and out of Interaction Fragments.	
<b>Diagram View</b>	The Enterprise Architect workspace area where the UML diagrams are displayed.	
<b>Disjoint Substate</b>	A substate that cannot be held simultaneously with other substates contained in the same composite State.	Composite State Substate Concurrent Substate

Name	Detail	See also
<b>Distribution Unit</b>	A set of objects or components that are allocated to a process or a processor as a group. A distribution unit can be represented by a run-time composite or an Aggregate.	
<b>Domain</b>	An area of knowledge or activity characterized by a set of concepts and terminology understood by practitioners in that area.	
<b>Dynamic Classification</b>	A semantic variation of Generalization in which an object can change its classifier.	Multiple Classification Static Classification

## 21.5 E

Name	Detail	See also
<b>Element</b>	<ol style="list-style-type: none"> <li>1. An atomic constituent of a model.</li> <li>2. A model object of any type, such as Class, Component, Node or Object.</li> </ol>	
<b>Endpoint</b>	Used in Interaction diagrams to reflect a lost message in sequence.	
<b>Entity</b>	A store or persistence mechanism that captures the information or knowledge in a system. It is the Model in the Model-View-Controller pattern.	
<b>Entry Action</b>	An action executed upon entering a state in a State Machine regardless of the transition taken to reach that state.	
<b>Entry Point</b>	Used to define where external states can enter a Sub Machine.	
<b>Enumeration</b>	A list of named values used as the range of a particular attribute type. For example, RGBColor = {red, green, blue}. Boolean is a predefined enumeration with values from the set {false, true}.	
<b>Event</b>	The specification of a significant occurrence that has a location in time and space. In the context of State diagrams, an event is an occurrence that can trigger a transition.	
<b>Exception Handler</b>	An element that defines the group of operations to carry out when an exception occurs.	
<b>Exit Action</b>	An action executed upon exiting a State in a State Machine regardless of the transition taken to exit that State.	
<b>Exit Point</b>	Used in Sub Machine states and State Machines to denote the point where the machine is exited and the transition sourcing this exit point, for Sub Machines, is triggered. Exit points are a type of pseudo-state used in the State Machine diagram.	
<b>Export</b>	In the context of packages, to make an element visible outside its enclosing namespace.	Visibility

Name	Detail	See also
		Import
<b>Expose Interface</b>	A toolbox icon that is a graphical way to depict the required and supplied interfaces of a Component, Class or Part.	
<b>Expression</b>	<p>A string that evaluates to a value of a particular type. For example, the expression <math>(7 + 5 * 3)</math> evaluates to a value of type number.</p> <p>A relationship from an extension Use Case to a base Use Case, specifying how the behavior defined for the extension Use Case augments (subject to conditions specified in the extension) the behavior defined for the base Use Case. The behavior is inserted at the location defined by the extension point in the base Use Case. The base Use Case does not depend on performing the behavior of the extension Use Case.</p>	Extend Include
<b>Extend</b>	A connector used to indicate that an element extends the behavior of another. Extensions are used in Use Case models to indicate one Use Case (optionally) extends the behavior of another.	Expression Include

## 21.6 F

Name	Detail	See also
<b>Facade</b>	A stereotyped package containing only references to model elements owned by another package; it is used to provide a 'public view' of some of the contents of a package.	
<b>Feature</b>	A property, like an operation or attribute, that is encapsulated within a classifier such as an Interface, Class, or Datatype.	
<b>Final</b>	A pseudo-state that indicates an end.	
<b>Final State</b>	A special kind of State signifying that the enclosing composite State or the entire State Machine is completed.	
<b>Fire</b>	To execute a State transition.	Transition
<b>Flow Final</b>	An element that depicts an exit from the system, as opposed to the Activity Final, which represents the completion of the activity.	
<b>Focus Class</b>	A stereotyped Class that defines the core logic or control flow for one or more auxiliary Classes that support it.  Focus Classes are typically used together with one or more auxiliary Classes, and are particularly useful for specifying the core business logic or control flow of components during design.	Auxiliary Class
<b>Focus of Control</b>	A symbol on a Sequence diagram that shows the period of time during which an object is performing an action, either directly or through a subordinate procedure.	
<b>Forward Engineering</b>	The process of generating source code from the UML model.	
<b>Fork</b>	Used in State Machine diagrams as pseudo-states.  With respect to State Machine diagrams, a Fork pseudo-state signifies that its incoming transition comes from a single State, and it has multiple outgoing transitions.	Join
<b>Framework</b>	A stereotyped package containing model elements that specify a reusable architecture for all or part of a system.	Pattern

Name	Detail	See also
	<p>Frameworks typically include Classes, Patterns or templates.</p> <p>When frameworks are specialized for an application domain, they are sometimes referred to as Application frameworks.</p>	

## 21.7 G

Name	Detail	See also
<b>Generalizable Element</b>	A model element that can participate in a Generalization relationship.	Generalization
<b>Generalization</b>	A taxonomic relationship between a more general element and a more specific element. The more specific element is fully consistent with the more general element and contains additional information. An instance of the more specific element can be used where the more general element is allowed.	Generalizable Element Inheritance
<b>Guard Condition</b>	A condition that must be satisfied in order to enable an associated transition to fire.	

## 21.8 H

Name	Detail	See also
<b>History State</b>	<p>There are two types of History pseudo-states defined in UML: shallow History and deep History.</p> <p>A shallow History sub-state is used to represent the most recently active sub-state of a composite State.</p> <p>A deep History sub-state, in contrast, reflects the most recent active configuration of the composite State.</p>	

## 21.9 I

Name	Detail	See also
<b>Implementation</b>	A definition of how something is constructed or computed. For example, a Class is an implementation of a type, a method is an implementation of an operation.	
<b>Implementation Class</b>	A stereotyped Class that specifies the implementation of a Class in some programming language (for example, C++, Smalltalk, Java) in which an instance can not have more than one Class. An Implementation Class is said to realize a type if it provides all of the operations defined for the type with the same behavior as specified for the type's operations.	Type
<b>Implementation Inheritance</b>	The inheritance of the implementation of a more general element. Includes inheritance of the interface.	Interface Inheritance
<b>Import</b>	In the context of packages, a dependency that shows the packages whose Classes can be referenced within a given package (including packages recursively embedded within it).	Visibility , Export
<b>Include</b>	A relationship from a base Use Case to an inclusion Use Case, specifying how the behavior for the base Use Case contains the behavior of the inclusion Use Case. The behavior is included at the location that is defined in the base Use Case. The base Use Case depends on performing the behavior of the inclusion Use Case, but not on its structure (that is, attributes or operations).	Extend, Expression
<b>Inheritance</b>	The mechanism by which more specific elements incorporate the structure and behavior of more general elements related by behavior.	Generalization, Delegation
<b>Initial State</b>	A pseudo-state used to denote the default state of a composite State; there can be one initial vertex in each region of the composite State.	
<b>Instance</b>	An entity that has a unique identity, a set of operations that can be applied to it, and a state that stores the effects of the operations.	Object
<b>Interaction</b>	A specification of how stimuli are sent between instances to perform a specific task. The interaction is defined in the context of a collaboration.	Collaboration

Name	Detail	See also
<b>Interaction Diagram</b>	A generic term that applies to several types of diagrams that emphasize object interactions. These include Timing diagrams, Sequence diagrams, Interaction Overview diagrams and Communication diagrams.	
<b>Interaction Occurrence</b>	A reference to an existing interaction element. Interaction occurrences are visually represented by a frame, with ref in the frame's title space. The diagram name is indicated in the frame contents.	
<b>Interaction Overview Diagram</b>	A diagram that visualizes the cooperation between other Interaction diagrams to illustrate a control flow serving an encompassing purpose. As Interaction Overview diagrams are a variant of Activity diagrams, most of the diagram notation is similar, as is the process in constructing the diagram.	
<b>Interface</b>	A named set of operations that characterize the behavior of an element.	Class , Type
<b>Interface Inheritance</b>	The inheritance of the interface of a more general element. Does not include inheritance of the implementation.	Implementation Inheritance
<b>Internal Transition</b>	A transition signifying a response to an event without changing the state of an object.	
<b>Interrupt Flow</b>	An Enterprise Architect-defined toolbox icon used to define the exception handler and interruptible activity region concepts.	

## 21.10 J

Name	Detail	See also
<b>Java</b>	A fully object-oriented, cross platform language based on elements from Smalltalk, C++ and other OO languages.	
<b>Join</b>	Used in State Machine diagrams and in Activity diagrams to synchronize multiple flows.	Fork
<b>Junction</b>	Junction pseudo-states are used to design complex transitional paths. A Junction can be used to combine, or merge, multiple paths into a shared transition path or to split an incoming path into multiple paths.	

## 21.11 L

Name	Detail	See also
<b>Layer</b>	The organization of classifiers or packages at the same level of abstraction. A layer represents a horizontal slice through an architecture, whereas a partition represents a vertical slice.	Partition
<b>Lifeline</b>	An individual participant in an interaction (that is, Lifelines cannot have multiplicity). A Lifeline represents a distinct connectable element.	
<b>Link</b>	A semantic connector among a tuple of objects. An instance of an Association.	Association
<b>Link End</b>	An instance of an Association end.	Association End, Classifier
<b>Local Path</b>	A relative path on a local machine, enabling developers to store shared source code in machine specific directories, but still generate and synchronize code.	

## 21.12 M

Name	Detail	See also
<b>Maintenance</b>	The support of a software system after it is deployed.	
<b>Manifest</b>	A relationship that indicates that the artifact source embodies the target model element. Stereotypes can be added to Enterprise Architect to classify the type of manifestation of the model element.	
<b>Message</b>	Messages indicate a flow of information, or transition of control, between elements. Messages are used by Communication diagrams, Sequence diagrams, Interaction Overview diagrams and Timing diagrams.	
<b>Message Endpoint</b>	An element that defines an endpoint of a Lifeline, such as a State or Value Lifeline in a Timing diagram.	
<b>Message Label</b>	Used for messages sent between Lifelines to make the diagram appear less cluttered. Labels with the same name indicate that a message can be interrupted.	
<b>Metaclass</b>	A Class whose instances are Classes. Metaclasses are typically used to construct metamodels.	
<b>Metafile</b>	A vector-based image format native to Windows. Supports high detail and excellent scaling. Typically used for saving diagram images for placement in documents. Comes in Placeable (an older format) and Enhanced (current standard format).	
<b>Meta-Metamodel</b>	A model that defines the language for expressing a metamodel. The relationship between a meta-metamodel and a metamodel is analogous to the relationship between a metamodel and a model.	
<b>Metamodel</b>	A model that defines the language for expressing a model.	
<b>Meta-Object</b>	A generic term for all meta-entities in a meta-modeling language. For example, meta-types, meta-classes, meta-attributes, and meta-associations.	
<b>Meta-Object Facility (MOF)</b>	An Object Management Group (OMG) standard. MOF originated in the UML, when the OMG required a Meta-	

Name	Detail	See also
	Modeling architecture to define the UML. MOF is designed as a four-layered architecture.	
<b>Method</b>	The implementation of an operation. It specifies the algorithm or procedure associated with an operation.	
<b>Model ( MOF )</b>	An abstraction of a physical system with a certain purpose.Usage note: In the context of the MOF specification, which describes a meta-metamodel, the meta-metamodel is for brevity frequently referred to simply as the model.	Physical System
<b>Model Aspect</b>	A dimension of modeling that emphasizes particular qualities of the metamodel. For example, the structural model aspect emphasizes the structural qualities of the metamodel.	
<b>Model Elaboration</b>	The process of generating a repository type from a published model. Includes the generation of interfaces and implementations which enables repositories to be instantiated and populated based on, and in compliance with, the model elaborated.	
<b>Model Element ( MOF )</b>	An element that is an abstraction drawn from the system being modeled. In the MOF specification model elements are considered to be meta-objects.	View Element
<b>Model Library</b>	A stereotyped package containing model elements that are intended to be reused by other packages. A model library differs from a profile in that a model library does not extend the metamodel using stereotypes and tagged definitions. A model library is analogous to a Class library in some programming languages.	
<b>Modeling Time</b>	Refers to something that occurs during the modeling phase of the software development process. It includes analysis time and design time.Usage note: When discussing object systems, it is often important to distinguish between modeling-time and run-time concerns.	Analysis Time Design Time Compile time Run time
<b>Module</b>	A software unit of storage and manipulation. Modules include source code modules, binary code modules and executable code modules.	Component
<b>MOF</b>	Meta-Object Facility, an Object Management Group (OMG)	

Name	Detail	See also
	standard. MOF originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture.	
<b>Multiple Classification</b>	A semantic variation of Generalization in which an object can belong directly to more than one classifier.	Static Classification Dynamic Classification
<b>Multiple Inheritance</b>	A semantic variation of Generalization in which a type can have more than one supertype.	Single Inheritance
<b>Multiplicity</b>	A specification of the range of enableable cardinalities that a set can assume. Multiplicity specifications can be given for roles within Associations, Parts within Composites, repetitions and other purposes. Essentially a multiplicity is a (possibly infinite) subset of the non-negative integers.	Cardinality
<b>Multi-Valued ( MOF )</b>	A model element with multiplicity defined whose Multiplicity Type:: upper attribute is set to a number greater than one. The term multi-valued does not pertain to the number of values held by, for example, an attribute or parameter, at any point in time.	Single-Valued

## 21.13 N

Name	Detail	See also
<b>Name</b>	A string used to identify a model element.	
<b>Namespace</b>	A part of the model in which the names can be defined and used. Within a namespace, each name has a unique meaning.	Name
<b>N-ary Association</b>	An Association among three or more Classes. Each instance of the Association is an n-tuple of values from the respective Classes.	Binary Association
<b>Nesting</b>	A connector used as an alternative membership notation to indicate nested members within an element; for example, a package that has nested members. The nested members of a package could also be shown inside the package rather than linked by the Nesting connector.	
<b>Node</b>	A classifier that represents a run-time computation resource, which generally has at least a memory and often processing capability. Run-time objects and components can reside on nodes.	

## 21.14 O

Name	Detail	See also
<b>Object</b>	An entity with a well-defined boundary and identity that encapsulates state and behavior. State is represented by attributes and relationships, behavior is represented by operations, methods and State Machines. An Object is an instance of a Class.	Class Instance
<b>Object Diagram</b>	A diagram that encompasses objects and their relationships at a point in time. An Object diagram can be considered as a special case of a Class diagram or Communication diagram.	Class Diagram Communication Diagram
<b>Object Flow</b>	A sub type of the State flow or transition. It implies the passing of an object instance between elements at run-time.	
<b>Object Flow State</b>	A state in an Activity graph that represents the passing of an object from the output of actions in one State to the input of actions in another State.	
<b>Object Lifeline</b>	A line in a Sequence diagram that represents the existence of an object over a period of time.	Sequence Diagram
<b>Object Management Group (OMG)</b>	The standards body responsible for the UML specification and management.	Their website is <a href="http://www.omg.org">www.omg.org</a> - follow the links to the UML pages.
<b>Occurrence</b>	A relationship that indicates that a Collaboration represents a classifier. An Occurrence connector is drawn from the collaboration to the classifier.	
<b>Operation</b>	A service that can be requested from an object to effect behavior. An operation has a signature, which could restrict the actual parameters that are possible.	

## 21.15 P

Name	Detail	See also
<b>Package</b>	<p>1. A namespace, as well as an element that can be contained in other packages' namespaces. Packages can own or merge with other packages, and their elements can be imported into a package's namespace.</p> <p>2. A logical container of model elements. It groups elements and can also contain other packages.</p> <p>The <i>OMG UML specification (UML Superstructure Specification, v2.1.1, p. 109)</i> states:</p> <p><i>A package is used to group elements, and provides a namespace for the grouped elements.</i></p> <p><i>A package is a namespace for its members, and can contain other packages. Only packageable elements can be owned members of a package. By virtue of being a namespace, a package can import either individual members of other packages, or all the members of other packages.</i></p> <p><i>In addition a package can be merged with other packages.</i></p> <p>Note that packages own model elements and are the basis for configuration control, storage and access control. Each element can be directly owned by a single package, so the package hierarchy is a strict tree. However, packages can reference other packages, modeled by using one of the stereotypes «import» and «access» of Permission dependency, so the usage network is a graph. Other kinds of dependencies between packages usually imply that one or more dependencies among the elements exist.</p> <p>A package is represented by the common folder icon - a large rectangle with a small rectangle (a 'tab') attached to the left side on top.</p>	
<b>Package Diagram</b>	Used to reflect the organization of packages and their elements, and provide a visualization of their corresponding namespaces.	
<b>Package Import</b>	A package import relationship is drawn from a source package to a package whose contents are imported. Private members of a target package cannot be imported.	
<b>Package Merge</b>	Indicates a relationship between two packages whereby the contents of the target package are merged with those of the source package. Private contents of a target package are not merged.	

Name	Detail	See also
<b>Parameter</b>	The specification of a variable that can be changed, passed, or returned. A parameter can include a name, type, and direction. Parameters are used for operations, messages and events.	Formal Parameter Argument Actual parameter
<b>Parameterized element</b>	The descriptor for a Class with one or more unbound parameters.	Template Parameterized class
<b>Parent</b>	In a generalization relationship, the generalization of another element, the child.	Subclass Subtype Child
<b>Part</b>	A run-time instance of a Class or Interface.	
<b>Participate</b>	The connection of a model element to a relationship or to a reified relationship. For example, a Class participates in an Association, an Actor participates in a Use Case.	
<b>Partition</b>	<ol style="list-style-type: none"> <li>1. activity graphs: A portion of an activity graph that organizes the responsibilities for actions.</li> <li>2. architecture: A set of related classifiers or packages at the same level of abstraction or across layers in a layered architecture. A partition represents a vertical slice through an architecture, whereas a layer represents a horizontal slice.</li> </ol>	Layer Swim Lane
<b>Pattern</b>	A template collaboration.	Framework
<b>Persistent Object</b>	An object that exists after the process or thread that created it has ceased to exist.	
<b>Physical System</b>	<ol style="list-style-type: none"> <li>1. The subject of a model.</li> <li>2. A collection of connected physical units, which can include software, hardware and people, that are organized to accomplish a specific purpose. A physical system can be described by one or more models, possibly from different viewpoints.</li> </ol>	Model (MOF) System
<b>Port</b>	Defines the interaction between a classifier and its environment. Interfaces controlling this interaction can be depicted using the 'Expose Interface' toolbox icon.	
<b>Postcondition</b>	A constraint that must be true at the completion of an	

Name	Detail	See also
	operation.	
<b>Precondition</b>	A constraint that must be true when an operation is invoked.	
<b>Primitive Type</b>	A pre-defined basic datatype without any substructure, such as an integer or a string.	
<b>Process</b>	<ol style="list-style-type: none"> <li>1. A heavyweight unit of concurrency and execution in an operating system. Thread, which includes heavyweight and lightweight processes. If necessary, an implementation distinction can be made using stereotypes.</li> <li>2. A software development process - the steps and guidelines by which to develop a system.</li> <li>3. To execute an algorithm or otherwise handle something dynamically.</li> </ol>	Thread
<b>Product</b>	A physical piece of information that is produced by a business or development process. Examples of products include models, source files, scripts, and binary executable files. An product can constitute the implementation of a deployable component.	Artifact Component
<b>Profile</b>	A stereotyped package that contains model elements that have been customized for a specific domain or purpose using extension mechanisms, such as stereotypes, tagged definitions and constraints. A profile can also specify model libraries on which it depends and the metamodel subset that it extends.	
<b>Project Browser</b>	The workspace window where the model contents are displayed in 'tree' format. Displays structures such as packages, diagrams and model elements.	
<b>Projection</b>	A mapping from a set to its subset.	
<b>Property</b>	A named value denoting a characteristic of an element. A property has semantic impact. Certain properties are predefined in the UML; others can be user defined.	Tagged Value
<b>Pseudo-State</b>	A vertex in a State Machine that has the form of a State, but doesn't behave as a State. Pseudo-states include initial and history vertices.	

Name	Detail	See also
<b>Published Model (MOF)</b>	A model that has been frozen, and that becomes available for instantiating repositories and for support in defining other models. A frozen model's model elements cannot be changed.	

## 21.16 Q

Name	Detail	See also
<b>Qualifier</b>	An Association attribute or tuple of attributes whose values partition the set of objects related to an object across an Association.	

## 21.17 R

Name	Detail	See also
<b>Realize</b>	A source object realizes the destination object.  Realize is used to express traceability and completeness in the model – a business process or requirement is realized by one or more Use Cases which are in turn realized by some Classes which in turn are realized by a Component, and so on.	
<b>Receive ( A message )</b>	The handling of a stimulus passed from a sender instance.	Sender, Receiver
<b>Receive</b>	An element used to define the acceptance or receipt of a request; movement on to the next action occurs until it has received what is defined.	
<b>Receiver ( Object )</b>	The object handling a stimulus passed from a sender object.	Sender
<b>Reception</b>	A declaration that a classifier is prepared to react to the receipt of a signal.	
<b>Recursion</b>	A type of message used in Sequence diagrams to indicate a recursive function.	
<b>Reference</b>	1. A denotation of a model element. 2. A named slot within a classifier that facilitates navigation to other classifiers.	Pointer
<b>Region</b>	UML 2.x supports both Expansion Regions and Interruptible Activity Regions. <ul style="list-style-type: none"><li>• An Expansion Region defines the bounds of a region consisting of one or more sets of input collections, where an input collection is a set of elements of the same type</li><li>• An Interruptible Activity Region contains Activity nodes - when a token leaves an interruptible region, this terminates all of the region's tokens and behaviors</li></ul>	
<b>Refinement</b>	A relationship that represents a fuller specification of something that has already been specified at a certain level of detail; for example, a design Class is a refinement of an analysis Class.	

Name	Detail	See also
<b>Relationship</b>	A semantic connection among model elements; examples of relationships include Associations and Generalizations.	
<b>Repository</b>	A facility for storing object models, interfaces and implementations.	
<b>Represents</b>	A connector that indicates a Collaboration Use is used in a classifier; the connector is drawn from the Collaboration Use to its owning classifier.	
<b>Requirement</b>	A required feature, property or behavior of a system (external requirement).	
<b>Responsibility</b>	A contract or obligation of a classifier (internal requirement).	
<b>Reuse</b>	The use of a pre-existing artifact.	
<b>Reverse Engineering</b>	The process of importing source code into the model as standard UML model objects (such as Classes, attributes and operations).	
<b>Rich Text Format</b>	A standard mark-up language for creating word processor documents, frequently associated with Microsoft Word.	
<b>Robustness Diagram</b>	Enterprise Architect supports business process modeling extensions from the UML business process model profile; Robustness diagrams are used in ICONIX.	Read more about this at <a href="http://www.sparxsystems.com/iconix/iconixsw.htm">www.sparxsystems.com/iconix/iconixsw.htm</a> .
<b>Role</b>	<ol style="list-style-type: none"> <li>1. The named detail and rules associated with one end of an association; a role can indicate name, constraints, multiplicity and collection details.</li> <li>2. The named specific behavior of an entity participating in a particular context; a role can be static (such as an Association end) or dynamic (such as a Collaboration role).</li> </ol>	
<b>Role Binding</b>	The mapping between a Collaboration Use's internal roles and the respective parts required to implement a specific situation; the associated parts can have	

Name	Detail	See also
	properties defined to enable the binding to occur, and the collaboration to take place.	
<b>Run Time</b>	The period of time during which a computer program executes.	Analysis Time, Compile Time, Design Time, Modeling Time

## 21.18 S

Name	Detail	See also
<b>Scenario</b>	<p>1. A specific sequence of actions that illustrates behaviors. A scenario can be used to illustrate an interaction or the execution of a Use Case instance.</p> <p>2. A sequence of operations carried out in some order to produce a known result. Can apply to Use Cases where it is the equivalent of a Sequence diagram, or to other objects to describe how they are used at run-time.</p>	Interaction
<b>Schema ( MOF )</b>	In the context of the MOF, analogous to a package that is a container of model elements. Schema corresponds to a MOF package.	Metamodel, Package
<b>Self-Message</b>	Reflects a new process or method invoked within the calling Lifeline's operation. It is a specification of a message.	
<b>Semantic Variation Point</b>	A point of variation in the semantics of a metamodel. It provides an intentional degree of freedom for the interpretation of the metamodel semantics.	
<b>Send (A message )</b>	The passing of a stimulus from a sender instance to a receiver instance.	Sender, Receiver
<b>Sender ( Object )</b>	The object passing a stimulus to a receiver object.	Receiver
<b>Sequence Diagram</b>	<p>A diagram that shows object interactions arranged in time sequence. In particular, it shows the objects participating in the interaction and the sequence of messages exchanged.</p> <p>Unlike a Communication (Collaboration) diagram, a Sequence diagram includes time sequences but does not include object relationships. A Sequence diagram can exist in a generic form (describes all possible scenarios) and in an instance form (describes one actual scenario).</p> <p>Sequence diagrams and Communication diagrams express similar information, but show it in different ways.</p>	Communication Diagram, Object Lifeline
<b>Signal</b>	The specification of an asynchronous stimulus communicated between instances. Signals can have parameters.	
<b>Signature</b>	The name and parameters of a behavioral feature. A signature can include an optional returned parameter.	

Name	Detail	See also
<b>Single Inheritance</b>	A semantic variation of Generalization in which a type can have only one supertype.	Multiple Inheritance
<b>Single Valued ( MOF )</b>	A model element with multiplicity defined is single valued when its Multiplicity Type: upper attribute is set to 1.  The term single-valued does not pertain to the number of values held by, for example, an attribute or parameter at any point in time, since a single-valued attribute (for instance, with a multiplicity lower bound of zero) could have no value.	Multi-Valued
<b>Specification</b>	A declarative description of what something is or does.	Implementation
<b>State</b>	A condition or situation during the life of an object during which it satisfies some condition, performs some activity, or waits for some event.	State (OMA)
<b>State Invariant</b>	A condition applied to a Lifeline that must be fulfilled for the Lifeline to exist.	
<b>State Machine</b>	A behavior that specifies the sequences of States that an object or an interaction goes through during its life in response to events, together with its responses and actions.	
<b>State Machine Diagram</b>	A diagram that illustrates how an element, often a Class, can move between States classifying its behavior, according to transition triggers, constraining guards and other aspects of State Machine diagrams that depict and explain movement and behavior.	
<b>State Chart</b>	A diagram that shows a State Machine.	State Machine, Activity Graph
<b>State Continuation</b>	A symbol that serves two different purposes for Interaction diagrams - as State Invariants and as Continuations.  A State Invariant is a condition applied to a Lifeline that must be fulfilled for the Lifeline to exist.  A Continuation is used in seq and alt combined fragments to indicate the branches of continuation that an operand follows.	
<b>State Lifeline</b>	A State Lifeline follows discrete transitions between States, which are defined along the y-axis of the timeline. Any transition has optional attributes of timing constraints, duration constraints and observations.	

Name	Detail	See also
<b>Static Classification</b>	A semantic variation of Generalization in which an object can not change classifier.	Multiple Classification, Dynamic Classification
<b>Stereotype</b>	<p>A new type of modeling element that extends the semantics of the metamodel.</p> <p>Stereotypes must be based on certain existing types or Classes in the metamodel.</p> <p>Stereotypes can extend the semantics, but not the structure of pre-existing types and Classes. Certain stereotypes are predefined in the UML, others can be user defined. Stereotypes are one of three extensibility mechanisms in UML.</p>	Constraint, Tagged value
<b>Stimulus</b>	The passing of information from one instance to another, such as raising a signal or invoking an operation. The receipt of a signal is normally considered an event.	Message
<b>String</b>	A sequence of text characters. The details of string representation depend on implementation, and can include character sets that support international characters and graphics.	
<b>Structural Diagram</b>	<p>A diagram that depicts the structural elements composing a system or function.</p> <p>These diagrams can reflect the static relationships of a structure, as do Class or Package diagrams, or run-time architectures, such as Object or Composite Structure diagrams.</p> <p>Structural diagrams include Class diagrams, Composite Structure diagrams, Component diagrams, Deployment diagrams, Object diagrams and Package diagrams.</p>	
<b>Structural Feature</b>	A static feature of a model element, such as an attribute.	
<b>Structural Model Aspect</b>	A model aspect that emphasizes the structure of the objects in a system, including their types, Classes, relationships, attributes and operations.	
<b>Subactivity State</b>	A State in an activity graph that represents the execution of a non-atomic sequence of steps that has some duration.	
<b>Subclass</b>	In a Generalization relationship, the specialization of another Class; the superclass.	Generalization, Child, Parent Superclass

Name	Detail	See also
<b>Submachine State</b>	A State in a State Machine that is equivalent to a composite State but its contents are described by another State Machine.	
<b>Subpackage</b>	A package that is contained in another package.	
<b>Substate</b>	A State that is part of a composite State.	Composite State, Concurrent Substate, Disjoint Substate
<b>Subsystem</b>	A grouping of model elements that represents a behavioral unit in a physical system.  A subsystem offers interfaces and has operations. In addition, the model elements of a subsystem can be partitioned into specification and realization elements.	Package, Physical System
<b>Subtype</b>	In a Generalization relationship, the specialization of another type; the supertype.	Generalization, Child, Parent Supertype
<b>Superclass</b>	In a Generalization relationship, the generalization of another Class; the subclass.	Generalization Subclass
<b>Supertype</b>	In a Generalization relationship, the generalization of another type; the subtype.	Generalization Subtype
<b>Supplier</b>	A classifier that provides services that can be invoked by others.	Client
<b>Swimlane</b>	A partition on an Activity diagram for organizing the responsibilities for actions. Swimlanes typically correspond to organizational units in a business model.	Partition
<b>Synch</b>	A State used for indicating that concurrent paths of a State Machine are synchronized. After bringing the paths to a synch state, the emerging transition indicates unison.	
<b>Synchronize Code</b>	The process of importing and exporting code changes to ensure the model and source code match.	
<b>System</b>	A top-level subsystem in a model.	Physical System

Name	Detail	See also
<b>System Boundary</b>	An element used to delineate a particular part of the system.	

## 21.19 T

Name	Detail	See also
<b>Table</b>	A relational table (composed of columns).	
<b>Tagged Value</b>	<p>The explicit definition of a property as a name-value pair.</p> <p>In a Tagged Value, the name is referred to as the tag. Certain tags are predefined in the UML; others can be user defined.</p> <p>Tagged Values are one of three extensibility mechanisms in UML.</p>	Constraint, Property, Stereotype
<b>Template</b>	The descriptor for a Class with one or more unbound parameters.	Parameterized Element, Parameterized Class
<b>Terminate</b>	A pseudostate indicating that upon entry of its pseudostate, the State Machine's execution ends.	
<b>Thread ( of Control )</b>	A single path of execution through a program, a dynamic model, or some other representation of control flow. Also, a stereotype for the implementation of an active object as a lightweight process.	Active Object, Process, Concurrency
<b>Time Event</b>	An event that denotes the time elapsed since the current state was entered.	Event
<b>Time Expression</b>	An expression that resolves to an absolute or relative value of time.	
<b>Timing Diagram</b>	A diagram that defines the behavior of different objects within a time-scale, with visual depictions of those objects changing state and interacting over time.	
<b>Toolbox</b>	The main toolbar running down the center of Enterprise Architect, from which you can select model elements to insert into diagrams. This is also known as the Diagram Toolbox and the Object toolbar.	
<b>Top Level</b>	<p>A stereotype of package denoting the top-most package in a containment hierarchy.</p> <p>The topLevel stereotype defines the outer limit for looking up names, as namespaces 'see' outwards. For example, <b>opTopLevelsubsystem</b> represents the top of the subsystem containment hierarchy.</p>	

Name	Detail	See also
<b>Trace</b>	A dependency that indicates a historical or process relationship between two elements that represent the same concept without specific rules for deriving one from the other.	
<b>Transient Object</b>	An object that exists only during the execution of the process or thread that created it.	
<b>Transition</b>	A relationship between two States indicating that an object in the first State performs certain specified actions and enters the second State when a specified event occurs and specified conditions are satisfied. On such a change of State, the transition is said to fire.	Fire, Object Flow
<b>Type</b>	<p>A stereotyped Class that specifies a domain of objects together with the operations applicable to the objects, without defining the physical implementation of those objects.</p> <p>A type can not contain any methods, maintain its own thread of control, or be nested. However, it can have attributes and associations.</p> <p>Although an object can have at most one implementation Class, it can conform to multiple different types.</p>	Implementation Class, Interface
<b>Type Expression</b>	An expression that evaluates to a reference to one or more types.	

## 21.20 U

Name	Detail	See also
<b>UML</b>	The Unified Modeling Language, a notation and specification for modeling software systems in an Object-Oriented manner.  You can read more about UML on the OMG home page or in our UML Tutorial.	
<b>UML Diagrams</b>	Diagrams used to model different aspects of the system under development. They include various elements and connectors, all of which have their own meanings and purposes.  UML 2.4.1 includes 14 diagrams: Use Case diagram, Activity diagram, State Machine diagram, Timing diagram, Sequence diagram, Interaction Overview diagram, Communication diagram, Package diagram, Class diagram, Profile diagram, Object diagram, Composite Structure diagram, Component diagram and Deployment diagram.	
<b>UML Toolbox</b>	The main toolbar running down the center of Enterprise Architect from which you can select model elements to insert into diagrams. This is also known as the Diagram Toolbox and the Object toolbar.	
<b>Uninterpreted</b>	A placeholder for a type or types whose implementation is not specified by the UML. Every uninterpreted value has a corresponding string representation.	Any ( CORBA )
<b>Usage</b>	A dependency in which one element (the client) requires the presence of another element (the supplier) for its correct functioning or implementation.	
<b>Use</b>	A connector that indicates that one element requires another to perform some interaction. The Usage relationship does not specify how the target supplier is used, other than that the source client uses it in definition or implementation.	
<b>Use Case ( Class )</b>	A UML model element that describes how a user of the proposed system interacts with the system to perform a discrete unit of work. It describes and signifies a single interaction over time that has meaning for the end user (person, machine or other system), and is required to leave the system in a complete state: either the interaction completed or was rolled back to the initial state.	Use Case Instance
<b>Use Case Diagram</b>	A diagram that captures Use Cases and Actor interactions. It describes the functional requirements of the system, the manner in which outside things (Actors) interact at the system boundary, and the response of the system.	

Name	Detail	See also
<b>Use Case Estimation</b>	The technique of estimating project size and complexity based on the number of Use Cases and their difficulty.	
<b>Use Case Instance</b>	The performance of a sequence of actions being specified in a Use Case. An instance of a Use Case.	Use Case Class
<b>Use Case Model</b>	A model that describes a system's functional requirements in terms of Use Cases.	
<b>Utility</b>	<p>A stereotype that groups global variables and procedures in the form of a Class declaration. The utility attributes and operations become global variables and global procedures, respectively.</p> <p>A utility is not a fundamental modeling construct, but a programming convenience.</p>	

## 21.21 V

Name	Detail	See also
<b>Value</b>	An element of a type domain.	
<b>Value Lifeline</b>	A Lifeline that shows the Lifeline's state across the diagram, within parallel lines indicating a steady state.  A cross between the lines indicates a transition or change in state.	
<b>Vertex</b>	A source or a target for a transition in a State Machine; a vertex can be either a State or a pseudo-state.	State, Pseudo-State
<b>View</b>	A projection of a model, which is seen from a given perspective or vantage point and omits entities that are not relevant to this perspective.	
<b>View Element</b>	An element that is a textual and/or graphical projection of a collection of model elements.	Model Element (MOF)
<b>View Projection</b>	A projection of model elements onto view elements.  A View Projection provides a location and a style for each view element.	
<b>Visibility</b>	An enumeration whose value (public, protected, package or private) denotes how the model element to which it refers can be seen outside its enclosing namespace.	Export, Import
<b>Visual Basic</b>	A rapid application development programming language.  Windows' only scripting language based on COM.

## 22 License Management

The License Management dialog in Enterprise Architect enables you to upgrade Enterprise Architect and to register Add-Ins. The dialog lists:

- The currently-registered keys
- The product each key applies to
- When each private key expires
- When each shared key is to be reactivated in the keystore for issue to another user

**Access**   **Help | Register and Manage License Key(s)**

### License Management options

Option	Action	See also
<b>Add Key</b>	Display the Add Registration Key dialog, which you can use to: <ul style="list-style-type: none"> <li>• Register your new Enterprise Architect license</li> <li>• Obtain a shared key from the Sparx Systems Key Store (available for version 4.51 and above)</li> <li>• Add a new key to update to a higher version of Enterprise Architect or to register an Add-In</li> </ul>	<a href="#">Register a Full License</a> <sup>[36]</sup> <a href="#">Add License Keys</a> <sup>[3165]</sup> <a href="#">Upgrade an Existing License</a> <sup>[3169]</sup> <a href="#">Register Add-In</a> <sup>[317]</sup>
<b>Remove Key</b>  <b>Release Key</b>	<ul style="list-style-type: none"> <li>• (Private Key) Make the Add-In or current version of Enterprise Architect inoperable</li> <li>• (Shared Key) Release the key to the keystore; however, the Keystore Manager is normally configured to release keys automatically when the user logs off</li> </ul>	
<b>Copy</b>	Place the highlighted key into the clipboard.	
<b>Close</b>	Close the dialog.	
<b>Help</b>	Display the help for this topic.

## 22.1 *Finding Your License Information*

You can find information on your Enterprise Architect license in the About Enterprise Architect dialog.

[Access](#) [Help](#) | [About EA](#)

## 22.2 Adding License Keys

Two types of license key can be used in conjunction with Enterprise Architect: Private and Shared.

### Reference

Topic	Detail	See also
<b>Private Keys</b>	<p>Private keys enable you to register, indefinitely, on the machine and user account that you are currently using:</p> <ul style="list-style-type: none"> <li>• An Enterprise Architect license for the edition of Enterprise Architect you have purchased, or</li> <li>• An Add-In product license (such as for MDG Link for Eclipse or MDG Link for Visual Studio.NET).</li> </ul>	<a href="#">Enterprise Architect Editions</a> <sup>18</sup>
<b>Shared Keys</b>	<p>Shared keys are obtained from a central shared key store, to give you temporary access to the installed 'suite' edition of Enterprise Architect.</p> <p>Shared Keys are available with the purchase of a floating license, and require Enterprise Architect version 4.51 or higher.</p> <p>Shared Keys require a shared license key store to be configured by your license administrator; the key store can be either file-based or network based (preferred).</p> <p>Only the Key Administrator is required to install the Sparx Enterprise Key Store application; end users simply connect to the configured key file - advised by the administrator - as described below.</p> <p>No additional software is required to be installed.</p>	<a href="#">Enterprise Architect Floating License</a> .
<b>Notes on Keys</b>	<p>Some license keys can override and remove others</p> <ul style="list-style-type: none"> <li>• The key for a more advanced edition of Enterprise Architect replaces the key for a simpler edition</li> <li>• The key for MDG Integration for Visual Studio replaces the key for MDG Link for Visual Studio</li> </ul> <p>Shared keys and Private keys have different formats and cannot be used interchangeably.</p>	

**Access** [Help | Register and Manage License Key\(s\) > License Management: Add Key > Add Registration Key](#)

### How to

To add a private key

Step	Action	See also
1	Click on the Enter Private Key tab.	<a href="#">License Management</a> 3162
2	In the <b>Name</b> and <b>Company</b> fields, type your user name and company name.	
3	In the <b>Copy registration key into space below...</b> field, copy the registration key (including any parentheses around the key).	
4	Click on the <b>OK</b> button to confirm the key selection.	

To add a shared key

Step	Action	See also
1	Click on the Get Shared Key tab.	<a href="#">License Management</a> 3162
2	In the <b>Name</b> and <b>Company</b> fields, type your user name and company name.	
3	In the <b>Shared Keystore</b> field, click on the ( ... ) (Browse) button. The Shared Keystore Selection dialog displays.	
4	If your keystore is file-based: <ul style="list-style-type: none"> <li>• Select the <b>File Based Keystore</b> radio button</li> <li>• Click on the <b>Browse</b> button, and</li> <li>• Locate and select the keystore file</li> </ul> Go to step 7.	
5	If the keystore is network-based: <ul style="list-style-type: none"> <li>• Click on the <b>Sparx Keystore Server</b> radio button</li> <li>• In the <b>Server Address</b> field, type the server address of the keystore.</li> </ul>	
6	If necessary, type in the password (advised by your administrator) and/or click on the <b>Test</b> button to ensure that you have a connection to the keystore.	

Step	Action	See also
7	Click on the <b>OK</b> button to return to the Get Shared Key tab. This now shows the name of the keystore in the <b>Shared Keystore</b> field.	
8	In the <b>Select a Product</b> field, click on the appropriate product name.	
9	Click on the <b>OK</b> button. The License Management dialog redisplay, indicating that the shared key is registered for the selected product until the key expiry date.	
10	Click on the <b>Close</b> button.	

## 22.3 Keystore Troubleshooting

Message Displayed:	Explanation
<i>Error reading Key Store file: (Access is denied)</i>	<p>All users who are to use the shared key facility require <b>Read, Write and Modify</b> access to the <code>sskeys.dat</code> file containing the shared keys.</p> <p>Please verify that all required users have sufficient permissions to the file and try again.</p> <p>Review the effective permissions calculated at the location of the key file for the user account reporting the problem - you should closely examine the permissions for both the Network Share and the File System; it is possible that these permissions have been overwritten at some point.</p> <p>If the problem continues, contact Sparx Support.</p>
<i>Error reading Key Store file: (Key File has been moved)</i>	<p>In the key store, as a security measure the hard drive serial number is recorded when the file is created; the file then cannot be moved from the original location in which it was created.</p> <p>If the key store has to be re-located for any reason, the administrator should re-create the key store in the new location using the original license keys.</p> <p>This issue is commonly seen after a file server has undergone a hardware upgrade in which the physical hard drives have been replaced; problems could also occur if the drive used is part of a RAID configuration.</p> <p>The message can also appear where the key store exists on a Novell-based file system - when creating the key store, the administrator is prompted to confirm that the key store is to be located on a Novell Netware file server; if they click on the <b>Yes</b> button, the key store instead records the logical path used to create it, and all users must connect to the key store using this same path.</p> <p>The recorded path is case-sensitive and must be an exact match.</p>

## 22.4 Upgrade an Existing License

This topic explains how to upgrade your installation of Enterprise Architect to a more powerful edition.

Topic	Detail	See also
<b>Editions</b>	<p>There are six Enterprise Architect editions:</p> <ul style="list-style-type: none"> <li>• Desktop</li> <li>• Professional</li> <li>• Corporate</li> <li>• Business and Software Engineering</li> <li>• Systems Engineering</li> <li>• Ultimate</li> </ul> <p>The installation file provides the facilities of all editions; your registration key gives access to the facilities of the edition you have purchased.</p>	<a href="#">Editions Available</a> <sup>[20]</sup>
<b>Upgrade</b>	<p>If you have purchased a less powerful edition, such as Professional or Desktop, you can subsequently upgrade your existing license to a more powerful edition by purchasing a special upgrade key from Sparx Systems.</p> <p>Once you have purchased and received the appropriate key, use the procedure below to gain access to the additional features.</p>	<a href="#">Enterprise Architect Purchase Details</a>
<b>Trial and Lite Editions</b>	<p>The Lite edition and the Trial version cannot be registered or upgraded.</p> <p>If you have used either of these versions and then purchased Enterprise Architect, you must download the registered version from:</p> <p style="text-align: center;"><a href="http://www.sparxsystems.com/securedownloads/easetupfull.exe">www.sparxsystems.com/securedownloads/easetupfull.exe</a></p> <p>Then you can enter your registration key.</p>	<a href="#">The Trial Version</a> <sup>[18]</sup> <a href="#">The Read-only 'Lite' Edition</a> <sup>[23]</sup> <a href="#">Registered User software download site</a>
<b>Application</b>	<p>This topic is mainly applicable to users with private keys.</p> <p>If you are an end-user with a shared key, you would simply be allocated the relevant key next time you requested one.</p> <p>If, however, you want to upgrade while using a shared key on a long lease, you would simply click on the <b>Release Key</b> button and then the <b>Add Key</b> button.</p>	<a href="#">Adding License Keys</a> <sup>[3165]</sup>

[Access](#)   **Help | Register and Manage License Key(s) > License Management: Add Key**

### How to

To upgrade from one license edition to another

Step	Action	See also
1	Make sure you have a valid upgrade key purchased from Sparx Systems; you typically receive this in an email or PDF format.	
2	On the Add Registration Key dialog, in the <b>Name</b> and <b>Company</b> fields, type your name and company name.	<a href="#">License Management</a> [3162]
3	Copy the key you received for the upgraded edition of Enterprise Architect - including the { and } bracket characters - from the email.	
4	Paste the key into the <b>Copy registration key</b> field.	
5	Click on the <b>OK</b> button.  Enterprise Architect displays the message:  <i>Registration succeeded – Thank you for purchasing Enterprise Architect xxxx Edition</i>	
6	Click on the <b>OK</b> button, and then on the <b>Close</b> button to continue working in Enterprise Architect.	
7	Select the <b>Help   About EA</b> menu option.  Copy the registration key shown and store it somewhere safe; this is a key to the full license of the edition you have upgraded to.  If you ever have to reinstall Enterprise Architect, you can register it with this key, so you won't have to go through the upgrade process again.	

## 22.5 Register Add-In

Apart from registering Enterprise Architect, you must also register any Add-Ins you purchase to use with the application. You can register either a private key as explained here, or a shared Add-In key as explained in *Add An Add-In Key*.

**Access**   [Help | Register and Manage License Key\(s\)](#)

### Register Add-Ins for Enterprise Architect

Step	Action	See also
1	Purchase one or more licenses for the Add-In from your Add-In provider.  Once you have paid for a licensed version of the Add-In, you receive (via email or other suitable means) a license key for the product.	
2	Save the license key and the latest full version of the Add-In.	
3	Run the Add-In's setup program to install the Add-In.	
4	In Enterprise Architect, select the menu option: <ul style="list-style-type: none"> <li><b>Register and Manage License Key(s)</b></li> </ul> The License Management dialog displays.	<a href="#">License Management</a> t <sub>[3162]</sub>
5	Click on the <b>Add Key</b> button.  The Add Registration Key dialog displays, showing the Enter Private Key tab.	
6	Type or copy-and-paste in the key you received with the Add-In, including the { and } characters.	
7	Click on the <b>OK</b> button.	
8	When the Add-In has been added successfully, close down Enterprise Architect and restart it to apply the integration changes imposed by the Add-In.

## 22.6 Add an Add-In Key

When your organization is using a keystore to distribute keys you can retrieve a key for a third party add-in in the same way as you would for a key for any Sparx Systems product.

**Access**   [Help](#) | [Register and Manage License Key\(s\): Add Key > Get Shared Key](#)

### Add a shared Add-In key

Step	Action	See also
1	In the <b>Name</b> and <b>Company</b> fields, type your user name and company name.	
2	In the <b>Shared Keystore</b> field, click on the <b>Browse</b> button ( ... ). The Shared Keystore Selection dialog displays.	
3	Click on the <b>Sparx Keystore Server</b> radio button, and in the <b>Server Address</b> field type the server address of the keystore.	
4	If necessary, in the <b>Password</b> field type the password (advised by your administrator) and/or click on the <b>Test</b> button to check the connection to the keystore.	
5	Click on the <b>OK</b> button to return to the Get Shared Keystore tab, which now shows the name of the keystore in the <b>Shared Keystore</b> field.	
6	In the <b>Select a Product</b> field, look for the appropriate product name, and click on it.	
7	Click on the <b>OK</b> button. The License Management dialog redisplay with the shared Add-In key in the <b>Currently Registered Keys</b> list.	
8	Click on the <b>Close</b> button.	

### Notes

- Shared Add-In keys require Enterprise Architect version 11 or higher
